80.11.9 DataPtr as Integer

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The memory address where the data is stored.
**Notes:**
Maybe useful for declares.
Returns nil for console pictures.
(Read only property)

80.11.10 GreenOffset as Integer

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The platform dependent offset of the green channel in the RGB data.
**Notes:**
A value between 0 and 3.
(Read only property)

80.11.11 HasAlphaChannel as Boolean

**Notes:** (Read only property)

80.11.12 Height as Integer

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The height of the image in pixels.
**Notes:** (Read only property)

80.11.13 Picture as Picture

**Notes:** (Read only property)
80.11. **RedOffset as Integer**

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The platform dependend offset of the red channel in the RGB data. **Notes:**
A value between 0 and 3. (Read only property)

80.11. **RowBytes as Integer**

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of an image row in bytes. **Notes:**
RowBytes can be width*bytesPerPixel, but often it is not. (Read only property)

80.11. **Width as Integer**

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of the image in pixels. **Notes:** (Read only property)
80.12 class PictureSepiaMBS

80.12.1 class PictureSepiaMBS

MBS Picture Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
A class for doing a sepia effect.

80.12.2 Methods

80.12.3 close

MBS Picture Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
The destructor.
Notes:
There is no need to call this method except you want to free all resources of this object now without waiting
for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

80.12.4 Run as boolean

MBS Picture Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Runs the picture effect.
Notes:
Fails if the pictures are not bitmap pictures. Source and Destination can be equal. If you provide a destina-
tion picture, the dimensions of source and destination must be equal.

For each pixel this method does:

sourcepixel=sourcepicture.pixel(x,y)
r=sourcepixel.red
g=sourcepixel.green
b=sourcepixel.blue

sum = r * RedFactor + g * GreenFactor + b * BlueFactor

r = sum + SepiaColor.red
g = sum + SepiaColor.green
b = sum + SepiaColor.blue
80.12.5 Properties

80.12.6 DestinationPicture as Picture

Notes: If you set this property, use a bitmap picture equal in size to the source picture.
If this property is nil, the Run method will create a picture.
(Read and Write property)

80.12.7 FactorBlue as Double

Notes: (Read and Write property)

80.12.8 FactorGreen as Double

Notes: (Read and Write property)

80.12.9 FactorRed as Double

Notes: (Read and Write property)

80.12.10 MaxX as Integer

Notes:
If 0 the width of the source picture defines this value.
(Read and Write property)

80.12.11 MaxY as Integer

MBS Picture Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The maximal y coordinate to use.
**Notes:**
If 0 the height of the source picture defines this value.
(Read and Write property)

80.12.12 MinX as Integer

MBS Picture Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The minimal x coordinate to use.
**Notes:**
Default is 0.
(Read and Write property)

80.12.13 MinY as Integer

MBS Picture Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The minimal y coordinate to use.
**Notes:**
Default is 0.
(Read and Write property)

80.12.14 SepiaBlue as Integer

MBS Picture Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The sepia color to use.
**Notes:**
Default is 0.
(Read and Write property)
80.12.15  **SepiaGreen as Integer**

MBS Picture Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The sepia color to use. **Notes:**
Default is 0. (Read and Write property)

80.12.16  **SepiaRed as Integer**

MBS Picture Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The sepia color to use. **Notes:**
Default is 0. (Read and Write property)

80.12.17  **SourcePicture as Picture**

MBS Picture Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The source picture. **Notes:**
Must be a bitmap picture. (you can use the picture.BitmapMBS function for this) (Read and Write property)
80.13 class PictureWriterMBS

80.13.1 class PictureWriterMBS

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class to build a picture by filling a memoryblock.

**Example:**

```vbs
dim p as PictureWriterMBS
dim m as MemoryBlock
dim r,g,b,rRow,gRow,bRow,h1,w1,x,y,bpp as Integer

// Create a new picture writer
p=NewPictureWriterMBS(512,512)

h1=p.Height-1
w1=p.Width-1

bpp=p.BytesPerPixel
rRow=p.RedOffset
gRow=p.GreenOffset
bRow=p.BlueOffset

// in each row the red, blue and green channels have different offsets.
// but offsets are platform dependend

for y=0 to h1
    // Get data in memory. This Memoryblock has a size property of 0!
    m=p.Data(y)
    r=rRow
    g=gRow
    b=bRow

    for x=0 to w1
        m.UInt8Value(r)=x\2
        m.UInt8Value(g)=y\2
        m.UInt8Value(b)=x*y\2

        r=r+bpp
        g=g+bpp
        b=b+bpp
    next
next

// Use Render to make a picture object
dim pic as Picture = p.Render
Backdrop = pic
```
Notes: This is the same code the plugin uses to create pictures.

### 80.13.2 Methods

#### 80.13.3 Data(Row as Integer) as MemoryBlock

MBS Picture Plugin, Plugin Version: 10.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The memoryblock with the original image data for the given row.
**Notes:**
Changes here will be visible in the picture.
This memoryblock has a size property with value 0!
No bound checking can be done by Realbasic on this memoryblock.
See also:
- 80.13.8 Data as MemoryBlock

#### 80.13.4 Render as picture

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates and returns a picture for this writer.
**Notes:**
The writer is destroyed with this call, so do not use it any more.
(one picture can be created with one writer currently)

### 80.13.5 Properties

#### 80.13.6 BlueOffset as Integer

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The platform dependend offset of the blue channel in the RGB data.
**Notes:**
A value between 0 and 3.
(Read only property)
80.13.7 BytesPerPixel as Integer

Notes: Most times 4, but for some platforms 3. (Read only property)

80.13.8 Data as Memoryblock

Notes: Changes here will be visible in the picture. This memoryblock has a size property with value 0! No bound checking can be done by Realbasic on this memoryblock. Returns nil for console pictures. (Read only property)
See also:
- 80.13.3 Data(Row as Integer) as MemoryBlock

80.13.9 DataCopy as Memoryblock

Notes: Changes to this memoryblock will not be visible in the rendered picture. (Read only property)

80.13.10 DataPtr as Integer

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: The memory address where the data is stored.
Notes: Maybe useful for declares. Returns nil for console pictures. (Read only property)
80.13.11 GreenOffset as Integer

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The platform dependend offset of the green channel in the RGB data.
**Notes:**
A value between 0 and 3.
(Read only property)

80.13.12 HasAlphaChannel as Boolean

MBS Picture Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether an alpha channel exists.
**Example:**
```vbs
Dim p As PictureWriterMBS = NewPictureWriterMBS(200, 200, True)
MsgBox "Alpha: " + Str(p.HasAlphaChannel)

// get pointer to bytes
Dim m As MemoryBlock = p.Data

// fill all with 127
m.FillBytesMBS 0, p.RowBytes * p.Height, 127

Dim x As Picture = p.Render
Break
```
**Notes:** (Read only property)

80.13.13 Height as Integer

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The height of the image in pixels.
**Notes:** (Read only property)

80.13.14 Picture as Picture

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The buffer picture reference.
**Notes:**
If the writer uses a RB picture as buffer it is available here.
(depends on the actual implementation for a given platform whether this property is used)
(Read only property)

**80.13.15 RedOffset as Integer**

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The platform dependend offset of the red channel in the RGB data.
**Notes:**
A value between 0 and 3.
(Read only property)

**80.13.16 RowBytes as Integer**

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The width of an image row in bytes.
**Notes:**
RowBytes can be width*bytesPerPixel, but often it is not.
(Read only property)

**80.13.17 Width as Integer**

MBS Picture Plugin, Plugin Version: 6.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The width of the image in pixels.
**Notes:** (Read only property)
Chapter 81

GraphicsMagick

81.1  class GM16BlobMBS

81.1.1  class GM16BlobMBS

Function: The class for binary large objects.

Example:

// get some image data (e.g. from blob in database)
dim logo as Picture = LogoMBS(500)
dim jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Dim mp as new GM16ImageMBS
dim blob as new GM16BlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask

Notes:

Blob provides the means to contain any opaque data. It is named after the term "Binary Large OBit" commonly used to describe unstructured data (such as encoded images) which is stored in a database. While the function of Blob is very simple (store a pointer and and size associated with allocated data), the Blob class provides some very useful capabilities. In particular, it is fully reference counted just like the Image class.
The Blob class supports value assignment while preserving any outstanding earlier versions of the object. Since assignment is via a pointer internally, Blob is efficient enough to be stored directly in an STL container or any other data structure which requires assignment. In particular, by storing a Blob in an associative container (such as STL’s ’map’) it is possible to create simple indexed in-memory ”database” of Blobs.

Magick++ currently uses Blob to contain encoded images (e.g. JPEG) as well as ICC and IPTC profiles. Since Blob is a general-purpose class, it may be used for other purposes as well.

81.1.2 Methods

81.1.3 Constructor

Function: Default constructor creating an empty blob object.

See also:

- 81.1.4 Constructor(data as memoryblock, offset as Integer, size as Integer)
- 81.1.5 Constructor(data as string)
- 81.1.6 Constructor(other as GM16BlobMBS)

81.1.4 Constructor(data as memoryblock, offset as Integer, size as Integer)

Function: Construct object with data, making a copy of the supplied data.

See also:

- 81.1.3 Constructor
- 81.1.5 Constructor(data as string)
- 81.1.6 Constructor(other as GM16BlobMBS)

81.1.5 Constructor(data as string)

Function: Construct object with data, making a copy of the supplied data.

Example:

```// get some image data (e.g. from blob in database)
dim logo as Picture = LogoMBS(500)
dim jpegData as string = PictureToJPEGStringMBS(logo, 80)```
// new image
Dim mp as new GM16ImageMBS
dim blob as new GM16BlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask

See also:

- 81.1.3 Constructor 13310
- 81.1.4 Constructor(data as memoryblock, offset as Integer, size as Integer) 13310
- 81.1.6 Constructor(other as GM16BlobMBS) 13311

81.1.6 Constructor(other as GM16BlobMBS)

Function: Copy constructor (reference counted).
See also:

- 81.1.3 Constructor 13310
- 81.1.4 Constructor(data as memoryblock, offset as Integer, size as Integer) 13310
- 81.1.5 Constructor(data as string) 13310

81.1.7 CopyMemory as memoryblock

Function: Returns a copy of the data as a memoryblock.
Notes: Returns nil on any error like low memory.

81.1.8 CopyString as string

Function: Returns a copy of the data as a string.
81.1.9  Data as Ptr

**Function:** A memoryblock with the data from this blob.

**Example:**

```vbscript
dim b as new GM16BlobMBS("Hello")

dim m as memoryblock = b.Data
MsgBox m.StringValue(0,5) // shows "Hello"
```

**Notes:** This is a memoryblock referencing the data of the blob. It has no size set. The memoryblock can only be used as long as the blob object exists. if you use it after you destroyed the blob object, you can crash you application.

81.1.10  Update(data as memoryblock, offset as Integer, size as Integer)

**Function:** Replaces the content of this blob with a copy of the bytes in the memoryblock.

See also:

- 81.1.11 Update(data as string)

81.1.11  Update(data as string)

**Function:** Replaces the content of this blob with a copy of the bytes in the string.

**Notes:** Offset is zero based.

See also:

- 81.1.10 Update(data as memoryblock, offset as Integer, size as Integer)

81.1.12  Properties

81.1.13  handle as Integer

**Function:** The internal handle of the blob object.

**Notes:** (Read and Write property)
81.1. CLASS GM16BLOBMBS

81.1.14 length as UInt64

Function: Obtain data length in bytes.

Example:

dim b as new GM16BlobMBS("Hello")

MsgBox str(b.length) // shows 5

Notes: (Read only property)

81.1.15 base64 as string

Function: The blob content as a string in Base64 format.

Example:

dim b as new GM16BlobMBS("Hello")

MsgBox b.base64 // shows "SGVsbG8="

Notes: (Read and Write computed property)
81.2  class GM16CoderInfoMBS

81.2.1  class GM16CoderInfoMBS

Function: The class used to get information about all registered coders.
Example:

```vbnet
dim coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList
dim names(-1) as string
for each coder as GM16CoderInfoMBS in coders
    names.Append coder.name
next
MsgBox Join(names, EndOfLine)
```

Notes: The CoderInfo class provides the means to provide information regarding GraphicsMagick support
for an image format (designated by a magick string). It may be used to provide support for a specific named
format (provided as an argument to the constructor), or as an element of a container when format support
is queried using the coderInfoList() templated function.

81.2.2  Methods

81.2.3  CoderInfoList(needReadable as boolean = true, needWriteable as boolean = false, needMultiFrame as boolean = false) as GM16CoderInfoMBS()

Function: Creates a list of all coders.
Example:

```vbnet
dim coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList
```

81.2.4  Properties

81.2.5  description as string

Function: Format description (e.g. "CompuServe graphics interchange format").
Example:
81.2.  CLASS GM16CODERINFOMBS

\[\text{dim coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList}\]
\[\text{dim names(-1) as string}\]

\text{for each coder as GM16CoderInfoMBS in coders}\]
\text{names.Append coder.name+" "+coder.description}\n\text{next}\]

\text{MsgBox Join(names,EndTimeLine)\]}

\textbf{Notes:} (Read and Write property)

\textbf{81.2.6  isMultiFrame as boolean}

\textbf{Function:} Format supports multiple frames.
\textbf{Example:}
\[\text{dim coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList}\]
\[\text{dim names(-1) as string}\]

\text{for each coder as GM16CoderInfoMBS in coders}\]
\text{names.Append coder.name+" "+str(coder.isMultiFrame)}\n\text{next}\]

\text{MsgBox Join(names,EndTimeLine)\]}

\textbf{Notes:} (Read and Write property)

\textbf{81.2.7  isReadable as boolean}

\textbf{Function:} Format is readable.
\textbf{Example:}
\[\text{dim coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList}\]
\[\text{dim names(-1) as string}\]

\text{for each coder as GM16CoderInfoMBS in coders}\]
\text{names.Append coder.name+" "+str(coder.isReadable)}\n\text{next}\]
MsgBox Join(names,EndOfLine)

**Notes:** (Read and Write property)

### 81.2.8 isWritable as boolean

**Function:** Format is writeable.
**Example:**

```vbscript
dim coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList
dim names(-1) as string

For Each coder As GM16CoderInfoMBS In coders
    names.Append coder.name + " " + Str(coder.isWritable)
Next

MsgBox Join(names, EndOfLine)
```

**Notes:** (Read and Write property)

### 81.2.9 name as string

**Function:** Format name (e.g. "GIF").
**Example:**

```vbscript
dim coders(-1) as GM16CoderInfoMBS = GM16CoderInfoMBS.CoderInfoList
dim coder as GM16CoderInfoMBS = coders(0) // pick first one

MsgBox coder.name
```

**Notes:** (Read and Write property)
81.3. class GM16ColorGrayMBS

81.3.1 class GM16ColorGrayMBS

**Function:** The color subclass for a grayscale color.

**Example:**

```dim g as new GM16ColorGrayMBS(0.5)
MsgBox str(g.shade)```

**Notes:**

Representation of grayscale RGB color.
Equal parts red, green, and blue specified as a ratio (0 to 1).
Subclass of the GM16ColorMBS class.

81.3.2 Methods

81.3.3 Constructor

**Function:** Creates a new color with transparent black.

**Example:**

```dim c as new GM16ColorGrayMBS
MsgBox str(c.redQuantum) +” ” +str(c.greenQuantum)+” ” +str(c.blueQuantum)```

See also:

- 81.3.4 Constructor(other as GM16ColorMBS)
- 81.3.5 Constructor(shade as Double)

81.3.4 Constructor(other as GM16ColorMBS)

**Function:** Creates a new color copying the existing color.

**Example:**

```dim g as new GM16ColorGrayMBS(0.5)
dim o as new GM16ColorGrayMBS(g)```
See also:

- 81.3.3 Constructor
- 81.3.5 Constructor(shade as Double)

### 81.3.5 Constructor(shade as Double)

**Function:** Creates a new color with the given value.

**Example:**

```vbnet
dim g as new GM16ColorGrayMBS(1.0)
MsgBox str(g.colorValue)
```

**Notes:** Range is 0.0 to 1.0.

See also:

- 81.3.3 Constructor
- 81.3.4 Constructor(other as GM16ColorMBS)

### 81.3.6 Properties

#### 81.3.7 shade as Double

**Function:** The gray value for this color.

**Example:**

```vbnet
dim g as new GM16ColorGrayMBS(1.0)
MsgBox str(g.shade)
```

**Notes:**

Range is 0.0 to 1.0
(Read and Write property)
81.4. **CLASS GM16COLORHSLMBS**

81.4  **class GM16ColorHSLMBS**

81.4.1  **class GM16ColorHSLMBS**

**Function:** The class for a HSL color.

**Example:**

```vbscript
dim g as new GM16ColorHSLMBS(0.1,0.2,0.3)
MsgBox str(g.colorValue)
```

**Notes:** Subclass of the GM16ColorMBS class.

81.4.2  **Methods**

81.4.3  **Constructor**

**Function:** Creates a new color with transparent black.

**Example:**

```vbscript
dim c as new GM16ColorHSLMBS
MsgBox str(c.redQuantum)+” ”+str(c.greenQuantum)+” ”+str(c.blueQuantum)
```

See also:

- 81.4.4 Constructor(hue as Double, saturation as Double, luminosity as Double)
- 81.4.5 Constructor(other as GM16ColorMBS)

81.4.4  **Constructor(hue as Double, saturation as Double, luminosity as Double)**

**Function:** Creates a new color with the given values.

**Example:**

```vbscript
dim g as new GM16ColorHSLMBS(0.1,0.2,0.3)
MsgBox str(g.hue)+” ”+str(g.saturation)+” ”+str(g.luminosity)
```

See also:
81.4.3 Constructor

81.4.5 Constructor(other as GM16ColorMBS)

81.4.5 Constructor(other as GM16ColorMBS)

Function: Creates a new color copying the existing color.

Example:

```vbs
dim g as new GM16ColorHSLMBS(0.1,0.2,0.3)
dim o as new GM16ColorHSLMBS(g)
MsgBox str(o.colorValue)
```

See also:

- 81.4.3 Constructor
- 81.4.4 Constructor(hue as Double, saturation as Double, luminosity as Double)

81.4.6 Properties

81.4.7 hue as Double

Function: The hue value.

Example:

```vbs
dim g as new GM16ColorHSLMBS(0.1,0.2,0.3)
MsgBox str(g.hue)
```

Notes: (Read and Write property)

81.4.8 luminosity as Double

Function: The luminosity value.

Example:

```vbs
dim g as new GM16ColorHSLMBS(0.1,0.2,0.3)
MsgBox str(g.luminosity)
```
81.4. CLASS GM16COLORHSLMBS

Notes: (Read and Write property)

81.4.9 saturation as Double

Function: The saturation value.
Example:

dim g as new GM16ColorHSLMBS(0.1,0.2,0.3)
MsgBox str(g.saturation)

Notes: (Read and Write property)
81.5  class GM16ColorMBS

81.5.1  class GM16ColorMBS

**Function:** Color is the base color class.  
**Example:**

```vbnet
dim c as new GM16ColorMBS(127,255,127) // light green  
MsgBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

**Notes:** It is a simple container class for the pixel red, green, blue, and alpha values scaled to fit GraphicsMagick's Quantum size. Normally users will instantiate a class derived from Color which supports the color model that fits the needs of the application. The Color class may be constructed directly from an X11-style color string. As a perhaps odd design decision, the value transparent black is considered to represent an unset value (invalid color) in many cases. This choice was made since it avoided using more memory. The default Color constructor constructs an invalid color (i.e. transparent black) and may be used as a parameter in order to remove a color setting.

81.5.2  Methods

81.5.3  Constructor

**Function:** Creates a new color with transparent black.  
**Example:**

```vbnet
dim c as new GM16ColorMBS  
MsgBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 81.5.4 Constructor(ColorName as string)  
- 81.5.5 Constructor(ColorValue as color)  
- 81.5.6 Constructor(ColorValue as color, alpha as Integer)  
- 81.5.7 Constructor(other as GM16ColorMBS)  
- 81.5.8 Constructor(red as Integer, green as Integer, blue as Integer)  
- 81.5.9 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer)
81.5.4 Constructor(ColorName as string)

Function: Creates a new color based on the X11 color name.
Example:

```vbscript
dim c as new GM16ColorMBS("red")
MsgBox str(c.redQuantum)+"-"+str(c.greenQuantum)+"-"+str(c.blueQuantum)  // shows "255-0-0"

dim d as new GM16ColorMBS("# 77FF00")
MsgBox str(d.redQuantum)+"-"+str(d.greenQuantum)+"-"+str(d.blueQuantum)  // shows "119-255-0"
```

Notes: An alternate way to construct the class is via an X11-compatible color specification string (e.g. Color("red") or Color("# FF0000")). Since the class may be constructed from a string, convenient strings may be passed in place of an explicit Color object in methods which accept a reference to Color. Color may also be converted to a std::string for convenience in user interfaces, and for saving settings to a text file.
See also:

- 81.5.3 Constructor
- 81.5.5 Constructor(ColorValue as color)
- 81.5.6 Constructor(ColorValue as color, alpha as Integer)
- 81.5.7 Constructor(other as GM16ColorMBS)
- 81.5.8 Constructor(red as Integer, green as Integer, blue as Integer)
- 81.5.9 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer)

81.5.5 Constructor(ColorValue as color)

Function: Creates a new color with the given values.
Example:

```vbscript
dim c as new GM16ColorMBS(& c FF0000)
MsgBox str(c.redQuantum)+"-"+str(c.greenQuantum)+"-"+str(c.blueQuantum)
```

See also:

- 81.5.3 Constructor
- 81.5.4 Constructor(ColorName as string)
81.5.6 Constructor(ColorValue as color, alpha as Integer)

Function: Creates a new color with the given values.

Example:
```
dim c as new GM16ColorMBS(& c FF0102, 127)
MsgBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)+" "+str(c.alpha)
```

See also:
- 81.5.3 Constructor
- 81.5.4 Constructor(ColorName as string)
- 81.5.5 Constructor(ColorValue as color)
- 81.5.7 Constructor(other as GM16ColorMBS)
- 81.5.8 Constructor(red as Integer, green as Integer, blue as Integer)
- 81.5.9 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer)

81.5.7 Constructor(other as GM16ColorMBS)

Function: Creates a new color copying the existing color.

Example:
```
dim r as new GM16ColorMBS(1,2,3)
dim c as new GM16ColorMBS(r)
MsgBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:
- 81.5.3 Constructor
- 81.5.4 Constructor(ColorName as string)
81.5. CLASS GM16COLORMBS

- 81.5.5 Constructor(ColorValue as color)
- 81.5.6 Constructor(ColorValue as color, alpha as Integer)
- 81.5.8 Constructor(red as Integer, green as Integer, blue as Integer)
- 81.5.9 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer)

81.5.8 Constructor(red as Integer, green as Integer, blue as Integer)

**Function:** Creates a new color with the given values.
**Example:**

```vbnet
dim c as new GM16ColorMBS(1,2,3)
MsgBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

**Notes:**
For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
See also:

- 81.5.3 Constructor
- 81.5.4 Constructor(ColorName as string)
- 81.5.5 Constructor(ColorValue as color)
- 81.5.6 Constructor(ColorValue as color, alpha as Integer)
- 81.5.7 Constructor(other as GM16ColorMBS)
- 81.5.9 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer)

81.5.9 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer)

**Function:** Creates a new color with the given values.
**Example:**

```vbnet
dim c as new GM16ColorMBS(1,2,3,4)
// display color, alpha is double...
MsgBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)+" "+str(c.alpha)
```
Notes:

For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
See also:

- 81.5.3 Constructor
- 81.5.4 Constructor(ColorName as string)
- 81.5.5 Constructor(ColorValue as color)
- 81.5.6 Constructor(ColorValue as color, alpha as Integer)
- 81.5.7 Constructor(other as GM16ColorMBS)
- 81.5.8 Constructor(red as Integer, green as Integer, blue as Integer)

81.5.10 QuantumByteSize as Integer

Function: The quantum byte size.
Example:
MsgBox str(GM16ColorMBS.QuantumByteSize)

Notes: As the plugin uses 8 bit this value should be 1.

81.5.11 scaleDoubleToQuantum(value as Double) as Integer

Function: Scales a double value to a value in the range of a quantum.
Example:

dim d as Double = 1.0
dim v as Integer = GM16ColorMBS.scaleDoubleToQuantum(d)
MsgBox str(v)

Notes: As the plugin uses 8 bit quantums, this is basically a multiplication by 255.0
81.5.12  scaleQuantumToDouble(value as Integer) as Double

**Function:** Scales a quantum to a double value.
**Example:**

```vbnet
dim v as Integer = 255
dim d as Double = GM16ColorMBS.scaleQuantumToDouble(v)
MsgBox str(d)
```

**Notes:** The plugin uses 8bit quantums, so this is basically the division of value by 255.0

---

81.5.13  Properties

81.5.14  alpha as Double

**Function:** The alpha value of this color.
**Example:**

```vbnet
dim c as new GM16ColorMBS(1,2,3,1.0)
MsgBox str(c.alpha)
```

**Notes:**
Range is 0.0 to 1.0. If you pass values higher, they are divided by 255.
(Read and Write property)

---

81.5.15  alphaQuantum as Integer

**Function:** The alpha color value.
**Notes:**
For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)
81.5.16 blueQuantum as Integer

Function: The blue color value.

Example:

```vba
dim c as new GM16ColorMBS(1,2,3)
MsgBox str(c.redQuantum) // 3
```

Notes:

For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)

81.5.17 colorValue as color

Function: The REALbasic color for the GraphicsMagick color.

Example:

```vba
dim c as new GM16ColorMBS(& c FF0102)
MsgBox str(c.ColorValue)
```

Notes: (Read and Write property)

81.5.18 greenQuantum as Integer

Function: The green color value.

Example:

```vba
dim r as new GM16ColorMBS(1,2,3)
MsgBox str(r.greenQuantum) // shows 2
```

Notes:

For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)
81.5. **CLASS GM16COLORMBS**

81.5.19  **handle as Integer**

**Function:** The internal color reference.

**Example:**

```vbnet
dim r as new GM16ColorMBS(1,2,3)
MsgBox str(r.handle)
```

**Notes:** (Read and Write property)

81.5.20  **intensity as Double**

**Function:** The intensity of this color.

**Example:**

```vbnet
dim c as new GM16ColorMBS(1,2,3)
MsgBox str(c.intensity)
```

**Notes:** (Read only property)

81.5.21  **isValid as boolean**

**Function:** Does object contain valid color?

**Example:**

```vbnet
dim c as new GM16ColorMBS(1,2,3)
MsgBox str(c.isValid)
```

**Notes:** (Read and Write property)

81.5.22  **redQuantum as Integer**

**Function:** The red color value.

**Example:**
`dim c as new GM16ColorMBS(1,2,3)`
`MsgBox str(c.redQuantum) // 1`

**Notes:**
For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)
81.6. **CLASS GM16COLORMONOMBS**

81.6. **class GM16ColorMonoMBS**

81.6.1. **class GM16ColorMonoMBS**

**Function:** Representation of a black/white color (true/false)

**Example:**

```vbscript
dim g as new GM16ColorMonoMBS(false)
MsgBox str(g.colorValue)
```

**Notes:** Subclass of the GM16ColorMBS class.

81.6.2. **Methods**

81.6.3. **Constructor**

**Function:** Creates a new color with transparent black.

**Example:**

```vbscript
dim c as new GM16ColorMonoMBS
MsgBox str(c.redQuantum)+” ”+str(c.greenQuantum)+” ”+str(c.blueQuantum)
```

See also:

- 81.6.4 Constructor(mono as boolean)
- 81.6.5 Constructor(other as GM16ColorMBS)

81.6.4. **Constructor(mono as boolean)**

**Function:** Creates a new color with the given values.

**Example:**

```vbscript
dim g as new GM16ColorMonoMBS(false)
MsgBox str(g.mono)
```

See also:
81.6.5 Constructor(other as GM16ColorMBS)

**Function:** Creates a new color copying the existing color.

**Example:**
```
dim g as new GM16ColorMonoMBS(false)
dim o as new GM16ColorMonoMBS(g)
MsgBox str(o.mono)
```

See also:

- 81.6.3 Constructor
- 81.6.4 Constructor(mono as boolean)

81.6.6 Properties

81.6.7 mono as boolean

**Function:** The color value.

**Example:**
```
dim g as new GM16ColorMonoMBS(true)
MsgBox str(g.mono)
```

**Notes:** (Read and Write property)
81.7. **CLASS GM16COLORRGBMBS**

81.7. **class GM16ColorRGBMBS**

81.7.1 **class GM16ColorRGBMBS**

**Function:** The color class for RGB colors.

**Example:**

```vbnet
dim c as new GM16ColorRGBMBS(1.0,0.0,0.0) // red
MsgBox str(c.red)+" " +str(c.green)+" " +str(c.blue)
MsgBox str(c.redQuantum)+" " +str(c.greenQuantum)+" " +str(c.blueQuantum)
```

**Notes:**

Representation of RGB color with red, green, and blue specified as ratios (0 to 1)
Subclass of the GM16ColorMBS class.

81.7.2 **Methods**

81.7.3 **Constructor**

**Function:** Creates a new color with transparent black.

**Example:**

```vbnet
dim c as new GM16ColorRGBMBS
MsgBox str(c.redQuantum)+" " +str(c.greenQuantum)+" " +str(c.blueQuantum)
```

See also:

- 81.7.4 Constructor(other as GM16ColorMBS)
- 81.7.5 Constructor(red as Double, green as Double, blue as Double)

81.7.4 **Constructor(other as GM16ColorMBS)**

**Function:** Creates a new color copying the existing color.

**Example:**

```vbnet
dim g as new GM16ColorRGBMBS(1.2,3)
dim o as new GM16ColorRGBMBS(g)
```
`MsgBox str(o.colorValue)`

See also:

- 81.7.3 Constructor
- 81.7.5 Constructor(red as Double, green as Double, blue as Double)

### 81.7.5 Constructor(red as Double, green as Double, blue as Double)

**Function:** Creates a new color with the given values.

**Example:**

```vba
dim c as new GM16ColorRGBMBS(0.1,0.2,0.3)
```

**Notes:** Range is 0.0 to 1.0.

See also:

- 81.7.3 Constructor
- 81.7.4 Constructor(other as GM16ColorMBS)

### 81.7.6 Properties

### 81.7.7 blue as Double

**Function:** The blue color component.

**Example:**

```vba
dim c as new GM16ColorRGBMBS(0.0,0.0,1.0)
MsgBox str(c.blue)
```

**Notes:**

Range is 0.0 to 1.0.

(Read and Write property)
81.7.8 green as Double

Function: The green color component.
Example:

dim c as new GM16ColorRGBMBS(0.0,1.0,0.0)
MsgBox str(c.green)

Notes:
Range is 0.0 to 1.0.
(Read and Write property)

81.7.9 red as Double

Function: The red color component.
Example:

dim c as new GM16ColorRGBMBS(1.0,0.0,0.0) // red
MsgBox str(c.red)

Notes:
Range is 0.0 to 1.0.
(Read and Write property)
81.8 class GM16ColorYUVMBS

81.8.1 class GM16ColorYUVMBS

Function: Representation of a color in the YUV colorspace
Example:

```
dim g as new GM16ColorYUVMBS(0.1, 0.2, 0.3)
MsgBox str(g.y)+" "+str(g.u)+" "+str(g.v)
```

Notes: Subclass of the GM16ColorMBS class.

81.8.2 Methods

81.8.3 Constructor

Function: Creates a new color with transparent black.
Example:

```
dim c as new GM16ColorYUVMBS
MsgBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 81.8.4 Constructor(other as GM16ColorMBS)
- 81.8.5 Constructor(y as Double, u as Double, v as Double)

81.8.4 Constructor(other as GM16ColorMBS)

Function: Creates a new color copying the existing color.
Example:

```
dim g as new GM16ColorYUVMBS(0.1, 0.2, 0.3)
dim o as new GM16ColorYUVMBS(g)
MsgBox str(o.colorValue)
```

See also:
81.8. **CLASS GM16COLORYUVMBS**

- 81.8.3 Constructor
- 81.8.5 Constructor(y as Double, u as Double, v as Double)

### 81.8.5 Constructor(y as Double, u as Double, v as Double)

**MBS GraphicsMagick Plugin, Plugin Version:** 14.1, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes.

**Function:** Creates a new color with the given values.

**Example:**

```dim g as new GM16ColorYUVMBS(0.1, 0.2, 0.3)```

See also:

- 81.8.3 Constructor
- 81.8.4 Constructor(other as GM16ColorMBS)

### 81.8.6 Properties

#### 81.8.7 u as Double

**MBS GraphicsMagick Plugin, Plugin Version:** 14.1, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes.

**Function:** The u color component.

**Example:**

```dim g as new GM16ColorYUVMBS(0.1, 0.2, 0.3) MsgBox str(g.u)```

**Notes:**

Range is -0.5 to +0.5.

(Read and Write property)

#### 81.8.8 v as Double

**MBS GraphicsMagick Plugin, Plugin Version:** 14.1, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes.

**Function:** The v color component.

**Example:**

```dim g as new GM16ColorYUVMBS(0.1, 0.2, 0.3) MsgBox str(g.v)```
Notes:
Range is -0.5 to +0.5.
(Read and Write property)

81.8.9 y as Double

**Function:** The y color component.
**Example:**
```vba
dim g as new GM16ColorYUVMBS(0.1, 0.2, 0.3)
MsgBox str(g.y)
```

Notes:
Range is 0.0 to 1.0.
(Read and Write property)
81.9.  CLASS GM16COORDINATEMBS

81.9  class GM16CoordinateMBS

81.9.1  class GM16CoordinateMBS

**Function:** The Graphics Magick class for a coordinate.
**Example:**
```vba
dim c as new GM16CoordinateMBS(5,6)
MsgBox str(c.x) + " " + str(c.y)
```

81.9.2  Methods

81.9.3  Constructor

**Function:** The constructor to create a new coordinate.
**See also:**
- 81.9.4 Constructor(x as Double, y as Double)

81.9.4  Constructor(x as Double, y as Double)

**Function:** The constructor to create a new coordinate.
**Example:**
```vba
dim c as new GM16CoordinateMBS(5,6)
MsgBox str(c.x) + " " + str(c.y)
```

**See also:**
- 81.9.3 Constructor

81.9.5  Properties

81.9.6  x as Double

**Function:** The x value.
**Example:**
dim c as new GM16CoordinateMBS
  c.x = 5
  MsgBox str(c.x)

Notes: (Read and Write property)

81.9.7  y as Double

Function: The y value.
Example:
  dim c as new GM16CoordinateMBS
  c.y = 5
  MsgBox str(c.y)

Notes: (Read and Write property)
81.10 class GM16ErrorExceptionMBS

81.10.1 class GM16ErrorExceptionMBS

**Function:** The exception to report errors in the GraphicMagick plugin.

**Notes:**

Check the message property for details.

Subclass of the RuntimeException class.
81.11 class GM16GeometryMBS

81.11.1 class GM16GeometryMBS

Function: Geometry provides a convenient means to specify a geometry argument.

Example:

dim g as new GM16GeometryMBS(300,400)
MsgBox str(G.width)+" "+str(G.height)

Notes: The object may be initialized from a string containing a geometry specification. It may also be initialized by more efficient parameterized constructors.

81.11.2 Methods

81.11.3 Constructor

Function: Creates empty geometry.

Example:

dim g as new GM16GeometryMBS
MsgBox str(G.width)+" "+str(G.height)

See also:

- 81.11.4 Constructor(geometry as string)
- 81.11.5 Constructor(other as GM16GeometryMBS)
- 81.11.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false)

81.11.4 Constructor(geometry as string)

Function: Construct geometry from string.

Example:

dim g as new GM16GeometryMBS("600x600")
81.11. CLASS GM16GEOMETRYMBS

MsgBox str(G.width)+" "+str(G.height)

Notes:
See the GraphicsMagick website for details.
http://www.graphicsmagick.org/Magick++/Geometry.html
See also:

- 81.11.3 Constructor
- 81.11.5 Constructor(other as GM16GeometryMBS)
- 81.11.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false)

81.11.5 Constructor(other as GM16GeometryMBS)

Function: Creates a new geometry object by copying an existing one.
Example:

dim g as new GM16GeometryMBS(600,600)
dim h as new GM16GeometryMBS(g)
MsgBox str(h.width)

See also:

- 81.11.3 Constructor
- 81.11.4 Constructor(geometry as string)
- 81.11.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false)

81.11.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false)

Function: Creates geometry with the given values.
Example:

dim g as new GM16GeometryMBS(600,600)
MsgBox str(g.width)
81.11.7 Make(geometry as string) as GM16GeometryMBS

**Function:** Construct geometry from string.  
**Example:**
```vbnet
dim g as GM16GeometryMBS = GM16GeometryMBS.Make("600x600")
MsgBox str(g.width)+" "+str(g.height)
```

**Notes:**
See the GraphicsMagick website for more details:  
http://www.graphicsmagick.org/Magick++/Geometry.html  
See also:

- 81.11.8 Make(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) as GM16GeometryMBS

81.11.8 Make(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) as GM16GeometryMBS

**Function:** Creates geometry with the given values.  
**Example:**
```vbnet
dim g as GM16GeometryMBS = GM16GeometryMBS.Make(600,600)
MsgBox str(g.width)
```

See also:

- 81.11.7 Make(geometry as string) as GM16GeometryMBS
81.11.10  aspect as boolean

Function: Resize without preserving aspect ratio (!).
Example:
```vbscript
dim g as new GM16GeometryMBS(600,600)
MsgBox str(g.aspect)
```

Notes: (Read and Write property)

81.11.11  greater as boolean

Function: Resize if image is greater than size (>).
Example:
```vbscript
dim g as new GM16GeometryMBS(600,600)
MsgBox str(g.greater)
```

Notes: (Read and Write property)

81.11.12  height as Uint32

Function: The height value.
Example:
```vbscript
dim g as new GM16GeometryMBS(600,600)
MsgBox str(g.height)
```

Notes: (Read and Write property)
81.11.13 isValid as boolean

**Function:** Does object contain a valid geometry?
**Example:**
```dim g as new GM16GeometryMBS(100,200)
MsgBox str(G.isValid)
```

**Notes:**
May be set to false in order to invalidate an existing geometry object.
(Read and Write property)

81.11.14 less as boolean

**Function:** Resize if image is less than size (<).
**Example:**
```dim g as new GM16GeometryMBS(600,600)
MsgBox str(g.less)
```

**Notes:** (Read and Write property)

81.11.15 percent as boolean

**Function:** Width and height are expressed as percentages.
**Example:**
```dim g as new GM16GeometryMBS(600,600)
MsgBox str(g.percent)
```

**Notes:** (Read and Write property)
81.11.  CLASS GM16GEOMETRYMBS

81.11.16  StringValue as string

Function: The string representation of the geometry object.
Example:

```vbscript
dim g as new GM16GeometryMBS(600,600)
MsgBox str(g.StringValue)
```

Notes: (Read and Write property)

81.11.17  width as Uint32

Function: The width value.
Example:

```vbscript
dim g as new GM16GeometryMBS(600,600)
MsgBox str(g.width)
```

Notes: (Read and Write property)

81.11.18  xNegative as boolean

Function: Sign of X offset negative? (X origin at right)
Example:

```vbscript
dim g as new GM16GeometryMBS(100,200,30,40,true,false)
MsgBox str(g.xNegative)
```

Notes: (Read and Write property)

81.11.19  xOff as Uint32

Function: X offset from origin.
Example:
dim g as new GM16GeometryMBS(100,200,30,40,true,true)
MsgBox str(G.xOff)+" "+str(G.yOff)

Notes: (Read and Write property)

81.11.20  yNegative as boolean

Function: Sign of Y offset negative? (Y origin at bottom)
Example:

dim g as new GM16GeometryMBS(100,200,30,40,false,true)
MsgBox str(G.yNegative)

Notes: (Read and Write property)

81.11.21  yOff as Uint32

Function: Y offset from origin
Example:

dim g as new GM16GeometryMBS(100,200,30,40,true,true)
MsgBox str(G.xOff)+" "+str(G.yOff)

Notes: (Read and Write property)
81.12. CLASS GM16GRAPHICSMBS

81.12 class GM16GraphicsMBS

81.12.1 class GM16GraphicsMBS

**Function:** The class for drawing commands targeting a GM16ImageMBS.
**Notes:** Please remember that all commands are collected till you call the Draw method.

81.12.2 Methods

81.12.3 Arc(startX as Double, startY as Double, endX as Double, endY as Double, startDegrees as Double, endDegrees as Double)

**Function:** Draw an arc using the stroke color and based on the circle starting at coordinates startX,startY, and ending with coordinates endX,endY, and bounded by the rotational arc startDegrees,endDegrees.
**Example:**

```vba
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.type = image.TrueColorType
image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics
draw.arc(250, 250, 100, 100,50,300)
draw.Draw

Backdrop=image.CopyPicture
```

81.12.4 Bezier(values() as GM16CoordinateMBS)

**Function:** Draw a bezier curve using the stroke color and based on the coordinates specified by the coordinates array.
### Chapter 81: GraphicsMagick

#### 81.12.5 Circle(originX as Double, originY as Double, perimX as Double, perimY as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Draw a circle using the stroke color and thickness using specified origin and perimeter coordinates.

**Example:**

```plaintext
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.type = image.TrueColorType
image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)
draw.Draw

Backdrop=image.CopyPicture
```

**Notes:** If a fill color is specified, then the object is filled.

#### 81.12.6 ClipPath(id as string)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Select a drawing clip path matching id.

#### 81.12.7 ColorPixel(x as Double, y as Double, paintMethod as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Color image according to paintMethod.

**Notes:** The point method recolors the target pixel. The replace method recolors any pixel that matches the color of the target pixel. Floodfill recolors any pixel that matches the color of the target pixel and is a neighbor, whereas filltoborder recolors any neighbor pixel that is not the border color. Finally, reset recolors all pixels.
81.12.8  CompositeImage(x as Double, y as Double, file as folderitem)

**Function:** Composite current image with contents of specified image, at specified coordinates.
**Notes:** If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through.

81.12.11  CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem)

**Function:** Composite current image with contents of specified image, rendered with specified width and height, at specified coordinates.

**Notes:** If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through. If the specified width or height is zero, then the image is composited at its natural size, without enlargement or reduction.

- 81.12.15 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string) 13355

81.12.17 Constructor(image as GM16ImageMBS)

Function: Creates a new object referencing the given image.

81.12.18 DashArray(values() as Double)

Function: Specify the pattern of dashes and gaps used to stroke paths.

Notes: The strokeDashArray represents a zero-terminated array of numbers that specify the lengths of alternating dashes and gaps in pixels. If an odd number of values is provided, then the list of values is repeated to yield an even number of values. A typical strokeDashArray array might contain the members 5 3 2 0, where the zero value indicates the end of the pattern array.

81.12.19 DashOffset(offset as Double)

Function: Specify the distance into the dash pattern to start the dash.

Notes: See documentation on SVG’s stroke-dashoffset property for usage details.
81.12.20  Draw

**Function:** Draws all draw commands collected.
**Example:**

```javascript
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.type = image.TrueColorType
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics

draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

81.12.21  DrawPath

**Function:** Draw on image using vector path.
**Example:**

```javascript
// new picture, 500x500 and filled with white
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

dim draw as GM16GraphicsMBS = image.Graphics

// Draw path

dim cr as new GM16ColorRGBMBS("red")
dim gr as new GM16ColorRGBMBS("green")
draw.StrokeColor cr
draw.FillColor gr
draw.PathMovetoAbs(30,10)
draw.PathLinetoAbs(20,55)
draw.PathLinetoAbs(70,50)
draw.PathLinetoAbs(80,5)
```
draw.DrawPath

draw.Draw

// show picture
image.type = image.TrueColorType // make sure it's a bitmap
Backdrop=image.CopyPicture

81.12.22 Ellipse(originX as Double, originY as Double, perimX as Double, perimY as Double, arcStart as Double, arcEnd as Double)

**Function:** Draw an ellipse using the stroke color and thickness, specified origin, x & y radius, as well as specified start and end of arc in degrees.
**Notes:** If a fill color is specified, then the object is filled.

81.12.23 FillColor(c as GM16ColorMBS)

**Function:** Specify drawing object fill color.

81.12.24 FillOpacity(opacity as Double)

**Function:** Specify opacity to use when drawing using fill color.

81.12.25 FillRule(fillRule as Integer)

**Function:** Specify the algorithm which is to be used to determine what parts of the canvas are included inside the shape.
**Notes:** See documentation on SVG’s fill-rule property for usage details.

81.12.26 Font(fontname as string)

**Function:** Specify font name to use when drawing text.
81.12.  CLASS GM16GRAPHICSMBS

Example:

```plaintext
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

dim draw as GM16GraphicsMBS = image.Graphics

// draw red text
draw.strokeColor(new GM16ColorRGBMBS("red")) // Outline color
draw.strokeWidth(1)
draw.Font("/Library/Fonts/Verdana.ttf")
draw.Text(50, 50, "Hello", ")
draw.Draw

Backdrop=image.CopyPicture
```

See also:

- 81.12.27 Font(fontname as string, StyleType as Integer, weight as Integer, StretchType as Integer)

81.12.27  Font(fontname as string, StyleType as Integer, weight as Integer, StretchType as Integer)

Function: Sets the font.
Notes: Specify font family, style, weight (one of the set { 100 | 200 | 300 | 400 | 500 | 600 | 700 | 800 | 900 } with 400 being the normal size), and stretch to be used to select the font used when drawing text. Wildcard matches may be applied to style via the AnyStyle enumeration, applied to weight if weight is zero, and applied to stretch via the AnyStretch enumeration.
See also:

- 81.12.26 Font(fontname as string)

81.12.28  Gravity(GravityType as Integer)

Function: Specify text positioning gravity.
81.12.29 **Line**(startX as Double, startY as Double, endX as Double, endY as Double)

**Function:** Draw a line using stroke color and thickness using starting and ending coordinates

**Example:**

```plaintext
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics

// Draw a line
draw.Line(100,100,400,400)
draw.Draw

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

81.12.30 **Matte**(x as Double, y as Double, paintMethod as Integer)

**Function:** Change the pixel matte value to transparent.

**Notes:** The point method changes the matte value of the target pixel. The replace method changes the matte value of any pixel that matches the color of the target pixel. Floodfill changes the matte value of any pixel that matches the color of the target pixel and is a neighbor, whereas filltoborder changes the matte value of any neighbor pixel that is not the border color. Finally reset changes the matte value of all pixels.

81.12.31 **MiterLimit**(miterlimit as Integer)

**Function:** Specify miter limit.

**Notes:** When two line segments meet at a sharp angle and miter joins have been specified for 'lineJoin', it is possible for the miter to extend far beyond the thickness of the line stroking the path. The miterLimit' imposes a limit on the ratio of the miter length to the 'lineWidth'. The default value of this parameter is 4.
81.12.32 PathArcAbs(c as GM16PathArgsMBS)

**Function:** Draws an elliptical arc from the current point to (x, y).

**Notes:**

The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

In the GM16PathArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag, sweepFlag, x and y.

See also:

- 81.12.33 PathArcAbs(c() as GM16PathArgsMBS)  

- 81.12.34 PathArcAbs(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)  

81.12.33 PathArcAbs(c() as GM16PathArgsMBS)

**Function:** Draws an elliptical arc from the current point to (x, y).

**Notes:**

The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

In the GM16PathArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag, sweepFlag, x and y.

See also:

- 81.12.32 PathArcAbs(c as GM16PathArgsMBS)  

- 81.12.34 PathArcAbs(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)
PathArcAbs(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)

**Function:** Draws an elliptical arc from the current point to (x, y).

**Example:**

```vba
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics

// Draw an arc

draw.PathMovetoAbs 100,100
draw.PathArcAbs(100,100, 0, false, false, 200,200)
draw.DrawPath
draw.Draw

Backdrop=image.CopyPicture
```

**Notes:** The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

- 81.12.33 PathArcAbs(c() as GM16PathArgsMBS)

PathArcRel(c as GM16PathArgsMBS)

**Function:** Draws an elliptical arc from the current point to (x, y).

**Notes:**

The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation,
which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center
(cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters.
largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is
drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the
arc matching a clock-wise rotation.

In the GM16PathArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag,
sweepFlag, x and y.
See also:

- 81.12.36 PathArcRel(c() as GM16PathArgsMBS)
- 81.12.37 PathArcRel(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag
  as boolean, sweepFlag as Boolean, x as Double, y as Double)

81.12.36  PathArcRel(c() as GM16PathArgsMBS)

Function: Draws an elliptical arc from the current point to (x, y).
Notes:
The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation,
which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center
(cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters.
largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is
drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the
arc matching a clock-wise rotation.

In the GM16PathArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag,
sweepFlag, x and y.
See also:

- 81.12.35 PathArcRel(c as GM16PathArgsMBS)
- 81.12.37 PathArcRel(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag
  as boolean, sweepFlag as Boolean, x as Double, y as Double)

81.12.37  PathArcRel(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag
as boolean, sweepFlag as Boolean, x as Double, y as Double)

Function: Draws an elliptical arc from the current point to (x, y).
Notes: The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxis-
Rotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system.
The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

### 81.12.38 PathClosePath

**Function:** Close the current subpath by drawing a straight line from the current point to current subpath’s most recent starting point (usually, the most recent moveto point).

### 81.12.39 PathCurvetoAbs(c as GM16PathArgsMBS)

**Function:** Draws a cubic Bzier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
**Notes:**
PathCurvetoAbs indicates that absolute coordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.

See also:

- 81.12.40 PathCurvetoAbs(c() as GM16PathArgsMBS)

81.12.53 PathLinetoVerticalAbs(v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draws a vertical line from the current point (cpx, cpy) to (cpx, y). PathLinetoVerticalAbs indicates that absolute coordinates are supplied; PathLinetoVerticalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (cpx, y) for the final value of y.

81.12.54 PathLinetoVerticalRel(v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The various "lineto" commands draw straight lines from the current point to a new point.
Notes: Draws a vertical line from the current point (cpx, cpy) to (cpx, y). PathLinetoVerticalAbs indicates that absolute coordinates are supplied; PathLinetoVerticalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (cpx, y) for the final value of y.
81.12.55  PathMovetoAbs(c as GM16CoordinateMBS)

Function: The "moveto" commands establish a new current point.
Notes:
The effect is as if the "pen" were lifted and moved to a new location. A path data segment must begin with either one of the "moveto" commands or one of the "arc" commands. Subsequent "moveto" commands (i.e., when the "moveto" is not the first command) represent the start of a new subpath.

Start a new sub-path at the given coordinate. PathMovetoAbs indicates that absolute coordinates will follow; PathMovetoRel indicates that relative coordinates will follow. If a relative moveto appears as the first element of the path, then it is treated as a pair of absolute coordinates. If a moveto is followed by multiple pairs of coordinates, the subsequent pairs are treated as implicit lineto commands.
See also:
• 81.12.56 PathMovetoAbs(x as Double, y as Double)

81.12.56  PathMovetoAbs(x as Double, y as Double)

Function: The "moveto" commands establish a new current point.
Notes:
The effect is as if the "pen" were lifted and moved to a new location. A path data segment must begin with either one of the "moveto" commands or one of the "arc" commands. Subsequent "moveto" commands (i.e., when the "moveto" is not the first command) represent the start of a new subpath.

Start a new sub-path at the given coordinate. PathMovetoAbs indicates that absolute coordinates will follow; PathMovetoRel indicates that relative coordinates will follow. ### 81.12.71 PathSmoothQuadraticCurvetoAbs(c as GM16CoordinateMBS)

**Function:** Draws a quadratic Bzier curve from the current point to (x,y).  
**Notes:** The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x and y.

See also:

- 81.12.72 PathSmoothQuadraticCurvetoAbs(c() as GM16CoordinateMBS)  
- 81.12.73 PathSmoothQuadraticCurvetoAbs(x as Double, y as Double)
81.12. **CLASS GM16GRAPHICSMBS**

81.12.72  **PathSmoothQuadraticCurvetoAbs(c() as GM16CoordinateMBS)**

**Function:** Draws a quadratic Bzier curve from the current point to (x,y).

**Notes:**

The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x and y.

See also:

- 81.12.71 PathSmoothQuadraticCurvetoAbs(c as GM16CoordinateMBS) 13376
- 81.12.73 PathSmoothQuadraticCurvetoAbs(x as Double, y as Double) 13377

81.12.73  **PathSmoothQuadraticCurvetoAbs(x as Double, y as Double)**

**Function:** Draws a quadratic Bzier curve from the current point to (x,y).

**Notes:**

The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

See also:

- 81.12.71 PathSmoothQuadraticCurvetoAbs(c as GM16CoordinateMBS) 13376
- 81.12.72 PathSmoothQuadraticCurvetoAbs(c() as GM16CoordinateMBS) 13377

81.12.74  **PathSmoothQuadraticCurvetoRel(c as GM16CoordinateMBS)**

**Function:** Draws a quadratic Bzier curve from the current point to (x,y).

**Notes:**
The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x and y.

See also:

- 81.12.75 PathSmoothQuadraticCurvetoRel(c() as GM16CoordinateMBS) 13378
- 81.12.76 PathSmoothQuadraticCurvetoRel(x as Double, y as Double) 13378

81.12.75  PathSmoothQuadraticCurvetoRel(c() as GM16CoordinateMBS)

Function: Draws a quadratic Bzier curve from the current point to (x,y).

Notes:

The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GM16PathArgsMBS object, set the following properties: x1, y1, x and y.

See also:

- 81.12.74 PathSmoothQuadraticCurvetoRel(c as GM16CoordinateMBS) 13377
- 81.12.76 PathSmoothQuadraticCurvetoRel(x as Double, y as Double) 13378

81.12.76  PathSmoothQuadraticCurvetoRel(x as Double, y as Double)

Function: Draws a quadratic Bzier curve from the current point to (x,y).

Notes:

The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurveto-
toAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

See also:

- 81.12.74 PathSmoothQuadraticCurvetoRel(c as GM16CoordinateMBS)
- 81.12.75 PathSmoothQuadraticCurvetoRel(c() as GM16CoordinateMBS)

### 81.12.77 Point(x as Double, y as Double)

**Function:** Draw a point using stroke color and thickness at coordinate.

**Example:**
```vbscript
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.fillColor = new GM16ColorRGBMBS("red") // set color
dim draw as GM16GraphicsMBS = image.Graphics

// draw cross with pixels
for x as Integer = 240 to 260
draw.Point(x, 250)
next
for y as Integer = 240 to 260
draw.Point(250, y)
next
draw.Draw

Backdrop=image.CopyPicture
```

### 81.12.78 PointSize(pointSize as Double)

**Function:** Set font point size.

### 81.12.79 Polygon(values() as GM16CoordinateMBS)

**Function:** Draw an arbitrary polygon using stroke color and thickness consisting of three or more
coordinates contained in an array.

**Example:**

```vbs
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.fillColor = new GM16ColorRGBMBS("red") // set color
image.strokeColor = new GM16ColorRGBMBS("green") // set color

dim draw as GM16GraphicsMBS = image.Graphics
dim coordinates(-1) as GM16CoordinateMBS
coordinates.Append new GM16CoordinateMBS(70,70)
coordinates.Append new GM16CoordinateMBS(100,340)
coordinates.Append new GM16CoordinateMBS(380,200)
coordinates.Append new GM16CoordinateMBS(70,70)
draw.Polygon coordinates
draw.Draw

Backdrop=image.CopyPicture
```

**Notes:** If a fill color is specified, then the object is filled.

**81.12.80 Polyline(values() as GM16CoordinateMBS)**

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Draw an arbitrary polyline using stroke color and thickness consisting of three or more coordinates contained in an array.

**Example:**

```vbs
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("green") // set color

dim draw as GM16GraphicsMBS = image.Graphics
dim coordinates(-1) as GM16CoordinateMBS
coordinates.Append new GM16CoordinateMBS(70,70)
coordinates.Append new GM16CoordinateMBS(100,340)
coordinates.Append new GM16CoordinateMBS(380,200)
coordinates.Append new GM16CoordinateMBS(70,70)
```
81.12. **CLASS GM16GRAPHICSMBS**

draw.Polyline coordinates
draw.Draw

Backdrop=image.CopyPicture

**Notes:** If a fill color is specified, then the object is filled.

### 81.12.81 PopClipPath

**Function:** Pop (terminate) clip path definition started by PushClipPath.

### 81.12.82 PopGraphicContext

**Function:** Pop Graphic Context.
**Example:**

```vbscript
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorMBS() // transparent fillcolor
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics

// Draw a Rectangle
draw.PushGraphicContext
draw.Translation(250,250)
draw.Rotation(50)
draw.Rectangle(0, 0, 100, 100) // rotated
draw.PopGraphicContext
draw.Rectangle(0, 0, 100, 100) // not rotated
draw.Draw

Backdrop=image.CopyPicture
```

**Notes:** Removing the current graphic context from the graphic context stack restores the options to the values they had prior to the preceding PushGraphicContext operation.
81.12.83 PopPattern

**Function:** Terminate a pattern definition started via PushPattern.

---

81.12.84 PushClipPath(id as string)

**Function:** Push (create) clip path definition with id.

**Notes:** Clip patch definition consists of subsequent drawing commands, terminated by PopClipPath.

---

81.12.85 PushGraphicContext

**Function:** Push Graphic Context.

**Example:**

```vbnet
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorMBS() // transparent fillcolor
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics

// Draw a Rectangle
draw.PushGraphicContext
draw.Translation(250,250)
draw.Rotation(50)
draw.Rectangle(0, 0, 100, 100) // rotated
draw.PopGraphicContext
draw.Rectangle(0, 0, 100, 100) // not rotated
draw.Draw

Backdrop=image.CopyPicture
```

**Notes:** When a graphic context is pushed, options set after the context is pushed (such as coordinate transformations, color settings, etc.) are saved to a new graphic context. This allows related options to be saved
on a graphic context "stack" in order to support hierarchical nesting of options. When \texttt{PopGraphicContext} is used to pop the current graphic context, the options in effect during the last \texttt{PushGraphicContext} operation are restored.

\section{PushPattern(id as string, x as Integer, y as Integer, width as Integer, height as Integer)}

\begin{verbatim}
\textbf{Function:} Start a pattern definition with arbitrary pattern name specified by id, pattern offset specified by x and y, and pattern size specified by width and height.
\textbf{Notes:} The pattern is defined within the coordinate system defined by the specified offset and size. Arbitrary drawing objects (including \texttt{DrawableCompositeImage}) may be specified between \texttt{PushPattern} and \texttt{PopPattern} in order to draw the pattern. Normally the pair \texttt{PushGraphicContext} & \texttt{PopGraphicContext} are used to enclose a pattern definition. Pattern definitions are terminated by a \texttt{PopPattern} object.
\end{verbatim}

\section{Rectangle(upperLeftX as Double, upperLeftY as Double, lowerRightX as Double, lowerRightY as Double)}

\begin{verbatim}
\textbf{Function:} Draw a rectangle using stroke color and thickness from upper-left coordinates to lower-right coordinates.
\textbf{Example:}

dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics

// Draw a rectangle
draw.Rectangle(250, 250, 100, 100)
draw.Draw

Backdrop=image.CopyPicture
\end{verbatim}

\textbf{Notes:} If a fill color is specified, then the object is filled.
81.12.88 Rotation (angle as Double)

**Function:** Set rotation to use when drawing (coordinate transformation).  
**Example:**

```vbscript
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics

draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Rotation 5
draw.StrokeColor new GM16ColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

81.12.89 RoundRectangle (centerX as Double, centerY as Double, width as Double, height as Double, cornerWidth as Double, cornerHeight as Double)

**Function:** Draw a rounded rectangle using stroke color and thickness, with specified center coordinate, specified width and height, and specified corner width and height.  
**Example:**

```vbscript
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics

// Draw a round rectangle
draw.RoundRectangle(250, 250, 100, 100,20,20)
draw.Draw
```
Notes: If a fill color is specified, then the object is filled.

### 81.12.90 Scaling(x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function**: Apply scaling in x and y direction while drawing objects (coordinate transformation). **Example**:

```vbs
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics
draw.FillColor new GM16ColorRGBMBS("red")
drawROKE 32.1,0.1

draw.Line(100,100,400,400)
draw.StrokeColor new GM16ColorRGBMBS("blue")
draw.Scaling 1.2,1.1

draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

### 81.12.91 SkewX(angle as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function**: Apply Skew in X direction (coordinate transformation) **Example**:

```vbs
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics
draw.FillColor new GM16ColorRGBMBS("red")
drawROKE 32.1,0.1

draw.Line(100,100,400,400)
draw.StrokeColor new GM16ColorRGBMBS("blue")
draw.Scaling 1.2,1.1

draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```
draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.SkewX 5
draw.StrokeColor new GM16ColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture

### 81.12.92 SkewY(angle as Double)

**Function:** Apply Skew in Y direction.  
**Example:**

```vbscript
Dim g As New GM16GeometryMBS(500,500)
Dim c As New GM16ColorRGBMBS("white") ' white
Dim image As New GM16ImageMBS(g, c)

image.strokeWidth = 5

Dim draw As GM16GraphicsMBS = image.Graphics

draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.SkewY 5
draw.StrokeColor new GM16ColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

### 81.12.93 StrokeAntialias(flag as boolean)

**Function:** Antialias while drawing lines or object outlines.
**81.12.94 StrokeColor(c as GM16ColorMBS)**

**Function:** Set color to use when drawing lines or object outlines.

**Example:**

```plaintext
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics
draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

**81.12.95 StrokeLineCap(LineCap as Integer)**

**Function:** Specify the shape to be used at the end of open subpaths when they are stroked.

**Notes:** Values of LineCap are UndefinedCap, ButtCap, RoundCap, and SquareCap.

**81.12.96 StrokeLineJoin(LineJoin as Integer)**

**Function:** Specify the shape to be used at the corners of paths (or other vector shapes) when they are stroked.

**Notes:** Values of LineJoin are UndefinedJoin, MiterJoin, RoundJoin, and BevelJoin.

**81.12.97 StrokeOpacity(opacity as Double)**

**Function:** Opacity to use when drawing lines or object outlines.
81.12.98 StrokeWidth(opacity as Double)

**Function:** Set width to use when drawing lines or object outlines.

81.12.99 Text(x as Double, y as Double, text as string)

**Function:** Annotate image with text using stroke color, font, font pointsize, and box color (text background color), at specified coordinates.  
**Example:**

```vbnet
dim g as new GM16GeometryMBS(500,500)  
dim c as new GM16ColorRBGMSB("white")  // white  
dim image as new GM16ImageMBS(g, c)  

dim draw as GM16GraphicsMBS = image.Graphics  
// draw red text  
draw.strokeColor(new GM16ColorRBGMSB("red"))  // Outline color  
draw.strokeWidth(1)  
draw.Font("/Library/Fonts/Verdana.ttf")  
draw.Text(50, 50, "Hello")  
draw.Draw  
Backdrop=image.CopyPicture  
```

**Notes:** If text contains special format characters the image filename, type, width, height, or other image attributes may be incorporated in the text (see label).  
See also:

- 81.12.100 Text(x as Double, y as Double, text as string, encoding as string)

81.12.100 Text(x as Double, y as Double, text as string, encoding as string)

**Function:** Annotate image with text represented with text encoding, using current stroke color, font, font pointsize, and box color (text background color), at specified coordinates.  
**Notes:**  
If text contains special format characters the image filename, type, width, height, or other image attributes may be incorporated in the text (see label()).
The text encoding specifies the code set to use for text annotations. The only character encoding which may be specified at this time is "UTF-8" for representing Unicode as a sequence of bytes. Specify an empty string to set text encoding to the system’s default. Successful text annotation using Unicode may require fonts designed to support Unicode.

Seems like you need ghostscript or the DPS library for text handling, so it may no be available for you. See also:

- 81.12.99 Text(x as Double, y as Double, text as string)

81.12.101  TextAntialias(flag as boolean)

**Function:** Antialias while drawing text (default true).

**Notes:** The main reason to disable text antialiasing is to avoid adding new colors to the image.

81.12.102  TextDecoration(DecorationType as Integer)

**Function:** Specify decoration (e.g. UnderlineDecoration) to apply to text.
81.12.103 TextUnderColor(c as GM16ColorMBS)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Draw a box under rendered text using the specified color.

81.12.104 Translation(x as Double, y as Double)

**Example:**
```vba
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics
draw.StrokeColor new GM16ColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Translation 5,5
draw.StrokeColor new GM16ColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

81.12.105 Viewbox(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer)

**Notes:** If the image is to be written to a vector format (e.g. MVG or SVG), then a PushGraphicContext() object should be pushed to the head of the list, followed by a Viewbox() statement to establish the output canvas size. A matching PopGraphicContext() object should be pushed to the tail of the list.
81.12.106 Properties

81.12.107 Image as GM16ImageMBS

**Function:** The image this graphics object belongs to.

**Notes:** (Read only property)
81.13  class GM16ImageArrayMBS

81.13.1  class GM16ImageArrayMBS

Function: The class for an array of images in GraphicsMagick.
Example:

// extract all layers of photoshop file
Dim file As FolderItem = SpecialFolder.Desktop.Child(“test.psd”)
Dim images As New GM16ImageArrayMBS
images.readImages(file.UnixpathMBS)

Dim c As Integer = images.size
For i As Integer = 0 To c-1
Dim image As GM16ImageMBS = images.Image(i)
file = SpecialFolder.Desktop.Child(image.FileName+“.”+str(i)+“.png”)
image.write(file)
Next

Notes: Can be used to assemble/disassemble gif images.

81.13.2  Methods

81.13.3  animateImages

Function: Animate a sequence of image frames.
Notes: Image frames are displayed in succession, creating an animated effect. The animation options are taken from the first image frame. This feature is only supported under X11 at the moment.

81.13.4  append(image as GM16ImageMBS)

Function: Adds an image to the end of the array.
Example:

// read gif
Dim g As New GM16ImageArrayMBS
Dim file As FolderItem = SpecialFolder.Desktop.Child(“test.gif”)
g.readImages(file.UnixpathMBS)
// put copy of first image on the back
dim n as GM16ImageMBS = g.FirstImage
g.append n

// write to file

dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages(output.UnixpathMBS)

### 81.13.5 appendImages(stack as boolean = false) as GM16ImageMBS

**Function:** Append a sequence of image frames, writing the result to new image.  
**Notes:** All the input image frames must have the same width or height. Image frames of the same width are stacked top-to-bottom. Image frames of the same height are stacked left-to-right. If the stack parameter is false, rectangular image frames are stacked left-to-right otherwise top-to-bottom.

### 81.13.6 averageImages as GM16ImageMBS

**Function:** Average a sequence of image frames, writing the result to averagedImage.  
**Example:**

```vba
// read gif
dim g as new GM16ImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// averageImages
dim n as GM16ImageMBS = g.averageImages
Backdrop = n.CopyPicture
```

**Notes:** All the input image frames must be the same size in pixels.

### 81.13.7 coalesceImages as GM16ImageArrayMBS

**Function:** Create a coalesced image sequence obtained by "playing" the image sequence (observing page
offsets and disposal methods) to create a new image sequence in which all frames are full size and completely rendered.

**Example:**

```javascript
// read gif
dim g as new GM16ImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// deconstruct

g = g.coalesceImages

// write gif

dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages output.UnixpathMBS
```

**Notes:** Note that if the original image sequence relied on page offsets and disposal methods that the resulting sequence will be larger (perhaps much larger) then the original. This is useful for GIF animation sequences that have page offsets and disposal methods. The resulting image sequence is returned.

### 81.13.8 Constructor

**Function:** Creates an empty image array.

### 81.13.9 deconstructImages as GM16ImageArrayMBS

**Function:** Break down an image sequence into constituent parts.

**Example:**

```javascript
// read gif

dim g as new GM16ImageArrayMBS

dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// deconstruct

g = g.deconstructImages

// write gif

dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages output.UnixpathMBS
```
Notes: This is useful for creating GIF or MNG animation sequences.

81.13.10 displayImages

Function: Display a sequence of image frames.
Notes:
Through use of a pop-up menu, image frames may be selected in succession. This feature is fully supported under X11 but may have only limited support in other environments.
Caution: if an image format is is not compatable with the display visual (e.g. JPEG on a colormapped display) then the original image will be altered. Use a copy of the original if this is a problem.

display methods are not supported currently.

81.13.11 FirstImage as GM16ImageMBS

Function: Returns first image in array.
Example:
```cpp
// read gif
dim g as new GM16ImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// show first image
dim img as GM16ImageMBS = g.FirstImage

// convert to true color for CopyPicture to work
const TrueColorType=6
img.type=TrueColorType
Backdrop = img.CopyPicture
```

81.13.12 flattenImages as GM16ImageMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Merge a sequence of image frames which represent image layers into a single composited
Example:

```vbnet
// read gif
dim g as new GM16ImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// put copy of first image on the back
dim n as GM16ImageMBS = g.flattenImages
Backdrop = n.CopyPicture
```

Notes: Returns the flattened image. This function is useful for combining Photoshop layers into a single image.

### 81.13.13 Image(index as Integer) as GM16ImageMBS

**Function:** Queries image with given index.

### 81.13.14 insert(image as GM16ImageMBS)

**Function:** Inserts an image on the front.  
**Example:**

```vbnet
// read gif
dim g as new GM16ImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// put copy of first image on the front
dim n as GM16ImageMBS = g.FirstImage
g.insert n

// write to file

dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages(output.UnixpathMBS)
```
81.13. CLASS GM16IMAGEARRAYMBS

81.13.15 LastImage as GM16ImageMBS

**Function:** Returns last image in array.

81.13.16 mapImages(map as GM16ImageMBS, dither as boolean = true, measureError as boolean = false)

**Function:** Replace the colors of a sequence of images with the closest color from a reference image.
**Notes:** Set dither to true to enable dithering. Set measureError to true in order to evaluate quantization error.

81.13.17 montageImages(options as GM16MontageMBS) as GM16ImageArrayMBS

**Function:** Create a composite image by combining several separate image frames.
**Example:**

```plaintext
// build montage
dim StackingMontage as New GM16MontageMBS
StackingMontage.backgroundColor = New GM16ColorMBS(& c E7E7E7)
StackingMontage.fillColor = New GM16ColorMBS(& c 000000)
StackingMontage.tile = New GM16GeometryMBS("1x20")
StackingMontage.geometry = New GM16GeometryMBS("160x120+5+5")
StackingMontage.font = "Helvetica"
StackingMontage.pointSize = 12
StackingMontage.title = "Title goes here"

// make picture
dim logo as Picture = LogoMBS(500)
dim image as New GM16ImageMBS(logo)
image.label("Sample label")

// Put the current image into the array
Dim StackingFrames As new GM16ImageArrayMBS
StackingFrames.insert(image)

// show result
dim resultImages as GM16ImageArrayMBS = StackingFrames.montageImages(StackingMontage)
Backdrop = resultImages.Image(0).CopyPicture
```
Notes: Multiple frames may be generated in the output array depending on the tile setting and the number of image frames montaged. Montage options are provided via the parameter options. Options set in the first image frame (backgroundColor, borderColor, matteColor, fillColor, strokeColor, font and fontPointsize) are also used as options by montageImages().

81.13.18 morphImages(frames as Integer) as GM16ImageArrayMBS

Function: Morph a sequence of image frames.
Example:

```plaintext
// read gif
dim g as new GM16ImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child(“test.gif”)  
g.readImages(file.UnixpathMBS)

// coalesce to make sure we have full images  
g = g.coalesceImages
// morph to 10 pictures  
g = g.morphImages(10)

// write gif  
dim output as FolderItem = SpecialFolder.Desktop.Child(“output.gif”)  
g.writeImages output.UnixpathMBS
```

Notes: This algorithm expands the number of image frames (output to the new image array) by adding the number of intervening frames specified by frames such that the original frames morph (blend) into each other when played as an animation.

81.13.19 mosaicImages as GM16ImageMBS

Function: Inlay a number of images to form a single coherent picture.
Notes: The result image argument is updated with a mosaic constructed from the image sequence.

81.13.20 quantizeImages(measureError as boolean = false)

Function: Quantize colors in images using current quantization settings.
81.13. CLASS GM16IMAGEARRAYMBS

Notes: Set measureError to true in order to measure quantization error.

81.13.21 readImages(blob as GM16BlobMBS)

Function: Read a sequence of image frames into existing container (appending to array) from blob.
See also:

- 81.13.22 readImages(imageSpec as string)

81.13.22 readImages(imageSpec as string)

Function: Read a sequence of image frames into existing container (appending to array) with image names specified in the string imageSpec.
See also:

- 81.13.21 readImages(blob as GM16BlobMBS)

81.13.23 remove(index as Integer)

Function: Removes the image with the given index.
Example:

```vbnet
// read gif
dim g as new GM16ImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// remove first
g.remove 0

// write to file

dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages(output.UnixpathMBS)
```

Notes: Index should be between 0 and size-1.
### 81.13.24 reverse

**Function:** Reverses the order of images in the array.

### 81.13.25 writeImages(blob as GM16BlobMBS, adjoin as boolean = true)

**Function:** Writes images to the given blob object.
**Notes:**
Write images in container to in-memory BLOB specified by Blob blob. Set adjoin to false to write a set of image frames via a wildcard imageSpec (e.g. image% 02d.miff).
Caution: if an image format is selected which is capable of supporting fewer colors than the original image or quantization has been requested, the original image will be quantized to fewer colors. Use a copy of the original if this is a problem.
See also:

- 81.13.26 writeImages(imageSpec as string, adjoin as boolean = true)

### 81.13.26 writeImages(imageSpec as string, adjoin as boolean = true)

**Function:** Writes images to the given path.
**Example:**
```plaintext
// read gif
dim g as new GM16ImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// write to file

dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages(output.UnixpathMBS)
```

**Notes:**
Write images in container to file specified by string imageSpec. Set adjoin, to false to write a set of image frames via a wildcard imageSpec (e.g. image% 02d.miff).
The wildcard must be one of % 0Nd, % 0No, or % 0Nx.
Caution: if an image format is selected which is capable of supporting fewer colors than the original image or quantization has been requested, the original image will be quantized to fewer colors. Use a copy of the
81.13. CLASS GM16IMAGEARRAYMBS

original if this is a problem.
See also:

- 81.13.25 writeImages(blob as GM16BlobMBS, adjoin as boolean = true)

81.13.27 Properties

81.13.28 empty as boolean

**Function:** Checks whether image array is empty.
**Notes:**
Returns true if array is empty or false if not.
(Read only property)

81.13.29 handle as Integer

**Function:** The internal handle of the image array.
**Notes:**
Should always be non zero.
(Read and Write property)

81.13.30 size as Integer

**Function:** Returns number of images in this array.
**Example:**

```vba
// read gif
dim g as new GM16ImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// display number of images
MsgBox str(g.size)
```

**Notes:** (Read only property)
81.14  class GM16ImageChannelStatisticsMBS

81.14.1  class GM16ImageChannelStatisticsMBS

Function: The statistics for image channel.
Example:

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GM16ImageMBS(f)
dim stat as GM16ImageStatisticsMBS = g.statistics
dim gs as GM16ImageChannelStatisticsMBS = stat.blue
MsgBox "blue channel: " + str(gs.minimum) + ", mean " + str(gs.mean)
```

Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

81.14.2  Methods

81.14.3  Constructor

Function: The private constructor.

81.14.4  Properties

81.14.5  maximum as Double

Function: Maximum value observed.
Example:

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GM16ImageMBS(f)
dim stat as GM16ImageStatisticsMBS = g.statistics
dim gs as GM16ImageChannelStatisticsMBS = stat.green
MsgBox "maximum green color: " + str(gs.maximum)
```
81.14. **mean as Double**

**Function:** Average (mean) value observed.

**Example:**

dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")  
dim g as new GM16ImageMBS(f)  
dim stat as GM16ImageStatisticsMBS = g.statistics  
dim r as GM16ImageChannelStatisticsMBS = stat.red  

MsgBox "mean red color: "+str(R.mean)  

**Notes:** (Read only property)

81.14.7 **minimum as Double**

**Function:** Minimum value observed.

**Notes:** (Read only property)

81.14.8 **standardDeviation as Double**

**Function:** Standard deviation, sqrt(variance).

**Notes:** (Read only property)

81.14.9 **variance as Double**

**Function:** Variance.

**Notes:** (Read only property)
81.15 class GM16ImageMBS

81.15.1 class GM16ImageMBS

Function: Image is the primary object in Magick++ and represents a single image frame (see image design).

Example:

dim c as new GM16ColorMBS("white")
dim g as new GM16GeometryMBS(100,100)
dim image as new GM16ImageMBS(g, c)

Notes:

With MBS Plugin 14.0 we offer this classes in 8bit (GM prefix) or 16bit (GM16 prefix).

The GM16ImageArrayMBS class must be used to operate on image sequences or images (e.g. of format GIF, TIFF, MIFF, Postscript, & MNG) which are comprised of multiple image frames. Individual frames of a multi-frame image may be requested by adding array-style notation to the end of the file name (e.g. "animation.gif [3]" retrieves the fourth frame of a GIF animation. Various image manipulation operations may be applied to the image. Attributes may be set on the image to influence the operation of the manipulation operations. The GM16PixelsMBS class provides low-level access to image pixels.

81.15.2 Methods

81.15.3 adaptiveThreshold(width as UInt32, height as UInt32, offset as UInt32=0)

Function: Apply adaptive thresholding to the image.

Notes:

see: http://www.dai.ed.ac.uk/HIPR2/adpthrsh.htm

Adaptive thresholding is useful if the ideal threshold level is not known in advance, or if the illumination gradient is not constant across the image. Adaptive thresholding works by evaluating the mean (average) of a pixel region (size specified by width and height) and using the mean as the thresholding value. In order to remove residual noise from the background, the threshold may be adjusted by subtracting a constant offset (default zero) from the mean to compute the threshold.
81.15. CLASS GM16IMAGEMBS

81.15.4  **addNoise(noise as Integer)**

**Function:** Add noise to image with the specified noise type.  
**Example:**

```vbs
dim p as Picture = LogoMBS(500)  
dim image as new GM16ImageMBS(p)
```

```vbs
image.addNoise(image.GaussianNoise)
```

```vbs
Backdrop=image.CopyPicture
```

**Notes:** Use one of this constants: GaussianNoise, ImpulseNoise, LaplacianNoise, MultiplicativeGaussianNoise, PoissonNoise, UniformNoise.

81.15.5  **addNoiseChannel(channel as Integer, noise as Integer)**

**Function:** Add noise to an image channel with the specified noise type. The channel parameter specifies the channel to add noise to.  
**Example:**

```vbs
dim p as Picture = LogoMBS(500)  
dim image as new GM16ImageMBS(p)
```

```vbs
image.addNoiseChannel(image.BlueChannel, image.ImpulseNoise)
```

```vbs
Backdrop=image.CopyPicture
```

**Notes:**  
The noiseType parameter specifies the type of noise.  
Use one of this constants: GaussianNoise, ImpulseNoise, LaplacianNoise, MultiplicativeGaussianNoise, PoissonNoise, UniformNoise.

81.15.6  **affineTransform(sx as Double, sy as Double, rx as Double, ry as Double, tx as Double, ty as Double)**

**Function:** Applies an affine transformation to the drawing matrix.
Notes: Specify a transformation matrix to adjust scaling, rotation, and translation (coordinate transformation) for subsequently drawn objects in the same or decendent drawing context. The sx & sy parameters represent the x & y scale factors, the rx & ry parameters represent the x & y rotation, and the tx & ty parameters represent the x & y translation.

81.15.7  annotate(text as string, boundingArea as GM16GeometryMBS, gravity as Integer)

Function: Annotate using specified text, bounding area, and placement gravity.
Notes:
Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

- NorthWestGravity: text bottom-left corner placed at top-left
- NorthGravity: text bottom-center placed at top-center
- NorthEastGravity: text bottom-right corner placed at top-right
- WestGravity: text left-center placed at left-center
- CenterGravity: text center placed at center
- EastGravity: text right-center placed at right-center
- SouthWestGravity: text top-left placed at bottom-left
- SouthGravity: text top-center placed at bottom-center
- SouthEastGravity: text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

- % b file size in bytes
- % c comment
- % d directory in which the image resides
- % e extension of the image file
- % f original filename of the image
- % h height of image
- % i filename of the image
- % k number of unique colors
- % l image label
- % m image file format
- % n number of images in a image sequence
- % o output image filename
- % p page number of the image
- % q image depth (8 or 16)
- % r page number of the image
- % s image scene number
- % t image filename without any extension
- % u a unique temporary filename
- % w image width
- % x x resolution of the image
- % y y resolution of the image

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

See also:

- 81.15.8 annotate(text as string, boundingArea as GM16GeometryMBS, gravity as Integer, degrees as Double)
81.15.  CLASS GM16IMAGEMBS

- 81.15.9 annotate(text as string, gravity as Integer) 13408
- 81.15.10 annotate(text as string, location as GM16GeometryMBS) 13409

81.15.8  annotate(text as string, boundingArea as GM16GeometryMBS, gravity as Integer, degrees as Double)

Function: Annotate with text using specified text, bounding area, placement gravity, and rotation.

Notes:
Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

- NorthWestGravity text bottom-left corner placed at top-left
- NorthGravity text bottom-center placed at top-center
- NorthEastGravity text bottom-right corner placed at top-right
- WestGravity text left-center placed at left-center
- CenterGravity text center placed at center
- EastGravity text right-center placed at right-center
- SouthWestGravity text top-left placed at bottom-left
- SouthGravity text top-center placed at bottom-center
- SouthEastGravity text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

- % b file size in bytes. % c comment. % d directory in which the image resides. % e extension of the image file. % f original filename of the image. % h height of image. % i filename of the image. % k number of unique colors. % l image label. % m image file format. % n number of images in a image sequence. % o output image filename. % p page number of the image. % q image depth (8 or 16). % r page number of the image. % s image scene number. % t image filename without any extension. % u a unique temporary filename. % w image width. % x x resolution of the image. % y y resolution of the image.

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

- 81.15.10 annotate(text as string, location as GM16GeometryMBS) 13409
CHAPTER 81. GRAPHICS MAGICK

81.15.9 annotate(text as string, gravity as Integer)

**Function:** Annotate with text (bounding area is entire image) and placement gravity.

**Example:**

```plaintext
dim White as new GM16ColorGrayMBS(1)
dim Black as new GM16ColorGrayMBS(0)
dim geo as new GM16GeometryMBS("300x200")

dim g as new GM16ImageMBS(geo, White)

g.antiAlias = False
g.fillColor = Black
g.lineWidth = 1
g.strokeColor = Black
g.font = "@/Library/Fonts/Tahoma.ttf"
g.fontPointsSize = 15

g.annotate("Hello World", g.SouthGravity)

Backdrop = g.CopyPicture
```

**Notes:**

Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

- NorthWestGravity: text bottom-left corner placed at top-left
- NorthGravity: text bottom-center placed at top-center
- NorthEastGravity: text bottom-right corner placed at top-right
- WestGravity: text left-center placed at left-center
- CenterGravity: text center placed at center
- EastGravity: text right-center placed at right-center
- SouthWestGravity: text top-left placed at bottom-left
- SouthGravity: text top-center placed at bottom-center
- SouthEastGravity: text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

- % b file size in bytes
- % c comment
- % d directory in which the image resides
- % e extension of the image file
- % f original filename of the image
- % h height of image
- % i filename of the image
- % k number of
unique colors. % l image label. % m image file format. % n number of images in a image sequence. % o output image filename. % p page number of the image. % q image depth (8 or 16). % p page number of the image. % q image depth (8 or 16). % s image scene number. % t image filename without any extension. % u a unique temporary filename. % w image width. % x x resolution of the image. % y y resolution of the image.

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

See also:

- 81.15.7 annotate(text as string, boundingArea as GM16GeometryMBS, gravity as Integer) 13406
- 81.15.8 annotate(text as string, boundingArea as GM16GeometryMBS, gravity as Integer, degrees as Double) 13407
- 81.15.10 annotate(text as string, location as GM16GeometryMBS) 13409

81.15.10 annotate(text as string, location as GM16GeometryMBS)

**Function:** Annotate using specified text, and placement location.

**Notes:**

Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

- NorthWestGravity text bottom-left corner placed at top-left
- NorthGravity text bottom-center placed at top-center
- NorthEastGravity text bottom-right corner placed at top-right
- WestGravity text left-center placed at left-center
- CenterGravity text center placed at center
- EastGravity text right-center placed at right-center
- SouthWestGravity text top-left placed at bottom-left
- SouthGravity text top-center placed at bottom-center
- SouthEastGravity text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

% b file size in bytes. % c comment. % d directory in which the image resides. % e extension of the image file. % f original filename of the image. % h height of image. % i filename of the image. % k number of unique colors. % l image label. % m image file format. % n number of images in a image sequence. % o output image filename. % p page number of the image. % q image depth (8 or 16). % p page number of the image. % q image depth (8 or 16). % s image scene number. % t image filename without any extension. % u
a unique temporary filename. \% w image width. \% x x resolution of the image. \% y y resolution of the image.

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

See also:

- 81.15.7 annotate(text as string, boundingArea as GM16GeometryMBS, gravity as Integer) 13406
- 81.15.8 annotate(text as string, boundingArea as GM16GeometryMBS, gravity as Integer, degrees as Double) 13407
- 81.15.9 annotate(text as string, gravity as Integer) 13408

81.15.11 attributeValues as dictionary

Function: A dictionary with all attributes.
Notes: As attributes are created on demand, this will only return all so far generated attributes.

81.15.12 blur(radius as Double=0.0, sigma as Double=1.0)

Function: Blur an image with the specified blur factor.
Example:

```dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.blur(30,10)
Backdrop=image.CopyPicture```

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

81.15.13 blurChannel(channel as Integer, radius as Double=0.0, sigma as Double=1.0)

Function: Blur an image channel with the specified blur factor.
Example:
81.15.  CLASS GM16IMAGEMBS

    dim p as Picture = LogoMBS(500)
    dim image as new GM16ImageMBS(p)

    image.blurChannel(image.BlueChannel, 30,10)
    Backdrop=image.CopyPicture

Notes: The channel parameter specifies the channel to modify. The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

81.15.14  border

Function: Border image (add border to image).
Example:

    dim p as Picture = LogoMBS(500)
    dim image as new GM16ImageMBS(p)

    image.border
    Backdrop=image.CopyPicture

Notes: The color of the border is specified by the borderColor attribute.
See also:
  • 81.15.15 border(geometry as GM16GeometryMBS)

81.15.15  border(geometry as GM16GeometryMBS)

Function: Border image (add border to image).
Example:

    dim p as Picture = LogoMBS(500)
    dim image as new GM16ImageMBS(p)

    image.border GM16GeometryMBS.Make(10,10)
    Backdrop=image.CopyPicture
Notes: The color of the border is specified by the borderColor attribute. See also:

- 81.15.14 border

81.15.16  borderGeometryDefault as String

Function: The default geometry description for border.

81.15.17  boundingBox as GM16GeometryMBS

Function: Return smallest bounding box enclosing non-border pixels.

Example:

```plaintext
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)

image.fillColor = new GM16ColorRGBMBS("red") // set color
image.strokeColor = new GM16ColorRGBMBS("green") // set color

image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics

// Draw a circle

draw.Circle(250, 250, 120, 150)
draw.Draw

draw = nil
image.type = image.TrueColorType

Backdrop = image.CopyPicture

MsgBox image.boundingBox.StringValue
```

Notes: The current fuzz value is used when discriminating between pixels. This is the crop bounding box used by crop(Geometry(0,0)).
81.15.18  cacheThreshold(threshold as UInt32)

**Function:** Pixel cache threshold in megabytes.
**Notes:** Once this memory threshold is exceeded, all subsequent pixels cache operations are to/from disk. This setting is shared by all Image objects.

81.15.19  cdl(cdl as string)

**Function:** Bake in the ASC-CDL.
**Notes:** Bake in the ASC-CDL, which is a convention for the exchange of basic primary color grading information between equipment and software from different manufacturers. It is a useful transform for other purposes as well.

81.15.20  channel(channel as Integer)

**Function:** Extract channel from image.
**Notes:** Use this option to extract a particular channel from the image. MatteChannel for example, is useful for extracting the opacity values from an image.

81.15.21  charcoal(radius as Double=0.0, sigma as Double=1.0)

**Function:** Charcoal effect image (looks like charcoal sketch).
**Example:**
```
  dim p as Picture = LogoMBS(500)
  dim image as new GM16ImageMBS(p)
  image.charcoal

  Backdrop=image.CopyPicture
```
**Notes:** The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.
81.15.22 chop( geometry as GM16GeometryMBS)

**Function:** Chop image (remove vertical or horizontal subregion of image).

81.15.23 colorHistogram as dictionary

**Function:** Calculates histogram. 
**Example:**
```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GM16ImageMBS(f)
dim d as Dictionary = g.colorHistogram

MsgBox str(d.Count) + " color"
// check first color
dim c as GM16ColorMBS = d.key(0)

MsgBox "Color " + str(c.colorValue) + ": " + str(d.Value(c))
```

**Notes:** The dictionary has a GM16ColorMBS/GMColor16MBS object as key for each color and an unsigned integer as value.

81.15.24 colorize(opacity as UInt32, penColor as GM16ColorMBS)

**Function:** Colorize image with pen color, using specified percent opacity. 
**Example:**
```
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.colorize(10, new GM16ColorMBS("red"))

Backdrop=image.CopyToPicture
```

See also:
- 81.15.25 colorize(opacityRed as UInt32, opacityGreen as UInt32, opacityBlue as UInt32, penColor as
81.15.5 Colorize image with pen color, using specified percent opacity for red, green, and blue quantums.

Example:

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.colorize(10, 0, 5, new GM16ColorMBS("red"))

Backdrop = image.CopyPicture
```

See also:

- 81.15.24 Colorize image with pen color, using specified percent opacity for red and green quantums.

81.15.26 Apply a color matrix to the image channels.

Example:

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GM16ImageMBS(f)

dim m(8) as Double

m(0) = 0.25
m(1) = 0
m(2) = 0.25
m(3) = 0
m(4) = 0
m(5) = 0
m(6) = 0.25
m(7) = 0
m(8) = 0.25

g.colorMatrix 3, m
```
Backdrop = g.CopyPicture

**Notes:** The user supplied matrix may be of order 1 to 5 (1x1 through 5x5).

### 81.15.27 columns as UInt32

**Function:** Image width.  
**Example:**
```vbs
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

Title = str(image.columns)+" \times "+str(image.rows)
Backdrop=image.CopyPicture
```

### 81.15.28 CombinePictureWithMask as picture

**Function:** Creates a copy of the image with mask.  
**Example:**
```vbs
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

dim c as new GM16ColorMBS("white")
image.transparent(c)

Backdrop=image.CombinePictureWithMask
```

**Notes:** Internally this calls Width and Height, CopyPicture and CopyMask.

### 81.15.29 compare(image as GM16ImageMBS) as boolean

**Function:** Compare current image with another image.  
**Notes:** Sets meanErrorPerPixel, normalizedMaxError, and normalizedMeanError in the current image. False is returned if the images are identical. An ErrorOption exception is thrown if the reference image
columns, rows, colorspace, or matte differ from the current image:

### 81.15.30 composite(compositeImage as GM16ImageMBS, gravity as Integer, CompositeOperator as Integer=2)

**Function:** Compose an image onto another at specified x and y offset and using a specified algorithm.
See also:

- 81.15.31 composite(compositeImage as GM16ImageMBS, offset as GM16GeometryMBS, CompositeOperator as Integer=2) 13417
- 81.15.32 composite(compositeImage as GM16ImageMBS, xOffset as Integer, yOffset as Integer, CompositeOperator as Integer=2) 13417

### 81.15.31 composite(compositeImage as GM16ImageMBS, offset as GM16GeometryMBS, CompositeOperator as Integer=2)

**Function:** Compose an image onto another at specified x and y offset and using a specified algorithm.
See also:

- 81.15.30 composite(compositeImage as GM16ImageMBS, gravity as Integer, CompositeOperator as Integer=2) 13417
- 81.15.32 composite(compositeImage as GM16ImageMBS, xOffset as Integer, yOffset as Integer, CompositeOperator as Integer=2) 13417

### 81.15.32 composite(compositeImage as GM16ImageMBS, xOffset as Integer, yOffset as Integer, CompositeOperator as Integer=2)

**Function:** Compose an image onto another at specified x and y offset and using a specified algorithm.
See also:

- 81.15.30 composite(compositeImage as GM16ImageMBS, gravity as Integer, CompositeOperator as Integer=2) 13417
- 81.15.31 composite(compositeImage as GM16ImageMBS, offset as GM16GeometryMBS, CompositeOperator as Integer=2) 13417
81.15.33 Constructor

**Example:**

```plaintext
// get some image data (e.g. from blob in database)
dim logo as Picture = LogoMBS(500)
dim jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Dim mp as new GM16ImageMBS
dim blob as new GM16BlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask
```

- 81.15.40 Constructor(other as GM16ImageMBS)
- 81.15.42 Constructor(pic as picture)
- 81.15.43 Constructor(size as GM16GeometryMBS, ColorValue as GM16ColorMBS)
- 81.15.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)

81.15.42 Constructor(pic as picture)

**Function:** Creates a new GMImage with the given picture.

**Example:**

```javascript
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
```
Notes: Pixels from both the picture and picture’s mask.

- 81.15.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)

81.15.43 Constructor(size as GM16GeometryMBS, ColorValue as GM16ColorMBS)

Function: Construct a blank image canvas of specified size and color.
Example:

```plaintext
dim g as new GM16GeometryMBS(600,600)
dim c as new GM16ColorRGBMBS(1.0,0.0,0.0) // red
dim image as new GM16ImageMBS(g, c)

const TrueColorType=6

// Ensure that there are no other references to this image.
image.modifyImage
// Set the image type to TrueColor DirectClass representation.
image.type=TrueColorType
```
81.15. **CLASS GM16IMAGEMBS**

Backdrop=image.CopyPicture(0,0,600,600)

- 81.15.41 Constructor(Path as string)
- 81.15.42 Constructor(pic as picture)
- 81.15.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)

**81.15.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)**

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Initializes single image frame from an array of raw pixels, with specified storage type (ConstituteImage).

**Example:**

```plaintext
dim data as new memoryblock(2048*2048) // your data
dim image as new GM16ImageMBS(2048, 2048, "I", GM16ImageMBS.StorageTypeCharPixel, data)
```

**Notes:**

Returns an Image corresponding to an image stored in a raw memory array format. The pixel data must be in scanline order top-to-bottom. The data can be unsigned char, unsigned short int, unsigned int, unsigned long, float, or double. Float and double require the pixels to be normalized to the range \([0..1]\), otherwise the range is \([0..\text{MaxVal}]\) where MaxVal is the maximum possible value for that type.
Note that for most 32-bit architectures the size of an unsigned long is the same as unsigned int, but for 64-bit architectures observing the LP64 standard, an unsigned long is 64 bits, while an unsigned int remains 32 bits. This should be considered when deciding if the data should be described as "Integer" or "Long".

For example, to create a 640x480 image from unsigned red-green-blue character data, use

```java
image = new GM16ImageMBS(640, 480, "RGB", GM16ImageMBS.StorageTypeCharPixel, pixels);
```

**width**: width in pixels of the image.
**height**: height in pixels of the image.
**map**: This string reflects the expected ordering of the pixel array. It can be any combination or order of R = red, G = green, B = blue, A = alpha (same as Transparency), O = Opacity, T = Transparency, C = cyan, Y = yellow, M = magenta, K = black, or I = intensity (for grayscale). Specify "P" = pad, to skip over a quantum which is intentionally ignored. Creation of an alpha channel for CMYK images is currently not supported.
**type**: Define the data type of the pixels. Float and double types are expected to be normalized \[ 0..1 \] otherwise \[ 0..MaxRGB \] . Choose from these types: StorageTypeCharPixel, StorageTypeShortPixel, StorageTypeIntegerPixel, StorageTypeLongPixel, StorageTypeFloatPixel, or StorageTypeDoublePixel.
**pixels**: This array of values contain the pixel components as defined by map and type. You must preallocate this array where the expected length varies depending on the values of width, height, map, and type.

- 81.15.39 Constructor(file as folderitem)
- 81.15.40 Constructor(other as GM16ImageMBS)
- 81.15.41 Constructor(Path as string)
- 81.15.42 Constructor(pic as picture)
- 81.15.43 Constructor(size as GM16GeometryMBS, ColorValue as GM16ColorMBS)
81.15.45  **contrast (sharpen as UInt32)**

**Function**: Contrast image (enhance intensity differences in image).  
**Example**:  
```vbscript
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.contrast(10)
```

Backdrop=image.CopyPicture

---

81.15.46  **convolve (order as Integer, ColorMatrix() as Double)**

**Function**: Convolve image.  
**Example**:  
```vbscript
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GM16ImageMBS(f)

dim m(8) as Double

m(0) = 0.25  
m(1) = 0  
m(2) = 0.25

m(3) = 0  
m(4) = 0  
m(5) = 0

m(6) = 0.25  
m(7) = 0  
m(8) = 0.25

g.convolve 3, m
```

Backdrop = g.CopyPicture

---

**Notes**:  
Applies a user-specified convolution to the image.  
order represents the number of columns and rows in the filter kernel.
kernel is an array of doubles representing the convolution kernel.

81.15.47 CopyPicture as picture

**Function:** Creates a copy of the image and returns it as a new picture.

**Example:**

```vbscript
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS("white") // white
dim image as new GM16ImageMBS(g, c)
image.strokeColor = new GM16ColorRGBMBS("red") // Outline color
image.fillColor = new GM16ColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics
// Draw a circle
draw.Rectangle(250, 250, 100, 100)
Backdrop=image.CopyPicture
```

**Notes:** You may need to set image type to RGB to get it working.

See also:

- 81.15.48 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

81.15.48 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

**Function:** Creates a copy of the image and returns it as a new picture.

**Example:**

```vbscript
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.threshold 127
// convert to RGB so CopyPicture works
image.type = image.TrueColorType
Backdrop=image.CopyPicture(0,0,250,250)
```
**Notes:** You may need to set image type to RGB to get it working.

See also:

- 81.15.47 CopyPicture as picture

### 81.15.49 CopyPictureMask as picture

**Function:** Creates a copy of the image's mask and returns it as a new picture.

See also:

- 81.15.50 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture

### 81.15.50 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture

**Function:** Creates a copy of the image's mask and returns it as a new picture.

See also:

- 81.15.49 CopyPictureMask as picture

### 81.15.51 CopyPixelsMemory as Memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Copy the pixels as they are into a memoryblock.

**Notes:**

Optional specify rectangle.

Returns nil on low memory or bad parameter. Image must be of type class direct (not palette picture).

Order of pixel data is normally Red, Green, Blue, Opacity. Or Cyan, Magenta, Yellow, Black for CMYK images.

For GM16ImageMBS, the data is 8bit per channel. For GMImage16MBS, the data is 16bit per channel.

See also:

- 81.15.52 CopyPixelsMemory(x as Integer, y as Integer, width as Integer, height as Integer) as Memoryblock
81.15.52 CopyPixelsMemory(x as Integer, y as Integer, width as Integer, height as Integer) as Memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Copy the pixels as they are into a memoryblock.
Notes:
Optional specify rectangle.
Returns nil on low memory or bad parameter. Image must be of type class direct (not palette picture).
Order of pixel data is normally Red, Green, Blue, Opacity. Or Cyan, Magenta, Yellow, Black for CMYK images.
For GM16ImageMBS, the data is 8bit per channel. For GMImage16MBS, the data is 16bit per channel.
See also:

- 81.15.51 CopyPixelsMemory as Memoryblock

81.15.53 CreateHBITMAP as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.
Function: Creates a HBITMAP for the image for use with Windows Declares.
Example:

```xoj
// get test image
dim logo as Picture = LogoMBS(500)

// create GraphicsMagick image
dim g as new GM16ImageMBS(logo)

// make a HBitmap
dim hBitmap as ptr = g.CreateHBITMAP

// convert back to Xojo picture
dim pic as Picture = WindowsBitmapMBS.HBitmapToPicture(hBitmap, true)

// show in window
Backdrop = pic

// and cleanup memory
WindowsBitmapMBS.DeleteBitmap(h_bitmap)
```

Notes: The HBITMAP returned needs to be freed when you are done with it or you risk having a memory leak.
81.15. CLASS GM16IMAGEMBS

81.15.54  **crop(geometry as GM16GeometryMBS)**

**Function:** Crop image (return subregion of original image).
**Example:**
```vbs
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.crop GM16GeometryMBS.Make(100,200)
Backdrop=image.CopyPicture
```

81.15.55  **cycleColormap(amount as Integer)**

**Function:** Cycle (rotate) image colormap.
**Example:**
```vbs
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.cycleColormap(5)
image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

81.15.56  **despeckle**

**Function:** Despeckle image (reduce speckle noise).
**Example:**
```vbs
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.despeckle
Backdrop=image.CopyPicture
```
**81.15.57 directory as string**

**Function:** Tile names from within an image montage.

**81.15.58 display**

**Function:** Display image on screen.  
**Notes:**  
Caution: if an image format is is not compatible with the display visual (e.g. JPEG on a colormapped display) then the original image will be altered. Use a copy of the original if this is a problem.

The plugin is not compiled with X11 so this call may not be useful.

**81.15.59 edge(radius as Double=0.0)**

**Function:** Edge image (hilight edges in image).  
**Example:**

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.edge
Backdrop=image.CopyPicture
```

**Notes:** The radius is the radius of the pixel neighborhood. Specify a radius of zero for automatic radius selection.

**81.15.60 emboss(radius as Double=0.0, sigma as Double=1.0)**

**Function:** Emboss image (hilight edges with 3D effect).  
**Example:**

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
```
image.emboss
Backdrop=image.CopyPicture

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

81.15.61 enhance

Function: Enhance image (minimize noise).
Example:
```dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.enhance
Backdrop=image.CopyPicture```

81.15.62 erase

Function: Set all image pixels to the current background color.

81.15.63 fileSize as Int64

Function: Number of bytes of the image on disk.

81.15.64 flip

Function: Flip image (reflect each scanline in the vertical direction).
Example:
```dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)```
image.flip
Backdrop=image.CopyPicture

81.15.65  floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS)

Function: Flood-fill color across pixels that match the color of the target pixel and are neighbors of the
target pixel.
Notes: Uses current fuzz setting when determining color match.
See also:

- 81.15.66 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 13434
- 81.15.67 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS) 13434
- 81.15.68 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 13435

81.15.66  floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS)

Function: Flood-fill color across pixels starting at target-pixel and stopping at pixels matching specified
border color.
Notes: Uses current fuzz setting when determining color match.
See also:

- 81.15.65 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS) 13434
- 81.15.67 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS) 13434
- 81.15.68 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 13435

81.15.67  floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS)

Function: Flood-fill color across pixels that match the color of the target pixel and are neighbors of the
target pixel.
81.15. CLASS GM16IMAGEMBS

Notes: Uses current fuzz setting when determining color match.
See also:

- 81.15.65 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS) 13434
- 81.15.66 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 13434
- 81.15.68 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 13435

81.15.68 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS)

Function: Flood-fill color across pixels starting at target-pixel and stopping at pixels matching specified border color.
Notes: Uses current fuzz setting when determining color match:
See also:

- 81.15.65 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS) 13434
- 81.15.66 floodFillColor(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 13434
- 81.15.67 floodFillColor(x as UInt32, y as UInt32, fillColor as GM16ColorMBS) 13434

81.15.69 floodFillOpacity(x as UInt32, y as UInt32, opacity as UInt32, Paint-Method as Integer)

Function: Flood-fill pixels matching color (within fuzz factor) of target pixel(x,y) with replacement opacity value using method.

81.15.70 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS)

Function: Flood-fill texture across pixels that match the color of the target pixel and are neighbors of the target pixel.
Notes: Uses current fuzz setting when determining color match.
See also:

- 81.15.71 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 13436
81.15.71 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS)

**Function:** Flood-fill texture across pixels starting at target-pixel and stopping at pixels matching specified border color.
**Notes:** Uses current fuzz setting when determining color match.
See also:

- 81.15.70 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS)
- 81.15.72 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS)
- 81.15.73 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS)

81.15.72 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS)

**Function:** Flood-fill texture across pixels that match the color of the target pixel and are neighbors of the target pixel.
**Notes:** Uses current fuzz setting when determining color match.
See also:

- 81.15.70 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS)
- 81.15.71 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS)
- 81.15.73 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS)

81.15.73 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS)

**Function:** Flood-fill texture across pixels starting at target-pixel and stopping at pixels matching specified border color.
**Notes:** Uses current fuzz setting when determining color match.
See also:
81.15.  CLASS GM16IMAGEMBS

- 81.15.70 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS) 13435
- 81.15.71 floodFillTexture(point as GM16GeometryMBS, fillColor as GM16ColorMBS, borderColor as GM16ColorMBS) 13436
- 81.15.72 floodFillTexture(x as UInt32, y as UInt32, fillColor as GM16ColorMBS) 13436

81.15.74  flop

**Function:** Flop image (reflect each scanline in the horizontal direction).
**Example:**
```vba
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.flop
Backdrop=image.CopyPicture```

81.15.75  fontTypeMetrics(name as string) as GM16TypeMetricMBS

**Function:** Obtain font metrics for text string given current font, pointsize, and density settings.

81.15.76  format as string

**Function:** Long image format description.

81.15.77  frame

**Function:** Draw a decorative frame around the image.
**Example:**
```vba
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.frame```
Backdrop=image.CopyPicture

See also:

- 81.15.78 frame(geometry as GM16GeometryMBS)
- 81.15.79 frame(width as UInt32, height as UInt32, innerBevel as Integer=6, outerBevel as Integer=6)

81.15.78  frame(geometry as GM16GeometryMBS)

Function: Draw a decorative frame around the image.
Example:

```
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.frame(GM16GeometryMBS.Make("10x10"))
```
Backdrop=image.CopyPicture

See also:

- 81.15.77 frame
- 81.15.79 frame(width as UInt32, height as UInt32, innerBevel as Integer=6, outerBevel as Integer=6)

81.15.79  frame(width as UInt32, height as UInt32, innerBevel as Integer=6, outerBevel as Integer=6)

Function: Draw a decorative frame around the image.
Example:

```
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.frame(15,15)
```
Backdrop=image.CopyPicture
81.15. CLASS GM16IMAGEMBS

See also:

- 81.15.77 frame
- 81.15.78 frame(geometry as GM16GeometryMBS)

81.15.80 frameGeometryDefault as String

**Function:** The default geometry description for frame.

81.15.81 gamma(gammaRed as Double, gammaGreen as Double, gammaBlue as Double)

**Function:** Gamma correct the image or individual image channels.

**Example:**

```vba
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.gamma(1,2,3)

Backdrop=image.CopyPicture
```

See also:

- 81.15.241 gamma as Double

81.15.82 gaussianBlur(width as Double, sigma as Double)

**Function:** Gaussian blur image.

**Example:**

```vba
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.gaussianBlur(30, 10)

Backdrop=image.CopyPicture
```
Notes: The number of neighbor pixels to be included in the convolution mask is specified by width. The standard deviation of the gaussian bell curve is specified by sigma.

81.15.83  gaussianBlurChannel(channel as Integer, width as Double, sigma as Double)

**Function:** Gaussian blur image channel.
**Notes:** The number of neighbor pixels to be included in the convolution mask is specified by width. The standard deviation of the gaussian bell curve is specified by sigma.

81.15.84  geometry as GM16GeometryMBS

**Function:** Preferred size of the image when encoding.

81.15.85  getChromaBluePrimary(byref x as Double, byref y as Double)

**Function:** Chromaticity blue primary point.

81.15.86  getChromaGreenPrimary(byref x as Double, byref y as Double)

**Function:** Chromaticity green primary point.
**Notes:** e.g. x=0.3, y=0.6

81.15.87  getChromaRedPrimary(byref x as Double, byref y as Double)

**Function:** Chromaticity red primary point.
**Notes:** e.g. x=0.64, y=0.33
81.15. **CLASS GM16IMAGEMBS**

81.15.88  **getchromaWhitePoint(byref x as Double, byref y as Double)**

**Function:** Chromaticity white point  
**Notes:** e.g. x=0.3127, y=0.329

81.15.89  **getConstIndexes as Ptr**

**Function:** Obtain immutable image pixel indexes (valid for PseudoClass images)

81.15.90  **getConstPixels(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr**

**Function:** Transfers read-only pixels from the image to the pixel cache as defined by the specified region

81.15.91  **getIndexes as Ptr**

**Function:** Obtain mutable image pixel indexes (valid for PseudoClass images)

81.15.92  **getPixels(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr**

**Function:** Transfers pixels from the image to the pixel cache as defined by the specified region.  
**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GM16ImageMBS(f)
```

```vbnet
// get pointer to some pixels to write
dim x as ptr = g.getPixels(0, 0, 100, 100)
```

```vbnet
// draw a red line to the pixel buffer
dim o as Integer
for i as Integer = 0 to 99
    o = 100 * i + i
    x.UInt32(o * 4) = &hFFFF0000
```
// write back
g.syncPixels

// show
me.Backdrop = g.CopyPicture

Notes: Modified pixels may be subsequently transferred back to the image via syncPixels. This method is valid for DirectClass images.

81.15.93 Graphics as GM16GraphicsMBS

Function: Creates a graphics object for this image.
Example:

    dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS(“white”) // white
dim image as new GM16ImageMBS(g, c)

    image.strokeColor = new GM16ColorRGBMBS(“red”) // Outline color
    image.fillColor = new GM16ColorRGBMBS(“green”) // Fill color
    image.strokeWidth = 5

    dim draw as GM16GraphicsMBS = image.Graphics

    // Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture

Notes: Using the graphics object you can draw on the image.

81.15.94 haldClut(image as GM16ImageMBS)

Function: Apply a color lookup table (Hald CLUT) to the image.
**81.15.95 implode(factor as Double=0.0)**

**Function:** Implode image (special effect).
**Example:**
```vba
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.implode(0.3)
Backdrop=image.CopyPicture
```

**81.15.96 label as string**

**Function:** Image label.
**Notes:** Use this option to assign a specific label to the image. Optionally you can include the image filename, type, width, height, or scene number in the label by embedding special format characters. If the first character of string is @, the image label is read from a file titled by the remaining characters in the string. When converting to Postscript, use this option to specify a header string to print above the image.
**See also:**
- 81.15.96 label as string

**81.15.97 label(text as string)**

**Function:** Assign a label to an image.
**Notes:** Use this option to assign a specific label to the image. Optionally you can include the image filename, type, width, height, or scene number in the label by embedding special format characters. If the first character of string is @, the image label is read from a file titled by the remaining characters in the string. When converting to Postscript, use this option to specify a header string to print above the image.
**See also:**
- 81.15.96 label as string

**81.15.98 level(black_point as Double, white_point as Double, mid_point as Double=1.0)**

**Function:** Level image to increase image contrast, and/or adjust image gamma.
**Example:**
```vba
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
```
image.level(0, 127.0)

Backdrop=image.CopyPicture

**Notes:** Adjust the levels of the image by scaling the colors falling between specified white and black points to the full available quantum range. The parameters provided represent the black, mid (gamma), and white points. The black point specifies the darkest color in the image. Colors darker than the black point are set to zero. Mid point (gamma) specifies a gamma correction to apply to the image. White point specifies the lightest color in the image. Colors brighter than the white point are set to the maximum quantum value. The black and white point have the valid range 0 to MaxRGB while mid (gamma) has a useful range of 0 to ten:

### 81.15.99  levelChannel(channel as Integer, black_point as Double, white_point as Double, mid_point as Double=1.0)

**Function:** Level image channel to increase image contrast, and/or adjust image gamma.

**Example:**

```lisp
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.levelChannel(image.BlueChannel, 0, 127.0)

Backdrop=image.CopyPicture
```

**Notes:** Adjust the levels of the image channel by scaling the colors falling between specified white and black points to the full available quantum range. The parameters provided represent the black, mid (gamma), and white points. The black point specifies the darkest color in the image. Colors darker than the black point are set to zero. Mid point (gamma) specifies a gamma correction to apply to the image. White point specifies the lightest color in the image. Colors brighter than the white point are set to the maximum quantum value. The black and white point have the valid range 0 to MaxRGB while mid (gamma) has a useful range of 0 to ten:

### 81.15.100  LibVersion as String

**Function:** Returns the version string of the GraphicsMagick library.
81.15.101 magnify

**Function:** Magnify image by integral size (double the dimensions)  
**Example:**

```vbs
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.magnify

Backdrop = image.CopyPicture
```

81.15.102 map(mapImage as GM16ImageMBS, dither as boolean=false)

**Function:** Remap image colors with closest color from a reference image.  
**Example:**

```vbs
// some picture we want to map colors
dim pic as Picture = LogoMBS(500)

// build a picture with palette
dim backgroundColor as new GM16ColorMBS(255,255,255)  // white
dim size as new GM16GeometryMBS(10,10)

dim i as new GM16ImageMBS(pic)
dim x as new GM16ImageMBS(size, backgroundColor)

x.pixelColor(0,0) = new GM16ColorMBS(0,0,0)  // black
x.pixelColor(0,1) = new GM16ColorMBS(255,0,0)  // red
x.pixelColor(0,2) = new GM16ColorMBS(0,255,0)  // green
x.pixelColor(0,3) = new GM16ColorMBS(0,0,255)  // blue
x.pixelColor(0,4) = new GM16ColorMBS(255,255,0)  // yellow
x.pixelColor(0,5) = new GM16ColorMBS(0,255,255)  // cyan
x.pixelColor(0,6) = new GM16ColorMBS(255,0,255)  // magenta

// do the map
i.map(x, false)

// convert result from palette picture to bitmap picture
i.type = i.TrueColorType

// and copy picture to backdrop
Backdrop = i.CopyPicture
```
Notes: Set dither to true in to apply Floyd/Steinberg error diffusion to the image. By default, color reduction chooses an optimal set of colors that best represent the original image. Alternatively, you can choose a particular set of colors from an image file with this option.
**81.15.103**  **matteFloodfill**

**(target as GM16ColorMBS, opacity as UInt32, x as Integer, y as Integer, PaintMethod as Integer)**

**Function:** Floodfill designated area with a replacement opacity value.

---

**81.15.104**  **meanErrorPerPixel as Double**

**Function:** The mean error per pixel computed when an image is color reduced.

**Notes:** This parameter is only valid if verbose is set to true and the image has just been quantized.

---

**81.15.105**  **medianFilter**(radius as Double=0.0)

**Function:** Filter image by replacing each pixel component with the median color in a circular neighborhood.

**Example:**

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.medianFilter(10)

Backdrop=image.CopyPicture
```

---

**81.15.106**  **minify**

**Function:** Reduce image by integral (half) size.

**Example:**

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.minify

Backdrop=image.CopyPicture
```
CHAPTER 81. GRAPHICS MAGICK

81.15.107  modequalizeifyImage

Function: Not documented.

81.15.108  modifyImage

Function: Prepare to update image (copy if reference >1).
Notes: Normally Magick++’s implicit reference counting takes care of all instance management. In the rare case that the automatic instance management does not work, use this method to assure that there is only one reference to the image to be modified. It should be used in the cases where a GraphicsMagick C function is used directly on an image which may have multiple references:

81.15.109  modulate(brightness as Double, saturation as Double, hue as Double)

Function: Modulate percent hue, saturation, and brightness of an image.
Example:

```cpp
dim logo as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(logo)
image.type = image.TrueColorType

// brightness 150%
image.modulate(150,100,100)
backdrop = image.CopyPicture
```

Notes: Modulation of saturation and brightness is as a ratio of the current value (100 for no change). Modulation of hue is an absolute rotation of -180 degrees to +180 degrees from the current position corresponding to an argument range of 0 to 200 (100 for no change).

81.15.110  montageGeometry as GM16GeometryMBS

Function: Tile size and offset within an image montage.
Notes: Only valid for montage images.
81.15. **CLASS GM16IMAGEMBS**

81.15.111 **motionBlur(radius as Double, sigma as Double, angle as Double)**

**Function:** Motion blur image with specified blur factor.  
**Example:**

```vba
dim p as Picture = LogoMBS(500)  
dim image as new GM16ImageMBS(p)

image.motionBlur(30,10,90)

Backdrop=image.CopyPicture
```

**Notes:** The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel.  
The sigma parameter specifies the standard deviation of the Laplacian, in pixels.  
The angle parameter specifies the angle the object appears to be coming from (zero degrees is from the right).

81.15.112 **negate(grayscale as boolean=false)**

**Function:** Negate colors in image.  
**Example:**

```vba
dim p as Picture = LogoMBS(500)  
dim image as new GM16ImageMBS(p)

image.negate

Backdrop=image.CopyPicture
```

**Notes:** Set grayscale to only negate grayscale values in image.

81.15.113 **normalize**

**Function:** Normalize image (increase contrast by normalizing the pixel values to span the full range of color values).  
**Example:**

```vba
dim p as Picture = LogoMBS(500)  
dim image as new GM16ImageMBS(p)
```
image.normalize

Backdrop=image.CopyPicture

### 81.15.114  normalizedMaxError as Double

**Function:** The normalized max error per pixel computed when an image is color reduced.
**Notes:** This parameter is only valid if verbose is set to true and the image has just been quantized.

### 81.15.115  normalizedMeanError as Double

**Function:** The normalized mean error per pixel computed when an image is color reduced.
**Notes:** This parameter is only valid if verbose is set to true and the image has just been quantized.

### 81.15.116  oilPaint(radius as Double=3.0)

**Function:** Oilpaint image (image looks like an oil painting).
**Example:**
```plaintext
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.oilPaint

Backdrop=image.CopyPicture
```

### 81.15.117  opacity(opacity as UInt32)

**Function:** Set or attenuate the opacity channel in the image.
**Notes:** If the image pixels are opaque then they are set to the specified opacity value, otherwise they are blended with the supplied opacity value. The value of opacity ranges from 0 (completely opaque) to MaxRGB. The defines OpaqueOpacity and TransparentOpacity are available to specify completely opaque or completely transparent, respectively.
81.15.118 opaque(opaqueColor as GM16ColorMBS, penColor as GM16ColorMBS)

**Function:** Change color of specified opaque pixel to specified pen color.

81.15.119 ping(data as GM16BlobMBS)

**Function:** Reads information for an image from the blob.
**Notes:** Ping is similar to read except only enough of the image is read to determine the image columns, rows, and filesize. Access the columns, rows, and fileSize attributes after invoking ping. The image pixels are not valid after calling ping.

See also:
- 81.15.120 ping(file as folderitem)
- 81.15.121 ping(Path as string)

81.15.120 ping(file as folderitem)

**Function:** Reads information for an image from the file.
**Example:**
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
// try with Constructor (same as read)
dim t1 as Double = Microseconds
dim g1 as new GM16ImageMBS(f)

// now just ping
dim t2 as Double = Microseconds
dim g2 as new GM16ImageMBS
  g2.ping(f)

// or read
dim t3 as Double = Microseconds
dim g3 as new GM16ImageMBS
  g3.read(f)

dim t4 as Double = Microseconds

// show speeds
MsgBox str(T4-t3)+" s for read"+EndOfLine+-
  str(T3-t2)+" s for ping"+EndOfLine+-
```
str(T2-t1)+" s for Constructor"

**Notes:** Ping is similar to read except only enough of the image is read to determine the image columns, rows, and filesize. Access the columns, rows, and fileSize attributes after invoking ping. The image pixels are not valid after calling ping.

See also:

- 81.15.119 ping(data as GM16BlobMBS)
- 81.15.121 ping(Path as string)

### 81.15.121 ping(Path as string)

**Function:** Reads information for an image from the image specification.

**Notes:** Ping is similar to read except only enough of the image is read to determine the image columns, rows, and filesize. Access the columns, rows, and fileSize attributes after invoking ping. The image pixels are not valid after calling ping.

See also:

- 81.15.119 ping(data as GM16BlobMBS)
- 81.15.120 ping(file as folderitem)

### 81.15.122 PNGLibVersion as string

**Function:** Queries PNG library version string.

### 81.15.123 quantize(measureError as boolean=false)

**Function:** Quantize image (reduce number of colors).

**Example:**

```vba
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.quantize
image.type = image.TrueColorType
Backdrop=image.CopyPicture
```
Notes: Set measureError to true in order to calculate error attributes.

81.15.124 QuantumDepth as Integer

Function: Returns the quantum depth.

81.15.125 quantumOperator(channel as Integer, Operator as Integer, rvalue as Double)

Function: Apply an arithmetic or bitwise operator to the image pixel quantums.
Example:
```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GM16ImageMBS(f)
const AddQuantumOp = 1
const ThresholdQuantumOp = 10

g.quantumOperator( g.AllChannels, AddQuantumOp, 100)
```

// show
me.Backdrop = g.CopyPicture

See also:

- 81.15.126 quantumOperator(x as Integer, y as Integer, columns as Integer, rows as Integer, channel as Integer, Operator as Integer, rvalue as Double)

81.15.126 quantumOperator(x as Integer, y as Integer, columns as Integer, rows as Integer, channel as Integer, Operator as Integer, rvalue as Double)

Function: Apply an arithmetic or bitwise operator to the image pixel quantums.
See also:

- 81.15.125 quantumOperator(channel as Integer, Operator as Integer, rvalue as Double)
**81.15.127 raiseGeometryDefault as String**

**Function:** The default geometry description for raise.

---

**81.15.128 raiseImage**

**Function:** Raise image (lighten or darken the edges of an image to give a 3-D raised or lowered effect).  
**Example:**

```vba
' See also:
• 81.15.128 raiseImage 13454
```

---

**81.15.129 raiseImage(geometry as GM16GeometryMBS, raisedFlag as boolean=false)**

**Function:** Raise image (lighten or darken the edges of an image to give a 3-D raised or lowered effect).  
**Example:**

```vba
' See also:
• 81.15.128 raiseImage 13454
```
81.15.130 randomThreshold(thresholds as GM16GeometryMBS)

Function: Random threshold image.
Example:

```vbscript
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.randomThreshold(GM16GeometryMBS.make("50x200"))

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

Notes: Changes the value of individual pixels based on the intensity of each pixel compared to a random threshold. The result is a low-contrast, two color image. The thresholds argument is a geometry containing LOWxHIGH thresholds. If the string contains 2x2, 3x3, or 4x4, then an ordered dither of order 2, 3, or 4 will be performed instead. If a channel argument is specified then only the specified channel is altered. This is a very fast alternative to 'quantize' based dithering.

81.15.131 randomThresholdChannel(thresholds as GM16GeometryMBS, channel as Integer)

Function: Random threshold image channel.
Notes: Changes the value of individual pixels based on the intensity of each pixel compared to a random threshold. The result is a low-contrast, two color image. The thresholds argument is a geometry containing LOWxHIGH thresholds. If the string contains 2x2, 3x3, or 4x4, then an ordered dither of order 2, 3, or 4 will be performed instead. If a channel argument is specified then only the specified channel is altered. This is a very fast alternative to 'quantize' based dithering.

81.15.132 read(blob as GM16BlobMBS)

Function: Read single image frame from in-memory Blob.
Example:

```vbscript
// get some image data (e.g. from blob in database)
dim logo as Picture = LogoMBS(500)
dim jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Dim mp as new GM16ImageMBS
```
dim blob as new GM16BlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask

- 81.15.137 read(file as folderitem) 13458
- 81.15.139 read(size as GM16GeometryMBS, file as folderitem) 13459
- 81.15.140 read(size as GM16GeometryMBS, Path as string) 13460
- 81.15.141 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 13460

### 81.15.139 read(size as GM16GeometryMBS, file as folderitem)

**MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Read single image frame of specified size into current object.

**See also:**

- 81.15.132 read(blob as GM16BlobMBS) 13455
- 81.15.133 read(blob as GM16BlobMBS, size as GM16GeometryMBS) 13456
- 81.15.134 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer) 13457
- 81.15.135 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer, magick as string) 13457
81.15.140  read(size as GM16GeometryMBS, Path as string)

Function: Read single image frame of specified size into current object.

See also:

- 81.15.132 read(blob as GM16BlobMBS)
- 81.15.133 read(blob as GM16BlobMBS, size as GM16GeometryMBS)
- 81.15.134 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer)
- 81.15.135 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer, magick as string)
- 81.15.136 read(blob as GM16BlobMBS, size as GM16GeometryMBS, magick as string)
- 81.15.137 read(file as folderitem)
- 81.15.138 read(path as string)
- 81.15.139 read(size as GM16GeometryMBS, file as folderitem)
- 81.15.141 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)

81.15.141  read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)

Function: Read single image frame from an array of raw pixels, with specified storage type (ConstituteImage).

Notes:

Returns an Image corresponding to an image stored in a raw memory array format. The pixel data must be in scanline order top-to-bottom. The data can be unsigned char, unsigned short int, unsigned int, unsigned long, float, or double. Float and double require the pixels to be normalized to the range [0..1], otherwise the range is [0..MaxVal] where MaxVal is the maximum possible value for that type.
Note that for most 32-bit architectures the size of an unsigned long is the same as unsigned int, but for 64-bit architectures observing the LP64 standard, an unsigned long is 64 bits, while an unsigned int remains 32 bits. This should be considered when deciding if the data should be described as "Integer" or "Long".

For example, to create a 640x480 image from unsigned red-green-blue character data, use

```plaintext
image = new GM16ImageMBS(640, 480, "RGB", GM16ImageMBS.StorageTypeCharPixel, pixels);
```

- **width**: width in pixels of the image.
- **height**: height in pixels of the image.
- **map**: This string reflects the expected ordering of the pixel array. It can be any combination or order of R = red, G = green, B = blue, A = alpha (same as Transparency), O = Opacity, T = Transparency, C = cyan, Y = yellow, M = magenta, K = black, or I = intensity (for grayscale). Specify "P" = pad, to skip over a quantum which is intentionally ignored. Creation of an alpha channel for CMYK images is currently not supported.
- **type**: Define the data type of the pixels. Float and double types are expected to be normalized \([0..1]\) otherwise \(0..\text{MaxRGB}\). Choose from these types: StorageTypeCharPixel, StorageTypeShortPixel, StorageTypeIntegerPixel, StorageTypeLongPixel, StorageTypeFloatPixel, or StorageTypeDoublePixel.
- **pixels**: This array of values contain the pixel components as defined by map and type. You must preallocate this array where the expected length varies depending on the values of width, height, map, and type.

- 81.15.133 read(blob as GM16BlobMBS, size as GM16GeometryMBS)
- 81.15.134 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer)
- 81.15.135 read(blob as GM16BlobMBS, size as GM16GeometryMBS, depth as Integer, magick as string)
- 81.15.136 read(blob as GM16BlobMBS, size as GM16GeometryMBS, magick as string)
- 81.15.137 read(file as folderitem)
- 81.15.138 read(path as string)
- 81.15.139 read(size as GM16GeometryMBS, file as folderitem)
- 81.15.140 read(size as GM16GeometryMBS, Path as string)

### 81.15.142 reduceNoise

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function**: Reduce noise in image using a noise peak elimination filter. **Example**:

```plaintext
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
```
image.reduceNoise
Backdrop=image.CopyPicture

See also:

- 81.15.143 reduceNoise(order as Double) 13462

81.15.143 reduceNoise(order as Double)

**Function:** Reduce noise in image using a noise peak elimination filter.
See also:

- 81.15.142 reduceNoise 13461

81.15.144 ReleaseDate as String

**Function:** Returns the release date of the used graphics magick library.
**Notes:** We update the library only when someone needs an update, so if you need, please contact us.

81.15.145 roll(columns as UInt32, rows as UInt32)

**Function:** Roll image (rolls image vertically and horizontally) by specified number of columns and rows.
**Example:**

```plaintext
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.roll(30,30)
Backdrop=image.CopyPicture
```

See also:

- 81.15.146 roll(roll as GM16GeometryMBS) 13463
81.15.146  roll(roll as GM16GeometryMBS)

Function: Roll image (rolls image vertically and horizontally) by specified number of columns and rows.
Example:

```vba
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.roll(GM16GeometryMBS.Make(0,0,30,30))

Backdrop=image.CopyPicture
```

See also:

- 81.15.145 roll(columns as UInt32, rows as UInt32)

81.15.147  rotate(degree as Double)

Function: Rotate image counter-clockwise by specified number of degrees.
Example:

```vba
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.rotate(30)

Backdrop=image.CopyPicture
```

81.15.148  rows as UInt32

Function: The number of pixel rows in the image.
Example:

```vba
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

Title = str(image.columns)+” x ”+str(image.rows)
Backdrop=image.CopyPicture
```
81.15.149  **sample(geometry as GM16GeometryMBS)**

**Function:** Resize image by using pixel sampling algorithm.  
**Example:**

```vba
    dim p as Picture = LogoMBS(500)
    dim image as new GM16ImageMBS(p)

    image.sample GM16GeometryMBS.make(100,100)

    Backdrop=image.CopyPicture
```

81.15.150  **scale(geometry as GM16GeometryMBS)**

**Function:** Resize image by using simple ratio algorithm which provides good quality.  
**Example:**

```vba
    dim p as Picture = LogoMBS(500)
    dim image as new GM16ImageMBS(p)

    image.scale new GM16GeometryMBS(100,100)

    Backdrop=image.CopyPicture
```

81.15.151  **segment(clusterThreshold as Double=1.0, smoothingThreshold as Double=1.5)**

**Function:** Segment (coalesce similar image components) by analyzing the histograms of the color components and identifying units that are homogeneous with the fuzzy c-means technique.  
**Example:**

```vba
    dim p as Picture = LogoMBS(500)
    dim image as new GM16ImageMBS(p)

    image.segment

    image.type = image.TrueColorType

    Backdrop=image.CopyPicture
```
Notes: A histogram is built for the image. This histogram is filtered to reduce noise and a second derivative of the histogram plot is built and used to identify potential cluster colors (peaks in the histogram). The cluster colors are then validated by scanning through all of the pixels to see how many pixels fall within each cluster. Some candidate cluster colors may not match any of the image pixels at all and should be discarded. Specify clusterThreshold, as the number of pixels matching a cluster color in order for the cluster to be considered valid. SmoothingThreshold eliminates noise in the second derivative of the histogram. As the value is increased, you can expect a smoother second derivative. The default is 1.5.

81.15.152 setChromaBluePrimary(x as Double, y as Double)
Function: Chromaticity blue primary point.
Notes: e.g. x=0.15, y=0.06

81.15.153 setChromaGreenPrimary(x as Double, y as Double)
Function: Chromaticity green primary point.
Notes: e.g. x=0.3, y=0.6

81.15.154 setChromaRedPrimary(x as Double, y as Double)
Function: Chromaticity red primary point
Notes: e.g. x=0.64, y=0.33

81.15.155 setChromaWhitePoint(x as Double, y as Double)
Function: Chromaticity white point
Notes: e.g. x=0.3127, y=0.329

81.15.156 SetPicture(pic as picture, x as Integer, y as Integer)
Function: Copies the picture into the Image at the given position.
81.15.157  SetPictureMask(maskpic as picture, x as Integer, y as Integer)

Function: Copies the picture into the Image’s mask at the given position.
Example:

// this converts 32 bit PNG with alpha channel to BMP

dim f as FolderItem = SpecialFolder.Desktop.Child("test.png")
dim p as Picture = Picture.Open(f)

dim g as new GM16ImageMBS(new GM16GeometryMBS(p.Width, p.Height), new GM16ColorGrayMBS(1.0))
g.type = g.TrueColorMatteType
g.matte = True
g.magick = "BMP"

g.SetPicture(p, 0, 0)
g.SetPictureMask(p.mask.invertMBS, 0, 0)

f = SpecialFolder.Desktop.Child("test.bmp")
g.write(f)

81.15.158  setPixels(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

Function: Allocates a pixel cache region to store image pixels as defined by the region rectangle.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GM16ImageMBS(f)

// get pointer to some pixels to write
dim x as ptr = g.setPixels(0, 0, 100, 100)

// draw a red line to the pixel buffer
dim o as Integer
for i as Integer = 0 to 99
    o = 100 * i + i
    x.UInt32(o * 4) = & hFFFF0000
next
// write back
g.syncPixels

// show
me.Backdrop = g.CopyPicture

**Notes:** This area is subsequently transferred from the pixel cache to the image via syncPixels.

### 81.15.159 setStrokeDashArray(values() as Double)

**Function:** Sets stroke dash pattern.

**Notes:** Specify the pattern of dashes and gaps used to stroke paths. The strokeLineArray represents a zero-terminated array of numbers that specify the lengths of alternating dashes and gaps in pixels. If an odd number of values is provided, then the list of values is repeated to yield an even number of values. A typical strokeLineArray array might contain the members 5 3 2 0, where the zero value indicates the end of the pattern array.

### 81.15.160 shade(azimuth as Double=30.0, elevation as Double=30.0, colorShading as boolean=false)

**Function:** Shade image using distant light source.

**Notes:** Specify azimuth and elevation as the position of the light source. By default, the shading results as a grayscale image. Set colorShading to true to shade the red, green, and blue components of the image.

### 81.15.161 sharpen(radius as Double=0.0, sigma as Double=1.0)

**Function:** Sharpen pixels in image.

**Example:**

```vba
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.sharpen

Backdrop=image.CopyPicture
```
Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

81.15.162  sharpenChannel(channel as Integer, radius as Double=0.0, sigma as Double=1.0)

Function: Sharpen pixels in image channel.
Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

81.15.163  shave(geometry as GM16GeometryMBS)

Function: Shave pixels from image edges.
Example:

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.shave(new GM16GeometryMBS(200,200))

Backdrop=image.CopyPicture
```

81.15.164  shear(xShearAngle as Double, yShearAngle as Double)

Function: Shear image (create parallelogram by sliding image by X or Y axis).
Example:

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.shear(10,20)

Backdrop=image.CopyPicture
```

Notes: Shearing slides one edge of an image along the X or Y axis, creating a parallelogram. An X direction
shear slides an edge along the X axis, while a Y direction shear slides an edge along the Y axis. The amount of the shear is controlled by a shear angle. For X direction shears, $x$ degrees is measured relative to the Y axis, and similarly, for Y direction shears y degrees is measured relative to the X axis. Empty triangles left over from shearing the image are filled with the color defined as borderColor.

### 81.15.165 signature (force as boolean=false) as string

**Function:** Image textual signature.  
**Example:**
```vbnet
dim p as Picture = LogoMBS(500)  
dim image as new GM16ImageMBS(p)  
MsgBox image.signature  
Backdrop=image.CopyPicture
```

**Notes:** Set force to true in order to re-calculate the signature regardless of whether the image data has been modified.

### 81.15.166 solarize (factor as Double=50.0)

**Function:** Solarize image (similar to effect seen when exposing a photographic film to light during the development process)  
**Example:**
```vbnet
dim p as Picture = LogoMBS(500)  
dim image as new GM16ImageMBS(p)  
image.solarize  
Backdrop=image.CopyPicture
```

### 81.15.167 spread (amount as UInt32=3)

**Function:** Spread pixels randomly within image by specified amount  
**Example:**
Dim p As Picture = LogoMBS(500)
Dim image As New GM16ImageMBS(p)

image.spread 5
Backdrop=image.CopyPicture

81.15.168 statistics as GM16ImageStatisticsMBS

**Function:** Obtain image statistics.  
**Example:**

```vbnet
Dim f As FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Dim g As New GM16ImageMBS(f)
Dim stat As GM16ImageStatisticsMBS = g.statistics
Dim gs As GM16ImageChannelStatisticsMBS = stat.blue

MsgBox "blue channel: "+Str(g.minimum)+"-"+Str(g.maximum)+", mean "+Str(gs.mean)
```

**Notes:** Statistics are normalized to the range of 0.0 to 1.0 and are output to the specified ImageStatistics structure.

81.15.169 stegano(watermark as GM16ImageMBS)

**Function:** Add a digital watermark to the image (based on second image).  
**Example:**

```vbnet
Dim p As Picture = LogoMBS(500)
Dim p1 As Picture = NewPicture(550,500,32)
Dim p2 As Picture = NewPicture(550,500,32)
p1.Graphics.DrawPicture p, 0,0
p2.Graphics.DrawPicture p,50,0

Dim image1 As New GM16ImageMBS(p1)
Dim image2 As New GM16ImageMBS(p2)

image2.zoom(New GM16GeometryMBS(100,100)) // scale down

// add watermark
```
image1.stego(image2)

// now make a threshold so you see the difference
image1.threshold 254

image1.type = image1.TrueColorType
Backdrop=image1.CopyPicture

81.15.170 stereo(rightImage as GM16ImageMBS)

**Function:** Create an image which appears in stereo when viewed with red-blue glasses (Red image on left, blue on right)
**Example:**

```vba
dim p as Picture = LogoMBS(500)
dim p1 as Picture = NewPicture(550,500,32)
dim p2 as Picture = NewPicture(550,500,32)

p1.Graphics.DrawPicture p, 0,0
p2.Graphics.DrawPicture p,50,0

dim image1 as new GM16ImageMBS(p1)
dim image2 as new GM16ImageMBS(p2)

image1.stereo(IMAGE2)

Backdrop=image1.CopyPicture
```

81.15.171 strip

**Function:** Remove all profiles and text attributes from the image.

81.15.172 strokeDashArray as Double()

**Function:** Queries stroke dash pattern.
**Notes:** Specify the pattern of dashes and gaps used to stroke paths. The strokeDashArray represents a zero-terminated array of numbers that specify the lengths of alternating dashes and gaps in pixels. If an
odd number of values is provided, then the list of values is repeated to yield an even number of values. A typical strokeDashArray array might contain the members 5 3 2 0, where the zero value indicates the end of the pattern array.

81.15.173  swirl(degree as Double)

**Function:** Swirl image (image pixels are rotated by degrees).
**Example:**
```dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.swirl 200
Backdrop=image.CopyPicture```

81.15.174  syncPixels

**Function:** Transfers the image cache pixels to the image.

81.15.175  texture(texture as GM16ImageMBS)

**Function:** Channel a texture on pixels matching image background color.

81.15.176  threshold(degree as Double)

**Function:** Threshold image channels (below threshold becomes black, above threshold becomes white).
**Example:**
```dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
image.threshold 127
// convert to RGB so CopyPicture works```
image.type = image.TrueColorType
Backdrop=image.CopyPicture

Notes: The range of the threshold parameter is 0 to MaxRGB.

81.15.177 thumbnail(geometry as GM16GeometryMBS)

Function: Resize image using several algorithms to make smaller images very quickly.
Example:

```vbs
    dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
    dim g as new GM16ImageMBS(f)

    // make thumbnail
    dim geo as new GM16GeometryMBS(100, 100)
    g.thumbnail(geo)

    // show
    me.Backdrop = g.CopyPicture
```

81.15.178 totalColors as UInt32

Function: Number of colors in the image.
Example:

```vbs
    dim p as Picture = LogoMBS(500)
    dim image as new GM16ImageMBS(p)

    Title = str(image.totalColors) // shows 5284
    Backdrop=image.CombinePictureWithMask
```

81.15.179 transform(imageGeometry as GM16GeometryMBS)

Function: Transform image based on image and crop geometries.
Notes: Crop geometry is optional.
See also:

- 81.15.180 transform(imageGeometry as GM16GeometryMBS, cropGeometry as GM16GeometryMBS)

81.15.180 transform(imageGeometry as GM16GeometryMBS, cropGeometry as GM16GeometryMBS)

Function: Transform image based on image and crop geometries.
Notes: Crop geometry is optional.
See also:

- 81.15.179 transform(imageGeometry as GM16GeometryMBS)

81.15.181 transformOrigin(tx as Double, ty as Double)

Function: Origin of coordinate system to use when annotating with text or drawing.

81.15.182 transformReset

Function: Reset transformation parameters to default.

81.15.183 transformRotation(angle as Double)

Function: Rotation to use when annotating with text or drawing.

81.15.184 transformScale(tx as Double, ty as Double)

Function: Scale to use when annotating with text or drawing.
81.15.185  **transformSkewX(x as Double)**

**Function:** Skew to use in X axis when annotating with text or drawing.

81.15.186  **transformSkewY(y as Double)**

**Function:** Skew to use in Y axis when annotating with text or drawing.

81.15.187  **transparent(color as GM16ColorMBS)**

**Function:** Add matte channel to image, setting pixels matching color to transparent.
**Example:**

```plaintext
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

dim c as new GM16ColorMBS("white")
image.transparent(c)

Backdrop=image.CombinePictureWithMask
```

81.15.188  **trim**

**Function:** Trim edges that are the background color from the image.
**Example:**

```plaintext
dim p as Picture = LogoMBS(500)
// make the logo picture bigger
dim q as Picture = NewPicture(700,700,32)

q.Graphics.DrawPicture p,100,100

dim image as new GM16ImageMBS(q)

// now trim the white border away
image.trim
```
81.15.189  unregisterId

Function: Not documented.

81.15.190  unsharpmask(radius as Double, sigma as Double, amount as Double, threshold as Double)

Function: Replace image with a sharpened version of the original image using the unsharp mask algorithm.
Example:

dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.unsharpmask(10,1,0.5,50)

Backdrop=image.CopyPicture

Notes:

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Gaussian, in pixels.
amount: the percentage of the difference between the original and the blur image that is added back into
the original.
threshold: the threshold in pixels needed to apply the difference amount.

81.15.191  unsharpmaskChannel(channel as Integer, radius as Double, sigma as Double, amount as Double, threshold as Double)

Function: Replace image channel with a sharpened version of the original image using the unsharp mask
algorithm.
Example:

dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
81.15. CLASS GM16IMAGE MBS

image.unsharpmaskChannel(Image.RedChannel, 10, 1, 0.5, 50)

Backdrop=image.CopyPicture

Notes:

channel: image channel to modify.
radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Gaussian, in pixels.
amount: the percentage of the difference between the original and the blur image that is added back into the original.
threshold: the threshold in pixels needed to apply the difference amount.

81.15.192 wave(amplitude as Double=25.0, wavelength as Double=150.0)

Function: Map image pixels to a sine wave.
Example:

dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.wave

Backdrop=image.CopyPicture

81.15.193 write(blob as GM16BlobMBS)

Function: Write single image frame to in-memory Blob, with optional format and adjoin parameters.
See also:

- 81.15.194 write(blob as GM16BlobMBS, magick as string)
- 81.15.195 write(blob as GM16BlobMBS, magick as string, depth as UInt32)
- 81.15.196 write(file as folderitem)
- 81.15.197 write(Path as string)
- 81.15.198 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr)
81.15.194  write(blob as GM16BlobMBS, magick as string)

**Function:** Write single image frame to in-memory Blob, with optional format and adjoin parameters.  
See also:

- 81.15.193 write(blob as GM16BlobMBS)  
- 81.15.195 write(blob as GM16BlobMBS, magick as string, depth as UInt32)  
- 81.15.196 write(file as folderitem)  
- 81.15.197 write(Path as string)  
- 81.15.198 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr)

81.15.195  write(blob as GM16BlobMBS, magick as string, depth as UInt32)

**Function:** Write single image frame to in-memory Blob, with optional format and adjoin parameters.  
See also:

- 81.15.193 write(blob as GM16BlobMBS)  
- 81.15.194 write(blob as GM16BlobMBS, magick as string)  
- 81.15.196 write(file as folderitem)  
- 81.15.197 write(Path as string)  
- 81.15.198 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr)

81.15.196  write(file as folderitem)

**Function:** Write single image frame to a file.  
**Example:**

```plaintext
// this converts 32 bit PNG with alpha channel to BMP

dim f as FolderItem = SpecialFolder.Desktop.Child(“test.png”)
dim p as Picture = Picture.Open(f)

dim g as new GM16ImageMBS( new GM16GeometryMBS(p.Width, p.Height), new GM16ColorGrayMBS(1.0))
g.type = g.TrueColorMatteType
```
81.15. CLASS GM16IMAGEMBS

g.matte = True
g.magick = "BMP"

g.SetPicture(p, 0, 0)
g.SetPictureMask(p.mask.invertMBS, 0, 0)

f = SpecialFolder.Desktop.Child("test.bmp")
g.write(f)

See also:

- 81.15.193 write(blob as GM16BlobMBS)
- 81.15.194 write(blob as GM16BlobMBS, magick as string)
- 81.15.195 write(blob as GM16BlobMBS, magick as string, depth as UInt32)
- 81.15.197 write(Path as string)
- 81.15.198 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr)

81.15.197 write(Path as string)

Function: Write single image frame to a file.
See also:

- 81.15.193 write(blob as GM16BlobMBS)
- 81.15.194 write(blob as GM16BlobMBS, magick as string)
- 81.15.195 write(blob as GM16BlobMBS, magick as string, depth as UInt32)
- 81.15.196 write(file as folderitem)
- 81.15.198 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr)

81.15.198 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr)

Function: Write single image frame to an array of pixels with storage type specified by user (DispatchImage).
Notes: e.g. image.write( 0, 0, 640, 1, "RGB", 0, pixels )
See also:
• 81.15.193 write(blob as GM16BlobMBS) 13477
• 81.15.194 write(blob as GM16BlobMBS, magick as string) 13478
• 81.15.195 write(blob as GM16BlobMBS, magick as string, depth as UInt32) 13478
• 81.15.196 write(file as folderitem) 13478
• 81.15.197 write(Path as string) 13479

81.15.199  xResolution as Double

Function: x resolution of the image.
Notes: See also density functions.

81.15.200  yResolution as Double

Function: y resolution of the image.

81.15.201  zoom(geometry as GM16GeometryMBS)

Function: Zoom (resize) image to specified size.
Example:

```
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.zoom(new GM16GeometryMBS(200,200))
```
Backdrop=image.CopyPicture

81.15.202  Properties

81.15.203  baseColumns as UInt32

Function: Base image width (before transformations)
Notes: (Read only property)
81.15. **CLASS GM16IMAGEMBS**

81.15.204 **baseFilename as String**

**Function:** Base image filename (before transformations)

**Notes:** (Read only property)

81.15.205 **baseRows as Uint32**

**Function:** Base image height (before transformations).

**Example:**

```vbscript
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
Title = str(image.baseRows) + " x " + str(image.baseColumns)
```

**Notes:** (Read only property)

81.15.206 **comment as string**

**Function:** Image comment.

**Notes:**

When you set this property, you add comment string to image.

By default, each image is commented with its file name. Use this method to assign a specific comment to the image. Optionally you can include the image filename, type, width, height, or other image attributes by embedding special format characters:

(Read and Write property)

81.15.207 **handle as Integer**

**Function:** The internal object reference.

**Example:**

```vbscript
dim c as new GM16ColorMBS("white")
dim g as new GM16GeometryMBS(100,100)
dim image as new GM16ImageMBS(g, c)
MsgBox hex(Image.handle) // valid if not zero
```
Notes: (Read and Write property)

81.15.208 height as Integer

Function: The height of the image.  
Example:

dim c as new GM16ColorRGBMBS(1.0,0.0,0.0)
dim size as new GM16GeometryMBS(100,100)
dim g as new GM16ImageMBS(size, c)

MsgBox str(g.width)+" "+str(g.height)

Notes:  
This is a convenience function for you which calls size.height.  
(Read only property)

81.15.209 width as Integer

Function: The width of the image.  
Example:

dim c as new GM16ColorRGBMBS(1.0,0.0,0.0)
dim size as new GM16GeometryMBS(100,100)
dim g as new GM16ImageMBS(size, c)

MsgBox str(g.width)+" "+str(g.height)

Notes:  
This is a convenience function for you which calls size.width.  
(Read only property)
81.15. CLASS GM16IMAGEMBS

81.15.210  adjoin as boolean
Function: Join images into a single multi-image file.
Notes: (Read and Write computed property)

81.15.211  animationDelay as UInt32
Function: Time in 1/100ths of a second (0 to 65535) which must expire before displaying the next image in an animated sequence.
Notes: This option is useful for regulating the animation of a sequence of GIF images within Netscape.
(Read and Write computed property)

81.15.212  animationIterations as UInt32
Function: Number of iterations to loop an animation (e.g. Netscape loop extension) for.
Notes: (Read and Write computed property)

81.15.213  antiAlias as boolean
Function: Control antialiasing of rendered Postscript and Postscript or TrueType fonts.
Notes: Enabled by default.
(Read and Write computed property)

81.15.214  attributeValue(name as string) as string
Function: Access an arbitrary named image attribute.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("IMG_4048.jpg")
dim g as new GM16ImageMBS(f)
dim a as string = g.attributeValue("EXIF:DateTime")
MsgBox a
Notes:
Any number of named attributes may be attached to the image. For example, the image comment is a named image attribute with the name "comment". EXIF tags are attached to the image as named attributes. Use the syntax "EXIF:<tag>" to request an EXIF tag similar to "EXIF:DateTime":
(Read and Write computed property)

81.15.215  **backgroundColor as GM16ColorMBS**

**Function:** Image background color.
**Notes:** (Read and Write computed property)

81.15.216  **backgroundTexture as string**

**Function:** Image file name to use as the background texture.
**Notes:** Does not modify image pixels.
(Read and Write computed property)

81.15.217  **borderColor as GM16ColorMBS**

**Function:** Image border color.
**Notes:** (Read and Write computed property)

81.15.218  **boxColor as GM16ColorMBS**

**Function:** Base color that annotation text is rendered on (default none).
**Notes:** (Read and Write computed property)
81.15.219  channelDepth(channel as Integer) as UINt32

Function: Set or obtain modulus channel depth.
Notes: (Read and Write computed property)

81.15.220  classType as Integer

Function: Image class (DirectClass or PseudoClass).
Notes:
NOTE: setting a DirectClass image to PseudoClass will result in the loss of color information if the number
of colors in the image is greater than the maximum palette size (either 256 or 65536 entries depending on
the value of QuantumDepth when ImageMagick was built):
(Read and Write computed property)

81.15.221  clipMask as GM16ImageMBS

Function: Associate a clip mask image with the current image.
Notes:
The clip mask image must have the same dimensions as the current image or an exception is thrown. Clipping
occurs wherever pixels are transparent in the clip mask image. Clipping Pass an invalid image to unset
an existing clip mask.
(Read and Write computed property)

81.15.222  colorFuzz as Double

Function: Colors within this distance are considered equal.
Notes:
A number of algorithms search for a target color. By default the color must be exact. Use this option to
match colors that are close to the target color in RGB space.
(Read and Write computed property)
81.15.223  colorMap(index as UInt32) as GM16ColorMBS

Function: Color at colormap position index.
Notes: (Read and Write computed property)

81.15.224  colorMapSize as UInt32

Function: Number of entries in the colormap.
Notes:
Setting the colormap size may extend or truncate the colormap. The maximum number of supported entries is specified by the MaxColormapSize constant, and is dependent on the value of QuantumDepth when GraphicsMagick is compiled. An exception is thrown if more entries are requested than may be supported. Care should be taken when truncating the colormap to ensure that the image colormap indexes reference valid colormap entries.
(Read and Write computed property)

81.15.225  colorSpace as Integer

Function: The colorspace (e.g. CMYK) used to represent the image pixel colors.
Notes: (Read and Write computed property)

81.15.226  compose as Integer

Function: Composition operator to be used when composition is implicitly used (such as for image flattening).
Notes: (Read and Write computed property)

81.15.227  compressType as Integer

Function: Image compression type.
Notes:
### 81.15. CLASS GM16IMAGEMBS

</tr>
</tbody>
</table>

The default is the compression type of the input image file.
(Read and Write computed property)

### 81.15.228  debug as boolean

**Function:** Enable printing of debug messages from GraphicsMagick as it executes.
**Notes:** (Read and Write computed property)

### 81.15.229  defineSet(magick as string, key as string) as boolean

**Function:** Set or obtain a definition flag to applied when encoding or decoding the specified format.
**Notes:**
Similar to the defineValue() method except that passing the flag value 'true' creates a value-less define with that format and key. Passing the flag value 'false' removes any existing matching definition. The method returns 'true' if a matching key exists, and 'false' if no matching key exists.
(Read and Write computed property)
81.15.230 defineValue(magick as string, key as string) as string

**Function:** Set or obtain a definition string to applied when encoding or decoding the specified format.
**Notes:**
The meanings of the definitions are format specific. The format is designated by the magick argument, the
format-specific key is designated by key, and the associated value is specified by value. See the defineSet() method if the key must be removed entirely.
(Read and Write computed property)

81.15.231 density as GM16GeometryMBS

**Function:** Vertical and horizontal resolution in pixels of the image.
**Example:**
```vbscript
dim p as new GM16ImageMBS

dim item as FolderItem = SpecialFolder.Desktop.Child(“input.png”)  
p.read(item)  
p.scale new GM16GeometryMBS(3750,3750)  
p.quality = 95  
p.resolutionUnits = p.PixelsPerInchResolution  
p.density = new GM16GeometryMBS(300, 300)

dim out as FolderItem = SpecialFolder.Desktop.Child(“output.png”)  
p.write out
```
**Notes:**
This option specifies an image density when decoding a Postscript or Portable Document page. Often used with psPageSize.
(Read and Write computed property)

81.15.232 depth as UInt32

**Function:** Image depth (bits allocated to red/green/blue components).
**Notes:**
Used to specify the bit depth when reading or writing raw images or when the output format supports multiple depths. Defaults to the quantum depth that GraphicsMagick is compiled with.
(Read and Write computed property)
81.15. CLASS GM16IMAGEMBS

81.15.233 endian as Integer

Function: The endian mode.
Notes: Endianness (LSBEndian like Intel, MSBEndian like SPARC, or NativeEndian for what this computer uses) for image formats which support endian-specific options.
(Read and Write computed property)

81.15.234 fileName as string

Function: Image file name.
Notes: (Read and Write computed property)

81.15.235 fillColor as GM16ColorMBS

Function: Color to use when filling drawn objects.
Example:

```vbnet
dim g as new GM16GeometryMBS(500,500)
dim c as new GM16ColorRGBMBS(“white”) // white
dim image as new GM16ImageMBS(g, c)

image.strokeColor = new GM16ColorRGBMBS(“red”) // Outline color
image.fillColor = new GM16ColorRGBMBS(“green”) // Fill color
image.strokeWidth = 5

dim draw as GM16GraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture
```

Notes: (Read and Write computed property)
81.15.236 fillPattern as GM16ImageMBS

Function: Pattern to use while filling drawn objects.
Notes: (Read and Write computed property)

81.15.237 fillRule as Integer

Function: Rule to use when filling drawn objects
Notes: (Read and Write computed property)

81.15.238 filterType as Integer

Function: The reduction filter employed has a significant effect on the time required to resize an image and
the resulting quality. The default filter is Lanczos which has been shown to produce high quality results
when reducing most images.
Notes: Filter to use when resizing image.
(Read and Write computed property)

81.15.239 font as string

Function: Text rendering font.
Notes: If the font is a fully qualified X server font name, the font is obtained from an X server. To use a TrueType
font, precede the TrueType filename with an @. Otherwise, specify a Postscript font name (e.g. ”helvetica”).
(Read and Write computed property)

81.15.240 fontPointSize as Double

Function: Text rendering font point size.
Notes: (Read and Write computed property)
81.15. CLASS GM16IMAGE MBS

81.15.241 gamma as Double

**Function:** Gamma correct the image or individual image channels.

**Example:**

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.gamma = 3.0

Backdrop=image.CopyPicture
```

**Notes:**

If you get the value, it is the gamma level of the image. Gamma is a pow() function which converts between the linear light representation and the representation for the computer display. Most computer images are gamma corrected to 2.2 \((1/0.4545)\) so that each step results in a visually linear step on a computer or video display:

(Read and Write computed property)

See also:

- 81.15.81 gamma(gammaRed as Double, gammaGreen as Double, gammaBlue as Double)

81.15.242 gifDisposeMethod as UInt32

**Function:** GIF disposal method.

**Notes:**

This option (specific to the GIF file format) is used to control how successive frames are rendered (how the preceding frame is disposed of) when creating a GIF animation.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Disposal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UndefinedDispose</td>
<td>0</td>
<td>No disposal specified.</td>
</tr>
<tr>
<td>NoneDispose</td>
<td>1</td>
<td>Do not dispose between frames.</td>
</tr>
<tr>
<td>BackgroundDispose</td>
<td>2</td>
<td>Overwrite frame with background color from header.</td>
</tr>
<tr>
<td>PreviousDispose</td>
<td>3</td>
<td>Overwrite with previous frame.</td>
</tr>
</tbody>
</table>

(Read and Write computed property)
81.15.243  iccColorProfile as GM16BlobMBS

Function: ICC color profile.
Example:

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("IMG_0793.tif")
dim Image as new GM16ImageMBS(f)
dim ProfileBlob as GM16BlobMBS = Image.iccColorProfile
dim ProfileData as string = ProfileBlob.CopyString
dim cm as LCMS2ProfileMBS = LCMS2ProfileMBS.OpenProfileFromString(ProfileData)
dim name as string = cm.Name

Break  // check data in debugger
```

Notes:
Supplied via a Blob since Magick++/ and GraphicsMagick do not currently support formatting this data structure directly. Specifications are available from the International Color Consortium for the format of ICC color profiles.
(Read and Write computed property)

81.15.244  interlaceType as Integer

Function: The type of interlacing scheme (default NoInterlace ).
Notes:
This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files (e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.
(Read and Write computed property)

81.15.245  iptcProfile as GM16BlobMBS

Function: IPTC profile.
Notes:
Supplied via a Blob since Magick++ and GraphicsMagick do not currently support formatting this data structure directly. Specifications are available from the International Press Telecommunications Council for IPTC profiles.
81.15. CLASS GM16IMAGEMBS

(Read and Write computed property)

81.15.246 isValid as boolean

**Function:** Does object contain valid image?
**Notes:**
Set to false in order to invalidate the image. Images constructed via the default constructor are invalid images and isValid() will return false.
(Read and Write computed property)

81.15.247 lineWidth as Double

**Function:** Stroke width for drawing vector objects (default one)
**Notes:**
This method is now deprecated. Please use strokeWidth instead.
(Read and Write computed property)

81.15.248 magick as string

**Function:** The name of the codec to use for compression.
**Example:**
```
// this converts 32 bit PNG with alpha channel to BMP

dim f as FolderItem = SpecialFolder.Desktop.Child("test.png")
dim p as Picture = Picture.Open(f)
dim g as new GM16ImageMBS( new GM16GeometryMBS(p.Width, p.Height), new GM16ColorGrayMBS(1.0))

g.type = g.TrueColorMatteType
g.matte = True
g.magick = "BMP"

g.SetPicture(p, 0, 0)
g.SetPictureMask(p.mask.invertMBS, 0, 0)

f = SpecialFolder.Desktop.Child("test.bmp")
g.write(f)
```
Notes: (Read and Write computed property)

81.15.249 matte as boolean

Function: Image supports transparency (matte channel)
Notes: (Read and Write computed property)

81.15.250 matteColor as GM16ColorMBS

Function: Image matte (frame) color.
Notes: (Read and Write computed property)

81.15.251 modulusDepth as UInt32

Function: Image modulus depth (minimum number of bits required to support red/green/blue components without loss of accuracy).
Notes: The pixel modulus depth may be decreased by supplying a value which is less than the current value, updating the pixels (reducing accuracy) to the new depth. The pixel modulus depth can not be increased over the current value using this method.
(Read and Write computed property)

81.15.252 monochrome as boolean

Function: Transform image to black and white while color reducing (quantizing).
Notes: (Read and Write computed property)

81.15.253 orientation as Integer

Function: Image orientation. Supported by some file formats such as DPX and TIFF. Useful for turning
81.15.  CLASS GM16IMAGEMBS

the right way up.
Notes: (Read and Write computed property)

81.15.254  page as GM16GeometryMBS

Function: Preferred size and location of an image canvas.
Notes:
Use this option to specify the dimensions and position of the Postscript page in dots per inch or a TEXT page in pixels. This option is typically used in concert with density.

Page may also be used to position a GIF image (such as for a scene in an animation).
(Read and Write computed property)

81.15.255  penColor as GM16ColorMBS

Function: The pen color.
Notes: (Read and Write computed property)

81.15.256  pixelColor(x as UInt32, y as UInt32) as GM16ColorMBS

Function: Get/set pixel color at location x & y.
Example:

dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)
dim c as new GM16ColorMBS("red")

for x as Integer = 240 to 260
    image.pixelColor(x,250)=c
next

for y as Integer = 240 to 260
    image.pixelColor(250,y)=c
next

Backdrop=image.CopyPicture
81.15.257 profile(name as string) as GM16BlobMBS

**Function:** Get or set a named profile.

**Notes:**
Add or remove a named profile to/from the image. Remove the profile by passing an empty Blob (e.g. Blob()). Valid names are "*", "8BIM", "ICM", "IPTC", or a user/format-defined profile name.

Retrieve a named profile from the image. Valid names are: "8BIM", "8BIMTEXT", "APP1", "APP1JPEG", "ICC", "ICM", & "IPTC" or an existing user/format-defined profile name (Read and Write computed property)

81.15.258 quality as UInt32

**Function:** JPEG/MIFF/PNG compression level (default 75).

**Notes:** (Read and Write computed property)

81.15.259 quantizeColors as UInt32

**Function:** Maximum number of colors to quantize to.

**Example:**

```pascal
    dim p as Picture = LogoMBS(500)
    dim image as new GM16ImageMBS(p)

    image.quantizeColors = 10
    image.quantize

    image.type = image.TrueColorType
    Backdrop=image.CopyPicture
```

**Notes:** (Read and Write computed property)
81.15. CLASS GM16IMAGEMBS

81.15.260 quantizeColorSpace as Integer

**Function:** Colorspace to quantize in (default RGB).

**Example:**

```vbnet
// load a picture
dim f as FolderItem = SpecialFolder.Desktop.Child("test.png")
dim pic as Picture = Picture.Open(f)

const GrayColorSpace = 2

Dim Converter As New GM16ImageMBS(Pic)

// quantize with dither
Converter.type = GM16ImageMBS.BilevelType
Converter.quantizeColorSpace = GrayColorSpace
Converter.quantizeColors = 2
Converter.quantizeDither = True
Converter.quantize

// convert back to Xojo
Converter.type = GM16ImageMBS.TrueColorType
Backdrop = Converter.CopyPicture
```

**Notes:**

Empirical evidence suggests that distances in color spaces such as YUV or YIQ correspond to perceptual color differences more closely than do distances in RGB space. These color spaces may give better results when color reducing an image.

(Read and Write computed property)

81.15.261 quantizeDither as boolean

**Function:** Apply Floyd/Steinberg error diffusion to the image.

**Example:**

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)

image.quantizeColors = 10
image.quantizeDither = true
image.quantize
```
image.type = image.TrueColorType
Backdrop=image.CopyPicture

Notes:
The basic strategy of dithering is to trade intensity resolution for spatial resolution by averaging the intensities of several neighboring pixels. Images which suffer from severe contouring when reducing colors can be improved with this option. The quantizeColors or monochrome option must be set for this option to take effect.
(Read and Write computed property)

81.15.262 quantizeTreeDepth as UInt32

Function: Depth of the quantization color classification tree.
Notes:
Values of 0 or 1 allow selection of the optimal tree depth for the color reduction algorithm. Values between 2 and 8 may be used to manually adjust the tree depth.
(Read and Write computed property)

81.15.263 renderingIntent as Integer

Function: The type of rendering intent (used when applying an ICC color profile).
Notes: (Read and Write computed property)

81.15.264 resolutionUnits as Integer

Function: Units of image resolution.
Notes: (Read and Write computed property)

81.15.265 scene as UInt32

Function: Image scene number.
Notes: (Read and Write computed property)
**81.15.266 size as GM16GeometryMBS**

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Width and height of a raw image (an image which does not support width and height information).

**Example:**

```vba
Dim p As Picture = LogoMBS(500)
Dim image As New GM16ImageMBS(p)
MsgBox image.size.StringValue

image.size = New GM16GeometryMBS(200, 200)
Backdrop = image.CopyPicture
```

**Notes:**

Size may also be used to affect the image size read from a multi-resolution format (e.g. Photo CD, JBIG, or JPEG.

(Read and Write computed property)

**81.15.267 strokeAntiAlias as boolean**

**Function:** Enable/disable stroke anti-aliasing.

**Notes:** (Read and Write computed property)

**81.15.268 strokeColor as GM16ColorMBS**

**Function:** Color to use when drawing object outlines.

**Example:**

```vba
Dim g As New GM16GeometryMBS(500, 500)
Dim c As New GM16ColorRGBMBS("white") 'white
Dim image As New GM16ImageMBS(g, c)

image.strokeColor = New GM16ColorRGBMBS("red") 'Outline color
image.fillColor = New GM16ColorRGBMBS("green") 'Fill color
image.strokeWidth = 5

Dim draw As GM16GraphicsMBS = image.Graphics
```
// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture

Notes: (Read and Write computed property)

81.15.269 strokeDashOffset as Double

Function: While drawing using a dash pattern, specify distance into the dash pattern to start the dash (default 0).
Notes: (Read and Write computed property)

81.15.270 strokeLineCap as Integer

Function: Specify the shape to be used at the end of open subpaths when they are stroked. #
Notes: Values of LineCap are UndefinedCap, ButtCap, RoundCap, and SquareCap.
(Read and Write computed property)

81.15.271 strokeLineJoin as Integer

Function: Specify the shape to be used at the corners of paths (or other vector shapes) when they are stroked. Values of LineJoin are UndefinedJoin, MiterJoin, RoundJoin, and BevelJoin.
Notes: (Read and Write computed property)

81.15.272 strokeMiterLimit as UInt32

Function: Specify miter limit.
Notes: When two line segments meet at a sharp angle and miter joins have been specified for 'lineJoin', it is possible for the miter to extend far beyond the thickness of the line stroking the path. The miterLimit imposes a
81.15. **CLASS GM16IMAGEMBS**

limit on the ratio of the miter length to the 'lineWidth'. The default value of this parameter is 4. 
(Read and Write computed property)

---

### 81.15.273 strokePattern as GM16ImageMBS

**Function:** Pattern image to use while stroking object outlines. 
**Notes:** (Read and Write computed property)

---

### 81.15.274 strokeWidth as Double

**Function:** Stroke width for drawing vector objects (default one). 
**Example:**

```plaintext
dim g as new GM16GeometryMBS(500,500)  
dim c as new GM16ColorRGBMBS("white")  // white  
dim image as new GM16ImageMBS(g, c)  

image.strokeColor = new GM16ColorRGBMBS("red")  // Outline color  
image.fillColor = new GM16ColorRGBMBS("green")  // Fill color  
image.strokeWidth = 5  

dim draw as GM16GraphicsMBS = image.Graphics  

// Draw a circle  
draw.Circle(250, 250, 120, 150)  

Backdrop=image.CopyPicture
```

**Notes:** (Read and Write computed property)

---

### 81.15.275 subImage as UInt32

**Function:** Subimage of an image sequence. 
**Notes:** (Read and Write computed property)
81.15.276  subRange as UInt32

**Function:** Number of images relative to the base image.
**Notes:** (Read and Write computed property)

81.15.277  textEncoding as string

**Function:** Annotation text encoding (e.g. "UTF-16").
**Notes:** (Read and Write computed property)

81.15.278  tileName as string

**Function:** Tile name.
**Notes:** (Read and Write computed property)

81.15.279  type as Integer

**Function:** The type of this image.
**Example:**
```dim p as Picture = LogoMBS(500)
dim image as new GM16ImageMBS(p)image.type = image.GrayscaleTypeBackdrop=image.CopyPicture```

**Notes:**
You can set this value to convert the image to the type.

Convert the image representation to the specified type or retrieve the current image type. If the image is reduced to an inferior type, then image information may be lost (e.g. color changed to grayscale).

Available enumerations for the type parameter:
81.15.280 verbose as boolean

**Function:** Print detailed information about the image.
**Notes:** (Read and Write computed property)

81.15.281 view as string

**Function:** FlashPix viewing parameters.
**Notes:** (Read and Write computed property)

81.15.282 x11Display as string

**Function:** X11 display to display to, obtain fonts from, or to capture image from.
**Notes:** (Read and Write computed property)

81.15.283 Constants

81.15.284 AbsoluteIntent = 3

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the intent type constants.
81.15.285  AddCompositeOp = 8

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants.

81.15.286  AllChannels = 10

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the possible channel constants.

81.15.287  AllCompliance = & hffff

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the Compliance type constants.

81.15.288  AssociatedAlpha = 1

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the possible alpha type constants.

81.15.289  AtopCompositeOp = 4

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants.

81.15.290  BackgroundDispose = 2

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the gif dispose type constants.

81.15.291  BesselFilter = 14

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the filter type constants.

81.15.292  BilevelType = 1

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the image type constants.

**Example:**
81.15. CLASS GM16IMAGEMBS

// load a picture
dim f as FolderItem = SpecialFolder.Desktop.Child("test.png")
dim pic as Picture = Picture.Open(f)

const GrayColorSpace = 2

Dim Converter As New GM16ImageMBS(Pic)

// quantize with dither
Converter.type = GM16ImageMBS.BilevelType
Converter.quantizeColorSpace = GrayColorSpace
Converter.quantizeColors = 2
Converter.quantizeDither = True
Converter.quantize

// convert back to Xojo
Converter.type = GM16ImageMBS.TrueColorType
Backdrop = Converter.CopyPicture

81.15.293 BlackChannel = 8

81.15.294 BlackmanFilter = 7

81.15.295 BlueChannel = 5

81.15.296 BottomLeftOrientation = 4

Notes:
Line direction: Left to right
Frame Direction: Bottom to top
81.15.297  **BottomRightOrientation = 3**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the orientation type constants.  
**Notes:**
- Line direction: Right to left  
- Frame Direction: Bottom to top

81.15.298  **BoxFilter = 2**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the filter type constants.

81.15.299  **BumpmapCompositeOp = 12**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants.

81.15.300  **BZipCompression = 2**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the compression type constants.

81.15.301  **CatromFilter = 11**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the filter type constants.

81.15.302  **CenterGravity = 5**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the possible gravity constants.

81.15.303  **ClearCompositeOp = 18**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants.
81.15.304 ColorizeCompositeOp = 28

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants.

81.15.305 ColorSeparationMatteType = 9

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the image type constants.

81.15.306 ColorSeparationType = 8

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants.
81.15.374 OverlayCompositeOp = 31

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants. **Notes:** Not yet implemented in GraphicsMagick.

81.15.375 PaletteMatteType = 5

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the image type constants.

81.15.376 PaletteType = 4

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the image type constants.

81.15.377 PartitionInterlace = 4

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the interlace type constants.

81.15.378 PerceptualIntent = 2

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the intent type constants.

81.15.379 PixelsPerCentimeterResolution = 2

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the resolution type constants.

81.15.380 PixelsPerInchResolution = 1

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the resolution type constants.

81.15.381 PlaneInterlace = 3

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the interlace type constants.
81.15.382 PlusCompositeOp = 6

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants.

81.15.383 PointFilter = 1

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the filter type constants.

81.15.384 PoissonNoise = 5

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the possible noise constants.

81.15.385 PreviousDispose = 3

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the gif dispose type constants.

81.15.386 PseudoClass = 2

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the class type constants.

81.15.387 QuadraticFilter = 9

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the filter type constants.

81.15.388 RedChannel = 1

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the possible channel constants.

81.15.389 RelativeIntent = 4

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the intent type constants.
81.15.390  **RightBottomOrientation = 7**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the orientation type constants.  
**Notes:**
Line direction: Bottom to top  
Frame Direction: Right to left

81.15.391  **RightTopOrientation = 6**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the orientation type constants.  
**Notes:**
Line direction: Top to bottom  
Frame Direction: Right to left

81.15.392  **RLECompression = 8**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the compression type constants.

81.15.393  **SaturateCompositeOp = 27**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants.

81.15.394  **SaturationIntent = 1**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the intent type constants.

81.15.395  **ScreenCompositeOp = 30**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants.  
**Notes:** Not yet implemented in GraphicsMagick.
81.15.396  **SincFilter = 15**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the filter type constants.

81.15.397  **SouthEastGravity = 9**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the possible gravity constants.

81.15.398  **SouthGravity = 8**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the possible gravity constants.

81.15.399  **SouthWestGravity = 7**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the possible gravity constants.

81.15.400  **StaticGravity = 10**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the possible gravity constants.

81.15.401  **StorageTypeCharPixel = 0**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the storage types. **Notes**: 8bit numbers.

81.15.402  **StorageTypeDoublePixel = 5**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the storage types. **Notes**: 64bit floating numbers.

81.15.403  **StorageTypeFloatPixel = 4**

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the storage types. **Notes**: 32bit floating numbers.
81.15.404 StorageTypeIntegerPixel = 2

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the storage types. **Notes:** 32bit numbers.

81.15.405 StorageTypeLongPixel = 3

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the storage types. **Notes:** 64bit numbers.

81.15.406 StorageTypeShortPixel = 1

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the storage types. **Notes:** 16bit numbers.

81.15.407 SubtractCompositeOp = 9

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants.

81.15.408 SVGCompliance = 1

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the Compliance type constants.

81.15.409 ThresholdCompositeOp = 22

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants.

81.15.410 TopLeftOrientation = 1

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the orientation type constants. **Notes:**
81.15.411  TopRightOrientation = 2

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the orientation type constants.  
**Notes:**

Line direction: Right to left  
Frame Direction: Top to bottom

81.15.412  TriangleFilter = 3

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the filter type constants.

81.15.413  TrueColorMatteType = 7

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the image type constants.  
**Example:**

```
Dim mp as new GM16ImageMBS(new GM16GeometryMBS(700, 700), New GM16ColorRGBMBS(1.0, 0.0, 0.0))
mp.type = mp.TrueColorMatteType
dim p as picture = mp.CopyPicture
break // see in debugger a red picture
```

81.15.414  TrueColorType = 6

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the image type constants.

81.15.415  UnassociatedAlpha = 2

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the possible alpha type constants.
81.15.416  UndefinedChannel = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the possible channel constants.

81.15.417  UndefinedClass = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the class type constants.

81.15.418  UndefinedCompliance = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the Compliance type constants.

81.15.419  UndefinedCompositeOp = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the composite type constants.

81.15.420  UndefinedCompression = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the compression type constants.

81.15.421  UndefinedDispose = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the gif dispose type constants.

81.15.422  UndefinedEndian = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the endian type constants.

81.15.423  UndefinedFilter = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function**: One of the filter type constants.
81.15. CLASS GM16IMAGEMBS

81.15.424  UndefinedIntent = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the intent type constants.

81.15.425  UndefinedInterlace = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the interlace type constants.

81.15.426  UndefinedMode = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the mode type constants.

81.15.427  UndefinedOrientation = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the orientation type constants. **Notes:**
Line direction: Unknown
Frame Direction: Unknown

81.15.428  UndefinedResolution = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the resolution type constants.

81.15.429  UndefinedType = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the image type constants.

81.15.430  UnframeMode = 2

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the mode type constants.
81.15.431 UniformNoise = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the possible noise constants.

81.15.432 UnspecifiedAlpha = 0

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the possible alpha type constants.

81.15.433 WestGravity = 4

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the possible gravity constants.

81.15.434 X11Compliance = 2

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the Compliance type constants.

81.15.435 XorCompositeOp = 5

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the composite type constants.

81.15.436 XPMCompliance = 4

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the Compliance type constants.

81.15.437 YellowChannel = 6

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the possible channel constants.

81.15.438 ZipCompression = 9

MBS GraphicsMagick Plugin, Plugin Version: 14.1. **Function:** One of the compression type constants.
81.16. class GM16ImageStatisticsMBS

81.16.1. class GM16ImageStatisticsMBS

Function: The class for image statistics.
Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

81.16.2. Methods

81.16.3. Constructor

Function: The private constructor.

81.16.4. Properties

81.16.5. blue as GM16ImageChannelStatisticsMBS

Function: The blue channel statistics.
Notes: (Read only property)

81.16.6. green as GM16ImageChannelStatisticsMBS

Function: The green channel statistics.
Notes: (Read only property)

81.16.7. opacity as GM16ImageChannelStatisticsMBS

Function: The opacity channel statistics.
Notes: (Read only property)
81.16.8  red as GM16ImageChannelStatisticsMBS

**Function:** The red channel statistics.
**Notes:** (Read only property)
81.17. *CLASS GM16LOCKMBS*

81.17  **class GM16LockMBS**

81.17.1  **class GM16LockMBS**

**Function:** The class for locking a certain resource.
**Notes:** The idea is to pass the constructor a mutexlock and keep the only reference to this new lock object on the stack. On the end of the method, the destructor is called by REALbasic and releases the mutexlock automatically.

81.17.2  **Methods**

81.17.3  **Constructor(mutexlock as GM16MutexLockMBS)**

**Function:** Creates a new Lock based on the given mutexlock.

81.17.4  **Properties**

81.17.5  **handle as Integer**

**Function:** The internal object reference.
**Notes:** (Read and Write property)

81.17.6  **target as GM16MutexLockMBS**

**Function:** The mutexlock this lock is referencing to.
**Notes:** (Read and Write property)
81.18 class GM16MontageFramedMBS

81.18.1 class GM16MontageFramedMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** MontageFramed provides the means to specify montage options when it is desired to have decorative frames around the image thumbnails.

**Notes:**
MontageFramed inherits from Montage and therefore provides all the methods of Montage as well as those shown in the table "MontageFramed Methods".

Framed thumbnails consist of four components: the thumbnail image, the thumbnail frame, the thumbnail border, an optional thumbnail shadow, and an optional thumbnail label area. Subclass of the GM16MontageMBS class.

81.18.2 Methods

81.18.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.

81.18.4 Properties

81.18.5 borderColor as GM16ColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Specifies the background color within the thumbnail frame.
**Notes:** (Read and Write computed property)

81.18.6 borderWidth as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Specifies the border (in pixels) to place between a thumbnail and its surrounding frame.
**Notes:**
This option only takes effect if thumbnail frames are enabled (via frameGeometry) and the thumbnail geometry specification doesn’t also specify the thumbnail border width. (Read and Write computed property)
81.18. **CLASS GM16MONTAGEFRAMEDMBS**

### 81.18.7 frameGeometry as GM16GeometryMBS

**Function:** Specifies the geometry specification for frame to place around thumbnail.

**Notes:**
If this parameter is not specified, then the montage is unframed.
(Read and Write computed property)

### 81.18.8 matteColor as GM16ColorMBS

**Function:** Specifies the thumbnail frame color.

**Notes:** (Read and Write computed property)
81.19 class GM16MontageMBS

81.19.1 class GM16MontageMBS

Function: Montage is the base class to provide montage options and provides methods to set all options required to render simple (unframed) montages.

Example:

```vbscript
// build montage
Dim StackingMontage As New GM16MontageMBS
StackingMontage.backgroundColor = New GM16ColorMBS(& cE7E7E7)
StackingMontage.fillColor = New GM16ColorMBS(& c000000)
StackingMontage.tile = New GM16GeometryMBS("1x20")
StackingMontage.geometry = New GM16GeometryMBS("160x120+5+5")
StackingMontage.font = "Helvetica"
StackingMontage.pointSize = 12
StackingMontage.title = "Title goes here"

// make picture
Dim logo As Picture = LogoMBS(500)
Dim image As New GM16ImageMBS(logo)
image.label("Sample label")

// Put the current image into the array
Dim StackingFrames As New GM16ImageArrayMBS
StackingFrames.insert(image)

// show result
Dim resultImages As GM16ImageArrayMBS = StackingFrames.montageImages(StackingMontage)
Backdrop = resultImages.Image(0).CopyPicture
```

Notes:
See GM16MontageFramedMBS if you would like to create a framed montage.

Unframed thumbnails consist of four components: the thumbnail image, the thumbnail border, an optional thumbnail shadow, and an optional thumbnail label area.
81.19. CLASS GM16MONTAGEMBS

81.19.2 Methods

81.19.3 Constructor

Function: The constructor.

81.19.4 Properties

81.19.5 handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

81.19.6 backgroundColor as GM16ColorMBS

Function: Specifies the background color that thumbnails are imaged upon.
Notes: (Read and Write computed property)

81.19.7 compose as Integer

Function: Specifies the image composition algorithm for thumbnails.
Notes:
This controls the algorithm by which the thumbnail image is placed on the background. Use of OverCompositeOp is recommended for use with images that have transparency. This option may have negative side-effects for images without transparency.
(Read and Write computed property)

81.19.8 fileName as string

Function: Specifies the image filename to be used for the generated montage images.
Notes:
To handle the case were multiple montage images are generated, a printf-style format may be embedded within the filename. For example, a filename specification of image%02d.miff names the montage images as...
81.19.9  fillColor as GM16ColorMBS

Function: Specifies the fill color to use for the label text.
Notes: (Read and Write computed property)

81.19.10  font as string

Function: Specifies the thumbnail label font.
Notes: (Read and Write computed property)

81.19.11  geometry as GM16GeometryMBS

Function: Specifies the size of the generated thumbnail.
Notes: (Read and Write computed property)

81.19.12  gravity as Integer

Function: Specifies the thumbnail positioning within the specified geometry area.
Notes:
If the thumbnail is smaller in any dimension than the geometry, then it is placed according to this specification.
See Gravity constants in GM16ImageMBS class.
(Read and Write computed property)

81.19.13  label as string

Function: Specifies the format used for the image label.
Notes:
Special format characters may be embedded in the format string to include information about the image. (Read and Write computed property)

81.19.14  **penColor as GM16ColorMBS**

**Function:** Specifies the pen color to use for the label text (same as fill).  
**Notes:** (Read and Write computed property)

81.19.15  **pointSize as UInt32**

**Function:** Specifies the thumbnail label font size.  
**Notes:** (Read and Write computed property)

81.19.16  **shadow as boolean**

**Function:** Enable/disable drop-shadow on thumbnails.  
**Notes:** (Read and Write computed property)

81.19.17  **strokeColor as GM16ColorMBS**

**Function:** Specifies the stroke color to use for the label text.  
**Notes:** (Read and Write computed property)

81.19.18  **texture as string**

**Function:** Specifies a texture image to use as montage background.  
**Notes:**  
The built-in textures "granite:" and "plasma:" are available. A texture is the same as a background image. (Read and Write computed property)
81.19.19  tile as GM16GeometryMBS

**Function:** Specifies the maximum number of montage columns and rows in the montage.  
**Notes:**  
The montage is built by filling out all cells in a row before advancing to the next row. Once the montage has reached the maximum number of columns and rows, a new montage image is started.  
(Read and Write computed property)

81.19.20  title as string

**Function:** Specifies the montage title.  
**Notes:** (Read and Write computed property)

81.19.21  transparentColor as GM16ColorMBS

**Function:** Specifies a montage color to set transparent.  
**Notes:**  
This option can be set the same as the background color in order for the thumbnails to appear without a background when rendered on an HTML page. For best effect, ensure that the transparent color selected does not occur in the rendered thumbnail colors.  
(Read and Write computed property)
class GM16MutexLockMBS

**Function:** The mutex class for GraphicsMagick.

### 81.20.2 Methods

#### 81.20.3 lock

**Function:** Locks the lock.

**Notes:** Only one thread at a time can get the lock. The other threads will wait when lock is called.

#### 81.20.4 unlock

**Function:** Unlocks the lock.

### 81.20.5 Properties

#### 81.20.6 handle as Integer

**Function:** The internal object reference.

**Notes:** (Read and Write property)
81.21 class GM16NotInitializedExceptionMBS

81.21.1 class GM16NotInitializedExceptionMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The exception raised if you access a method/property in an object and the object was not initialized properly.

**Notes:**

Check the message property for details.
Subclass of the GM16ErrorExceptionMBS class.
### 81.22. CLASS GM16PATHARGSMBS

#### 81.22 class GM16PathArgsMBS

**Function:** This is a class for arguments to the path arc/curve methods in GM16GraphicsMBS.

**Example:**

```vba
    dim g as new GM16PathArgsMBS(1,2,3,4) // for a QuadraticCurveto
    MsgBox str(g.x1)+EndOfLine+str(g.y1)+EndOfLine+str(g.x)+EndOfLine+str(g.y)
```

**Notes:** Due we use this class for three different ways, we have three constructors to fill in the value you need for the calls.

#### 81.22.2 Methods

#### 81.22.3 Constructor

**Function:** The constructor for creating an empty object.

See also:

- 81.22.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 13537
- 81.22.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double) 13538
- 81.22.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 13538

**Function:** The constructor to create the arguments object for the PathArc methods in GM16GraphicsMBS.

See also:

- 81.22.3 Constructor 13537
- 81.22.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double) 13538
81.22.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)

81.22.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor to create the arguments object for the QuadraticCurveto methods in GM16GraphicsMBS.

**Example:**

```vbnet
dim g as new GM16PathArgsMBS(1,2,3,4)
MsgBox str(g.x1)+EndOfLine+str(g.y1)+EndOfLine+str(g.x)+EndOfLine+str(g.y)
```

See also:

- 81.22.3 Constructor
- 81.22.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)
- 81.22.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double)

81.22.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor to create the arguments object for the Curveto methods in GM16GraphicsMBS.

**Example:**

```vbnet
dim g as new GM16PathArgsMBS(1,2,3,4,5,6)
MsgBox str(g.x1)+EndOfLine+str(g.y1)+EndOfLine+str(g.x2)+EndOfLine+str(g.y2)+EndOfLine+str(g.x)+EndOfLine+str(g.y)
```

See also:

- 81.22.3 Constructor
- 81.22.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)
- 81.22.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double)
81.22.7 Properties

81.22.8 largeArcFlag as Boolean

Function: The large arc flag.
Notes: Draw longer of the two matching arcs (Read and Write property)

81.22.9 radiusX as Double

Function: The radius x value.
Notes: (Read and Write property)

81.22.10 radiusY as Double

Function: The radius y value.
Notes: (Read and Write property)

81.22.11 sweepFlag as Boolean

Function: The sweep flag value.
Notes: Draw arc matching clock-wise rotation. (Read and Write property)

81.22.12 x as Double

Function: The x value.
Notes: For an arc: End-point X (Read and Write property)
CHAPTER 81. GRAPHICS MAGICK

81.22.13  x1 as Double

Function: The x1 value.
Notes: (Read and Write property)

81.22.14  x2 as Double

Function: The x2 value.
Notes: (Read and Write property)

81.22.15  xAxisRotation as Double

Function: The x Axis Rotation value.
Notes:
Rotation relative to X axis.
(Read and Write property)

81.22.16  y as Double

Function: The y value.
Notes:
for an arc: End-point Y
(Read and Write property)

81.22.17  y1 as Double

Function: The y1 value.
Notes: (Read and Write property)
81.22. CLASS GM16PATHARGSMBS

81.22.18  y2 as Double

Function: The y2 value.
Notes: (Read and Write property)
81.23 class GM16PixelsMBS

81.23.1 class GM16PixelsMBS

Function: Creates an empty pixels object.
Example:

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GM16ImageMBS(f)
dim p as new GM16PixelsMBS(g)

// get pointer to some pixels to read/write
dim x as ptr = p.get(0, 0, 100, 100)

// draw a red line to the pixel buffer
dim o as Integer
for i as Integer = 0 to 99
    o = 100 * i + i
    x.UInt32(o * 4) = &hFFFF0000
next

// write back
p.sync

// show
window1.Backdrop = g.CopyPicture
```

81.23.2 Methods

81.23.3 Constructor(Image as GM16ImageMBS)

Function: Creates a new Pixels object with the pixels from an image.

81.23.4 get(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

Function: Transfer pixels from the image to the pixel view as defined by the specified region.
Example:
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GM16ImageMBS(f)
dim p as new GM16PixelsMBS(g)

// get pointer to some pixels
dim x as ptr = p.get(0, 0, 100, 100)

// draw a red line to the pixel buffer
dim o as Integer
for i as Integer = 0 to 99
    o = 100 * i + i
    x.UInt32(o * 4) = &hFFFF0000
next

// write back
p.sync

// show
window1.Backdrop = g.CopyPicture

Notes: Modified pixels may be subsequently transferred back to the image via sync.

81.23.5 getConst(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

Function: Transfer read-only pixels from the image to the pixel view as defined by the specified region.

81.23.6 indexes as Ptr

Function: Return pixel colormap index array.

81.23.7 set(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

Function: Allocate a pixel view region to store image pixels as defined by the region rectangle.
Example:
```vbnet
    dim f as FolderItem = SpecialFolder/Desktop/Child("test.jpg")
dim g as new GM16ImageMBS(f)
dim p as new GM16PixelsMBS(g)

    // get pointer to some pixels to write
    dim x as ptr = p.set(0, 0, 100, 100)

    // draw a red line to the pixel buffer
    dim o as Integer
    for i as Integer = 0 to 99
        o = 100 * i + i
        x.UInt32(o * 4) = &hFFFF0000
    next

    // write back
    p.sync

    // show
    window1.Backdrop = g.CopyPicture
```

**Notes:** This area is subsequently transferred from the pixel view to the image via sync.

### 81.23.8 sync

**Function:** Transfers the image cache pixels to the image.

### 81.23.9 Properties

#### 81.23.10 columns as Integer

**Function:** Width of view.
**Example:**

```vbnet
    dim f as FolderItem = SpecialFolder/Desktop/Child("test.jpg")
dim g as new GM16ImageMBS(f)
dim p as new GM16PixelsMBS(g)

    // get pointer to some pixels
    dim x as ptr = p.get(0, 0, 100, 100)
```
// and show size
MsgBox str(p.columns)+" x "+str(p.rows)

**Notes:** (Read only property)

### 81.23.11 handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

### 81.23.12 rows as Integer

**Function:** Height of view.
**Notes:** (Read only property)

### 81.23.13 x as Integer

**Function:** Left ordinate of view.
**Notes:** (Read only property)

### 81.23.14 y as Integer

**Function:** Top ordinate of view.
**Notes:** (Read only property)
81.24 class GM16TypeMetricMBS

81.24.1 class GM16TypeMetricMBS

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The TypeMetric class provides the means to pass data from the Image class’s TypeMetric method to the user.

Notes:

It provides information regarding font metrics such as ascent, descent, text width, text height, and maximum horizontal advance. The units of these font metrics are in pixels, and that the metrics are dependent on the current Image font (default Ghostscript’s "Helvetica"), pointsize (default 12 points), and x/y resolution (default 72 DPI) settings.

The pixel units may be converted to points (the standard resolution-independent measure used by the typesetting industry) via the following equation:

\[
\text{size\_points} = \frac{\text{size\_pixels} \times 72}{\text{resolution}}
\]

where resolution is in dots-per-inch (DPI). This means that at the default image resolution, there is one pixel per point.

Note that a font’s pointsize is only a first-order approximation of the font height (ascender + descender) in points. The relationship between the specified pointsize and the rendered font height is determined by the font designer.

See FreeType Glyph Conventions for a detailed description of font metrics related issues.

81.24.2 Methods

81.24.3 Constructor

81.24.4 Properties

81.24.5 ascent as Double

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Returns the distance in pixels from the text baseline to the highest/upper grid coordinate used
to place an outline point.

**Notes:**
Always a positive value.
(Read only property)

### 81.24.6 descent as Double

**Function:** Returns the the distance in pixels from the baseline to the lowest grid coordinate used to place an outline point.

**Notes:**
Always a negative value.
(Read only property)

### 81.24.7 maxHorizontalAdvance as Double

**Function:** Returns the maximum horizontal advance (advance from the beginning of a character to the beginning of the next character) in pixels.

**Notes:** (Read only property)

### 81.24.8 textHeight as Double

**Function:** Returns text height in pixels.

**Notes:** (Read only property)

### 81.24.9 textWidth as Double

**Function:** Returns text width in pixels.

**Notes:** (Read only property)
81.25 **class GM16UnsupportedExceptionMBS**

81.25.1 **class GM16UnsupportedExceptionMBS**

**Function:** An exception raised if you call the GM functions on an unsupported platform.  
**Notes:**  
Check the message property for details.  
This exception is currently only used on Windows.  
(Windows support may come later)  
Subclass of the GM16ErrorExceptionMBS class.
81.26. CLASS GMBLOBMBS

81.26 class GMBlobMBS

81.26.1 class GMBlobMBS

Function: The class for binary large objects.

Example:

// get some image data (e.g. from blob in database)
dim logo as Picture = LogoMBS(500)
dim jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Dim mp as new GMImageMBS
dim blob as new GMBlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask

Notes:

Blob provides the means to contain any opaque data. It is named after the term "Binary Large OBject" commonly used to describe unstructured data (such as encoded images) which is stored in a database. While the function of Blob is very simple (store a pointer and and size associated with allocated data), the Blob class provides some very useful capabilities. In particular, it is fully reference counted just like the Image class.

The Blob class supports value assignment while preserving any outstanding earlier versions of the object. Since assignment is via a pointer internally, Blob is efficient enough to be stored directly in an STL container or any other data structure which requires assignment. In particular, by storing a Blob in an associative container (such as STL's 'map') it is possible to create simple indexed in-memory "database" of Blobs.

Magick++ currently uses Blob to contain encoded images (e.g. JPEG) as well as ICC and IPTC profiles. Since Blob is a general-purpose class, it may be used for other purposes as well.
CHAPTER 81. GRAPHICSMAGICK

81.26.2 Methods

81.26.3 Constructor

Function: Default constructor creating an empty blob object.
See also:

- 81.26.4 Constructor(data as memoryblock, offset as Integer, size as Integer) 13550
- 81.26.5 Constructor(data as string) 13550
- 81.26.6 Constructor(other as GMBlobMBS) 13551

81.26.4 Constructor(data as memoryblock, offset as Integer, size as Integer)

Function: Construct object with data, making a copy of the supplied data.
See also:

- 81.26.3 Constructor 13550
- 81.26.5 Constructor(data as string) 13550
- 81.26.6 Constructor(other as GMBlobMBS) 13551

81.26.5 Constructor(data as string)

Function: Construct object with data, making a copy of the supplied data.

Example:

```vba
// get some image data (e.g. from blob in database)
dim logo as Picture = LogoMBS(500)
dim jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Dim mp as new GMImageMBS
dim blob as new GMBlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask
```
81.26. CLASS GMBLOBMBS

See also:

• 81.26.3 Constructor
• 81.26.4 Constructor(data as memoryblock, offset as Integer, size as Integer)
• 81.26.6 Constructor(other as GMBlobMBS)

81.26.6 Constructor(other as GMBlobMBS)

Function: Copy constructor (reference counted).
See also:

• 81.26.3 Constructor
• 81.26.4 Constructor(data as memoryblock, offset as Integer, size as Integer)
• 81.26.5 Constructor(data as string)

81.26.7 CopyMemory as memoryblock

Function: Returns a copy of the data as a memoryblock.
Notes: Returns nil on any error like low memory.

81.26.8 CopyString as string

Function: Returns a copy of the data as a string.

81.26.9 Data as Ptr

Function: A memoryblock with the data from this blob.
Example:

dim b as new GMBlobMBS("Hello")

dim m as memoryblock = b.Data
MsgBox m.StringValue(0,5) // shows "Hello"
Notes: This is a memoryblock referencing the data of the blob. It has no size set. The memoryblock can only be used as long as the blob object exists. If you use it after you destroyed the blob object, you can crash your application.

81.26.10 Update(data as memoryblock, offset as Integer, size as Integer)

Function: Replaces the content of this blob with a copy of the bytes in the memoryblock.
See also:
  • 81.26.11 Update(data as string)

81.26.11 Update(data as string)

Function: Replaces the content of this blob with a copy of the bytes in the string.
Notes: Offset is zero based.
See also:
  • 81.26.10 Update(data as memoryblock, offset as Integer, size as Integer)

81.26.12 Properties

81.26.13 handle as Integer

Function: The internal handle of the blob object.
Notes: (Read and Write property)

81.26.14 length as UInt64

Function: Obtain data length in bytes.
Example:
  dim b as new GMBlobMBS("Hello")
  MsgBox str(B.length) // shows 5
81.26. CLASS GMBLOBMBS

Notes: (Read only property)

81.26.15 base64 as string

Function: The blob content as a string in Base64 format.
Example:

```vbscript
dim b as new GMBlobMBS("Hello")
MsgBox b.base64 // shows "SGVsbG8="
```

Notes: (Read and Write computed property)
81.27 class GMCoderInfoMBS

81.27.1 class GMCoderInfoMBS

Function: The class used to get information about all registered coders.

Example:

```vba
dim coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
dim names(-1) as string

for each coder as GMCoderInfoMBS in coders
    names.Append coder.name
next

MsgBox Join(names, EndOfLine)
```

Notes: The CoderInfo class provides the means to provide information regarding GraphicsMagick support for an image format (designated by a magick string). It may be used to provide support for a specific named format (provided as an argument to the constructor), or as an element of a container when format support is queried using the coderInfoList() templated function.

81.27.2 Methods

81.27.3 CoderInfoList(needReadable as boolean = true, needWriteable as boolean = false, needMultiFrame as boolean = false) as GMCoderInfoMBS()

Function: Creates a list of all coders.

Example:

```vba
dim coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
```

81.27.4 Properties

81.27.5 description as string

Function: Format description (e.g. "CompuServe graphics interchange format").

Example:
81.27. **CLASS GMCODERINFOMBS**

```vba
dim coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
dim names(-1) as string

for each coder as GMCoderInfoMBS in coders
    names.Append coder.name + " " + coder.description
next

MsgBox Join(names, EndOfLine)
```

**Notes:** (Read and Write property)

### 81.27.6 isMultiFrame as boolean

**Function:** Format supports multiple frames.  
**Example:**

```vba
dim coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
dim names(-1) as string

for each coder as GMCoderInfoMBS in coders
    names.Append coder.name + " " + str(coder.isMultiFrame)
next

MsgBox Join(names, EndOfLine)
```

**Notes:** (Read and Write property)

### 81.27.7 isReadable as boolean

**Function:** Format is readable.  
**Example:**

```vba
dim coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
dim names(-1) as string

for each coder as GMCoderInfoMBS in coders
    names.Append coder.name + " " + str(coder.isReadable)
next
```

**Notes:** (Read and Write property)
MsgBox Join(names, EndOfLine)

**Notes:** (Read and Write property)

### 81.27.8 `isWritable` as boolean

**Function:** Format is writeable.

**Example:**

```vba
dim coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
dim names(-1) as string

for each coder as GMCoderInfoMBS in coders
    names.Append coder.name & " " + str(coder.isWritable)
next

MsgBox Join(names, EndOfLine)
```

**Notes:** (Read and Write property)

### 81.27.9 `name` as string

**Function:** Format name (e.g. "GIF").

**Example:**

```vba
dim coders(-1) as GMCoderInfoMBS = GMCoderInfoMBS.CoderInfoList
dim coder as GMCoderInfoMBS = coders(0) // pick first one

MsgBox coder.name
```

**Notes:** (Read and Write property)
81.28. class GMColorGrayMBS

81.28.1 class GMColorGrayMBS

Function: The color subclass for a grayscale color.
Example:

dim g as new GMColorGrayMBS(0.5)
MsgBox str(g.shade)

Notes:
Representation of grayscale RGB color.
Equal parts red, green, and blue specified as a ratio (0 to 1).
Subclass of the GMColorMBS class.

81.28.2 Methods

81.28.3 Constructor

Function: Creates a new color with transparent black.
Example:

dim c as new GMColorGrayMBS
MsgBox str(c.redQuantum)+"" +str(c.greenQuantum)+"" +str(c.blueQuantum)

See also:

- 81.28.4 Constructor(other as GMColorMBS)
- 81.28.5 Constructor(shade as Double)

81.28.4 Constructor(other as GMColorMBS)

Function: Creates a new color copying the existing color.
Example:

dim g as new GMColorGrayMBS(0.5)
dim o as new GMColorGrayMBS(g)
CHAPTER 81. GRAPHICS MAGICK

MsgBox str(o.shade)

See also:

- 81.28.3 Constructor
- 81.28.5 Constructor (shade as Double)

81.28.5 Constructor (shade as Double)

Function: Creates a new color with the given value.

Example:

dim g as new GMColorGrayMBS(1.0)
MsgBox str(g.colorValue)

Notes: Range is 0.0 to 1.0.

See also:

- 81.28.3 Constructor
- 81.28.4 Constructor (other as GMColorMBS)

81.28.6 Properties

81.28.7 shade as Double

Function: The gray value for this color.

Example:

dim g as new GMColorGrayMBS(1.0)
MsgBox str(g.shade)

Notes:

Range is 0.0 to 1.0
(Read and Write property)
class GMColorHSLMBS

81.29.1 class GMColorHSLMBS

**Function:** The class for a HSL color.  
**Example:**

```vbnet
dim g as new GMColorHSLMBS(0.1,0.2,0.3)  
MsgBox str(g.colorValue)
```

**Notes:** Subclass of the GMColorMBS class.

81.29.2 Methods

81.29.3 Constructor

**Function:** Creates a new color with transparent black.  
**Example:**

```vbnet
dim c as new GMColorHSLMBS  
MsgBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 81.29.4 Constructor(hue as Double, saturation as Double, luminosity as Double)  
- 81.29.5 Constructor(other as GMColorMBS)

81.29.4 Constructor(hue as Double, saturation as Double, luminosity as Double)

**Function:** Creates a new color with the given values.  
**Example:**

```vbnet
dim g as new GMColorHSLMBS(0.1,0.2,0.3)  
MsgBox str(g.hue)+" "+str(g.saturation)+" "+str(g.luminosity)
```

See also:
81.29.5 Constructor(other as GMColorMBS)

Function: Creates a new color copying the existing color.

Example:

```vbnet
dim g as new GMColorHSLMBS(0.1,0.2,0.3)
dim o as new GMColorHSLMBS(g)
MsgBox str(o.colorValue)
```

See also:

- 81.29.3 Constructor
- 81.29.4 Constructor(hue as Double, saturation as Double, luminosity as Double)

81.29.6 Properties

81.29.7 hue as Double

Function: The hue value.

Example:

```vbnet
dim g as new GMColorHSLMBS(0.1,0.2,0.3)
MsgBox str(g.hue)
```

Notes: (Read and Write property)

81.29.8 luminosity as Double

Function: The luminosity value.

Example:

```vbnet
dim g as new GMColorHSLMBS(0.1,0.2,0.3)
MsgBox str(g.luminosity)
```
Notes: (Read and Write property)

81.29.9 saturation as Double

Function: The saturation value.
Example:

```vbnet
dim g as new GMColorHSLMBS(0.1,0.2,0.3)
MsgBox str(g.saturation)
```

Notes: (Read and Write property)
### 81.30 class GMColorMBS

#### 81.30.1 class GMColorMBS

**Function:** Color is the base color class.

**Example:**

```vba
dim c as new GMColorMBS(127,255,127) // light green
MsgBox str(c.redQuantum)+” ”+str(c.greenQuantum)+” ”+str(c.blueQuantum)
```

**Notes:** It is a simple container class for the pixel red, green, blue, and alpha values scaled to fit GraphicsMagick’s Quantum size. Normally users will instantiate a class derived from Color which supports the color model that fits the needs of the application. The Color class may be constructed directly from an X11-style color string. As a perhaps odd design decision, the value transparent black is considered to represent an unset value (invalid color) in many cases. This choice was made since it avoided using more memory. The default Color constructor constructs an invalid color (i.e. transparent black) and may be used as a parameter in order to remove a color setting.

### 81.30.2 Methods

#### 81.30.3 Constructor

**Function:** Creates a new color with transparent black.

**Example:**

```vba
dim c as new GMColorMBS
MsgBox str(c.redQuantum)+” ”+str(c.greenQuantum)+” ”+str(c.blueQuantum)
```

See also:

- 81.30.4 Constructor(ColorName as string) 13563
- 81.30.5 Constructor(ColorValue as color) 13563
- 81.30.6 Constructor(ColorValue as color, alpha as Integer) 13564
- 81.30.7 Constructor(other as GMColorMBS) 13564
- 81.30.8 Constructor(red as Integer, green as Integer, blue as Integer) 13565
- 81.30.9 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 13565
81.30. CLASS GMCOLORMBS

81.30.4 Constructor(ColorName as string)

Function: Creates a new color based on the X11 color name.

Example:

dim c as new GMColorMBS("red")

MsgBox str(c.redQuantum)+"-"+str(c.greenQuantum)+"-"+str(c.blueQuantum) // shows "255-0-0"

dim d as new GMColorMBS("# 77FF00")

MsgBox str(d.redQuantum)+"-"+str(d.greenQuantum)+"-"+str(d.blueQuantum) // shows "119-255-0"

Notes: An alternate way to construct the class is via an X11-compatible color specification string (e.g. Color("red") or Color ("# FF0000")). Since the class may be constructed from a string, convenient strings may be passed in place of an explicit Color object in methods which accept a reference to Color. Color may also be converted to a std::string for convenience in user interfaces, and for saving settings to a text file.

See also:

- 81.30.3 Constructor 13562
- 81.30.5 Constructor(ColorValue as color) 13563
- 81.30.6 Constructor(ColorValue as color, alpha as Integer) 13564
- 81.30.7 Constructor(other as GMColorMBS) 13564
- 81.30.8 Constructor(red as Integer, green as Integer, blue as Integer) 13565
- 81.30.9 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer) 13565

81.30.5 Constructor(ColorValue as color)

Function: Creates a new color with the given values.

Example:

dim c as new GMColorMBS(& c FF0000)

MsgBox str(c.redQuantum)+"-"+str(c.greenQuantum)+"-"+str(c.blueQuantum)

See also:

- 81.30.3 Constructor 13562
- 81.30.4 Constructor(ColorName as string) 13563
81.30.6 Constructor(ColorValue as color, alpha as Integer)

Function: Creates a new color with the given values.

Example:

```vba
dim c as new GMColorMBS(& c FF0102, 127)
MsgBox str(c.redQuantum) + " " + str(c.greenQuantum) + " " + str(c.blueQuantum) + " " + str(c.alpha)
```

See also:

- 81.30.3 Constructor
- 81.30.4 Constructor(ColorName as string)
- 81.30.5 Constructor(ColorValue as color)
- 81.30.7 Constructor(other as GMColorMBS)
- 81.30.8 Constructor(red as Integer, green as Integer, blue as Integer)
- 81.30.9 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer)

81.30.7 Constructor(other as GMColorMBS)

Function: Creates a new color copying the existing color.

Example:

```vba
dim r as new GMColorMBS(1, 2, 3)
dim c as new GMColorMBS(r)
MsgBox str(c.redQuantum) + " " + str(c.greenQuantum) + " " + str(c.blueQuantum)
```

See also:

- 81.30.3 Constructor
- 81.30.4 Constructor(ColorName as string)
81.30. CLASS GMCOLORMBS

- 81.30.5 Constructor(ColorValue as color)  
- 81.30.6 Constructor(ColorValue as color, alpha as Integer)  
- 81.30.8 Constructor(red as Integer, green as Integer, blue as Integer)  
- 81.30.9 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer)  

81.30.8 Constructor(red as Integer, green as Integer, blue as Integer)

**Function:** Creates a new color with the given values.

**Example:**

dim c as new GMColorMBS(1,2,3)
MsgBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)

**Notes:**

For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.

See also:

- 81.30.3 Constructor  
- 81.30.4 Constructor(ColorName as string)  
- 81.30.5 Constructor(ColorValue as color)  
- 81.30.6 Constructor(ColorValue as color, alpha as Integer)  
- 81.30.7 Constructor(other as GMColorMBS)  
- 81.30.9 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer)  

81.30.9 Constructor(red as Integer, green as Integer, blue as Integer, alpha as Integer)

**Function:** Creates a new color with the given values.

**Example:**

dim c as new GMColorMBS(1,2,3,4)

// display color, alpha is double...
MsgBox str(C.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)+" "+str(c.alpha)
Notes:
For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
See also:

- 81.30.3 Constructor
- 81.30.4 Constructor(ColorName as string)
- 81.30.5 Constructor(ColorValue as color)
- 81.30.6 Constructor(ColorValue as color, alpha as Integer)
- 81.30.7 Constructor(other as GMColorMBS)
- 81.30.8 Constructor(red as Integer, green as Integer, blue as Integer)

81.30.10 QuantumByteSize as Integer

Function: The quantum byte size.
Example:
MsgBox str(GMColorMBS.QuantumByteSize)

Notes: As the plugin uses 8 bit this value should be 1.

81.30.11 scaleDoubleToQuantum(value as Double) as Integer

Function: Scales a double value to a value in the range of a quantum.
Example:

dim d as Double = 1.0
dim v as Integer = GMColorMBS.scaleDoubleToQuantum(d)
MsgBox str(v)

Notes: As the plugin uses 8 bit quantums, this is basically a multiplication by 255.0
81.30. CLASS GMCOLORMBS

81.30.12 scaleQuantumToDouble(value as Integer) as Double

Function: Scales a quantum to a double value.
Example:

```vba
dim v as Integer = 255
dim d as Double = GMColorMBS.scaleQuantumToDouble(v)
MsgBox str(d)
```

Notes: The plugin uses 8bit quantums, so this is basicly the division of value by 255.0

81.30.13 Properties

81.30.14 alpha as Double

Function: The alpha value of this color.
Example:

```vba
dim c as new GMColorMBS(1,2,3,1.0)
MsgBox str(c.alpha)
```

Notes:
Range is 0.0 to 1.0. If you pass values higher, they are divided by 255.
(Read and Write property)

81.30.15 alphaQuantum as Integer

Function: The alpha color value.
Notes:
For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)
81.30.16 blueQuantum as Integer

**Function:** The blue color value.
**Example:**
```vbnet
dim c as new GMColorMBS(1,2,3)
MsgBox str(c.redQuantum) // 3
```

**Notes:**
For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)

81.30.17 colorValue as color

**Function:** The REALbasic color for the GraphicsMagick color.
**Example:**
```vbnet
dim c as new GMColorMBS(& c FF0102)
MsgBox str(c.ColorValue)
```

**Notes:** (Read and Write property)

81.30.18 greenQuantum as Integer

**Function:** The green color value.
**Example:**
```vbnet
dim r as new GMColorMBS(1,2,3)
MsgBox str(r.greenQuantum) // shows 2
```

**Notes:**
For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)
81.30. CLASS GMCOLORMBS

81.30.19  handle as Integer

Function: The internal color reference.
Example:
```vbscript
dim r as new GMColorMBS(1,2,3)
MsgBox str(r.handle)
```

Notes: (Read and Write property)

81.30.20  intensity as Double

Function: The intensity of this color.
Example:
```vbscript
dim c as new GMColorMBS(1,2,3)
MsgBox str(c.intensity)
```

Notes: (Read only property)

81.30.21  isValid as boolean

Function: Does object contain valid color?
Example:
```vbscript
dim c as new GMColorMBS(1,2,3)
MsgBox str(c.isValid)
```

Notes: (Read and Write property)

81.30.22  redQuantum as Integer

Function: The red color value.
Example:
dim c as new GMColorMBS(1,2,3)
MsgBox str(c.redQuantum) // 1

Notes:
For 8-bit range is 0 to 255.
For 16-bit range is 0 to 65535.
(Read and Write property)
81.31  class GMColorMonoMBS

81.31.1  class GMColorMonoMBS

Function: Representation of a black/white color (true/false)

Example:

dim g as new GMColorMonoMBS(false)
MsgBox str(g.colorValue)

Notes: Subclass of the GMColorMBS class.

81.31.2  Methods

81.31.3  Constructor

Function: Creates a new color with transparent black.

Example:

dim c as new GMColorMonoMBS
MsgBox str(c.redQuantum)+” ”+str(c.greenQuantum)+” ”+str(c.blueQuantum)

See also:

- 81.31.4 Constructor(mono as boolean)
- 81.31.5 Constructor(other as GMColorMBS)

81.31.4  Constructor(mono as boolean)

Function: Creates a new color with the given values.

Example:

dim g as new GMColorMonoMBS(false)
MsgBox str(g.mono)

See also:
81.31.5 Constructor(other as GMColorMBS)

**Function:** Creates a new color copying the existing color.

**Example:**

```vbnet
dim g as new GMColorMonoMBS(false)
dim o as new GMColorMonoMBS(g)
MsgBox str(o.mono)
```

See also:

- 81.31.3 Constructor
- 81.31.4 Constructor(mono as boolean)

### 81.31.6 Properties

#### 81.31.7 mono as boolean

**Function:** The color value.

**Example:**

```vbnet
dim g as new GMColorMonoMBS(true)
MsgBox str(g.mono)
```

**Notes:** (Read and Write property)
81.32. class GMColorRGBMBS

81.32.1 class GMColorRGBMBS

Function: The color class for RGB colors.
Example:

```vba
dim c as new GMColorRGBMBS(1.0,0.0,0.0) // red
MsgBox str(c.red)+" "+str(c.green)+" "+str(c.blue)
MsgBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

Notes:
Representation of RGB color with red, green, and blue specified as ratios (0 to 1).
Subclass of the GMColorMBS class.

81.32.2 Methods

81.32.3 Constructor

Function: Creates a new color with transparent black.
Example:

```vba
dim c as new GMColorRGBMBS
MsgBox str(c.redQuantum)+" "+str(c.greenQuantum)+" "+str(c.blueQuantum)
```

See also:

- 81.32.4 Constructor(other as GMColorMBS)
- 81.32.5 Constructor(red as Double, green as Double, blue as Double)

81.32.4 Constructor(other as GMColorMBS)

Function: Creates a new color copying the existing color.
Example:

```vba
dim g as new GMColorRGBMBS(1,2,3)
dim o as new GMColorRGBMBS(g)
```
MsgBox str(o.colorValue)

See also:

- 81.32.3 Constructor
- 81.32.5 Constructor(red as Double, green as Double, blue as Double)

### 81.32.5 Constructor(red as Double, green as Double, blue as Double)

**Function:** Creates a new color with the given values.

**Example:**

```dim c as new GMColorRGBMBS(0.1,0.2,0.3)```

**Notes:** Range is 0.0 to 1.0.

See also:

- 81.32.3 Constructor
- 81.32.4 Constructor(other as GMColorMBS)

### 81.32.6 Properties

#### 81.32.7 blue as Double

**Function:** The blue color component.

**Example:**

```dim c as new GMColorRGBMBS(0.0,0.0,1.0)
MsgBox str(c.blue)```

**Notes:**

Range is 0.0 to 1.0.

(Read and Write property)
81.32. **CLASS GMCOLORRGBMBS**

### 81.32.8 green as Double

**Function:** The green color component.

**Example:**

```vbnet
dim c as new GMColorRGBMBS(0.0,1.0,0.0)
MsgBox str(c.green)
```

**Notes:**

- Range is 0.0 to 1.0.
- (Read and Write property)

### 81.32.9 red as Double

**Function:** The red color component.

**Example:**

```vbnet
dim c as new GMColorRGBMBS(1.0,0.0,0.0) // red
MsgBox str(C.red)
```

**Notes:**

- Range is 0.0 to 1.0.
- (Read and Write property)
81.33 class GMColorYUVMBS

81.33.1 class GMColorYUVMBS

Function: Representation of a color in the YUV colorspace
Example:

```vba
dim g as new GMColorYUVMBS(0.1, 0.2, 0.3)
MsgBox str(g.y)+" " +str(g.u)+" " +str(g.v)
```

Notes: Subclass of the GMColorMBS class.

81.33.2 Methods

81.33.3 Constructor

Function: Creates a new color with transparent black.
Example:

```vba
dim c as new GMColorYUVMBS
MsgBox str(c.redQuantum)+" " +str(c.greenQuantum)+" " +str(c.blueQuantum)
```

See also:

- 81.33.4 Constructor(other as GMColorMBS)
- 81.33.5 Constructor(y as Double, u as Double, v as Double)

81.33.4 Constructor(other as GMColorMBS)

Function: Creates a new color copying the existing color.
Example:

```vba
dim g as new GMColorYUVMBS(0.1, 0.2, 0.3)
dim o as new GMColorYUVMBS(g)
MsgBox str(o.colorValue)
```

See also:
81.33.  CLASS GMCOLORYUVMS

- 81.33.3 Constructor
- 81.33.5 Constructor(y as Double, u as Double, v as Double)

81.33.5  Constructor(y as Double, u as Double, v as Double)

**Function:** Creates a new color with the given values.

**Example:**

```vba
dim g as new GMColorYUVMS(0.1, 0.2, 0.3)
```

See also:

- 81.33.3 Constructor
- 81.33.4 Constructor(other as GMColorMBS)

81.33.6  Properties

81.33.7  u as Double

**Function:** The u color component.

**Example:**

```vba
dim g as new GMColorYUVMS(0.1, 0.2, 0.3)
MsgBox str(g.u)
```

**Notes:**

Range is -0.5 to +0.5.
(Read and Write property)

81.33.8  v as Double

**Function:** The v color component.

**Example:**

```vba
dim g as new GMColorYUVMS(0.1, 0.2, 0.3)
MsgBox str(g.v)
```
Notes:
Range is -0.5 to +0.5.
(Read and Write property)

81.33.9  y as Double

Function: The y color component.
Example:

```vbscript
dim g as new GMColorYUVMBS(0.1, 0.2, 0.3)
MsgBox str(g.y)
```

Notes:
Range is 0.0 to 1.0.
(Read and Write property)
**81.34. CLASS GMCOORDINATEMBS**

**81.34 class GMCoordinateMBS**

**81.34.1 class GMCoordinateMBS**

**Function:** The Graphics Magick class for a coordinate.
**Example:**
```vbs
dim c as new GMCoordinateMBS(5,6)
MsgBox str(c.x)+" "+str(c.y)
```

**81.34.2 Methods**

**81.34.3 Constructor**

**Function:** The constructor to create a new coordinate.
**See also:**
- 81.34.4 Constructor(x as Double, y as Double)

**81.34.4 Constructor(x as Double, y as Double)**

**Function:** The constructor to create a new coordinate.
**Example:**
```vbs
dim c as new GMCoordinateMBS(5,6)
MsgBox str(c.x)+" "+str(c.y)
```
**See also:**
- 81.34.3 Constructor

**81.34.5 Properties**

**81.34.6 x as Double**

**Function:** The x value.
**Example:**
dim c as new GMCoordinateMBS
c.x = 5
MsgBox str(c.x)

Notes: (Read and Write property)

81.34.7 y as Double

Function: The y value.
Example:
  dim c as new GMCoordinateMBS
c.y = 5
MsgBox str(c.y)

Notes: (Read and Write property)
81.35. class GMErrorExceptionMBS

81.35.1. class GMErrorExceptionMBS

**Function:** The exception to report errors in the GraphicMagick plugin.

**Notes:**
Check the message property for details.
Subclass of the RuntimeException class.
81.36 class GMGeometryMBS

81.36.1 class GMGeometryMBS

Function: Geometry provides a convenient means to specify a geometry argument.
Example:

```vbscript
dim g as new GMGeometryMBS(300,400)
MsgBox str(G.width)+" " +str(G.height)
```

Notes: The object may be initialized from a string containing a geometry specification. It may also be initialized by more efficient parameterized constructors.

81.36.2 Methods

81.36.3 Constructor

Function: Creates empty geometry.
Example:

```vbscript
dim g as new GMGeometryMBS
MsgBox str(G.width)+" " +str(G.height)
```

See also:

- 81.36.4 Constructor(geometry as string) 13582
- 81.36.5 Constructor(other as GMGeometryMBS) 13583
- 81.36.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) 13583

81.36.4 Constructor(geometry as string)

Function: Construct geometry from string.
Example:

```vbscript
dim g as new GMGeometryMBS("600x600")
```
81.36. CLASS GMGEOMETRYMBS

MsgBox str(G.width) + " " + str(G.height)

Notes:
See the GraphicsMagick website for details.
http://www.graphicsmagick.org/Magick++/Geometry.html
See also:

- 81.36.3 Constructor
- 81.36.5 Constructor(other as GMGeometryMBS)
- 81.36.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false)

81.36.5 Constructor(other as GMGeometryMBS)

Function: Creates a new geometry object by copying an existing one.
Example:

dim g as new GMGeometryMBS(600,600)
dim h as new GMGeometryMBS(g)
MsgBox str(h.width)

See also:

- 81.36.3 Constructor
- 81.36.4 Constructor(geometry as string)
- 81.36.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false)

81.36.6 Constructor(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false)

Function: Creates geometry with the given values.
Example:

dim g as new GMGeometryMBS(600,600)
MsgBox str(g.width)
CHAPTER 81. GRAPHICSMAGICK

See also:

- 81.36.3 Constructor 13582
- 81.36.4 Constructor(geometry as string) 13582
- 81.36.5 Constructor(other as GMGeometryMBS) 13583

81.36.7 Make(geometry as string) as GMGeometryMBS

Function: Construct geometry from string.
Example:

```vbscript
dim g as GMGeometryMBS = GMGeometryMBS.Make("600x600")
MsgBox str(g.width)+"x"+str(g.height)
```

Notes:
See the GraphicsMagick website for more details:
http://www.graphicsmagick.org/Magick++/Geometry.html
See also:

- 81.36.8 Make(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) as GMGeometryMBS 13584

81.36.8 Make(Width as UInt32, Height as UInt32, XOffset as UInt32=0, YOffset as UInt32=0, xNegative as boolean=false, yNegative as boolean=false) as GMGeometryMBS

Function: Creates geometry with the given values.
Example:

```vbscript
dim g as GMGeometryMBS = GMGeometryMBS.Make(600,600)
MsgBox str(g.width)
```

See also:

- 81.36.7 Make(geometry as string) as GMGeometryMBS 13584
81.36. CLASS GMGEOMETRYMBS

81.36.9 Properties

81.36.10 aspect as boolean

Function: Resize without preserving aspect ratio (!).

Example:

```dim g as new GMGeometryMBS(600,600)
MsgBox str(g.aspect)```

Notes: (Read and Write property)

81.36.11 greater as boolean

Function: Resize if image is greater than size (>).

Example:

```dim g as new GMGeometryMBS(600,600)
MsgBox str(g.greater)```

Notes: (Read and Write property)

81.36.12 height as Uint32

Function: The height value.

Example:

```dim g as new GMGeometryMBS(600,600)
MsgBox str(g.height)```

Notes: (Read and Write property)
81.36.13  isValid as boolean

**Function:** Does object contain a valid geometry?
**Example:**
```vba
dim g as new GMGeometryMBS(100,200)
MsgBox str(G.isValid)
```

**Notes:**
May be set to false in order to invalidate an existing geometry object.
(Read and Write property)

---

81.36.14  less as boolean

**Function:** Resize if image is less than size (<).
**Example:**
```vba
dim g as new GMGeometryMBS(600,600)
MsgBox str(g.less)
```

**Notes:** (Read and Write property)

---

81.36.15  percent as boolean

**Function:** Width and height are expressed as percentages.
**Example:**
```vba
dim g as new GMGeometryMBS(600,600)
MsgBox str(g.percent)
```

**Notes:** (Read and Write property)
81.36. **CLASS GMGEOMETRYMBS**

### 81.36.16 StringValue as string

**Function:** The string representation of the geometry object.

**Example:**

```plaintext
dim g as new GMGeometryMBS(600,600)
MsgBox str(g.StringValue)
```

**Notes:** (Read and Write property)

### 81.36.17 width as Uint32

**Function:** The width value.

**Example:**

```plaintext
dim g as new GMGeometryMBS(600,600)
MsgBox str(g.width)
```

**Notes:** (Read and Write property)

### 81.36.18 xNegative as boolean

**Function:** Sign of X offset negative? (X origin at right)

**Example:**

```plaintext
dim g as new GMGeometryMBS(100,200,30,40,true,false)
MsgBox str(G.xNegative)
```

**Notes:** (Read and Write property)

### 81.36.19 xOff as Uint32

**Function:** X offset from origin.

**Example:**
dim g as new GMGeometryMBS(100,200,30,40,true,true)
MsgBox str(G.xOff)+" "+str(G.yOff)

Notes: (Read and Write property)

81.36.20 yNegative as boolean

Function: Sign of Y offset negative? (Y origin at bottom)
Example:
  dim g as new GMGeometryMBS(100,200,30,40,false,true)
  MsgBox str(G.yNegative)

Notes: (Read and Write property)

81.36.21 yOff as Uint32

Function: Y offset from origin
Example:
  dim g as new GMGeometryMBS(100,200,30,40,true,true)
  MsgBox str(G.xOff)+" "+str(G.yOff)

Notes: (Read and Write property)
81.37  class GMGraphicsMBS

81.37.1  class GMGraphicsMBS

**Function:** The class for drawing commands targeting a GMImageMBS.
**Notes:** Please remember that all commands are collected till you call the Draw method.

81.37.2  Methods

81.37.3  Arc(startX as Double, startY as Double, endX as Double, endY as Double, startDegrees as Double, endDegrees as Double)

**Function:** Draw an arc using the stroke color and based on the circle starting at coordinates startX,startY, and ending with coordinates endX,endY, and bounded by the rotational arc startDegrees,endDegrees.
**Example:**

```vbnet
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.type = image.TrueColorType
image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics
draw.arc(250, 250, 100, 100,50,300)
draw.Draw

Backdrop=image.CopyPicture
```

81.37.4  Bezier(values() as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Draw a bezier curve using the stroke color and based on the coordinates specified by the coordinates array.
81.37.5 Circle(originX as Double, originY as Double, perimX as Double, perimY as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Draw a circle using the stroke color and thickness using specified origin and perimeter coordinates.

**Example:**

```vbs
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.type = image.TrueColorType
image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)
draw.Draw

Backdrop=image.CopyPicture
```

**Notes:** If a fill color is specified, then the object is filled.

81.37.6 ClipPath(id as string)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Select a drawing clip path matching id.

81.37.7 ColorPixel(x as Double, y as Double, paintMethod as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Color image according to paintMethod.

**Notes:** The point method recolors the target pixel. The replace method recolors any pixel that matches the color of the target pixel. Floodfill recolors any pixel that matches the color of the target pixel and is a neighbor, whereas filltoborder recolors any neighbor pixel that is not the border color. Finally, reset recolors all pixels.
81.37. CLASS GMGRAPHICSMBS

81.37.8 CompositeImage(x as Double, y as Double, file as folderitem)

**Function:** Composite current image with contents of specified image, at specified coordinates.
**Notes:** If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through.

See also:

- 81.37.9 CompositeImage(x as Double, y as Double, image as GMImageMBS)
- 81.37.10 CompositeImage(x as Double, y as Double, path as string)
- 81.37.11 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem)
- 81.37.12 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem, CompositeOperator as Integer)
- 81.37.13 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GMImageMBS)
- 81.37.14 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GMImageMBS, CompositeOperator as Integer)
- 81.37.15 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string)
- 81.37.16 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string, CompositeOperator as Integer)

81.37.9 CompositeImage(x as Double, y as Double, image as GMImageMBS)

**Function:** Composite current image with contents of specified image, at specified coordinates.
**Notes:** If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through.

See also:

- 81.37.8 CompositeImage(x as Double, y as Double, file as folderitem)
- 81.37.10 CompositeImage(x as Double, y as Double, path as string)
- 81.37.11 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem)
- 81.37.12 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem, CompositeOperator as Integer)
- 81.37.13 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GMImageMBS)
81.37.10 CompositeImage(x as Double, y as Double, path as string)

Function: Composite current image with contents of specified image, rendered with specified width and height, at specified coordinates.

Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through. If the specified width or height is zero, then the image is composited at its natural size, without enlargement or reduction.

See also:

- 81.37.8 CompositeImage(x as Double, y as Double, file as folderitem) 13591
- 81.37.9 CompositeImage(x as Double, y as Double, image as GMImageMBS) 13591
- 81.37.11 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem) 13592
- 81.37.12 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem, CompositeOperator as Integer) 13593
- 81.37.13 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GMImageMBS) 13594
- 81.37.14 CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GMImageMBS, CompositeOperator as Integer) 13594
- 81.37.15 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string) 13595
- 81.37.16 CompositeImage(x as Double, y as Double, w as Double, h as Double, path as string, CompositeOperator as Integer) 13595

81.37.11 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem)

Function: Composite current image with contents of specified image, rendered with specified width and height, at specified coordinates.

Notes: If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through. If the specified width or height is zero, then the image is composited at its natural size, without enlargement or reduction.

### 81.37.12 CompositeImage(x as Double, y as Double, w as Double, h as Double, file as folderitem, CompositeOperator as Integer)

**Function:** Composite current image with contents of specified image, rendered with specified width and height, using specified composition algorithm, at specified coordinates.

**Notes:** If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through. If the specified width or height is zero, then the image is composited at its natural size, without enlargement or reduction.

81.37.13 **CompositeImage(x as Double, y as Double, w as Double, h as Double, image as GMImageMBS)**

**Function:** Composite current image with contents of specified image, rendered with specified width and height, at specified coordinates.

**Notes:** If the matte attribute is set to true, then the image composition will consider an alpha channel, or transparency, present in the image file so that non-opaque portions allow part (or all) of the composite image to show through. If the specified width or height is zero, then the image is composited at its natural size, without enlargement or reduction.

81.37.17 Constructor(image as GMImageMBS)

Function: Creates a new object referencing the given image.

81.37.18 DashArray(values() as Double)

Function: Specify the pattern of dashes and gaps used to stroke paths.

Notes: The strokeDashArray represents a zero-terminated array of numbers that specify the lengths of alternating dashes and gaps in pixels. If an odd number of values is provided, then the list of values is repeated to yield an even number of values. A typical strokeDashArray array might contain the members 5 3 2 0, where the zero value indicates the end of the pattern array.

81.37.19 DashOffset(offset as Double)

Function: Specify the distance into the dash pattern to start the dash.

Notes: See documentation on SVG’s stroke-dashoffset property for usage details.
81.37.20 Draw

**Function:** Draws all draw commands collected.

**Example:**

```plaintext
Dim g As New GMGeometryMBS(500,500)
Dim c As New GMMColorRGBMBS("white") // white
Dim image As New GMImageMBS(g, c)

image.Type = image.TrueColorType
image.StrokeWidth = 5

Dim draw As GMMGraphicsMBS = image.Graphics

draw.StrokeColor New GMMColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Draw

Backdrop = image.CopyPicture
```

81.37.21 DrawPath

**Function:** Draw on image using vector path.

**Example:**

```plaintext
// new picture, 500x500 and filled with white
Dim g As New GMGeometryMBS(500,500)
Dim c As New GMMColorRGBMBS("white") // white
Dim image As New GMImageMBS(g, c)

Dim draw As GMMGraphicsMBS = image.Graphics

// Draw path

Dim cr As New GMMColorRGBMBS("red")
Dim gr As New GMMColorRGBMBS("green")
draw.StrokeColor cr
draw.FillColor gr
draw.PathMovetoAbs(30,10)
draw.PathLinetoAbs(20,55)
draw.PathLinetoAbs(70,50)
draw.PathLinetoAbs(80,5)
```
CHAPTER 81. GRAPHICSMAGICK

draw.DrawPath

draw.Draw

// show picture
image.type = image.TrueColorType // make sure it's a bitmap
Backdrop=image.CopyPicture

81.37.22 Ellipse(originX as Double, originY as Double, perimX as Double, perimY as Double, arcStart as Double, arcEnd as Double)

Function: Draw an ellipse using the stroke color and thickness, specified origin, x & y radius, as well as specified start and end of arc in degrees.
Notes: If a fill color is specified, then the object is filled.

81.37.23 FillColor(c as GMColorMBS)

Function: Specify drawing object fill color.

81.37.24 FillOpacity(opacity as Double)

Function: Specify opacity to use when drawing using fill color.

81.37.25 FillRule(fillRule as Integer)

Function: Specify the algorithm which is to be used to determine what parts of the canvas are included inside the shape.
Notes: See documentation on SVG’s fill-rule property for usage details.

81.37.26 Font(fontname as string)

Function: Specify font name to use when drawing text.
81.37. CLASS GMGRAPHICSMBS

Example:

```vbnet
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

dim draw as GMGraphicsMBS = image.Graphics

// draw red text
draw.strokeColor(new GMColorRGBMBS("red").Red) // Outline color
draw.strokeWidth(1)
draw.Font("/Library/Fonts/Verdana.ttf")
draw.Text(50, 50, "Hello", "")
draw.Draw

Backdrop = image.CopyPicture
```

See also:

- 81.37.27 Font(fontname as string, StyleType as Integer, weight as Integer, StretchType as Integer)

81.37.27 Font(fontname as string, StyleType as Integer, weight as Integer, StretchType as Integer)

**Function:** Sets the font.

**Notes:** Specify font family, style, weight (one of the set { 100 | 200 | 300 | 400 | 500 | 600 | 700 | 800 | 900 } with 400 being the normal size), and stretch to be used to select the font used when drawing text. Wildcard matches may be applied to style via the AnyStyle enumeration, applied to weight if weight is zero, and applied to stretch via the AnyStretch enumeration.

See also:

- 81.37.26 Font(fontname as string)

81.37.28 Gravity(GravityType as Integer)

**Function:** Specify text positioning gravity.
81.37.29 Line(startX as Double, startY as Double, endX as Double, endY as Double)

**Function:** Draw a line using stroke color and thickness using starting and ending coordinates
**Example:**

```vba
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

// Draw a line
draw.Line(100,100,400,400)
draw.Draw

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

81.37.30 Matte(x as Double, y as Double, paintMethod as Integer)

**Function:** Change the pixel matte value to transparent.
**Notes:** The point method changes the matte value of the target pixel. The replace method changes the matte value of any pixel that matches the color of the target pixel. Floodfill changes the matte value of any pixel that matches the color of the target pixel and is a neighbor, whereas filltoborder changes the matte value of any neighbor pixel that is not the border color. Finally reset changes the matte value of all pixels.

81.37.31 MiterLimit(miterlimit as Integer)

**Function:** Specify miter limit.
**Notes:** When two line segments meet at a sharp angle and miter joins have been specified for 'lineJoin', it is possible for the miter to extend far beyond the thickness of the line stroking the path. The miterLimit' imposes a limit on the ratio of the miter length to the 'lineWidth'. The default value of this parameter is 4.
81.37. CLASS GMGRAPHICSMBS

81.37.32 PathArcAbs(c as GMPatchArgsMBS)

Function: Draws an elliptical arc from the current point to (x, y).
Notes:
The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

In the GMPatchArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag, sweepFlag, x and y.
See also:

- 81.37.33 PathArcAbs(c() as GMPatchArgsMBS)
- 81.37.34 PathArcAbs(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)

81.37.33 PathArcAbs(c() as GMPatchArgsMBS)

Function: Draws an elliptical arc from the current point to (x, y).
Notes:
The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

In the GMPatchArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag, sweepFlag, x and y.
See also:

- 81.37.32 PathArcAbs(c as GMPatchArgsMBS)
- 81.37.34 PathArcAbs(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)
81.37.34 PathArcAbs(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)

**Function:** Draws an elliptical arc from the current point to (x, y).

**Example:**

```vbnet
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

// Draw an arc

draw.PathMovetoAbs 100,100
draw.PathArcAbs(100,100, 0, false, false, 200,200)
draw.DrawPath
draw.Draw

Backdrop=image.CopyPicture
```

**Notes:** The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

- 81.37.33 PathArcAbs(c() as GMPPathArgsMBS)

81.37.35 PathArcRel(c as GMPPathArgsMBS)

**Function:** Draws an elliptical arc from the current point to (x, y).

**Notes:**

The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation,
which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

In the GMPathArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag, sweepFlag, x and y.
See also:

- 81.37.36 PathArcRel(c() as GMPathArgsMBS) 13603
- 81.37.37 PathArcRel(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 13603

81.37.36 PathArcRel(c() as GMPathArgsMBS)

**Function:** Draws an elliptical arc from the current point to (x, y).
**Notes:**

The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxisRotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system. The center (cx, cy) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. largeArcFlag and sweepFlag contribute to the automatic calculations and help determine how the arc is drawn. If largeArcFlag is true then draw the larger of the available arcs. If sweepFlag is true, then draw the arc matching a clock-wise rotation.

In the GMPathArgsMBS, set the following properties: radiusX, radiusY, xAxisRotation, bool largeArcFlag, sweepFlag, x and y.
See also:

- 81.37.35 PathArcRel(c as GMPathArgsMBS) 13602
- 81.37.37 PathArcRel(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 13603

81.37.37 PathArcRel(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)

**Function:** Draws an elliptical arc from the current point to (x, y).
**Notes:** The size and orientation of the ellipse are defined by two radii (radiusX, radiusY) and an xAxis-Rotation, which indicates how the ellipse as a whole is rotated relative to the current coordinate system.
The center \((cx, cy)\) of the ellipse is calculated automatically to satisfy the constraints imposed by the other parameters. `largeArcFlag` and `sweepFlag` contribute to the automatic calculations and help determine how the arc is drawn. If `largeArcFlag` is true then draw the larger of the available arcs. If `sweepFlag` is true, then draw the arc matching a clock-wise rotation.

- 81.37.36 PathArcRel\((c() as GMPathArgsMBS)\)

### 81.37.38 PathClosePath

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Close the current subpath by drawing a straight line from the current point to current subpath’s most recent starting point (usually, the most recent moveto point).

### 81.37.39 PathCurvetoAbs\((c as GMPathArgsMBS)\)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Draws a cubic Bzier curve from the current point to \((x, y)\) using \((x_1, y_1)\) as the control point at the beginning of the curve and \((x_2, y_2)\) as the control point at the end of the curve. **Notes:**

PathCurvetoAbs indicates that absolute coordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final \((x, y)\) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: \(x_1, y_1, x_2, y_2, x\) and \(y\).

See also:

- 81.37.40 PathCurvetoAbs\((c() as GMPathArgsMBS)\)
- 81.37.41 PathCurvetoAbs\((x_1 as Double, y_1 as Double, x_2 as Double, y_2 as Double, x as Double, y as Double)\)

### 81.37.40 PathCurvetoAbs\((c() as GMPathArgsMBS)\)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Draws a cubic Bzier curve from the current point to \((x, y)\) using \((x_1, y_1)\) as the control point at the beginning of the curve and \((x_2, y_2)\) as the control point at the end of the curve. **Notes:**

PathCurvetoAbs indicates that absolute coordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the
command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.

See also:

- 81.37.39 PathCurvetoAbs(c as GMPathArgsMBS)  
  - 81.37.41 PathCurvetoAbs(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)

81.37.41  PathCurvetoAbs(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)

Function: Draws a cubic Bzier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolute coordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.
See also:

- 81.37.39 PathCurvetoAbs(c as GMPathArgsMBS)
- 81.37.40 PathCurvetoAbs(c() as GMPathArgsMBS)

81.37.42  PathCurvetoRel(c as GMPathArgsMBS)

Function: Draws a cubic Bzier curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.
Notes: PathCurvetoAbs indicates that absolute coordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.
See also:

- 81.37.43 PathCurvetoRel(c() as GMPathArgsMBS)
- 81.37.44 PathCurvetoRel(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)
81.37.43  *PathCurvetoRel(c() as GMPathArgsMBS)*

**Function:** Draws a cubic Bzern curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.  
**Notes:**  
PathCurvetoAbs indicates that absolute coordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.  
See also:

- 81.37.42  *PathCurvetoRel(c as GMPathArgsMBS)*  
- 81.37.44  *PathCurvetoRel(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)*  

81.37.44  *PathCurvetoRel(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)*

**Function:** Draws a cubic Bzern curve from the current point to (x,y) using (x1,y1) as the control point at the beginning of the curve and (x2,y2) as the control point at the end of the curve.  
**Notes:**  
PathCurvetoAbs indicates that absolute coordinates will follow; PathCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.  
See also:

- 81.37.42  *PathCurvetoRel(c as GMPathArgsMBS)*  
- 81.37.43  *PathCurvetoRel(c() as GMPathArgsMBS)*  

81.37.45  *PathLinetoAbs(c as GMCoordinateMBS)*

**Function:** The various "lineto" commands draw straight lines from the current point to a new point.  
**Notes:** Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.  
See also:

- 81.37.46  *PathLinetoAbs(c() as GMCoordinateMBS)*  
- 81.37.47  *PathLinetoAbs(x as Double, y as Double)*

- 81.37.47  *PathLinetoAbs(x as Double, y as Double)*
81.37. **PathLinetoAbs(c() as GMCoordinateMBS)**

**Function:** The various "lineto" commands draw straight lines from the current point to a new point.
**Notes:** Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:
- 81.37.45 PathLinetoAbs(c as GMCoordinateMBS)
- 81.37.46 PathLinetoAbs(c() as GMCoordinateMBS)

81.37. **PathLinetoAbs(x as Double, y as Double)**

**Function:** The various "lineto" commands draw straight lines from the current point to a new point.
**Notes:** Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.
See also:
- 81.37.45 PathLinetoAbs(c as GMCoordinateMBS)
- 81.37.46 PathLinetoAbs(c() as GMCoordinateMBS)

81.37. **PathLinetoHorizontalAbs(v as Double)**

**Function:** The various "lineto" commands draw straight lines from the current point to a new point.
**Notes:** Draws a horizontal line from the current point (cpx, cpy) to (x, cpy). PathLinetoHorizontalAbs indicates that absolute coordinates are supplied; PathLinetoHorizontalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (x, cpy) for the final value of x.

81.37. **PathLinetoHorizontalRel(v as Double)**

**Function:** The various "lineto" commands draw straight lines from the current point to a new point.
**Notes:** Draws a horizontal line from the current point (cpx, cpy) to (x, cpy). PathLinetoHorizontalAbs indicates that absolute coordinates are supplied; PathLinetoHorizontalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (x, cpy) for the final value of x.
81.37.50 PathLinetoRel(c as GMCoordinateMBS)

Function: The various "lineto" commands draw straight lines from the current point to a new point.

Notes: Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.

- 81.37.50 PathLinetoRel(c as GMCoordinateMBS) 13608
- 81.37.52 PathLinetoRel(x as Double, y as Double) 13608

81.37.52 PathLinetoRel(x as Double, y as Double)

Function: The various "lineto" commands draw straight lines from the current point to a new point.

Example:

```java
// new picture, 500x500 and filled with white
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

dim draw as GMGraphicsMBS = image.Graphics

// Draw path

dim cr as new GMColorRGBMBS("red")
dim gr as new GMColorRGBMBS("green")
```
81.37. **CLASS GMGRAPHICSMBS**

draw.StrokeColor cr
draw.FillColor gr
draw.PathMovetoAbs(30,10)
draw.PathLinetoAbs(20,55)
draw.PathLinetoAbs(70,50)
draw.PathLinetoAbs(80,5)
draw.DrawPath

draw.Draw

// show picture
image.type = image.TrueColorType // make sure it’s a bitmap
Backdrop=image.CopyPicture

**Notes:** Draw a line from the current point to the given coordinate which becomes the new current point. PathLinetoAbs indicates that absolute coordinates are used; PathLinetoRel indicates that relative coordinates are used. A number of coordinates pairs may be specified in a list to draw a polyline. At the end of the command, the new current point is set to the final set of coordinates provided.

- 81.37.50 PathLinetoRel(c as GMCoordinateMBS)
- 81.37.51 PathLinetoRel(c() as GMCoordinateMBS)

### 81.37.53 PathLinetoVerticalAbs(v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The various "lineto" commands draw straight lines from the current point to a new point. **Notes:** Draws a vertical line from the current point (cpx, cpy) to (cpx, y). PathLinetoVerticalAbs indicates that absolute coordinates are supplied; PathLinetoVerticalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (cpx, y) for the final value of y.

### 81.37.54 PathLinetoVerticalRel(v as Double)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The various "lineto" commands draw straight lines from the current point to a new point. **Notes:** Draws a vertical line from the current point (cpx, cpy) to (cpx, y). PathLinetoVerticalAbs indicates that absolute coordinates are supplied; PathLinetoVerticalRel indicates that relative coordinates are supplied. At the end of the command, the new current point becomes (cpx, y) for the final value of y.
81.37.55 PathMovetoAbs(c as GMCoordinateMBS)

Function: The "moveto" commands establish a new current point.
Notes:
The effect is as if the "pen" were lifted and moved to a new location. A path data segment must begin with either one of the "moveto" commands or one of the "arc" commands. Subsequent "moveto" commands (i.e., when the "moveto" is not the first command) represent the start of a new subpath.

Start a new sub-path at the given coordinate. PathMovetoAbs indicates that absolute coordinates will follow; PathMovetoRel indicates that relative coordinates will follow. If a relative moveto appears as the first element of the path, then it is treated as a pair of absolute coordinates. If a moveto is followed by multiple pairs of coordinates, the subsequent pairs are treated as implicit lineto commands.
See also:
- 81.37.56 PathMovetoAbs(x as Double, y as Double)

81.37.56 PathMovetoAbs(x as Double, y as Double)

Function: The "moveto" commands establish a new current point.
Notes:
The effect is as if the "pen" were lifted and moved to a new location. A path data segment must begin with either one of the "moveto" commands or one of the "arc" commands. Subsequent "moveto" commands (i.e., when the "moveto" is not the first command) represent the start of a new subpath.

Start a new sub-path at the given coordinate. PathMovetoAbs indicates that absolute coordinates will follow; PathMovetoRel indicates that relative coordinates will follow. If a relative moveto appears as the first element of the path, then it is treated as a pair of absolute coordinates. If a moveto is followed by multiple pairs of coordinates, the subsequent pairs are treated as implicit lineto commands.

### 81.37.63 PathQuadraticCurvetoRel(c() as GMPathArgsMBS)

**Function:** Draws a quadratic Bzier curve from the current point to (x,y) using (x1,y1) as the control point.

**Notes:**
PathQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathQuadraticCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x and y.

See also:
- 81.37.62 PathQuadraticCurvetoRel(c as GMPathArgsMBS)
- 81.37.64 PathQuadraticCurvetoRel(x1 as Double, y1 as Double, x as Double, y as Double)

### 81.37.64 PathQuadraticCurvetoRel(x1 as Double, y1 as Double, x as Double, y as Double)

**Function:** Draws a quadratic Bzier curve from the current point to (x,y) using (x1,y1) as the control point.

**Notes:**
PathQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathQuadraticCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

- 81.37.63 PathQuadraticCurvetoRel(c() as GMPathArgsMBS)

### 81.37.65 PathSmoothCurvetoAbs(c as GMCoordinateMBS)

**Function:** Draws a cubic Bzier curve from the current point to (x,y).

**Notes:**
The first control point is assumed to be the reflection of the second control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not
an PathCurvetoAbs, PathCurvetoRel, PathSmoothCurvetoAbs or PathSmoothCurvetoRel, assume the first control point is coincident with the current point.) (x2, y2) is the second control point (i.e., the control point at the end of the curve). PathSmoothCurvetoAbs indicates that absolute coordinates will follow; PathSmoothCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x, y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.
See also:

- 81.37.66 PathSmoothCurvetoAbs(c() as GMCoordinateMBS) 13614
- 81.37.67 PathSmoothCurvetoAbs(x as Double, y as Double) 13614

81.37.66 PathSmoothCurvetoAbs(c() as GMCoordinateMBS)

Function: Draws a cubic Bzier curve from the current point to (x, y).
Notes:
The first control point is assumed to be the reflection of the second control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not an PathCurvetoAbs, PathCurvetoRel, PathSmoothCurvetoAbs or PathSmoothCurvetoRel, assume the first control point is coincident with the current point.) (x2, y2) is the second control point (i.e., the control point at the end of the curve). PathSmoothCurvetoAbs indicates that absolute coordinates will follow; PathSmoothCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x, y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x2, y2, x and y.
See also:

- 81.37.65 PathSmoothCurvetoAbs(c as GMCoordinateMBS) 13613
- 81.37.67 PathSmoothCurvetoAbs(x as Double, y as Double) 13614

81.37.67 PathSmoothCurvetoAbs(x as Double, y as Double)

Function: Draws a cubic Bzier curve from the current point to (x, y).
Notes: The first control point is assumed to be the reflection of the second control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not an PathCurvetoAbs, PathCurvetoRel, PathSmoothCurvetoAbs or PathSmoothCurvetoRel, assume the first control point is coincident with the current point.) (x2, y2) is the second control point (i.e., the control point at the end of the curve). PathSmoothCurvetoAbs indicates that absolute coordinates will follow;
81.37. CLASS GMGRAPHICSMBs

PathSmoothCurvetoRel indicates that relative coordinates will follow. Multiple sets of coordinates may be specified to draw a polybezier. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

See also:

- 81.37.75 PathSmoothQuadraticCurvetoRel(c() as GMCoordinateMBS) 13618
- 81.37.76 PathSmoothQuadraticCurvetoRel(x as Double, y as Double) 13618

### 81.37.75 PathSmoothQuadraticCurvetoRel(c() as GMCoordinateMBS)

**Function:** Draws a quadratic Bzier curve from the current point to (x,y).  
**Notes:**

The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurvetoAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

In the GMPathArgsMBS object, set the following properties: x1, y1, x and y.
See also:

- 81.37.74 PathSmoothQuadraticCurvetoRel(c as GMCoordinateMBS) 13617
- 81.37.76 PathSmoothQuadraticCurvetoRel(x as Double, y as Double) 13618

### 81.37.76 PathSmoothQuadraticCurvetoRel(x as Double, y as Double)

**Function:** Draws a quadratic Bzier curve from the current point to (x,y).  
**Notes:**

The control point is assumed to be the reflection of the control point on the previous command relative to the current point. (If there is no previous command or if the previous command was not a PathQuadraticCurvetoAbs, PathQuadraticCurvetoRel, PathSmoothQuadraticCurvetoAbs or PathSmoothQuadraticCurvetoRel, assume the control point is coincident with the current point.) PathSmoothQuadraticCurveto-
toAbs indicates that absolute coordinates will follow; PathSmoothQuadraticCurvetoRel indicates that relative coordinates will follow. At the end of the command, the new current point becomes the final (x,y) coordinate pair used in the polybezier.

See also:

- 81.37.74 PathSmoothQuadraticCurvetoRel(c as GMCoordinateMBS) 13617
- 81.37.75 PathSmoothQuadraticCurvetoRel(c() as GMCoordinateMBS) 13618

81.37.77  Point(x as Double, y as Double)

**Function:** Draw a point using stroke color and thickness at coordinate.

**Example:**

```dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)
image.fillColor = new GMColorRGBMBS("red") // set color
dim draw as GMGraphicsMBS = image.Graphics
  // draw cross with pixels
for x as Integer = 240 to 260
draw.Point(x, 250)
next
for y as Integer = 240 to 260
draw.Point(250,y)
next
draw.Draw
Backdrop=image.CopyPicture```

81.37.78  PointSize(pointSize as Double)

**Function:** Set font point size.

81.37.79  Polygon(values() as GMCoordinateMBS)

**Function:** Draw an arbitrary polygon using stroke color and thickness consisting of three or more
coordinates contained in an array.

**Example:**

```vbs
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.fillColor = new GMColorRGBMBS("red") // set color
image.strokeColor = new GMColorRGBMBS("green") // set color

dim draw as GMGraphicsMBS = image.Graphics
dim coordinates(-1) as GMCoordinateMBS

coordinates.Append new GMCoordinateMBS(70,70)
coordinates.Append new GMCoordinateMBS(100,340)
coordinates.Append new GMCoordinateMBS(380,200)
coordinates.Append new GMCoordinateMBS(70,70)

draw.Polygon coordinates
draw.Draw

Backdrop=image.CopyPicture
```

**Notes:** If a fill color is specified, then the object is filled.

### 81.37.80 Polyline(values() as GMCoordinateMBS)

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Draw an arbitrary polyline using stroke color and thickness consisting of three or more coordinates contained in an array.

**Example:**

```vbs
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("green") // set color

dim draw as GMGraphicsMBS = image.Graphics
dim coordinates(-1) as GMCoordinateMBS

coordinates.Append new GMCoordinateMBS(70,70)
coordinates.Append new GMCoordinateMBS(100,340)
coordinates.Append new GMCoordinateMBS(380,200)
coordinates.Append new GMCoordinateMBS(70,70)

draw.Polygon coordinates
draw.Draw

Backdrop=image.CopyPicture
```
draw.Polyline coordinates
draw.Draw

Backdrop=image.CopyPicture

**Notes:** If a fill color is specified, then the object is filled.

### 81.37.81 PopClipPath

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Pop (terminate) clip path definition started by PushClipPath.

### 81.37.82 PopGraphicContext

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Pop Graphic Context. **Example:**

```vba
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorMBS() // transparent fillcolor
image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

// Draw a Rectangle
draw.PushGraphicContext
draw.Translation(250,250)
draw.Rotation(50)
draw.Rectangle(0, 0, 100, 100) // rotated
draw.PopGraphicContext
draw.Rectangle(0, 0, 100, 100) // not rotated
draw.Draw

Backdrop=image.CopyPicture

**Notes:** Removing the current graphic context from the graphic context stack restores the options to the values they had prior to the preceding PushGraphicContext operation.
81.37.83  PopPattern

**Function:** Terminate a pattern definition started via PushPattern.

81.37.84  PushClipPath(id as string)

**Function:** Push (create) clip path definition with id.
**Notes:** Clip patch definition consists of subsequent drawing commands, terminated by PopClipPath.

81.37.85  PushGraphicContext

**Function:** Push Graphic Context.
**Example:**

```pascal
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white")  // white
dim image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red")  // Outline color
image.fillColor = new GMColorMBS()  // transparent fillcolor
image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

// Draw a Rectangle
draw.PushGraphicContext
draw.Translation(250,250)
draw.Rotation(50)
draw.Rectangle(0, 0, 100, 100)  // rotated
draw.PopGraphicContext
draw.Rectangle(0, 0, 100, 100)  // not rotated
draw.Draw

Backdrop=image.CopyPicture
```

**Notes:** When a graphic context is pushed, options set after the context is pushed (such as coordinate transformations, color settings, etc.) are saved to a new graphic context. This allows related options to be saved.
on a graphic context "stack" in order to support hierarchial nesting of options. When \texttt{PopGraphicContext} is used to pop the current graphic context, the options in effect during the last \texttt{PushGraphicContext} operation are restored.

### 81.37.86 PushPattern(id as string, x as Integer, y as Integer, width as Integer, height as Integer)

\textbf{Function:} Start a pattern definition with arbitrary pattern name specified by \texttt{id}, pattern offset specified by \texttt{x} and \texttt{y}, and pattern size specified by \texttt{width} and \texttt{height}.  
\textbf{Notes:} The pattern is defined within the coordinate system defined by the specified offset and size. Arbitrary drawing objects (including \texttt{DrawableCompositeImage}) may be specified between \texttt{PushPattern} and \texttt{PopPattern} in order to draw the pattern. Normally the pair \texttt{PushGraphicContext} & \texttt{PopGraphicContext} are used to enclose a pattern definition. Pattern definitions are terminated by a \texttt{PopPattern} object.

### 81.37.87 Rectangle(upperLeftX as Double, upperLeftY as Double, lowerRightX as Double, lowerRightY as Double)

\textbf{Function:} Draw a rectangle using stroke color and thickness from upper-left coordinates to lower-right coordinates.  
\textbf{Example:}

```vbnet
dim g as new GMGeometryMBS(500,500)  
dim c as new GMColorRGBMBS("white") // white  
dim image as new GMImageMBS(g, c)  
image.strokeColor = new GMColorRGBMBS("red") // Outline color  
image.fillColor = new GMColorRGBMBS("green") // Fill color  
image.strokeWidth = 5  

dim draw as GMGraphicsMBS = image.Graphics  
// Draw a rectangle  
draw.Rectangle(250, 250, 100, 100)  
draw.Draw  
Backdrop=image.CopyPicture
```

\textbf{Notes:} If a fill color is specified, then the object is filled.
81.37.88 **Rotation(angle as Double)**

**Function:** Set rotation to use when drawing (coordinate transformation).

**Example:**

```vbscript
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

draw.StrokeColor new GMColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Rotation 5
draw.StrokeColor new GMColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

81.37.89 **RoundRectangle(centerX as Double, centerY as Double, width as Double, height as Double, cornerWidth as Double, cornerHeight as Double)**

**Function:** Draw a rounded rectangle using stroke color and thickness, with specified center coordinate, specified width and height, and specified corner width and height.

**Example:**

```vbscript
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

// Draw a round rectangle
draw.RoundRectangle(250, 250, 100, 100,20,20)
draw.Draw
```
Notes: If a fill color is specified, then the object is filled.

81.37.90  Scaling(x as Double, y as Double)

Function: Apply scaling in x and y direction while drawing objects (coordinate transformation).
Example:

```vbs
' 1. Define a new geometry
  g = New GMGeometryMBS(500, 500)

' 2. Assign a color to the image
  c = GMColorRGBMBS("white") // white

' 3. Create a new image
  image = GMImageMBS(g, c)

' 4. Set the stroke width
  image.strokeWidth = 5

' 5. Create a graphics object
  draw = image.Graphics

' 6. Set fill color
  draw.FillColor = new GMColorRGBMBS("red")

' 7. Set stroke color
  draw.StrokeColor = new GMColorRGBMBS("red")

' 8. Draw a line
  draw.Line(100,100,400,400)

' 9. Scale the image
  draw.Scaling = 1.2,1.1

' 10. Redraw
  draw.Draw

Backdrop=image.CopyPicture
```

81.37.91  SkewX(angle as Double)

Function: Apply skew in X direction (coordinate transformation)
Example:

```vbs
' 1. Define a new geometry
  g = New GMGeometryMBS(500, 500)

' 2. Assign a color to the image
  c = GMColorRGBMBS("white") // white

' 3. Create a new image
  image = GMImageMBS(g, c)

' 4. Set the stroke width
  image.strokeWidth = 5

' 5. Create a graphics object
  draw = image.Graphics

' 6. Set fill color
  draw.FillColor = new GMColorRGBMBS("red")

' 7. Set stroke color
  draw.StrokeColor = new GMColorRGBMBS("red")

' 8. Draw a line
  draw.Line(100,100,400,400)

' 9. Apply skew
  draw.SkewX = 1.1

' 10. Draw
  draw.Draw

Backdrop=image.CopyPicture
```
draw.StrokeColor new GMColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.SkewX 5
draw.StrokeColor new GMColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture

81.37.92 SkewY(angle as Double)

**Function:** Apply Skew in Y direction.

**Example:**

```vba
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

draw.StrokeColor new GMColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.SkewY 5
draw.StrokeColor new GMColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture
```

81.37.93 StrokeAntialias(flag as boolean)

**Function:** Antialias while drawing lines or object outlines.
81.37.94 **StrokeColor(c as GMColorMBS)**

**Function:** Set color to use when drawing lines or object outlines.

**Example:**

```vba
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS(“white”) // white
dim image as new GMImageMBS(g, c)

image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

draw.StrokeColor new GMColorRGBMBS(“red”)  
draw.Line(100,100,400,400)  
draw.Draw

Backdrop=image.CopyPicture
```

81.37.95 **StrokeLineCap(LineCap as Integer)**

**Function:** Specify the shape to be used at the end of open subpaths when they are stroked.

**Notes:** Values of LineCap are UndefinedCap, ButtCap, RoundCap, and SquareCap.

81.37.96 **StrokeLineJoin(LineJoin as Integer)**

**Function:** Specify the shape to be used at the corners of paths (or other vector shapes) when they are stroked.

**Notes:** Values of LineJoin are UndefinedJoin, MiterJoin, RoundJoin, and BevelJoin.

81.37.97 **StrokeOpacity(opacity as Double)**

**Function:** Opacity to use when drawing lines or object outlines.
81.37.98 StrokeWidth(opacity as Double)

**Function:** Set width to use when drawing lines or object outlines.

81.37.99 Text(x as Double, y as Double, text as string)

**Function:** Annotate image with text using stroke color, font, font pointsize, and box color (text background color), at specified coordinates.

**Example:**
```vbnet
dim g as new GMGeometryMBS(500,500)
dim c as new GMCColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

dim draw as GMGraphicsMBS = image.Graphics

// draw red text
draw.strokeColor(new GMCColorRGBMBS("red")) // Outline color
draw.strokeWidth(1)
draw.Font("/Library/Fonts/Verdana.ttf")
draw.Text(50, 50, "Hello")
draw.Draw

Backdrop=image.CopyPicture
```

**Notes:** If text contains special format characters the image filename, type, width, height, or other image attributes may be incorporated in the text (see label).

See also:
- 81.37.100 Text(x as Double, y as Double, text as string, encoding as string)

81.37.100 Text(x as Double, y as Double, text as string, encoding as string)

**Function:** Annotate image with text represented with text encoding, using current stroke color, font, font pointsize, and box color (text background color), at specified coordinates.

**Notes:**
If text contains special format characters the image filename, type, width, height, or other image attributes may be incorporated in the text (see label()).
The text encoding specifies the code set to use for text annotations. The only character encoding which may be specified at this time is "UTF-8" for representing Unicode as a sequence of bytes. Specify an empty string to set text encoding to the system’s default. Successful text annotation using Unicode may require fonts designed to support Unicode.

Seems like you need ghostscript or the DPS library for text handling, so it may not be available for you. See also:

- 81.37.99 Text(x as Double, y as Double, text as string)

### 81.37.101 TextAntialias(flag as boolean)

**Function:** Antialias while drawing text (default true).

**Notes:** The main reason to disable text antialiasing is to avoid adding new colors to the image.

### 81.37.102 TextDecoration(DecorationType as Integer)

**Function:** Specify decoration (e.g. UnderlineDecoration) to apply to text.
81.37.103  TextUnderColor(c as GMColorMBS)

Function: Draw a box under rendered text using the specified color.

81.37.104  Translation(x as Double, y as Double)

Function: Apply coordinate translation (set new coordinate origin).
Example:

```dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

draw.StrokeColor new GMColorRGBMBS("red")
draw.Line(100,100,400,400)
draw.Translation 5,5
draw.StrokeColor new GMColorRGBMBS("blue")
draw.Line(100,100,400,400)
draw.Draw

Backdrop=image.CopyPicture```

81.37.105  Viewbox(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer)

Function: Dimensions of the output viewbox.
Notes: If the image is to be written to a vector format (e.g. MVG or SVG), then a PushGraphicContext() object should be pushed to the head of the list, followed by a Viewbox() statement to establish the output canvas size. A matching PopGraphicContext() object should be pushed to the tail of the list.
81.37. CLASS GMGRAPHICSMBS

81.37.106 Properties

81.37.107 Image as GMImageMBS

**Function:** The image this graphics object belongs to.

**Notes:** (Read only property)
81.38 class GMImageArrayMBS

81.38.1 class GMImageArrayMBS

Function: The class for an array of images in GraphicsMagick.

Example:

```vba
// extract all layers of photoshop file
Dim file As FolderItem = SpecialFolder.Desktop.Child("test.psd")
Dim images As new GMImageArrayMBS

images.readImages(file.UnixpathMBS)

Dim c As Integer = images.size
For i As Integer = 0 To c-1
    Dim image As GMImageMBS = images.Image(i)
    Dim file As SpecialFolder.Desktop.Child(image.FileName + "." + Str(i) + ".png")
    image.write(file)
Next
```

Notes: Can be used to assemble/disassemble gif images.

81.38.2 Methods

81.38.3 animateImages

Function: Animate a sequence of image frames.

Notes: Image frames are displayed in succession, creating an animated effect. The animation options are taken from the first image frame. This feature is only supported under X11 at the moment.

81.38.4 append(image as GMImageMBS)

Function: Adds an image to the end of the array.

Example:

```vba
// read gif
Dim g As new GMImageArrayMBS
Dim file As FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)
```
/ put copy of first image on the back
dim n as GMImageMBS = g.FirstImage
   g.append n

// write to file
   dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
   g.writeImages(output.UnixpathMBS)

81.38.5 appendImages(stack as boolean = false) as GMImageMBS

Function: Append a sequence of image frames, writing the result to new image.
Notes: All the input image frames must have the same width or height. Image frames of the same width
are stacked top-to-bottom. Image frames of the same height are stacked left-to-right. If the stack parameter
is false, rectangular image frames are stacked left-to-right otherwise top-to-bottom.

81.38.6 averageImages as GMImageMBS

Function: Average a sequence of image frames, writing the result to averagedImage.
Example:
   // read gif
   dim g as new GMImageArrayMBS
   dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
   g.readImages(file.UnixpathMBS)
   // averageImages
   dim n as GMImageMBS = g.averageImages
   Backdrop = n.CopyPicture

Notes: All the input image frames must be the same size in pixels.

81.38.7 coalesceImages as GMImageArrayMBS

Function: Create a coalesced image sequence obtained by "playing" the image sequence (observing page
offsets and disposal methods) to create a new image sequence in which all frames are full size and completely rendered.

**Example:**

```plaintext
// read gif
dim g as new GMImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// deconstruct
g = g.coalesceImages

// write gif
dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages output.UnixpathMBS
```

**Notes:** Note that if the original image sequence relied on page offsets and disposal methods that the resulting sequence will be larger (perhaps much larger) than the original. This is useful for GIF animation sequences that have page offsets and disposal methods. The resulting image sequence is returned.

### 81.38.8 Constructor

**Function:** Creates an empty image array.

### 81.38.9 deconstructImages as GMImageArrayMBS

**Function:** Break down an image sequence into constituent parts.

**Example:**

```plaintext
// read gif
dim g as new GMImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// deconstruct
g = g.deconstructImages

// write gif
dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages output.UnixpathMBS
```
Notes: This is useful for creating GIF or MNG animation sequences.

81.38.10 displayImages

Function: Display a sequence of image frames.
Notes:
Through use of a pop-up menu, image frames may be selected in succession. This feature is fully supported under X11 but may have only limited support in other environments. 
Caution: if an image format is is not compatible with the display visual (e.g. JPEG on a color-mapped display) then the original image will be altered. Use a copy of the original if this is a problem.

display methods are not supported currently.

81.38.11 FirstImage as GMImageMBS

Function: Returns first image in array.
Example:

```vbg
// read gif
dim g as new GMImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child(“test.gif”)
g.readImages(file.UnixpathMBS)

// show first image
dim img as GMImageMBS = g.FirstImage

// convert to true color for CopyPicture to work
const TrueColorType=6
img.type=TrueColorType
Backdrop = img.CopyPicture
```

81.38.12 flattenImages as GMImageMBS

Function: Merge a sequence of image frames which represent image layers into a single composited
representation.

**Example:**

```vbs
// read gif
dim g as new GMImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixPathMBS)

// put copy of first image on the back
dim n as GMImageMBS = g.flattenImages
Backdrop = n.CopyPicture
```

**Notes:** Returns the flattened image. This function is useful for combining Photoshop layers into a single image.

### 81.38.13 Image(index as Integer) as GMImageMBS

**Function:** Queries image with given index.

### 81.38.14 insert(image as GMImageMBS)

**Function:** Inserts an image on the front.

**Example:**

```vbs
// read gif
dim g as new GMImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixPathMBS)

// put copy of first image on the front
dim n as GMImageMBS = g.FirstImage
g.insert n

// write to file

dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages(output.UnixPathMBS)
```
81.38.15 LastImage as GMImageMBS

**Function:** Returns last image in array.

81.38.16 mapImages(map as GMImageMBS, dither as boolean = true, measureError as boolean = false)

**Function:** Replace the colors of a sequence of images with the closest color from a reference image.
**Notes:** Set dither to true to enable dithering. Set measureError to true in order to evaluate quantization error.

81.38.17 montageImages(options as GMMontageMBS) as GMImageArrayMBS

**Function:** Create a composite image by combining several separate image frames.
**Example:**

```plaintext
// build montage
dim StackingMontage as New GM16MontageMBS
StackingMontage.backgroundColor = New GM16ColorMBS(& cE7E7E7)
StackingMontage.fillColor = New GM16ColorMBS(& c000000)
StackingMontage.tile = New GM16GeometryMBS("1x20")
StackingMontage.geometry = New GM16GeometryMBS("160x120+5+5")
StackingMontage.font = "Helvetica"
StackingMontage.pointSize = 12
StackingMontage.title = "Title goes here"

// make picture
dim logo as Picture = LogoMBS(500)
dim image as New GM16ImageMBS(logo)

image.label("Sample label")

// Put the current image into the array
Dim StackingFrames As new GM16ImageArrayMBS
StackingFrames.insert(image)

// show result
dim resultImages as GM16ImageArrayMBS = StackingFrames.montageImages(StackingMontage)
Backdrop = resultImages.Image(0).CopyPicture
```
Notes: Multiple frames may be generated in the output array depending on the tile setting and the number of image frames montaged. Montage options are provided via the parameter options. Options set in the first image frame (backgroundColor, borderColor, matteColor, fillColor, strokeColor, font and fontPointsize) are also used as options by montageImages().

81.38.18  morphImages(frames as Integer) as GMImageArrayMBS

Function: Morph a sequence of image frames.
Example:

`// read gif
dim g as new GMImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// coalesce to make sure we have full images
g = g.coalesceImages

// morph to 10 pictures
\[ g = g.morphImages(10) \]

// write gif
\[ \text{dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")} \]
\[ g.writeImages output.UnixpathMBS \]

Notes: This algorithm expands the number of image frames (output to the new image array) by adding the number of intervening frames specified by frames such that the original frames morph (blend) into each other when played as an animation.

81.38.19  mosaicImages as GMImageMBS

Function: Inlay a number of images to form a single coherent picture.
Notes: The result image argument is updated with a mosaic constructed from the image sequence.

81.38.20  quantizeImages(measureError as boolean = false)

Function: Quantize colors in images using current quantization settings.
Notes: Set measureError to true in order to measure quantization error.
81.38. CLASS GMIMAGEARRAYMBS

81.38.21 readImages(blob as GMBlobMBS)

Function: Read a sequence of image frames into existing container (appending to array) from blob.
See also:

- 81.38.22 readImages(imageSpec as string)

81.38.22 readImages(imageSpec as string)

Function: Read a sequence of image frames into existing container (appending to array) with image names specified in the string imageSpec.
See also:

- 81.38.21 readImages(blob as GMBlobMBS)

81.38.23 remove(index as Integer)

Function: Removes the image with the given index.

Example:

```vbnet
// read gif
dim g as new GMImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// remove first
g.remove 0

// write to file

dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages(output.UnixpathMBS)
```

Notes: Index should be between 0 and size-1.

81.38.24 reverse

Function: Reverses the order of images in the array.
81.38.25 writeImages(blob as GMBlobMBS, adjoin as boolean = true)

Function: Writes images to the given blob object.

Notes:
Write images in container to in-memory BLOB specified by Blob blob. Set adjoin to false to write a set of image frames via a wildcard imageSpec (e.g. image% 02d.miff).
Caution: if an image format is selected which is capable of supporting fewer colors than the original image or quantization has been requested, the original image will be quantized to fewer colors. Use a copy of the original if this is a problem.
See also:

• 81.38.26 writeImages(imageSpec as string, adjoin as boolean = true)

81.38.26 writeImages(imageSpec as string, adjoin as boolean = true)

Function: Writes images to the given path.

Example:

```plaintext
// read gif
dim g as new GMImageArrayMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
g.readImages(file.UnixpathMBS)

// write to file

dim output as FolderItem = SpecialFolder.Desktop.Child("output.gif")
g.writeImages(output.UnixpathMBS)
```

Notes:
Write images in container to file specified by string imageSpec. Set adjoin, to false to write a set of image frames via a wildcard imageSpec (e.g. image% 02d.miff).
The wildcard must be one of % 0Nd, % 0No, or % 0Nx.
Caution: if an image format is selected which is capable of supporting fewer colors than the original image or quantization has been requested, the original image will be quantized to fewer colors. Use a copy of the original if this is a problem.
See also:

• 81.38.25 writeImages(blob as GMBlobMBS, adjoin as boolean = true)
81.38.27  Properties

81.38.28  empty as boolean

Function: Checks whether image array is empty.
Notes:
Returns true if array is empty or false if not.
(Read only property)

81.38.29  handle as Integer

Function: The internal handle of the image array.
Notes:
Should always be non zero.
(Read and Write property)

81.38.30  size as Integer

Function: Returns number of images in this array.
Example:
   // read gif
   dim g as new GMImageArrayMBS
   dim file as FolderItem = SpecialFolder.Desktop.Child("test.gif")
   g.readImages(file.UnixpathMBS)
   // display number of images
   MsgBox str(g.size)

Notes: (Read only property)
81.39 class GMImageChannelStatisticsMBS

81.39.1 class GMImageChannelStatisticsMBS

Function: The statistics for image channel.

Example:

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)
dim stat as GMImageStatisticsMBS = g.statistics
dim gs as GMImageChannelStatisticsMBS = stat.blue

MsgBox "blue channel: " + str(gs.minimum) + ", maximum " + str(gs.maximum) + ", mean " + str(gs.mean)
```

Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

81.39.2 Methods

81.39.3 Constructor

Function: The private constructor.

81.39.4 Properties

81.39.5 maximum as Double

Function: Maximum value observed.

Example:

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)
dim stat as GMImageStatisticsMBS = g.statistics
dim gs as GMImageChannelStatisticsMBS = stat.green

MsgBox "maximum green color: " + str(gs.maximum)
```
81.39. **mean as Double**

**Function:** Average (mean) value observed.  
**Example:**
```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)
dim stat as GMImageStatisticsMBS = g.statistics
dim r as GMImageChannelStatisticsMBS = stat.red

MsgBox "mean red color: " + str(R.mean)
```

**Notes:** (Read only property)

81.39. **minimum as Double**

**Function:** Minimum value observed.  
**Notes:** (Read only property)

81.39. **standardDeviation as Double**

**Function:** Standard deviation, sqrt(variance).  
**Notes:** (Read only property)

81.39. **variance as Double**

**Function:** Variance.  
**Notes:** (Read only property)
81.40 class GMImageMBS

81.40.1 class GMImageMBS

Function: Image is the primary object in Magick++ and represents a single image frame (see image design).

Example:

```
dim c as new GMColorMBS("white")
dim g as new GMGeometryMBS(100,100)
dim image as new GMImageMBS(g, c)
```

Notes:

With MBS Plugin 14.0 we offer this classes in 8bit (GM prefix) or 16bit (GM16 prefix).

The GMImageArrayMBS class must be used to operate on image sequences or images (e.g. of format GIF, TIFF, MIFF, Postscript, & MNG) which are comprised of multiple image frames. Individual frames of a multi-frame image may be requested by adding array-style notation to the end of the file name (e.g. "animation.gif [ 3 ] " retrieves the fourth frame of a GIF animation. Various image manipulation operations may be applied to the image. Attributes may be set on the image to influence the operation of the manipulation operations. The GMPixelsMBS class provides low-level access to image pixels.

81.40.2 Methods

81.40.3 adaptiveThreshold(width as UInt32, height as UInt32, offset as UInt32=0)

Function: Apply adaptive thresholding to the image.

Notes:

see:
http://www.dai.ed.ac.uk/HIPR2/adpthrsh.htm

Adaptive thresholding is useful if the ideal threshold level is not known in advance, or if the illumination gradient is not constant across the image. Adaptive thresholding works by evaluating the mean (average) of a pixel region (size specified by width and height) and using the mean as the thresholding value. In order to remove residual noise from the background, the threshold may be adjusted by subtracting a constant offset (default zero) from the mean to compute the threshold.
81.40.4  **addNoise(noise as Integer)**

**Function:** Add noise to image with the specified noise type.
**Example:**
```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.addNoise(image.GaussianNoise)

Backdrop=image.CopyPicture
```

**Notes:** Use one of this constants: GaussianNoise, ImpulseNoise, LaplacianNoise, MultiplicativeGaussianNoise, PoissonNoise, UniformNoise.

81.40.5  **addNoiseChannel(channel as Integer, noise as Integer)**

**Function:** Add noise to an image channel with the specified noise type. The channel parameter specifies the channel to add noise to.
**Example:**
```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.addNoiseChannel(image.BlueChannel, image.ImpulseNoise)

Backdrop=image.CopyPicture
```

**Notes:**
The noiseType parameter specifies the type of noise.
Use one of this constants: GaussianNoise, ImpulseNoise, LaplacianNoise, MultiplicativeGaussianNoise, PoissonNoise, UniformNoise.

81.40.6  **affineTransform(sx as Double, sy as Double, rx as Double, ry as Double, tx as Double, ty as Double)**

**Function:** Applies an affine transformation to the drawing matrix.
Notes: Specify a transformation matrix to adjust scaling, rotation, and translation (coordinate transformation) for subsequently drawn objects in the same or decendent drawing context. The sx & sy parameters represent the x & y scale factors, the rx & ry parameters represent the x & y rotation, and the tx & ty parameters represent the x & y translation.

81.40.7  annotate(text as string, boundingArea as GMSGeometryMBS, gravity as Integer)

Function: Annotate using specified text, bounding area, and placement gravity.

Notes:

Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

- NorthWestGravity: text bottom-left corner placed at top-left
- NorthGravity: text bottom-center placed at top-center
- NorthEastGravity: text bottom-right corner placed at top-right
- WestGravity: text left-center placed at left-center
- CenterGravity: text center placed at center
- EastGravity: text right-center placed at right-center
- SouthWestGravity: text top-left placed at bottom-left
- SouthGravity: text top-center placed at bottom-center
- SouthEastGravity: text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

- %b file size in bytes.
- %c comment.
- %d directory in which the image resides.
- %e extension of the image file.
- %f original filename of the image.
- %h height of image.
- %i filename of the image.
- %k number of unique colors.
- %l image label.
- %m image file format.
- %n number of images in a image sequence.
- %o output image filename.
- %p page number of the image.
- %q image depth (8 or 16).
- %r page number of the image.
- %s image scene number.
- %t image filename without any extension.
- %u a unique temporary filename.
- %w image width.
- %x x resolution of the image.
- %y y resolution of the image.

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

See also:

- 81.40.8 annotate(text as string, boundingArea as GMSGeometryMBS, gravity as Integer, degrees as Double)
81.40. **CLASS GMIMAGEMBS**

- 81.40.9 `annotate(text as string, gravity as Integer)`
- 81.40.10 `annotate(text as string, location as GMGeometryMBS)`

### 81.40.8 `annotate(text as string, boundingArea as GMGeometryMBS, gravity as Integer, degrees as Double)`

**Function:** Annotate with text using specified text, bounding area, placement gravity, and rotation.  

**Notes:**

Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

<table>
<thead>
<tr>
<th>Gravity</th>
<th>Placement</th>
</tr>
</thead>
<tbody>
<tr>
<td>NorthWestGravity</td>
<td>text bottom-left corner placed at top-left</td>
</tr>
<tr>
<td>NorthGravity</td>
<td>text bottom-center placed at top-center</td>
</tr>
<tr>
<td>NorthEastGravity</td>
<td>text bottom-right corner placed at top-right</td>
</tr>
<tr>
<td>WestGravity</td>
<td>text left-center placed at left-center</td>
</tr>
<tr>
<td>CenterGravity</td>
<td>text center placed at center</td>
</tr>
<tr>
<td>EastGravity</td>
<td>text right-center placed at right-center</td>
</tr>
<tr>
<td>SouthWestGravity</td>
<td>text top-left placed at bottom-left</td>
</tr>
<tr>
<td>SouthGravity</td>
<td>text top-center placed at bottom-center</td>
</tr>
<tr>
<td>SouthEastGravity</td>
<td>text top-right placed at bottom-right</td>
</tr>
</tbody>
</table>

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

- `%b` file size in bytes.  
- `%c` comment.  
- `%d` directory in which the image resides.  
- `%e` extension of the image file.  
- `%f` original filename of the image.  
- `%h` height of image.  
- `%i` filename of the image.  
- `%k` number of unique colors.  
- `%l` image label.  
- `%m` image file format.  
- `%n` number of images in a image sequence.  
- `%o` output image filename.  
- `%p` page number of the image.  
- `%q` image depth (8 or 16).  
- `%s` image scene number.  
- `%t` image filename without any extension.  
- `%u` a unique temporary filename.  
- `%w` image width.  
- `%x` resolution of the image.  
- `%y` resolution of the image.

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

**See also:**

- 81.40.7 `annotate(text as string, boundingArea as GMGeometryMBS, gravity as Integer)`  
- 81.40.9 `annotate(text as string, gravity as Integer)`  
- 81.40.10 `annotate(text as string, location as GMGeometryMBS)`
81.40.9 annotate(text as string, gravity as Integer)

**Function:** Annotate with text (bounding area is entire image) and placement gravity.

**Example:**

```vba
dim White as new GMColorGrayMBS(1)
dim Black as new GMColorGrayMBS(0)
dim geo as new GMGeometryMBS("300x200")

dim g as new GMImageMBS(geo, White)

g.antiAlias = False
g.fillColor = Black
g.lineWidth = 1
g.strokeColor = Black
g.font = "@/Library/Fonts/Tahoma.ttf"
g.fontPointsize = 15

g.annotate("Hello World", g.SouthGravity)

Backdrop = g.CopyPicture
```

**Notes:**

Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

- **NorthWestGravity** text bottom-left corner placed at top-left
- **NorthGravity** text bottom-center placed at top-center
- **NorthEastGravity** text bottom-right corner placed at top-right
- **WestGravity** text left-center placed at left-center
- **CenterGravity** text center placed at center
- **EastGravity** text right-center placed at right-center
- **SouthWestGravity** text top-left placed at bottom-left
- **SouthGravity** text top-center placed at bottom-center
- **SouthEastGravity** text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

- % b file size in bytes
- % c comment
- % d directory in which the image resides
- % e extension of the image file
- % f original filename of the image
- % h height of image
- % i filename of the image
- % k number of
unique colors. \%l image label. \%m image file format. \%n number of images in a image sequence. \%o output image filename. \%p page number of the image. \%q image depth (8 or 16). \%r page number of the image. \%s image scene number. \%t image filename without any extension. \%u a unique temporary filename. \%w image width. \%x x resolution of the image. \%y y resolution of the image.

Set a font with full path and @ in front. e.g. "@/Library/Fonts/Arial.ttf". This way the plugin loads it directly.

- 81.40.10 annotate(text as string, location as GMGeometryMBS) 13649

81.40.10 annotate(text as string, location as GMGeometryMBS)

**Function:** Annotate using specified text, and placement location.
**Notes:**
Annotate image (draw text on image)

Gravity effects text placement in bounding area according to these rules:

- NorthWestGravity text bottom-left corner placed at top-left
- NorthGravity text bottom-center placed at top-center
- NorthEastGravity text bottom-right corner placed at top-right
- WestGravity text left-center placed at left-center
- CenterGravity text center placed at center
- EastGravity text right-center placed at right-center
- SouthWestGravity text top-left placed at bottom-left
- SouthGravity text top-center placed at bottom-center
- SouthEastGravity text top-right placed at bottom-right

Annotate annotates an image with text. Optionally you can include any of the following bits of information about the image by embedding the appropriate special characters:

- \%b file size in bytes.
- \%c comment.
- \%d directory in which the image resides.
- \%e extension of the image file.
- \%f original filename of the image.
- \%h height of image.
- \%i filename of the image.

- 81.40.9 annotate(text as string, gravity as Integer) 13648

81.40.11 attributeValues as dictionary

Function: A dictionary with all attributes.
Notes: As attributes are created on demand, this will only return all so far generated attributes.

81.40.12 blur(radius as Double=0.0, sigma as Double=1.0)

Function: Blur an image with the specified blur factor.
Example:

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.blur(30,10)

Backdrop=image.CopyPicture
```

Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

81.40.13 blurChannel(channel as Integer, radius as Double=0.0, sigma as Double=1.0)

Function: Blur an image channel with the specified blur factor.
Example:
81.40. CLASS GMIMAGEMBS

```vbs
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.blurChannel(image.BlueChannel, 30, 10)

Backdrop=image.CopyPicture
```

**Notes:** The channel parameter specifies the channel to modify. The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

### 81.40.14 border

**Function:** Border image (add border to image).

**Example:**

```vbs
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.border

Backdrop=image.CopyPicture
```

**Notes:** The color of the border is specified by the borderColor attribute.

See also:

- 81.40.15 border(geometry as GMGeometryMBS)

### 81.40.15 border(geometry as GMGeometryMBS)

**Function:** Border image (add border to image).

**Example:**

```vbs
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.border GMGeometryMBS.Make(10, 10)

Backdrop=image.CopyPicture
```
Notes: The color of the border is specified by the borderColor attribute. 
See also: 
- 81.40.14 border 

81.40.16  borderGeometryDefault as String

Function: The default geometry description for border.

81.40.17  boundingBox as GMGeometryMBS

Function: Return smallest bounding box enclosing non-border pixels. 
Example: 
```vbnet
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS(“white”) // white
dim image as new GMImageMBS(g, c)

image.fillColor = new GMColorRGBMBS(“red”) // set color
image.strokeColor = new GMColorRGBMBS(“green”) // set color

image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)
draw.Draw

draw = nil
image.type = image.TrueColorType

Backdrop = image.CopyPicture

MsgBox image.boundingBox.StringValue
```

Notes: The current fuzz value is used when discriminating between pixels. This is the crop bounding box used by crop(Geometry(0,0)).
### 81.40.18 cacheThreshold(threshold as UInt32)

**Function:** Pixel cache threshold in megabytes.
**Notes:** Once this memory threshold is exceeded, all subsequent pixels cache operations are to/from disk. This setting is shared by all Image objects.

### 81.40.19 cdl(cdl as string)

**Function:** Bake in the ASC-CDL.
**Notes:** Bake in the ASC-CDL, which is a convention for the exchange of basic primary color grading information between equipment and software from different manufacturers. It is a useful transform for other purposes as well.

### 81.40.20 channel(channel as Integer)

**Function:** Extract channel from image.
**Notes:** Use this option to extract a particular channel from the image. MatteChannel for example, is useful for extracting the opacity values from an image.

### 81.40.21 charcoal(radius as Double=0.0, sigma as Double=1.0)

**Function:** Charcoal effect image (looks like charcoal sketch).
**Example:**
```vba
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
image.charcoal
Backdrop=image.CopyPicture
```
**Notes:** The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.
81.40.22 chop(geom as GMGeometryMBS)

**Function:** Chop image (remove vertical or horizontal subregion of image).

81.40.23 colorHistogram as dictionary

**Function:** Calculates histogram.
**Example:**
```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)
dim d as Dictionary = g.colorHistogram

MsgBox str(d.Count)+" color"

// check first color
dim c as GMColorMBS = d.key(0)

MsgBox "Color "+str(c.colorValue)+": "+str(d.Value(c))
```

**Notes:** The dictionary has a GMColorMBS/GMColor16MBS object as key for each color and an unsigned integer as value.

81.40.24 colorize(opacity as UInt32, penColor as GMColorMBS)

**Function:** Colorize image with pen color, using specified percent opacity.
**Example:**
```
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.colorize(10, new GMColorMBS("red"))

Backdrop=image.CopyPicture
```

See also:

- 81.40.25 colorize(opacityRed as UInt32, opacityGreen as UInt32, opacityBlue as UInt32, penColor as
81.40. **CLASS GMIMAGE,MBS**

GMColorMBS)

81.40.25 `colorize(opacityRed as UInt32, opacityGreen as UInt32, opacityBlue as UInt32, penColor as GMColorMBS)`

**Function:** Colorize image with pen color, using specified percent opacity for red, green, and blue quantums.
**Example:**

```vba
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.colorize(10, 0, 5, new GMColorMBS("red"))

Backdrop=image.CopyPicture
```

See also:

- 81.40.24 `colorize(opacity as UInt32, penColor as GMColorMBS)`

81.40.26 `colorMatrix(order as Integer, ColorMatrix() as Double)`

**Function:** Apply a color matrix to the image channels.
**Example:**

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)

dim m(8) as Double

m(0) = 0.25
m(1) = 0
m(2) = 0.25

m(3) = 0
m(4) = 0
m(5) = 0

m(6) = 0.25
m(7) = 0
m(8) = 0.25

g.colorMatrix 3, m
```
Notes: The user supplied matrix may be of order 1 to 5 (1x1 through 5x5).

### 81.40.27 columns as UInt32

**Function:** Image width.
**Example:**
```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
```

Title = str(image.columns) + ” x ” + str(image.rows)
Backdrop = image.CopyPicture

### 81.40.28 CombinePictureWithMask as picture

**Function:** Creates a copy of the image with mask.
**Example:**
```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

dim c as new GMColorMBS(”white”) 
image.transparent(c)

Backdrop = image.CombinePictureWithMask
```

**Notes:** Internally this calls Width and Height, CopyPicture and CopyMask.

### 81.40.29 compare(image as GMImageMBS) as boolean

**Function:** Compare current image with another image.
**Notes:** Sets meanErrorPerPixel, normalizedMaxError, and normalizedMeanError in the current image. False is returned if the images are identical. An ErrorOption exception is thrown if the reference image
columns, rows, colorspace, or matte differ from the current image:

### 81.40.30 composite(compositeImage as GMImageMBS, gravity as Integer, CompositeOperator as Integer=2)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose an image onto another at specified x and y offset and using a specified algorithm. See also:

- 81.40.31 composite(compositeImage as GMImageMBS, offset as GMGeometryMBS, CompositeOperator as Integer=2)
- 81.40.32 composite(compositeImage as GMImageMBS, xOffset as Integer, yOffset as Integer, CompositeOperator as Integer=2)

### 81.40.31 composite(compositeImage as GMImageMBS, offset as GMGeometryMBS, CompositeOperator as Integer=2)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose an image onto another at specified x and y offset and using a specified algorithm. See also:

- 81.40.30 composite(compositeImage as GMImageMBS, gravity as Integer, CompositeOperator as Integer=2)
- 81.40.32 composite(compositeImage as GMImageMBS, xOffset as Integer, yOffset as Integer, CompositeOperator as Integer=2)

### 81.40.32 composite(compositeImage as GMImageMBS, xOffset as Integer, yOffset as Integer, CompositeOperator as Integer=2)

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose an image onto another at specified x and y offset and using a specified algorithm. See also:

- 81.40.30 composite(compositeImage as GMImageMBS, gravity as Integer, CompositeOperator as Integer=2)
- 81.40.31 composite(compositeImage as GMImageMBS, offset as GMGeometryMBS, CompositeOperator as Integer=2)
- 81.40.32 composite(compositeImage as GMImageMBS, xOffset as Integer, yOffset as Integer, CompositeOperator as Integer=2)
CHAPTER 81. GRAPHICSMAGICK

81.40.33 Constructor

Function: Default constructor.

Example:

```vba
// get some image data (e.g. from blob in database)
dim logo as Picture = LogoMBS(500)
dim jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Dim mp as new GMImageMBS
dim blob as new GMBlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask
```

See also:

- 81.40.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)  

81.40.42 Constructor(pic as picture)

**Function:** Creates a new GMImage with the given picture.  
**Example:**

```vba
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
Backdrop=image.CopyPicture
```

**Notes:** Pixels from both the picture and picture’s mask.  
See also:
81.40.43 Constructor(size as GMGeometryMBS, ColorValue as GMColorMBS)

Function: Construct a blank image canvas of specified size and color.

Example:

```plaintext
dim g as new GMGeometryMBS(600,600)
dim c as new GMColorRGBMBS(1.0,0.0,0.0) // red
dim image as new GMImageMBS(g, c)

const TrueColorType=6

// Ensure that there are no other references to this image.
image.modifyImage
// Set the image type to TrueColor DirectClass representation.
image.type=TrueColorType

Backdrop=image.CopyPicture(0,0,600,600)
```

### 81.40.44 Constructor(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)

MBS GraphicsMagick Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Initializes single image frame from an array of raw pixels, with specified storage type (ConstituteImage).

**Example:**

```delphi
dim data as new memoryblock(2048*2048) // your data
dim image as new GMImageMBS(2048, 2048, "I", GMImageMBS.StorageTypeCharPixel, data)
```

**Notes:**

Returns an Image corresponding to an image stored in a raw memory array format. The pixel data must be in scanline order top-to-bottom. The data can be unsigned char, unsigned short int, unsigned int, unsigned long, float, or double. Float and double require the pixels to be normalized to the range \([0..1]\), otherwise the range is \([0..\text{MaxVal}]\) where MaxVal is the maximum possible value for that type.

Note that for most 32-bit architectures the size of an unsigned long is the same as unsigned int, but for 64-bit architectures observing the LP64 standard, an unsigned long is 64 bits, while an unsigned int remains 32 bits. This should be considered when deciding if the data should be described as "Integer" or "Long".

For example, to create a 640x480 image from unsigned red-green-blue character data, use

```delphi
image = new GMImageMBS(640, 480, "RGB", GMImageMBS.StorageTypeCharPixel, pixels);
```

width: width in pixels of the image.
height: height in pixels of the image.
map: This string reflects the expected ordering of the pixel array. It can be any combination or order of R = red, G = green, B = blue, A = alpha (same as Transparency), O = Opacity, T = Transparency, C = cyan, Y = yellow, M = magenta, K = black, or I = intensity (for grayscale). Specify "P" = pad, to skip over a quantum which is intentionally ignored. Creation of an alpha channel for CMYK images is currently not supported.

type: Define the data type of the pixels. Float and double types are expected to be normalized [ 0..1 ] otherwise [ 0..MaxRGB ]. Choose from these types: StorageTypeCharPixel, StorageTypeShortPixel, StorageTypeIntegerPixel, StorageTypeLongPixel, StorageTypeFloatPixel, or StorageTypeDoublePixel.

pixels: This array of values contain the pixel components as defined by map and type. You must preallocate this array where the expected length varies depending on the values of width, height, map, and type. You must preallocate this array where the expected length varies depending on the values of width, height, map, and type.

- 81.40.43 Constructor(size as GMGeometryMBS, ColorValue as GMColorMBS)

81.40.45 contrast(sharpen as UInt32)

Function: Contrast image (enhance intensity differences in image).

Example:

dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.contrast(10)

Backdrop=image.CopyPicture
81.40.46  **convolve(order as Integer, ColorMatrix() as Double)**

**Function:** Convolves the image.
**Example:**

```vbs
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)

dim m(8) as Double
m(0) = 0.25
m(1) = 0
m(2) = 0.25
m(3) = 0
m(4) = 0
m(5) = 0
m(6) = 0.25
m(7) = 0
m(8) = 0.25

g.convolve 3, m

Backdrop = g.CopyPicture
```

**Notes:**

Applies a user-specified convolution to the image.
order represents the number of columns and rows in the filter kernel.
kernel is an array of doubles representing the convolution kernel.

---

81.40.47  **CopyPicture as picture**

**Function:** Creates a copy of the image and returns it as a new picture.
**Example:**

```vbs
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

text.strokeColor = new GMColorRGBMBS("red") // Outline color
text.fillColor = new GMColorRGBMBS("green") // Fill color
```
image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

// Draw a circle
draw.Rectangle(250, 250, 100, 100)

Backdrop=image.CopyPicture

Notes: You may need to set image type to RGB to get it working.
See also:

- 81.40.48 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

**81.40.48 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture**

Function: Creates a copy of the image and returns it as a new picture.
Example:

dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.threshold 127

// convert to RGB so CopyPicture works
image.type = image.TrueColorType
Backdrop=image.CopyPicture(0,0,250,250)

Notes: You may need to set image type to RGB to get it working.
See also:

- 81.40.47 CopyPicture as picture

**81.40.49 CopyPictureMask as picture**

Function: Creates a copy of the image’s mask and returns it as a new picture.
See also:

- 81.40.50 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture
81.40. CLASS GMIMAGEMBS

81.40.50 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture

**Function:** Creates a copy of the image’s mask and returns it as a new picture.

See also:
- 81.40.49 CopyPictureMask as picture

81.40.51 CopyPixelsMemory as Memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Copy the pixels as they are into a memoryblock.

**Notes:**
Optional specify rectangle.
Returns nil on low memory or bad parameter. Image must be of type class direct (not palette picture).
Order of pixel data is normally Red, Green, Blue, Opacity. Or Cyan, Magenta, Yellow, Black for CMYK images.
For GMImageMBS, the data is 8bit per channel. For GMImage16MBS, the data is 16bit per channel.

See also:
- 81.40.52 CopyPixelsMemory(x as Integer, y as Integer, width as Integer, height as Integer) as Memoryblock

81.40.52 CopyPixelsMemory(x as Integer, y as Integer, width as Integer, height as Integer) as Memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Copy the pixels as they are into a memoryblock.

**Notes:**
Optional specify rectangle.
Returns nil on low memory or bad parameter. Image must be of type class direct (not palette picture).
Order of pixel data is normally Red, Green, Blue, Opacity. Or Cyan, Magenta, Yellow, Black for CMYK images.
For GMImageMBS, the data is 8bit per channel. For GMImage16MBS, the data is 16bit per channel.

See also:
- 81.40.51 CopyPixelsMemory as Memoryblock

81.40.53 CreateHBITMAP as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.
**Function:** Creates a HBITMAP for the image for use with Windows Declares.
Example:

```plaintext
// get test image
dim logo as Picture = LogoMBS(500)

// create GraphicsMagick image
dim g as new GMImageMBS(logo)

// make a HBitmap
dim hBitmap as ptr = g.CreateHBITMAP

// convert back to Xojo picture
dim pic as Picture = WindowsBitmapMBS.HBitmapToPicture(hBitmap, true)

// show in window
Backdrop = pic

// and cleanup memory
WindowsBitmapMBS.DeleteBitmap(hBitmap)
```

Notes: The HBITMAP returned needs to be freed when you are done with it or you risk having a memory leak.

### 81.40.54 crop(geometry as GMGeometryMBS)

**Function:** Crop image (return subregion of original image).
**Example:**

```plaintext
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.crop GMGeometryMBS.Make(100,200)

Backdrop=image.CopyPicture
```

### 81.40.55 cycleColormap(amount as Integer)

**Function:** Cycle (rotate) image colormap.
**Example:**
81.40. CLASS GMIMAGEMBS

```vbs```
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
image.cycleColormap(5)
image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

81.40.56 despeckle

**Function:** Despeckle image (reduce speckle noise).
**Example:**
```vbs```
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
image.despeckle
Backdrop=image.CopyPicture```

81.40.57 directory as string

**Function:** Tile names from within an image montage.

81.40.58 display

**Function:** Display image on screen.
**Notes:**
Caution: if an image format is is not compatible with the display visual (e.g. JPEG on a colormapped display) then the original image will be altered. Use a copy of the original if this is a problem.

The plugin is not compiled with X11 so this call may not be useful.
81.40.59  edge(radius as Double=0.0)

**Function:** Edge image (hilight edges in image).  
**Example:**

```vba
    dim p as Picture = LogoMBS(500)  
    dim image as new GMImageMBS(p)  

    image.edge  
    Backdrop=image.CopyPicture
```

**Notes:** The radius is the radius of the pixel neighborhood. Specify a radius of zero for automatic radius selection.

81.40.60  emboss(radius as Double=0.0, sigma as Double=1.0)

**Function:** Emboss image (hilight edges with 3D effect).  
**Example:**

```vba
    dim p as Picture = LogoMBS(500)  
    dim image as new GMImageMBS(p)  

    image.emboss  
    Backdrop=image.CopyPicture
```

**Notes:** The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

81.40.61  enhance

**Function:** Enhance image (minimize noise).  
**Example:**

```vba
    dim p as Picture = LogoMBS(500)  
    dim image as new GMImageMBS(p)  

    image.enhance
```
Backdrop=image.CopyPicture

81.40.62 erase

Function: Set all image pixels to the current background color.

81.40.63 fileSize as Int64

Function: Number of bytes of the image on disk.

81.40.64 flip

Function: Flip image (reflect each scanline in the vertical direction).
Example:

dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.flip

Backdrop=image.CopyPicture

81.40.65 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS)

Function: Flood-fill color across pixels that match the color of the target pixel and are neighbors of the
target pixel.
Notes: Uses current fuzz setting when determining color match.
See also:

- 81.40.66 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS)
- 81.40.67 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS)

**Function:** Flood-fill color across pixels starting at target-pixel and stopping at pixels matching specified border color.

**Notes:** Uses current fuzz setting when determining color match.

**See also:**

- 81.40.65 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS)
- 81.40.67 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS)
- 81.40.68 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS)
- 81.40.68 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS)

---

**Function:** Flood-fill color across pixels that match the color of the target pixel and are neighbors of the target pixel.

**Notes:** Uses current fuzz setting when determining color match.

**See also:**

- 81.40.65 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS)
- 81.40.67 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS)
- 81.40.68 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS)
- 81.40.68 floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS)

---

**Function:** Flood-fill color across pixels starting at target-pixel and stopping at pixels matching specified border color.

**Notes:** Uses current fuzz setting when determining color match.

**See also:**

- 81.40.65 floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS)
81.40. **CLASS GMIMAGEMBS**

- 81.40.66 `floodFillColor(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS)`
- 81.40.67 `floodFillColor(x as UInt32, y as UInt32, fillColor as GMColorMBS)`

81.40.69 `floodFillOpacity(x as UInt32, y as UInt32, opacity as UInt32, PaintMethod as Integer)`

**Function:** Flood-fill pixels matching color (within fuzz factor) of target pixel(x,y) with replacement opacity value using method.

81.40.70 `floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS)`

**Function:** Flood-fill texture across pixels that match the color of the target pixel and are neighbors of the target pixel.  
**Notes:** Uses current fuzz setting when determining color match.  
See also:

- 81.40.71 `floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS)`
- 81.40.72 `floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS)`
- 81.40.73 `floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS)`

81.40.71 `floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS)`

**Function:** Flood-fill texture across pixels starting at target-pixel and stopping at pixels matching specified border color.  
**Notes:** Uses current fuzz setting when determining color match.  
See also:

- 81.40.70 `floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS)`
- 81.40.72 `floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS)`
- 81.40.73 `floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS)`
81.40.72 floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS)

Function: Flood-fill texture across pixels that match the color of the target pixel and are neighbors of the target pixel.
Notes: Uses current fuzz setting when determining color match.
See also:

- 81.40.70 floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS)
- 81.40.71 floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS)
- 81.40.73 floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS)

81.40.73 floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS, borderColor as GMColorMBS)

Function: Flood-fill texture across pixels starting at target-pixel and stopping at pixels matching specified border color.
Notes: Uses current fuzz setting when determining color match.
See also:

- 81.40.70 floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS)
- 81.40.71 floodFillTexture(point as GMGeometryMBS, fillColor as GMColorMBS, borderColor as GMColorMBS)
- 81.40.72 floodFillTexture(x as UInt32, y as UInt32, fillColor as GMColorMBS)

81.40.74 flop

Function: Flop image (reflect each scanline in the horizontal direction).
Example:

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.flop

Backdrop=image.CopyPicture```

81.40.75  `fontTypeMetrics(name as string) as GMTypeMetricMBS`  
**Function:** Obtain font metrics for text string given current font, pointsize, and density settings.

81.40.76  `format as string`  
**Function:** Long image format description.

81.40.77  `frame`  
**Function:** Draw a decorative frame around the image.  
**Example:**  
```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.frame

Backdrop=image.CopyPicture
```

See also:
- 81.40.78 `frame(geometry as GMGeometryMBS)`  
- 81.40.79 `frame(width as UInt32, height as UInt32, innerBevel as Integer=6, outerBevel as Integer=6)`

81.40.78  `frame(geometry as GMGeometryMBS)`  
**Function:** Draw a decorative frame around the image.  
**Example:**  
```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.frame(GMGeometryMBS.Make("10x10"))

Backdrop=image.CopyPicture
```
See also:

- 81.40.77 frame
- 81.40.79 frame(width as UInt32, height as UInt32, innerBevel as Integer=6, outerBevel as Integer=6)

81.40.79 frame(width as UInt32, height as UInt32, innerBevel as Integer=6, outerBevel as Integer=6)

**Function:** Draw a decorative frame around the image.

**Example:**

```plaintext
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.frame(15,15)

Backdrop=image.CopyPicture
```

See also:

- 81.40.77 frame
- 81.40.78 frame(geometry as GMGeometryMBS)

81.40.80 frameGeometryDefault as String

**Function:** The default geometry description for frame.

81.40.81 gamma(gammaRed as Double, gammaGreen as Double, gammaBlue as Double)

**Function:** Gamma correct the image or individual image channels.

**Example:**

```plaintext
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
```
image.gamma(1,2,3)
Backdrop=image.CopyPicture

See also:

- 81.40.241 gamma as Double

### 81.40.82 gaussianBlur(width as Double, sigma as Double)

**Function:** Gaussian blur image.  
**Example:**
```
    dim p as Picture = LogoMBS(500)
    dim image as new GMImageMBS(p)

    image.gaussianBlur(30, 10)

    Backdrop=image.CopyPicture
```

**Notes:** The number of neighbor pixels to be included in the convolution mask is specified by width. The standard deviation of the gaussian bell curve is specified by sigma.

### 81.40.83 gaussianBlurChannel(channel as Integer, width as Double, sigma as Double)

**Function:** Gaussian blur image channel.  
**Notes:** The number of neighbor pixels to be included in the convolution mask is specified by width. The standard deviation of the gaussian bell curve is specified by sigma.

### 81.40.84 geometry as GMGeometryMBS

**Function:** Preferred size of the image when encoding.
81.40.85 getChromaBluePrimary(byref x as Double, byref y as Double)

Function: Chromaticity blue primary point.

81.40.86 getChromaGreenPrimary(byref x as Double, byref y as Double)

Function: Chromaticity green primary point.
Notes: e.g. x=0.3, y=0.6

81.40.87 getChromaRedPrimary(byref x as Double, byref y as Double)

Function: Chromaticity red primary point.
Notes: e.g. x=0.64, y=0.33

81.40.88 getChromaWhitePoint(byref x as Double, byref y as Double)

Function: Chromaticity white point.
Notes: e.g. x=0.3127, y=0.329

81.40.89 getConstIndexes as Ptr

Function: Obtain immutable image pixel indexes (valid for PseudoClass images)

81.40.90 getConstPixels(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

Function: Transfers read-only pixels from the image to the pixel cache as defined by the specified region
81.40.91  getIndexes as Ptr

Function: Obtain mutable image pixel indexes (valid for PseudoClass images)

81.40.92  getPixels(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

Function: Transfers pixels from the image to the pixel cache as defined by the specified region.
Example:

```vbscript
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)

// get pointer to some pixels to write
dim x as ptr = g.getPixels(0, 0, 100, 100)

// draw a red line to the pixel buffer
dim o as Integer
for i as Integer = 0 to 99
    o = 100 * i + i
    x.UInt32(o * 4) = &hFFFF0000
next

// write back
g.syncPixels

// show
me.Backdrop = g.CopyPicture
```

Notes: Modified pixels may be subsequently transferred back to the image via syncPixels. This method is valid for DirectClass images.

81.40.93  Graphics as GMGraphicsMBS

Function: Creates a graphics object for this image.
Example:

```vbscript
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)
```
image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture

Notes: Using the graphics object you can draw on the image.

81.40.94 haldClut(image as GMImageMBS)

Function: Apply a color lookup table (Hald CLUT) to the image.

81.40.95 implode(factor as Double=0.0)

Function: Implode image (special effect).
Example:

dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.implode(0.3)

Backdrop=image.CopyPicture

81.40.96 label as string

Function: Image label.
See also:
- 81.40.97 label(text as string)
81.40. CLASS GMIMAGEMBS

81.40.97 label(text as string)

**Function:** Assign a label to an image.
**Notes:** Use this option to assign a specific label to the image. Optionally you can include the image filename, type, width, height, or scene number in the label by embedding special format characters. If the first character of string is @, the image label is read from a file titled by the remaining characters in the string. When converting to Postscript, use this option to specify a header string to print above the image.
See also:
- 81.40.96 label as string

81.40.98 level(black_point as Double, white_point as Double, mid_point as Double=1.0)

**Function:** Level image to increase image contrast, and/or adjust image gamma.
**Example:**
```
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.level(0, 127.0)
```

**Notes:** Adjust the levels of the image by scaling the colors falling between specified white and black points to the full available quantum range. The parameters provided represent the black, mid (gamma), and white points. The black point specifies the darkest color in the image. Colors darker than the black point are set to zero. Mid point (gamma) specifies a gamma correction to apply to the image. White point specifies the lightest color in the image. Colors brighter than the white point are set to the maximum quantum value. The black and white point have the valid range 0 to MaxRGB while mid (gamma) has a useful range of 0 to ten:

81.40.99 levelChannel(channel as Integer, black_point as Double, white_point as Double, mid_point as Double=1.0)

**Function:** Level image channel to increase image contrast, and/or adjust image gamma.
**Example:**
```
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
```
image.levelChannel(image.BlueChannel, 0, 127.0)
Backdrop=image.CopyPicture

**Notes:** Adjust the levels of the image channel by scaling the colors falling between specified white and black points to the full available quantum range. The parameters provided represent the black, mid (gamma), and white points. The black point specifies the darkest color in the image. Colors darker than the black point are set to zero. Mid point (gamma) specifies a gamma correction to apply to the image. White point specifies the lightest color in the image. Colors brighter than the white point are set to the maximum quantum value. The black and white point have the valid range 0 to MaxRGB while mid (gamma) has a useful range of 0 to ten.

### 81.40.100 LibVersion as String

**Function:** Returns the version string of the GraphicsMagick library.

### 81.40.101 magnify

**Function:** Magnify image by integral size (double the dimensions)  
**Example:**
```
    dim p as Picture = LogoMBS(500)
    dim image as new GMImageMBS(p)
    image.magnify
    Backdrop=image.CopyPicture
```

### 81.40.102 map(mapImage as GMImageMBS, dither as boolean=false)

**Function:** Remap image colors with closest color from a reference image.  
**Example:**
```
    // some picture we want to map colors
    dim pic as Picture = LogoMBS(500)
```
// build a picture with palette
dim backgroundColor as new GMColorMBS(255,255,255) // white
dim size as new GMGeometryMBS(10,10)

dim i as new GMImageMBS(pic)
dim x as new GMImageMBS(size, backgroundColor)

x.pixelColor(0,0) = new GMColorMBS(0,0,0) // black
x.pixelColor(0,1) = new GMColorMBS(255,0,0) // red
x.pixelColor(0,2) = new GMColorMBS(0,255,0) // green
x.pixelColor(0,3) = new GMColorMBS(0,0,255) // blue
x.pixelColor(0,4) = new GMColorMBS(255,255,0) // yellow
x.pixelColor(0,5) = new GMColorMBS(0,255,255) // cyan
x.pixelColor(0,6) = new GMColorMBS(255,0,255) // magenta

// do the map
i.map(x, false)

// convert result from palette picture to bitmap picture
i.type = i.TrueColorType

// and copy picture to backdrop
Backdrop = i.CopyPicture

Notes: Set dither to true in to apply Floyd/Steinberg error diffusion to the image. By default, color reduction chooses an optimal set of colors that best represent the original image. Alternatively, you can choose a particular set of colors from an image file with this option.
81.40.103 matteFloodfill(target as GMColorMBS, opacity as UInt32, x as Integer, y as Integer, PaintMethod as Integer)

**Function:** Floodfill designated area with a replacement opacity value.

81.40.104 meanErrorPerPixel as Double

**Function:** The mean error per pixel computed when an image is color reduced.  
**Notes:** This parameter is only valid if verbose is set to true and the image has just been quantized.

81.40.105 medianFilter(radius as Double=0.0)

**Function:** Filter image by replacing each pixel component with the median color in a circular neighborhood.  
**Example:**
```vba
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
image.medianFilter(10)
Backdrop=image.CopyPicture
```

81.40.106 minify

**Function:** Reduce image by integral (half) size.  
**Example:**
```vba
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
image.minify
Backdrop=image.CopyPicture
```
81.40. **modequalizeifyImage**

**Function:** Not documented.

81.40.**modifyImage**

**Function:** Prepare to update image (copy if reference >1).
**Notes:** Normally Magick++’s implicit reference counting takes care of all instance management. In the rare case that the automatic instance management does not work, use this method to assure that there is only one reference to the image to be modified. It should be used in the cases where a GraphicsMagick C function is used directly on an image which may have multiple references:

81.40.**modulate(brightness as Double, saturation as Double, hue as Double)**

**Function:** Modulate percent hue, saturation, and brightness of an image.
**Example:**
```
dim logo as Picture = LogoMBS(500)
dim image as new GMImageMBS(logo)
image.type = image.TrueColorType

// brightness 150%
image.modulate(150,100,100)
backdrop = image.CopyPicture
```
**Notes:** Modulation of saturation and brightness is as a ratio of the current value (100 for no change). Modulation of hue is an absolute rotation of -180 degrees to +180 degrees from the current position corresponding to an argument range of 0 to 200 (100 for no change).

81.40.**montageGeometry as GMGeometryMBS**

**Function:** Tile size and offset within an image montage.
**Notes:** Only valid for montage images.
81.40.111  **motionBlur(radius as Double, sigma as Double, angle as Double)**

**Function:** Motion blur image with specified blur factor.
**Example:**
```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.motionBlur(30,10,90)
Backdrops=image.CopyPicture
```

**Notes:** The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels. The angle parameter specifies the angle the object appears to be coming from (zero degrees is from the right).

81.40.112  **negate(grayscale as boolean=false)**

**Function:** Negate colors in image.
**Example:**
```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.negate
Backdrops=image.CopyPicture
```

**Notes:** Set grayscale to only negate grayscale values in image.

81.40.113  **normalize**

**Function:** Normalize image (increase contrast by normalizing the pixel values to span the full range of color values).
**Example:**
```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
```
81.40. CLASS GMIMAGEMBS

image.normalize

Backdrop=image.CopyPicture

81.40.114  normalizedMaxError as Double

Function: The normalized max error per pixel computed when an image is color reduced.
Notes: This parameter is only valid if verbose is set to true and the image has just been quantized.

81.40.115  normalizedMeanError as Double

Function: The normalized mean error per pixel computed when an image is color reduced.
Notes: This parameter is only valid if verbose is set to true and the image has just been quantized.

81.40.116  oilPaint(radius as Double=3.0)

Function: Oilpaint image (image looks like an oil painting).
Example:

```
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.oilPaint

Backdrop=image.CopyPicture
```

81.40.117  opacity(opacity as UInt32)

Function: Set or attenuate the opacity channel in the image.
Notes: If the image pixels are opaque then they are set to the specified opacity value, otherwise they are blended with the supplied opacity value. The value of opacity ranges from 0 (completely opaque) to MaxRGB. The defines OpaqueOpacity and TransparentOpacity are available to specify completely opaque or completely transparent, respectively.
81.40.118  
**opaque(opaqueColor as GMColorMBS, penColor as GMColorMBS)**

**Function:** Change color of specified opaque pixel to specified pen color.

81.40.119  
**ping(data as GMBlobMBS)**

**Function:** Reads information for an image from the blob.  
**Notes:** Ping is similar to read except only enough of the image is read to determine the image columns, rows, and filesize. Access the columns, rows, and fileSize attributes after invoking ping. The image pixels are not valid after calling ping.  
**See also:**
- 81.40.120 ping(file as folderitem)
- 81.40.121 ping(Path as string)

81.40.120  
**ping(file as folderitem)**

**Function:** Reads information for an image from the file.  
**Example:**
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child( “test.jpg”)

// try with Constructor (same as read)
dim t1 as Double = Microseconds
dim g1 as new GMImageMBS(f)

// now just ping
dim t2 as Double = Microseconds
dim g2 as new GMImageMBS
g2.ping(f)

// or read
dim t3 as Double = Microseconds
dim g3 as new GMImageMBS
g3.read(f)

dim t4 as Double = Microseconds

// show speeds
MsgBox str(T4-t3)+” s for read”+EndOfLine+-
str(T3-t2)+” s for ping”+EndOfLine+.-```
**81.40. CLASS GMIMAGEMBS**

`str(T2-t1) + " s for Constructor"`

**Notes:** Ping is similar to read except only enough of the image is read to determine the image columns, rows, and filesize. Access the columns, rows, and fileSize attributes after invoking ping. The image pixels are not valid after calling ping.

See also:

- 81.40.119 ping(data as GMBlobMBS)
- 81.40.121 ping(Path as string)

**81.40.121  ping(Path as string)**

**Function:** Reads information for an image from the image specification.

**Notes:** Ping is similar to read except only enough of the image is read to determine the image columns, rows, and filesize. Access the columns, rows, and fileSize attributes after invoking ping. The image pixels are not valid after calling ping.

See also:

- 81.40.119 ping(data as GMBlobMBS)
- 81.40.120 ping(file as folderitem)

**81.40.122  PNGLibVersion as string**

**Function:** Queries PNG library version string.

**81.40.123  quantize(measureError as boolean=false)**

**Function:** Quantize image (reduce number of colors).

**Example:**

```plaintext
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.quantize

image.type = image.TrueColorType
Backdrop = image.CopyPicture
```
Notes: Set `measureError` to true in order to calculate error attributes.

81.40.124  **QuantumDepth as Integer**

**Function:** Returns the quantum depth.

81.40.125  **quantumOperator(channel as Integer, Operator as Integer, rvalue as Double)**

**Function:** Apply an arithmetic or bitwise operator to the image pixel quantums.  
**Example:**
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)

const AddQuantumOp = 1
const ThresholdQuantumOp = 10

g.quantumOperator( g.AllChannels, AddQuantumOp, 100)

// show
me.Backdrop = g.CopyPicture
```

See also:
- 81.40.126 quantumOperator(x as Integer, y as Integer, columns as Integer, rows as Integer, channel as Integer, Operator as Integer, rvalue as Double)

81.40.126  **quantumOperator(x as Integer, y as Integer, columns as Integer, rows as Integer, channel as Integer, Operator as Integer, rvalue as Double)**

**Function:** Apply an arithmetic or bitwise operator to the image pixel quantums.  
See also:
- 81.40.125 quantumOperator(channel as Integer, Operator as Integer, rvalue as Double)
81.40. CLASS GMIMAGEMBS

81.40.127 raiseGeometryDefault as String

**Function:** The default geometry description for raise.

81.40.128 raiseImage

**Function:** Raise image (lighten or darken the edges of an image to give a 3-D raised or lowered effect).

**Example:**
```
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.raiseImage

Backdrop=image.CopyPicture
```

See also:

- 81.40.129 raiseImage(geometry as GMGeometryMBS, raisedFlag as boolean=false)

81.40.129 raiseImage(geometry as GMGeometryMBS, raisedFlag as boolean=false)

**Function:** Raise image (lighten or darken the edges of an image to give a 3-D raised or lowered effect).

**Example:**
```
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.raiseImage(GMGeometryMBS.Make(5,8))

Backdrop=image.CopyPicture
```

See also:

- 81.40.128 raiseImage
**81.40.130 randomThreshold(thresholds as GMGeometryMBS)**

**Function:** Random threshold image.

**Example:**

```vba
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.randomThreshold(GMGeometryMBS.make("50x200"))

image.type = image.TrueColorType
Backdrop=image.CopyPicture
```

**Notes:** Changes the value of individual pixels based on the intensity of each pixel compared to a random threshold. The result is a low-contrast, two color image. The thresholds argument is a geometry containing LOWxHIGH thresholds. If the string contains 2x2, 3x3, or 4x4, then an ordered dither of order 2, 3, or 4 will be performed instead. If a channel argument is specified then only the specified channel is altered. This is a very fast alternative to 'quantize' based dithering.

**81.40.131 randomThresholdChannel(thresholds as GMGeometryMBS, channel as Integer)**

**Function:** Random threshold image channel.

**Notes:** Changes the value of individual pixels based on the intensity of each pixel compared to a random threshold. The result is a low-contrast, two color image. The thresholds argument is a geometry containing LOWxHIGH thresholds. If the string contains 2x2, 3x3, or 4x4, then an ordered dither of order 2, 3, or 4 will be performed instead. If a channel argument is specified then only the specified channel is altered. This is a very fast alternative to 'quantize' based dithering.

**81.40.132 read(blob as GMBlobMBS)**

**Function:** Read single image frame from in-memory Blob.

**Example:**

```vba
// get some image data (e.g. from blob in database)
dim logo as Picture = LogoMBS(500)
dim jpegData as string = PictureToJPEGStringMBS(logo, 80)

// new image
Dim mp as new GMImageMBS
```
81.40. CLASS GMIMAGEMBS

dim blob as new GMBlobMBS(jpegData)

// read data from blob into this image object
mp.Read blob

// sometimes you need to explicit convert to RGB/RGBA
'mp.type = mp.TrueColorMatteType
Backdrop=mp.CombinePictureWithMask

See also:

- 81.40.141 read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr) 13699

81.40.141  read(width as UInt32, height as UInt32, map as string, StorageType as Integer, data as ptr)

Function: Read single image frame from an array of raw pixels, with specified storage type (ConstituteImage).
Notes:

Returns an Image corresponding to an image stored in a raw memory array format. The pixel data must be in scanline order top-to-bottom. The data can be unsigned char, unsigned short int, unsigned int, unsigned long, float, or double. Float and double require the pixels to be normalized to the range [ 0..1 ] , otherwise the range is [ 0..MaxVal ] where MaxVal is the maximum possible value for that type.
Note that for most 32-bit architectures the size of an unsigned long is the same as unsigned int, but for 64-bit architectures observing the LP64 standard, an unsigned long is 64 bits, while an unsigned int remains 32 bits. This should be considered when deciding if the data should be described as "Integer" or "Long".

For example, to create a 640x480 image from unsigned red-green-blue character data, use

```csharp
image = new GMImageMBS(640, 480, "RGB", GMImageMBS.StorageTypeCharPixel, pixels);
```

width: width in pixels of the image.

height: height in pixels of the image.

map: This string reflects the expected ordering of the pixel array. It can be any combination or order of R = red, G = green, B = blue, A = alpha (same as Transparency), O = Opacity, T = Transparency, C = cyan, Y = yellow, M = magenta, K = black, or I = intensity (for grayscale). Specify "P" = pad, to skip over a quantum which is intentionally ignored. Creation of an alpha channel for CMYK images is currently not supported.

type: Define the data type of the pixels. Float and double types are expected to be normalized [ 0..1 ] otherwise [ 0..MaxRGB ] . Choose from these types: StorageTypeCharPixel, StorageTypeShortPixel, StorageTypeIntegerPixel, StorageTypeLongPixel, StorageTypeFloatPixel, or StorageTypeDoublePixel.

pixels: This array of values contain the pixel components as defined by map and type. You must preallocate this array where the expected length varies depending on the values of width, height, map, and type.

81.40.142 reduceNoise

**Function:** Reduce noise in image using a noise peak elimination filter.

**Example:**

```csharp
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
```
81.40. CLASS GMIMAGEMBS

image.reduceNoise

Backdrop=image.CopyPicture

See also:

• 81.40.143 reduceNoise(order as Double)

81.40.143 reduceNoise(order as Double)

**Function:** Reduce noise in image using a noise peak elimination filter.

See also:

• 81.40.142 reduceNoise

81.40.144 ReleaseDate as String

**Function:** Returns the release date of the used graphics magick library.
**Notes:** We update the library only when someone needs an update, so if you need, please contact us.

81.40.145 roll(columns as UInt32, rows as UInt32)

**Function:** Roll image (rolls image vertically and horizontally) by specified number of columns and rows.
**Example:**

```pascal
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.roll(30,30)

Backdrop=image.CopyPicture
```

See also:

• 81.40.146 roll(roll as GMGeometryMBS)
81.40.146  roll(roll as GMGeometryMBS)

**Function:** Roll image (rolls image vertically and horizontally) by specified number of columns and rows.
**Example:**
```vbscript
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
image.roll(GMGeometryMBS.Make(0,0,30,30))
Backdrop=image.CopyPicture
```

See also:
- 81.40.145 roll(columns as UInt32, rows as UInt32)

81.40.147  rotate(degree as Double)

**Function:** Rotate image counter-clockwise by specified number of degrees.
**Example:**
```vbscript
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
image.rotate(30)
Backdrop=image.CopyPicture
```

81.40.148  rows as UInt32

**Function:** The number of pixel rows in the image.
**Example:**
```vbscript
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
Title = str(image.columns)+" x "+str(image.rows)
Backdrop=image.CopyPicture
```
81.40. CLASS GMIMAGEMBS

81.40.149 sample(geometry as GMGeometryMBS)

Function: Resize image by using pixel sampling algorithm.
Example:

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.sample GMGeometryMBS.make(100,100)

Backdrop=image.CopyPicture
```

81.40.150 scale(geometry as GMGeometryMBS)

Function: Resize image by using simple ratio algorithm which provides good quality.
Example:

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.scale new GMGeometryMBS(100,100)

Backdrop=image.CopyPicture
```

81.40.151 segment(clusterThreshold as Double=1.0, smoothingThreshold as Double=1.5)

Function: Segment (coalesce similar image components) by analyzing the histograms of the color components and identifying units that are homogeneous with the fuzzy c-means technique.
Example:

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.segment

image.type = image.TrueColorType

Backdrop=image.CopyPicture
```
Notes: A histogram is built for the image. This histogram is filtered to reduce noise and a second derivative of the histogram plot is built and used to identify potential cluster colors (peaks in the histogram). The cluster colors are then validated by scanning through all of the pixels to see how many pixels fall within each cluster. Some candidate cluster colors may not match any of the image pixels at all and should be discarded. Specify clusterThreshold, as the number of pixels matching a cluster color in order for the cluster to be considered valid. SmoothingThreshold eliminates noise in the second derivative of the histogram. As the value is increased, you can expect a smoother second derivative. The default is 1.5.

81.40.152  setChromaBluePrimary(x as Double, y as Double)
Function: Chromaticity blue primary point.
Notes: e.g. x=0.15, y=0.06

81.40.153  setChromaGreenPrimary(x as Double, y as Double)
Function: Chromaticity green primary point.
Notes: e.g. x=0.3, y=0.6

81.40.154  setChromaRedPrimary(x as Double, y as Double)
Function: Chromaticity red primary point
Notes: e.g. x=0.64, y=0.33

81.40.155  setChromaWhitePoint(x as Double, y as Double)
Function: Chromaticity white point
Notes: e.g. x=0.3127, y=0.329

81.40.156  SetPicture(pic as picture, x as Integer, y as Integer)
Function: Copies the picture into the Image at the given position.
81.40.157  SetPictureMask(maskpic as picture, x as Integer, y as Integer)

Function: Copies the picture into the Image’s mask at the given position.
Example:

```vba
' this converts 32 bit PNG with alpha channel to BMP

Dim f As FolderItem = SpecialFolder.Desktop.Child("test.png")
Dim p As Picture = Picture.Open(f)

Dim g As New GMImageMBS( New GMGeometryMBS(p.Width, p.Height), New GMColorGrayMBS(1.0))

G.Type = G.TrueColorMatteType
G.Matte = True
G.Magick = "BMP"

G.SetPicture(p, 0, 0)
G.SetPictureMask(p.mask.invertMBS, 0, 0)

F = SpecialFolder.Desktop.Child("test.bmp")
G.Write(f)
```

81.40.158  setPixels(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

Function: Allocates a pixel cache region to store image pixels as defined by the region rectangle.
Example:

```vba
Dim f As FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Dim g As New GMImageMBS(f)

' get pointer to some pixels to write
Dim x As ptr = g.setPixels(0, 0, 100, 100)

' draw a red line to the pixel buffer
Dim o As Integer
For i As Integer = 0 To 99
    o = 100 * i + i
    x.UInt32(o * 4) = &HFFFF0000
Next
```
// write back
g.syncPixels

// show
me.Backdrop = g.CopyPicture

**Notes:** This area is subsequently transferred from the pixel cache to the image via syncPixels.

### 81.40.159  setStrokeDashArray(values() as Double)

**Function:** Sets stroke dash pattern.

**Notes:** Specify the pattern of dashes and gaps used to stroke paths. The strokeDashArray represents a zero-terminated array of numbers that specify the lengths of alternating dashes and gaps in pixels. If an odd number of values is provided, then the list of values is repeated to yield an even number of values. A typical strokeDashArray array might contain the members 5 3 2 0, where the zero value indicates the end of the pattern array.

### 81.40.160  shade(azimuth as Double=30.0, elevation as Double=30.0, colorShading as boolean=false)

**Function:** Shade image using distant light source.

**Notes:** Specify azimuth and elevation as the position of the light source. By default, the shading results as a grayscale image. Set colorShading to true to shade the red, green, and blue components of the image.

### 81.40.161  sharpen(radius as Double=0.0, sigma as Double=1.0)

**Function:** Sharpen pixels in image.

**Example:**

```vbs
    dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.sharpen

Backdrop=image.CopyPicture
```
Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

81.40.162 sharpenChannel(channel as Integer, radius as Double=0.0, sigma as Double=1.0)

Function: Sharpen pixels in image channel.
Notes: The radius parameter specifies the radius of the Gaussian, in pixels, not counting the center pixel. The sigma parameter specifies the standard deviation of the Laplacian, in pixels.

81.40.163 shave(geometry as GMGeometryMBS)

Function: Shave pixels from image edges.
Example:
```vba
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
image.shave(new GMGeometryMBS(200,200))
Backdroup=image.CopyPicture
```

81.40.164 shear(xShearAngle as Double, yShearAngle as Double)

Function: Shear image (create parallelogram by sliding image by X or Y axis).
Example:
```vba
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
image.shear(10,20)
Backdroup=image.CopyPicture
```

Notes: Shearing slides one edge of an image along the X or Y axis, creating a parallelogram. An X direction
shear slides an edge along the X axis, while a Y direction shear slides an edge along the Y axis. The amount of the shear is controlled by a shear angle. For X direction shears, x degrees is measured relative to the Y axis, and similarly, for Y direction shears y degrees is measured relative to the X axis. Empty triangles left over from shearing the image are filled with the color defined as borderColor.

**81.40.165 signature(force as boolean=false) as string**

**Function:** Image textual signature.  
**Example:**

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
MsgBox image.signature
Backdrop=image.CopyPicture
```

**Notes:** Set force to true in order to re-calculate the signature regardless of whether the image data has been modified.

**81.40.166 solarize(factor as Double=50.0)**

**Function:** Solarize image (similar to effect seen when exposing a photographic film to light during the development process)  
**Example:**

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
image.solarize
Backdrop=image.CopyPicture
```

**81.40.167 spread(amount as UInt32=3)**

**Function:** Spread pixels randomly within image by specified amount  
**Example:**
81.40. CLASS GMIMAGEMBS

dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.spread 5

Backdrop=image.CopyPicture

81.40.168 statistics as GMImageStatisticsMBS

**Function:** Obtain image statistics.  
**Example:**

dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)
dim stat as GMImageStatisticsMBS = g.statistics
dim gs as GMImageChannelStatisticsMBS = stat.blue

MsgBox "blue channel: "+str(gs.minimum)+" - "+str(gs.maximum)+", mean "+str(gs.mean)

**Notes:** Statistics are normalized to the range of 0.0 to 1.0 and are output to the specified ImageStatistics structure.

81.40.169 stegano(watermark as GMImageMBS)

**Function:** Add a digital watermark to the image (based on second image).  
**Example:**

dim p as Picture = LogoMBS(500)
dim p1 as Picture = NewPicture(550,500,32)
dim p2 as Picture = NewPicture(550,500,32)
p1.Graphics.DrawPicture p, 0,0
p2.Graphics.DrawPicture p,50,0

dim image1 as new GMImageMBS(p1)
dim image2 as new GMImageMBS(p2)

image2.zoom(new GMGeometryMBS(100,100)) // scale down

// add watermark
image1.stegano(image2)

// now make a threshold so you see the difference
image1.threshold 254

image1.type = image1.TrueColorType
Backdrop=image1.CopyPicture

81.40.170  stereo(rightImage as GMImageMBS)

**Function:** Create an image which appears in stereo when viewed with red-blue glasses (Red image on left, blue on right)
**Example:**

```vbscript
dim p as Picture = LogoMBS(500)
dim p1 as Picture = NewPicture(550,500,32)
dim p2 as Picture = NewPicture(550,500,32)

p1.Graphics.DrawPicture p, 0,0
p2.Graphics.DrawPicture p,50,0

dim image1 as new GMImageMBS(p1)
dim image2 as new GMImageMBS(p2)

image1.stereo(IMAGE2)

Backdrop=image1.CopyPicture
```

81.40.171  strip

**Function:** Remove all profiles and text attributes from the image.

81.40.172  strokeDashArray as Double()

**Function:** Queries stroke dash pattern.
**Notes:** Specify the pattern of dashes and gaps used to stroke paths. The strokeDashArray represents a zero-terminated array of numbers that specify the lengths of alternating dashes and gaps in pixels. If an
odd number of values is provided, then the list of values is repeated to yield an even number of values. A typical strokeDashArray array might contain the members 5 3 2 0, where the zero value indicates the end of the pattern array.

### 81.40.173 swirl(degree as Double)

**Function:** Swirl image (image pixels are rotated by degrees).

**Example:**
```
Dim p as Picture = LogoMBS(500)
Dim image as new GMImageMBS(p)

Image.swirl 200

Backdrop = Image.CopyPicture
```

### 81.40.174 syncPixels

**Function:** Transfers the image cache pixels to the image.

### 81.40.175 texture(texture as GMImageMBS)

**Function:** Channel a texture on pixels matching image background color.

### 81.40.176 threshold(degree as Double)

**Function:** Threshold image channels (below threshold becomes black, above threshold becomes white).

**Example:**
```
Dim p as Picture = LogoMBS(500)
Dim image as new GMImageMBS(p)

Image.threshold 127

// convert to RGB so CopyPicture works
```
image.type = image.TrueColorType
Backdrop=image.CopyPicture

**Notes:** The range of the threshold parameter is 0 to MaxRGB.

### 81.40.177  thumbnail(geometry as GMGeometryMBS)

**MBS GraphicsMagick Plugin, Plugin Version:** 16.4, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes.  
**Function:** Resize image using several algorithms to make smaller images very quickly.  
**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)

// make thumbnail
dim geo as new GMGeometryMBS(100, 100)
g.thumbnail(geo)

// show
me.Backdrop = g.CopyPicture
```

### 81.40.178  totalColors as UInt32

**MBS GraphicsMagick Plugin, Plugin Version:** 9.3, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes.  
**Function:** Number of colors in the image.  
**Example:**

```vbnet
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

Title = str(image.totalColors) // shows 5284
Backdrop=image.CombinePictureWithMask
```

### 81.40.179  transform(imageGeometry as GMGeometryMBS)

**MBS GraphicsMagick Plugin, Plugin Version:** 9.3, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes.  
**Function:** Transform image based on image and crop geometries.
81.40. CLASS GMIMAGEMBS

Notes: Crop geometry is optional.
See also:

- 81.40.180 transform(imageGeometry as GMGeometryMBS, cropGeometry as GMGeometryMBS) 13713

81.40.180 transform(imageGeometry as GMGeometryMBS, cropGeometry as GMGeometryMBS)

Function: Transform image based on image and crop geometries.
Notes: Crop geometry is optional.
See also:

- 81.40.179 transform(imageGeometry as GMGeometryMBS) 13712

81.40.181 transformOrigin(tx as Double, ty as Double)

Function: Origin of coordinate system to use when annotating with text or drawing.

81.40.182 transformReset

Function: Reset transformation parameters to default.

81.40.183 transformRotation(angle as Double)

Function: Rotation to use when annotating with text or drawing.

81.40.184 transformScale(tx as Double, ty as Double)

Function: Scale to use when annotating with text or drawing.
**81.40.185 transformSkewX(x as Double)**

**Function:** Skew to use in X axis when annotating with text or drawing.

**81.40.186 transformSkewY(y as Double)**

**Function:** Skew to use in Y axis when annotating with text or drawing.

**81.40.187 transparent(color as GMColorMBS)**

**Function:** Add matte channel to image, setting pixels matching color to transparent.
**Example:**

```vba
Dim p As Picture = LogoMBS(500)
Dim image As New GMImageMBS(p)

Dim c As New GMColorMBS("white")
image.transparent(c)
Backdrop = image.CombinePictureWithMask
```

**81.40.188 trim**

**Function:** Trim edges that are the background color from the image.
**Example:**

```vba
Dim p As Picture = LogoMBS(500)
// make the logo picture bigger
Dim q As Picture = NewPicture(700,700,32)
q.Graphics.DrawPicture p,100,100

Dim image As New GMImageMBS(q)
// now trim the white border away
image.trim
```
81.40.189 unregisterId

**Function:** Not documented.

81.40.190 unsharpmask(radius as Double, sigma as Double, amount as Double, threshold as Double)

**Function:** Replace image with a sharpened version of the original image using the unsharp mask algorithm.  
**Example:**
```pascal
    dim p as Picture = LogoMBS(500)
    dim image as new GMImageMBS(p)
    image.unsharpmask(10,1,0.5,50)
```

Notes:
- radius: the radius of the Gaussian, in pixels, not counting the center pixel.
- sigma: the standard deviation of the Gaussian, in pixels.
- amount: the percentage of the difference between the original and the blur image that is added back into the original.
- threshold: the threshold in pixels needed to apply the difference amount.

81.40.191 unsharpmaskChannel(channel as Integer, radius as Double, sigma as Double, amount as Double, threshold as Double)

**Function:** Replace image channel with a sharpened version of the original image using the unsharp mask algorithm.  
**Example:**
```pascal
    dim p as Picture = LogoMBS(500)
    dim image as new GMImageMBS(p)
```
image.unsharpmaskChannel(Image.RedChannel, 10,1,0.5,50)

Backdrop=image.CopyPicture

Notes:

channel: image channel to modify.
radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Gaussian, in pixels.
amount: the percentage of the difference between the original and the blur image that is added back into the original.
threshold: the threshold in pixels needed to apply the difference amount.

81.40.192 wave(amplitude as Double=25.0, wavelength as Double=150.0)

Function: Map image pixels to a sine wave.
Example:

dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.wave

Backdrop=image.CopyPicture

81.40.193 write(blob as GMBlobMBS)

Function: Write single image frame to in-memory Blob, with optional format and adjoin parameters.
See also:

- 81.40.194 write(blob as GMBlobMBS, magick as string) 13717
- 81.40.195 write(blob as GMBlobMBS, magick as string, depth as UInt32) 13717
- 81.40.196 write(file as folderitem) 13717
- 81.40.197 write(Path as string) 13718
- 81.40.198 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 13718
81.40.  CLASS GMIMAGEMBS

81.40.194  write(blob as GMBlobMBS, magick as string)

Function: Write single image frame to in-memory Blob, with optional format and adjoin parameters.
See also:

- 81.40.193 write(blob as GMBlobMBS)
- 81.40.195 write(blob as GMBlobMBS, magick as string, depth as UInt32)
- 81.40.196 write(file as folderitem)
- 81.40.197 write(Path as string)
- 81.40.198 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr)

81.40.195  write(blob as GMBlobMBS, magick as string, depth as UInt32)

Function: Write single image frame to in-memory Blob, with optional format and adjoin parameters.
See also:

- 81.40.193 write(blob as GMBlobMBS)
- 81.40.194 write(blob as GMBlobMBS, magick as string)
- 81.40.196 write(file as folderitem)
- 81.40.197 write(Path as string)
- 81.40.198 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr)

81.40.196  write(file as folderitem)

Function: Write single image frame to a file.
Example:

// this converts 32 bit PNG with alpha channel to BMP

dim f as FolderItem = SpecialFolder.Desktop.Child("test.png")
dim p as Picture = Picture.Open(f)

dim g as new GMImageMBS( new GMGeometryMBS(p.Width, p.Height), new GMColorGrayMBS(1.0))
g.type = g.TrueColorMatteType
g.matte = True
g.magick = "BMP"

g.SetPicture(p, 0, 0)
g.SetPictureMask(p.mask.invertMBS, 0, 0)

f = SpecialFolder.Desktop.Child("test.bmp")
g.write(f)

See also:

- 81.40.193 write(blob as GMBlobMBS) 13716
- 81.40.194 write(blob as GMBlobMBS, magick as string) 13717
- 81.40.195 write(blob as GMBlobMBS, magick as string, depth as UInt32) 13717
- 81.40.197 write(Path as string) 13718
- 81.40.198 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 13718

81.40.197 write(Path as string)

Function: Write single image frame to a file.

See also:

- 81.40.193 write(blob as GMBlobMBS) 13716
- 81.40.194 write(blob as GMBlobMBS, magick as string) 13717
- 81.40.195 write(blob as GMBlobMBS, magick as string, depth as UInt32) 13717
- 81.40.196 write(file as folderitem) 13717
- 81.40.198 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr) 13718

81.40.198 write(x as Integer, y as Integer, columns as Integer, rows as Integer, map as string, type as Integer, Pixels as Ptr)

Function: Write single image frame to an array of pixels with storage type specified by user (DispatchImage).

Notes: e.g. image.write( 0, 0, 640, 1, "RGB", 0, pixels)

See also:
81.40. **CLASS GMIMAGEMBS**  
- 81.40.193 write(blob as GMBlobMBS)  
- 81.40.194 write(blob as GMBlobMBS, magick as string)  
- 81.40.195 write(blob as GMBlobMBS, magick as string, depth as UInt32)  
- 81.40.196 write(file as folderitem)  
- 81.40.197 write(Path as string)

81.40.199 **xResolution as Double**

**Function:** x resolution of the image.  
**Notes:** See also density functions.

81.40.200 **yResolution as Double**

**Function:** y resolution of the image.

81.40.201 **zoom(geometry as GMGeometryMBS)**

**Function:** Zoom (resize) image to specified size.  
**Example:**
```
dim p as Picture = LogoMBS(500)  
dim image as new GMImageMBS(p)  
image.zoom(new GMGeometryMBS(200,200))  
Backdrop=image.CopyPicture
```

81.40.202 **Properties**

81.40.203 **baseColumns as UInt32**

**Function:** Base image width (before transformations)  
**Notes:** (Read only property)
81.40.204  baseFilename as String

Function: Base image filename (before transformations)
Notes: (Read only property)

81.40.205  baseRows as Uint32

Function: Base image height (before transformations).
Example:

```vba
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
Title = str(image.baseRows)+" x "+str(image.baseColumns)
```

Notes: (Read only property)

81.40.206  comment as string

Function: Image comment.
Notes:
When you set this property, you add comment string to image.
By default, each image is commented with its file name. Use this method to assign a specific comment to
the image. Optionally you can include the image filename, type, width, height, or other image attributes by
embedding special format characters:
(Read and Write property)

81.40.207  handle as Integer

Function: The internal object reference.
Example:

```vba
dim c as new GMColorMBS("white")
dim g as new GMGeometryMBS(100,100)
dim image as new GMImageMBS(g, c)
MsgBox hex(image.handle) // valid if not zero
```
Notes: (Read and Write property)

81.40.208 height as Integer

Function: The height of the image.  
Example:  

```vbnet
dim c as new GMColorRGBMBS(1.0,0.0,0.0)
dim size as new GMGeometryMBS(100,100)
dim g as new GMImageMBS(size, c)
```

MsgBox str(g.width)+" "+str(g.height)

Notes:  
This is a convenience function for you which calls size.height.  
(Read only property)

81.40.209 width as Integer

Function: The width of the image.  
Example:  

```vbnet
dim c as new GMColorRGBMBS(1.0,0.0,0.0)
dim size as new GMGeometryMBS(100,100)
dim g as new GMImageMBS(size, c)
```

MsgBox str(g.width)+" "+str(g.height)

Notes:  
This is a convenience function for you which calls size.width.  
(Read only property)
81.40.210  adjoin as boolean

**Function:** Join images into a single multi-image file.  
**Notes:** (Read and Write computed property)

81.40.211  animationDelay as UInt32

**Function:** Time in 1/100ths of a second (0 to 65535) which must expire before displaying the next image in an animated sequence.  
**Notes:**  
This option is useful for regulating the animation of a sequence of GIF images within Netscape. (Read and Write computed property)

81.40.212  animationIterations as UInt32

**Function:** Number of iterations to loop an animation (e.g. Netscape loop extension) for.  
**Notes:** (Read and Write computed property)

81.40.213  antiAlias as boolean

**Function:** Control antialiasing of rendered Postscript and Postscript or TrueType fonts.  
**Notes:**  
Enabled by default.  
(Read and Write computed property)

81.40.214  attributeValue(name as string) as string

**Function:** Access an arbitrary named image attribute.  
**Example:**
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("IMG_4048.jpg")
dim g as new GMImageMBS(f)
dim a as string = g.attributeValue("EXIF:DateTime")
MsgBox a
```
Any number of named attributes may be attached to the image. For example, the image comment is a named image attribute with the name "comment". EXIF tags are attached to the image as named attributes. Use the syntax "EXIF:<tag>" to request an EXIF tag similar to "EXIF:DateTime":

(Read and Write computed property)
**81.40.219 channelDepth(channel as Integer) as UInt32**

Function: Set or obtain modulus channel depth.
Notes: (Read and Write computed property)

**81.40.220 classType as Integer**

Function: Image class (DirectClass or PseudoClass).
Notes: NOTE: setting a DirectClass image to PseudoClass will result in the loss of color information if the number of colors in the image is greater than the maximum palette size (either 256 or 65536 entries depending on the value of QuantumDepth when ImageMagick was built):
(Read and Write computed property)

**81.40.221 clipMask as GMImageMBS**

Function: Associate a clip mask image with the current image.
Notes: The clip mask image must have the same dimensions as the current image or an exception is thrown. Clipping occurs wherever pixels are transparent in the clip mask image. Clipping Pass an invalid image to unset an existing clip mask.
(Read and Write computed property)

**81.40.222 colorFuzz as Double**

Function: Colors within this distance are considered equal.
Notes: A number of algorithms search for a target color. By default the color must be exact. Use this option to match colors that are close to the target color in RGB space.
(Read and Write computed property)
81.40.223 colorMap(index as UInt32) as GMColorMBS

**Function:** Color at colormap position index.
**Notes:** (Read and Write computed property)

81.40.224 colorMapSize as UInt32

**Function:** Number of entries in the colormap.
**Notes:**
Setting the colormap size may extend or truncate the colormap. The maximum number of supported entries is specified by the MaxColormapSize constant, and is dependent on the value of QuantumDepth when GraphicsMagick is compiled. An exception is thrown if more entries are requested than may be supported. Care should be taken when truncating the colormap to ensure that the image colormap indexes reference valid colormap entries.
(Read and Write computed property)

81.40.225 colorSpace as Integer

**Function:** The colorspace (e.g. CMYK) used to represent the image pixel colors.
**Notes:**
(Read and Write computed property)

81.40.226 compose as Integer

**Function:** Composition operator to be used when composition is implicitly used (such as for image flattening).
**Notes:** (Read and Write computed property)

81.40.227 compressType as Integer

**Function:** Image compression type.
**Notes:**
UndefinedColors = 0
RGBColors = 1 (Plain old RGB colorspace)
GRAYColors = 2 (Plain old full-range grayscale)
TransparentColor = 3 (RGB but preserve matte channel during quantize)
OHTAColors = 4
XYZColors = 5 (CIE XYZ)
YCCColors = 6 (Kodak PhotoCD PhotoYCC)
YIQColors = 7
YPbPrColors = 8
YUVColors = 9
CMYKColors = 10 (Cyan, magenta, yellow, black, alpha)
sRGBColors = 11 (Kodak PhotoCD sRGB)
HSLColors = 12 (Hue, saturation, luminosity)
HWBColors = 13 (Hue, whiteness, blackness)
LABColors = 14 (LAB colorspace not supported yet other than via lcms)
CineonLogRGBColors = 15 (RGB data with Cineon Log scaling, 2.048 density range)
Rec601LumaColors = 16 (Luma (Y) according to ITU-R 601)
Rec601YCbCrColors = 17 (YCbCr according to ITU-R 601)
Rec709LumaColors = 18 (Luma (Y) according to ITU-R 709)
Rec709YCbCrColors = 19 (YCbCr according to ITU-R 709)

The default is the compression type of the input image file.
(Read and Write computed property)

81.40.228 debug as boolean

Function: Enable printing of debug messages from GraphicsMagick as it executes.
Notes: (Read and Write computed property)

81.40.229 defineSet(magick as string, key as string) as boolean

Function: Set or obtain a definition flag to applied when encoding or decoding the specified format.
Notes:
Similar to the defineValue() method except that passing the flag value 'true' creates a value-less define with
that format and key. Passing the flag value 'false' removes any existing matching definition. The method
returns 'true' if a matching key exists, and 'false' if no matching key exists.
(Read and Write computed property)
81.40.230  **defineValue(magick as string, key as string) as string**

**Function:** Set or obtain a definition string to applied when encoding or decoding the specified format.  
**Notes:**

The meanings of the definitions are format specific. The format is designated by the magick argument, the format-specific key is designated by key, and the associated value is specified by value. See the defineSet() method if the key must be removed entirely.  
(Read and Write computed property)

81.40.231  **density as GMGeometryMBS**

**Function:** Vertical and horizontal resolution in pixels of the image.  
**Example:**

```vbnet
dim p as new GMImageMBS

item as FolderItem = SpecialFolder.Desktop.Child(“input.png”)  
p.read(item)  
p.scale new GMGeometryMBS(3750,3750)  
p.quality = 95  
p.resolutionUnits = p.PixelsPerInchResolution  
p.density = new GMGeometryMBS(300, 300)  
dim out as FolderItem = SpecialFolder.Desktop.Child(“output.png”)  
p.write out
```

**Notes:**

This option specifies an image density when decoding a Postscript or Portable Document page. Often used with psPageSize.  
(Read and Write computed property)

81.40.232  **depth as UInt32**

**Function:** Image depth (bits allocated to red/green/blue components).  
**Notes:**

Used to specify the bit depth when reading or writing raw images or when the output format supports multiple depths. Defaults to the quantum depth that GraphicsMagick is compiled with.  
(Read and Write computed property)
81.40.233  endian as Integer

**Function:** The endian mode.
**Notes:**
Endianness (LSBEndian like Intel, MSBEndian like SPARC, or NativeEndian for what this computer uses)
for image formats which support endian-specific options.
(Read and Write computed property)

81.40.234  fileName as string

**Function:** Image file name.
**Notes:** (Read and Write computed property)

81.40.235  fillColor as GMColorMBS

**Function:** Color to use when filling drawn objects.
**Example:**
```plaintext
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS(“white”) // white
dim image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS(“red”) // Outline color
image.fillColor = new GMColorRGBMBS(“green”) // Fill color
image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)
Backdrop=image.CopyPicture
```
**Notes:** (Read and Write computed property)
81.40. CLASS GMIMAGEMBS

81.40.236 fillPattern as GMImageMBS

**Function:** Pattern to use while filling drawn objects.
**Notes:** (Read and Write computed property)

81.40.237 fillRule as Integer

**Function:** Rule to use when filling drawn objects
**Notes:** (Read and Write computed property)

81.40.238 filterType as Integer

**Function:** The reduction filter employed has a significant effect on the time required to resize an image and the resulting quality. The default filter is Lanczos which has been shown to produce high quality results when reducing most images.
**Notes:**
Filter to use when resizing image.
(Read and Write computed property)

81.40.239 font as string

**Function:** Text rendering font.
**Notes:**
If the font is a fully qualified X server font name, the font is obtained from an X server. To use a TrueType font, precede the TrueType filename with an @. Otherwise, specify a Postscript font name (e.g. "helvetica").
(Read and Write computed property)

81.40.240 fontPointsize as Double

**Function:** Text rendering font point size.
**Notes:** (Read and Write computed property)
81.40.241  gamma as Double

Function:  Gamma correct the image or individual image channels.

Example:

```vba
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.gamma = 3.0

Backdrop=image.CopyPicture
```

Notes:

If you get the value, it is the gamma level of the image. Gamma is a pow() function which converts between the linear light representation and the representation for the computer display. Most computer images are gamma corrected to 2.2 (1/0.4545) so that each step results in a visually linear step on a computer or video display:

(Read and Write computed property)

See also:

- 81.40.81 gamma(gammaRed as Double, gammaGreen as Double, gammaBlue as Double)

81.40.242  gifDisposeMethod as UInt32

Function:  GIF disposal method.

Notes:

This option (specific to the GIF file format) is used to control how successive frames are rendered (how the preceding frame is disposed of) when creating a GIF animation.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Disposal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UndefinedDispose</td>
<td>0</td>
<td>No disposal specified.</td>
</tr>
<tr>
<td>NoneDispose</td>
<td>1</td>
<td>Do not dispose between frames.</td>
</tr>
<tr>
<td>BackgroundDispose</td>
<td>2</td>
<td>Overwrite frame with background color from header.</td>
</tr>
<tr>
<td>PreviousDispose</td>
<td>3</td>
<td>Overwrite with previous frame.</td>
</tr>
</tbody>
</table>

(Read and Write computed property)
81.40.243  iccColorProfile as GMBlobMBS

**Function:** ICC color profile.

**Example:**
```vbscript
dim f as FolderItem = SpecialFolder.Desktop.Child("IMG_0793.tif")
dim Image as new GMImageMBS(f)
dim ProfileBlob as GMBlobMBS = Image.iccColorProfile

dim.ProfileData as string = ProfileBlob.CopyString

dim cm as LCMS2ProfileMBS = LCMS2ProfileMBS.OpenProfileFromString(ProfileData)
dim name as string = cm.Name

Break  // check data in debugger
```

**Notes:**
Supplied via a Blob since Magick++/ and GraphicsMagick do not currently support formatting this data structure directly. Specifications are available from the International Color Consortium for the format of ICC color profiles.
(Read and Write computed property)

81.40.244  interlaceType as Integer

**Function:** The type of interlacing scheme (default NoInterlace).

**Notes:**
This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files (e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.
(Read and Write computed property)

81.40.245  iptcProfile as GMBlobMBS

**Function:** IPTC profile.

**Notes:**
Supplied via a Blob since Magick++ and GraphicsMagick do not currently support formatting this data structure directly. Specifications are available from the International Press Telecommunications Council for IPTC profiles.
81.40.246 isValid as boolean

Function: Does object contain valid image?
Notes: Set to false in order to invalidate the image. Images constructed via the default constructor are invalid images and isValid() will return false.
(Read and Write computed property)

81.40.247 lineWidth as Double

Function: Stroke width for drawing vector objects (default one)
Notes: This method is now deprecated. Please use strokeWidth instead.
(Read and Write computed property)

81.40.248 magick as string

Function: The name of the codec to use for compression.
Example:

```javascript
// this converts 32 bit PNG with alpha channel to BMP

dim f as FolderItem = SpecialFolder.Desktop.Child("test.png")
dim p as Picture = Picture.Open(f)

dim g as new GMImageMBS( new GMGeometryMBS(p.Width, p.Height), new GMColorGrayMBS(1.0))
g.type = g.TrueColorMatteType
g.matte = True
g.magick = ”BMP”
g.SetPicture(p, 0, 0)
g.SetPictureMask(p.mask.invertMBS, 0, 0)

f = SpecialFolder.Desktop.Child("test.bmp")
g.write(f)
```
81.40. CLASS GMIMAGEMBS

Notes: (Read and Write computed property)

81.40.249  matte as boolean

Function: Image supports transparency (matte channel)
Notes: (Read and Write computed property)

81.40.250  matteColor as GMColorMBS

Function: Image matte (frame) color.
Notes: (Read and Write computed property)

81.40.251  modulusDepth as UInt32

Function: Image modulus depth (minimum number of bits required to support red/green/blue components without loss of accuracy).
Notes: The pixel modulus depth may be decreased by supplying a value which is less than the current value, updating the pixels (reducing accuracy) to the new depth. The pixel modulus depth can not be increased over the current value using this method.
(Read and Write computed property)

81.40.252  monochrome as boolean

Function: Transform image to black and white while color reducing (quantizing).
Notes: (Read and Write computed property)

81.40.253  orientation as Integer

Function: Image orientation. Supported by some file formats such as DPX and TIFF. Useful for turning
the right way up.

Notes: (Read and Write computed property)

81.40.254 page as GMGeometryMBS

Function: Preferred size and location of an image canvas.

Notes:

Use this option to specify the dimensions and position of the Postscript page in dots per inch or a TEXT page in pixels. This option is typically used in concert with density. Page may also be used to position a GIF image (such as for a scene in an animation).

(Read and Write computed property)

81.40.255 penColor as GMColorMBS

Function: The pen color.

Notes: (Read and Write computed property)

81.40.256 pixelColor(x as UInt32, y as UInt32) as GMColorMBS

Function: Get/set pixel color at location x & y.

Example:

```pascal
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)
dim c as new GMColorMBS(“red”)

for x as Integer = 240 to 260
     image.pixelColor(x,250)=c
next

for y as Integer = 240 to 260
     image.pixelColor(250,y)=c
next

Backdrop=image.CopyPicture
```
81.40. CLASS GMIMAGEMBS

Notes: (Read and Write computed property)

81.40.257 profile(name as string) as GMBlobMBS

Function: Get or set a named profile.
Notes:
Add or remove a named profile to/from the image. Remove the profile by passing an empty Blob (e.g. Blob()). Valid names are "**", "8BIM", "ICM", "IPTC", or a user/format-defined profile name.

Retrieve a named profile from the image. Valid names are: "8BIM", "8BIMTEXT", "APP1", "APP1JPEG", "ICC", "ICM", & "IPTC" or an existing user/format-defined profile name
(Read and Write computed property)

81.40.258 quality as UInt32

Function: JPEG/MIFF/PNG compression level (default 75).
Notes: (Read and Write computed property)

81.40.259 quantizeColors as UInt32

Function: Maximum number of colors to quantize to.
Example:

dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.quantizeColors = 10
image.quantize

image.type = image.TrueColorType
Backdrop=image.CopyPicture

Notes: (Read and Write computed property)
81.40.260  quantizeColorSpace as Integer

**Function:** Colorspace to quantize in (default RGB).  
**Example:**

```vba
// load a picture
dim f as FolderItem = SpecialFolder.Desktop.Child("test.png")
dim pic as Picture = Picture.Open(f)

const GrayColorSpace = 2

Dim Converter As New GMImageMBS(Pic)

// quantize with dither
Converter.type = GMImageMBS.BilevelType
Converter.quantizeColorSpace = GrayColorSpace
Converter.quantizeColors = 2
Converter.quantizeDither = True
Converter.quantize

// convert back to Xojo
Converter.type = GMImageMBS.TrueColorType
Backdrop = Converter.CopyPicture
```

**Notes:**

Empirical evidence suggests that distances in color spaces such as YUV or YIQ correspond to perceptual color differences more closely than do distances in RGB space. These color spaces may give better results when color reducing an image.  
(Read and Write computed property)

81.40.261  quantizeDither as boolean

**Function:** Apply Floyd/Steinberg error diffusion to the image.  
**Example:**

```vba
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.quantizeColors = 10
image.quantizeDither = true
image.quantize
```
image.type = image.TrueColorType
Backdrop=image.CopyPicture

Notes:
The basic strategy of dithering is to trade intensity resolution for spatial resolution by averaging the intensities of several neighboring pixels. Images which suffer from severe contouring when reducing colors can be improved with this option. The quantizeColors or monochrome option must be set for this option to take effect.
(Read and Write computed property)

81.40.262 quantizeTreeDepth as UInt32

Function: Depth of the quantization color classification tree.
Notes:
Values of 0 or 1 allow selection of the optimal tree depth for the color reduction algorithm. Values between 2 and 8 may be used to manually adjust the tree depth.
(Read and Write computed property)

81.40.263 renderingIntent as Integer

Function: The type of rendering intent (used when applying an ICC color profile).
Notes: (Read and Write computed property)

81.40.264 resolutionUnits as Integer

Function: Units of image resolution.
Notes: (Read and Write computed property)

81.40.265 scene as UInt32

Function: Image scene number.
Notes: (Read and Write computed property)
81.40.266 size as GMGeometryMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Width and height of a raw image (an image which does not support width and height information).

**Example:**

```vba
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

MsgBox image.size.StringValue

image.size = new GMGeometryMBS(200,200)

Backdrop=image.CopyPicture
```

**Notes:**

Size may also be used to affect the image size read from a multi-resolution format (e.g. Photo CD, JBIG, or JPEG.
(Read and Write computed property)

81.40.267 strokeAntiAlias as boolean

**Notes:** (Read and Write computed property)

81.40.268 strokeColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Color to use when drawing object outlines.

**Example:**

```vba
dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics
```
81.40. CLASS GMIMAGEMBS

// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture

Notes: (Read and Write computed property)

81.40.269  strokeLineJoin as Integer

Function: Specify the shape to be used at the corners of paths (or other vector shapes) when they are stroked. 
Notes: (Read and Write computed property)

Values of LineJoin are UndefinedJoin, MiterJoin, RoundJoin, and BevelJoin.
(Read and Write computed property)

81.40.271  strokeLineCap as Integer

Function: Specify the shape to be used at the end of open subpaths when they are stroked. 
Notes: (Read and Write computed property)

Values of LineCap are UndefinedCap, ButtCap, RoundCap, and SquareCap.
(Read and Write computed property)

81.40.272  strokeMiterLimit as UInt32

Function: Specify miter limit.
Notes:
When two line segments meet at a sharp angle and miter joins have been specified for 'lineJoin', it is possible for the miter to extend far beyond the thickness of the line stroking the path. The miterLimit imposes a
limit on the ratio of the miter length to the 'lineWidth'. The default value of this parameter is 4.
(Read and Write computed property)

81.40.273 strokePattern as GMImageMBS

Function: Pattern image to use while stroking object outlines.
Notes: (Read and Write computed property)

81.40.274 strokeWidth as Double

Function: Stroke width for drawing vector objects (default one).
Example:

```dim g as new GMGeometryMBS(500,500)
dim c as new GMColorRGBMBS("white") // white
dim image as new GMImageMBS(g, c)

image.strokeColor = new GMColorRGBMBS("red") // Outline color
image.fillColor = new GMColorRGBMBS("green") // Fill color
image.strokeWidth = 5

dim draw as GMGraphicsMBS = image.Graphics

// Draw a circle
draw.Circle(250, 250, 120, 150)

Backdrop=image.CopyPicture```

Notes: (Read and Write computed property)

81.40.275 subImage as UInt32

Function: Subimage of an image sequence.
Notes: (Read and Write computed property)
81.40. CLASS GMIMAGEMBS

81.40.276  subRange as UInt32

**Function:** Number of images relative to the base image.
**Notes:** (Read and Write computed property)

81.40.277  textEncoding as string

**Function:** Annotation text encoding (e.g. "UTF-16").
**Notes:** (Read and Write computed property)

81.40.278  tileName as string

**Function:** Tile name.
**Notes:** (Read and Write computed property)

81.40.279  type as Integer

**Function:** The type of this image.
**Example:**

```
dim p as Picture = LogoMBS(500)
dim image as new GMImageMBS(p)

image.type = image.GrayscaleType

Backdrop=image.CopyPicture
```

**Notes:**
You can set this value to convert the image to the type.

Convert the image representation to the specified type or retrieve the current image type. If the image is reduced to an inferior type, then image information may be lost (e.g. color changed to grayscale).

Available enumerations for the type parameter:
<table>
<thead>
<tr>
<th>Variable</th>
<th>Value Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BilevelType</td>
<td>1 black/white</td>
</tr>
<tr>
<td>GrayscaleType</td>
<td>2 grayscale</td>
</tr>
<tr>
<td>GrayscaleMatteType</td>
<td>3 grayscale with alpha (opacity) channel</td>
</tr>
<tr>
<td>PaletteType</td>
<td>4 colormapped</td>
</tr>
<tr>
<td>PaletteMatteType</td>
<td>5 colormapped with transparency</td>
</tr>
<tr>
<td>TrueColorType</td>
<td>6 true (full) color</td>
</tr>
<tr>
<td>TrueColorMatteType</td>
<td>7 true (full) color with alpha (opacity) channel</td>
</tr>
<tr>
<td>ColorSeparationType</td>
<td>8 Cyan, magenta, yellow, and black</td>
</tr>
<tr>
<td>ColorSeparationMatteType</td>
<td>9 Cyan, magenta, yellow, and black with alpha (opacity) channel</td>
</tr>
<tr>
<td>OptimizeType</td>
<td>10 Optimize the image type to best represent the existing pixels</td>
</tr>
</tbody>
</table>

(Read and Write computed property)

**81.40.280  verbose as boolean**

**Function:** Print detailed information about the image.  
**Notes:** (Read and Write computed property)

**81.40.281  view as string**

**Function:** FlashPix viewing parameters.  
**Notes:** (Read and Write computed property)

**81.40.282  x11Display as string**

**Function:** X11 display to display to, obtain fonts from, or to capture image from.  
**Notes:** (Read and Write computed property)

**81.40.283  Constants**

81.40.284  **AbsoluteIntent = 3**

MBS GraphicsMagick Plugin, Plugin Version: 10.2.  
**Function:** One of the intent type constants.
81.40.285  AddCompositeOp = 8

MBS GraphicsMagick Plugin, Plugin Version: 10.2. **Function:** One of the composite type constants.

81.40.286  AllChannels = 10

MBS GraphicsMagick Plugin, Plugin Version: 9.3. **Function:** One of the possible channel constants.

81.40.287  AllCompliance = & hffff

MBS GraphicsMagick Plugin, Plugin Version: 10.2. **Function:** One of the Compliance type constants.

81.40.288  AssociatedAlpha = 1

MBS GraphicsMagick Plugin, Plugin Version: 9.3. **Function:** One of the possible alpha type constants.

81.40.289  AtopCompositeOp = 4

MBS GraphicsMagick Plugin, Plugin Version: 10.2. **Function:** One of the composite type constants.

81.40.290  BackgroundDispose = 2

MBS GraphicsMagick Plugin, Plugin Version: 10.2. **Function:** One of the gif dispose type constants.

81.40.291  BesselFilter = 14

MBS GraphicsMagick Plugin, Plugin Version: 10.2. **Function:** One of the filter type constants.

81.40.292  BilevelType = 1

MBS GraphicsMagick Plugin, Plugin Version: 10.2. **Function:** One of the image type constants.

**Example:**
CHAPTER 81. GRAPHICSMAGICK

// load a picture
dim f as FolderItem = SpecialFolder.Desktop.Child("test.png")
dim pic as Picture = Picture.Open(f)

const GrayColorSpace = 2

Dim Converter As New GMImageMBS(Pic)

// quantize with dither
Converter.type = GMImageMBS.BilevelType
Converter.quantizeColorSpace = GrayColorSpace
Converter.quantizeColors = 2
Converter.quantizeDither = True
Converter.quantize

// convert back to Xojo
Converter.type = GMImageMBS.TrueColorType
Backdrop = Converter.CopyPicture

81.40.293 BlackChannel = 8

MBS GraphicsMagick Plugin, Plugin Version: 9.3. **Function:** One of the possible channel constants.

81.40.294 BlackmanFilter = 7

81.41 class GMImageStatisticsMBS

81.41.1 class GMImageStatisticsMBS

Function: The class for image statistics.
Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

81.41.2 Methods

81.41.3 Constructor

Function: The private constructor.

81.41.4 Properties

81.41.5 blue as GMImageChannelStatisticsMBS

Function: The blue channel statistics.
Notes: (Read only property)

81.41.6 green as GMImageChannelStatisticsMBS

Function: The green channel statistics.
Notes: (Read only property)

81.41.7 opacity as GMImageChannelStatisticsMBS

Function: The opacity channel statistics.
Notes: (Read only property)
81.41.8 red as GMImageChannelStatisticsMBS

**Function:** The red channel statistics.

**Notes:** (Read only property)
81.42 class GMLockMBS

81.42.1 class GMLockMBS

Function: The class for locking a certain resource.
Notes: The idea is to pass the constructor a mutexlock and keep the only reference to this new lock object on the stack. On the end of the method, the destructor is called by REALbasic and releases the mutexlock automatically.

81.42.2 Methods

81.42.3 Constructor(mutexlock as GMMutexLockMBS)

Function: Creates a new Lock based on the given mutexlock.

81.42.4 Properties

81.42.5 handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

81.42.6 target as GMMutexLockMBS

Function: The mutexlock this lock is referencing to.
Notes: (Read and Write property)
81.43  class GMMontageFramedMBS

81.43.1  class GMMontageFramedMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** MontageFramed provides the means to specify montage options when it is desired to have decorative frames around the image thumbnails.

**Notes:**

MontageFramed inherits from Montage and therefore provides all the methods of Montage as well as those shown in the table "MontageFramed Methods".

Framed thumbnails consist of four components: the thumbnail image, the thumbnail frame, the thumbnail border, an optional thumbnail shadow, and an optional thumbnail label area.

Subclass of the GMMontageMBS class.

81.43.2  Methods

81.43.3  Constructor

81.43.4  Properties

81.43.5  borderColor as GMColorMBS

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Specifies the background color within the thumbnail frame.

**Notes:** (Read and Write computed property)

81.43.6  borderWidth as Uint32

MBS GraphicsMagick Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Specifies the border (in pixels) to place between a thumbnail and its surrounding frame.

**Notes:**

This option only takes effect if thumbnail frames are enabled (via frameGeometry) and the thumbnail geometry specification doesn’t also specify the thumbnail border width.

(Read and Write computed property)
81.43.7 frameGeometry as GMGeometryMBS

**Function:** Specifies the geometry specification for frame to place around thumbnail.
**Notes:**
If this parameter is not specified, then the montage is unframed.
(Read and Write computed property)

81.43.8 matteColor as GMColorMBS

**Function:** Specifies the thumbnail frame color.
**Notes:** (Read and Write computed property)
81.44 class GMMontageMBS

81.44.1 class GMMontageMBS

**Function:** Montage is the base class to provide montage options and provides methods to set all options required to render simple (unframed) montages.

**Example:**

```plaintext
// build montage
dim StackingMontage as New GM16MontageMBS
StackingMontage.backgroundColor = New GM16ColorMBS(& cE7E7E7)
StackingMontage.fillColor = New GM16ColorMBS(& c000000)
StackingMontage.tile = New GM16GeometryMBS(“1x20”)  
StackingMontage.geometry = New GM16GeometryMBS(“160x120+5+5”)  
StackingMontage.font = ”Helvetica”
StackingMontage.pointSize = 12
StackingMontage.title = ”Title goes here”

// make picture
dim logo as Picture = LogoMBS(500)
dim image as New GM16ImageMBS(logo)
image.label(”Sample label”)

// Put the current image into the array
Dim StackingFrames As new GM16ImageArrayMBS
StackingFrames.insert(image)

// show result
dim resultImages as GM16ImageArrayMBS = StackingFrames.montageImages(StackingMontage)
Backdrop = resultImages.Image(0).CopyPicture
```

**Notes:**

See GMMontageFramedMBS if you would like to create a framed montage.

Unframed thumbnails consist of four components: the thumbnail image, the thumbnail border, an optional thumbnail shadow, and an optional thumbnail label area.
81.44.2 Methods

81.44.3 Constructor

**Function:** The constructor.

81.44.4 Properties

81.44.5 handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

81.44.6 backgroundColor as GMColorMBS

**Function:** Specifies the background color that thumbnails are imaged upon.
**Notes:** (Read and Write computed property)

81.44.7 compose as Integer

**Function:** Specifies the image composition algorithm for thumbnails.
**Notes:**
This controls the algorithm by which the thumbnail image is placed on the background. Use of OverCompositeOp is recommended for use with images that have transparency. This option may have negative side-effects for images without transparency.
(Read and Write computed property)

81.44.8 fileName as string

**Function:** Specifies the image filename to be used for the generated montage images.
**Notes:**
To handle the case were multiple montage images are generated, a printf-style format may be embedded within the filename. For example, a filename specification of image%02d.miff names the montage images as
81.44.9 fillColor as GMColorMBS

Function: Specifies the fill color to use for the label text.
Notes: (Read and Write computed property)

81.44.10 font as string

Function: Specifies the thumbnail label font.
Notes: (Read and Write computed property)

81.44.11 geometry as GMGeometryMBS

Function: Specifies the size of the generated thumbnail.
Notes: (Read and Write computed property)

81.44.12 gravity as Integer

Function: Specifies the thumbnail positioning within the specified geometry area.
Notes:
If the thumbnail is smaller in any dimension than the geometry, then it is placed according to this specification.
See Gravity constants in GMImageMBS class.
(Read and Write computed property)

81.44.13 label as string

Function: Specifies the format used for the image label.
Notes:
Special format characters may be embedded in the format string to include information about the image.
(Read and Write computed property)

**81.44.14 penColor as GMColorMBS**

**Function:** Specifies the pen color to use for the label text (same as fill).
**Notes:** (Read and Write computed property)

**81.44.15 pointSize as UInt32**

**Function:** Specifies the thumbnail label font size.
**Notes:** (Read and Write computed property)

**81.44.16 shadow as boolean**

**Function:** Enable/disable drop-shadow on thumbnails.
**Notes:** (Read and Write computed property)

**81.44.17 strokeColor as GMColorMBS**

**Function:** Specifies the stroke color to use for the label text.
**Notes:** (Read and Write computed property)

**81.44.18 texture as string**

**Function:** Specifies a texture image to use as montage background.
**Notes:**
The built-in textures "granite:" and "plasma:" are available. A texture is the same as a background image.
(Read and Write computed property)
81.44. CLASS GMTAGEMBS

81.44.19 tile as GMGeometryMBS

Function: Specifies the maximum number of montage columns and rows in the montage.
Notes:
The montage is built by filling out all cells in a row before advancing to the next row. Once the montage has reached the maximum number of columns and rows, a new montage image is started.
(Read and Write computed property)

81.44.20 title as string

Function: Specifies the montage title.
Notes: (Read and Write computed property)

81.44.21 transparentColor as GMColorMBS

Function: Specifies a montage color to set transparent.
Notes:
This option can be set the same as the background color in order for the thumbnails to appear without a background when rendered on an HTML page. For best effect, ensure that the transparent color selected does not occur in the rendered thumbnail colors.
(Read and Write computed property)
81.45 class GMMutexLockMBS

81.45.1 class GMMutexLockMBS

**Function:** The mutex class for GraphicsMagick.

81.45.2 Methods

81.45.3 lock

**Function:** Locks the lock.
**Notes:** Only one thread at a time can get the lock. The other threads will wait when lock is called.

81.45.4 unlock

**Function:** Unlocks the lock.

81.45.5 Properties

81.45.6 handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)
class GMNotInitializedExceptionMBS

Function: The exception raised if you access a method/property in an object and the object was not initialized properly.

Notes:
Check the message property for details.
Subclass of the GMErrorExceptionMBS class.
81.47  class GMPathArgsMBS

81.47.1  class GMPathArgsMBS

**Function:** This is a class for arguments to the path arc/curve methods in GMGraphicsMBS.

**Example:**

```vbs
dim g as new GMPathArgsMBS(1,2,3,4) // for a QuadraticCurveto
MsgBox str(g.x1)+EndOfLine+str(g.y1)+EndOfLine+str(g.x)+EndOfLine+str(g.y)
```

**Notes:** Due we use this class for three different ways, we have three constructors to fill in the value you need for the calls.

81.47.2  Methods

81.47.3  Constructor

**Function:** The constructor for creating an empty object.

See also:

- 81.47.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 13776
- 81.47.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double) 13777
- 81.47.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 13777

81.47.4  Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double)

**Function:** The constructor to create the arguments object for the PathArc methods in GMGraphicsMBS.

See also:

- 81.47.3 Constructor 13776
- 81.47.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double) 13777
81.47. **CLASS GMPATHARGSMBS**

- 81.47.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 13777

81.47.5 **Constructor(x1 as Double, y1 as Double, x as Double, y as Double)**

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor to create the arguments object for the QuadraticCurveto methods in GMGraphicsMBS.

**Example:**

```vba
dim g as new GMPathArgsMBS(1,2,3,4)
MsgBox str(g.x1)+EndOfLine+str(g.y1)+EndOfLine+str(g.x)+EndOfLine+str(g.y)
```

See also:

- 81.47.3 Constructor 13776
- 81.47.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 13776
- 81.47.6 Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double) 13777

81.47.6 **Constructor(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x as Double, y as Double)**

MBS GraphicsMagick Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor to create the arguments object for the Curveto methods in GMGraphicsMBS.

**Example:**

```vba
dim g as new GMPathArgsMBS(1,2,3,4,5,6)
MsgBox str(g.x1)+EndOfLine+str(g.y1)+EndOfLine+str(g.x2)+EndOfLine+str(g.y2)+EndOfLine+str(g.x)+EndOfLine+str(g.y)
```

See also:

- 81.47.3 Constructor 13776
- 81.47.4 Constructor(radiusX as Double, radiusY as Double, xAxisRotation as Double, largeArcFlag as boolean, sweepFlag as Boolean, x as Double, y as Double) 13776
- 81.47.5 Constructor(x1 as Double, y1 as Double, x as Double, y as Double) 13777
CHAPTER 81. GRAPHICSMAGICK

81.47.7 Properties

81.47.8 largeArcFlag as Boolean

Function: The large arc flag.
Notes:
Draw longer of the two matching arcs
(Read and Write property)

81.47.9 radiusX as Double

Function: The radius x value.
Notes: (Read and Write property)

81.47.10 radiusY as Double

Function: The radius y value.
Notes: (Read and Write property)

81.47.11 sweepFlag as Boolean

Function: The sweep flag value.
Notes:
Draw arc matching clock-wise rotation.
(Read and Write property)

81.47.12 x as Double

Function: The x value.
Notes:
For an arc: End-point X
(Read and Write property)
81.47. CLASS GMPATHARGSMBS

81.47.13  x1 as Double
**Function:** The x1 value.
**Notes:** (Read and Write property)

81.47.14  x2 as Double
**Function:** The x2 value.
**Notes:** (Read and Write property)

81.47.15  xAxisRotation as Double
**Function:** The x Axis Rotation value.
**Notes:**
Rotation relative to X axis.
(Read and Write property)

81.47.16  y as Double
**Function:** The y value.
**Notes:**
for an arc: End-point Y
(Read and Write property)

81.47.17  y1 as Double
**Function:** The y1 value.
**Notes:** (Read and Write property)
81.47.18  y2 as Double

Function: The y2 value.
Notes: (Read and Write property)
81.48. class GMPixelsMBS

81.48.1 class GMPixelsMBS

Function: Creates an empty pixels object.  
Example:

```vbscript
    dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
    dim g as new GMImageMBS(f)
    dim p as new GMPixelsMBS(g)

    // get pointer to some pixels to read/write
    dim x as ptr = p.get(0, 0, 100, 100)

    // draw a red line to the pixel buffer
    dim o as Integer
    for i as Integer = 0 to 99
        o = 100 * i + i
        x.UInt32(o * 4) = &hFFFF0000
    next

    // write back
    p.sync

    // show
    window1.Backdrop = g.CopyPicture
```

81.48.2 Methods

81.48.3 Constructor(Image as GMImageMBS)

Function: Creates a new Pixels object with the pixels from an image.

81.48.4 get(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

Function: Transfer pixels from the image to the pixel view as defined by the specified region.  
Example:
```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)
dim p as new GMPixelsMBS(g)

// get pointer to some pixels
dim x as ptr = p.get(0, 0, 100, 100)

// draw a red line to the pixel buffer
dim o as Integer
for i as Integer = 0 to 99
    o = 100 * i + i
    x.UInt32(o * 4) = & hFFFF0000
next

// write back
p.sync

// show
window1.Backdrop = g.CopyPicture
```

Notes: Modified pixels may be subsequently transferred back to the image via sync.

### 81.48.5 getConst(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Transfer read-only pixels from the image to the pixel view as defined by the specified region.

### 81.48.6 indexes as Ptr

### 81.48.7 set(x as Integer, y as Integer, columns as Integer, rows as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Allocate a pixel view region to store image pixels as defined by the region rectangle. **Example:**
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)
dim p as new GMPixelsMBS(g)

// get pointer to some pixels to write
dim x as ptr = p.set(0, 0, 100, 100)

// draw a red line to the pixel buffer
dim o as Integer
for i as Integer = 0 to 99
    o = 100 * i + i
    x.UInt32(o * 4) = & hFFFF0000
next

// write back
p.sync

// show
window1.Backdrop = g.CopyPicture

Notes: This area is subsequently transferred from the pixel view to the image via sync.

81.48.8 sync

Function: Transfers the image cache pixels to the image.

81.48.9 Properties

81.48.10 columns as Integer

Function: Width of view.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim g as new GMImageMBS(f)
dim p as new GMPixelsMBS(g)

// get pointer to some pixels
dim x as ptr = p.get(0, 0, 100, 100)
```
// and show size
MsgBox str(p.columns) + " x " + str(p.rows)
```

**Notes:** (Read only property)

### 81.48.11 handle as Integer

**Function:** The internal object reference.  
**Notes:** (Read and Write property)

### 81.48.12 rows as Integer

**Function:** Height of view.  
**Notes:** (Read only property)

### 81.48.13 x as Integer

**Function:** Left ordinate of view.  
**Notes:** (Read only property)

### 81.48.14 y as Integer

**Function:** Top ordinate of view.  
**Notes:** (Read only property)
class GMTypeMetricMBS

Function: The TypeMetric class provides the means to pass data from the Image class’s TypeMetric method to the user.

Notes:
It provides information regarding font metrics such as ascent, descent, text width, text height, and maximum horizontal advance. The units of these font metrics are in pixels, and that the metrics are dependent on the current Image font (default Ghostscript’s “Helvetica”), pointsize (default 12 points), and x/y resolution (default 72 DPI) settings.

The pixel units may be converted to points (the standard resolution-independent measure used by the typesetting industry) via the following equation:

\[ \text{size\_points} = \frac{(\text{size\_pixels} \times 72)}{\text{resolution}} \]

where resolution is in dots-per-inch (DPI). This means that at the default image resolution, there is one pixel per point.

Note that a font’s pointsize is only a first-order approximation of the font height (ascender + descender) in points. The relationship between the specified pointsize and the rendered font height is determined by the font designer.

See FreeType Glyph Conventions for a detailed description of font metrics related issues.

Methods

Constructor

Properties

ascent as Double

Function: Returns the distance in pixels from the text baseline to the highest/upper grid coordinate used
to place an outline point.

Notes:
Always a positive value.
(Read only property)

81.49.6 descent as Double

Function: Returns the the distance in pixels from the baseline to the lowest grid coordinate used to place
an outline point.
Notes:
Always a negative value.
(Read only property)

81.49.7 maxHorizontalAdvance as Double

Function: Returns the maximum horizontal advance (advance from the beginning of a character to the
beginning of the next character) in pixels.
Notes: (Read only property)

81.49.8 textHeight as Double

Function: Returns text height in pixels.
Notes: (Read only property)

81.49.9 textWidth as Double

Function: Returns text width in pixels.
Notes: (Read only property)
81.50. class GMUnsupportedExceptionMBS

81.50.1 class GMUnsupportedExceptionMBS

**Function:** An exception raised if you call the GM functions on an unsupported platform.

**Notes:**
Check the message property for details.
This exception is currently only used on Windows.
(Windows support may come later)
Subclass of the GMErrorExceptionMBS class.
Chapter 82

Growl

82.1 class GrowlApplicationBridgeMBS

82.1.1 class GrowlApplicationBridgeMBS

Function: The class for Growl Framework 1.3 or newer.
Notes:

A class used to interface with Growl.
This class provides a means to interface with Growl.

Currently it provides a way to detect if Growl is installed and launch the GrowlHelperApp if it’s not already running.

The plugin installs this class for you as delegate, so all the events go the plugin events defined in this class. If you don’t have code in an event, the plugin reports it to Growl as not existant.

Please use LoadFramework before calling other methods.

82.1.2 Methods

82.1.3 bestRegistrationDictionary as Dictionary

Function: Obtains a registration dictionary, filled out to the best of GrowlApplicationBridge’s knowledge.
Example:
CHAPTER 82. GROWL

dim d as Dictionary = GrowlApplicationBridgeMBS.bestRegistrationDictionary

Notes:
This method creates a registration dictionary as best GrowlApplicationBridge knows how.

First, GrowlApplicationBridge contacts the Growl delegate (if there is one) and gets the registration dictionary from that. If no such dictionary was obtained, GrowlApplicationBridge looks in your application’s main bundle for an auto-discoverable registration dictionary file. If that doesn’t exist either, this method returns nil.

Second, GrowlApplicationBridge calls registrationDictionaryByFillingInDictionary with whatever dictionary was obtained. The result of that method is the result of this method.

GrowlApplicationBridge uses this method when you call registerWithDictionary with nil.

This method was introduced in Growl.framework 0.7.

Returns a registration dictionary.

82.1.4 Constructor

82.1.5 Destructor

82.1.6 frameworkInfoDictionary as Dictionary

Example:

dim d as Dictionary = GrowlApplicationBridgeMBS.frameworkInfoDictionary
break // check values in debugger
Notes: You can find e.g. the version in value for the CFBundleVersion key.

82.1.7 IsFrameworkLoaded as boolean

Function: Whether the Growl Framework has been loaded.
Example:
MsgBox str(GrowlApplicationBridgeMBS.IsFrameworkLoaded)

Notes: Returns true if framework is loaded.

82.1.8 isGrowlRunning as boolean

Function: Detects whether GrowlHelperApp is currently running.
Example:
MsgBox str(GrowlApplicationBridgeMBS.isGrowlRunning)

Notes:
Cycles through the process list to find whether GrowlHelperApp is running and returns its findings.
Returns true if GrowlHelperApp is running, false otherwise.

82.1.9 isMistEnabled as boolean

Function: Gives the caller a fairly good indication of whether or not built-in notifications(Mist) will be used.
Notes:
Since this call makes use of isGrowlRunning it is entirely possible for this value to change between call and executing a notification dispatch
Returns true if Growl isn’t reachable and the developer has not opted-out of Mist and the user hasn’t set the global mist enable key to false.
82.1.10  LoadFramework(path as folderitem) as boolean

Function: Loads the growl framework.
Example:

if GrowlApplicationBridgeMBS.LoadFramework(SpecialFolder.Desktop.Child("Growl.framework")) then
    MsgBox "OK"
else
    MsgBox "Failed."
end if

Notes:
Framework should be version 1.3.
Please call this method before you use other Growl methods.
The framework can be inside your application bundle.

82.1.11  notificationDictionaryByFillingInDictionary(notifDict as dictionary) as Dictionary

Function: Tries to fill in missing keys in a notification dictionary.
Notes:
notifDict: The dictionary to fill in.

Returns the dictionary with the keys filled in. This will be a separate instance from notifDict.

This function examines the notifDict for missing keys, and tries to get them from the last known registration dictionary. As of 1.1, the keys that it will look for are: kApplicationName and kApplicationIcon

82.1.12  notifyWithDictionary(userInfo as dictionary)

Function: Notifies using a userInfo dictionary suitable for passing to NSDistributedNotificationCenter.
Notes:
userInfo: The dictionary to notify with.

Before Growl 0.6, your application would have posted notifications using NSDistributedNotificationCenter by creating a userInfo dictionary with the notification data. This had the advantage of allowing you to add
other data to the dictionary for programs besides Growl that might be listening.

This method allows you to use such dictionaries without being restricted to using NSDistributedNotificationCenter. The keys for this dictionary can be found in constants.

82.1.13 notifyWithTitle(title as string, description as string, notificationName as string, iconData as memoryblock = nil, Priority as Integer = 0, isSticky as boolean = false, clickContext as Variant = nil)

Function: Send a Growl notification.
Notes:
This is the preferred means for sending a Growl notification. The notification name and at least one of the title and description are required (all three are preferred). All other parameters may be nil (or 0 or false as appropriate) to accept default values.

If using the Growl-WithInstaller framework, if Growl is not installed the user will be prompted to install Growl. If the user cancels, this method will have no effect until the next application session, at which time when it is called the user will be prompted again. The user is also given the option to not be prompted again. If the user does choose to install Growl, the requested notification will be displayed once Growl is installed and running.

See also:
- 82.1.14 notifyWithTitle(title as string, description as string, notificationName as string, iconData as memoryblock, Priority as Integer, isSticky as boolean, clickContext as Variant, identifier as string)

82.1.14 notifyWithTitle(title as string, description as string, notificationName as string, iconData as memoryblock, Priority as Integer, isSticky as boolean, clickContext as Variant, identifier as string)

Function: Send a Growl notification.
Notes:
This is the preferred means for sending a Growl notification. The notification name and at least one of the title and description are required (all three are preferred). All
other parameters may be nil (or 0 or false as appropriate) to accept default values.

If using the Growl-WithInstaller framework, if Growl is not installed the user will be prompted to install Growl. If the user cancels, this method will have no effect until the next application session, at which time when it is called the user will be prompted again. The user is also given the option to not be prompted again. If the user does choose to install Growl, the requested notification will be displayed once Growl is installed and running.

- **title** The title of the notification displayed to the user.
- **description** The full description of the notification displayed to the user.
- **notifName** The internal name of the notification. Should be human-readable, as it will be displayed in the Growl preference pane.
- **iconData** Memoryblock to show with the notification as its icon. If nil, the application’s icon will be used instead.
- **priority** The priority of the notification. The default value is 0; positive values are higher priority and negative values are lower priority. Not all Growl displays support priority.
- **isSticky** If true, the notification will remain on screen until clicked. Not all Growl displays support sticky notifications.
- **clickContext** A context passed back to the Growl delegate if it implements `growlNotificationWasClicked` and the notification is clicked. Not all display plugins support clicking. The `clickContext` must be plist-encodable (completely of String, Array, Numbers, Dictionary, and Memoryblock types).
- **identifier** An identifier for this notification. Notifications with equal identifiers are coalesced.

See also:

- 82.1.13 `notifyWithTitle(title as string, description as string, notificationName as string, iconData as memoryblock = nil, Priority as Integer = 0, isSticky as boolean = false, clickContext as Variant = nil)`

### 82.1.15 `registerWithDictionary(regDict as dictionary = nil) as boolean`

**Function:** Register your application with Growl without setting a delegate.

**Notes:**

When you call this method with a dictionary, GrowlApplicationBridge registers your application using that dictionary. If you pass nil, GrowlApplicationBridge will ask the delegate (if there is one) for a dictionary, and if that doesn’t work, it will look in your application’s bundle for an auto-discoverable plist.
If you pass a dictionary to this method, it must include the kApplicationName key, unless a delegate is set.

This method is mainly an alternative to the delegate system introduced with Growl 0.6. Without a delegate, you cannot receive callbacks such as growlIsReady (since they are sent to the delegate). You can, however, set a delegate after registering without one.

This method was introduced in Growl.framework 0.7.

**82.1.16 registrationDictionaryByFillingInDictionary(regDict as dictionary) as Dictionary**

**Function:** Tries to fill in missing keys in a registration dictionary.

**Notes:**
This method examines the passed-in dictionary for missing keys, and tries to work out correct values for them. As of 0.7, it uses:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>kApplicationName</td>
<td>CFBundleExecutableName</td>
</tr>
<tr>
<td>kApplicationIcon</td>
<td>The data of the icon of the application.</td>
</tr>
<tr>
<td>App Location</td>
<td>The location of the application.</td>
</tr>
<tr>
<td>kNotificationsDefault</td>
<td>kNotificationsDefault</td>
</tr>
</tbody>
</table>

Keys are only filled in if missing; if a key is present in the dictionary, its value will not be changed.

This method was introduced in Growl.framework 0.7.

regDict: The dictionary to fill in.

Returns the dictionary with the keys filled in.
See also:

- **82.1.17 registrationDictionaryByFillingInDictionary(regDict as dictionary, restrictToKeys() as string) as Dictionary**

**82.1.17 registrationDictionaryByFillingInDictionary(regDict as dictionary, restrictToKeys() as string) as Dictionary**

**Function:** Tries to fill in missing keys in a registration dictionary.

**Notes:**
This method examines the passed-in dictionary for missing keys, and tries to work out correct values for them. As of 0.7, it uses:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>kApplicationName</td>
<td>CFBundleExecutableName</td>
</tr>
<tr>
<td>kApplicationIcon</td>
<td>The data of the icon of the application.</td>
</tr>
<tr>
<td>App Location</td>
<td>The location of the application.</td>
</tr>
<tr>
<td>kNotificationsDefault</td>
<td>kNotificationsDefault</td>
</tr>
</tbody>
</table>

Only those keys that are listed in restrictToKeys array will be filled in. Other missing keys are ignored. Also, keys are only filled in if missing; if a key is present in the dictionary, its value will not be changed.

This method was introduced in Growl.framework 0.7.
regDict: The dictionary to fill in.
restrictToKeys: The keys to fill in. If nil, any missing keys are filled in.

Returns the dictionary with the keys filled in.
See also:

- 82.1.16 registrationDictionaryByFillingInDictionary(regDict as dictionary) as Dictionary

### 82.1.18 registrationDictionaryFromBundle(bundle as Variant = nil) as Dictionary

**Function:** Looks in a bundle for a registration dictionary.

**Example:**

```Dim d As Dictionary = GrowlApplicationBridgeMBS.registrationDictionaryFromBundle(NSBundleMBS.mainBundle)```

**Notes:**

Bundle must be an instance of NSBundleMBS class.

This method looks in a bundle for an auto-discoverable registration dictionary file using NSBundle methods. If it finds one, it loads the file using dictionaryWithContentsOfFile and returns the result.

If you pass nil as the bundle, the main bundle is examined.

This method does not attempt to clean up the dictionary in any way - for example, if it is missing the
<code>GROWL_APP_NAME</code> key, the result will be missing it too. Use registrationDictionaryByFillingInDictionary to try to fill in missing keys.

This method was introduced in Growl.framework 0.7.
Returns a registration dictionary.

### 82.1.19 registrationDictionaryFromDelegate as Dictionary

**Function:** Asks the delegate for a registration dictionary.
**Notes:**
If no delegate is set, or if the delegate’s registrationDictionaryForGrowl method returns nil, this method returns nil.

This method does not attempt to clean up the dictionary in any way - for example, if it is missing the kApplicationName key, the result will be missing it too. Use registrationDictionaryByFillingInDictionary to try to fill in missing keys.

This method was introduced in Growl.framework 0.7.
Returns a registration dictionary.

### 82.1.20 reregisterGrowlNotifications

**Function:** Reregister the notifications for this application.
**Notes:**
This method does not normally need to be called. If your application changes what notifications it is registering with Growl, call this method to have the Growl delegate’s registrationDictionaryForGrowl method called again and the Growl registration information updated.

This method is now implemented using registerWithDictionary.

### 82.1.21 shouldUseBuiltInNotifications as boolean

**Function:** The current opt-in state of the framework’s use of the Mist display style.
**Notes:**
Opt-out mechanism for the mist notification style in the event growl can’t be reached.

If growl is unavailable due to not being installed or as a result of being turned off then this option can enable/disable a built-in fire and forget display style.

Specifies whether or not the developer wants to opt-in (default) or opt out of the built-in Mist style in the event Growl is unreachable.  
(Read and Write computed property)

82.1.22  willRegisterWhenGrowlIsReady as boolean

MBS MacExtras Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether to register with Growl when Growl launches (or not). Notes: When Growl has started listening for notifications, it posts a GROWL_IS_READY notification on the Distributed Notification Center. GrowlApplicationBridge listens for this notification, using it to perform various tasks (such as calling your delegate’s growlIsReady method, if it has one). If this method is called with true, one of those tasks will be to reregister with Growl (in the manner of reregisterGrowlNotifications). This attribute is automatically set back to false (the default) after every GROWL_IS_READY notification. Value: True, if you want GrowlApplicationBridge to register with Growl when next it is ready; false if not. (Read and Write computed property)

82.1.23  Properties

82.1.24  Handle as Integer

MBS MacExtras Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The internal handle for the Growl object. Notes: (Read and Write property)

82.1.25  Events

82.1.26  applicationIconDataForGrowl as Memoryblock

MBS MacExtras Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Return the data to treat as the application icon.
Notes:
The delegate may optionally return a memoryblock object to use as the application icon; if this is not implemented, the application’s own icon is used. This is not generally needed.
Return the memoryblock to treat as the application icon.
Deprecated In version 1.1, in favor of `applicationIconForGrowl`.

### 82.1.27 `applicationIconForGrowl` as Variant

**Function:** Return the NSImage to treat as the application icon.
**Notes:**
The delegate may optionally return an NSImageMBS object to use as the application icon. If this method is not implemented, `applicationIconDataForGrowl` is tried. If that method is not implemented, the application’s own icon is used. Neither method is generally needed.

Return a NSImageMBS to treat as the application icon.

### 82.1.28 `applicationNameForGrowl` as string

**Function:** Return the name of this application which will be used for Growl bookkeeping.
**Notes:**
This name is used both internally and in the Growl preferences.

This should remain stable between different versions and incarnations of your application.
For example, "SurfWriter" is a good app name, whereas "SurfWriter 2.0" and "SurfWriter Lite" are not.

You do not need to implement this method if you are providing the application name elsewhere, meaning in an auto-discoverable plist file in your app bundle or in the result of `registrationDictionaryForGrowl`.

Return the name of the application using Growl.

### 82.1.29 `growlIsReady`

**Function:** Informs the delegate that Growl has launched.
**Notes:** Informs the delegate that Growl (specifically, the GrowlHelperApp) was launched successfully. The
application can take actions with the knowledge that Growl is installed and functional.

82.1.30  growlNotificationTimedOut(clickContext as Variant)

Function: Informs the delegate that a Growl notification timed out.
Notes:
Informs the delegate that a Growl notification timed out. It is only sent for notifications sent with a non-nil clickContext, so if you want to receive a message when a notification is clicked, clickContext must not be nil when calling notifyWithTitle.

clickContext: The clickContext passed when displaying the notification originally via notifyWithTitle.

82.1.31  growlNotificationWasClicked(clickContext as Variant)

Function: Informs the delegate that a Growl notification was clicked.
Notes:
Informs the delegate that a Growl notification was clicked. It is only sent for notifications sent with a non-nil clickContext, so if you want to receive a message when a notification is clicked, clickContext must not be nil when calling notifyWithTitle.

clickContext: The clickContext passed when displaying the notification originally via notifyWithTitle.

82.1.32  hasNetworkClientEntitlement as boolean

Function: Used only in sandboxed situations since we don’t know whether the app has com.apple.security.network.client entitlement.
Notes: GrowlDelegate calls to find out if we have the com.apple.security.network.client entitlement, since we can’t find this out without hitting the sandbox. We only call it if we detect that the application is sandboxed.

82.1.33  registrationDictionaryForGrowl as dictionary

Function: Return the dictionary used to register this application with Growl.
Notes:
The returned dictionary gives Growl the complete list of notifications this application will ever send, and it also specifies which notifications should be enabled by default. Each is specified by an array of strings.

For most applications, these two arrays can be the same (if all sent notifications should be displayed by default).

The strings of these arrays will correspond to the notificationName parameter passed in notifyWithTitle calls.

The dictionary should have the required key object pairs:

```plaintext
key: kNotificationsAll object: Array of Strings
key: kNotificationsDefault object: Array of Strings
```

The dictionary may have the following key object pairs:

```plaintext
key: kNotificationsHumanReadableNames
object: Dictionary of key: notification name object: human-readable notification name
```

You do not need to implement this method if you have an auto-discoverable plist file in your app bundle. Return the Dictionary to use for registration.

### 82.1.34 Constants

#### 82.1.35 kApplicationIcon = ”ApplicationIcon”

MBS MacExtras Plugin, Plugin Version: 11.3. **Function**: One of the keys for the registration dictionary. **Notes:**

The image data for your application's icon. Image data representing your application's icon. This may be superimposed on a notification icon as a badge, used as the notification icon when a notification-specific icon is not supplied, or ignored altogether, depending on the display. Must be in a format supported by NSImage, such as TIFF, PNG, GIF, JPEG, BMP, PICT, or PDF.

Optional. Not supported by all display plugins.

#### 82.1.36 kApplicationId = ”ApplicationId”

MBS MacExtras Plugin, Plugin Version: 11.3. **Function**: One of the keys for the registration dictionary. **Notes:**
The bundle identifier of your application. This key should be unique for your application while there may be several applications with the same kApplicationName. This key is optional.

82.1.37 kApplicationName = ”ApplicationName”

MBS MacExtras Plugin, Plugin Version: 11.3. Function: One of the keys for the registration dictionary.
Notes:
The name of your application. This should remain stable between different versions and incarnations of your application. For example, ”SurfWriter” is a good app name, whereas ”SurfWriter 2.0” and ”SurfWriter Lite” are not.

82.1.38 kApplicationPID = ”ApplicationPID”

MBS MacExtras Plugin, Plugin Version: 11.3. Function: One of the keys for the notification dictionary.
Notes:
The process identifier of the process which sends this notification. If this field is set, the application will only receive clicked and timed out notifications which originate from this process.
Optional.

82.1.39 kGrowlNotificationIdentifier = ”GrowlNotificationIdentifier”

MBS MacExtras Plugin, Plugin Version: 11.3. Function: One of the keys for the notification dictionary.
Notes:
An identifier for the notification for coalescing purposes.
Notifications with the same identifier fall into the same class; only the last notification of a class is displayed on the screen. If a notification of the same class is currently being displayed, it is replaced by this notification.
Optional. Not supported by all display plugins.
82.1.40 kNotificationAppIcon = "NotificationAppIcon"

MBS MacExtras Plugin, Plugin Version: 11.3. **Function:** One of the keys for the notification dictionary. **Notes:**

Image data for the application icon, in case kNotificationAppIcon does not apply for some reason. Image data be in a format supported by NSImage, such as TIFF, PNG, GIF, JPEG, BMP, PICT, or PDF.

Optional. Not supported by all display plugins.

82.1.41 kNotificationClickContext = "NotificationClickContext"

MBS MacExtras Plugin, Plugin Version: 11.3. **Function:** One of the keys for the notification dictionary. **Notes:**

Identifies which notification was clicked.

An identifier for the notification for clicking purposes.

This will be passed back to the application when the notification is clicked. It must be plist-encodable (a data, dictionary, array, number, or string), and it should be unique for each notification you post. A good click context would be a UUID string returned by UUIDMBS class.

Optional. Not supported by all display plugins.

82.1.42 kNotificationDescription = "NotificationDescription"

MBS MacExtras Plugin, Plugin Version: 11.3. **Function:** One of the keys for the notification dictionary. **Notes:**

The description to display in the notification. The description should be longer and more verbose than the title. The description usually tells the subject of the action, e.g. "Growl-0.6.dmg downloaded in 5.02 minutes".

82.1.43 kNotificationIcon = "NotificationIcon"

MBS MacExtras Plugin, Plugin Version: 11.3. **Function:** One of the keys for the notification dictionary. **Notes:**

Image data for the application icon, in case kNotificationAppIcon does not apply for some reason. Image data be in a format supported by NSImage, such as TIFF, PNG, GIF, JPEG, BMP, PICT, or PDF.
CHAPTER 82. GROWL

Optional. Not supported by all display plugins.

82.1.44 kNotificationName = "NotificationName"

MBS MacExtras Plugin, Plugin Version: 11.3. **Function:** One of the keys for the notification dictionary. **Notes:**
The name of the notification.
The name of the notification. Note that if you do not define kNotificationsHumanReadableNames when registering your ticket originally this name will the one displayed within the Growl preference pane and should be human-readable.

82.1.45 kNotificationPriority = "NotificationPriority"

MBS MacExtras Plugin, Plugin Version: 11.3. **Function:** One of the keys for the notification dictionary. **Notes:**
The priority of the notification as an integer number from -2 to +2 (+2 being highest).
Optional. Not supported by all display plugins.

82.1.46 kNotificationProgress = "NotificationProgress"

MBS MacExtras Plugin, Plugin Version: 11.3. **Function:** One of the keys for the notification dictionary. **Notes:**
If this key is set, it should contain a double value which describes some sort of progress (from 0.0 to 100.0).
If this is key is not set, no progress bar is shown.
Optional. Not supported by all display plugins.

82.1.47 kNotificationsAll = "AllNotifications"

MBS MacExtras Plugin, Plugin Version: 11.3. **Function:** One of the keys for the registration dictionary. **Notes:** The array of all notifications your application can send.
82.1.48  kNotificationsDefault = "DefaultNotifications"

MBS MacExtras Plugin, Plugin Version: 11.3. Function: One of the keys for the registration dictionary. Notes:
The array of notifications to turn on by default.
These are the names of the notifications that should be enabled by default when your application registers for the first time. If your application reregisters, Growl will look here for any new notification names found in kNotificationsAll, but ignore any others.

82.1.49  kNotificationsDescriptions = "NotificationDescriptions"

MBS MacExtras Plugin, Plugin Version: 11.3. Function: One of the keys for the registration dictionary. Notes:
A dictionary of descriptions of _when_ each notification occurs

This is an Dictionary whose keys are kNotificationName strings and whose objects are descriptions of _when_ each notification occurs, such as "You received a new mail message" or "A file finished downloading".

This key is optional.

82.1.50  kNotificationsHumanReadableNames = "HumanReadableNames"

MBS MacExtras Plugin, Plugin Version: 11.3. Function: One of the keys for the registration dictionary. Notes:
A dictionary of human-readable names for your notifications.

By default, the Growl UI will display notifications by the names given in kNotificationsAll which correspond to the kNotificationName. This dictionary specifies the human-readable name to display.
The keys of the dictionary are kNotificationName strings; the objects are the human-readable versions.
For any kNotificationName not specific in this dictionary, the kNotificationName will be displayed.

This key is optional.

82.1.51  kNotificationSticky = "NotificationSticky"

MBS MacExtras Plugin, Plugin Version: 11.3. Function: One of the keys for the notification dictionary. Notes:
A Boolean number controlling whether the notification is sticky. Optional. Not supported by all display plugins.

### 82.1.52 `kNotificationTitle = "NotificationTitle"`

MBS MacExtras Plugin, Plugin Version: 11.3. **Function:** One of the keys for the notification dictionary. 
**Notes:**

The title to display in the notification. 
Should be very brief. The title usually says what happened, e.g. "Download complete".

### 82.1.53 `kTicketVersion = "TicketVersion"`

MBS MacExtras Plugin, Plugin Version: 11.3. **Function:** One of the keys for the registration dictionary. 
**Notes:**

The version of your registration ticket. 
Include this key in a ticket.plist file that you put in your application bundle for auto-discovery. The current ticket version is 1.
82.2. CLASS GROWLMBS

82.2  class GrowlMBS

82.2.1  class GrowlMBS

Function: A class for all the global growl functions.
Notes: On the growl website you will find more information:  
http://growl.info

The plugin is compatible to framework v0.7.5.

82.2.2  Methods

82.2.3  IsInstalled as boolean

Function: Determines whether the Growl prefpane and its helper app are installed.  
Notes: Returns true if Growl is installed, false otherwise.

82.2.4  IsRunning as boolean

Function: Cycles through the process list to find whether GrowlHelperApp is running.  
Notes: Warning: This function crashes with Growl version 0.7.5.

Returns true if Growl is running, false otherwise.

82.2.5  LaunchIfInstalled as boolean

Function: Launches GrowlHelperApp if it is not already running.  
Notes: Calls the Launched event after the helper application was launched.  
Returns true on success and false on any error.
82.2.6 LoadFramework(file as folderitem) as boolean

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Loads the framework from a given folderitem.
**Notes:**
Must be called before using any other function.
Returns true on success and false on any error.

The best thing is to take the framework and copy it into the application bundle with a build step so you can locate and load it easily.

82.2.7 Register

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Registers the current application.
**Notes:**
Must be called before posting notifications.

If you are using Growl-WithInstaller.framework, and an older version of Growl is installed on the user’s system, the user will automatically be prompted to update.

This will fail if you don’t have a bundle identifier on your application.

82.2.8 SetAllNotificationArray(names() as string)

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Contains the names of all notifications your application may post.
**Notes:** You must call this function before using Register.

82.2.9 SetDefaultNotificationArray(names() as string)

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Names of notifications that should be enabled by default.
**Notes:**
This array can be set optional.
If not set, all notifications will be enabled by default.
82.2. CLASS GROWLMBS

82.2.10 Properties

82.2.11 ApplicationIconData as String

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The icon to display in the notifications.

**Notes:**
The data can be in any format supported by NSImage. As of Mac OS X 10.3, this includes the .icns, TIFF, JPEG, GIF, PNG, PDF, and PICT formats.

If this is not supplied, Growl will look up your application’s icon by its application name.
(Read and Write property)

82.2.12 ApplicationName as String

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This name is used both internally and in the Growl preferences.

**Notes:**
This should remain stable between different versions and incarnations of your application.
For example, ”SurfWriter” is a good app name, whereas ”SurfWriter 2.0” and ”SurfWriter Lite” are not.
(Read and Write property)

82.2.13 InstallationInformation as String

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The installation window information text.

**Notes:**
This information may be as long or short as desired (the window will be sized to fit it). If Growl is not installed, it will be displayed to the user as an explanation of what Growl is and what it can do in your application.
It should probably note that no download is required to install.

If this is empty, Growl will use a default, localized explanation.

Only used if you’re using Growl-WithInstaller.framework. Otherwise, this member is ignored.
(Read and Write property)
82.2.14 InstallationWindowTitle as String

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The installation window title. **Notes:** Leave empty for default localized title. (Read and Write property)

82.2.15 UpdateInformation as String

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The update window information text. **Notes:** This information may be as long or short as desired (the window will be sized to fit it). If an older version of Growl is installed, it will be displayed to the user as an explanation that an updated version of Growl is included in your application and no download is required.

If this is empty, Growl will use a default, localized explanation.

Only used if you’re using Growl-WithInstaller.framework. Otherwise, this member is ignored. (Read and Write property)

82.2.16 UpdateWindowTitle as String

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The update window information title. **Notes:** Leave empty to use default text. (Read and Write property)

82.2.17 WillRegisterWhenGrowlIsReady as boolean

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tells framework to register with Growl when Growl launches (or not). **Notes:** (Read and Write computed property)
82.2. CLASS GROWLMBS

82.2.18 Events

82.2.19 Launched

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
An event to inform application that the helper application was launched.
82.3 class GrowlNotificationMBS

82.3.1 class GrowlNotificationMBS

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for all the global notification related functions.

**Notes:**
You may subclass this class to fill the events in case you need them.

On this website you will find more information:
http://growl.info

The plugin is compatible to framework v0.7.5.

82.3.2 Methods

82.3.3 PostNotification

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Posts a Growl notification.

**Notes:**
This is the preferred means for sending a Growl notification.
The notification name and at least one of the title and description are required (all three are preferred). All other parameters may be empty (or 0 or false as appropriate) to accept default values.

If using the Growl-WithInstaller framework, if Growl is not installed the user will be prompted to install Growl.
If the user cancels, this function will have no effect until the next application session, at which time when it is called the user will be prompted again. The user is also given the option to not be prompted again.
If the user does choose to install Growl, the requested notification will be displayed once Growl is installed and running.

82.3.4 Properties

82.3.5 Description as String

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The description supplements the title with more information.

**Notes:**
It is usually longer and sometimes involves a list of subjects. For example, for a 'Download complete' notification, the description might have one filename per line. GrowlMail in Growl 0.6 uses a description of '%d new mail(s)' (formatted with the number of messages).

### 82.3.6 IconData as String

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The icon to display in the notification.

**Notes:**
The data can be in any format supported by NSImage. As of Mac OS X 10.3, this includes the .icns, TIFF, JPEG, GIF, PNG, PDF, and PICT formats.

If this is not supplied, Growl will look up your application’s icon by its application name.

(Read and Write property)

### 82.3.7 Identifier as String

MBS MacOSX Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier to use for the application.

**Notes:**
Optional. Growl will use the bundle identifier of your application if you don’t have one.

(Read and Write property)

### 82.3.8 IsSticky as Boolean

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Requests that a notification stay on-screen until dismissed explicitly.

**Notes:**
notifications disappear after a certain amount of time. Sticky notifications, however, remain on-screen until the user dismisses them explicitly, usually by clicking them.

Sticky notifications were introduced in Growl 0.6. Most notifications should not be sticky. Not all displays support sticky notifications, and the user may choose in Growl’s preference pane to force the notification to be sticky or non-sticky, in which case the sticky bit in the notification will be ignored.

(Read and Write property)
82.3.9 Name as String

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The notification name distinguishes one type of notification from another.

**Notes:**
The name should be human-readable, as it will be displayed in the Growl preference pane.

The name is used in the All Notification Array and the Default Notification Array.
(Read and Write property)

82.3.10 Priority as Integer

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The priority of the notification.

**Notes:**
Priority is new in Growl 0.6, and is represented as a signed integer from -2 to +2. 0 is Normal priority, -2 is Very Low priority, and +2 is Very High priority.

Not all displays support priority. If you do not wish to assign a priority to your notification, assign 0.
(Read and Write property)

82.3.11 Title as String

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A notification’s title describes the notification briefly.

**Notes:**
It should be easy to read quickly by the user.
(Read and Write property)

82.3.12 Events

82.3.13 Clicked

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This notification was clicked.
82.3.14 TimeOut

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This notification timed out.
82.4 class WindowsGrowlMBS

82.4.1 class WindowsGrowlMBS

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for sending growl notifications on Windows.

82.4.2 Methods

82.4.3 Constructor(protocol as Integer, password as string, application as string, notifications() as string)

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new Growl object to send notifications to a local server.

**Example:**

```plaintext
dim notifications(-1) as string
Notifications.Append "MyNotification"

dim g as new WindowsGrowlMBS(WindowsGrowlMBS.kGrowlUDP, "pass", "MyApp", notifications)
```

See also:

- 82.4.4 Constructor(protocol as Integer, server as string, password as string, application as string, notifications() as string)

82.4.4 Constructor(protocol as Integer, server as string, password as string, application as string, notifications() as string)

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new Growl object to send notifications to a remote server.

**Example:**

```plaintext
dim notifications(-1) as string
Notifications.Append "MyNotification"

dim g as new WindowsGrowlMBS(WindowsGrowlMBS.kGrowlUDP, "192.168.1.12", "pass", "MyApp", notifications)
```
82.4. CLASS WINDOWSGROWLMBS

See also:

- 82.4.3 Constructor(protocol as Integer, password as string, application as string, notifications() as string)

82.4.5 Notify(notification as string, title as string, message as string)

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Send a notification.

**Example:**

```vba
dim g as WindowsGrowlMBS // your growl instance
g.Notify("MyNotification", "Just a test to show what growl can do for you.", "http://www.mbsplugins.de/")
```

**Notes:**

- notification: Name of notification
- title: Title text to show
- message: Message text.

See also:

- 82.4.6 Notify(notification as string, title as string, message as string, url as string, icon as string)

82.4.6 Notify(notification as string, title as string, message as string, url as string, icon as string)

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Send a notification.

**Example:**

```vba
dim g as WindowsGrowlMBS // your growl instance
g.Notify("MyNotification", "Just a test", "to show what growl can do for you.")
```

**Notes:**

- notification: Name of notification
- title: Title text to show
- message: Message text.
- URL: The URL to display with message.
- icon: The URL to the icon for this message.

See also:

- 82.4.5 Notify(notification as string, title as string, message as string)
82.4.7 Properties

82.4.8 Application as string

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The application name. Notes: (Read only property)

82.4.9 Password as string

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The password. Notes: (Read only property)

82.4.10 Protocol as Integer

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The protocol to use. Notes: (Read only property)

82.4.11 Server as string

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The server address. Notes: (Read only property)

82.4.12 Constants

82.4.13 kGrowlTCP = 1

82.4.14 kGrowlUDP = 0

Chapter 83

Hotkey

83.1 class HotKeyMBS

83.1.1 class HotKeyMBS

Notes: This is a crossplatform replacement for our CarbonHotKeyMBS class.

83.1.2 Methods

83.1.3 Close

Notes: Same as destructor, but to unregister hotkey now.

83.1.4 Constructor(KeyCode as Integer, Modifiers as Integer, Exclusive as Boolean = false)

Notes: The plugin may not check if combination is allowed, makes sense or can be pressed.
83.1.5 **KeyCodeForText(name as string) as Integer**

MBS Util Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Queries a keycode for a character.  
**Example:**

MsgBox "Return: " + str(HotKeyMBS.KeyCodeForText("return"))

**Notes:**
Helper function to return platform specific key codes for various keys.  
Plugin has a list based on the constants defined by Apple and Microsoft for keys.

83.1.6 **Properties**

83.1.7 **Exclusive as Boolean**

MBS Util Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Whether exclusive ownership of hotkey was requested.  
**Notes:** (Read only property)

83.1.8 **Handle as Integer**

MBS Util Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The internal object reference.  
**Notes:**
Only used on Mac OS X.  
(Read only property)

83.1.9 **ID as Integer**

MBS Util Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The internal ID of the hotkey.  
**Notes:** (Read only property)
83.1. CLASS HOTKEYMBS

83.1.10 KeyCode as Integer

**Function:** The keycode registered.
**Notes:** (Read only property)

83.1.11 Modifiers as Integer

**Function:** The modifiers used at registration.
**Notes:** (Read only property)

83.1.12 Events

83.1.13 KeyDown

**Function:** The key down event.

83.1.14 KeyUp

**Function:** The key up event.

83.1.15 Constants

83.1.16 AlphaKey = &h400

MBS Util Plugin, Plugin Version: 15.2. **Function:** One of the modifier flags.
**Notes:** Alpha Lock

83.1.17 CommandKey = &h100

MBS Util Plugin, Plugin Version: 15.2. **Function:** One of the modifier flags.
**Notes:** Command Key on Mac, Windows Key on Windows.
83.1.18  **ControlKey = & h1000**

MBS Util Plugin, Plugin Version: 15.2. **Function:** One of the modifier flags.  
**Notes:** Control Key

83.1.19  **OptionKey = & h800**

MBS Util Plugin, Plugin Version: 15.2. **Function:** One of the modifier flags.  
**Notes:** Option/Alt Key

83.1.20  **ShiftKey = & h200**

MBS Util Plugin, Plugin Version: 15.2. **Function:** One of the modifier flags.  
**Notes:** Shift Key
Chapter 84

HTMLViewer Linux

84.1 class LinuxJavaScriptContextMBS

84.1.1 class LinuxJavaScriptContextMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The class for a javascript context. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

84.1.2 Methods

84.1.3 CheckScriptSyntax(script as string, sourceURL as string = "", StartLineNumber as Integer = 0) as boolean

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Checks for syntax errors in a string of JavaScript. **Notes:**

- script: A string containing the script to check for syntax errors.
- sourceURL: A string containing a URL for the script’s source file. This is only used when reporting exceptions. Pass "" if you do not care to include source file information in exceptions.
- startingLineNumber: An integer value specifying the script’s starting line number in the file located at sourceURL. This is only used when reporting exceptions.
- exception: A string in which to store a syntax error exception, if any.

Returns true if the script is syntactically correct, otherwise false.

See also:

- 84.1.4 CheckScriptSyntax(script as string, sourceURL as string, StartLineNumber as Integer, byref
84.1.4 CheckScriptSyntax(script as string, sourceURL as string, StartLineNumber as Integer, byref JSExtension as string) as boolean

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Checks for syntax errors in a string of JavaScript.  
**Notes:**  
script: A string containing the script to check for syntax errors.  
sourceURL: A string containing a URL for the script’s source file. This is only used when reporting exceptions. Pass "" if you do not care to include source file information in exceptions.  
startingLineNumber: An integer value specifying the script’s starting line number in the file located at sourceURL. This is only used when reporting exceptions.  
exception: A string in which to store a syntax error exception, if any.  
Returns true if the script is syntactically correct, otherwise false.  
See also:  
- 84.1.3 CheckScriptSyntax(script as string, sourceURL as string = ""), StartLineNumber as Integer = 0) as boolean

84.1.5 Constructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**  
The private constructor.

84.1.6 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**  
The destructor.

84.1.7 EvaluateScript(script as string, sourceURL as string = ""), StartLineNumber as Integer = 0) as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**  
Evaluates a string of JavaScript.  
**Notes:**  
script A string containing the script to evaluate.  
sourceURL: A string containing a URL for the script’s source file. This is only used when reporting exceptions. Pass "" if you do not care to include source file information in exceptions.  
startingLineNumber: An integer value specifying the script’s starting line number in the file located at
sourceURL. This is only used when reporting exceptions.
exception A string in which to store an exception, if any.
Returns the value as string that results from evaluating script, or "" if an exception is thrown.
See also:

- 84.1.8 EvaluateScript(script as string, sourceURL as string, StartLineNumber as Integer, byref JSException as string) as string

84.1.8 EvaluateScript(script as string, sourceURL as string, StartLineNumber as Integer, byref JSException as string) as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Evaluates a string of JavaScript.
**Notes:**

script A string containing the script to evaluate.
sourceURL: A string containing a URL for the script’s source file. This is only used when reporting exceptions. Pass "" if you do not care to include source file information in exceptions.
startingLineNumber: An integer value specifying the script’s starting line number in the file located at sourceURL. This is only used when reporting exceptions.
exception A string in which to store an exception, if any.
Returns the value as string that results from evaluating script, or "" if an exception is thrown.
See also:

- 84.1.7 EvaluateScript(script as string, sourceURL as string = "", StartLineNumber as Integer = 0) as string

84.1.9 GarbageCollect

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Performs a JavaScript garbage collection.
**Notes:** You should not need to call this.

84.1.10 Properties

84.1.11 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The internal object reference.
**Notes:** (Read and Write property)
84.1.12 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The reference to the parent HTMLViewer.
**Notes:** (Read and Write property)
84.2. class LinuxWebBackForwardListMBS

84.2.1 class LinuxWebBackForwardListMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The history of a WebView.

84.2.2 Methods

84.2.3 AddItem(item as LinuxWebHistoryItemMBS)

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Adds the item to the WebBackForwardList.

84.2.4 BackItem as LinuxWebHistoryItemMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the item that precedes the current item.

84.2.5 BackLength as Integer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the number of items that preced the current item.

84.2.6 Clear

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Clears the webBackForwardList by removing all its elements. **Notes:** Note that not even the current page is kept in list when cleared so you would have to add it later. This method also clears the list of visited links which means that all links will appear unvisited.

84.2.7 Constructor(webview as LinuxWebViewMBS)

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Creates an instance of the back forward list with a controlling WebView.
84.2.8 ContainsItem(item as LinuxWebHistoryItemMBS) as boolean

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Checks if item is in the back forward list.

84.2.9 CurrentItem as LinuxWebHistoryItemMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The current item. **Notes:** Returns a nil value if the back forward list is empty.

84.2.10 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The destructor.

84.2.11 ForwardItem as LinuxWebHistoryItemMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The next item forward in the list. **Notes:** Returns a nil value if there nothing that succeeds the current item.

84.2.12 ForwardLength as Integer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the number of items that succeed the current item.

84.2.13 GoBack

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Steps backward in the back forward list.

84.2.14 GoForward

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Steps forward in the back forward list.
84.2.15 GoToItem(item as LinuxWebHistoryItemMBS)

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Go to the specified item in the back forward list.

84.2.16 Item(index as Integer) as LinuxWebHistoryItemMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Returns the item at a given index relative to the current item.

84.2.17 Properties

84.2.18 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The internal object reference.
**Notes:** (Read and Write property)

84.2.19 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The parent htmlviewer.
**Notes:** (Read and Write property)

84.2.20 Limit as Integer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The maximum limit of the back forward list.
**Notes:** (Read and Write computed property)
84.3 class LinuxWebCookieMBS

84.3.1 class LinuxWebCookieMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The class for a cookie used with WebKit on Linux.

**Example:**
```
    dim c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", ",", LinuxWebCookieMBS.kMaxAge-Week)
    MsgBox c.Expires.ShortDate+" "+c.Expires.ShortTime
```

**Notes:**
LinuxWebCookieMBS implements HTTP cookies, primarily as described by the original Netscape cookie specification, but with slight modifications based on RFC 2109, Microsoft’s HttpOnly extension attribute, and observed real-world usage (and, in particular, based on what Firefox does).

An HTTP cookie.

name and value will be set for all cookies. If the cookie is generated from a string that appears to have no name, then name will be the empty string.

domain and path give the host or domain, and path within that host/domain, to restrict this cookie to. If domain starts with ".", that indicates a domain (which matches the string after the ".", or any hostname that has domain as a suffix). Otherwise, it is a hostname and must match exactly.

expires will be non-nil if the cookie uses either the original "expires" attribute, or the "max-age" attribute specified in RFC 2109. If expires is nil, it indicates that neither "expires" nor "max-age" was specified, and the cookie expires at the end of the session.

If http_only is set, the cookie should not be exposed to untrusted code (eg, javascript), so as to minimize the danger posed by cross-site scripting attacks.

84.3.2 Methods

84.3.3 Constructor(name as string, value as string, domain as string, path as string, maxAge as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Creates a new cookie with the given attributes.
Example:

```vbnet
dim c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", ",", LinuxWebCookieMBS.kMaxAge-Week)
MsgBox str(c.Name)
```

Notes:

Use Secure and HTTPOnly properties if you need to set those attributes on the returned cookie.

maxAge is used to set the "expires" attribute on the cookie; pass -1 to not include the attribute (indicating that the cookie expires with the current session), 0 for an already-expired cookie, or a lifetime in seconds. You can use the constants kMaxAgeHour, kMaxAgeDay, kMaxAgeWeek and kMaxAgeYear (or multiples thereof) to calculate this value. (If you really care about setting the exact time that the cookie will expire, use Expire property.)

name: cookie name
value: cookie value
domain: cookie domain or hostname
path: cookie path, or ""
maxage: max age of the cookie, or -1 for a session cookie

### 84.3.4 Copy as LinuxWebCookieMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Creates a copy.

**Notes:** If you want to edit an existing cookie, please make a copy first.

### 84.3.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The destructor.

### 84.3.6 Equal(other as LinuxWebCookieMBS) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Compares two cookies.

**Notes:** Returns true if they are equal.
CHAPTER 84. HTMLVIEWER LINUX

84.3.7 SetMaxAge(value as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Sets cookie’s max age to value.

**Example:**

```vba
dim c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", ",", LinuxWebCookieMBS.kMaxAge-Hour)
c.SetMaxAge(c.kMaxAgeWeek)
MsgBox c.ToSetCookieHeader
```

**Notes:**

If max_age is -1, the cookie is a session cookie, and will expire at the end of the client’s session. Otherwise, it is the number of seconds until the cookie expires. You can use the constants kMaxAgeHour, kMaxAgeDay, kMaxAgeWeek and kMaxAgeYear (or multiples thereof) to calculate this value. (A value of 0 indicates that the cookie should be considered already-expired.)

(This sets the same property as Expire.)

84.3.8 ToCookieHeader as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Serializes cookie in the format used by the Cookie header (ie, for returning a cookie from to a server).

**Example:**

```vba
dim c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", ",", LinuxWebCookieMBS.kMaxAge-Week)
MsgBox c.ToCookieHeader
```

84.3.9 ToSetCookieHeader as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Serializes cookie in the format used by the Set-Cookie header (ie, for sending a cookie from to a client).

**Example:**

```vba
dim c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", ",", LinuxWebCookieMBS.kMaxAge-Week)
MsgBox c.ToSetCookieHeader
```
84.3. CLASS LINUXWEBCOOKIEMBS

84.3.10 Properties

84.3.11 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The internal object reference.
**Notes:** (Read and Write property)

84.3.12 Owner as Variant

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The owner of this object.
**Notes:** (Read and Write property)

84.3.13 Domain as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The domain text.
**Example:**
```vba
dim c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", ",", LinuxWebCookieMBS.kMaxAge-Week)
MsgBox str(c.Domain)
```
**Notes:** (Read and Write computed property)

84.3.14 Expires as date

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The expiration time.
**Example:**
```vba
dim c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", ",", LinuxWebCookieMBS.kMaxAge-Week)
MsgBox c.Expires.ShortDate+" "+c.Expires.ShortTime
```
**Notes:**
If expires is nil, cookie will be a session cookie and will expire at the end of the client’s session.
84.3.15 **HTTPOnly as boolean**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The `httponly` attribute.

**Notes:**
If true, cookie will be marked as "http only", meaning it should not be exposed to web page scripts or other untrusted code.
(Read and Write computed property)

84.3.16 **Name as string**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The name of the cookie.

**Example:**

```vbnet
dim c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", ",", LinuxWebCookieMBS.kMaxAgeWeek)
MsgBox str(c.Name)
```

**Notes:** (Read and Write computed property)

84.3.17 **Path as string**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The path of the cookie.

**Example:**

```vbnet
dim c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "test", LinuxWebCookieMBS.kMaxAgeWeek)
MsgBox str(c.Path)
```

**Notes:** (Read and Write computed property)
84.3. CLASS LINUXWEBCOOKIEMBS

84.3.18 Secure as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The secure attribute.
**Example:**

```vba
dim c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "", LinuxWebCookieMBS.kMaxAgeWeek)
MsgBox str(c.Secure)
c.Secure = true
MsgBox str(c.Secure)
```

**Notes:**
Cookie will only be transmitted from the client to the server over secure (https) connections if secure is true. (Read and Write computed property)

84.3.19 Value as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The value of the cookie.
**Example:**

```vba
dim c as new LinuxWebCookieMBS("test", "12345", "mbsplugins.de", "", LinuxWebCookieMBS.kMaxAgeWeek)
MsgBox str(c.Value)
```

**Notes:** (Read and Write computed property)

84.3.20 Constants

84.3.21 kMaxAgeDay = 86400

MBS Linux Plugin, Plugin Version: 12.4. **Function:** A constant for one day in seconds.

84.3.22 kMaxAgeHour = 3600

MBS Linux Plugin, Plugin Version: 12.4. **Function:** A constant for one hour in seconds.
84.3.23 $k\text{MaxAgeWeek} = 604800$

MBS Linux Plugin, Plugin Version: 12.4. **Function:** A constant for one week in seconds.

84.3.24 $k\text{MaxAgeYear} = 31556926$

MBS Linux Plugin, Plugin Version: 12.4. **Function:** A constant for one year in seconds.
84.4.  CLASS LINUXWEBCOOKIESTOREMBS

84.4  class LinuxWebCookieStoreMBS

84.4.1  class LinuxWebCookieStoreMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The store for cookies.

**Example:**

```vbscript
dim store as LinuxWebCookieStoreMBS = LinuxWebCookieStoreMBS.CookieStore
dim cookies() as LinuxWebCookieMBS = store.AllCookies
MsgBox str(UBound(cookies)+1)+" cookies"
```

84.4.2  Methods

84.4.3  AddCookie(cookie as LinuxWebCookieMBS)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Adds cookie to store.

84.4.4  AllCookies as LinuxWebCookieMBS()

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Returns an array with all cookies.

**Example:**

```vbscript
// show all cookies
dim store as LinuxWebCookieStoreMBS = LinuxWebCookieStoreMBS.CookieStore
dim cookies(-1) as LinuxWebCookieMBS = store.AllCookies
dim lines() as string

for each c as LinuxWebCookieMBS in cookies
lines.Append c.ToSetCookieHeader
next

MsgBox Join(lines,EndOfLine)
```

84.4.5  Available as Boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Returns true if the plugin found all functions for the web cookie store.
84.4.6 Constructor

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Creates a new cookie store. **Notes:** The base LinuxWebCookieStoreMBS class does not support persistent storage of cookies; use a subclass for that.

84.4.7 CookieStore as LinuxWebCookieStoreMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Queries the default cookie store. **Example:**

```vbscript
dim w as LinuxWebCookieStoreMBS = LinuxWebCookieStoreMBS.CookieStore

MsgBox "AcceptPolicy: "+str(w.AcceptPolicy)
w.AcceptPolicy = w.kAcceptNoThirdParty
MsgBox "AcceptPolicy: "+str(w.AcceptPolicy)
```

84.4.8 DeleteAllCookies

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Deletes all cookies. **Example:**

```vbscript
dim w as LinuxWebCookieStoreMBS = LinuxWebCookieStoreMBS.CookieStore
w.DeleteAllCookies
```

84.4.9 DeleteCookie(cookie as LinuxWebCookieMBS)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Deletes cookie.
84.4.10 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The destructor.

84.4.11 SetCookieStore(newStore as LinuxWebCookieStoreMBS)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Makes the given cookie store the default one.

84.4.12 Properties

84.4.13 Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The internal object reference. **Notes:** (Read and Write property)

84.4.14 Owner as Variant

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The owner of this object. **Notes:** (Read and Write property)

84.4.15 AcceptPolicy as Integer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Get/set the policy for accepting cookies. **Example:**

```vbnet
dim w as LinuxWebCookieStoreMBS = LinuxWebCookieStoreMBS.CookieStore

MsgBox "AcceptPolicy: " + str(w.AcceptPolicy)
w.AcceptPolicy = w.kAcceptNoThirdParty
MsgBox "AcceptPolicy: " + str(w.AcceptPolicy)
```

**Notes:** (Read and Write computed property)
84.4.16 Constants

84.4.17 \texttt{kAcceptAlways} = 0

MBS Linux Plugin, Plugin Version: 12.4. \textbf{Function}: One of the cookie accept modes. \textbf{Notes}: Accept all cookies unconditionally.

84.4.18 \texttt{kAcceptNever} = 1

MBS Linux Plugin, Plugin Version: 12.4. \textbf{Function}: One of the cookie accept modes. \textbf{Notes}: Reject all cookies unconditionally.

84.4.19 \texttt{kAcceptNoThirdParty} = 2

MBS Linux Plugin, Plugin Version: 12.4. \textbf{Function}: One of the cookie accept modes. \textbf{Notes}:

No Third party cookies.
Accept all cookies set by the main document loaded in the application using libsoup. An example of the most common case, web browsers, would be: If http://www.example.com is the page loaded, accept all cookies set by example.com, but if a resource from http://www.third-party.com is loaded from that page reject any cookie that it could try to set. For libsoup to be able to tell apart first party cookies from the rest, the application must call \texttt{soup_message_set_first_party()} on each outgoing SoupMessage, setting the SoupURI of the main document. If no first party is set in a message when this policy is in effect, cookies will be assumed to be third party by default. (this is done by webkit)
84.5. class LinuxWebDataSourceMBS

84.5.1 class LinuxWebDataSourceMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Data source encapsulates the content of a WebFrame.
**Notes:** A WebFrame has a main resource and subresources and the data source provides access to these resources. When a request gets loaded initially, it is set to a provisional state. The application can request for the request that initiated the load by asking for the provisional data source and invoking the InitialRequest method of DataSource. This data source may not have enough data and some methods may return empty values. To get a "full" data source with the data and resources loaded, you need to get the non-provisional data source through WebFrame’s DataSource method. This data source will have the data after everything was loaded. Make sure that the data source was finished loading before using any of its methods. You can do this via IsLoading.

84.5.2 Methods

84.5.3 Constructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Creates a new WebKitWebDataSource instance.
**Notes:** The URL of the WebKitWebDataSource will be set to "about:blank".
See also:

• 84.5.4 Constructor(request as LinuxWebNetworkRequestMBS)

84.5.4 Constructor(request as LinuxWebNetworkRequestMBS)

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Creates a new data source with the given network request.
See also:

• 84.5.3 Constructor

84.5.5 Data as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Returns the raw data that represents the the frame’s content.
**Notes:** The data will be incomplete until the data has finished loading. Returns "" if the web frame hasn’t loaded any data. Use isLoading to test if data source is in the process of loading.
84.5.6 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The destructor.

84.5.7 Encoding as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the text encoding name as set in the WebView, or if not, the text encoding of the response.

84.5.8 InitialRequest as LinuxWebNetworkRequestMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns a reference to the original request that was used to load the web content. **Notes:** The NetworkRequest returned by this method is the request prior to the "committed" load state. See Request for getting the "committed" request.

84.5.9 IsLoading as boolean

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Determines whether the data source is in the process of loading its content. **Notes:** Returns true if loading or false if not.

84.5.10 MainResource as LinuxWebResourceMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the main resource of the data source.

84.5.11 Request as LinuxWebNetworkRequestMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns a NetworkRequest that was used to create this DataSource. **Notes:** The NetworkRequest returned by this method is the request that was "committed", and hence, different from the request you get from the InitialRequest method.
84.5.12  **Subresources as LinuxWebResourceMBS()**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Gives you a list of WebKitWebResource objects that compose the WebView to which this DataSource is attached.

84.5.13  **UnrechableURI as string**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Return the unreachable URI of data source.
**Notes:** The data source will have an unreachable URL if it was created using WebFrame's LoadAlternate-HtmlString method.

84.5.14  **WebFrame as LinuxWebFrameMBS**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Returns the WebFrame that represents this data source.
**Notes:**
The WebFrame is owned by WebKit and should not be freed or destroyed.
This will return nil if the data source is not attached to a frame.

84.5.15  **Properties**

84.5.16  **Handle as Integer**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The internal object reference.
**Notes:** (Read and Write property)

84.5.17  **HTMLViewer as HTMLViewer**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The parent HTMLViewer.
**Notes:** (Read and Write property)
84.6 class LinuxWebFrameMBS

84.6.1 class LinuxWebFrameMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The class for a WebKit WebFrame on Linux. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

84.6.2 Methods

84.6.3 Constructor

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The private constructor.

84.6.4 DataSource as LinuxWebDataSourceMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the committed data source.

84.6.5 Destructor

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The destructor.

84.6.6 FindFrame(name as string) as LinuxWebFrameMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Searches a frame by name. **Notes:** For pre-defined names, returns frame if name is ",self" or ",current", returns frame’s parent frame if name is ",parent", and returns the main frame if name is ",top". Also returns frame if it is the main frame and name is either ",parent" or ",top". For other names, this function returns the first frame that matches name. This function searches frame and its descendents first, then frame’s parent and its children moving up the hierarchy until a match is found. If no match is found in frame’s hierarchy, this function will search for a matching frame in other main frame hierarchies. Returns nil if no match is found.
name: the name of the frame to be found
Returns the found WebKitWebFrame or nil in case none is found.

84.6.7 JSContext as LinuxJavaScriptContextMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Queries the javascript context for this webframe.

84.6.8 LoadAlternateString(content as string, BaseURL as string, unreachableURL as string)

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Request loading of an alternate content for a URL that is unreachable. **Notes:** Using this method will preserve the back-forward list. The URI passed in base url has to be an absolute URI.

84.6.9 LoadRequest(request as LinuxWebNetworkRequestMBS)

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Connects to a given URI by initiating an asynchronous client request. **Notes:** Creates a provisional data source that will transition to a committed data source once any data has been received. Use StopLoading to stop the load. This function is typically invoked on the main frame.

84.6.10 LoadStatus as Integer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the current load state.

84.6.11 LoadString(content as string, MimeType as String, Encoding as String, BaseURL as string)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Requests loading of the given content with the specified MimeType, encoding and BaseURL. **Notes:**

If mime_type is "", "text/html" is assumed.
If encoding is "", "UTF-8" is assumed.
CHAPTER 84. HTMLVIEWER LINUX

84.6.12  LoadURL(URL as string)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. Function:
Requests loading of the specified URI string.

84.6.13  Name as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. Function:
Returns the frame’s name

84.6.14  NetworkResponse as LinuxWebNetworkResponseMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. Function:
Returns the network response.
Notes: Returns a NetworkResponse object representing the response that was given to the request for the
given frame, or nil if the frame was not created by a load. You must unref the object when you are done
with it.

84.6.15  Parent as LinuxWebFrameMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. Function:
Returns the frame’s parent frame, or nil if it has none.

84.6.16  Print

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. Function:
Asks the control to print it’s content.
84.6.17  ProvisionalDataSource as LinuxWebDataSourceMBS

**Function:**
You use the LoadRequest method to initiate a request that creates a provisional data source.
**Notes:**
The provisional data source will transition to a committed data source once any data has been received. Use DataSource to get the committed data source.

Returns the provisional WebDataSource or nil if a load request is not in progress.

84.6.18  Reload

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes.
**Function:**
Reloads the initial request.

84.6.19  StopLoading

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes.
**Function:**
Stops any pending loads on frame’s data source, and those of its children.

84.6.20  Title as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes.
**Function:**
Returns the frame’s document title

84.6.21  URL as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes.
**Function:**
Returns the current URI of the contents displayed by the frame.

84.6.22  Properties

84.6.23  Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes.
**Function:**
The internal object reference.
CHAPTER 84. HTMLVIEWER LINUX

84.6.24 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The parent HTMLViewer.
**Notes:** (Read and Write property)

84.6.25 WebView as LinuxWebViewMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The reference to the parent webview.
**Notes:** (Read and Write property)

84.6.26 Constants

84.6.27 kLoadCommitted = 1

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the load state constants.
**Notes:** The first data chunk has arrived, meaning that the necessary transport requirements are stabilised, and the load is being performed.

84.6.28 kLoadFailed = 4

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the load state constants.
**Notes:** This state means that some error occurred during the page load that prevented it from being completed. You can connect to the error event if you want to know precisely what kind of error occurred.

84.6.29 kLoadFinished = 2

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the load state constants.
**Notes:** This state means that everything that was required to display the page has been loaded.
84.6.30  \texttt{kLoadFirstVisuallyNonEmptyLayout} = 3

MBS Linux Plugin, Plugin Version: 12.4. \textbf{Function}: One of the load state constants.
\textbf{Notes}: The first layout with actual visible content happened; one or more layouts may have happened before that caused nothing to be visible on the screen, because the data available at the time was not significant enough.

84.6.31  \texttt{kLoadProvisional} = 0

MBS Linux Plugin, Plugin Version: 12.4. \textbf{Function}: One of the load state constants.
\textbf{Notes}: No data has been received yet, empty structures have been allocated to perform the load; the load may still fail for transport issues such as not being able to resolve a name, or connect to a port.
84.7  class LinuxWebHistoryItemMBS

84.7.1  class LinuxWebHistoryItemMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** One item of the WebBackForwardList and or global history.  
**Notes:** A history item consists out of a title and a uri. It can be part of the WebBackForwardList and the global history. The global history is used for coloring the links of visited sites. WebHistoryItem’s constructed with Constructor() are automatically added to the global history.

84.7.2  Methods

84.7.3  Constructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Creates a new WebHistoryItem instance.  
See also:

- 84.7.4 Constructor(URI as string, Title as string)  

84.7.4  Constructor(URI as string, Title as string)

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Creates a new WebHistoryItem with the given URI and title.  
See also:

- 84.7.3 Constructor

84.7.5  Copy as LinuxWebHistoryItemMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Makes a copy of the item for use with other WebView objects.

84.7.6  Destructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The destructor.
84.7. **CLASS LINUXWEBHISTORYITEMMBS**

### 84.7.7 LastVisitedTime as Double

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The last visited timestamp.

### 84.7.8 OriginalURI as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The original URL of this item.

### 84.7.9 Title as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The title of this item.

### 84.7.10 URI as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The URL of this item.

### 84.7.11 Properties

#### 84.7.12 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The internal object reference. **Notes:** (Read and Write property)

### 84.7.13 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The parent htmlviewer. **Notes:** (Read and Write property)
84.7.14 AlternateTitle as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The alternate title.
**Notes:** (Read and Write computed property)
84.8. class LinuxWebInspectorMBS

84.8.1 class LinuxWebInspectorMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The WebKit Inspector is a graphical tool to inspect and change the content of a WebKitWebView.

**Notes:**
It also includes an interactive JavaScriptDebugger. Using this class one can get a GtkWidget which can be embedded into an application to show the inspector.

The inspector is available when the WebKitWebSettings of the WebKitWebView has set the "enable-developer-extras" to true otherwise no inspector is available.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

84.8.2 Methods

84.8.3 Close

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Causes the Web Inspector to be closed.

84.8.4 Constructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The private constructor.

84.8.5 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The destructor.

84.8.6 InspectCoordinates(x as Double, y as Double)

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Causes the Web Inspector to inspect the node that is located at the given coordinates of the widget.

**Notes:**
The coordinates should be relative to the WebKitWebView widget, not to the scrollable content, and may be obtained from a GdkEvent directly. This means x, and y being zero doesn’t guarantee you will hit the left-most top corner of the content, since the contents may have been scrolled.

x: the X coordinate of the node to be inspected
y: the Y coordinate of the node to be inspected

84.8.7 InspectedURI as string
MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Obtains the URI that is currently being inspected.

84.8.8 Show
MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Causes the Web Inspector to be shown.

84.8.9 WebView as LinuxWebViewMBS
MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Obtains the WebKitWebView that is used to render the inspector.

84.8.10 Properties

84.8.11 Handle as Integer
MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The internal object reference.
**Notes:** (Read and Write property)

84.8.12 HTMLViewer as HTMLViewer
MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The reference to the parent HTMLViewer.
**Notes:** (Read and Write property)
84.9. **CLASS LINUXWEBNETWORKREQUESTMBS**

84.9  **class LinuxWebNetworkRequestMBS**

84.9.1  **class LinuxWebNetworkRequestMBS**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** This class represents the network related aspects of a navigation request. **Notes:** It is used whenever WebKit wants to provide information about a request that will be sent, or has been sent. Inside it you can find the URI of the request, and, for valid URIs, a SoupMessage object, which provides access to further information such as headers.

84.9.2  **Methods**

84.9.3  **Constructor(url as string)**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Creates a new NetworkRequest initialized with an URI.

84.9.4  **Destructor**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The destructor.

84.9.5  **Properties**

84.9.6  **Handle as Integer**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The internal object reference. **Notes:** (Read and Write property)

84.9.7  **HTMLViewer as HTMLViewer**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The parent HTMLViewer. **Notes:** (Read and Write property)
84.9.8 URL as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Get or set the URL for this request. 
**Notes:** (Read and Write computed property)
84.10. Class LinuxWebNetworkResponseMBS

84.10.1 class LinuxWebNetworkResponseMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
This class represents the network related aspects of a navigation response.

84.10.2 Methods

84.10.3 Constructor(url as string)

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Creates a new response object with the given URL.

84.10.4 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The destructor.

84.10.5 Properties

84.10.6 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The internal object reference.
**Notes:** (Read and Write property)

84.10.7 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The parent HTMLViewer.
**Notes:** (Read and Write property)
84.10.8 URL as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Get or set the URL for this request. **Notes:** (Read and Write computed property)
84.11 class LinuxWebResourceMBS

84.11.1 class LinuxWebResourceMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** A web resource encapsulates the data of the download as well as the URI, MIME type and frame name of the resource.

84.11.2 Methods

84.11.3 Constructor(data as string, uri as string, mimeType as string, encoding as string = "", FrameName as string = "")

**Notes:**
The encoding can be "". The FrameName argument can be used if the resource represents contents of an entire HTML frame, otherwise pass "".

See also FileExtensionToMimeTypeMBS function.

84.11.4 Data as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the data of the webResource.

84.11.5 Destructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The destructor.

84.11.6 Encoding as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the encoding for this resource.
84.11.7  FrameName as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Queries the frame name.

84.11.8  MimeType as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The MIME Type for this resource.
**Notes:** See also MimeTypeToFileExtensionMBS function.

84.11.9  URL as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The URL for this resource.

84.11.10  Properties

84.11.11  Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The internal object reference.
**Notes:** (Read and Write property)

84.11.12  HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The parent HTMLViewer.
**Notes:** (Read and Write property)
84.12.  CLASS LINUXWEBSETTINGSMBS

84.12  class LinuxWebSettingsMBS

84.12.1  class LinuxWebSettingsMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** WebSettings can be applied to a WebKitWebView to control text encoding, color, font sizes, printing mode, script support, loading of images and various other things. **Notes:** After creation, a WebSettings object contains default settings.

84.12.2  Methods

84.12.3  Constructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Creates a new WebSettings instance with default values. **Notes:** It must be manually attached to a WebView.

84.12.4  Copy as LinuxWebSettingsMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Copies an existing WebSettings instance.

84.12.5  Destructor

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The destructor.

84.12.6  UserAgent as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the User-Agent string currently used by the web view(s) associated with the web settings.
84.12.7 Properties

84.12.8 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

84.12.9 HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The parent htmlviewer.  
**Notes:** (Read and Write property)
84.13. **CLASS LINUXWEBVIEWMBS**

### 84.13 class LinuxWebViewMBS

**84.13.1 class LinuxWebViewMBS**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The class for a WebKit WebView on Linux.  
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

**84.13.2 Methods**

**84.13.3 Available as Boolean**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Whether the plugin found libwebkit on linux.  
**Notes:** Returns true on linux if the class can work. Else it returns false.

**84.13.4 BackForwardList as LinuxWebBackForwardListMBS**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Obtains the BackForwardList associated with the given WebView.  
**Notes:** The BackForwardList is owned by the WebView.

**84.13.5 CacheModel as Integer**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The cache model for the htmlviewer.  
**Notes:** (Read and Write computed property)

**84.13.6 CanCopyClipboard as boolean**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Whether copy is possible.
84.13.7 CanCutClipboard as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Whether cut is possible.

84.13.8 CanGoBack as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Determines whether web_view has a previous history item. **Notes:** Returns true if able to move back, false otherwise.

84.13.9 CanGoBackOrForward(steps as Integer) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Determines whether web_view has a history item of steps. **Notes:** Negative values represent steps backward while positive values represent steps forward. steps: the number of steps Returns true if able to move back or forward the given number of steps, false otherwise.

84.13.10 CanGoForward as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Determines whether web_view has a next history item. **Notes:** Returns true if able to move forward, false otherwise.

84.13.11 CanPasteClipboard as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Whether paste is possible.

84.13.12 CanRedo as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Whether redo is possible.
84.13. CLAS LINUXWEBVIEWMBS

84.13.13 CanShowMimeType(MimeType as string) as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
This function returns whether or not a MIME type can be displayed using this view.

**Notes:**
MimeType: a MIME type

Return boolean indicating if the MIME type can be displayed.
See also FileExtensionToMimeTypeMBS function.

84.13.14 CanUndo as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Whether undo is possible.

84.13.15 Constructor

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The private constructor.

84.13.16 CookieStore as LinuxWebCookieStoreMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Queries the default cookie store.

84.13.17 CopyClipboard

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Copies the current selection inside the web_view to the clipboard.

84.13.18 CutClipboard

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Cuts the current selection inside the web_view to the clipboard.
84.13.19  DeleteSelection

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Deletes the current selection inside the web view.

84.13.20  Destructor

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The destructor.

84.13.21  Encoding as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Returns the default encoding of the WebKitWebView.

84.13.22  EvaluateScript(script as string) as string

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Evaluates a string of JavaScript.
**Notes:**
script A string containing the script to evaluate.
Returns the value as string that results from evaluating script, or "" if an exception is thrown.

84.13.23  ExecuteScript(script as string)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Executes java script.

84.13.24  FocusedFrame as LinuxWebFrameMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Returns the frame that has focus or an active text selection.
**Notes:**
Returns the focused frame or nil if no frame is focused
84.13.25  GoBack

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Loads the previous history item.

84.13.26  GoBackOrForward(steps as Integer)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Loads the history item that is the number of steps away from the current item.
**Notes:** Negative values represent steps backward while positive values represent steps forward.

84.13.27  GoForward

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Loads the next history item.

84.13.28  GoToItem(item as LinuxWebHistoryItemMBS) as boolean

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Go to the specified history item.
**Notes:** Returns true if loading of item is successful, false if not.

84.13.29  HasSelection as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Determines whether text was selected.
**Notes:** Returns true if there is selected text, false if not

84.13.30  IconURL as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Returns the favorite icon URL for the current website.
84.13.31 Inspector as LinuxWebInspectorMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Obtains the WebKitWebInspector associated with the WebKitWebView.

**Notes:** Every WebKitWebView object has a WebKitWebInspector object attached to it as soon as it is created, so this function will only return nil if the argument is not a valid WebKitWebView.

84.13.32 JSContext as LinuxJavaScriptContextMBS

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Queries the javascript context for the main webframe.

84.13.33 LoadHTMLString(HTMLString as string, BaseURL as string = "")

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Loads a HTML string.

84.13.34 LoadRequest(request as LinuxWebNetworkRequestMBS)

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Requests loading of the specified asynchronous client request.

**Notes:** Creates a provisional data source that will transition to a committed data source once any data has been received. Use StopLoading to stop the load.

84.13.35 LoadStatus as Integer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the current load state.

84.13.36 LoadString(content as string, MimeType as String, Encoding as String, BaseURL as string)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Requests loading of the given content with the specified MIMEType, encoding and BaseURL.

**Notes:**
If mime_type is "", "text/html" is assumed.
If encoding is "", "UTF-8" is assumed.
Content: an URI string
MimeType: the MIME type, or "."
Encoding: the encoding, or "."
BaseUrl: the base URI for relative locations.

See also FileExtensionToMimeTypeMBS function.

84.13.37 LoadURL(URL as string)

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Requests loading of the specified URI string.

84.13.38 MainFrame as LinuxWebFrameMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the main frame of the document.

84.13.39 MajorVersion as Integer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns major version of webkit.

84.13.40 MarkTextMatches(text as string, caseSensitive as boolean = false, limit as Integer = 99) as Integer

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Attempts to highlight all occurrences of string inside webview. **Notes:**

- string: a string to look for
- case_sensitive: whether to respect the case of text
- limit: the maximum number of strings to look for or 0 for all

Returns the number of strings highlighted.
84.13.41  **MicroVersion as Integer**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns micro version of webkit.

84.13.42  **MinorVersion as Integer**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns minor version of webkit.

84.13.43  **PasteClipboard**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Pastes the current contents of the clipboard to the webview.

84.13.44  **Progress as Double**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The global locating progress in percent. **Notes:** 1.0 is full progress.

84.13.45  **ProxyURL as String**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The proxy URL setting. **Notes:** (Read and Write computed property)

84.13.46  **Redo**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Redos last action if possible.

84.13.47  **Reload**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Reloads the initial request.
84.13.48  **ReloadIgnoreCache**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Reloads the webview without using any cached data.

84.13.49  **SearchText(text as string, caseSensitive as boolean = false, forward as boolean = true, wrap as boolean = true) as boolean**

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Looks for a specified string inside webview.  
**Notes:**
- text: a string to look for.
- case_sensitive: whether to respect the case of text.
- forward: whether to find forward or not.
- wrap: whether to continue looking at the beginning after reaching the end.
Returns true on success or false on failure.

84.13.50  **SelectAll**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Attempts to select everything inside the webview.

84.13.51  **SetCookieStore(newStore as LinuxWebCookieStoreMBS)**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Makes the given cookie store the default one.

84.13.52  **SetHighlightTextMatches(highlight as boolean)**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Highlights text matches previously marked by MarkTextMatches.
84.13.53 SetMaintainsBackForwardList(flag as boolean)

MBS Linux Plugin, Plugin Version: 13.5, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Set the view to maintain a back or forward list of history items.

84.13.54 StopLoading

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Stops any pending loads on frame’s data source, and those of its children.

84.13.55 Title as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The title of the website.

84.13.56 Undo

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Undos last action if possible.

84.13.57 UnmarkTextMatches

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Unmarks text matches from search.

84.13.58 URL as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Returns the current URL.

84.13.59 ZoomIn

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Increases the zoom level of web_view.
**Notes:** The current zoom level is incremented by the value of the "zoom-step" property of the settings
84.13. CLASS LINUXWEBVIEWMBS

associated with webview.

84.13.60  ZoomOut

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Decreases the zoom level of webview.  
**Notes:** The current zoom level is decremented by the value of the "zoom-step" property of the settings associated with webview.

84.13.61  Properties

84.13.62  Handle as Integer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

84.13.63  HTMLViewer as HTMLViewer

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The reference to the parent HTMLViewer.  
**Notes:** (Read and Write property)

84.13.64  CustomEncoding as string

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The current WebKitWebView encoding.  
**Notes:** (Read and Write computed property)

84.13.65  Editable as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Whether the user is allowed to edit the document.  
**Notes:** If flag is true, webview allows the user to edit the document. If flag is false, an element in webview's document can only be edited if the CONTENTEDITABLE attribute has been set on the element or one of its parent elements. You can change webview's document programmatically regardless of this setting. By
default a WebKitWebView is not editable.

Normally, an HTML document is not editable unless the elements within the document are editable. This function provides a low-level way to make the contents of a WebKitWebView editable without altering the document or DOM structure.

(Read and Write computed property)

84.13.66 FullContentZoom as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. Function: Whether the zoom level affects only text or all elements.

Notes: False if only text should be scaled (the default), true if the full content of the view should be scaled.

(Read and Write computed property)

84.13.67 Settings as LinuxWebSettingsMBS

Notes: (Read and Write computed property)

84.13.68 Transparent as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. Function: Whether the WebKitWebView has a transparent background.

Notes: False when the WebKitWebView draws a solid background (the default), otherwise true.

(Read and Write computed property)

84.13.69 ViewSourceMode as boolean

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. Function: Whether we are viewing the source code.

Notes: (Read and Write computed property)
84.13. **CLASS LINUXWEBVIEWMBS**

84.13.70 **ZoomLevel as Double**

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Returns the zoom level of web_view, i.e. the factor by which elements in the page are scaled with respect to their original size.

**Notes:**
If the "full-content-zoom" property is set to false (the default) the zoom level changes the text size, or if true, scales all elements in the page.
(Read and Write computed property)

84.13.71 **Constants**

84.13.72 **kCacheModelDocumentViewer = 1**

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the cache model constants.
**Notes:** Cache in Document Viewer.

84.13.73 **kCacheModelWebBrowser = 2**

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the cache model constants.
**Notes:** Cache in Web Browser.

84.13.74 **kLoadCommitted = 1**

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the load state constants.
**Notes:** The first data chunk has arrived, meaning that the necessary transport requirements are stabilished, and the load is being performed.

84.13.75 **kLoadFailed = 4**

MBS Linux Plugin, Plugin Version: 12.4. **Function:** One of the load state constants.
**Notes:** This state means that some error occurred during the page load that prevented it from being completed. You can connect to the error event if you want to know precisely what kind of error occurred.
84.13.76  \texttt{kLoadFinished} = 2

MBS Linux Plugin, Plugin Version: 12.4. \textbf{Function}: One of the load state constants. 
\textbf{Notes}: This state means that everything that was required to display the page has been loaded.

84.13.77  \texttt{kLoadFirstVisuallyNonEmptyLayout} = 3

MBS Linux Plugin, Plugin Version: 12.4. \textbf{Function}: One of the load state constants. 
\textbf{Notes}: The first layout with actual visible content happened; one or more layouts may have happened before that caused nothing to be visible on the screen, because the data available at the time was not significant enough.

84.13.78  \texttt{kLoadProvisional} = 0

MBS Linux Plugin, Plugin Version: 12.4. \textbf{Function}: One of the load state constants. 
\textbf{Notes}: No data has been received yet, empty structures have been allocated to perform the load; the load may still fail for transport issues such as not being able to resolve a name, or connect to a port.
Chapter 85

HTMLViewer Mac

85.1 class DOMAbstractViewMBS

85.1.1 class DOMAbstractViewMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

85.1.2 Methods

85.1.3 document as DOMDocumentMBS

Function: Check the DOM documentation for details on this function.
85.2 class DOMAttrMBS

85.2.1 class DOMAttrMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMNodeMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.2.2 Methods

85.2.3 name as String

Function: Check the DOM documentation for details on this function.

85.2.4 ownerElement as DOMElementMBS

Function: Check the DOM documentation for details on this function.

85.2.5 specified as boolean

Function: Check the DOM documentation for details on this function.

85.2.6 Properties

85.2.7 value as String

Function: Check the DOM documentation for details on this function.
85.2. *CLASS DOMATTRMBS*

**Notes:** (Read and Write computed property)
85.3 class DOMCDATASectionMBS

85.3.1 class DOMCDATASectionMBS

Function: One of the DOM classes.

Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

Subclass of the DOMTextMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.
85.4. CLASS DOMCHARACTERDATAMBS

85.4 class DOMCharacterDataMBS

85.4.1 class DOMCharacterDataMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMNodeMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin
functions.

85.4.2 Methods

85.4.3 appendData(arg as string)

Function: Check the DOM documentation for details on this function.

85.4.4 deleteData(offset as Integer, count as Integer)

Function: Check the DOM documentation for details on this function.

85.4.5 insertData(offset as Integer, arg as string)

Function: Check the DOM documentation for details on this function.

85.4.6 length as Integer

Function: Check the DOM documentation for details on this function.
85.4.7 replaceData(offset as Integer, count as Integer, arg as string)

**Function:** Check the DOM documentation for details on this function.

85.4.8 substringData(offset as Integer, count as Integer) as string

**Function:** Check the DOM documentation for details on this function.

85.4.9 Properties

85.4.10 data as string

**Function:** Check the DOM documentation for details on this function.  
**Notes:** (Read and Write computed property)
85.5.  CLASS DOMCOMMENTMBS

85.5  class DOMCommentMBS

85.5.1  class DOMCommentMBS

Function: One of the DOM classes.
Notes:

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMCharacterDataMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.
85.6  class DOMCounterMBS

85.6.1  class DOMCounterMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.6.2  Methods

85.6.3  identifier as String

Function: Check the DOM documentation for details on this function.

85.6.4  listStyle as String

Function: Check the DOM documentation for details on this function.

85.6.5  separator as String

Function: Check the DOM documentation for details on this function.
85.7.  **CLASS DOMCSSCharsetRuleMBS**

85.7  **class DOMCSSCharsetRuleMBS**

**Function:** One of the DOM classes.  
**Notes:**  
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.  
Subclass of the DOMCSSRuleMBS class.  
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.7.2  **Methods**

85.7.3  **encoding as String**

**Function:** Check the DOM documentation for details on this function.
85.8 class DOMCSSFontFaceRuleMBS

85.8.1 class DOMCSSFontFaceRuleMBS

Function: One of the DOM classes.
Notes:

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMCSSRuleMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.8.2 Methods

85.8.3 style as DOMCSSStyleDeclarationMBS

Function: Check the DOM documentation for details on this function.
85.9. class DOMCSSImportRuleMBS

85.9.1 class DOMCSSImportRuleMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMCSSRuleMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

85.9.2 Methods

85.9.3 href as String

Function: Check the DOM documentation for details on this function.

85.9.4 media as DOMMediaListMBS

Function: Check the DOM documentation for details on this function.

85.9.5 styleSheet as DOMCSSStyleSheetMBS

Function: Check the DOM documentation for details on this function.
85.10  class DOMCSSMediaRuleMBS

85.10.1  class DOMCSSMediaRuleMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMCSSRuleMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin
functions.

85.10.2  Methods

85.10.3  cssRules as DOMCSSRuleListMBS

Function: Check the DOM documentation for details on this function.

85.10.4  deleteRule(index as Integer)

Function: Check the DOM documentation for details on this function.

85.10.5  insertRule(rule as string, index as Integer) as Integer

Function: Check the DOM documentation for details on this function.

85.10.6  media as DOMMediaListMBS

Function: Check the DOM documentation for details on this function.
85.11. class DOMCSSPageRuleMBS

85.11.1 class DOMCSSPageRuleMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMCSSRuleMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.11.2 Methods

85.11.3 style as DOMCSSStyleDeclarationMBS

Function: Check the DOM documentation for details on this function.

85.11.4 Properties

85.11.5 selectorText as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.12 class DOMCSSPrimitiveValueMBS

85.12.1 class DOMCSSPrimitiveValueMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMCSSValueMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.12.2 Methods

85.12.3 getCounterValue as DOMCounterMBS

Function: Check the DOM documentation for details on this function.

85.12.4 getRectValue as DOMRectMBS

Function: Check the DOM documentation for details on this function.

85.12.5 getRGBColorValue as DOMRGBColorMBS

Function: Check the DOM documentation for details on this function.

85.12.6 getStringValue as String

Function: Check the DOM documentation for details on this function.
85.12.7  primitiveType as Integer

Function: The type of this value.
Notes: See the constants for possible values.

85.12.8  setStringValue(StringType as Integer, StringValue as string)

Function: Check the DOM documentation for details on this function.

85.12.9  Properties

85.12.10  getFloatValue(unitType as Integer) as single

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.12.11  Constants

85.12.12  DOM_CSS_ATTR = 22

MBS MacControls Plugin, Plugin Version: 7.4. Function: A constant for the primitiveType property.

85.12.13  DOM_CSS_CM = 6

MBS MacControls Plugin, Plugin Version: 7.4. Function: A constant for the primitiveType property.

85.12.14  DOM_CSS_COUNTER = 23

MBS MacControls Plugin, Plugin Version: 7.4. Function: A constant for the primitiveType property.
85.12.15  DOM_CSS_DEG = 11

MBS MacControls Plugin, Plugin Version: 7.4. Function: A constant for the primitiveType property.

85.12.16  DOM_CSS_DIMENSION = 18

MBS MacControls Plugin, Plugin Version: 7.4. Function: A constant for the primitiveType property.

85.12.17  DOM_CSSEMS = 3

85.13. class DOMCSSRuleListMBS

85.13.1. class DOMCSSRuleListMBS

Function: A class for a list of css rules.

Notes:

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

Subclass of the DOMObjectMBS class.

This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.13.2. Methods

85.13.3. item(index as UInt32) as DOMCSSRuleMBS

Function: Returns the item with the given index or nil.

Notes: Index is zero based.

85.13.4. length as Integer

Function: The number of items in this list.
85.14 class DOMCSSRuleMBS

85.14.1 class DOMCSSRuleMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.14.2 Methods

85.14.3 parentRule as DOMCSSRuleMBS

Function: Check the DOM documentation for details on this function.

85.14.4 parentStyleSheet as DOMCSSStyleSheetMBS

Function: Check the DOM documentation for details on this function.

85.14.5 type as Integer

Function: The type of this rule.
Notes: See the constants for possible values.

85.14.6 Properties

85.14.7 cssText as String

Function: Check the DOM documentation for details on this function.
85.14.8  Constants

85.14.9  DOM_CHARSET_RULE = 2
MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the type property.

85.14.10 DOM_IMPORT_RULE = 3
MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the type property.

85.14.11 DOM_MEDIA_RULE = 4
MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the type property.

85.14.12 DOM_STYLE_RULE = 1
MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the type property.

85.14.13 DOM_UNKNOWN_RULE = 0
MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the type property.
85.15 **class DOMCSSStyleDeclarationMBS**

85.15.1 **class DOMCSSStyleDeclarationMBS**

**Function:** One of the DOM classes.

**Notes:**
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

85.15.2 **Methods**

85.15.3 **Constructor**

**Function:** The private constructor.

85.15.4 **getPropertyCSSValue(propertyName as string) as DOMCSSValueMBS**

**Function:** Check the DOM documentation for details on this function.

85.15.5 **getPropertyPriority(propertyName as string) as string**

**Function:** Check the DOM documentation for details on this function.

85.15.6 **getPropertyValue(propertyName as string) as string**

**Function:** Check the DOM documentation for details on this function.
85.15.7 item(index as UInt32) as string

Function: Check the DOM documentation for details on this function.

85.15.8 length as Integer

Function: Check the DOM documentation for details on this function.

85.15.9 parentRule as DOMCSSRuleMBS

Function: Check the DOM documentation for details on this function.

85.15.10 removeProperty(propertyName as string) as string

Function: Check the DOM documentation for details on this function.

85.15.11 setProperty(propertyName as string, value as string, priority as string)

Function: Check the DOM documentation for details on this function.

85.15.12 Properties

85.15.13 azimuth as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.15.14  background as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.15  backgroundAttachment as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.16  backgroundColor as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.17  backgroundImage as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.18  backgroundPosition as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.19  backgroundRepeat as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.15.20  **border** as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)

85.15.21  **borderBottom** as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)

85.15.22  **borderBottomColor** as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)

85.15.23  **borderBottomStyle** as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)

85.15.24  **borderBottomWidth** as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)

85.15.25  **borderCollapse** as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)
85.15.26  borderColor as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.27  borderLeft as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.28  borderLeftColor as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.29  borderLeftStyle as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.30  borderLeftWidth as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.31  borderRight as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.15.32  **borderRightColor as String**

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.33  **borderRightStyle as String**

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.34  **borderRightWidth as String**

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.35  **borderSpacing as String**

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.36  **borderStyle as String**

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.37  **borderTop as String**

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.15.38  borderTopColor as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.39  borderTopStyle as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.40  borderTopWidth as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.41  borderWidth as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.42  bottom as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.43  captionSide as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.15.44 clear as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)

85.15.45 clip as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)

85.15.46 colorValue as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)

85.15.47 content as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)

85.15.48 counterIncrement as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)

85.15.49 counterReset as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)
85.15.50  cssFloat as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.51  cssText as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.52  cue as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.53  cueAfter as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.54  cueBefore as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.55  cursor as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.15.  CLASS DOMCSSSTYLEDECLARATIONMBS

85.15.56  direction as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.57  display as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.58  elevation as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.59  emptyCells as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.60  font as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.15.61  fontFamily as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.15.62  fontSize as String

85.17.3 cssRules as DOMCSSRuleListMBS

Function: Check the DOM documentation for details on this function.

85.17.4 deleteRule(index as Integer)

Function: Check the DOM documentation for details on this function.

85.17.5 insertRule(rule as string, index as Integer) as Integer

Function: Check the DOM documentation for details on this function.

85.17.6 ownerRule as DOMCSSRuleMBS

Function: Check the DOM documentation for details on this function.
85.18. class DOMCSSUnknownRuleMBS

85.18.1 class DOMCSSUnknownRuleMBS

Function: One of the DOM classes.

Notes:

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

Subclass of the DOMCSSRuleMBS class.

This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.
85.19 class DOMCSSValueListMBS

85.19.1 class DOMCSSValueListMBS

**Function:** A class for a list of css values.
**Notes:**
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMCSSValueMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.19.2 Methods

85.19.3 item(index as UInt32) as DOMCSSValueMBS

**Function:** Returns the item with the given index or nil.
**Notes:** Index is zero based.

85.19.4 length as Integer

**Function:** The number of items in this list.
85.20. class DOMCSSValueMBS

85.20.1 class DOMCSSValueMBS

**Function:** One of the DOM classes. 
**Notes:**
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct. 
Subclass of the DOMObjectMBS class. 
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.20.2 Methods

85.20.3 cssValueType as Integer

**Function:** The type of this value. 
**Notes:** See the constants for possible values.

85.20.4 Properties

85.20.5 cssText as String

**Function:** Check the DOM documentation for details on this function. 
**Notes:** (Read and Write computed property)

85.20.6 Constants

85.20.7 DOM_CSS_CUSTOM = 3

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the cssValueType property.
85.20.8  DOM_CSS_INHERIT = 0

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the cssValueType property.

85.20.9  DOM_CSS_PRIMITIVE_VALUE = 1

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the cssValueType property.

85.20.10 DOM_CSS_VALUE_LIST = 2

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the cssValueType property.
85.21. **CLASS DOMDOCUMENTFRAGMENTMBS**

### 85.21 class DOMDocumentFragmentMBS

#### 85.21.1 class DOMDocumentFragmentMBS

**Function:** One of the DOM classes.  
**Notes:**  
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.  
Subclass of the DOMNodeMBS class.  
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.
85.22  class DOMDocumentMBS

85.22.1 class DOMDocumentMBS

**Function:** One of the DOM classes.
**Notes:**
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMNodeMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.22.2 Methods

85.22.3 createAttribute(name as string) as DOMAttrMBS

**Function:** Check the DOM documentation for details on this function.

85.22.4 createAttributeNS(namespaceURI as string, qualifiedName as string) as DOMAttrMBS

**Function:** Check the DOM documentation for details on this function.

85.22.5 createCDATASection(data as string) as DOMCDATASectionMBS

**Function:** Check the DOM documentation for details on this function.

85.22.6 createComment(data as string) as DOMCommentMBS

**Function:** Check the DOM documentation for details on this function.
85.22.27. createCSSStyleDeclaration as DOMCSSStyleDeclarationMBS

**Function:** Check the DOM documentation for details on this function.

85.22.28. createDocumentFragment as DOMDocumentFragmentMBS

**Function:** Check the DOM documentation for details on this function.

85.22.29. createElement(tagName as string) as DOMElementMBS

**Function:** Check the DOM documentation for details on this function.

85.22.30. createElementNS(namespaceURI as string, qualifiedName as string) as DOMElementMBS

**Function:** Check the DOM documentation for details on this function.

85.22.31. createEntityReference(name as string) as DOMEntityReferenceMBS

**Function:** Check the DOM documentation for details on this function.

85.22.32. createProcessingInstruction(target as string, data as string) as DOMProcessingInstructionMBS

**Function:** Check the DOM documentation for details on this function.
85.22.13 **createRange as DOMRangeMBS**

**Function:** Check the DOM documentation for details on this function.

85.22.14 **createTextNode(data as string) as DOMTextMBS**

**Function:** Check the DOM documentation for details on this function.

85.22.15 **defaultView as DOMAbstractViewMBS**

**Function:** Check the DOM documentation for details on this function.

85.22.16 **doctype as DOMDocumentTypeMBS**

**Function:** Check the DOM documentation for details on this function.

85.22.17 **documentElement as DOMElementMBS**

**Function:** Check the DOM documentation for details on this function.

85.22.18 **getComputedStyle(elt as DOMElementMBS, pseudoElt as string) as DOMCSSStyleDeclarationMBS**

**Function:** Check the DOM documentation for details on this function.

85.22.19 **getElementById(elementId as string) as DOMElementMBS**

**Function:** Check the DOM documentation for details on this function.
85.22.20  getElementsByTagName(name as string) as DOMNodeListMBS

Function: Check the DOM documentation for details on this function.

85.22.21  getElementsByTagNameNS(namespaceURI as string, localName as string) as DOMNodeListMBS

Function: Check the DOM documentation for details on this function.

85.22.22  getOverrideStyle(elt as DOMElementMBS, pseudoElt as string) as DOMCSSStyleDeclarationMBS

Function: Check the DOM documentation for details on this function.

85.22.23  implementation as DOMImplementationMBS

Function: Check the DOM documentation for details on this function.

85.22.24  importNode(importedNode as DOMNodeMBS, deep as boolean) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.22.25  styleSheets as DOMStyleSheetListMBS

Function: Check the DOM documentation for details on this function.
85.23 class DOMDocumentTypeMBS

85.23.1 class DOMDocumentTypeMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMNodeMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.23.2 Methods

85.23.3 entities as DOMElementMBS

Function: Check the DOM documentation for details on this function.

85.23.4 internalSubset as String

Function: Check the DOM documentation for details on this function.

85.23.5 name as String

Function: Check the DOM documentation for details on this function.

85.23.6 notations as DOMElementMBS

Function: Check the DOM documentation for details on this function.
85.23. **CLASS DOMDOCUMENTTYPEMBS**

85.23.7 **publicId as String**

**Function:** Check the DOM documentation for details on this function.

85.23.8 **systemId as String**

**Function:** Check the DOM documentation for details on this function.
85.24 class DOMElementMBS

85.24.1 class DOMElementMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMNodeMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.24.2 Methods

85.24.3 getAttribute(name as string) as string

Function: Check the DOM documentation for details on this function.

85.24.4 getAttributeNode(name as string) as DOMAttrMBS

Function: Check the DOM documentation for details on this function.

85.24.5 getAttributeNodeNS(namespaceURI as string, localName as string) as DOMAttrMBS

Function: Check the DOM documentation for details on this function.

85.24.6 getAttributeNS(namespaceURI as string, localName as string) as String

Function: Check the DOM documentation for details on this function.
85.24. CLASS DOMELEMENTMBS

85.24.7 getElementsByTagName(name as string) as DOMNodeListMBS

Function: Check the DOM documentation for details on this function.

85.24.8 getElementsByTagNameNS(namespaceURI as string, localName as string) as DOMNodeListMBS

Function: Check the DOM documentation for details on this function.

85.24.9 hasAttribute(name as string) as boolean

Function: Check the DOM documentation for details on this function.

85.24.10 hasAttributeNS(namespaceURI as string, localName as string) as boolean

Function: Check the DOM documentation for details on this function.

85.24.11 removeAttribute(name as string)

Function: Check the DOM documentation for details on this function.

85.24.12 removeAttributeNode(oldAttr as DOMAttrMBS) as DOMAttrMBS

Function: Check the DOM documentation for details on this function.

85.24.13 removeAttributeNS(namespaceURI as string, qualifiedName as string)

Function: Check the DOM documentation for details on this function.
85.24.14  setAttribute(name as string, value as string)

Function: Check the DOM documentation for details on this function.

85.24.15  setAttributeNode(newAttr as DOMAttrMBS) as DOMAttrMBS

Function: Check the DOM documentation for details on this function.

85.24.16  setAttributeNodeNS(newAttr as DOMAttrMBS) as DOMAttrMBS

Function: Check the DOM documentation for details on this function.

85.24.17  setAttributeNS(namespaceURI as string, qualifiedName as string, value as string)

Function: Check the DOM documentation for details on this function.

85.24.18  style as DOMCSSStyleDeclarationMBS

Function: Check the DOM documentation for details on this function.

85.24.19  tagName as String

Function: Check the DOM documentation for details on this function.
85.25 class DOMEntityMBS

85.25.1 class DOMEntityMBS

**Function:** One of the DOM classes.

**Notes:**
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMNodeMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.25.2 Methods

85.25.3 notationName as String

**Function:** Check the DOM documentation for details on this function.

85.25.4 publicId as String

**Function:** Check the DOM documentation for details on this function.

85.25.5 systemId as String

**Function:** Check the DOM documentation for details on this function.
85.26 class DOMEntityReferenceMBS

85.26.1 class DOMEntityReferenceMBS

Function: One of the DOM classes.

Notes:

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

Subclass of the DOMNodeMBS class.

This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.
class DOMHTMLAnchorElementMBS

Function: One of the DOM classes.

Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMHTMLElementMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

Methods

blur

85.35  class DOMHTMLCollectionMBS

85.35.1  class DOMHTMLCollectionMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

85.35.2  Methods

85.35.3  item(index as UInt32) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.35.4  length as Integer

Function: Check the DOM documentation for details on this function.

85.35.5  namedItem(name as string) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.
85.36.  class DOMHTMLDirectoryElementMBS

85.36.1  class DOMHTMLDirectoryElementMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMHTMLElementMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

85.36.2  Properties

85.36.3  compact as boolean

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.37 class DOMHTMLDivElementMBS

85.37.1 class DOMHTMLDivElementMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMHTMLDivElementMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

85.37.2 Properties

85.37.3 align as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.38. **CLASS DOMHTMLDLISTELEMENTMBS**

85.38 **class DOMHTMLDListElementMBS**

85.38.1 **class DOMHTMLDLListElementMBS**

**Function:** One of the DOM classes.

**Notes:**

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

Subclass of the DOMHTMLElementMBS class.

This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.38.2 **Properties**

85.38.3 **compact as boolean**

**Function:** Check the DOM documentation for details on this function.

**Notes:** (Read and Write computed property)
85.39 class DOMHTMLDocumentMBS

85.39.1 class DOMHTMLDocumentMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMDocumentMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.39.2 Methods

85.39.3 anchors as DOMHTMLCollectionMBS

Function: Check the DOM documentation for details on this function.

85.39.4 applets as DOMHTMLCollectionMBS

Function: Check the DOM documentation for details on this function.

85.39.5 close

Function: Check the DOM documentation for details on this function.

85.39.6 domain as String

Function: Check the DOM documentation for details on this function.
85.39. **CLASS DOMHTMLDOCUMENTMBS**

85.39.7 **forms as DOMHTMLCollectionMBS**

**Function:** Check the DOM documentation for details on this function.

85.39.8 **getElementById(elementId as string) as DOMElementMBS**

**Function:** Check the DOM documentation for details on this function.

85.39.9 **getElementsByName(elementName as string) as DOMNodeListMBS**

**Function:** Check the DOM documentation for details on this function.

85.39.10 **images as DOMHTMLCollectionMBS**

**Function:** Check the DOM documentation for details on this function.

85.39.11 **links as DOMHTMLCollectionMBS**

**Function:** Check the DOM documentation for details on this function.

85.39.12 **open**

**Function:** Check the DOM documentation for details on this function.

85.39.13 **referrer as String**

**Function:** Check the DOM documentation for details on this function.
85.39.14 **URL as String**

**Function:** Check the DOM documentation for details on this function.

85.39.15 **write(text as string)**

**Function:** Check the DOM documentation for details on this function.

85.39.16 **writeln(text as string)**

**Function:** Check the DOM documentation for details on this function.

85.39.17 **Properties**

85.39.18 **body as DOMHTMLMBS**

**Function:** Check the DOM documentation for details on this function.

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)

85.81.16  `tabIndex` as Integer

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)

85.81.17  `value` as String

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)
85.82. CLASS DOMHTMLTITLEELEMENTMBS

85.82 class DOMHTMLTitleElementMBS

85.82.1 class DOMHTMLTitleElementMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMHTMLElementMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

85.82.2 Properties

85.82.3 text as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.83 class DOMHTMLULItemListElementMBS

85.83.1 class DOMHTMLULItemListElementMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMHTMLElementMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

85.83.2 Properties

85.83.3 compact as boolean

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.83.4 type as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.84  class DOMImplementationMBS

85.84.1  class DOMImplementationMBS

**Function:** One of the DOM classes.
**Notes:**
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.84.2  Methods

85.84.3  createCSSStyleSheet(title as string, media as string) as DOMCSSStyleSheetMBS

**Function:** Check the DOM documentation for details on this function.

85.84.4  createDocument(namespaceURI as string, qualifiedName as string, doctype as string) as DOMDocumentTypeMBS

**Function:** Check the DOM documentation for details on this function.

85.84.5  createDocumentType(qualifiedName as string, publicId as string, systemId as string) as DOMDocumentTypeMBS

**Function:** Check the DOM documentation for details on this function.

85.84.6  hasFeature(feature as string, version as string) as boolean

**Function:** Check the DOM documentation for details on this function.
85.85 class DOMMediaListMBS

85.85.1 class DOMMediaListMBS

Function: A class for a list of medias.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.85.2 Methods

85.85.3 appendMedium(newMedium as string)

Function: Check the DOM documentation for details on this function.

85.85.4 deleteMedium(oldMedium as string)

Function: Check the DOM documentation for details on this function.

85.85.5 item(index as Integer) as string

Function: Returns the item with the given index or "".
Notes: Index is zero based.

85.85.6 length as Integer

Function: The number of items in this list.
85.85.7 Properties

85.85.8 mediaText as String

**Function:** Check the DOM documentation for details on this function.  
**Notes:** (Read and Write computed property)
85.86 class DOMNamedNodeMapMBS

85.86.1 class DOMNamedNodeMapMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

http://www.w3schools.com/dom/dom_namednodemap.asp
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.86.2 Methods

85.86.3 getNamedItem(name as string) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.86.4 getNamedItemNS(namespaceURI as string, localName as string) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.86.5 item(index as UInt32) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.
85.86. CLASS DOMNAMEDNODEMAPMBS

85.86.6  length as Integer

Function: Check the DOM documentation for details on this function.

85.86.7  removeNamedItem(name as string) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.86.8  removeNamedItemNS(namespaceURI as string, localName as string) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.86.9  setNamedItem(arg as DOMNodeMBS) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.86.10 setNamedItemNS(arg as DOMNodeMBS) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.
85.87 class DOMNodeListMBS

85.87.1 class DOMNodeListMBS

Function: A class for a list of nodes.
Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

see also http://www.w3schools.com/dom/dom_nodeList.asp
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.87.2 Methods

85.87.3 item(index as UInt32) as DOMNodeMBS

Function: Returns the item with the given index or nil.
Notes: Index is zero based.

85.87.4 length as Integer

Function: The number of items in this list.
**85.88. CLASS DOMNODEMBS**

**85.88. class DOMNodeMBS**

**85.88.1. class DOMNodeMBS**

**Function:** One of the DOM classes.

**Notes:**

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

Subclass of the DOMObjectMBS class.

This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

**85.88.2. Methods**

**85.88.3. appendChild(newChild as DOMNodeMBS) as DOMNodeMBS**

**Function:** Check the DOM documentation for details on this function.

**85.88.4. childNodes as DOMNodeListMBS**

**Function:** Check the DOM documentation for details on this function.

**85.88.5. cloneNode(deep as boolean) as DOMNodeMBS**

**Function:** Check the DOM documentation for details on this function.

**85.88.6. firstChild as DOMNodeMBS**

**Function:** Check the DOM documentation for details on this function.
85.88.7  getAttributes as DOMNamedNodeMapMBS

Function: Check the DOM documentation for details on this function.
Notes: Renamed Attributes parameter to getAttributes in plugin version 8.2.

85.88.8  hasAttributes as boolean

Function: Check the DOM documentation for details on this function.

85.88.9  hasChildNodes as boolean

Function: Check the DOM documentation for details on this function.

85.88.10  insertBefore(newChild as DOMNodeMBS, refChild as DOMNodeMBS) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.88.11  isSupported(feature as string, version as string) as boolean

Function: Check the DOM documentation for details on this function.

85.88.12  lastChild as DOMNodeMBS

Function: Check the DOM documentation for details on this function.
85.88.13  **localName as String**

**Function:** Check the DOM documentation for details on this function.

85.88.14  **namespaceURI as String**

**Function:** Check the DOM documentation for details on this function.

85.88.15  **nextSibling as DOMNodeMBS**

**Function:** Check the DOM documentation for details on this function.

85.88.16  **nodeName as String**

**Function:** Check the DOM documentation for details on this function.

85.88.17  **nodeType as Integer**

**Function:** The type of this node.
**Notes:** See the constants for possible values.

85.88.18  **normalize**

**Function:** Check the DOM documentation for details on this function.

85.88.19  **ownerDocument as DOMDocumentMBS**

**Function:** Check the DOM documentation for details on this function.
85.88.20  parentNode as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.88.21  previousSibling as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.88.22  removeChild(oldChild as DOMNodeMBS) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.88.23  replaceChild(newChild as DOMNodeMBS, oldChild as DOMNodeMBS) as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.88.24  Properties

85.88.25  nodeValue as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)

85.88.26  prefix as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
85.88.27 Constants

85.88.28 **DOM_ATTRIBUTE_NODE = 2**

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the nodeType property.

85.88.29 **DOM_CDATA_SECTION_NODE = 4**

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the nodeType property.

85.88.30 **DOM_COMMENT_NODE = 8**

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the nodeType property.

85.88.31 **DOM_DOCUMENT_FRAGMENT_NODE = 11**

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the nodeType property.

85.88.32 **DOM_DOCUMENT_NODE = 9**

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the nodeType property.

85.88.33 **DOM_DOCUMENT_TYPE_NODE = 10**

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the nodeType property.

85.88.34 **DOM_ELEMENT_NODE = 1**

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the nodeType property.
85.88.35  DOM_ENTITY_NODE = 6

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the nodeType property.

85.88.36  DOM_ENTITY_REFERENCE_NODE = 5

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the nodeType property.

85.88.37  DOM_NOTATION_NODE = 12

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the nodeType property.

85.88.38  DOM_PROCESSING_INSTRUCTION_NODE = 7

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the nodeType property.

85.88.39  DOM_TEXT_NODE = 3

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for the nodeType property.
85.89  class DOMNotationMBS

85.89.1  class DOMNotationMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMNodeMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

85.89.2  Methods

85.89.3  publicId as String

Function: Check the DOM documentation for details on this function.

85.89.4  systemId as String

Function: Check the DOM documentation for details on this function.
85.90  class DOMObjectMBS

85.90.1  class DOMObjectMBS

Function: One of the DOM classes.
Notes:

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the WebScriptObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

85.90.2  Methods

85.90.3  sheet as DOMStyleSheetMBS

Function: Check the DOM documentation for details on this function.
85.91. class DOMProcessingInstructionMBS

85.91.1 class DOMProcessingInstructionMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMNodeMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

85.91.2 Methods

85.91.3 target as String

Function: Check the DOM documentation for details on this function.

85.91.4 Properties

85.91.5 data as String

Function: Check the DOM documentation for details on this function.
Notes: (Read and Write computed property)
CHAPTER 85. HTMLVIEWER MAC

85.92 class DOMRangeMBS

85.92.1 class DOMRangeMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.92.2 Methods

85.92.3 cloneContents as DOMDocumentFragmentMBS

Function: Check the DOM documentation for details on this function.

85.92.4 cloneRange as DOMRangeMBS

Function: Check the DOM documentation for details on this function.

85.92.5 collapse(toStart as boolean)

Function: Check the DOM documentation for details on this function.

85.92.6 collapsed as boolean

Function: Check the DOM documentation for details on this function.
85.92.7 commonAncestorContainer as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.92.8 compareBoundaryPoints(how as Integer, sourceRange as DOMRangeMBS) as Integer

Function: Check the DOM documentation for details on this function.

85.92.9 deleteContents

Function: Check the DOM documentation for details on this function.

85.92.10 detach

Function: Check the DOM documentation for details on this function.

85.92.11 endContainer as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.92.12 endOffset as Integer

Function: Check the DOM documentation for details on this function.

85.92.13 extractContents as DOMDocumentFragmentMBS

Function: Check the DOM documentation for details on this function.
85.92.14  insertNode(newNode as DOMNodeMBS)

Function: Check the DOM documentation for details on this function.

85.92.15  selectNode(refNode as DOMNodeMBS)

Function: Check the DOM documentation for details on this function.

85.92.16  selectNodeContents(refNode as DOMNodeMBS)

Function: Check the DOM documentation for details on this function.

85.92.17  setEnd(refNode as DOMNodeMBS, offset as Integer)

Function: Check the DOM documentation for details on this function.

85.92.18  setEndAfter(refNode as DOMNodeMBS)

Function: Check the DOM documentation for details on this function.

85.92.19  setEndBefore(refNode as DOMNodeMBS)

Function: Check the DOM documentation for details on this function.

85.92.20  setStart(refNode as DOMNodeMBS, offset as Integer)

Function: Check the DOM documentation for details on this function.
85.92.21 setStartAfter(refNode as DOMNodeMBS)

**Function:** Check the DOM documentation for details on this function.

85.92.22 setStartBefore(refNode as DOMNodeMBS)

**Function:** Check the DOM documentation for details on this function.

85.92.23 startContainer as DOMNodeMBS

**Function:** Check the DOM documentation for details on this function.

85.92.24 startOffset as Integer

**Function:** Check the DOM documentation for details on this function.

85.92.25 surroundContents(newParent as DOMNodeMBS)

**Function:** Check the DOM documentation for details on this function.

85.92.26 toString as string

**Function:** Check the DOM documentation for details on this function.
85.92.27  Constants

85.92.28  DOM_BAD_BOUNDRYPOINTS_ERR = 1

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for a special offset value.

85.92.29  DOM_END_TO_END = 2

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for a special offset value.

85.92.30  DOM_END_TO_START = 3

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for a special offset value.

85.92.31  DOM_INVALID_NODE_TYPE_ERR = 2

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for a special offset value.

85.92.32  DOM_START_TO_END = 1

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for a special offset value.

85.92.33  DOM_START_TO_START = 0

MBS MacControls Plugin, Plugin Version: 7.4. **Function:** A constant for a special offset value.
85.93. **CLASS DOMRECTMBS**

85.93  **class DOMRectMBS**

85.93.1  **class DOMRectMBS**

**Function:** One of the DOM classes.
**Notes:**
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.93.2  **Methods**

85.93.3  **bottom as DOMCSSPrimitiveValueMBS**

**Function:** The bottom distance.

85.93.4  **left as DOMCSSPrimitiveValueMBS**

**Function:** The left distance.

85.93.5  **right as DOMCSSPrimitiveValueMBS**

**Function:** The right distance.

85.93.6  **top as DOMCSSPrimitiveValueMBS**

**Function:** The top distance.
85.94 class DOMRGBColorMBS

85.94.1 class DOMRGBColorMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.94.2 Methods

85.94.3 alpha as DOMCSSPrimitiveValueMBS

Function: The alpha color component.

85.94.4 blue as DOMCSSPrimitiveValueMBS

Function: The blue color component.

85.94.5 green as DOMCSSPrimitiveValueMBS

Function: The green color component.

85.94.6 red as DOMCSSPrimitiveValueMBS

Function: The red color component.
85.95. class DOMStyleSheetListMBS

Function: A class for a list of style sheets.
Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.95.2 Methods

85.95.3 item(index as UInt32) as DOMStyleSheetMBS

Function: Returns the item with the given index or nil.
Notes: There is a bug in Webkit 2.x which makes this method returns only DOMStyleSheetMBS objects and not DOMCSSStyleSheetMBS objects.
Index is zero based.

85.95.4 length as Integer

Function: The number of items in this list.
85.96 class DOMStyleSheetMBS

85.96.1 class DOMStyleSheetMBS

Function: One of the DOM classes.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMObjectMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

85.96.2 Methods

85.96.3 href as String

Function: Check the DOM documentation for details on this function.

85.96.4 media as DOMMediaListMBS

Function: Check the DOM documentation for details on this function.

85.96.5 ownerNode as DOMNodeMBS

Function: Check the DOM documentation for details on this function.

85.96.6 parentStyleSheet as DOMStyleSheetMBS

Function: Check the DOM documentation for details on this function.
85.96.7  title as String

**Function:** Check the DOM documentation for details on this function.

85.96.8  type as String

**Function:** Check the DOM documentation for details on this function.

85.96.9  Properties

85.96.10  disabled as boolean

**Function:** Check the DOM documentation for details on this function.
**Notes:** (Read and Write computed property)
85.97 class DOMTextMBS

85.97.1 class DOMTextMBS

Function: One of the DOM classes.
Notes:

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
Subclass of the DOMCharacterDataMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

85.97.2 Methods

85.97.3 splitText(offset as Integer) as DOMTextMBS

Function: Check the DOM documentation for details on this function.
85.98. **CLASS HTMLVIEWER**

85.98  **class HTMLViewer**

85.98.1  **class HTMLViewer**

Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Class in Realbasic 2005 for HTML rendering. **Notes:** The class itself is available on all platforms, but all the plugin methods are currently only working on Mac OS X.

85.98.2  **Methods**

85.98.3  **backForwardListMBS as WebBackForwardListMBS**

MBS MacControls Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The backforward list for this webView. **Notes:** Nil on failure.

85.98.4  **canGoBackMBS as boolean**

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the history can be used to move back one website. **Example:**

MsgBox str(HTMLViewer1.canGoBackMBS)

85.98.5  **canGoForwardMBS as boolean**

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the history can be used to move forward one website. **Example:**

MsgBox str(HTMLViewer1.canGoForwardMBS)

85.98.6  **canMakeTextLargerMBS as boolean**

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the text size can be increased. **Example:**
85.98.7  canMakeTextSmallerMBS as boolean

Function: Whether the text size can be decreased.
Example:
MsgBox str(HTMLViewer1.canMakeTextSmallerMBS)

85.98.8  canResetPageZoomMBS as boolean

MBS MacControls Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether web page can be reset.
Example:
MsgBox str(HTMLViewer1.canResetPageZoomMBS)

Notes: This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.98.9  CanShowMIMETypeAsHTMLMBS(mime as string) as boolean

Function: Checks if the the MIME type is a type that the WebKit will interpret as HTML.
Example:
MsgBox str(HTMLViewer1.CanShowMIMETypeAsHTMLMBS("text/plain"))

Notes:
Returns false on any error and true on success.
See also FileExtensionToMimeTypeMBS function.
85.98.10 CanShowMIMETypeMBS(mime as string) as boolean

Function: Checks if the WebKit can show content of a certain MIME type.
Example:
MsgBox str(HTMLViewer1.CanShowMIMETypeMBS(“text/plain”))

Notes:
Returns false on any error and true on success.
See also FileExtensionToMimeTypeMBS function.

85.98.11 canZoomPageInMBS as boolean

MBS MacControls Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether web page can be zoomed in.
Example:
MsgBox str(HTMLViewer1.canZoomPageInMBS)

Notes: This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.98.12 canZoomPageOutMBS as boolean

MBS MacControls Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether web page can be zoomed out.
Example:
MsgBox str(HTMLViewer1.canZoomPageOutMBS)

Notes: This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.
85.98.13 ChromiumBrowserMBS as ChromiumBrowserMBS

**Example:**

```vbnet
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MsgBox b.MainFrame.URL
```

**Notes:**

Works only on Windows if Webkit is chosen as renderer.
Returns nil on any error.

Please call all chromium functions only on main thread.
Do not call in open event of HTMLViewer as browser control is not yet initialized there.

85.98.14 ClearFocusMBS

MBS MacControls Plugin, Plugin Version: 7.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Clears the focus.

**Example:**

HTMLViewer1.ClearFocusMBS

**Notes:** If the focus is on the webpage, it will be cleared so there is no focus on the window. Useful if you want to workaround a focus bug in the htmlviewer control.

85.98.15 EstimatedProgressMBS as Double

MBS MacControls Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An estimate of the percent complete for a document load.

**Example:**

MsgBox str(HTMLViewer1.EstimatedProgressMBS)

**Notes:** This value will range from 0 to 1.0 and, once a load completes, will remain at 1.0 until a new load starts, at which point it will be reset to 0. The value is an estimate based on the total number of bytes expected to be received for a document, including all it’s possible subresources. For more accurate progress indication it is recommended that you implement a WebFrameLoadDelegate and a WebResourceLoadDelegate.
85.98.16 EvaluateJavaScriptMBS(code as string) as string

Function: Runs the given java script and returns the result.
Example:

// shows current user agent string which the control sends to website
MsgBox htmlviewer1.EvaluateJavaScriptMBS("navigator.userAgent")

// using eval:
MsgBox HTMLViewer1.EvaluateJavaScriptMBS("eval(""x=10;y=20;x*y"""")")

// with function:
MsgBox HTMLViewer1.EvaluateJavaScriptMBS(" test(); function test() {
  x = 10 ; y = 20; return x * y; } ")

// with multiline script:
dim s as string = "test();" +EndOfLine+
"function test()"+EndOfLine+
" {"+EndOfLine+
"  x = 10; "+EndOfLine+
"  y = 20; "+EndOfLine+
"  return x * y;"+EndOfLine+
" } "
MsgBox HTMLViewer1.EvaluateJavaScriptMBS(s)

Notes:
Returns "" on any error.

In Safari 2 we used "return 1+2;" while in Safari 3 we only need "1+2;". The return is no longer needed.
Be aware that there is an implicit return now with Safari 3!

For Windows use IERunJavaScriptMBS function.

85.98.17 GetPageFormatMBS as string

Function: The current page format settings as a string.
Example:
MsgBox HTMLViewer1.GetPageFormatMBS
// shows a big XML String

Notes:
Can be used to save current printer settings to a preferences file.
Value is an empty string until a page format is defined.

85.98.18  GoBackMBS

Function: Go back to the previous URL in the backforward list.
Example:
HTMLViewer1.GoBackMBS

Notes: Returns true if able to go back in the backforward list, false otherwise.

85.98.19  GoForwardMBS

Function: Go forward to the next URL in the backforward list.
Example:
HTMLViewer1.GoForwardMBS

Notes: Returns true if able to go forward in the backforward list, false otherwise.

85.98.20  goToBackForwardItemMBS(item as WebHistoryItemMBS) as boolean

Function: Moves on the history to the given item.
Notes: Returns true on success or false on failure.
85.98. **CLASS HTMLVIEWER**

85.98.21 **HandleMBS as Integer**

**Function:** The Handle of the WebView behind the HTMLViewer control.  
**Example:**

```vbnet
MsgBox str(HTMLViewer1.HandleMBS)
```

**Notes:** Must be non zero for the plugin functions to work.

85.98.22 **HTMLTextMBS as string**

**Function:** Returns HTML text for this document.  
**Notes:** This is the text as we generate it from current DOM tree. It is not the html text we loaded from the website. To get this original html text, please use HTMLViewer1.mainFrameMBS.dataSource.data instead.

85.98.23 **IEContinueFindTextMBS(text as string, count as Integer, flags as Integer, selectText as boolean) as boolean**

**Function:** Continues a search started with IEFindTextMBS.  
**Notes:** Parameters are the same as for IEFindTextMBS.

85.98.24 **IEDrawToHDCMBS(HDC as Ptr, PrinterName as string = "]") as boolean**

**Function:** Draws the content of the html document into the graphics context.  
**Notes:** As of Windows Internet Explorer 9, this method is deprecated and should not be used. Returns true on success and false on failure.  
With some printers, running DrawToDC may cause problems. You can ensure that DrawToDC works properly on all printers by running SetDocumentPrinter method first, and then passing the modified device context to DrawToDC. The plugin calls SetDocumentPrinter for you when you provide a printer name.
CHAPTER 85. HTMLVIEWER MAC

85.98.25  IEFileCreationDateMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Retrieves the date the file was created.
Notes: Example value: "09/13/2007"

85.98.26  IEFileModifiedDateMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Retrieves the date the file was last modified.
Notes: Example value: "12/03/2007"

85.98.27  IEFileSizeMBS as string

Notes: Example value: "12475"

85.98.28  IEFileUpdatedDateMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Retrieves the date the file was last updated.
Notes: Example value: "01/01/1601"

85.98.29  IEFindTextMBS(text as string, count as Integer, flags as Integer, selectText as boolean) as boolean

Notes:
text: the string that specifies the text to find.
count: long that specifies the number of characters to search from the starting point of the range. A positive integer indicates a forward search; a negative integer indicates a backward search.
Flags: integer that specifies one or more of the following flags to indicate the type of search:
Returns true: The search text was found.
Returns false: The search text was not found.
85.98.30  IEGetTextAreaMBS(FormName as String, FieldName as String) as String

Notes:
FormName can be "" to look for any field with given name.
Raises exception if field is not found.
Returns text from textarea.

85.98.31  IEHandleMBS as Integer

MBS Win Plugin, Plugin Version: 8.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: The handle to the windows browser object.

Notes: If this value is zero, the plugin htmlviewer functions for Windows will not work.

85.98.32  IEHistoryBackMBS

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Loads a previous URL from the History list.

85.98.33  IEHistoryForwardMBS

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Loads the next URL from the History list.
85.98.34  **IEHistoryLengthMBS as Integer**

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the number of elements in the History list.  
**Notes:** Example value: "0"

85.98.35  **IEHTMLTextMBS as string**

MBS Win Plugin, Plugin Version: 7.7, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns a copy of the html source code of the current webpage.  
**Example:**

```vbnet
msgbox htmlviewer1.IEHTMLTextMBS
```

**Notes:**

Improved in plugin version 12.2 to return better HTML text. This is the html generated from current web content and not the page we originally loaded. So this works with IEditableMBS property.  
Returns "" on any error.

On Mac OS X, you can use HTMLViewer1.mainFrameMBS.dataSource.data to get the document html text.

85.98.36  **IEImageMBS as picture**

MBS Win Plugin, Plugin Version: 9.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Copies the picture form the htmlviewer.  
**Example:**

```vbnet
Sub Action()
    ClearFocus
    Dim picWeb As Picture

    // Get image from IE
    picWeb = HTMLViewer1.IEImageMBS

    canvas1.backdrop = picWeb
End Sub
```

**Notes:**
You may want to resize the htmlviewer to get a picture without scrollbars. (See example projects)
You may need to call ClearFocus as it seems like if the focus is on the htmlviewer it does not draw itself in our picture.

85.98.37  IELastModifiedMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Gets the date that the page was last modified, if the page supplies one.
**Notes:** Example value: "12/03/2007 20:08:17"

85.98.38  IELoadHTMLMBS(HTMLText as string) as boolean

MBS Win Plugin, Plugin Version: 15.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Loads the HTML text into the htmlviewer.
**Example:**
```vba
// in window open event, load blank page
HTMLViewer1.LoadURL "about:blank"

// later somewhere in app load HTML:
HTMLViewer1.IELoadHTMLMBS "<html><body>Hello World</body></html>"
```

**Notes:**
Does not use a temp file like Xojo’s built in method.
Returns true on success.
On Windows you may need to reset webviewer before or load "about:blank" to initialize the webviewer by Xojo (or Real Studio).

85.98.39  IEMimeTypeMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Retrieves the MIME type for the file.
**Notes:**
Example value: "HTM-Datei"
See also MimeTypeToFileExtensionMBS function.
CHAPTER 85. HTMLVIEWER MAC

85.98.40 IENNamePropMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Gets the title of the document file.  
**Notes:** Example value: "Apple"

85.98.41 IENavigatorAppMinorVersionMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the application's minor version value.  
**Notes:** Example value: ";SP2;"

85.98.42 IENavigatorAppNameMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the name of the browser.  
**Notes:** Example value: "Microsoft Internet Explorer"

85.98.43 IENavigatorAppVersionMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the platform and version of the browser.  
**Notes:** Example value: "4.0 (compatible; MSIE 6.0; Windows NT 5.1; SV1; .NET CLR 1.1.4322; .NET CLR 2.0.50727)"

85.98.44 IENavigatorBrowserLanguageMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the current browser language.  
**Notes:** Example value: "de"

85.98.45 IENavigatorCookieEnabledMBS as boolean

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves whether client-side persistent cookies are enabled in the browser.  
**Notes:**
Persistent cookies are those that are stored on the client-side computer.
Example value: "True"

**85.98.46 IENavigatorJavaEnabledMBS as boolean**

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Returns whether Java is enabled.
**Notes:** Example value: "True"

**85.98.47 IENavigatorOnLineMBS as boolean**

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Retrieves a value indicating whether the system is in global offline mode.
**Notes:**
The user can modify the global offline state by choosing Work Offline from the File menu in Microsoft Internet Explorer version 4.0 or later. This property does not indicate whether the system is connected to the network.
Example value: "True"

**85.98.48 IENavigatorUserAgentMBS as string**

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Retrieves a string equivalent to the HTTP user-agent request header.
**Notes:**
The HTTP user-agent request header contains information about compatibility, the browser, and the platform name. For more information about the browser, see the IENavigatorappNameMBS property. For more information about the platform, see the IENavigatorappVersionMBS property.

The IENavigatoruserAgentMBS property dynamically returns a different value depending on the browser and platform versions. For example, Microsoft Internet Explorer 6 returns the following string for Microsoft Windows XP.

Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1)

Example value: "Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1; SV1; .NET CLR 1.1.4322; .NET CLR 2.0.50727)"
Like other plugin function, this can only work if a page has been loaded. Real Studio won’t create the internal htmlviewer object before you load a page.

85.98.49  IENavigatorUserLanguageMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Retrieves the operating system’s natural language setting.
Notes: Example value: "de"

85.98.50  IEPrintMBS as boolean

Notes: Returns false on failure.

85.98.51  IEPrintPreviewMBS as boolean

MBS Win Plugin, Plugin Version: 12.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Commands Internet Explorer to show the print preview dialog for this htmlviewer.
Example:
call htmlviewer1.IEPrintPreviewMBS

Notes:
Returns true on success. Returns false if function is not supported.
The function returns directly while the preview dialog is still running.

85.98.52  IEProtocolMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Sets or retrieves the protocol portion of a URL.
Notes: Example value: "HTTP (HyperText Transfer-Protokoll)"
**85.98.53  IEReadyStateMBS as string**

MBS Win Plugin, Plugin Version: 12.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves a value that indicates the current state of the htmlviewer.
**Notes:**

uninitialized: Object is not initialized with data.
loading: Object is loading its data.
loaded: Object has finished loading its data.
interactive: User can interact with the object even though it is not fully loaded.
complete: Object is completely initialized.

An object’s state is initially set to uninitialized, and then to loading. When data loading is complete, the state of the link object passes through the loaded and interactive states to reach the complete state.

The states through which an object passes are determined by that object; an object can skip certain states (for example, interactive) if the state does not apply to that object.

Data source objects and databound elements are normally populated asynchronously, and certain programmatic operations can only be performed reliably on databound objects when they are ready for use. Therefore, the appropriate code should be written to confirm the readyState of objects prior to performing certain operations on them. For example, walking the rows of a table should not be attempted until after the table has reached the complete state.

The readyState property enables the status of an object to be tested. The correct place to test the readyState property is in the event handler for onreadystatechange. Similarly, a data source object (DSO) fires the ondatasetcomplete event to notify the document that the dataset is ready for programmatic operation.

**85.98.54  IERefCountMBS as Integer**

MBS Win Plugin, Plugin Version: 15.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries the reference count of the IE browser object.
**Notes:** Useful to check if references are leaked.

**85.98.55  IEReferrerMBS as string**

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Gets the URL of the location that referred the user to the current page.
**Notes:** Example value: ”http://www.apple.com/”
85.98.56 IEReloadMBS(Force as boolean = false) as boolean

MBS Win Plugin, Plugin Version: 12.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Reloads the current page.  
**Notes:**  
Boolean that specifies one of the following possible values:  
False: Default. Reloads the document from the cache.  
True: Reloads the document from the server.

85.98.57 IERunJavaScriptMBS(JavaScript as string) as boolean

MBS Win Plugin, Plugin Version: 8.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Runs a given javascript code.  
**Example:**  
// shows current user agent string which the control sends to website  
call htmlviewer1.IERunJavaScriptMBS("document.title=navigator.userAgent;")  
MsgBox htmlviewer1.IETitleMBS

// load a dummy page:  
HTMLViewer1.LoadPage "<html><head></head><body></body></html>", nil

// shows an error message because of the navigator having a 6 inside:  
call htmlviewer1.IERunJavaScriptMBS("document.title=navig6ator.userAgent;")

// uses try to avoid error message

dim script as string = "document.title=navig6ator.userAgent;"  
dim s as string = "try { " + SCRIPT + " } catch(err) { document.title = err.description; } "

call htmlviewer1.IERunJavaScriptMBS(s)  
MsgBox HTMLViewer1.IETitleMBS // shows "navig6ator is undefined"

**Notes:**  
Returns true if the javascript code was sent to the browser.  
Returns false on any error.

The IE API does not allow to return values from Javascript. So you need to store your result in window.title and access it later using IETitleMBS.

IERunJavaScriptMBS fails if the htmlviewer is empty. You can load a dummy page like above.
For Windows use EvaluateJavaScriptMBS function.

### 85.98.58 IEScrollHeightMBS as Integer

MBS Win Plugin, Plugin Version: 9.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries the height of the html viewer content. **Notes:** Returns 0 on any error.

### 85.98.59 IEScrollWidthMBS as Integer

MBS Win Plugin, Plugin Version: 9.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries the width of the html viewer content. **Notes:** Returns 0 on any error.

### 85.98.60 IESecurityMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the security state. **Notes:** Example value: "Fr diesen Dokumententyp gibt es kein Sicherheitszertifikat."

### 85.98.61 IESetTextAreaMBS(FormName as String, FieldName as String, Value as String) as Boolean

MBS Win Plugin, Plugin Version: 16.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets text for a textarea. **Notes:** FormName can be "" to look for any field with given name. Raises exception if field is not found. Returns true if text is set or false on failure.

### 85.98.62 IEStopMBS as boolean

MBS Win Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Stops loading. **Notes:** Returns true on success and false on failure.
85.98.63  IETextMBS as string

MBS Win Plugin, Plugin Version: 7.7, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns a copy of the text of the current webpage.

**Example:**

msgbox htmlviewer1.IETextMBS

**Notes:**
Asks Internet Explorer for a selection of the whole document and asks selection about the text content. Returns "" on any error.

On Mac OS X, you can use HTMLViewer1.mainFrameMBS.dataSource.data to get the document html text.

85.98.64  IEToStringMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves a string representation of the object.

**Notes:** Example value: " [ object ] "

85.98.65  IEZoomMBS(factor as Integer) as boolean

**Notes:**
Factor can be 50 for 50%. Returns true on success.

85.98.66  InstallWebDownloadDelegateMBS(WebDownloadDelegate as WebDownloadDelegateMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Installs a WebDownloadDelegateMBS to receive events from htmlviewer control.

**Notes:** You need to keep a reference to this WebDownloadDelegateMBS object in the window where the htmlviewer is inside so the class is not destroyed too early.
85.98.67 InstallWebFrameLoadDelegateMBS(WebFrameLoadDelegate as WebFrameLoadDelegateMBS)

MBS MacControls Plugin, Plugin Version: 7.5, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** Installs a WebFrameLoadDelegateMBS to receive events from htmlviewer control.  **Notes:** You need to keep a reference to this WebFrameLoadDelegateMBS object in the window where the htmlviewer is inside so the class is not destroyed too early.

85.98.68 InstallWebPolicyDelegateMBS(WebPolicyDelegate as WebPolicyDelegateMBS)

MBS MacControls Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** Installs a WebPolicyDelegateMBS to receive events from htmlviewer control.  **Notes:** You need to keep a reference to this WebPolicyDelegateMBS object in the window where the htmlviewer is inside so the class is not destroyed too early.

85.98.69 InstallWebResourceLoadDelegateMBS(WebResourceLoadDelegate as WebResourceLoadDelegateMBS)

MBS MacControls Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** Installs a WebResourceLoadDelegateMBS to receive events from htmlviewer control.  **Notes:** You need to keep a reference to this WebResourceLoadDelegateMBS object in the window where the htmlviewer is inside so the class is not destroyed too early.

85.98.70 InstallWebUIDelegateMBS(WebUIDelegate as WebUIDelegateMBS)

MBS MacControls Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** Installs a HTMLViewerUIDelegateMBS to receive events from htmlviewer control.  **Notes:** You need to keep a reference to this HTMLViewerUIDelegateMBS object in the window where the htmlviewer is inside so the class is not destroyed too early.

85.98.71 LinuxWebViewMBS as LinuxWebViewMBS

MBS Linux Plugin, Plugin Version: 12.4, Console & Web: No, Mac: No, Win: No, Linux: Yes.  **Function:** Queries the linux WebKit web view for the given htmlviewer.  **Notes:** Requires a recent Real Studio version (2011?).  And libwekit-1.0 must be installed, so Real Studio uses it for browsing.
CHAPTER 85. HTMLVIEWER MAC

Check Also the Available shared method on LinuxWebViewMBS class.

85.98.72  LoadHTMLStringMBS(data as memoryblock, mime as string, encoding as string, url as string)

Function: Loads data as a webpage.
Example:
HTMLViewer1.LoadHTMLStringMBS "<b>test</b>",”text/plain”,”,”,” // show as plain text
HTMLViewer1.LoadHTMLStringMBS "<b>test</b>",”text/html”,”,”,” // show as html

Notes:
data: The data to use for the main page of the document.
mime: The MIME type of the data. e.g. "text/html"
textencoding: The encoding of the data.
url: The base URL to apply to relative URLs within the document.

All parameters can be empty if needed.
Using "text/plain" mime type you can show source code of website.

Like a most Webkit Methods this one can not be called from a thread.
See also:

• 85.98.73 LoadHTMLStringMBS(text as string, url as string)

85.98.73  LoadHTMLStringMBS(text as string, url as string)

Function: Loads a html page from a string.
Example:
HTMLViewer1.LoadHTMLStringMBS("<p>Hello <a href = ""realbasic/"">realbasic</a></p>", "http://www.monkeybreadsoftware.de/")

Notes:
html: The string to use for the main page of the document.
url: The base URL to apply to relative URLs within the document. (optional)
Like most Webkit Methods this one can not be called from a thread.

See also:

- 85.98.72 LoadHTMLStringMBS(data as memoryblock, mime as string, encoding as string, url as string) 14086

85.98.74 LoadRequest(request as NSURLRequestMBS)

Function: Loads the given url request.
Example:

```pascal
dim r as NSURLRequestMBS = NSURLRequestMBS.requestWithURL("http://www.apple.de")
HTMLViewer1.LoadRequest r
```

Notes: Like most Webkit Methods this one can not be called from a thread.

85.98.75 LoadURLMBS(url as string)

Function: Loads the url.
Example:

```pascal
htmlviewer1.LoadURLMBS "http://www.monkeybreadsoftware.de"
```

Notes:
Like most Webkit Methods this one can not be called from a thread.
Internally this calls LoadRequest with a NSURLRequest based on the given URL.
See also:

- 85.98.76 LoadURLMBS(url as string, CachePolicy as Integer, TimeOut as Double) 14087

85.98.76 LoadURLMBS(url as string, CachePolicy as Integer, TimeOut as Double)

Function: htmlviewer1.LoadURLMBS "http://www.monkeybreadsoftware.de", 1, 2.0
Notes:
The timeout interval is in seconds.
Constants for the CachePolicy parameter:

const UseProtocolCachePolicy = 0 Specifies that the caching logic defined in the protocol implementation, if any, is used for a particular URL load request. This is the default policy for URL load requests.

const ReloadIgnoringCacheData = 1 Specifies that the data for the URL load should be loaded from the originating source. No existing cache data should be used to satisfy a URL load request.

const ReturnCacheDataElseLoad = 2 Specifies that the existing cached data should be used to satisfy the request, regardless of its age or expiration date. If there is no existing data in the cache corresponding the request, the data is loaded from the originating source.

const ReturnCacheDataDontLoad = 3 Specifies that the existing cache data should be used to satisfy a request, regardless of its age or expiration date. If there is no existing data in the cache corresponding to a URL load request, no attempt is made to load the data from the originating source, and the load is considered to have failed. This constant specifies a behavior that is similar to an “offline” mode.

Like most Webkit Methods this one can not be called from a thread.
Internally this calls LoadRequest with a NSURLRequest based on the given URL. It is Webkit’s decision what it does based on the given constants.
See also:

- 85.98.75 LoadURLMBS(url as string)

85.98.77 mainFrameMBS as WebFrameMBS

Function: The main webframe currently displayed.

Example:

// get the current page url:

MsgBox HTMLViewer1.mainFrameMBS.dataSource.request.URL

// get the html data of the current page:

MsgBox HTMLViewer1.mainFrameMBS.dataSource.data

Notes: Nil if no is present.

85.98.78 makeTextLargerMBS

Function: Increases the text size in the webview.

Example:
85.98. CLASS HTMLVIEWER

HTMLViewer1.LoadPage "<p>Hello</p>", nil
HTMLViewer1.makeTextLargerMBS

85.98.79  makeTextSmallerMBS

Function: Decreases the text size in the webview.
Example:

HTMLViewer1.LoadPage "<p>Hello</p>", nil
HTMLViewer1.makeTextSmallerMBS

85.98.80  mediaVolumeMBS as Double

MBS MacControls Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Queries the maximum volume of all sounds generated on this webview.
Example:

// shows 1 normally
MsgBox str(HTMLViewer1.mediaVolumeMBS)

// set to 50%
HTMLViewer1.setMediaVolumeMBS 0.5

// and check
MsgBox str(HTMLViewer1.mediaVolumeMBS)

Notes: This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.98.81  NSScrollViewMBS as Variant

Function: Returns the scrollview for this webviewer.
Example:

// get the scrollview
dim s as NSScrollViewMBS = HTMLViewer1.NSScrollViewMBS
// and destroy the scrollbars
s.horizontalScroller = nil
s.verticalScroller = nil

Notes:
Same as calling HTMLViewer.mainFrameMBS.frameView.documentView.enclosingScrollView.

We return a variant to avoid plugin dependencies. Please assign to a NSScrollViewMBS variable.

85.98.82 PageSetupDialogMBS(sheetTarget as window=nil) as boolean

Function: Shows a page setup sheet.
Example:
call HTMLViewer1.PageSetupDialogMBS(Window1)

Notes:
If sheetTarget is nil a modal dialog is shown and the function returns after the user clicked one of the buttons
to close the dialog.
If sheetTarget is a valid window reference this window will show a sheet and the function returns while the
sheet waits for mouseclicks.

Returns true on success.

85.98.83 pageSizeMultiplierMBS as Double

MBS MacControls Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Queries the page size multiplier.
Example:
MsgBox str(HTMLViewer1.pageSizeMultiplierMBS)

Notes: This is a new webview function which is not available on all webview versions. So be aware that
you may get an NSExceptionMBS about the function not being available.
85.98.84 PrintDialogMBS(sheetTarget as window=nil, PDFFile as folderitem=nil) as boolean

Function: Show the print sheet and allows the user to print the web content.
Example:
call HTMLViewer1.PrintDialogMBS(Workbook1)

Notes:
If sheetTarget is nil a modal dialog is shown and the function returns after the user clicked one of the buttons
to close the dialog.
If sheetTarget is a valid window reference this window will show a sheet and the function returns while the
sheet waits for mouseclicks.

If PDFFile is not nil, printing is redirected to a PDF file.

Returns true on success.

85.98.85 PrintDialogVisibleMBS as boolean

Function: Whether a printing sheet is visible.
Example:
MsgBox str(HTMLViewer1.PrintDialogVisibleMBS)

Notes:
Used with the PageSetupDialog and the PrintDialog methods.
Returns true when a dialog is visible and false when not.

85.98.86 PrintingEndMBS

Function: Releases memory from the printing code.
Notes: First call PrintingStartMBS with your page size, then call several times PrintingPageMBS and
finally call PrintingEndMBS.
CHAPTER 85. HTMLVIEWER MAC

85.98.87 PrintingPageMBS(index as UInt32) as Memoryblock

Function: Returns the given page as string.
Notes:
On any error the function returns nil.
The string contains an one page PDF document.

First call PrintingStartMBS with your page size, then call several times PrintingPageMBS and finally call PrintingEndMBS.

You may want to set
HTMLViewer.preferencesMBS.shouldPrintBackgrounds = true
HTMLViewer.preferencesMBS.allowsAnimatedImageLooping = true
to get a print which includes backgrounds and animated images.

85.98.88 PrintingStartMBS(width as Double, height as Double) as Integer

Function: Starts the printing code.
Example:

dim i,c as Integer
dim f as FolderItem
dim s as string
dim b as BinaryStream

HTMLViewer1.preferencesMBS.shouldPrintBackgrounds = true // with backgrounds
HTMLViewer1.preferencesMBS.allowsAnimatedImageLooping = true // and with animated images

c=HTMLViewer1.PrintingStartMBS(800,600)
i=0
while i<c
s=HTMLViewer1.PrintingPageMBS(i)

f=SpecialFolder.Desktop.Child("Page "+str(i+1)+".pdf")
b=f.CreateBinaryFile(""")
if b<>nil then
b.Write s
b.Close
end if
i=i+1
wend
Notes:
First call PrintingStartMBS with your page size, then call several times PrintingPageMBS and finally call PrintingEndMBS.

Only one print job can be processed at the same time as they use all the same global properties.

Returns the number of pages to be printed.

85.98.89  PrintMBS(PDFFile as folderitem=nil) as boolean

Function: Prints the web content without a dialog.
Example:
MsgBox str(HTMLViewer1.PrintMBS)

Notes:
If PDFFile is not nil, printing is redirected to a PDF file.
Returns true on success.

85.98.90  PrintToPDFFileMBS(PDFFile as folderitem, LeftMargin as Double = 50.0, TopMargin as Double = 50.0, RightMargin as Double = 50.0, BottomMargin as Double = 50.0) as boolean

MBS MacControls Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Prints the PDF to a file.
Example:
Dim file as folderitem = Specialfolder.desktop.child("test.pdf")
If not HTMLViewer1.PrintToPDFFileMBS(file) then
MsgBox "Failed"
End If
Notes:
This uses the Cocoa printing system to format the web pages into nice pages.
Returns true on success.
Margin is measured in points in the user coordinate space.

85.98.91 reloadFromOriginMBS

Function: Action method that performs an end-to-end revalidation using cache-validating conditionals if possible.
Notes: Available in OS X v10.6 and later. On older versions the plugin will fall back to normal reload method.

85.98.92 ReloadMBS

Function: Reloads the current page.
Example:
HTMLViewer1.ReloadMBS

85.98.93 RenderDocumentToEPSMBS as Memoryblock

MBS MacControls Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the content of the view as a EPS file’s data.
Example:

dim f as FolderItem
dim b as BinaryStream

// create a new pdf with current content of view
f=SpecialFolder.Desktop.Child(”test.eps”)
b=f.CreateBinaryFile(””)
b.Write theHTMLViewer.RenderDocumentToEPSMBS
b.Close
f.Launch // show the pdf in preview

Notes:
85.98. CLASS HTMLVIEWER

Returns nil on any error.
Will resize the eps page to match the size of the website.

85.98.94 RenderDocumentToPDFMBS as Memoryblock

MBS MacControls Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the content of the view as a PDF file’s data.
Example:

```vba
dim f as FolderItem
dim b as BinaryStream

// create a new pdf with current content of view
f=SpecialFolder.Desktop.Child("test.pdf")
b=f.CreateBinaryFile("")
b.Write theHTMLViewer.RenderDocumentToPDFMBS
b.Close

f.Launch // show the pdf in preview
```

Notes:

Returns nil on any error.
Will resize the pdf page to match the size of the website.

85.98.95 RenderEPSMBS as Memoryblock

Function: Returns the content of the view as a EPS file’s data.
Example:

```vba
dim f as FolderItem
dim b as BinaryStream

// create a new pdf with current content of view
f=SpecialFolder.Desktop.Child("test.eps")
b=f.CreateBinaryFile("")
b.Write theHTMLViewer.RenderEPSMBS
b.Close

f.Launch // show the pdf in preview
```
Notes:

Returns nil on any error.
If there is a scrollbar, it will be included.
For nice printouts, use the webview/htmlviewer printmbs method.

**85.98.96 RenderPDFMBS as Memoryblock**

**Function:** Returns the content of the view as a PDF file’s data.  
**Example:**

```vba
dim f as FolderItem  
dim b as BinaryStream

// create a new pdf with current content of view  
f=SpecialFolder.Desktop.Child("test.pdf")  
b=f.CreateBinaryFile("")  
b.Write theHTMLViewer.RenderPDFMBS  
b.Close

f.Launch // show the pdf in preview
```

Notes:

Returns nil on any error.  
If there is a scrollbar, it will be included.  
For nice printouts, use the webview/htmlviewer printmbs method.

**85.98.97 RenderWebsiteImageMBS(ResolutionScale as Double = 1.0) as NSImageMBS**

**Function:** Makes a screenshot of the current displayed content.  
**Example:**

```vba
dim f as FolderItem  
dim b as BinaryStream  
dim i as NSImageMBS  
dim p as string

i=HTMLViewer1.RenderWebsiteImageMBS

p=i.PNGRepresentation
```
f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile(""")
b.Write p

Notes:
Nil on failure.
The image returned is the page completely without scrollbars, so it may be a few thousand pixels height and may not fit on a page to print.

The value of this variant must be an object of class NSImageMBS.

Added ResolutionScale in version 13.1 to allow to get high res images. Pass 2 for a retina resolution image (independent of whether your app runs on retina display).

85.98.98 resetPageZoomMBS

MBS MacControls Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Resets the web page zoom.
Example:
HTMLViewer1.resetPageZoomMBS

Notes: This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.98.99 SearchForMBS(text as string, Forward as boolean, CaseSensitive as boolean, Wrap as Boolean) as boolean

Function: Searches a document view for a string and highlights the string if it is found.
Example:
call HTMLViewer1.SearchForMBS "holiday",true,false,true

Notes:
Starts the search from the current selection. Will search across all frames.
text: The string to search for.
forward: True to search forward, False to search backwards.
caseSensitive: True for case-sensitive search, False for case-insensitive search.

Returns true if found, false if not found.

85.98.100  setMaintainsBackForwardListMBS(value as boolean)

Function: Whether the back forward history list is created by the webview.
Example:
HTMLViewer1.setMaintainsBackForwardListMBS true

Notes: Default is true.

85.98.101  setMediaVolumeMBS(value as Double)

MBS MacControls Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sets the maximum volume of all sounds generated on this webview.
Example:
HTMLViewer1.setMediaVolumeMBS 0.5

Notes:
Sets a master volume control for all media elements in the WebView. Valid values are 0..1.

This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.98.102  SetPageFormatMBS(data as string) as boolean

Function: Loads page format settings from a string.
Notes: Returns true on success and false on failure.
85.98.103  setPageSizeMultiplierMBS(value as Double)

MBS MacControls Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Sets the page size multiplier.
Example:
HTMLViewer1.setPageSizeMultiplierMBS 2.0

Notes:
Change the zoom factor of the page in views managed by this webView.
value: A fractional percentage value, 1.0 is 100%.

This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.98.104  StopLoadingMBS

Function: Stop any pending loads on the frame’s data source, and its children.
Example:
HTMLViewer1.StopLoadingMBS

85.98.105  SupportsTextEncodingMBS as boolean

Function: Find out if the current web page supports text encodings.
Example:
MsgBox str(HTMLViewer1.SupportsTextEncodingMBS)

Notes: Returns true if the document view of the current web page can support different text encodings.

85.98.106  userAgentForURLMBS(url as string) as String

Function: The user agent used for accessing the given URL.
Example:

```
msgbox htmlviewer1.userAgentForURLMBS("http://www.apple.com")
// shows: Mozilla/5.0 (Macintosh; U; PPC Mac OS X; de-de) AppleWebKit/419 (KHTML, like Gecko)
```

Notes: An empty string on failure else the user-agent string for the supplied URL.

85.98.107 VisibleHeightMBS as Double

Function: The visible height of the htmlviewer control.
Example:

```
MsgBox str(HTMLViewer1.VisibleWidthMBS)+" x "+str(HTMLViewer1.VisibleHeightMBS)
```

Notes: Bounds is the width and height of the controls area, but visible is only a part depending on the window size. So if Bounds are equal to the visible part, there is no scrollbar.

85.98.108 VisibleLeftMBS as Double

Function: The left position of the visible area.
Example:

```
MsgBox str(HTMLViewer1.VisibleLeftMBS)+" x "+str(HTMLViewer1.VisibleTopMBS)
```

Notes: Should be 0.

85.98.109 VisibleTopMBS as Double

Function: The top position of the visible area.
Example:

```
MsgBox str(HTMLViewer1.VisibleLeftMBS)+" x "+str(HTMLViewer1.VisibleTopMBS)
```

Notes: Should be 0.
85.98.110 VisibleWidthMBS as Double

Function: The visible width of the htmlviewer control.
Example:
MsgBox str(HTMLViewer1.VisibleWidthMBS) + " x " + str(HTMLViewer1.VisibleHeightMBS)

Notes: Bounds is the width and height of the controls area, but visible is only a part depending on the window size. So if Bounds are equal to the visible part, there is no scrollbar.

85.98.111 WebViewMBS as WebViewMBS

Function: Returns the webview for this htmlviewer.
Example:
HTMLViewer1.WebViewMBS.toolTip = "Test tooltip"

Notes: Nil on failure.

85.98.112 zoomPageInMBS

MBS MacControls Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Zooms web page in.
Example:
HTMLViewer1.zoomPageInMBS

Notes: This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.
85.98.113  zoomPageOutMBS

MBS MacControls Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Zooms web page out.
Example:
HTMLViewer1.zoomPageOutMBS

Notes: This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.98.114  Properties

85.98.115  ApplicationNameForUserAgentMBS as String

Function: The application name.
Example:
htmlviewer1.ApplicationNameForUserAgentMBS=”test”
// useragent is now ”Mozilla/5.0 (Macintosh; U; PPC Mac OS X; de-de) AppleWebKit/417.9 (KHTML, like Gecko) test”

Notes:
This name will be used in user-agent strings that are chosen for best results in rendering web pages.
(Read and Write computed property)

85.98.116  BoundsHeightMBS as Double

Function: The height of the htmlviewer control.
Example:
MsgBox str(HTMLViewer1.BoundsLeftMBS)+” ”+str(HTMLViewer1.BoundsTopMBS)+” ”+str(HTMLViewer1.BoundsWidthMBS)+” ”+str(HTMLViewer1.BoundsHeightMBS)

Notes:
Bounds is the width and height of the controls area, but visible is only a part depending on the window size. So if Bounds are equal to the visible part, there is no scrollbar.
85.98. CLASS HTMLVIEWER

(Read and Write computed property)

85.98.117 BoundsLeftMBS as Double

Function: The left position of the control size.
Example:

MsgBox str(HTMLViewer1.BoundsLeftMBS)+" "+str(HTMLViewer1.BoundsTopMBS)+" "+str(HTMLViewer1.BoundsWidthMBS)+" "+str(HTMLViewer1.BoundsHeightMBS)

Notes:
Should be 0.
(Read and Write computed property)

85.98.118 BoundsTopMBS as Double

Function: The top position of the view size.
Example:

MsgBox str(HTMLViewer1.BoundsLeftMBS)+" "+str(HTMLViewer1.BoundsTopMBS)+" "+str(HTMLViewer1.BoundsWidthMBS)+" "+str(HTMLViewer1.BoundsHeightMBS)

Notes:
Should be 0.
(Read and Write computed property)

85.98.119 BoundsWidthMBS as Double

Function: The width of the htmlviewer control.
Example:

dim w as NSViewMBS

w=HTMLViewer1.mainFrameMBS.frameView.documentView

MsgBox "width: "+str(w.Bounds.Width)+" height: "+str(w.Bounds.Height)
w=HTMLViewer1.WebViewMBS

MsgBox "width: " +str(w.Bounds.Width)+" height: " +str(w.Bounds.Height)

Notes:
Bounds is the width and height of the controls area, but visible is only a part depending on the window size. So if Bounds are equal to the visible part, there is no scrollbar. (Read and Write computed property)

85.98.120 ContinuousSpellCheckingEnabledMBS as boolean

Function: Whether continuous spell checking is enabled.
Example:
htmlviewer1.ContinuousSpellCheckingEnabledMBS=True

Notes: (Read and Write computed property)

85.98.121 CustomTextEncodingNameMBS as String

Function: The custom text encoding name.
Example:
MsgBox HTMLViewer1.CustomTextEncodingNameMBS

Notes:
On getting:
The custom text encoding name or "" if no custom text encoding name has been set.

On setting:
Make the page display with a different text encoding; stops any load in progress.
The text encoding passed in overrides the normal text encoding smarts including what’s specified in a web page’s header or HTTP response.
The text encoding automatically goes back to the default when the top level frame changes to a new location.
Setting the text encoding name to nil makes the webView use default encoding rules.  
(Read and Write computed property)

85.98.122  CustomUserAgentMBS as String

**Function:** The custom user-agent string or nil if no custom user-agent string has been set.  
**Example:**

```plaintext
htmlviewer1.CustomUserAgentMBS = NewCFStringMBS("HelloWorldBrowser")
```

**Notes:** (Read and Write computed property)

85.98.123  dashboardBehaviorMBS(behavior as Integer) as boolean

**Function:** Get or set the htmlviewer behavior.  
**Notes:**
This is a private API from Apple which may break in the future.  
It seems to exist for the dashboard application to switch some flags for event handling.

Behavior constants:
- `const WebDashboardBehaviorAlwaysSendMouseEventsToAllWindows = 0`
- `const WebDashboardBehaviorAlwaysSendActiveNullEventsToPlugIns = 1`
- `const WebDashboardBehaviorAlwaysAcceptsFirstMouse = 2`
- `const WebDashboardBehaviorAllowWheelScrolling = 3`
- `const WebDashboardBehaviorUseBackwardCompatibilityMode = 4`

(Read and Write computed property)

85.98.124  DrawsBackgroundMBS as Boolean

**Function:** Enable or disable the background drawing.  
**Example:**

```plaintext
HTMLViewer1.DrawsBackgroundMBS = false
```

**Notes:**
CHAPTER 85. HTMLVIEWER MAC

Works only with Webkit on Mac OS X 10.3.9 and newer. Returns false on unsupported Webkit versions. If you set it to false, the background is not drawn and you can have transparent websites like the Dashboard widgets. (Read and Write computed property)

85.98.125 EditableMBS as boolean

Function: Whether the user is allowed to edit the document. 
Notes: You can change the receiver’s document programmatically regardless of this setting. Available in Mac OS X v10.3.9 and later.

Normally, an HTML document is not editable unless the elements within the document are editable. This method provides a low-level way to make the contents of a WebView object editable without altering the document or DOM structure.

True if the receiver allows the user to edit the document. False if an element in the receiver’s document can be edited only if the CONTENTEDITABLE attribute has been set on the element or one of its parent elements. (Read and Write computed property)

85.98.126 FrameHeightMBS as Double

Function: The height of the view frame. 
Example:
MsgBox str(HTMLViewer1.FrameLeftMBS)+” ”+str(HTMLViewer1.FrameTopMBS)+” ”+str(HTMLViewer1.FrameWidthMBS)+” ”+str(HTMLViewer1.FrameHeightMBS)

Notes: (Read and Write computed property)

85.98.127 FrameLeftMBS as Double

Function: The left position of the view frame. 
Example:
85.98. CLASS HTMLVIEWER

MsgBox str(HTMLViewer1.FrameLeftMBS) + " " + str(HTMLViewer1.FrameTopMBS) + " " + str(HTMLViewer1.FrameWidthMBS) + " " + str(HTMLViewer1.FrameHeightMBS)

Notes: (Read and Write computed property)

85.98.128 FrameTopMBS as Double

Function: The top position of the view frame.
Example:
MsgBox str(HTMLViewer1.FrameLeftMBS) + " " + str(HTMLViewer1.FrameTopMBS) + " " + str(HTMLViewer1.FrameWidthMBS) + " " + str(HTMLViewer1.FrameHeightMBS)

Notes: (Read and Write computed property)

85.98.129 FrameWidthMBS as Double

Function: The width of the view frame.
Example:
MsgBox str(HTMLViewer1.FrameLeftMBS) + " " + str(HTMLViewer1.FrameTopMBS) + " " + str(HTMLViewer1.FrameWidthMBS) + " " + str(HTMLViewer1.FrameHeightMBS)

Notes: (Read and Write computed property)

85.98.130 GroupNameMBS as string

Function: The group name for this WebView.
Example:
HTMLViewer1.GroupNameMBS = "Hello"

Notes:
JavaScript may access named frames within the same group.
(Read and Write computed property)

85.98.131  **IECharSetMBS as string**

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets or retrieves the character set used to encode the object.
**Notes:**
Example value: "utf-8"
(Read and Write computed property)

85.98.132  **IECookieMBS as string**

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets or gets the string value of a cookie.
**Notes:**
Example value: 
"s_vi= [ CS ] v1 | 427CA13500002D10-A000B5B00000001 [ CE ] ; s_cc=true; s_nr=1196708888562;
s_sq=% 5B% 5BB% 5D% 5D"
(Read and Write computed property)

85.98.133  **IEDefaultCharsetMBS as string**

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Gets the default character set from the current regional language settings.
**Notes:**
Example value: "windows-1252"
(Read and Write computed property)

85.98.134  **IEDomainMBS as string**

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets or gets the security domain of the document.
**Notes:**
Example value: "www.apple.com"
(Read and Write computed property)
85.98.135  IEEEditableMBS as boolean

MBS Win Plugin, Plugin Version: 11.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Makes the htmlviewer editable on Windows.  
**Notes:** (Read and Write computed property)

85.98.136  IETitleMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets or gets the title of the document.  
**Notes:**  
Example value: "Apple" 
(Read and Write computed property)

85.98.137  IEURLMBS as string

MBS Win Plugin, Plugin Version: 7.8, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets or gets the URL for the current document.  
**Notes:**  
Example value: "http://www.apple.com/" 
(Read and Write computed property)

85.98.138  mediaStyleMBS as String

MBS MacControls Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The value to use for the CSS media property.  
**Example:** 
htmlviewer1.mediaStyleMBS="print"

**Notes:**  
Set or get the media style for the WebView. The mediaStyle will override the normal value of the CSS media property. Setting the value to nil will restore the normal value.  
(Read and Write computed property)
85.98.139 PreferencesIdentifierMBS as string

Function: The string to use a prefix for storing values for this WebView in the user defaults database.
Example:
MsgBox HTMLViewer1.PreferencesIdentifierMBS

Notes:
If the WebPreferences for this WebView are stored in the user defaults database, the string set in this method will be used a key prefix.
(Read and Write computed property)

85.98.140 preferencesMBS as WebPreferencesMBS

Function: The preferences for this htmlviewer.
Example:
HTMLViewer1.preferencesMBS.defaultFontSize = 10
HTMLViewer1.Loadpage "<p>Hello</p>", nil

Notes:
Nil on failure.
(Read and Write computed property)

85.98.141 ScrollHeightMBS as single

Function: The height of the scroll view.
Example:
MsgBox str(HTMLViewer1.ScrollWidthMBS)+" "+str(HTMLViewer1.ScrollHeightMBS)

Notes: (Read and Write computed property)
85.98.142 ScrollLeftMBS as single

Function: The left position of the scroll view.
Example:
```
HTMLViewer1.ScrollLeftMBS=HTMLViewer1.ScrollLeftMBS+5
```

Notes:
You can set this value to scroll manually.
(Read and Write computed property)

85.98.143 ScrollTopMBS as single

Function: The top position of the scroll view.
Example:
```
HTMLViewer1.ScrollTopMBS=HTMLViewer1.ScrollTopMBS+5
```

Notes:
You can set this value to scroll manually.
(Read and Write computed property)

85.98.144 ScrollWidthMBS as single

Function: The width of the scroll view.
Example:
```
MsgBox str(HTMLViewer1.ScrollWidthMBS)+" "+str(HTMLViewer1.ScrollHeightMBS)
```

Notes: (Read and Write computed property)
85.98.145 **TextSizeMultiplierMBS as single**

Function: The size of the text rendering in views managed by this webView.
Example:

```pascal
HTMLViewer1.LoadPage "<p>Hello</p>", nil
HTMLViewer1.TextSizeMultiplierMBS = 5
```

Notes:
A fractional percentage value, 1.0 is 100% .
(Read and Write computed property)

85.98.146 **tooltipMBS as String**

Function: The tooltip for this htmlviewer.
Example:

```pascal
HTMLViewer1.tooltipMBS = "Test tooltip"
```

Notes: (Read and Write computed property)

85.98.147 **visibleMBS as boolean**

Function: Whether the control is visible.
Example:

```pascal
MsgBox str(HTMLViewer1.visibleMBS)
```

Notes:
True is visible and false if hidden.
(Read and Write computed property)
85.99 Globals

85.99.1 InstallWebDownloadDelegate(extends w as WebViewMBS, theDelegate as WebDownloadDelegateMBS)

Function: Installs a WebDownloadDelegateMBS to receive events from webview.
Notes: You need to keep a reference to this WebDownloadDelegateMBS object in the window where the webview is inside so the class is not destroyed too early.

85.99.2 InstallWebFrameLoadDelegate(extends w as WebViewMBS, theDelegate as WebFrameLoadDelegateMBS)

Function: Installs a WebFrameLoadDelegateMBS to receive events from a webview control.
Notes: You need to keep a reference to this WebFrameLoadDelegateMBS object in the window where the htmlviewer is inside so the class is not destroyed too early.

85.99.3 InstallWebPolicyDelegate(extends w as WebViewMBS, theDelegate as WebPolicyDelegateMBS)

Function: Installs a WebPolicyDelegateMBS to receive events from a webview control.
Notes: You need to keep a reference to this WebPolicyDelegateMBS object in the window where the htmlviewer is inside so the class is not destroyed too early.

85.99.4 InstallWebResourceLoadDelegate(extends w as WebViewMBS, theDelegate as WebResourceLoadDelegateMBS)

Function: Installs a WebResourceLoadDelegateMBS to receive events from a webview control.
Notes: You need to keep a reference to this WebResourceLoadDelegateMBS object in the window where the WebView is inside so the class is not destroyed too early.
85.99.5  InstallWebUIDelegate(extends w as WebViewMBS, theDelegate as WebUIDelegateMBS)

Function: Installs a HTMLViewerUIDelegateMBS to receive events from a webview control.
Notes: You need to keep a reference to this HTMLViewerUIDelegateMBS object in the window where the htmlviewer is inside so the class is not destroyed too early.

85.100  class WebArchiveMBS

85.100.1  class WebArchiveMBS

Function: The class to represent a webarchive.
Notes:
WebArchive represents a main resource as well as all the subresources and subframes associated with the main resource.
The main resource can be an entire web page, a portion of a web page, or some other kind of data such as an image.
This class can be used for saving standalone web pages, representing portions of a web page on the pasteboard, or any other application where one class is needed to represent rich web content.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

85.100.2  Methods

85.100.3  Constructor(data as Memoryblock)

Function: The initializer for creating a WebArchive from data.
Notes: data: The data representing the archive. This can be obtained using WebArchive’s data method.
See also:

- 85.100.4 Constructor(mainResource as WebResourceMBS)
- 85.100.5 Constructor(mainResource as WebResourceMBS, subresources() as WebResourceMBS)
- 85.100.6 Constructor(mainResource as WebResourceMBS, subresources() as WebResourceMBS, sub-frameArchives() as WebArchiveMBS)
85.100. CLASS WEBARCHIVEMBS

85.100.4 Constructor(mainResource as WebResourceMBS)

Function: A constructor for WebArchive.
Notes: Creates a new archive object with the given webresources.
See also:
- 85.100.3 Constructor(data as Memoryblock)
- 85.100.5 Constructor(mainResource as WebResourceMBS, subresources() as WebResourceMBS)
- 85.100.6 Constructor(mainResource as WebResourceMBS, subresources() as WebResourceMBS, subframeArchives() as WebArchiveMBS)

85.100.5 Constructor(mainResource as WebResourceMBS, subresources() as WebResourceMBS)

Function: A constructor for WebArchive.
Notes: Creates a new archive object with the given webresources.
The array can be empty.
See also:
- 85.100.3 Constructor(data as Memoryblock)
- 85.100.4 Constructor(mainResource as WebResourceMBS)
- 85.100.6 Constructor(mainResource as WebResourceMBS, subresources() as WebResourceMBS, subframeArchives() as WebArchiveMBS)

85.100.6 Constructor(mainResource as WebResourceMBS, subresources() as WebResourceMBS, subframeArchives() as WebArchiveMBS)

Function: A constructor for WebArchive.
Notes: Creates a new archive object with the given webresources.
The arrays can be empty.
See also:
- 85.100.3 Constructor(data as Memoryblock)
- 85.100.4 Constructor(mainResource as WebResourceMBS)
- 85.100.5 Constructor(mainResource as WebResourceMBS, subresources() as WebResourceMBS)
85.100.7  data as Memoryblock

Function: The data representation of the archive.
Notes: The data returned by this method can be used to save a web archive to a file or to place a web archive on the pasteboard using WebArchivePboardType. To create a WebArchive using the returned data, use the matching constructor.

85.100.8  mainResource as WebResourceMBS

Function: The main resource of the archive.
Notes: Nil on any error.

85.100.9  subframeArchives as WebArchiveMBS()

Function: The archives representing the subframes of the archive (can be empty).

85.100.10  subresources as WebResourceMBS()

Function: The subresource of the archive (can be empty).

85.100.11  Properties

85.100.12  Handle as Integer

Function: The handle to the internal used WebArchive object.
Notes: (Read and Write property)
85.101. class WebBackForwardListMBS

85.101.1 class WebBackForwardListMBS

Function: WebBackForwardList holds an ordered list of WebHistoryItems that comprises the back and forward lists.
Notes:
Note that the methods which modify instances of this class do not cause navigation to happen in other layers of the stack; they are only for maintaining this data structure.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

85.101.2 Methods

85.101.3 addItem(item as WebHistoryItemMBS)

Function: Adds an entry to the list.
Notes:
The added entry is inserted immediately after the current entry.
If the current position in the list is not at the end of the list, elements in the forward list will be dropped at this point. In addition, entries may be dropped to keep the size of the list within the maximum size.

85.101.4 backItem as WebHistoryItemMBS

Function: Returns the entry right before the current entry.

85.101.5 backListCount as Integer

Function: Returns the back list’s current count.
85.101.6 backListWithLimit(limit as Integer) as WebHistoryItemMBS()

Function: Returns a portion of the list before the current entry.
Notes:
limit: A cap on the size of the array returned.
An array of items before the current entry. The entries are in the order that they were originally visited.

85.101.7 Constructor

Function: The private constructor.

85.101.8 containsItem(item as WebHistoryItemMBS) as boolean

Function: Whether the item is part of the list.
Notes: Returns true if the item is found.

85.101.9 currentItem as WebHistoryItemMBS

Function: Returns the current entry.

85.101.10 forwardItem as WebHistoryItemMBS

Function: Returns the entry right after the current entry.

85.101.11 forwardListCount as Integer

Function: Returns the forward list’s current count.
85.101.12  forwardListWithLimit(limit as Integer) as WebHistoryItemMBS()

Function: Returns a portion of the list after the current entry.
Notes:
limit: A cap on the size of the array returned.
An array of items after the current entry, or nil if there are none. The entries are in the order that they were
originally visited.

85.101.13  goBack

Function: Move the current pointer back to the entry before the current entry.

85.101.14  goForward

Function: Move the current pointer ahead to the entry after the current entry.

85.101.15  goToItem(item as WebHistoryItemMBS)

Function: Move the current pointer to the given entry.

85.101.16  itemAtIndex(index as Integer) as WebHistoryItemMBS

Function: Returns an entry the given distance from the current entry.
Notes:
index: Index of the desired list item relative to the current item; 0 is current item, -1 is back item, 1 is
forward item, etc.
Returns the entry the given distance from the current entry. If index exceeds the limits of the list, nil is
returned.
85.101.17 Properties

85.101.18 Handle as Integer

Function: The internal WebBackForwardList reference.
Notes: (Read and Write property)

85.101.19 capacity as Integer

Function: The list’s maximum size.
Notes: (Read and Write computed property)

85.101.20 PageCacheSize as Integer

Function: The number of pages that may be cached.
Notes: (Read and Write computed property)
85.102. class WebDataSourceMBS

85.102.1 class WebDataSourceMBS

Function: A WebDataSource represents the data associated with a web page.

Notes:

A datasource has a WebDocumentRepresentation which holds an appropriate representation of the data. WebDataSources manage a hierarchy of WebFrames. WebDataSources are typically related to a view by their containing WebFrame.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

85.102.2 Methods

85.102.3 addSubresource(Subresource as WebResourceMBS)

Function: Adds a subresource to the data source.

Notes:

Adds a subresource to the data source’s list of subresources.
Later, if something causes the data source to load the URL of the subresource, the data source will load the data from the subresource instead of from the network. For example, if one wants to add an image that is already downloaded to a web page, addSubresource can be called so that the data source uses the downloaded image rather than accessing the network. NOTE: If the data source already has a subresource with the same URL, addSubresource will replace it.

85.102.4 Constructor(request as NSURLRequestMBS)

Function: Creates a new data source based on the given request.

Notes: Handle will be non 0 on success.

85.102.5 data as MemoryBlock

Function: The data will be incomplete until the datasource has completely loaded.
Notes: Returns the raw data associated with the datasource. Returns nil if the datasource hasn’t loaded any data.

85.102.6 initialRequest as NSURLRequestMBS

Function: Returns a reference to the original request that created the datasource.
Notes: This request will be unmodified by WebKit.

85.102.7 isLoading as boolean

Function: Returns true if there are any pending loads.

85.102.8 mainResource as WebResourceMBS

Function: The main resource for this web data resource.
Notes: Nil on any error.

85.102.9 pageTitle as string

Function: Returns "" or the page title.

85.102.10 representation as WebDocumentRepresentationMBS

Function: A representation holds a type specific representation of the datasource’s data.
Notes:
The representation class is determined by mapping a MIME type to a class.
The representation is created once the MIME type of the datasource content has been determined.
Returns the representation associated with this datasource.
Returns nil if the datasource hasn’t created it’s representation.
85.102.11  request as NSURLRequestMBS

Function: Returns the request that was used to create this datasource.
Notes: Nil on any error.

85.102.12  response as NSURLResponseMBS

Function: The response for the data source.
Notes: Nil on any error.

85.102.13  subresourceForURL(url as string) as WebResourceMBS

Function: Returns a subresource for a given URL.
Notes: Returns non-nil if the data source has fully downloaded a subresource with the given URL.

85.102.14  subresources as WebResourceMBS()

Function: Returns all the subresources associated with the data source.
Notes: The returned array only contains subresources that have fully downloaded.

85.102.15  textEncodingName as string

Function: Returns either the override encoding, as set on the WebView for this dataSource or the encoding
from the response.

85.102.16  unreachableURL as String

Function: This will be non-empty only for dataSources created by calls to the WebFrame method loadAl-
ternateHTMLString.
85.102.17 webArchive as WebArchiveMBS

Function: This method constructs a WebArchive using the original downloaded data.
Notes: In the case of HTML, if the current state of the document is preferred, webArchive should be called on the DOM document instead.
Returns a WebArchive representing the data source, its subresources and child frames.
Nil on any error.

85.102.18 webFrame as WebFrameMBS

Function: Return the frame that represents this data source.
Notes: Nil on any error.

85.102.19 Properties

85.102.20 Handle as Integer

Function: The handle to the internal used WebDataSource reference.
Notes: (Read and Write property)
85.103. class WebDocumentRepresentationMBS

85.103.1 class WebDocumentRepresentationMBS

Function: A class to represent a web document representation.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

85.103.2 Methods

85.103.3 canProvideDocumentSource as boolean

Function: Returns true if the representation can provide document source.

85.103.4 Constructor

Function: The private constructor.

85.103.5 documentSource as string

Function: Returns the textual source representation of the document.
Notes: For HTML documents this is the original HTML source.

85.103.6 title as string

Function: Return the title for the document.
85.103.7 Properties

85.103.8 Handle as Integer

**Function:** The internal used handle to a WebDocumentRepresentation.
**Notes:** (Read and Write property)
85.104. class WebDocumentViewMBS

Function: The view to render a webdocument.

Notes:

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

85.104.2 Methods

85.104.3 attributedString as NSAttributedStringMBS

Function: the document view content as one attributed string.

Example:

```java
// save website as word document (if possible)

dim f as FolderItem
dim b as BinaryStream
dim a as NSAttributedStringMBS

a=HTMLViewer1.mainFrameMBS.frameView.documentView.attributedString

f=SpecialFolder.Desktop.Child("test.doc")
b=f.CreateBinaryFile(""")
b.Write a.docFormatFromRange(0,a.length)
b.Close
```

Notes:

Works only if TextFunctionsAvailable returns true.

Returns nil on failure.
85.104.4  **dataSourceUpdated(dataSource as WebDataSourceMBS)**

**Function:** Called when the corresponding data source has received data.

85.104.5  **deselectAll**

**Function:** Deselects all text in the document view.  
**Example:**

```plaintext
HTMLViewer1.mainFrameMBS.frameView.documentView.selectAll
```

**Notes:** Works only if TextFunctionsAvailable returns true.

85.104.6  **Image as NSImageMBS**

**Function:** Makes a screenshot of the current displayed content.  
**Example:**

```plaintext
dim f as FolderItem  
dim b as BinaryStream  
dim i as NSImageMBS  
dim p as string

i=theWebDocumentView.Image  
p=i.PNGRepresentation  

f=SpecialFolder.Desktop.Child("test.png")  
b=f.CreateBinaryFile("")  
b.Write p
```

**Notes:**

Nil on failure.  
The image returned is the page completely without scrollbars, so it may be a few thousand pixels height and may not fit on a page to print.
85.104.7  layout

**Function:** Called when the document view must immediately layout.
**Notes:** For simple views, setting the frame is a sufficient implementation of this method.

85.104.8  print

**Function:** Prints this view.
**Notes:** This is printing the whole view. The Cocoa framework shows print dialog and progress bar window for you.

85.104.9  SearchFor(text as string, Forward as boolean, CaseSensitive as boolean, Wrap as Boolean) as boolean

**Function:** Searches a document view for a string and highlights the string if it is found.
**Example:**
```
call myWebDocumentView.SearchFor "holiday",true,false,true
```

**Notes:**
Starts the search from the current selection. Will search across all frames.

text: The string to search for.
forward: True to search forward, False to seach backwards.
caseSensitive: True to for case-sensitive search, False for case-insensitive search.

Returns true if found, false if not found.

Works only if SearchFunctionsAvailable returns true.

85.104.10  SearchFunctionsAvailable as boolean

**Function:** Whether the document view implements the search functions.
Notes: Not all document view classes support all functions.

### 85.104.11 selectAll

**Function:** Selects all text in the document view.
**Example:**

```plaintext```
HTMLViewer1.mainFrameMBS.frameView.documentView.selectAll
```

Notes: Works only if TextFunctionsAvailable returns true.

### 85.104.12 selectedAttributedString as NSAttributedStringMBS

**Function:** Attributed string that represents the current selection.
**Notes:** Works only if TextFunctionsAvailable returns true.

### 85.104.13 SelectedString as String

**Function:** String that represents the current selection.
**Example:**

```plaintext```
MsgBox HTMLViewer1.mainFrameMBS.frameView.documentView.SelectedValue
```

Notes: Works only if TextFunctionsAvailable returns true.

### 85.104.14 setDataSource(dataSource as WebDataSourceMBS)

**Function:** Called when the corresponding data source has been created.
85.104.15 setNeedsLayout(flag as boolean)

Function: Called when WebKit has determined that the document view needs to layout.

85.104.16 stringValue as String

Function: The plain text content of this document view.
Example:
MsgBox HTMLViewer1.mainFrameMBS.frameView.documentView.stringValue

Notes:
Works only if TextFunctionsAvailable returns true.
This method should be named string, but RB does not allow that.

85.104.17 supportsTextEncoding as boolean

Function: True if the document view support text encoding, false if it doesn’t.
Notes: Works only if TextFunctionsAvailable returns true.

85.104.18 TextFunctionsAvailable as boolean

Function: Whether the document view implements the text functions.
Notes: Not all document view subclasses support all functions.
85.105 class WebDownloadDelegateMBS

85.105.1 class WebDownloadDelegateMBS

Function: The class for receiving events about downloads running in a htmlviewer/webviewer.

Notes:

The NSURLDownloadDelegate protocol defines methods that allow an object to receive informational callbacks about the asynchronous load of a download’s URL request. Other delegate methods provide facilities that allow the delegate to customize the process of performing an asynchronous URL load.

Note that these delegate methods will be called on the thread that started the asynchronous load operation for the associated NSURLDownload object.

- A didBegin message will be sent to the delegate immediately upon starting the download.
- Zero or more willSendRequest messages will be sent to the delegate before any further messages are sent if it is determined that the download must redirect to a new location. The delegate can allow the redirect, modify the destination or deny the redirect.
- Zero or more didReceiveAuthenticationChallenge messages will be sent to the delegate if it is necessary to authenticate in order to download the request and NSURLDownload does not already have authenticated credentials.
- Zero or more didCancelAuthenticationChallenge messages will be sent to the delegate if NSURLDownload cancels the authentication challenge due to encountering a protocol implementation error.
- Zero or more didReceiveResponse messages will be sent to the delegate before receiving a didReceiveDataOfLength message. The only case where didReceiveResponse is not sent to a delegate is when the protocol implementation encounters an error before a response could be created.
- Zero or more didReceiveDataOfLength messages will be sent before didFinish or didFailWithError is sent to the delegate.
- Zero or one decideDestinationWithSuggestedFilename will be sent to the delegate when sufficient information has been received to determine the suggested filename for the downloaded file. The delegate will not receive this message if setDestination has already been sent to the NSURLDownload instance.
- A didCreateDestination message will be sent to the delegate when the NSURLDownload instance creates the file on disk.
- If NSURLDownload determines that the downloaded file is in a format that it is able to decode (MacBinary, Binhex or gzip), the delegate will receive a shouldDecodeSourceDataOfMIMEType. The delegate should return true to decode the data, false otherwise.
- Unless an NSURLDownload instance receives a cancel message, the delegate will receive one and only one didFinish or didFailWithError: message, but never both. In addition, once either of messages are sent, the delegate will receive no further messages for the given NSURLDownload.
Please use one delegate class per HTMLViewer (or WebViewMBS) and make sure they live about the same time. Our class keeps a reference on the WebView, so we can remove our delegate when the delegate is destroyed.

85.105.2 Events

85.105.3 canAuthenticateAgainstProtectionSpace(download as NSURLDownloadMBS, protectionSpace as NSURLProtectionSpaceMBS) as boolean

Function: Sent to determine whether the delegate is able to respond to a protection space’s form of authentication. (required)

Notes:

download: The download sending the message.
protectionSpace: The protection space that generates an authentication challenge.

This method is called before didReceiveAuthenticationChallenge, allowing the delegate to inspect a protection space before attempting to authenticate against it. By returning true, the delegate indicates that it can handle the form of authentication, which it does in the subsequent call to didReceiveAuthenticationChallenge. Not implementing this method is the same as returning false, in which case default authentication handling is used.

Available in Mac OS X v10.6 and later.

85.105.4 Close

Function: The close event.

Notes: Called when the delegate is destroyed.

85.105.5 decideDestinationWithSuggestedFilename(download as NSURLDownloadMBS, filename as string)

Function: The delegate receives this message when download has determined a suggested filename for the downloaded file. (required)

Notes:

download: The URL download object sending the message.
filename: The suggested filename for the download.
The suggested filename is either derived from the last path component of the URL and the MIME type or, if the download was encoded, from the encoding. If the delegate wishes to modify the path, it should send setDestination to download.

The delegate will not receive this message if setDestination has already been called for the download.

Available in Mac OS X v10.2 and later.

85.105.6 DidBegin(download as NSURLDownloadMBS)

Function: Sent immediately after a download object begins a download. (required)
Notes:
download: The URL download object sending the message.

Available in Mac OS X v10.2 and later.

85.105.7 didCancelAuthenticationChallenge(download as NSURLDownloadMBS, challenge as NSURLAuthenticationChallengeMBS)

Function: Sent if an authentication challenge is canceled due to the protocol implementation encountering an error. (required)
Notes:
download: The URL download object sending the message.
challenge: The authentication challenge that caused the download object to cancel the download.
If the delegate receives this message the download will fail and the delegate will receive a didFailWithError message.

Available in Mac OS X v10.2 and later.
85.105.8 didCreateDestination(download as NSURLDownloadMBS, path as string, file as folderitem)

**Function:** Sent when the destination file is created. (required)
**Notes:**
download: The URL download object sending the message.
path: The path to the destination file.
file: The path to the destination file as folderitem.

Available in Mac OS X v10.2 and later.

85.105.9 didFailWithError(download as NSURLDownloadMBS, error as NSErrorMBS)

**Function:** Sent if the download fails or if an I/O error occurs when the file is written to disk. (required)
**Notes:**
download: The URL download object sending the message.
error: The error that caused the failure of the download.

Any partially downloaded file will be deleted.

Once the delegate receives this message, it will receive no further messages for download.
Available in Mac OS X v10.2 and later.

85.105.10 DidFinish(download as NSURLDownloadMBS)

**Function:** Sent when a download object has completed downloading successfully and has written its results to disk. (required)
**Notes:**
download: The URL download object sending the message.

The delegate will receive no further messages for download.
Available in Mac OS X v10.2 and later.
85.105.11 didReceiveAuthenticationChallenge(download as NSURLDownloadMBS, challenge as NSURLAuthenticationChallengeMBS)

**Function:** Sent when the URL download must authenticate a challenge in order to download the request. (required)

**Notes:**

download: The URL download object sending the message.

challenge: The URL authentication challenge that must be authenticated in order to download the request.

This method gives the delegate the opportunity to determine the course of action taken for the challenge: provide credentials, continue without providing credentials or cancel the authentication challenge and the download.

The delegate can determine the number of previous authentication challenges by sending the message previousFailureCount to challenge.

If the previous failure count is 0 and the value returned by proposedCredential is nil, the delegate can create a new NSURLCredential object, providing information specific to the type of credential, and send a useCredential message to challenge, passing the credential and challenge as parameters. If proposedCredential is not nil, the value is a credential from the URL or the shared credential storage that can be provided to the user as feedback.

The delegate may decide to abandon further attempts at authentication at any time by sending challenge a continueWithoutCredentialForAuthenticationChallenge or a cancelAuthenticationChallenge message. The specific action is implementation dependent.

If the delegate implements this method, the download will suspend until [challenge sender] is sent one of the following messages: useCredential, continueWithoutCredentialForAuthenticationChallenge or cancelAuthenticationChallenge.

If the delegate does not implement this method the default implementation is used. If a valid credential for the request is provided as part of the URL, or is available from the NSURLCredentialStorage the challenge is sent a useCredential:forAuthenticationChallenge with the credential. If the challenge has no credential or the credentials fail to authorize access, then continueWithoutCredentialForAuthenticationChallenge is sent to challenge sender instead.

Available in Mac OS X v10.2 and later.
85.105.12 didReceiveDataOfLength(download as NSURLDownloadMBS, length as UInt64)

Function: Sent as a download object receives data incrementally. (required)
Notes:
download: The URL download object sending the message.
length: The amount of data received in this increment of the download, measured in bytes.

Available in Mac OS X v10.2 and later.

85.105.13 didReceiveResponse(download as NSURLDownloadMBS, response as NSURLResponseMBS)

Function: Sent when a download object has received sufficient load data to construct the NSURLResponse object for the download. (required)
Notes:
download: The URL download object sending the message.
response: The URL response object received as part of the download. response is immutable and will not be modified after this method is called.

In some rare cases, multiple responses may be received for a single download. In this case, the client should assume that each new response resets the download progress to 0 and should check the new response for the expected content length.
Available in Mac OS X v10.2 and later.

85.105.14 Open

Function: The open event.
Notes:
Called just after the delegate has been installed in a htmlviewer control.
This allows you to initialize your stuff before the first event is called.
85.105.15 shouldDecodeSourceDataOfMIMEType(download as NSURLDownloadMBS, encodingType as string) as boolean

Function: Sent when a download object determines that the downloaded file is encoded to inquire whether the file should be automatically decoded. (required)

Notes:

download: The URL download object sending the message.
encodingType: The type of encoding used by the downloaded file. The supported encoding formats are MacBinary ("application/macbinary"), Binhex ("application/mac-binhex40") and gzip ("application/gzip").

Return true to decode the file, false otherwise.

The delegate may receive this message more than once if the file has been encoded multiple times. This method is not called if the downloaded file is not encoded.
Available in Mac OS X v10.2 and later.

85.105.16 ShouldUseCredentialStorage(download as NSURLDownloadMBS) as boolean

Function: Sent to determine whether the URL loader should consult the credential storage to authenticate the download. (required)

Notes:

collection: The connection sending the message.

This method is called before any attempt to authenticate is made. By returning false, the delegate tells the download not to consult the credential storage and makes itself responsible for providing credentials for any authentication challenges. Not implementing this method is the same as returning true. The delegate is free to consult the credential storage itself when it receives a didReceiveAuthenticationChallenge message.

Available in Mac OS X v10.6 and later.

85.105.17 willResumeWithResponse(download as NSURLDownloadMBS, response as NSURLResponseMBS, startingByte as Int64)

Function: Sent when a download object has received a response from the server after attempting to resume a download. (required)

Notes:
download: The URL download object sending the message.
response: The URL response received from the server in response to an attempt to resume a download.

The location of the start of the resumed data, in bytes.
Available in Mac OS X v10.4 and later.

85.105.18 willSendRequest(download as NSURLDownloadMBS, request as NSURLRequestMBS, redirectResponse as NSURLResponseMBS) as NSURLRequestMBS

Function: Sent when the download object determines that it must change URLs in order to continue loading a request. (required)
Notes:
download: The URL download object sending the message.
request: The proposed redirected request. The delegate should inspect the redirected request to verify that it meets its needs, and create a copy with new attributes to return to the connection if necessary.
redirectResponse: The URL response that caused the redirect. May be nil in cases where this method is not being sent as a result of involving the delegate in redirect processing.

Return the actual URL request to use in light of the redirection response. The delegate may copy and modify request as necessary to change its attributes, return request unmodified, or return nil.

If the delegate wishes to cancel the redirect, it should call the download object’s cancel method. Alternatively, the delegate method can return nil to cancel the redirect, and the download will continue to process. This has special relevance in the case where redirectResponse is not nil. In this case, any data that is loaded for the download will be sent to the delegate, and the delegate will receive a downloadDidFinish: or download:didFailWithError: message, as appropriate.

The delegate can receive this message as a result of transforming a request’s URL to its canonical form, or for protocol-specific reasons, such as an HTTP redirect. The delegate implementation should be prepared to receive this message multiple times.

Available in Mac OS X v10.2 and later.

85.105.19 WindowForAuthenticationSheet(download as NSURLDownloadMBS) as NSWindowMBS

Function: Called to query the right window when automatically prompting with a sheet.
85.106.1  class WebFrameLoadDelegateMBS

Function: The delegate to receive events about frames being loaded.
Notes:
A WebView’s WebFrameLoadDelegate tracks the loading progress of its frames. When a data source of a
frame starts to load, the data source is considered provisional”. Once at least one byte is received, the data
source is considered “committed”. This is done so the contents of the frame will not be lost if the new data
source fails to successfully load.

Please use one delegate class per HTMLViewer (or WebViewMBS) and make sure they live about the same
time. Our class keeps a reference on the WebView, so we can remove our delegate when the delegate is
destroyed.

85.106.2  Events

85.106.3  Close

Function: The close event.
Notes: Called when the delegate is destroyed.

85.106.4  didCancelClientRedirectForFrame(WebView as WebViewMBS, frame
as WebFrameMBS) as boolean

Function: Invoked when a client redirect is cancelled.
Notes:
Webview: The web view containing the frame.
frame: The frame being loaded.

This might happen if a frame changes locations before a pending client redirect is fired. The client redirect
occurred in frame.
85.106.5 didChangeLocationWithinPageForFrame(WebView as WebViewMBS, frame as WebFrameMBS) as boolean

Function: Notifies the delegate that the scroll position in a frame has changed
Notes:
frame: The frame that scrolled

This method is called when anchors within a page have been clicked.

If you have code in this event, return true to block the event from being sent to the next delegate. Return false to allow sending to next delegate.

85.106.6 didCommitLoadForFrame(WebView as WebViewMBS, frame as WebFrameMBS) as boolean

Function: Notifies the delegate that the load has changed from provisional to committed
Notes:
frame: The frame for which the load has committed

This method is called after the provisional data source has become the committed data source.

In some cases, a single load may be committed more than once. This happens in the case of multipart/x-mixed-replace, also known as "server push". In this case, a single location change leads to multiple documents that are loaded in sequence. When this happens, a new commit will be sent for each document.

If you have code in this event, return true to block the event from being sent to the next delegate. Return false to allow sending to next delegate.

85.106.7 didFailLoadWithError(WebView as WebViewMBS, ErrorString as string, frame as WebFrameMBS) as boolean

Function: Notifies the delegate that the committed load of a frame has failed
Notes:
error: The error that occurred
This method is called after a data source has committed but failed to completely load.

If you have code in this event, return true to block the event from being sent to the next delegate. Return false to allow sending to next delegate.

**85.106.8** `didFailProvisionalLoadWithError(WebView as WebViewMBS, ErrorString as string, frame as WebFrameMBS) as boolean`

Function: Notifies the delegate that the provisional load has failed
Notes:
error: The error that occurred
frame: The frame for which the error occurred
This method is called after the provisional data source has failed to load.
The frame will continue to display the contents of the committed data source if there is one.

If you have code in this event, return true to block the event from being sent to the next delegate. Return false to allow sending to next delegate.

**85.106.9** `didFinishLoadForFrame(WebView as WebViewMBS, frame as WebFrameMBS) as boolean`

Function: Notifies the delegate that the committed load of a frame has completed
Notes:
frame: The frame that finished loading
This method is called after the committed data source of a frame has successfully loaded and will only be called when all subresources such as images and stylesheets are done loading. Plug-In content and JavaScript-requested loads may occur after this method is called.

If you have code in this event, return true to block the event from being sent to the next delegate. Return false to allow sending to next delegate.
85.106.10  didReceiveIcon(WebView as WebViewMBS, image as NSImageMBS, frame as WebFrameMBS) as boolean

Function: Notifies the delegate that a page icon image for a frame has been received
Notes:
image: The icon image. Also known as a "favicon".
frame: The frame for which a page icon has been received

If you have code in this event, return true to block the event from being sent to the next delegate. Return false to allow sending to next delegate.

85.106.11  didReceiveServerRedirectForProvisionalLoadForFrame(WebView as WebViewMBS, frame as WebFrameMBS) as boolean

Function: Notifies the delegate that a server redirect occurred during the provisional load.
Notes:
frame: The frame for which the redirect occurred

If you have code in this event, return true to block the event from being sent to the next delegate. Return false to allow sending to next delegate.

85.106.12  didReceiveTitle(WebView as WebViewMBS, title as string, frame as WebFrameMBS) as boolean

Function: Notifies the delegate that the page title for a frame has been received
Notes:
title: The new page title
frame: The frame for which the title has been received

The title may update during loading; clients should be prepared for this.

If you have code in this event, return true to block the event from being sent to the next delegate. Return false to allow sending to next delegate.
85.106.13  didStartProvisionalLoadForFrame(WebView as WebViewMBS, frame as WebFrameMBS) as boolean

Function: Notifies the delegate that the provisional load of a frame has started
Notes:
frame: The frame for which the provisional load has started
This method is called after the provisional data source of a frame has started to load.

If you have code in this event, return true to block the event from being sent to the next delegate. Return false to allow sending to next delegate.

85.106.14  Open

Function: The open event.
Notes:
Called just after the delegate has been installed in a htmlviewer control.
This allows you to initialize your stuff before the first event is called.

85.106.15  willCloseFrame(WebView as WebViewMBS, frame as WebFrameMBS) as boolean

Function: Notifies the delegate that a pending client-side redirect has been cancelled
Notes:
frame: The frame for which the pending redirect was cancelled

A client-side redirect can be cancelled if a frame changes location before the timeout.

If you have code in this event, return true to block the event from being sent to the next delegate. Return false to allow sending to next delegate.
85.106.16  willPerformClientRedirectToURL(WebView as WebViewMBS, URL as String, delay as Double, fireDate as Date, frame as WebFrameMBS) as boolean

Function: Notifies the delegate that a frame will perform a client-side redirect
Notes:
frame: The frame for which the pending redirect was cancelled
URL: The URL to be redirected to
seconds: Seconds in which the redirect will happen
date: The fire date
frame: The frame on which the redirect will occur

This method can be used to continue progress feedback while a client-side redirect is pending.

If you have code in this event, return true to block the event from being sent to the next delegate. Return false to allow sending to next delegate.

85.106.17  windowScriptObjectAvailable(WebView as WebViewMBS, windowScriptObject as WebScriptObjectMBS) as boolean

Function: Notifies the delegate that the scripting object for a page is available.
Notes:
This is called before the page is loaded. It may be useful to allow delegates to bind native objects to the window.

windowScriptObject: The WebScriptObject for the window in the scripting environment.

If you have code in this event, return true to block the event from being sent to the next delegate. Return false to allow sending to next delegate.
85.107. class WebFrameMBS

85.107.1. class WebFrameMBS

Function: Every web page is represented by at least one WebFrame.
Notes: A WebFrame has a WebFrameView and a WebDataSource.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.107.2. Methods

85.107.3. childFrames as WebFrameMBS()

Function: The frames in the array are associated with a frame set or iframe.
Notes: Returns an array of WebFrames.

85.107.4. Constructor

Function: The private constructor.

85.107.5. dataSource as WebDataSourceMBS

Function: Returns the committed data source.
Example:
// shows the page source in a msgbox:

dim w as WebFrameMBS
w=HTMLViewer1.mainFrameMBS
msgbox w.dataSource.data
Notes: Will return nil if the provisional data source hasn’t yet been loaded.

85.107.6 DOMDocument as Variant

Function: The DOM representation of this web document.
Notes: The value of this variant must be an object of class DOMDocumentMBS.

85.107.7 findFrameNamed(name as string) as WebFrameMBS

Function: This method returns a frame with the given name.
Notes:
findFrameNamed returns self for _self and _current, the parent frame for _parent and the main frame for _top.
findFrameNamed returns self for _parent and _top if the receiver is the mainFrame.
findFrameNamed first searches from the current frame to all descending frames then the rest of the frames in the WebView. If still not found, findFrameNamed searches the frames of the other WebViews.

85.107.8 frameElement as Variant

Function: Returns the FRAME element from the HTML source code as a DOM HTML Element object.
Notes:
nil on any error.

The value of this variant must be an object of class DOMHTML ElementMBS.

85.107.9 frameView as WebFrameViewMBS

Function: The WebFrameView for this frame.
85.107.10 loadArchive(archive as WebArchiveMBS)

**Function:** Causes WebFrame to load a WebArchive.

85.107.11 LoadHTMLString(data as memoryblock, mime as string, encoding as string, url as string)

**Function:** Loads a html string.
**Notes:**
- data: The data to use for the main page of the document.
- mime: The MIME type of the data.
- encoding: The encoding of the data.
- url: The base URL to apply to relative URLs within the document.
See also:
- 85.107.12 LoadHTMLString(text as string, url as string)

85.107.12 LoadHTMLString(text as string, url as string)

**Function:** Loads a html string.
**Notes:**
- text: The string to use for the main page of the document.
- url: The base URL to apply to relative URLs within the document.
See also:
- 85.107.11 LoadHTMLString(data as memoryblock, mime as string, encoding as string, url as string)

85.107.13 LoadURL(url as string)

**Function:** Loads the given URL.
See also:
- 85.107.14 LoadURL(url as string, CachePolicy as Integer, TimeOut as Double)
85.107.14  LoadURL(url as string, CachePolicy as Integer, TimeOut as Double)

Function: Loads the url.
Notes:
The timeout interval is in seconds.

Constants for the CachePolicy parameter:

- const UseProtocolCachePolicy = 0 Specifies that the caching logic defined in the protocol implementation, if any, is used for a particular URL load request. This is the default policy for URL load requests.
- const ReloadIgnoringCacheData = 1 Specifies that the data for the URL load should be loaded from the originating source. No existing cache data should be used to satisfy a URL load request.
- const ReturnCacheDataElseLoad = 2 Specifies that the existing cached data should be used to satisfy the request, regardless of its age or expiration date. If there is no existing data in the cache corresponding the request, the data is loaded from the originating source.
- const ReturnCacheDataDontLoad = 3 Specifies that the existing cache data should be used to satisfy a request, regardless of its age or expiration date. If there is no existing data in the cache corresponding to a URL load request, no attempt is made to load the data from the originating source, and the load is considered to have failed. This constant specifies a behavior that is similar to an "offline" mode.

See also:
- 85.107.13 LoadURL(url as string)

85.107.15  name as String

Function: The frame name.

85.107.16  parentFrame as WebFrameMBS

Function: The frame containing this frame, or nil if this is a top level frame.
Notes: Nil on any error.

85.107.17  provisionalDataSource as WebDataSourceMBS

Function: Will return the provisional data source.
Notes: The provisional data source will be nil if no data source has been set on the frame, or the data source has successfully transitioned to the committed data source.

85.107.18  reload

Function: Reloads the frame.

85.107.19  reloadFromOrigin

Function: Performs an end-to-end revalidation using cache-validating conditionals if possible.
Notes: End-to-end reload may be necessary if the cache entry has become corrupted for some reason.

Available in OS X v10.6 and later. So this raises exception on older OS X versions. In that case, please catch exception and call reload.

85.107.20  stopLoading

Function: Stop any pending loads on the frame’s data source, and its children.

85.107.21  webView as WebViewMBS

Function: Returns the WebView for the document that includes this frame.

85.107.22  Properties

85.107.23  Handle as Integer

Function: The internal used reference to a WebFrame object.
Notes: (Read and Write property)
85.108 class WebFrameViewMBS

85.108.1 class WebFrameViewMBS

Function: A class to display a webframe.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

85.108.2 Methods

85.108.3 Constructor

Function: Creates a new web frame view with size 100/100 and position 0/0
Example:

dim t as new WebFrameViewMBS

Notes: On success the handle property is not zero.
See also:

- 85.108.4 Constructor(Handle as Integer)
- 85.108.5 Constructor(left as Double, top as Double, width as Double, height as Double)

85.108.4 Constructor(Handle as Integer)

Function: Creates an object based on the given WebFrameView handle.
Example:

dim t as new WebFrameViewMBS(0, 0, 100, 100)
dim v as new WebFrameViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+” x “+str(v.Bounds.Height)
**Notes:** The handle is casted to a WebFrameView and the plugin retains this handle.
See also:

- 85.108.3 Constructor
- 85.108.5 Constructor(left as Double, top as Double, width as Double, height as Double)

### 85.108.5 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new button with the given size and position.
**Example:**

```vbnet
dim x as new WebFrameViewMBS(0, 0, 100, 100)
```

**Notes:** On success the handle property is not zero.
See also:

- 85.108.3 Constructor
- 85.108.4 Constructor(Handle as Integer)

### 85.108.6 printDocumentView

**Function:** Called by the host application when the WebFrameView returns true from documentView-ShouldHandlePrint.

### 85.108.7 printOperationWithPrintInfo(printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

**Function:** Creates a print operation set up to print this frame.
**Notes:**

Returns a newly created print operation object (NSPrintOperationMBS).
printInfo must be a NSPrintInfoMBS object.
85.108.8 Properties

85.108.9 allowsScrolling as boolean

**Function:** Whether the WebFrameView allows its document to be scrolled.
**Notes:**
True to allow the document to be scrolled, false to disallow scrolling.
(Read and Write property)

85.108.10 canPrintHeadersAndFooters as Boolean

**Function:** Whether this frame can print headers and footers.
**Notes:** (Read only property)

85.108.11 documentView as WebDocumentViewMBS

**Function:** Returns the WebFrameView’s document subview.
**Notes:**
Returns nil on error or the subview that renders the WebFrameView’s contents.
(Read only property)

85.108.12 documentViewShouldHandlePrint as Boolean

**Function:** Called by the host application before it initializes and runs a print operation.
**Notes:**
If false is returned, the host application will abort its print operation and call printDocumentView on the WebFrameView. The document view is then expected to run its own print operation.
If true is returned, the host application’s print operation will continue as normal.
(Read only property)

85.108.13 webFrame as WebFrameMBS

**Function:** Returns the WebFrame associated with this WebFrameView.
85.108.  CLASS WEBFRAMEVIEWMBS  14155

Notes: (Read only property)
85.109 class WebHistoryItemMBS

85.109.1 class WebHistoryItemMBS

Function: WebHistoryItems are created by WebKit to represent pages visited.
Notes:
The WebBackForwardList and WebHistory classes both use WebHistoryItems to represent pages visited. With the exception of the displayTitle, the properties of WebHistoryItems are set by WebKit. WebHistoryItems are normally never created directly.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

85.109.2 Methods

85.109.3 Constructor(URLstring as String, title as string, lastVisited as date)

Function: Constructor for a new history item with the given values.
Example:
```
dim w as WebHistoryItemMBS
dim d as new date
w=new WebHistoryItemMBS("http://www.apple.com","Apple Inc.",d)
```
Notes:
WebHistoryItems are normally created for you by the WebKit.
You may use this method to prepopulate a WebBackForwardList, or create 'artificial' items to add to a WebBackForwardList. When first initialized the URLString and originalURLString will be the same.
See also:
- 85.109.4 Constructor(URLstring as String, title as string, lastVisited as Double)

85.109.4 Constructor(URLstring as String, title as string, lastVisited as Double)

Function: Constructor for a new history item with the given values.
Notes:

WebHistoryItems are normally created for you by the WebKit. You may use this method to prepopulate a WebBackForwardList, or create 'artificial' items to add to a WebBackForwardList. When first initialized the URLString and originalURLString will be the same. See also:

- 85.109.3 Constructor(URLString as String, title as string, lastVisited as date)

85.109.5 icon as NSImage

Function: The favorite icon of the page represented by this item.
Notes: This icon returned will be determined by the WebKit.

85.109.6 lastVisited as date

Function: The last time the page represented by this item was visited.
Notes: Nil on any error.

85.109.7 lastVisitedTimeInterval as Double

Function: The last time the page represented by this item was visited.
Notes: The interval is since the reference date as determined by NSDate. This value is normally set by the WebKit.

85.109.8 originalURLString as String

Function: The string representation of the originial URL of this item.
Notes: This value is normally set by the WebKit.

85.109.9 title as String

Function: The title of the page represented by this item.
Notes: This title cannot be changed by the client. This value is normally set by the WebKit when a page
title for the item is received.

85.109.10 URLString as String

Function: The string representation of the URL represented by this item.
Notes:
The URLString may be different than the originalURLString if the page redirected to a new location. This value is normally set by the WebKit.
The value is the string corresponding to the final URL of this item.

85.109.11 Properties

85.109.12 Handle as Integer

Function: The handle to the internal used WebHistoryItem reference.
Notes: (Read and Write property)

85.109.13 alternateTitle as String

Function: A title that may be used by the client to display this item.
Notes: (Read and Write computed property)
85.110. CLASS WEBHISTORYMBS

85.110  class WebHistoryMBS

85.110.1  class WebHistoryMBS

Function: WebHistory is used to track pages that have been loaded by WebKit.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.110.2  Methods

85.110.3  addItem(item as WebHistoryItemMBS)

Function: Adds an item to the history.

85.110.4  addItems(items() as WebHistoryItemMBS)

Function: Adds all items in the array to the history.

85.110.5  Constructor

Function: The private constructor.

85.110.6  itemForURL(url as string) as WebHistoryItemMBS

Function: Get an item for a specific URL.
Notes:
URL: The URL of the history item to search for.
Returns an item matching the URL or nil on any error.
85.110.7  loadFromURL(file as folderitem, byref description as string) as boolean

Function: Loads a web history from the given file.
Notes:
Returns true if successful, false otherwise.
description will be set to the error description on return in case of an error.
See also:

• 85.110.8 loadFromURL(url as string, byref description as string) as boolean

85.110.8  loadFromURL(url as string, byref description as string) as boolean

Function: Loads a web history from the given URL.
Notes:
Returns true if successful, false otherwise.
description will be set to the error description on return in case of an error.
See also:

• 85.110.7 loadFromURL(file as folderitem, byref description as string) as boolean

85.110.9  optionalSharedHistory as WebHistoryMBS

Function: A shared WebHistory instance initialized with the default history file.
Notes:
Nil on any error.
If you set it, don’t set it to nil.
(Read and Write computed property)

85.110.10  orderedItemsLastVisitedOnDay(day as date) as WebHistoryItemMBS()
85.110.11  orderedLastVisitedDays as date()

Function: Get an array of dates, each one representing a unique day that contains one or more history items, ordered from most recent to oldest.

85.110.12  removeAllItems

Function: Removes all items from this history.

85.110.13  removeItem(item as WebHistoryItemMBS)

Function: Removes a WebHistoryItem from the WebHistory.

85.110.14  removeItems(items() as WebHistoryItemMBS)

Function: Removes an array of WebHistoryItems from the WebHistory.

85.110.15  saveToURL(file as folderitem, byref description as string) as boolean

Function: Save history to file.
Notes:
It is the client’s responsibility to call this at appropriate times.
Returns true if successful, false otherwise.
description will be set to the error description on return in case of an error.
See also:
- 85.110.16 saveToURL(url as string, byref description as string) as boolean

85.110.16  saveToURL(url as string, byref description as string) as boolean

Function: Save history to URL.
Notes:
It is the client’s responsibility to call this at appropriate times. Returns true if successful, false otherwise. Description will be set to the error description on return in case of an error.
See also:

- 85.110.15 saveToURL(file as folderitem, byref description as string) as boolean

85.110.17 Properties

85.110.18 Handle as Integer

Function: The handle to the internal used WebHistory reference.
Notes: (Read and Write property)

85.110.19 historyAgeInDaysLimit as Integer

Function: The maximum number of days to be read from stored history.
Notes: (Read and Write computed property)

85.110.20 historyItemLimit as Integer

Function: The maximum number of items that will be stored by the WebHistory.
Notes: (Read and Write computed property)
85.111. class WebOpenPanelResultListenerMBS

85.111.1 class WebOpenPanelResultListenerMBS

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** WebView user interface delegates that implement the runOpenPanelForFileButtonWithResultListener method use the methods defined in this protocol to communicate with the listener object.

**Notes:**
The methods allow the delegate to send a cancel message, or set the selected file name. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.111.2 Methods

85.111.3 cancel

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a file open operation was cancelled.

85.111.4 chooseFilename(file as folderitem)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Handles the results of a file open panel.

**Notes:** This method is invoked when a file was selected in a file open panel.
See also:
- 85.111.5 chooseFilename(filename as string) 14163

85.111.5 chooseFilename(filename as string)

MBS MacControls Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Handles the results of a file open panel.

**Notes:** This method is invoked when a file was selected in a file open panel.
See also:
- 85.111.4 chooseFilename(file as folderitem) 14163

85.111.6 chooseFilenames(filenames() as string)

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Handles the results of a file open panel.
Notes: This method is invoked when a file was selected in a file open panel.
See also:

- 85.111.7 chooseFilenames(files() as folderitem)

85.111.7 chooseFilenames(files() as folderitem)

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Handles the results of a file open panel.
Notes: This method is invoked when a file was selected in a file open panel.
See also:

- 85.111.6 chooseFilenames(filenames() as string)

85.111.8 Constructor

Function: The private constructor.

85.111.9 Properties

85.111.10 allowMultipleFiles as Boolean

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether multiple selection is allowed.
Notes: (Read only property)

85.111.11 Handle as Integer

Function: The handle to the internal reference.
Notes: (Read and Write property)
85.112. class WebPolicyDecisionListenerMBS

85.112.1. class WebPolicyDecisionListenerMBS

Function: This protocol is used to call back with the results of a policy decision.
Notes:
This provides the ability to make these decisions asynchronously, which means the decision can be made by prompting with a sheet, for example.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.112.2. Methods

85.112.3. Constructor

Function: The private constructor.

85.112.4. download

Function: Download this resource.
Notes:
Download the resource instead of displaying it.
This method is more than just a convenience because it allows an in-progress navigation to be converted to a download based on content type, without having to stop and restart the load.

85.112.5. ignore

Function: Ignore this resource.
Notes:
Do nothing (but the client may choose to handle the request itself)

A policy of ignore prevents WebKit from doing anything further with the load, however, the client is still free to handle the request in some other way, such as opening a new window, opening a new window behind the current one, opening the URL in an external app, revealing the location in Finder if a file URL, etc.

### 85.112.6 use

**Function:** Use the resource.

**Notes:**

If there remain more policy decisions to be made, then the next policy delegate method gets to decide. This will be either the next navigation policy delegate if there is a redirect, or the content policy delegate. If there are no more policy decisions to be made, the resource will be displayed inline if possible.

If there is no view available to display the resource inline, then unableToImplementPolicyWithError will be called with an appropriate error.

If a new window is going to be created for this navigation as a result of frame targetting, then it will be created once you call this method.

### 85.112.7 Properties

### 85.112.8 Handle as Integer

**Function:** The internal used reference to the WebPolicyDecisionListener object.

**Notes:** (Read and Write property)
85.113. Class WebPolicyDelegateMBS

85.113.1 Class WebPolicyDelegateMBS

**Function:** A class to decide policies for webkit.

**Notes:**

While loading a URL, WebKit asks the WebPolicyDelegate for policies that determine the action of what to do with the URL or the data that the URL represents. Typically, the policy handler methods are called in this order:

- `decidePolicyForNewWindowAction` (at most once)
- `decidePolicyForNavigationAction` (zero or more times)
- `decidePolicyForMIMEType:request` (zero or more times)

New window policy is always checked. Navigation policy is checked for the initial load and every redirect unless blocked by an earlier policy. Content policy is checked once the content type is known, unless an earlier policy prevented it.

In rare cases, content policy might be checked more than once. This occurs when loading a "multipart/x-mixed-replace" document, also known as "server push". In this case, multiple documents come in one navigation, with each replacing the last. In this case, content policy will be checked for each one.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

Please use one delegate class per HTMLViewer (or WebViewMBS) and make sure they live about the same time. Our class keeps a reference on the WebView, so we can remove our delegate when the delegate is destroyed.

85.113.2 Events

85.113.3 Close

**Function:** The close event.

**Notes:** Called when the delegate is destroyed.
**85.113.4 decidePolicyForMIMEType**

```
decidePolicyForMIMEType(type as string, request as NSURLRequestMBS, frame as WebFrameMBS, decisionListener as WebPolicyDecisionListenerMBS) as boolean
```

**Function:** Returns the policy for content which has been partially loaded.

**Notes:**
Sent after `didStartProvisionalLoadForFrame` is sent on the `WebFrameLoadDelegate`.

- **type:** MIME type for the resource.
- **request:** A `NSURLRequest` for the partially loaded content.
- **frame:** The frame which is loading the URL.
- **decisionListener:** The object to call when the decision is made.

Return true to avoid the default delegate to handle this request. Call listener methods to decide what to do.

See also `MimeTypeToFileExtensionMBS` function.

**85.113.5 decidePolicyForNavigationAction**

```
decidePolicyForNavigationAction(request as NSURLRequestMBS, frame as WebFrameMBS, decisionListener as WebPolicyDecisionListenerMBS, NavigationType as Integer, ModifierFlags as Integer, OriginalURL as string) as boolean
```

**Function:** This method is called to decide what to do with a proposed navigation.

**Notes:**
- **request:** The request for the proposed navigation.
- **frame:** The `WebFrame` in which the navigation is happening.
- **decisionListener:** The object to call when the decision is made.

This method will be called before loading starts, and on every redirect.

**Values for NavigationType:**

- `const WebNavigationTypeLinkClicked = 0` A link with an href was clicked.
- `const WebNavigationTypeFormSubmitted = 1` A form was submitted.
- `const WebNavigationTypeBackForward = 2` The user chose back or forward.
- `const WebNavigationTypeReload = 3` The User hit the reload button.
- `const WebNavigationTypeFormResubmitted = 4` A form was resubmitted (by virtue of doing back, forward or reload).
- `const WebNavigationTypeOther = 5` Navigation is taking place for some other reason.

Return true to avoid the default delegate to handle this request. Call listener methods to decide what to do.
85.113.6  decidePolicyForNewWindowAction(request as NSURLRequestMBS, framename as string, decisionListener as WebPolicyDecisionListenerMBS, NavigationType as Integer, ModifierFlags as Integer, OriginalURL as string) as boolean

**Function:** This method is called to decide what to do with a targeted navigation that would open a new window.

**Notes:**

request The request for the proposed navigation
frame The frame in which the navigation is taking place
decisionListener The object to call when the decision is made

This method is provided so that modified clicks on a targeted link which opens a new frame can prevent the new window from being opened if they decide to do something else, like download or present the new frame in a specialized way.

If this method picks a policy of Use, the new window will be opened, and decidePolicyForNavigationAction will be called with a WebNavigationType of WebNavigationTypeOther in its action. This is to avoid possible confusion about the modifiers.

**Values for NavigationType:**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>const WebNavigationTypeLinkClicked</td>
<td>0</td>
<td>A link with an href was clicked.</td>
</tr>
<tr>
<td>const WebNavigationTypeFormSubmitted</td>
<td>1</td>
<td>A form was submitted.</td>
</tr>
<tr>
<td>const WebNavigationTypeBackForward</td>
<td>2</td>
<td>The user chose back or forward.</td>
</tr>
<tr>
<td>const WebNavigationTypeReload</td>
<td>3</td>
<td>The User hit the reload button.</td>
</tr>
<tr>
<td>const WebNavigationTypeFormResubmitted</td>
<td>4</td>
<td>A form was resubmitted (by virtue of doing back, forward or reload).</td>
</tr>
<tr>
<td>const WebNavigationTypeOther</td>
<td>5</td>
<td>Navigation is taking place for some other reason.</td>
</tr>
</tbody>
</table>

Return true to avoid the default delegate to handle this request. Call listener methods to decide what to do.

85.113.7  Open

**Function:** The open event.

**Notes:**

Called just after the delegate has been installed in a htmlviewer control.
This allows you to initialize your stuff before the first event is called.
85.113.8  unableToImplementPolicyWithError(errorString as string, frame as WebFrameMBS) as boolean

**Function:** Called when a WebPolicy could not be implemented.
**Notes:**

It is up to the client to display appropriate feedback.

errorString: The error that caused the policy to not be implemented.
frame: The frame in which the policy could not be implemented.

Return true to avoid the default delegate to handle this request.
85.114. class WebPreferencesMBS

85.114.1 class WebPreferencesMBS

Function: A class for handling webkit preferences.
Example:
MsgBox WebPreferencesMBS.standardPreferences.serifFontFamily

Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

85.114.2 Methods

85.114.3 Constructor(identifier as String)

Function: Creates a new WebPreferences object with loading the values stored with the given identifier.
Example:
dim w as new WebPreferencesMBS("de.monkeybreadsoftware.mytest")

Notes: On success handle is not zero.

85.114.4 standardPreferences as WebPreferencesMBS

Function: Returns the default preferences.
Example:
MsgBox WebPreferencesMBS.standardPreferences.identifier

Notes: nil on any error.
85.114.5 Properties

85.114.6 allowsAnimatedImageLooping as boolean

Function: Whether animated image files are allowed to loop.
Example:
HTMLViewer1.preferencesMBS.allowsAnimatedImageLooping = false

Notes: (Read and Write property)

85.114.7 allowsAnimatedImages as boolean

Function: Whether to allow animated images.
Example:
HTMLViewer1.preferencesMBS.allowsAnimatedImages = false

Notes:
  e.g. GIF images.
  (Read and Write property)

85.114.8 arePlugInsEnabled as boolean

Function: Whether plugins are enabled.
Example:
HTMLViewer1.preferencesMBS.arePlugInsEnabled = False

Notes: (Read and Write property)
85.114.9 autosaves as boolean

**Function:** Whether preferences are saved automatically.

**Example:**

```javascript
HTMLViewer1.preferencesMBS.autosaves = false
```

**Notes:**

If autosave preferences is true the settings represented by WebPreferences will be stored in the user defaults database.

*(Read and Write property)*

85.114.10 cacheModel as Integer

**Function:** The usage model according to which WebKit determines its caching behavior.

**Example:**

```javascript
HTMLViewer1.preferencesMBS.cacheModel = WebPreferencesMBS.WebCacheModelDocumentViewer
```

**Notes:**

Specifies a usage model for a WebView, which WebKit will use to determine its caching behavior.

If necessary, WebKit will prune its caches to match cacheModel if you set the value.

Research indicates that users tend to browse within clusters of documents that hold resources in common, and to revisit previously visited documents. WebKit and the frameworks below it include built-in caches that take advantage of these patterns, substantially improving document load speed in browsing situations. The WebKit cache model controls the behaviors of all of these caches, including NSURLCache and the various WebCore caches.

Applications with a browsing interface can improve document load speed substantially by specifying WebCacheModelDocumentBrowser. Applications without a browsing interface can reduce memory usage substantially by specifying WebCacheModelDocumentViewer.
If cacheModel is not set, WebKit will select a cache model automatically.  
(Read and Write property)

85.114.11  cursiveFontFamily as String

Function: The name of the cursive font family.  
Example:  
MsgBox HTMLViewer1.preferencesMBS.cursiveFontFamily

Notes: (Read and Write property)

85.114.12  databasesEnabled as Boolean

Function: Whether databases are enabled.  
Example:  
\[ \text{dim p as WebPreferencesMBS = HTMLViewer1.preferencesMBS} \]
MsgBox str(p.databasesEnabled)

Notes:  
This is a property defined in WebKit, but not in Apple's headers, so please wrap in try/catch to catch 
NSExceptionMBS if method is not implemented in older Webkit versions.  
(Read and Write property)

85.114.13  defaultFixedFontSize as Integer

Function: The default font size for fixed fonts.  
Example:  
MsgBox str(WebPreferencesMBS.standardPreferences.defaultFixedFontSize)
85.114. **defaultFontSize as Integer**

**Function:** The default font size for fonts.

**Example:**

MsgBox str(HTMLViewer1.preferencesMBS.defaultFontSize)

**Notes:**

(for non fixed fonts)
(Read and Write property)

85.114.15 **defaultTextEncodingName as String**

**Function:** The name of the default text encoding.

**Example:**

MsgBox HTMLViewer1.preferencesMBS.defaultTextEncodingName

**Notes:** (Read and Write property)

85.114.16 **fantasyFontFamily as String**

**Function:** The name of the fantasy font family.

**Example:**

MsgBox HTMLViewer1.preferencesMBS.fantasyFontFamily

**Notes:** (Read and Write property)
85.114.17 fixedFontFamily as String

Function: The name of the fixed font family.
Example:
MsgBox HTMLViewer1.preferencesMBS.fixedFontFamily

Notes: (Read and Write property)

85.114.18 Handle as Integer

Function: The internal used reference to the WebPreferences object.
Example:
MsgBox str(WebPreferencesMBS.standardPreferences.Handle)

Notes: (Read and Write property)

85.114.19 identifier as String

Function: The identifier for this WebPreferences.
Example:
MsgBox HTMLViewer1.preferencesMBS.identifier

Notes: (Read only property)

85.114.20 isJavaEnabled as boolean

Function: Whether java is enabled.
Example:
HTMLViewer1.preferencesMBS.isJavaEnabled = false
85.114.21 isJavaScriptEnabled as boolean

Function: Whether Javascript is enabled.
Example:
```javascript
HTMLViewer1.preferencesMBS.isJavaScriptEnabled = false
```

Notes: (Read and Write property)

85.114.22 javaScriptCanOpenWindowsAutomatically as boolean

Function: Whether javascript is allowed to open windows automatically.
Example:
```javascript
HTMLViewer1.preferencesMBS.javaScriptCanOpenWindowsAutomatically = false
```

Notes: (Read and Write property)

85.114.23 loadsImagesAutomatically as boolean

Function: Whether images are loaded automatically.
Example:
```javascript
HTMLViewer1.preferencesMBS.loadsImagesAutomatically = false
```

Notes: (Read and Write property)
### 85.114.24 localStorageDatabasePath as String

**Function:** The local path for local storage.

**Example:**

```vba
' create folder
dim f as FolderItem = SpecialFolder.Desktop.Child("databases")
f.CreateAsFolder

' set it
dim p as WebPreferencesMBS = HTMLViewer1.preferencesMBS
p.localStorageDatabasePath = f.NativePath
p.localStorageEnabled = true
```

**Notes:**

This is a property defined in WebKit, but not in Apple's headers, so please wrap in try/catch to catch NSExceptionMBS if method is not implemented in older Webkit versions.  
(Read and Write property)

### 85.114.25 localStorageEnabled as Boolean

**Function:** Whether local storage is enabled.

**Example:**

```vba
dim p as WebPreferencesMBS = HTMLViewer1.preferencesMBS
MsgBox str(p.localStorageEnabled)
```

**Notes:**

This is a property defined in WebKit, but not in Apple's headers, so please wrap in try/catch to catch NSExceptionMBS if method is not implemented in older Webkit versions.  
(Read and Write property)

### 85.114.26 minimumFontSize as Integer

**Function:** The minimum font size.

**Example:**
85.114. CLASS WEBPREFERENCESMBS

MsgBox str(HTMLViewer1.preferencesMBS.minimumFontSize)

Notes: (Read and Write property)

85.114.27 minimumLogicalFontSize as Integer

Function: The minimum logical font size.
Example:
MsgBox str(HTMLViewer1.preferencesMBS.minimumLogicalFontSize)

Notes: (Read and Write property)

85.114.28 privateBrowsingEnabled as boolean

Function: Whether private browsing is enabled.
Example:
HTMLViewer1.preferencesMBS.privateBrowsingEnabled = false

Notes:
If private browsing is enabled, WebKit will not store information about sites the user visits.
(Read and Write property)

85.114.29 sansSerifFontFamily as String

Function: The name of the sans serif font family.
Example:
MsgBox HTMLViewer1.preferencesMBS.sansSerifFontFamily

Notes: (Read and Write property)
**85.114.30 serifFontFamily as String**

**Function:** The name of the serif font family.

**Example:**

MsgBox HTMLViewer1.preferencesMBS.serifFontFamily

**Notes:** (Read and Write property)

---

**85.114.31 shouldPrintBackgrounds as boolean**

**Function:** Whether webkit draws background on printing.

**Example:**

HTMLViewer1.preferencesMBS.shouldPrintBackgrounds = false

**Notes:** (Read and Write property)

---

**85.114.32 standardFontFamily as String**

**Function:** The name of the standard font family.

**Example:**

MsgBox HTMLViewer1.preferencesMBS.standardFontFamily

**Notes:** (Read and Write property)

---

**85.114.33 suppressesIncrementalRendering as boolean**

**Function:** True if the WebView suppresses incremental rendering.

**Notes:**

Available in Mac OS X 10.8 or newer.

(Read and Write property)
85.114.34  tabsToLinks as boolean

Function: Whether the tab key will move focus on links.
Example:
HTMLViewer1.preferencesMBS.tabsToLinks = false

Notes:
If tabsToLinks is true, the tab key will focus links and form controls.
The option key temporarily reverses this preference.
(Read and Write property)

85.114.35  textAreasAreResizable as Boolean

Function: Whether text areas are resizable.
Example:

dim p as WebPreferencesMBS = HTMLViewer1.preferencesMBS
MsgBox str(p.textAreasAreResizable)

Notes:
This is a property defined in WebKit, but not in Apple’s headers, so please wrap in try/catch to catch
NSExcetionMBS if method is not implemented in older Webkit versions.
(Read and Write property)

85.114.36  userStyleSheetEnabled as boolean

Function: Whether an user style sheet is enabled.
Example:
HTMLViewer1.preferencesMBS.userStyleSheetEnabled = false
85.114.37  **userStyleSheetLocation as string**

**Function:** The location of the user style sheet.  
**Example:**

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.css")
HTMLViewer1.preferencesMBS.userStyleSheetLocation = f.UnixPathMBS
```

**Notes:** (Read and Write property)

85.114.38  **usesPageCache as boolean**

**Function:** Whether the receiver should use the shared page cache.  
**Example:**

```
HTMLViewer1.preferencesMBS.usesPageCache = false
```

**Notes:**  
Pages are cached as they are added to a WebBackForwardList, and removed from the cache as they are removed from a WebBackForwardList. Because the page cache is global, caching a page in one WebBackForwardList may cause a page in another WebBackForwardList to be evicted from the cache.  
(Read and Write property)

85.114.39  **Constants**

85.114.40  **WebCacheModelDocumentBrowser=1**

MBS MacControls Plugin, Plugin Version: 9.4.  
**Function:**  
One of the constants for the usage model for a WebView, which WebKit will use to determine its caching behavior.  
**Example:**

```
HTMLViewer1.preferencesMBS.cacheModel = WebPreferencesMBS.WebCacheModelDocumentBrowser
```
Notes:
Appropriate for a WebView displaying a browsable series of documents with a UI for navigating between them – for example, a reference materials browser or a website designer. The WebView will cache a reasonable number of resources and previously viewed documents in memory and/or on disk.

Examples: Dictionary, Help Viewer, Coda.

85.114.41 WebCacheModelDocumentViewer=0

MBS MacControls Plugin, Plugin Version: 9.4. **Function:**

One of the constants for the usage model for a WebView, which WebKit will use to determine its caching behavior.

**Example:**

HTMLViewer1.preferencesMBS.cacheModel = WebPreferencesMBS.WebCacheModelDocumentViewer

Notes:
Appropriate for a WebView displaying a fixed document – like a splash screen, a chat document, or a word processing document – with no UI for navigation. The WebView will behave like any other view, releasing resources when they are no longer referenced. Remote resources, if any, will be cached to disk. This is the most memory-efficient setting.

Examples: iChat, Mail, TextMate, Growl.

85.114.42 WebCacheModelPrimaryWebBrowser=2

MBS MacControls Plugin, Plugin Version: 9.4. **Function:**

One of the constants for the usage model for a WebView, which WebKit will use to determine its caching behavior.

**Example:**

HTMLViewer1.preferencesMBS.cacheModel = WebPreferencesMBS.WebCacheModelPrimaryWebBrowser

Notes:
Appropriate for a WebView in the application that acts as the user’s primary web browser. The WebView will cache a very large number of resources and previously viewed documents in memory and/or on disk.
Examples: Safari, OmniWeb, Shiira.
85.115. CLASS WEBPRINTMBS

85.115 class WebPrintMBS

85.115.1 class WebPrintMBS

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: A class for printing webviews.
Notes:
Can be used with HTMLViewer control and the WebViewMBS class.
With the WebViewMBS class you can render to PDF even in console applications.

85.115.2 Methods

85.115.3 Constructor(view as htmlviewer)

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The constructor to attach this class to a htmlviewer.
See also:

- 85.115.4 Constructor(WebViewHandle as Integer)

85.115.4 Constructor(WebViewHandle as Integer)

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The constructor to attach this class to a webview.
See also:

- 85.115.3 Constructor(view as htmlviewer)

85.115.5 GetPageFormat as string

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The current page format settings as a string.
Notes:
Can be used to save current printer settings to a preferences file.
Value is an empty string until a page format is defined.

85.115.6 PageSetup as boolean

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Shows a page setup sheet.
Notes:
If sheetTarget is nil a modal dialog is shown and the function returns after the user clicked one of the buttons
to close the dialog.
If sheetTarget is a valid window reference this window will show a sheet and the function returns while the
sheet waits for mouseclicks.

Returns true on success.

85.115.7 Print as boolean

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Prints the web content without a dialog.
Notes:
If PDFFile is not nil, printing is redirected to a PDF file.
Returns true on success.

85.115.8 PrintDialog as boolean

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Show the print sheet/dialog and allows the user to print the web content.
Notes:
If sheetTarget is nil a modal dialog is shown and the function returns after the user clicked one of the buttons
to close the dialog.
If sheetTarget is a valid window reference this window will show a sheet and the function returns while the
sheet waits for mouseclicks.

If PDFFile is not nil, printing is redirected to a PDF file.

Returns true on success.

85.115.9 PrintingEnd

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Releases memory from the printing code.
Notes: First call PrintingStart with your page size, then call several times PrintingPage and finally call
PrintingEnd.
85.115.10  **PrintingPage(index as UInt32) as Memoryblock**

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Returns the given page as string.
**Notes:**
On any error the function returns nil.
The string contains an one page PDF document.

First call PrintingStart with your page size, then call several times PrintingPage and finally call PrintingEnd.

85.115.11  **PrintingStart(width as Double, height as Double) as Integer**

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Starts the printing code.
**Example:**

```vbs
dim i,c as Integer
dim f as FolderItem
dim s as string
dim b as BinaryStream
dim web as new WebPrintMBS(HTMLViewer1)
c=web.PrintingStart(800,600)
i=0
while i<c
    s=web.PrintingPage(i)
    f=SpecialFolder.Desktop.Child("Page "+str(i+1)+".pdf")
    b=f.CreateBinaryFile(""")
    if b<>nil then
        b.Write s
        b.Close
    end if
    i=i+1
wend
web.PrintingEnd
MsgBox str(c)+" pages printed."
```

**Notes:**
First call PrintingStart with your page size, then call several times PrintingPage and finally call PrintingEnd.
Only one print job can be processed at the same time as they use all the same global properties.

Returns the number of pages to be printed.

85.115.12 SetPageFormat(data as string) as boolean

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Loads page format settings from a string.
Notes: Returns true on success and false on failure.

85.115.13 Properties

85.115.14 DialogOpen as Boolean

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Whether a printing sheet is visible.
Notes: Used with the PageSetup and the PrintDialog methods.
Returns true when a dialog is visible and false when not.
(Read and Write property)

85.115.15 HTMLViewer as HTMLViewer

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The htmlviewer control this webprint object is attached to.
Notes: (Read only property)

85.115.16 PageFormatHandle as Integer

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal handle for the page format.
Notes: (Read only property)
85.115.17  PDFFile as Folderitem

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The pdf file where data is written to.
Notes: If not nil, the printing goes to this file instead of the printer.
(Read and Write property)

85.115.18  PrintSessionHandle as Integer

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal handle for the print session.
Notes: (Read only property)

85.115.19  PrintSettingsHandle as Integer

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The internal handle for the print settings.
Notes: (Read only property)

85.115.20  SheetTarget as Window

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The sheet parent window.
Notes: If you set this property to a window, the dialogs will be sheets and attached to the window. If you set it to nil, the dialogs will be modal.
(Read and Write property)

85.115.21  Events

85.115.22  PageSetupDialogDone(accepted as boolean)

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event to notify you about the result from the page format dialog.
85.115.23  PrintDialogDone(accepted as boolean)

MBS MacControls Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to notify you about the result from the print dialog.
85.116  class WebResourceLoadDelegateMBS

85.116.1  class WebResourceLoadDelegateMBS

Function: A class to receive informations about resource loading.  
Notes: Implementors of this protocol will receive messages indicating that a resource is about to be loaded, data has been received for a resource, an error has been received for a resource, and completion of a resource load.

Implementors are also given the opportunity to mutate requests before they are sent.  
The various progress methods of this protocol all receive an identifier as the parameter. This identifier can be used to track messages associated with a single resource. For example, a single resource may generate multiple willSendRequest calls as it’s URL is redirected.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

Please use one delegate class per HTMLViewer (or WebViewMBS) and make sure they live about the same time. Our class keeps a reference on the WebView, so we can remove our delegate when the delegate is destroyed.

85.116.2  Events

85.116.3  Close

Function: The close event.  
Notes: Called when the delegate is destroyed.

85.116.4  didCancelAuthenticationChallenge(id as Variant, challenge as NSURLAuthenticationChallengeMBS, dataSource as WebDataSourceMBS)

Function: Cancel authentication for a given request.
85.116.5 didFailLoadingWithError(id as Variant, errorString as string, dataSource as WebDataSourceMBS)

Function: This event is called after a load has failed to load due to an error.
Notes:
id: An identifier that can be used to track the progress of a resource load across multiple call backs.
errorString: The error associated with this load.
dataSource: The dataSource that initiated the load.

85.116.6 didFinishLoadingFromDataSource(id as Variant, dataSource as WebDataSourceMBS)

Function: This event is called after a load has successfully completed.
Notes:
id: An identifier that can be used to track the progress of a resource load across multiple call backs.
dataSource: The dataSource that initiated the load.

85.116.7 didReceiveAuthenticationChallenge(id as Variant, challenge as NSURLAuthenticationChallengeMBS, dataSource as WebDataSourceMBS)

Function: Start authentication for the resource, providing a challenge
Notes:
Call useCredential, continueWithoutCredential or cancel on the challenge when done.

If you do not implement this event, WebKit will handle authentication automatically by prompting with a sheet on the window that the WebView is associated with.

85.116.8 didReceiveContentLoaded(id as Variant, length as Integer, dataSource as WebDataSourceMBS)

Function: Multiple of these messages may be sent as data arrives.
Notes:
id: An identifier that can be used to track the progress of a resource load across multiple events.
length: The amount of new data received. This is not the total amount, just the new amount received.
dataSource: The dataSource that initiated the load.

**85.116.9 didReceiveResponse(id as Variant, response as NSURLResponseMBS, dataSource as WebDataSourceMBS)**

**Function:** This event is called after a response has been received for this load.

**Notes:**

id: An identifier that can be used to track the progress of a resource load across multiple call backs.
response: The response for the request.
dataSource: The dataSource that initiated the load.

In some rare cases, multiple responses may be received for a single load. This occurs with multipart/x-mixed-replace, or “server push”. In this case, the client should assume that each new response resets progress so far for the resource back to 0, and should check the new response for the expected content length.

**85.116.10 identifierForInitialRequest(request as NSURLRequestMBS, dataSource as WebDataSourceMBS) as Variant**

**Function:** An implementor of WebResourceLoadDelegate should provide an identifier that can be used to track the load of a single resource.

**Notes:**

This identifier will be passed as the first argument for all of the other WebResourceLoadDelegate methods. The identifier is useful to track changes to a resources request, which will be provided by one or more calls to willSendRequest:redirectResponse.

Return an identifier that will be passed back to the implementor for each event.

**85.116.11 Open**

**Function:** The open event.

**Notes:**

Called just after the delegate has been installed in a htmlviewer control. This allows you to initialize your stuff before the first event is called.
85.116.12 plugInFailedWithError(errorString as string, dataSource as WebDataSourceMBS)

MBS MacControls Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Called when a plug-in is not found, fails to load or is not available for some reason. Notes: errorString is the localized description.

85.116.13 willSendRequest(id as Variant, request as NSURLRequestMBS, redirectResponse as NSURLResponseMBS, dataSource as WebDataSourceMBS) as NSURLRequestMBS

MBS MacControls Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This event is called before a load is initiated. Notes: The request may be modified as necessary by the receiver.

id: An identifier that can be used to track the progress of a resource load across multiple call backs.
request: The request about to be sent.
redirectResponse: If the request is being made in response to a redirect we received, the response that conveyed that redirect.
dataSource: The dataSource that initiated the load.

Returns the request, which may be mutated by the implementor, although typically will be request. You can return a new request if you like.
85.117. CLASS WEBRESOURCEMS

85.117 class WebResourceMBS

85.117.1 class WebResourceMBS

Function: A WebResource represents a fully downloaded URL.

Example:

dim w as new WebResourceMBS(“Hello World”, ”http://www.server.invalid”, ”text/plain”, ”ASCII”, ”myframe”)

MsgBox w.URL+EndOfLine+w.textEncodingName+EndOfLine+w.MIMEType

Notes:

It includes the data of the resource as well as the metadata associated with the resource.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

85.117.2 Methods

85.117.3 Constructor(data as MemoryBlock, url as string, mimeType as string, TextEncodingName as string=’”, frameName as string=’”’)

Function: The constructor to create an new WebResource.

Example:

dim w as new WebResourceMBS(“Hello World”, ”http://www.server.invalid”, ”text/plain”, ”ASCII”, ”myframe”)

Notes:

Handle is not 0 on success.

data: The data of the resource.

URL: The URL of the resource.

MIMEType: The MIME type of the resource.

TextEncodingName: The text encoding name of the resource (can be empty).

frameName: The frame name of the resource if the resource represents the contents of an entire HTML frame (can be empty).
See also FileExtensionToMimeTypeMBS function.

### 85.117.4 data as MemoryBlock

**Function:** The data of the resource.

**Example:**

```vba
Dim w As New WebResourceMBS("Hello World", "http://www.server.invalid", "text/plain", "ASCII", "myframe")
MsgBox w.data
```

### 85.117.5 frameName as String

**Function:** The frame name of the resource if the resource represents the contents of an entire HTML frame.

**Example:**

```vba
Dim w As New WebResourceMBS("Hello World", "http://www.server.invalid", "text/plain", "ASCII", "myframe")
MsgBox w.frameName
```

**Notes:** Can be an empty string.

### 85.117.6 MIMEType as String

**Function:** The MIME type of the resource.

**Example:**

```vba
Dim w As New WebResourceMBS("Hello World", "http://www.server.invalid", "text/plain", "ASCII", "myframe")
MsgBox w.MIMEType
```

**Notes:** See also MimeTypeToFileExtensionMBS function.
85.117.7  textEncodingName as String

Function: The text encoding name of the resource.

Example:

dim w as new WebResourceMBS("Hello World", "http://www.server.invalid", "text/plain", "ASCII", "myframe")

MsgBox w.textEncodingName

Notes: Can be an empty string.

85.117.8  URL as String

Function: The URL of the resource.

Example:

dim w as new WebResourceMBS("Hello World", "http://www.server.invalid", "text/plain", "ASCII", "myframe")

MsgBox w.URL

85.117.9  Properties

85.117.10  Handle as Integer

Function: The handle to the internal used webresource reference.

Example:

dim w as new WebResourceMBS("Hello World", "http://www.server.invalid", "text/plain", "ASCII", "myframe")

MsgBox str(w.Handle)

Notes: (Read and Write property)
class WebScriptCallbackMBS

85.118.1 Methods

85.118.3 ArgumentValue(index as Integer) as Variant

Function: The argument with the given index for the current callback.
Notes:
Index is from 0 to ArgumentCount-1.
variant can be a string, a number, a boolean or a date.
Only valid while a callback event is running.

85.118.4 Constructor

Function: The constructor creating a new web script callback object.
Notes: On success the handle property is not zero.

85.118.5 Properties

85.118.6 ArgumentCount as Integer

Function: The number of arguments for the current callback.
Notes:
Only valid while a callback event is running.
(Read only property)
85.118.7 Handle as Integer

Function: The internally used handle for the callback object.
Notes: (Read and Write property)

85.118.8 Events

85.118.9 Callback(Name as string) as Variant

Function: The callback event.
Notes:
Name is the name of the method which was called.

The functions ArgumentCount and ArgumentValue give you the parameters of this method call.

You can return numbers, strings, date objects or booleans.

85.118.10 Close

Notes: Called when the object is destroyed.
85.119 class WebScriptObjectMBS

85.119.1 class WebScriptObjectMBS

**Function:** The base object for scripting and all DOM objects. 
**Notes:**
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

85.119.2 Methods

85.119.3 Constructor

**Function:** The private constructor.

85.119.4 evaluateWebScript(script as String) as Variant

**Function:** Evaluates a script. 
**Example:**

dim code as string

// code="1+5"
code="""hello """+5"

dim d as DOMDocumentMBS = HTMLViewer1.mainFrameMBS.DOMDocument
MsgBox d.evaluateWebScript(code)
// shows result of calculations

**Notes:**
The script will be executed in the target script environment. The format of the script is dependent of the target script environment. 
**Name:** The script to execute in the target script environment.
85.119.5  getValue(name as String) as Variant

Function: Gets a value in this webscript object.
Example:
  dim w as WebFrameMBS = HTMLViewer1.mainFrameMBS
  dim d as DOMDocumentMBS = w.DOMDocument

  MsgBox d.getValue("key")

Notes: Works for numbers, booleans, dates and strings.

85.119.6  removeValue(name as String)

Function: Removes a value with the given name.

85.119.7  setValue(name as String, value as Variant)

Function: Sets a value in this webscript object.
Example:
  dim w as WebFrameMBS = HTMLViewer1.mainFrameMBS
  dim d as DOMDocumentMBS = w.DOMDocument

  d.setValue("key","Hello")

Notes: Works for numbers, booleans, dates and strings.

85.119.8  setWebScriptCallback(name as String, value as WebScriptCallbackMBS)

Function: Sets a value in this webscript object.
Example:
  // in the windowScriptObjectAvailable event you can register the callback object

  Function windowScriptObjectAvailable(windowScriptObject as WebScriptObjectMBS) As boolean
// Install an Object called "MyBrowser" on the javascript document object
// Any function call inside will trigger callback event
dim callback as WebScriptCallbackMBS // your global callback object
windowScriptObject.setWebScriptCallback "MyBrowser", callback
End Function

Notes: This is the special version of SetValue to be used with the WebScriptCallbackMBS class.

85.119.9 setWebScriptValueAtIndex(index as Integer, value as Variant)
Function: Sets the value of the property at the specified index.
Notes:
Index is zero based.
Works for numbers, booleans, dates and strings.

85.119.10 stringRepresentation as String
Function: The string representation of this object.
Notes: Returns an empty string on any error.

85.119.11 webScriptValueAtIndex(index as Integer) as Variant
Function: Gets the value of the property at the specified index.
Example:
dim d as DOMDocumentMBS = HTMLViewer1.mainFrameMBS.DOMDocument
MsgBox d.webScriptValueAtIndex(1)

Notes:
Index is zero based.
Works for numbers, booleans, dates and strings.
85.119. CLASS WEBSHRIPTOBJECTMBS

85.119.12 Properties

85.119.13 Handle as Integer

Function: The handle of the internal used reference to a WebScriptObject.
Notes: (Read and Write property)
85.120  class WebUIDelegateMBS

85.120.1  class WebUIDelegateMBS

Function: A class to handle user interface requests.
Notes:
The plugin is very careful on which events it registers.
All events where you don’t have code inside (not even comments), is not registered with the system and you
get the default behavior.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the
message, name and reason properties you can see what was the reason for this exception. Please report if
you find a method which does not handle exceptions correct.

Please use one delegate class per HTMLViewer (or WebViewMBS) and make sure they live about the same
time. Our class keeps a reference on the WebView, so we can remove our delegate when the delegate is
destroyed.

85.120.2  Methods

85.120.3  Constructor

Function: The constructor for this class.

85.120.4  Properties

85.120.5  DisableContextMenu as Boolean

Function: Whether the plugin should disable contextual menus completely.
Notes:
Set to true to disabled the context menu.
(Read and Write property)
85.120.  CLASS WEBUIDELEGATEMBS

85.120.6  DisableNewWindow as Boolean

Function: Whether the plugin should block new window requests.
Notes:
Set to true to block all requests.
(Read and Write property)

85.120.7  Events

85.120.8  AreToolbarsVisible as boolean

Function: Determine whether the window’s toolbars are currently visible.
Notes:
This method should return true if the window has any toolbars that are currently on, besides the status bar. If the app has more than one toolbar per window, for example a regular command toolbar and a favorites bar, it should return true from this method if at least one is on.

If you place code in this event, return a value.
If no code is in the event, the default delegate will be called.

85.120.9  Close

Notes: Called when the delegate is destroyed.

85.120.10  CreateWithRequest(Request as NSURLRequestMBS) as object

Function: Create a new window and begin to load the specified request.
Notes:
The newly created window is hidden, and the window operations delegate on the new WebViews will get a webViewShow call.

If no value is returned or no code is in the event, the default delegate is called.
Return nil, nothing or a valid htmlviewer or WebviewMBS object. Your application will certainly crash if you return something different.

Request may be nil. In this case WebKit later calls LoadRequest for the new webview.

85.120.11  dragDestinationActionMaskForDraggingInfo(draggingInfo as NSDraggingInfoMBS) as Integer

Function: Controls behavior when dragging to a WebView.
Notes:

draggingInfo: The dragging info of the drag
This method is called periodically as something is dragged over a WebView. The UI delegate can return a mask indicating which drag destination actions can occur, WebDragDestinationActionAny to allow any kind of action or WebDragDestinationActionNone to not accept the drag.

If you implement this, the default delegate is not called.

If you return WebDragDestinationActionAny you simply allow all kind of drag and drop including javascript using it.

85.120.12  dragSourceActionMaskForPoint(x as Double, y as Double) as Integer

Function: Controls behavior when dragging from a WebView.
Notes:

X/Y: The point where the drag started in the coordinates of the WebView.

This method is called after the user has begun a drag from a WebView. The UI delegate can return a mask indicating which drag source actions can occur, WebDragSourceActionAny to allow any kind of action or WebDragSourceActionNone to not begin a drag.

If you implement this, the default delegate is not called.

If you return WebDragDestinationActionAny you simply allow all kind of drag and drop including javascript using it.
85.120.13  **drawFooterInRect**(rect as NSRectMBS, g as NSGraphicsMBS)

**Function:** The delegate should draw a footer for the sender in the supplied rect.
**Notes:** rect: The NSRectMBS reserved for the footer of the page

85.120.14  **drawHeaderInRect**(rect as NSRectMBS, g as NSGraphicsMBS)

**Function:** The delegate should draw a header for the sender in the supplied rect.
**Notes:** rect: The NSRect reserved for the header of the page

85.120.15  **FooterHeight** as single

**Function:** The height returned will be used to calculate the rect passed to drawFooterInRect.
**Notes:**
Reserve a height for the printed page footer.
Returns the height to reserve for the printed page footer, return 0.0 to not reserve any space for a footer.

85.120.16  **GetContentRect**(byref left as Double, byref top as Double, byref width as Double, byref height as Double) as boolean

**Function:** Return the window’s content rect.
**Notes:** If you want to return values, return true, else return false and the default delegate will be called for this.

85.120.17  **GetFrame**(byref left as Double, byref top as Double, byref width as Double, byref height as Double) as boolean

**Function:** Return the window’s frame rect.
**Notes:** If you want to return values, return true, else return false and the default delegate will be called for this.
85.120.18  GetStatusText as String

Function: Get the currently displayed status text.
Notes:
If you place code in this event, return a value.
If no code is in the event, the default delegate will be called.

85.120.19  HeaderHeight as single

Function: The height returned will be used to calculate the rect passed to drawHeaderInRect.
Notes:
Reserve a height for the printed page header.
Return the height to reserve for the printed page header, return 0.0 to not reserve any space for a header.

85.120.20  IsResizable as boolean

Function: Determine whether the window is resizable or not.
Notes:
If there are multiple views in the same window, they have have their own separate resize controls and this
may need to be handled specially.

If you place code in this event, return a value.
If no code is in the event, the default delegate will be called.

85.120.21  IsStatusBarVisible as boolean

Function: Determine whether the status bar is visible.
Notes:
true if the status bar is visible, otherwise false.

If you place code in this event, return a value.
If no code is in the event, the default delegate will be called.
**85.120.22**  
**MouseDidMoveOverElement(elementInformation as Dictionary, modifierFlags as Integer) as boolean**

**Function:** Updates information about the element the user is mousing over.  
**Notes:**

- **elementInformation:** A dictionary that describes the element under the mouse, or nil. Keys and values:
  - WebElementKeyDOMNode: DOMNodeMBS of the element
  - WebElementFrame: WebFrameMBS of the element
  - WebImageAltString: String of the ALT attribute of the image element
  - WebImage: NSImageMBS of the image element
  - WebImageRect: NSRectMBS of an NSRect, the rect of the image element
  - WebImageURL: String of the image element
  - WebIsSelected: Number of BOOL indicating whether the element is selected or not
  - WebLinkURL: String of the link if the element is within an anchor
  - WebLinkTargetFrame: WebFrameMBS of the target of the anchor
  - WebLinkTitle: String of the title of the anchor
  - WebLinkLabel: String of the text within the anchor

- **modifierFlags:** An integer bit field that indicates the modifier keys in effect during the event.

**85.120.23**  
**Open**

**Function:** The open event.  
**Notes:**  
Called just after the delegate has been installed in a htmlviewer control.  
This allows you to initialize your stuff before the first event is called.

**85.120.24**  
**printFrameView(frameView as WebFrameViewMBS)**

**Function:** Informs that a WebFrameView needs to be printed.  
**Notes:**

- **frameView:** The WebFrameView needing to be printed

This method is called when a script or user requests the page to be printed.  
In this method the delegate can prepare the WebFrameView to be printed. Some content that WebKit dis-
plays can be printed directly by the WebFrameView, other content will need to be handled by the delegate. To determine if the WebFrameView can handle printing the delegate should check WebFrameView’s documentViewShouldHandlePrint, if true then the delegate can call printDocumentView on the WebFrameView. Otherwise the delegate will need to request a NSPrintOperation from the WebFrameView’s printOperationWithPrintInfo to handle the printing.

85.120.25  RunJavaScriptAlertPanelWithMessage(message as String)

Notes: Clients should visually indicate that this panel comes from JavaScript. The panel should have a single OK button.

85.120.26  RunJavaScriptConfirmPanelWithMessage(message as String) as boolean

Notes:
Return true if the user hit OK, false if the user chose Cancel.
Clients should visually indicate that this panel comes from JavaScript. The panel should have two buttons, e.g. "OK" and "Cancel".

If you place code in this event, return a value.
If no code is in the event, the default delegate will be called.

85.120.27  RunJavaScriptTextInputPanelWithPrompt(prompt as String, defaultText as String) as String

Notes:
Return the typed text if the user hit OK, otherwise an empty string.
Clients should visually indicate that this panel comes from JavaScript. The panel should have two buttons, e.g. "OK" and "Cancel", and an area to type text.

If you place code in this event, return a value.
If no code is in the event, the default delegate will be called.
85.120.28  **runOpenPanelForFileButtonWithResultListener**

**Function:** Called when an open panel should be shown.

**Notes:**
Return true if you handled this event.
Call chooseFilename or cancel on the listener to inform about the result.

85.120.29  **setContentRect**

**Function:** Set the window’s content rect.

**Notes:**
Even though a plugin could set the frame directly using the Window, this method is provided so implemen-
tors of this protocol can do special things on programmatic move/resize, like avoiding autosaving of the size.

If you return true the default delegate will not be called for this.

85.120.30  **setFrame**

**Function:** Set the window’s frame rect.

**Notes:**
Even though a plugin could set the frame directly using the Window, this method is provided so implemen-
tors of this protocol can do special things on programmatic move/resize, like avoiding autosaving of the size.

If you return true the default delegate will not be called for this.

85.120.31  **setResizable**

**Function:** Set the window to resizable or not.

**Notes:**
If there are multiple views in the same window, they have have their own separate resize controls and this may need to be handled specially.
If you return true the default delegate will not be called for this.

85.120.32  SetStatusBarVisible(visible as boolean) as boolean

MBS MacControls Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Set whether the status bar is currently visible.
Notes: Setting this to true should show the status bar, setting it to false should hide it.
If you return true the default delegate will not be called for this.

85.120.33  SetStatusText(text as String) as boolean

MBS MacControls Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Set the window’s status display, if any, to the specified string.
Notes: If you return true the default delegate will not be called for this.

85.120.34  SetToolbarsVisible(visible as boolean) as boolean

MBS MacControls Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Set whether the window’s toolbars are currently visible.
Notes: Setting this to true should turn on all toolbars (except for a possible status bar). Setting it to false should turn off all toolbars (with the same exception).
If you return true the default delegate will not be called for this.

85.120.35  willPerformDragDestinationAction(WebDrag DestinationAction as Integer, draggingInfo as NSDraggingInfoMBS)

Notes: action: The drag destination action
draggingInfo: The dragging info of the drag
This method is called after the last call to dragDestinationActionMaskForDraggingInfo after something is dropped on a WebView.
This method informs the UI delegate of the drag destination action that WebView will perform.

**85.120.36**  
**willPerformDragSourceAction(WebDragDestinationAction as Integer, X as Double, Y as Double, pasteboard as NSPasteboardMBS)**

**Function:** Informs that a drag a has begun from a WebView.
**Notes:**
- action: The drag source action
- X/Y: The point where the drag started in the coordinates of the WebView
- pasteboard: The drag pasteboard

This method is called after dragSourceActionMaskForPoint is called after the user has begun a drag from a WebView.
This method informs the UI delegate of the drag source action that will be performed and gives the delegate an opportunity to modify the contents of the dragging pasteboard.

**85.120.37**  
**WindowClose as boolean**

**Function:** Close the current window.
**Notes:**
- Clients showing multiple views in one window may choose to close only the one corresponding to this WebView. Other clients may choose to ignore this method entirely.
- If this event returns false the control is handled to the default delegate.

**85.120.38**  
**WindowFocus as boolean**

**Function:** Focus the current window.
**Notes:**
- Clients showing multiple views in one window may want to also do something to focus the one corresponding to this WebView.
- If this event returns false the control is handled to the default delegate.
85.120.39 WindowShow as boolean

Function: Show the window that contains the top level view of the WebView, ordering it frontmost.
Notes:
This will only be called just after CreateWithRequest is used to create a new window.
If this event returns false the control is handled to the default delegate.

85.120.40 WindowUnfocus as boolean

Function: Unfocus the current window.
Notes:
Clients showing multiple views in one window may want to also do something to unfocus the one correspond-
ing to this WebView.
If this event returns false the control is handled to the default delegate.

85.120.41 Constants

85.120.42 WebDragDestinationActionAny = -1

MBS MacControls Plugin, Plugin Version: 16.1. Function: One of the action constants that the destination
object of a drag operation can perform.
Notes: Allows any defined action to occur.

85.120.43 WebDragDestinationActionDHTML = 1

MBS MacControls Plugin, Plugin Version: 16.1. Function: One of the action constants that the destination
object of a drag operation can perform.
Notes: Allows DHTML (such as JavaScript) to handle the drag.

85.120.44 WebDragDestinationActionEdit = 2

MBS MacControls Plugin, Plugin Version: 16.1. Function: One of the action constants that the destination
object of a drag operation can perform.
Notes: Allows editable documents to be changed by the drag operation.
85.120.45  WebDragDestinationActionLoad = 4

MBS MacControls Plugin, Plugin Version: 16.1. **Function:** One of the action constants that the destination object of a drag operation can perform.
**Notes:** Allows the drag operation to change the location.

85.120.46  WebDragDestinationActionNone = 0

MBS MacControls Plugin, Plugin Version: 16.1. **Function:** One of the action constants that the destination object of a drag operation can perform.
**Notes:** No action.
85.121 class WebViewMBS

85.121.1 class WebViewMBS

Function: The class to handle a webview.
Notes:
A webview is simply a content viewer for any web based content. It can render html pages, text pages and with plugins also flash or pdf files.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

85.121.2 Methods

85.121.3 alignCenter

Function: An action method that applies center alignment to selected content or all content if there’s no selection.
Notes: Available in Mac OS X v10.3.9 and later.

85.121.4 alignJustified

Function: An action method that applies full justification to selected content or all content if there’s no selection.
Notes: Available in Mac OS X v10.3.9 and later.

85.121.5 alignLeft

Function: An action method that applies left justification to selected content or all content if there’s no selection.
**85.121. CLASS WEBVIEWMBS**

*Notes:* Available in Mac OS X v10.3.9 and later.

---

### 85.121.6 alignRight

*Function:* An action method that applies right justification to selected content or all content if there is no selection.

*Notes:* Available in Mac OS X v10.3.9 and later.

---

### 85.121.7 applyStyle(style as Variant)

*Function:* Applies the CSS typing style to the current selection.

*Example:*

```vbnet
dim w as WebViewMBS = HTMLViewer1.WebViewMBS
dim doc as DOMDocumentMBS = w.mainFrame.DOMDocument
dim d as DOMCSSStyleDeclarationMBS = doc.createCSSStyleDeclaration

d.fontWeight="bold"

w.applyStyle d
```

*Notes:*

- *style:* The style to apply to the current selection. Must be a DOMCSSStyleDeclarationMBS object.

- This method does nothing if there is no current selection or if the current selection is collapsed.

- This method hides the complexities of applying styles to elements. If necessary, this method will make multiple passes over the range of the current selection to ensure that the requested style is applied to the elements in that range, and takes into account the complexities of CSS style application rules. This method also simplifies styling attributes so that the minimum number of styling directives are used to yield a given computed style.

---

### 85.121.8 backForwardList as WebBackForwardListMBS

*Function:* Returns the backforward list for this webView.
85.121.9  canGoBack as boolean

Function: Whether the history can be used to move back one website.

85.121.10  canGoForward as boolean

Function: Whether the history can be used to move forward one website.

85.121.11  canMakeTextLarger as boolean

Function: Whether the text size can be increased.

85.121.12  canMakeTextSmaller as boolean

Function: Whether the text size can be decreased.

85.121.13  canResetPageZoom as boolean

Function: Whether web page can be reset.
Notes: This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.121.14  CanShowMIMEType(mime as string) as boolean

Function: Checks if the WebKit can show content of a certain MIME type.
Notes:
Returns false on any error and true on success.
See also MimeTypeToFileExtensionMBS function.

85.121.15 CanShowMIMETypeAsHTML(mime as string) as boolean

Function: Checks if the the MIME type is a type that the WebKit will interpret as HTML.
Notes: Returns false on any error and true on success.
See also MimeTypeToFileExtensionMBS function.

85.121.16 canZoomPageIn as boolean

Function: Whether web page can be zoomed in.
Notes: This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.121.17 canZoomPageOut as boolean

Function: Whether web page can be zoomed out.
Notes: This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.121.18 capitalizeWord

Function: Implemented by WebView to capitalize the word or words surrounding the insertion point or selection, expanding the selection if necessary.
Notes: If either end of the selection partially covers a word, that entire word is made lowercase. The sender argument is typically the object that invoked this method.

85.121.19 centerSelectionInVisibleArea

Function: Implemented by WebView to scroll the selection, whatever it is, inside its visible area.
85.121.20  changeAttributes

**Function:** An action method that changes the attributes of the current selection.
**Notes:** Available in Mac OS X v10.3.9 and later.

85.121.21  changeCaseOfLetter

**Function:** Implemented by WebView to change the case of a letter or letters in the selection, perhaps by opening a panel with capitalization options or by cycling through possible case combinations.

85.121.22  changeColor

**Function:** Sets the color of the selected content.
**Notes:**
This method is invoked by the NSColorPanel sender.
Available in Mac OS X v10.3.9 and later.

85.121.23  changeDocumentBackgroundColor

**Function:** Sets the background color of the selected content.
**Notes:**
This method is invoked by the NSColorPanel sender.
Available in Mac OS X v10.3.9 and later.

85.121.24  changeFont

**Function:** An action method that changes the font of the selection, or all content if there is no selection.
**Notes:**
If the receiver doesn't use the Fonts panel, this method does nothing.

Available in Mac OS X v10.3.9 and later.

**85.121.25 checkSpelling**

**Function:** An action method that searches for a misspelled word in the receiver.

**Notes:**
This action method starts a search at the end of the selection and continues until it reaches a word suspected of being misspelled or the end of the content. If a word isn't recognized by the spelling server, a showGuessPanel message is sent to the receiver which opens the Guess panel and allows the user to make a correction or add the word to the local dictionary.

Available in Mac OS X v10.3.9 and later.

**85.121.26 ClearFocus**

**Function:** Clears the focus.

**Example:**

```plaintext
webview.ClearFocus
```

**Notes:** If the focus is on the webpage, it will be cleared so there is no focus on the window. Useful if you want to workaround a focus bug in the htmlviewer control.

**85.121.27 complete**

**Function:** Implemented by WebView to complete an operation in progress or a partially constructed element.

**Notes:** This method can be interpreted, for example, as a request to attempt expansion of a partial word, such as for expanding a glossary shortcut, or to close a graphics item being drawn.
85.121.28 Constructor

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```vba
dim x as new WebViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 85.121.29 Constructor(Handle as Integer)
- 85.121.30 Constructor(left as Double, top as Double, width as Double, height as Double)
- 85.121.31 Constructor(x as Double, y as Double, w as Double, h as Double, FrameName as string, GroupName as string)

85.121.29 Constructor(Handle as Integer)

Function: Creates an object based on the given WebView handle.
Example:

```vba
dim t as new WebViewMBS(0, 0, 100, 100)
dim v as new WebViewMBS(t.handle)
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a WebView and the plugin retains this handle.
See also:

- 85.121.28 Constructor
- 85.121.30 Constructor(left as Double, top as Double, width as Double, height as Double)
- 85.121.31 Constructor(x as Double, y as Double, w as Double, h as Double, FrameName as string, GroupName as string)

85.121.30 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new button with the given size and position.
Example:
**85.121. CLASS WEBVIEWMBS**

`dim w as new WebViewMBS(0,0,800,600)`

`w.LoadHTMLString "Hello World",""

// and later

`dim n as NSImageMBS = w.RenderImage`
`Backdrop=n.CopyPicture`

**Notes:** On success the handle property is not zero.

See also:

- 85.121.28 Constructor
- 85.121.29 Constructor(Handle as Integer)
- 85.121.31 Constructor(x as Double, y as Double, w as Double, h as Double, FrameName as string, GroupName as string)

**85.121.31 Constructor(x as Double, y as Double, w as Double, h as Double, FrameName as string, GroupName as string)**

**Function:** Initializes a webview with a frame rectangle, a WebFrame name, and a group name.

**Example:**

```plaintext```
dim w as webviewmbs

w=new WebViewMBS(0,0,800,600,"test","test")

w.LoadHTMLString "Hello World",""

// and later

dim n as NSImageMBS = w.RenderImage
Backdrop=n.CopyPicture
```

**Notes:**

The `FrameName` should not be one of the pre-defined frame names (see the WebFrame `findFrameNamed` for a description of their meaning), but a custom name or a name used in HTML source. The `GroupName` argument is an arbitrary identifier used to group related frames. For example, JavaScript running in a frame can access any other frame in the same group. It’s up to the application how it chooses to scope related frames. Both `FrameName` and `GroupName` may be "". This method is the designated initializer for the WebView class.
On success the handle property is not zero.

See also:

- 85.121.28 Constructor
- 85.121.29 Constructor(Handle as Integer)
- 85.121.30 Constructor(left as Double, top as Double, width as Double, height as Double)

85.121.32 copy

**Function:** Action method that copies the selected content to the general pasteboard.

**Notes:**
This action method copies the selected content onto the general pasteboard, in as many formats as the receiver supports. For example, a plain text object uses NSStringPboardType for plain text, and a rich text object also uses NSRTFPboardType.

Available in Mac OS X v10.3.9 and later.

85.121.33 copyFont

**Function:** An action method that copies font information onto the font pasteboard.

**Notes:**
This action method copies the font information for the first character of the selection (or for the insertion point) onto the font pasteboard as NSFontPboardType.

Available in Mac OS X v10.3.9 and later.

85.121.34 cut

**Function:** An action method that deletes selected content and puts it on the general pasteboard.

**Notes:**
This action method deletes the selected content and places it onto the general pasteboard, in as many formats as the receiver supports. For example, a plain text object uses NSStringPboardType for plain text, and a rich text object also uses NSRTFPboardType.
85.121. CLASS WEBCVIEWMBS

Available in Mac OS X v10.3.9 and later.

85.121.35 delete

Function: An action method that deletes the selected content.
Notes:
The pasteboard is unaffected by invoking this method.

Available in Mac OS X v10.3.9 and later.

85.121.36 deleteBackward

Function: Implemented by WebView to delete the selection, if there is one, or a single element backward from the insertion point (a letter or character in text, for example).

85.121.37 deleteBackwardByDecomposingPreviousCharacter

Function: Implemented by WebView to delete the selection, if there is one, or a single character backward from the insertion point.
Notes: If the previous character is canonically decomposable, this method should try to delete only the last character in the grapheme cluster (for example, deleting "a"+ "’" results in "a"). NSResponder declares but does not implement this method.

85.121.38 deleteForward

Function: Implemented by WebView to delete the selection, if there is one, or a single element forward from the insertion point (a letter or character in text, for example).

85.121.39 deleteSelection

Function: Deletes the receiver’s current selection unless it’s collapsed.
Notes: No content is removed if the current selection is collapsed (a range is selected with the same nodes and offsets for the start and end) or if there is no current selection.

85.121.40 deleteToBeginningOfLine

Function: Implemented by WebView to delete the selection, if there is one, or all text from the insertion point to the beginning of a line (typically of text). 
Notes: Also places the deleted text into the kill buffer.

85.121.41 deleteToBeginningOfParagraph

Function: Implemented by WebView to delete the selection, if there is one, or all text from the insertion point to the beginning of a paragraph of text. 
Notes: Also places the deleted text into the kill buffer.

85.121.42 deleteToEndOfLine

Function: Implemented by WebView to delete the selection, if there is one, or all text from the insertion point to the end of a line (typically of text). 
Notes: Also places the deleted text into the kill buffer.

85.121.43 deleteToEndOfParagraph

Function: Implemented by WebView to delete the selection, if there is one, or all text from the insertion point to the end of a paragraph of text. 
Notes: Also places the deleted text into the kill buffer.

85.121.44 deleteWordBackward

Function: Implemented by WebView to delete the selection, if there is one, or a single word backward from the insertion point.
85.121.45 deleteWordForward

Function: Implemented by WebView to delete the selection, if there is one, or a single word forward from
the insertion point.

85.121.46 EstimatedProgress as Double

Function: An estimate of the percent complete for a document load.
Example:
// waits till rendering is done:
dim f as FolderItem = SpecialFolder.Desktop.Child(“test.html”)
WebView.mainFrame.LoadURL f.URLPath
while WebView.EstimatedProgress>0
DelayMBS 0.1
wend
// this works only because EstimatedProgress is set to 0.1 by LoadURL
// and set back to zero when the load process finishes.
// If future Webkit versions change the EstimatedProgress results,
// it will break.

Notes: This value will range from 0 to 1.0 and, once a load completes, will remain at 1.0 until a new load
starts, at which point it will be reset to 0. The value is an estimate based on the total number of bytes
expected to be received for a document, including all it’s possible subresources. For more accurate progress
indication it is recommended that you implement a WebFrameLoadDelegate and a WebResourceLoadDelegate.

85.121.47 EvaluateJavaScript(code as string) as string

Function: Runs the given java script and returns the result.
Example:
// shows current user agent string which the control sends to website
MsgBox webview1.EvaluateJavaScript(”navigator.userAgent;”)
// using eval:
MsgBox webview1.EvaluateJavaScript(”eval(“”x=10;y=20;x*y”””)”
// with function:
MsgBox webview1.EvaluateJavaScript(" test(); function test() { x = 10 ; y = 20; return x * y; } ")

// with multiline script:
dim s as string = "test();"+EndOfLine+ 
" function test()"+EndOfLine+ 
" { "+EndOfLine+ 
" x = 10; "+EndOfLine+ 
" y = 20; "+EndOfLine+ 
" return x * y;"+EndOfLine+ 
" } "

MsgBox webview1.EvaluateJavaScript(s)

Notes:
Returns "" on any error.

In Safari 2 we used "return 1+2;" while in Safari 3 we only need "1+2;". The return is no longer needed. Be aware that there is an implicit return now with Safari 3!

85.121.48  GoBack

Function: Go back to the previous URL in the backforward list.

85.121.49  GoForward

Function: Go forward to the next URL in the backforward list.

85.121.50  goToBackForwardItem(item as WebHistoryItemMBS) as boolean

Function: Moves on the history to the given item. 
Notes: Returns true on success or false on failure.
85.121.51 HTMLText as string

Function: Returns HTML text for this document.
Notes: This is the text as we generate it from current DOM tree. It is not the html text we loaded from the website. To get this original html text, please use mainFrameMBS.dataSource.data instead.

85.121.52 indent

Function: Implemented by WebView to indent the selection or the insertion point if there is no selection.

85.121.53 insertBacktab

Function: Implemented by WebView to handle a backward tab.
Notes: A field editor might respond to this method by selecting the field before it, while a regular text object either doesn't respond to or ignores such a message.

85.121.54 insertNewline

Function: Implemented by WebView to insert a newline character at the insertion point or selection, deleting the selection if there is one, or to end editing if the receiver is a text field or other field editor.

85.121.55 insertParagraphSeparator

Function: Implemented by WebView to insert a paragraph separator at the insertion point or selection, deleting the selection if there is one.

85.121.56 insertTab

Function: Implemented by WebView to insert a tab character at the insertion point or selection, deleting the selection if there is one, or to end editing if the receiver is a text field or other field editor.
**85.121.57 LoadHTMLString(data as memoryblock, mime as string, encoding as string, url as string)**

**Function:** Loads data as a webpage.

**Example:**

```javascript
webview.LoadHTMLString "<b>test</b>" , "text/plain" , "" , "" ; // show as plain text
webview.LoadHTMLString "<b>test</b>" , "text/html" , "" , "" ; // show as html
```

**Notes:**

data: The data to use for the main page of the document.
mime: The MIME type of the data. e.g. "text/html"
textencoding: The encoding of the data.
url: The base URL to apply to relative URLs within the document.

All parameters can be empty if needed.
Using "text/plain" mime type you can show source code of website.

Like most Webkit Methods this one can not be called from a thread.
See also:

- 85.121.58 LoadHTMLString(text as string, url as string)

**85.121.58 LoadHTMLString(text as string, url as string)**

**Function:** Loads a html page from a string.

**Notes:**

html: The string to use for the main page of the document.
url: The base URL to apply to relative URLs within the document. (optional)

Like most Webkit Methods this one can not be called from a thread.
See also:

- 85.121.57 LoadHTMLString(data as memoryblock, mime as string, encoding as string, url as string)
85.121.59  LoadRequest(request as NSURLRequestMBS)

Function: Loads the given url request.
Notes: Like most Webkit Methods this one can not be called from a thread.

85.121.60  LoadURL(url as string)

Function: Loads the url.
Example:
webview.LoadURL "http://www.monkeybreadsoftware.de"

Notes:
Like most Webkit Methods this one can not be called from a thread.
Internally this calls LoadRequest with a NSURLRequest based on the given URL.
See also:
• 85.121.61 LoadURL(url as string, CachePolicy as Integer, TimeOut as Double)

85.121.61  LoadURL(url as string, CachePolicy as Integer, TimeOut as Double)

Function: Loads the URL.
Example:
webview.LoadURL "http://www.monkeybreadsoftware.de", 1, 2.0

Notes:
The timeout interval is in seconds.

Constants for the CachePolicy parameter:
Like most Webkit Methods this one can not be called from a thread.
Internally this calls LoadRequest with a NSURLRequest based on the given URL.
See also:
• 85.121.60 LoadURL(url as string)
const UseProtocolCachePolicy = 0 Specifies that the caching logic defined in the protocol implementation, if any, is used for a particular URL load request. This is the default policy for URL load requests.

const ReloadIgnoringCacheData = 1 Specifies that the data for the URL load should be loaded from the originating source. No existing cache data should be used to satisfy a URL load request.

const ReturnCacheDataElseLoad = 2 Specifies that the existing cached data should be used to satisfy the request, regardless of its age or expiration date. If there is no existing data in the cache corresponding to the request, the data is loaded from the originating source.

const ReturnCacheDataDontLoad = 3 Specifies that the existing cache data should be used to satisfy a request, regardless of its age or expiration date. If there is no existing data in the cache corresponding to a URL load request, no attempt is made to load the data from the originating source, and the load is considered to have failed. This constant specifies a behavior that is similar to an "offline" mode.

85.121.62 lowercaseWord

Function: Implemented by WebView to make lowercase every letter in the word or words surrounding the insertion point or selection, expanding the selection if necessary.

Notes: If either end of the selection partially covers a word, that entire word is made lowercase. NSResponder declares, but doesn’t implement this method.

85.121.63 mainFrame as WebFrameMBS

Function: The main webframe currently displayed.

Notes: Nil if no is present.

85.121.64 makeTextLarger

Function: Increases the text size in the webview.

85.121.65 makeTextSmaller

Function: Decreases the text size in the webview.
85.121.66 mediaVolume as single

**Function:** Queries the maximum volume of all sounds generated on this webview.
**Notes:** This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.121.67 moveBackward

**Function:** Implemented by WebView to move the selection or insertion point one element or character backward.
**Notes:** In text, if there is a selection it should be deselected, and the insertion point should be placed at the beginning of the former selection.

85.121.68 moveBackwardAndModifySelection

**Function:** Implemented by WebView to expand or reduce either end of the selection backward by one element or character.
**Notes:** If the end being modified is the backward end, this method expands the selection; if the end being modified is the forward end, it reduces the selection. The first moveBackwardAndModifySelection or moveForwardAndModifySelection method in a series determines the end being modified by always expanding. Hence, this method results in the backward end becoming the mobile one if invoked first. By default, moveLeftAndModifySelection is bound to the left arrow key.

85.121.69 moveDown

**Function:** Implemented by WebView to move the selection or insertion point one element or character down.
**Notes:** In text, if there is a selection it should be deselected, and the insertion point should be placed below the beginning of the former selection.

85.121.70 moveDownAndModifySelection

**Function:** Implemented by WebView to expand or reduce the top or bottom end of the selection downward by one element, character, or line (whichever is appropriate for text direction).
**Notes:** If the end being modified is the bottom, this method expands the selection; if the end being modified
is the top, it reduces the selection. The first moveDownAndModifySelection or moveUpAndModifySelection
method in a series determines the end being modified by always expanding. Hence, this method results in
the bottom end becoming the mobile one if invoked first.

85.121.71 moveForward

Function: Implemented by WebView to move the selection or insertion point one element or character
forward.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed at
the end of the former selection.

85.121.72 moveForwardAndModifySelection

Function: Implemented by WebView to expand or reduce either end of the selection forward by one ele-
ment or character.
Notes: If the end being modified is the backward end, this method reduces the selection; if the end be-
ing modified is the forward end, it expands the selection. The first moveBackwardAndModifySelection or
moveForwardAndModifySelection method in a series determines the end being modified by always expand-
ing. Hence, this method results in the forward end becoming the mobile one if invoked first. By default,
moveRightAndModifySelection is bound to the right arrow key.

85.121.73 moveLeft

Function: Implemented by WebView to move the selection or insertion point one element or character to
the left.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed at
the left end of the former selection.

85.121.74 moveLeftAndModifySelection

Function: Implemented by WebView to expand or reduce either end of the selection to the left (display
order) by one element or character.
Notes:
If the end being modified is the left end, this method expands the selection; if the end being modified is the
right end, it reduces the selection. The first moveLeftAndModifySelection or moveRightAndModifySelect-
tion method in a series determines the end being modified by always expanding. Hence, this method results in the left end becoming the mobile one if invoked first. By default, this method is bound to the left arrow key.

The essential difference between this method and the corresponding moveBackwardAndModifySelection is that the latter method moves in logical order, which can differ in bidirectional text, whereas this method moves in display order.

85.121.75 moveRight

Function: Implemented by WebView to move the selection or insertion point one element or character to the right.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed at the right end of the former selection.

85.121.76 moveRightAndModifySelection

Function: Implemented by WebView to expand or reduce either end of the selection to the right (display order) by one element or character.
Notes: If the end being modified is the left end, this method reduces the selection; if the end being modified is the right end, it expands the selection. The first moveLeftAndModifySelection or moveRightAndModifySelection method in a series determines the end being modified by always expanding. Hence, this method results in the right end becoming the mobile one if invoked first. By default, this method is bound to the right arrow key.

The essential difference between this method and the corresponding moveForwardAndModifySelection is that the latter method moves in logical order, which can differ in bidirectional text, whereas this method moves in display order.

85.121.77 moveToBeginningOfDocument

Function: Implemented by WebView to move the selection to the first element of the document or the insertion point to the beginning.
**85.121.78  moveToBeginningOfDocumentAndModifySelection**

**Function:** Implemented by WebView to move the selection or insertion point to the beginning of the document, expanding or reducing the current selection.

**85.121.79  moveToBeginningOfLine**

**Function:** Implemented by WebView to move the selection to the first element of the selected line or the insertion point to the beginning of the line.

**85.121.80  moveToBeginningOfLineAndModifySelection**

**Function:** Implemented by WebView to move the selection or insertion point to the beginning of the line, expanding or reducing the current selection.

**85.121.81  moveToBeginningOfParagraph**

**Function:** Implemented by WebView to move the insertion point to the beginning of the selected paragraph.

**85.121.82  moveToBeginningOfParagraphAndModifySelection**

**Function:** Implemented by WebView to move the selection or insertion point to the beginning of the current paragraph, expanding or reducing the current selection.

**85.121.83  moveToBeginningOfSentence**

**Function:** Moves the insertion point to the beginning of the current sentence.
**85.121.84 moveToBeginningOfSentenceAndModifySelection**

**Function:** Moves the insertion point and extends the selection to the beginning of the current sentence.

**85.121.85 moveToEndOfDocument**

**Function:** Implemented by WebView to move the selection to the last element of the document or the insertion point to the end.

**85.121.86 moveToEndOfDocumentAndModifySelection**

**Function:** Implemented by WebView to move the selection or insertion point to the end of the document, expanding or reducing the current selection.

**85.121.87 moveToEndOfLine**

**Function:** Implemented by WebView to move the selection to the last element of the selected line or the insertion point to the end of the line.

**85.121.88 moveToEndOfLineAndModifySelection**

**Function:** Implemented by WebView to move the selection or insertion point to the end of the line, expanding or reducing the current selection.

**85.121.89 moveToEndOfParagraph**

**Function:** Implemented by WebView to move the insertion point to the end of the selected paragraph.
85.121.90  moveToEndOfParagraphAndModifySelection

Function: Implemented by WebView to move the selection or insertion point to the end of the current paragraph, expanding or reducing the current selection.

85.121.91  moveToEndOfSentence

Function: Moves the insertion point to the end of the current sentence.

85.121.92  moveToEndOfSentenceAndModifySelection

Function: Moves the insertion point and extends the selection to the end of the current sentence.

85.121.93  moveUp

Function: Implemented by WebView to move the selection or insertion point one element or character up.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed above the beginning of the former selection.

85.121.94  moveUpAndModifySelection

Function: Implemented by WebView to move the selection or insertion point one element or character up.
Notes: If the end being modified is the bottom, this method reduces the selection; if the end being modified is the top, it expands the selection. The first moveDownAndModifySelection or moveUpAndModifySelection method in a series determines the end being modified by always expanding. Hence, this method results in the top end becoming the mobile one if invoked first.

85.121.95  moveWordBackward

Function: Implemented by WebView to move the selection or insertion point one word backward.
Notes: If there is a selection it should be deselected, and the insertion point should be placed at the end of the first word preceding the former selection.

85.121.96  moveWordBackwardAndModifySelection

Function: Implemented by WebView to expand or reduce either end of the selection backward by one whole word.
Notes: If the end being modified is the backward end, this method expands the selection; if the end being modified is the forward end, it reduces the selection. The first moveWordBackwardAndModifySelection or moveWordForwardAndModifySelection method in a series determines the end being modified by always expanding. Hence, this method results in the backward end becoming the mobile one if invoked first.

85.121.97  moveWordForward

Function: Implemented by WebView to move the selection or insertion point one word forward, in logical order.
Notes: If there is a selection it should be deselected, and the insertion point should be placed at the beginning of the first word following the former selection.

85.121.98  moveWordForwardAndModifySelection

Function: Implemented by WebView to expand or reduce either end of the selection forward by one whole word.
Notes: If the end being modified is the backward end, this method reduces the selection; if the end being modified is the forward end, it expands the selection. The first moveWordBackwardAndModifySelection or moveWordForwardAndModifySelection method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first.

85.121.99  moveWordLeft

Function: Implemented by WebView to move the selection or insertion point one word to the left, in display order.
Notes: If there is a selection it should be deselected, and the insertion point should be placed at the end of the first word to the left of the former selection.
The main difference between this method and the corresponding moveWordBackward method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

### 85.121.100 moveWordLeftAndModifySelection

**Function:** Implemented by WebView to expand or reduce either end of the selection left by one whole word in display order.  
**Notes:**  
If the end being modified is the left end, this method expands the selection; if the end being modified is the right end, it reduces the selection. The first moveWordLeftAndModifySelection or moveWordRightAndModifySelection method in a series determines the end being modified by always expanding. Hence, this method results in the left end becoming the mobile one if invoked first.

The main difference between this method and the corresponding moveWordBackwardAndModifySelection method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

### 85.121.101 moveWordRight

**Function:** Implemented by WebView to move the selection or insertion point one word right.  
**Notes:**  
If there is a selection it should be deselected, and the insertion point should be placed at the beginning of the first word to the right of the former selection.

The main difference between this method and the corresponding moveWordForward method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

### 85.121.102 moveWordRightAndModifySelection

**Function:** Implemented by WebView to expand or reduce either end of the selection to the right by one whole word.  
**Notes:**  
If the end being modified is the backward end, this method reduces the selection; if the end being modified is
the forward end, it expands the selection. The first moveWordBackwardAndModifySelection or moveWord ForwardAndModifySelection method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first.

The main difference between this method and the corresponding moveWordForwardAndModifySelection method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.
85.121.103 **NSScrollView as NSScrollViewMBS**

**Function:** Returns the scrollview for this webviewer.
**Notes:** Same as calling WebViewMBS.mainFrame.frameView.documentView.enclosingScrollView.

85.121.104 **pageDown**

**Function:** Implemented by WebView to scroll the receiver down (or back) one page in its scroll view, also moving the insertion point to the top of the newly displayed page.

85.121.105 **pageSizeMultiplier as single**

**Function:** Queries the page size multiplier.
**Notes:** This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.121.106 **pageUp**

**Function:** Implemented by WebView to scroll the receiver up (or forward) one page in its scroll view, also moving the insertion point to the top of the newly displayed page.

85.121.107 **paste**

**Function:** An action method that pastes content from the pasteboard at the insertion point or over the selection.
**Notes:** Available in Mac OS X v10.3.9 and later.

85.121.108 **pasteAsPlainText**

**Function:** An action method that pastes pasteboard content as plain text.
**Notes:** Available in Mac OS X v10.3.9 and later.
85.121.109 pasteAsRichText

**Function:** An action method that pastes pasteboard content into the receiver as rich text, maintaining its attributes.
**Notes:**
The text is inserted at the insertion point if there is one; otherwise, it replaces the selection.

Available in Mac OS X v10.3.9 and later.

85.121.110 pasteFont

**Function:** An action method that pastes font information from the font pasteboard.
**Notes:**
This action method pastes font information from the font pasteboard onto the selected content or insertion point of a rich text object, or over all text of the receiver.

Available in Mac OS X v10.3.9 and later.

85.121.111 performFindPanelAction

**Function:** An action method that opens the Find menu and Find panel.
**Notes:** Available in Mac OS X v10.3.9 and later.

85.121.112 PrintToPDFFile(PDFFile as folderitem, LeftMargin as Double = 50.0, TopMargin as Double = 50.0, RightMargin as Double = 50.0, BottomMargin as Double = 50.0) as boolean

**Function:** Prints the PDF to a file.
**Example:**
```plaintext
dim file as folderitem = Specialfolder.desktop.child("test.pdf")
if not myWebView.PrintToPDFFile(file) then
    msgbox "Failed"
end if
```
Notes:
This uses the Cocoa printing system to format the web pages into nice pages.
Returns true on success.

85.121.113  Reload

Function: Reloads the current page.

85.121.114  reloadFromOrigin

Function: Action method that performs an end-to-end revalidation using cache-validating conditionals if possible.
Notes: Available in OS X v10.6 and later. So this raises exception on older OS X versions. In that case, please catch exception and call reload.

85.121.115  RenderDocumentToEPS as Memoryblock

Function: Returns the content of the view as a EPS file’s data.
Example:

```vbnet
dim f as FolderItem
dim b as BinaryStream

// create a new pdf with current content of view
f=SpecialFolder.Desktop.Child(“test.eps”)
b=f.CreateBinaryFile(“”)
b.Write theWebView.RenderDocumentToEPS
b.Close

f.Launch // show the pdf in preview
```

Notes:
Returns nil on any error.
Will resize the eps page to match the size of the website.
85.121. CLASS WEBVIEWMBS

85.121.116 RenderDocumentToPDF as Memoryblock

Function: Returns the content of the view as a PDF file’s data.
Example:

```vbs
dim f as FolderItem
dim b as BinaryStream

// create a new pdf with current content of view
f=SpecialFolder.Desktop.Child(”test.pdf”)
b=f.CreateBinaryFile(””)
b.Write thewebview.RenderDocumentToPDF
b.Close

f.Launch // show the pdf in preview
```

Notes:

Returns nil on any error.
Will resize the pdf page to match the size of the website.

85.121.117 RenderWebsiteImage as NSImageMBS

Function: Makes a screenshot of the current displayed content.
Example:

```vbs
dim f as FolderItem
dim b as BinaryStream
dim i as NSImageMBS
dim p as string

i=webview.RenderWebsiteImage

p=i.PNGRepresentation

f=SpecialFolder.Desktop.Child(”test.png”)  
b=f.CreateBinaryFile(””)
b.Write p
```

Notes:

Nil on failure.
The image returned is the page completely without scrollbars, so it may be a few thousand pixels height and may not fit on a page to print.

85.121.118 replaceSelectionWithMarkupString(html as string)

Function: Replaces the current selection with mixed text and markup.
Notes:
markupString: The markup string that replaces the current selection.

If the current selection is collapsed (a range is selected with the same nodes and offsets for the start and end) then no content is removed when inserting the markup, and the selection is collapsed and moved to the end of the inserted content. If no content is selected, the markup is not inserted.

85.121.119 replaceSelectionWithText(text as string)

Function: Replaces the current selection with a string of text.
Notes:
text: The text that replaces the current selection.

If the current selection is collapsed (a range is selected with the same nodes and offsets for the start and end) then no content is removed when inserting the text, and the selection is collapsed and moved to the end of the inserted content. If no content is selected, the text is not inserted.

85.121.120 resetPageZoom

Function: Resets the web page zoom.
Notes: This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.121.121 scrollLineDown

Function: Implemented by WebView to scroll the receiver one line down in its scroll view, without changing the selection.
85.121.122 scrollLineUp

**Function:** Implemented by WebView to scroll the receiver one line up in its scroll view, without changing the selection.

85.121.123 scrollPageDown

**Function:** Implemented by WebView to scroll the receiver one page down in its scroll view, without changing the selection.

85.121.124 scrollPageUp

**Function:** Implemented by WebView to scroll the receiver one page up in its scroll view, without changing the selection.

85.121.125 SearchFor(text as string, Forward as boolean, CaseSensitive as boolean, Wrap as Boolean) as boolean

**Function:** Searches a document view for a string and highlights the string if it is found.
**Notes:**
Starts the search from the current selection. Will search across all frames.

- text: The string to search for.
- forward: True to search forward, False to search backwards.
- caseSensitive: True to for case-sensitive search, False for case-insensitive search.

Returns true if found, false if not found.
85.121.126 selectAll

Function: Implemented by WebView to select all selectable elements.

85.121.127 selectLine

Function: Implemented by WebView to select all elements in the line or lines containing the selection or insertion point.

85.121.128 selectParagraph

Function: Implemented by WebView to select all paragraphs containing the selection or insertion point.

85.121.129 selectSentence

Function: Selects the entire sentence around the insertion point.

85.121.130 selectWord

Function: Implemented by WebView to extend the selection to the nearest word boundaries outside it (up to, but not including, word delimiters).

85.121.131 setMaintainsBackForwardList(value as boolean)

Function: Whether the back forward history list is created by the webview.
Notes: Default is true.
85.121.132  setMediaVolume(value as single)

Function: Sets the maximum volume of all sounds generated on this webview.
Notes:
Sets a master volume control for all media elements in the WebView. Valid values are 0..1.

This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.121.133  setPageSizeMultiplier(value as single)

Function: Sets the page size multiplier.
Notes:
Change the zoom factor of the page in views managed by this webView.
value: A fractional percentage value, 1.0 is 100%.

This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

85.121.134  showGuessPanel

Function: An action method that shows a spelling correction panel.
Notes:
This action method opens the Spelling panel, allowing the user to make a correction during spell checking.

Available in Mac OS X v10.3.9 and later.

85.121.135  startSpeaking

Function: An action method that starts speaking the selected text or all text if there’s no selection.
Notes:
Speech continues asynchronously until the end of the text or until terminated by invoking the stopSpeaking: method.
CHAPTER 85. HTMLVIEWER MAC

Available in Mac OS X v10.3.9 and later.

85.121.136 StopLoading

Function: Stop any pending loads on the frame’s data source, and its children.

85.121.137 stopSpeaking

Function: An action method that stops speaking that is in progress.
Notes: This action method stops speech that was previously started with startSpeaking.
Available in Mac OS X v10.3.9 and later.

85.121.138 SupportsTextEncoding as boolean

Function: Find out if the current web page supports text encodings.
Notes: Returns true if the document view of the current web page can support different text encodings.

85.121.139 uppercaseWord

Function: Implemented by WebView to make uppercase every letter in the word or words surrounding the insertion point or selection, expanding the selection if necessary.
Notes: If either end of the selection partially covers a word, that entire word is made uppercase.

85.121.140 userAgentForURL(url as string) as String

Function: The user agent used for accessing the given URL.
Example: 
msgbox htmlviewer1.WebViewMBS.userAgentForURL("http://www.apple.com")
// shows: Mozilla/5.0 (Macintosh; U; PPC Mac OS X; de-de) AppleWebKit/419 (KHTML, like Gecko)

**Notes:** An empty string on failure else the user-agent string for the supplied URL.

### 85.121.141 zoomPageIn

**Function:** Zooms web page in.
**Notes:** This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

### 85.121.142 zoomPageOut

**Function:** Zooms web page out.
**Notes:** This is a new webview function which is not available on all webview versions. So be aware that you may get an NSExceptionMBS about the function not being available.

### 85.121.143 Properties

#### 85.121.144 ApplicationNameForUserAgent as String

**Function:** The application name.
**Example:**

```
webview1.ApplicationNameForUserAgent="test"
// useragent is now "Mozilla/5.0 (Macintosh; U; PPC Mac OS X; de-de) AppleWebKit/417.9 (KHTML, like Gecko) test"
```

**Notes:**

This name will be used in user-agent strings that are chosen for best results in rendering web pages.
(Read and Write computed property)
85.121.145  **ContinuousSpellCheckingEnabled as boolean**

**Function:** Whether continuous spell checking is enabled.  
**Example:**  
```plaintext```
webview1.ContinuousSpellCheckingEnabled=True
```plaintext```

**Notes:**
True if the object should have continuous spell-checking enabled; otherwise, false.
Available in Mac OS X v10.3.9 and later.
(Read and Write computed property)

85.121.146  **CustomTextEncodingName as String**

**Function:** The custom text encoding name.  
**Notes:**
On getting:
The custom text encoding name or "" if no custom text encoding name has been set.

On setting:
Make the page display with a different text encoding; stops any load in progress.
The text encoding passed in overrides the normal text encoding smarts including what’s specified in a web page’s header or HTTP response.
The text encoding automatically goes back to the default when the top level frame changes to a new location.
Setting the text encoding name to nil makes the webView use default encoding rules.
(Read and Write computed property)

85.121.147  **CustomUserAgent as String**

**Function:** The custom user-agent string or nil if no custom user-agent string has been set.  
**Example:**  
```plaintext```
webview1.CustomUserAgent="HelloWorldBrowser"
```plaintext```

**Notes:** (Read and Write computed property)
**85.121.148  dashboardBehavior(behavior as Integer) as boolean**

**Function:** Get or set the htmlviewer behavior.

**Notes:**
This is a private API from Apple which may break in the future.
It seems to exist for the dashboard application to switch some flags for event handling.

Behavior constants:
- `const WebDashboardBehaviorAlwaysSendMouseEventsToAllWindows = 0`
- `const WebDashboardBehaviorAlwaysSendActiveNullEventsToPlugIns = 1`
- `const WebDashboardBehaviorAlwaysAcceptsFirstMouse = 2`
- `const WebDashboardBehaviorAllowWheelScrolling = 3`
- `const WebDashboardBehaviorUseBackwardCompatibilityMode = 4`

(Read and Write computed property)

**85.121.149  DrawsBackground as Boolean**

**Function:** Enable or disable the background drawing.

**Notes:**
Works only with Webkit on Mac OS X 10.3.9 and newer.
Returns false on unsupported Webkit versions.
If you set it to false, the background is not drawn and you can have transparent websites like the Dashboard widgets.
(Read and Write computed property)

**85.121.150  Editable as boolean**

**Function:** Whether the user is allowed to edit the document.

**Notes:**
You can change the receiver’s document programmatically regardless of this setting.
Available in Mac OS X v10.3.9 and later.

Normally, an HTML document is not editable unless the elements within the document are editable. This method provides a low-level way to make the contents of a WebView object editable without altering the document or DOM structure.

True if the receiver allows the user to edit the document. False if an element in the receiver’s document
can be edited only if the CONTENTEDITABLE attribute has been set on the element or one of its parent elements.
(Read and Write computed property)

### 85.121.151 GroupName as string

**Function:** The group name for this WebView.
**Notes:**
JavaScript may access named frames within the same group.
(Read and Write computed property)

### 85.121.152 mediaStyle as String

**Function:** The value to use for the CSS media property.
**Example:**
```javascript
dim w as WebViewMBS // your WebView
w.mediaStyle="print"
```
**Notes:**
Set or get the media style for the WebView. The mediaStyle will override the normal value of the CSS media property. Setting the value to nil will restore the normal value.
(Read and Write computed property)

### 85.121.153 preferences as WebPreferencesMBS

**Function:** The preferences for this webview.
**Notes:**
Nil on failure.
(Read and Write computed property)
85.121.154 PreferencesIdentifier as string

Function: The string to use a prefix for storing values for this WebView in the user defaults database.
Notes: If the WebPreferences for this WebView are stored in the user defaults database, the string set in this method will be used a key prefix.
(Read and Write computed property)

85.121.155 ScrollHeight as single

Function: The height of the scroll view.
Notes: (Read and Write computed property)

85.121.156 ScrollLeft as single

Function: The left position of the scroll view.
Example:
myWebView.ScrollLeft=myWebView.ScrollLeft+5

Notes: You can set this value to scroll manually.
(Read and Write computed property)

85.121.157 ScrollTop as single

Function: The top position of the scroll view.
Example:
myWebView.ScrollTop=myWebView.ScrollTop+5

Notes: You can set this value to scroll manually.
85.121.158 ScrollWidth as single

**Function:** The width of the scroll view.
**Notes:** (Read and Write computed property)

85.121.159 ShouldUpdateWhileOffscreen as boolean

**Function:** Whether the web view should update even when it is not in a window that is currently visible.
**Notes:**
If true, the web view updates regardless if it is visible. If false, it updates only if it is visible, possibly improving performance, and then updates automatically when it becomes visible. The default value is true.

Available in OS X v10.6 and later.
(Read and Write computed property)

85.121.160 smartInsertDeleteEnabled as boolean

**Function:** Whether the receiver should insert or delete spaces around selected words to preserve proper spacing and punctuation.
**Notes:**
If true, the receiver performs smart insert and delete; if false, it inserts and deletes exactly what’s selected.

Available in Mac OS X v10.3.9 and later.
(Read and Write computed property)

85.121.161 TextSizeMultiplier as single

**Function:** The size of the text rendering in views managed by this webView.
**Notes:**
A fractional percentage value, 1.0 is 100% .
(Read and Write computed property)
85.121.162 typingStyle as Variant

**Function:** The CSS typing style.

**Notes:**

This is a DOMCSSStyleDeclarationMBS object.
The typing style is reset automatically when the receiver’s selection changes.
(Read and Write computed property)
85.122  control WKWebViewControlMBS

85.122.1  control WKWebViewControlMBS

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: A WKWebView object displays interactive web content, such as for an in-app browser.
Notes:
This is a control to use WebKit in 32-bit and WebKit 2 in 64-bit.
Most of the events provided by Xojo for the control will not work.
But we can add features over time as needed.

85.122.2  Methods

85.122.3  addScriptMessageHandler(Name as String)

Example:
// register once
browser.addScriptMessageHandler "test"
// later use in javascript:
browser.EvaluateJavaScript("window.webkit.messageHandlers.test.postMessage('Hello');")

Notes:
Name: The name of the message handler.

Adding a script message handler with name name causes the JavaScript function window.webkit.messageHandlers.name.postMessage(messageBody) to be defined in all frames in all web views that use the user content controller.

85.122.4  EvaluateJavaScript(JavaScript as String, Tag as String = "")

Notes: Calls later JavaScriptEvaluated event with result and passed tag value.
85.122.5  goBack

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to the back item in the back-forward list.

85.122.6  goForward

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to the forward item in the back-forward list.

85.122.7  LoadData(Data as MemoryBlock, MIMEType as String, textEncodingName as String, baseURL as string = ””)

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the webpage contents and base URL.

**Notes:**
- **data:** The data to use as the contents of the webpage.
- **MIMEType:** The MIME type of the data.
- **characterEncodingName:** The data’s character encoding name.
- **baseURL:** A URL used to resolve relative URLs within the document.

85.122.8  LoadHTML(htmlText as String, baseURL as string = ””)

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the webpage contents and base URL.

**Notes:**
- **htmlText:** The string to use as the contents of the webpage.
- **baseURL:** A URL used to resolve relative URLs within the document.

85.122.9  LoadURL(URL as string)

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to a requested URL.
85.122.10 LoadURLRequest(Request as NSURLRequestMBS)

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Navigates to a requested URL.

85.122.11 reload

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Reloads the current page.

85.122.12 reloadFromOrigin

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Reloads the current page, performing end-to-end revalidation using cache-validating conditionals if possible.

85.122.13 removeScriptMessageHandler(Name as String)

MBS Mac64bit Plugin, Plugin Version: 18.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Removes a script message handler.  
**Notes:** name: The name of the message handler to remove.

85.122.14 stopLoading

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Stops loading all resources on the current page.

85.122.15 takeSnapshot(tag as string = "")

MBS Mac64bit Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Requests a snapshot.  
**Notes:**  
Calls later takeSnapshotCompleted event.  
Tag is passed to event to distinguish various snapshot requests.
### 85.122.16 Properties

#### 85.122.17 allowFileAccessFromFileURLs as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Allow file access for file URLs.  
**Notes:**  
Access to files is allowed for some files. Please check WebKit documentation for details.

Set allowFileAccessFromFileURLs and allowUniversalAccessFromFileURLs to true to disable all the security checks to block local file access for websites. allowUniversalAccessFromFileURLs would allow all file URLs. allowFileAccessFromFileURLs would only allow in same path.  
(Read and Write property)

#### 85.122.18 allowsBackForwardNavigationGestures as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether horizontal swipe gestures will trigger back-forward list navigations.  
**Notes:**  
The default value is false. Available for 64-bit on macOS 10.10 or newer.  
(Read and Write property)

#### 85.122.19 allowsLinkPreview as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that determines whether pressing on a link displays a preview of the destination for the link.  
**Notes:**  
(Read and Write property)

#### 85.122.20 allowUniversalAccessFromFileURLs as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Allow universal file access for URLs.  
**Notes:**  
Any file URL will be loaded if true. Please check WebKit documentation for details.
85.122.21 CanGoBack as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: A Boolean value indicating whether there is a back item in the back-forward list that can be navigated to.
Notes: (Read only property)

85.122.22 CanGoForward as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: A Boolean value indicating whether there is a forward item in the back-forward list that can be navigated to.
Notes: (Read only property)

85.122.23 customUserAgent as String

Notes: If no custom user agent string has been set, this is set to "". Available in 32-bit. Available in 64-bit for macOS 10.11 or newer. (Read and Write property)

85.122.24 developerExtrasEnabled as Boolean

Notes: For WebKit 2 (64bit) to enable the context menu to inspect items. (Read and Write property)

85.122.25 EstimatedProgress as Double

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: An estimate of what fraction of the current navigation has been loaded.
Notes:
This value ranges from 0.0 to 1.0 based on the total number of bytes expected to be received, including the main document and all of its potential subresources. After a navigation loading completes, the estimatedProgress remains at 1.0 until a new navigation starts, at which point the estimatedProgress is reset to 0.0. 
(Read only property)

**85.122.26** hasOnlySecureContent as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: A Boolean value indicating whether all resources on the page have been loaded through securely encrypted connections.
**Notes**: Only set for 64-bit, always false on 32-bit. 
(Read only property)

**85.122.27** IsLoading as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: A Boolean value indicating whether the view is currently loading content.
**Notes**: (Read only property)

**85.122.28** javaEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: Whether java is enabled.
**Notes**: (Read and Write property)

**85.122.29** javaScriptCanOpenWindowsAutomatically as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: Whether javascript can open new windows.
**Notes**: (Read and Write property)

**85.122.30** javaScriptEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: Whether javascript is enabled.
85.122.31  loadsImagesAutomatically as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** Whether to load images automatically.  
**Notes:** (Read and Write property)

85.122.32  minimumFontSize as Double

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** The minimum font size to use.  
**Notes:** (Read and Write property)

85.122.33  plugInsEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** Whether plugins are enabled.  
**Notes:** (Read and Write property)

85.122.34  Title as String

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** The page title.  
**Notes:** (Read only property)

85.122.35  URL as String

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** The active URL.  
**Notes:** This is the URL that should be reflected in the user interface.  
(Read only property)
85.122.36  View as NSViewMBS

MBS Mac64bit Plugin, Plugin Version: 16.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The used view.
**Notes:**
Should be either a WebView (32bit) or WKWebView (64bit).
(Read only property)

85.122.37  Events

85.122.38  BoundsChanged

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when the bounds, but not the frame, changed.

85.122.39  decidePolicyForNavigationAction(URL as String, NavigationType as String, modifierFlags as Integer, buttonNumber as Integer, newWindow as boolean, frameName as string) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Decides whether to allow or cancel a navigation.
**Notes:**
Return true to cancel or false to allow.
URL is the URL to load.
NavigationType defines what navigation is happening: LinkClicked, FormSubmitted, BackForward, Reload, FormResubmitted or Other.
modifierFlags: The keyboard modifiers.
buttonNumber: Which mouse button was clicked: 0 for left button, 1 for middle button, 2 for right button
newWindow: True if a new window should be opened or false if not.
frameName: The frame name. (32-bit only)

85.122.40  didCommitNavigation

MBS Mac64bit Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when content starts arriving for the main frame.
85.122.41  didFailNavigation(Error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when an error occurs during a committed main frame navigation.

85.122.42  didFailProvisionalNavigation(Error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when an error occurs while starting to load data for the main frame.

85.122.43  didFinishNavigation

MBS Mac64bit Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a main frame navigation completes.

**Notes:** Same as DocumentComplete in HTMLViewer.

85.122.44  didReceiveScriptMessage(Body as Variant, name as String)

MBS Mac64bit Plugin, Plugin Version: 18.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a script message is received from a webpage.

**Notes:**

body: The body of the message. Automatic translated from Javascript types.
name: The name of the message handler to which the message is sent.

85.122.45  didReceiveServerRedirectForProvisionalNavigation

MBS Mac64bit Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a server redirect is received for the main frame.

85.122.46  didStartProvisionalNavigation

MBS Mac64bit Plugin, Plugin Version: 17.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a main frame navigation starts.
85.122.47 EnableMenuItems

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event where you can enable menu items.

85.122.48 FrameChanged

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when the frame changed.

85.122.49 GotFocus

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control itself got focus. **Notes:** This only fires if the control itself got focus and not a sub control.

85.122.50 JavaScriptEvaluated(JavaScript as String, Result as Variant, Error as NSErrorMBS, Tag as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** JavaScript was evaluated. **Notes:** Error is only set with 64-bit, not with 32-bit. Tag is passed from EvaluateJavaScript call.

85.122.51 LostFocus

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The control lost focus. **Notes:** This only fires if the control itself lost focus and not a sub control.

85.122.52 MenuAction(HitItem as MenuItem) As Boolean

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a menuitem is chosen. **Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or
false to give others a chance.

85.122.53 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was pressed inside the controls region at the location passed in to x, y.

**Notes:**
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

85.122.54 MouseDrag(x as Integer, y as Integer)

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event fires continuously after the mouse button was pressed inside the Control.

**Notes:**
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

85.122.55 MouseUp(x as Integer, y as Integer)

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The mouse button was released.

**Notes:** Use the x and y parameters to determine if the mouse button was released within the control’s boundaries.

85.122.56 runJavaScriptAlertPanel(message as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Displays a JavaScript alert panel.
Notes:
message: The message to display.

If you do not implement this method, the web view will behave as if the user selected the OK button.

85.122.57 runJavaScriptConfirmPanel(message as String) as boolean

Notes:
message: The message to display.

Return true if the user chose OK, false if the user chose Cancel.

If you do not implement this method, the web view will behave as if the user selected the Cancel button.

85.122.58 runJavaScriptTextInputPanel(prompt as String, defaultText as String) as String

Notes:
message: The message to display.
defaultText: The initial text to display in the text entry field.

Return the entered text if the user chose OK, otherwise "".

If you do not implement this method, the web view will behave as if the user selected the Cancel button.

85.122.59 ScaleFactorChanged(NewFactor as Double)

MBS Mac64bit Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.
85.122.60  takeSnapshotCompleted(image as NSImageMBS, error as NSErrorMBS, tag as string)

MBS Mac64bit Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Called when snapshot of website is completed. Notes: If snapshot creation failed, error is set.
Chapter 86

HTMLViewer Win

86.1 class ChromiumBrowserMBS

86.1.1 class ChromiumBrowserMBS

Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

86.1.2 Methods

86.1.3 CanGoBack as boolean

Example:

```vba
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MsgBox str(m.CanGoBack)
```

86.1.4 CanGoForward as boolean

Example:
86.1.5 ClearFocus

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Clears focus.
**Example:**
```vba
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.ClearFocus
```

86.1.6 ClearHistory

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Clear the back/forward browsing history.
**Example:**
```vba
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.ClearHistory
```

**Notes:** Only supported for Chromium 2.x, but not 3.x.

86.1.7 CloseDevTools

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Explicitly close the developer tools window if one exists for this browser instance.
**Example:**
```vba
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.CloseDevTools
```

**Notes:** Only supported for Chromium 2.x, but not 3.x.
86.1.8 Constructor

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The private constructor.

86.1.9 Destructor

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The destructor.

86.1.10 ExecuteJavaScript(jsCode as string, scriptUrl as string = "", startLine as Integer = 0)

MBS Win Plugin, Plugin Version: 14.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Execute a string of JavaScript code in this frame.
**Example:**
```vba
// go back to last page via javascript
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b.ExecuteJavaScript "window.history.back();"
```

**Notes:** The scriptUrl parameter is the URL where the script in question can be found, if any. The renderer may request this URL to show the developer the source of the error. The startLine parameter is the base line number to use for error reporting.

86.1.11 Find(identifier as Integer, searchText as string, forward as boolean, MatchCase as boolean, FindNext as boolean)

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Search for searchText.
**Example:**
```vba
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.Find 1, "Hello", true, false, false
// later
m.Find 1, "Hello", true, false, true
```

**Notes:** Identifier can be used to have multiple searches running simultaneously. forward indicates whether
to search forward or backward within the page. matchCase indicates whether the search should be case-sensitive. findNext indicates whether this is the first request or a follow-up.

### 86.1.12 Frame(ID as Int64) as ChromiumFrameMBS

MBS Win Plugin, Plugin Version: 17.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Returns the frame with the specified identifier, or nil if not found.

Example:

```vba
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
if b<>Nil then
    dim idn() as Int64 = b.FrameIdentifiers
    dim ids() as string
    for each n as Int64 in idn
        dim f as ChromiumFrameMBS = b.Frame(n)
        ids.Append str(n)+" " +f.Name
    next
    MsgBox "FrameIdentifiers: "+EndOfLine+EndOfLine+Join(ids, EndOfLine)
end if
```

See also:

- 86.1.13 Frame(name as string) as ChromiumFrameMBS

### 86.1.13 Frame(name as string) as ChromiumFrameMBS

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Returns the frame with the specified name, or nil if not found.

Example:

```vba
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim f as ChromiumFrameMBS = b.Frame("TopFrame")
dim s as string = f.Name
MsgBox s
```

See also:

- 86.1.12 Frame(ID as Int64) as ChromiumFrameMBS
86.1.14 FrameIdentifiers as Int64()

MBS Win Plugin, Plugin Version: 17.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries list of frame identifiers.

**Example:**

```vba
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
if b<>Nil then
    dim idn() as Int64= b.FrameIdentifiers
    dim ids() as string
    for each n as Int64 in idn
        dim f as ChromiumFrameMBS = b.Frame(n)
        ids.Append str(n)+" "+f.Name
    next
    MsgBox "FrameIdentifiers: " +EndOfLine+EndOfLine+Join(ids, EndOfLine)
end if
```

86.1.15 FrameNames as String()

MBS Win Plugin, Plugin Version: 17.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries list of frame names.

**Example:**

```vba
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
if b<>Nil then
    dim Names() as string = b.FrameNames
    MsgBox "FrameNames: " +EndOfLine+EndOfLine+Join(Names, EndOfLine)
end if
```

**Notes:** Often frames are unnamed, so named is generic.

86.1.16 GoBack

**Example:**

```vba
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.GoBack
```
86.1.17 GoForward

**Example:**
```vbnet
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.GoForward
```

86.1.18 HasDocument as boolean

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if a document has been loaded in the browser.
**Example:**
```vbnet
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MsgBox str(m.HasDocument)
```

86.1.19 HidePopup

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Hide the currently visible popup, if any.
**Example:**
```vbnet
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.HidePopup
```

**Notes:** Only supported for Chromium 2.x, but not 3.x.

86.1.20 Image(width as Integer, height as Integer) as Picture

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Get the raw image data contained in the specified element without performing validation.
**Example:**
```vbnet
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim p as picture = m.Image(600, 800)
window1.backdrop = p
```
86.1. CLASS CHROMIUMBROWSERMBS

Notes:
The specified width and height dimensions must match the current element size.
Only supported for Chromium 2.x, but not 3.x.

86.1.21 invalidate(x as Integer, y as Integer, width as Integer, height as Integer)

Example:
```
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.invalidate 0, 0, 600, 800
```

Notes: This function is only used when window rendering is disabled and will result in a call to HandlePaint().

86.1.22 IsLoading as boolean

Notes:
Returns true while page is loading.
Only available for Xojo 2017 and newer.

86.1.23 IsPopup as boolean

Example:
```
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MsgBox str(m.IsPopup)
```
86.1.24 LibVersion as Integer

MBS Win Plugin, Plugin Version: 14.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns revision number of the Chromium library.

**Example:**

```vbnet
Dim b As ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MsgBox str(b.LibVersion)
```

**Notes:**

up to Xojo 2014r1 this is 607.
Xojo 2014r2 uses 1562.

86.1.25 Release

MBS Win Plugin, Plugin Version: 15.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Releases the browser object.

**Notes:**

You don’t need this normally.
This method can be used for working around Feedback case 33565.

86.1.26 Reload

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Reload the current page.

**Example:**

```vbnet
Dim m As ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.Reload
```

86.1.27 ReloadIgnoreCache

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Reload the current page ignoring any cached data.

**Example:**

```vbnet
Dim m As ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.ReloadIgnoreCache
```
86.1.28  Retain

MBS Win Plugin, Plugin Version: 15.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Retains the browser object.
**Notes:** You don’t need this normally.

86.1.29  SetFocus(enableFocus as boolean = true)

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Set focus for the browser window.
**Example:**
```
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.SetFocus
```

**Notes:** If enable is true focus will be set to the window. Otherwise, focus will be removed.

86.1.30  setSize(width as Integer, height as Integer)

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Set the size of the specified element.
**Example:**
```
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.setSize 600, 800
```

**Notes:** Only supported for Chromium 2.x, but not 3.x.

86.1.31  ShowDevTools

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Open developer tools in its own window.
**Example:**
```
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.ShowDevTools
```
Notes: Only supported for Chromium 2.x, but not 3.x.

86.1.32  StopFinding(clearSelection as boolean)

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function:  
Cancel all searches that are currently going on.

86.1.33  StopLoad

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function:  
Stop loading the page.  
Example:  
```vba
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS  
m.StopLoad
```

86.1.34  Properties

86.1.35  FocusedFrame as ChromiumFrameMBS

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function:  
Returns the focused frame for the browser window.  
Example:  
```vba
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS  
dim f as ChromiumFrameMBS = b.FocusedFrame  
dim s as string = f.URL  
MsgBox s
```

Notes: (Read only property)

86.1.36  FrameCount as Integer

MBS Win Plugin, Plugin Version: 17.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function:  
Queries frame count.
Example:
```
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
if b<>Nil then
    MsgBox "FrameCount: "+str(b.FrameCount)
end if
```

Notes:
Only available in Xojo 2017 and newer.
(Read only property)

86.1.37 Handle as Integer

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The internal object reference.
**Notes:** (Read only property)

86.1.38 Height as Integer

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Queries height of the browser.
**Example:**
```
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MsgBox str(m.Width) + " x " + str(m.Height)
```

Notes:
Only supported for Chromium 2.x, but not 3.x.
(Read only property)

86.1.39 MainFrame as ChromiumFrameMBS

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Returns the main (top-level) frame for the browser window.
**Example:**
```
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim f as ChromiumFrameMBS = bMainFrame
dim s as string = f.URL
```
Notes: (Read only property)

86.1.40 Parent as HTMLViewer

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The owner htmlviewer.
**Notes:** (Read only property)

86.1.41 PopupVisible as Boolean

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Returns true if a popup is currently visible.
**Example:**
```vbnet
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
msgbox str(m.PopupVisible)
```

**Notes:**
Only supported for Chromium 2.x, but not 3.x.
(Read only property)

86.1.42 ReferenceCount as Integer

MBS Win Plugin, Plugin Version: 15.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Queries reference count of this browser object.
**Notes:**
Normal it is 3 or 4, but due to a bug in Xojo, it can increase a lot.
See Feedback case 33565 for details.
(Read only property)

86.1.43 Width as Integer

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Queries width of the browser.
86.1. **CLASS CHROMIUMBROWSERMBS**

**Example:**

```vba
dim m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MsgBox str(m.Width) + " x " + str(m.Height)
```

**Notes:**

Only supported for Chromium 2.x, but not 3.x.
(Read only property)

---

### 86.1.44 WindowRenderingDisabled as Boolean

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if window rendering is disabled.

**Notes:**

Only supported for Chromium 2.x, but not 3.x.
(Read only property)

---

### 86.1.45 ZoomLevel as Double

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Get/Set the zoom level.

**Example:**

```vba
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b.ZoomLevel = 2
```

**Notes:**

Change the zoom level to the specified value.
(Read and Write property)
86.2 class ChromiumCookieManagerMBS

86.2.1 class ChromiumCookieManagerMBS

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The class to manage cookies for Chromium on Windows.

**Notes:**
May need to have a HTMLViewer first being initialized by Xojo before the Chromium DLLs can work properly.

Due to bugs in thread or stack handling, this class currently does not work well.
It frequently crashes in the Chromium DLLs when calling AllCookies method to query cookies.

86.2.2 Methods

86.2.3 AllCookies as ChromiumCookieMBS()

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Visit all cookies.

**Example:**
```vba
dim m as new ChromiumCookieManagerMBS
dim cookies() as ChromiumCookieMBS = m.AllCookies
MsgBox str(cookies.Ubound+1)+" cookies"
```

**Notes:** The returned cookies are ordered by longest path, then by earliest creation date. Returns false (0) if cookies cannot be accessed.

86.2.4 Constructor

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The constructor.

**Notes:**
Can raise exception if no cookie manager is available, e.g. when calling on Linux or Mac OS X or Windows if you don’t have the dlls.
May not work if the Chromium was not initialized before by Xojo.
See also:

- 86.2.5 Constructor(path as string)
86.2. CLASS CHROMIUMCOOKIEMANAGERMBS

86.2.5 Constructor(path as string)

MBS Win Plugin, Plugin Version: 16.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The constructor for a new cookie manager.

**Notes:**
Can raise exception if no cookie manager is available, e.g. when calling on Linux or Mac OS X or Windows if you don’t have the dlls.
May not work if the Chromium was not initialized before by Xojo.
See also:

- 86.2.4 Constructor

86.2.6 DeleteAllCookies as Integer

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Deletes all cookies.

**Notes:** Returns number of deleted cookies.

86.2.7 DeleteCookie(URL as string, CookieName as string) as boolean

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Delete all cookies that match the specified parameters.

**Notes:**
If both url and values cookieName are specified all host and domain cookies matching both will be deleted.
If only | url | is specified all host cookies (but not domain cookies) irrespective of path will be deleted. If url is empty all cookies for all hosts and domains will be deleted. Returns false if a non-empty invalid URL is specified or if cookies cannot be accessed.
Returns true on success.

86.2.8 DeleteCookies(URLs() as string, CookieNames() as string) as Integer

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Deletes several cookies.

**Notes:**
Same as DeleteCookie, but with arrays for parameters.
Returns number of successful delete attempts.
86.2.9 DeleteURLCookies(URL as String, HTTPOnly as boolean = false) as Integer

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Deletes all cookies for a given URL.
Notes: The cookies to delete are filtered by the given url scheme, host, domain and path. If includeHttpOnly is true HTTP-only cookies will also be included in the deletion.
Returns number of cookies deleted.

86.2.10 Destructor

86.2.11 SetCookie(URL as string, cookie as ChromiumCookieMBS) as boolean

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Sets a cookie given a valid URL and explicit user-provided cookie attributes.
Example:

```vba
dim d as new Date
dim c as new ChromiumCookieMBS

c.Domain = "www.mbsplugins.de"
c.Path = "/"
c.CreationDate = d
c.LastAccessDate = d
c.ExpirationDate = nil
c.Value = "test " + d.SQLDateTime
c.Name = "test"
c.Secure = false
c.HTTPOnly = false

if CookieManager.SetCookie(c.URL, c) then
t_msgbox "OK"
else
MsgBox "Failed to add cookie"
end if
```

Notes: This function expects each attribute to be well-formed. It will check for disallowed characters (e.g. the ';' character is disallowed within the cookie value attribute) and will return false without setting the
cookie if such characters are found.

### 86.2.12 SetCookies(URL() as string, cookies() as ChromiumCookieMBS) as Integer

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets a lot of cookies.  
**Notes:** 
Same as SetCookie, but with arrays of URLs and cookie objects.  
Returns number of cookies created successfully.

### 86.2.13 SetStoragePath(Path as string) as boolean

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets the directory path that will be used for storing cookie data.  
**Example:**
```vbnet
dim CookieManager as ChromiumCookieManagerMBS // property of window/app

dim f as FolderItem = SpecialFolder.Desktop.Child("cookies")
f.CreateAsFolder

CookieManager = new ChromiumCookieManagerMBS

if CookieManager.SetStoragePath(f.NativePath) then
    MsgBox "OK"
else
    MsgBox "Failed"
end if
```

**Notes:**

If path is empty data will be stored in memory only.  
Returns false if cookies cannot be accessed.

### 86.2.14 URLCookies(URL as String, HTTPOnly as boolean = false) as ChromiumCookieMBS()

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries a subset of cookies.
Notes:
The results are filtered by the given url scheme, host, domain and path. If includeHttpOnly is true HTTP-only cookies will also be included in the results. The returned cookies are ordered by longest path, then by earliest creation date. Returns empty array if cookies cannot be accessed. Returns nil on any error like low memory.

86.2.15 Properties

86.2.16 Handle as Integer

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The internal object reference.
**Notes:** (Read only property)

86.2.17 ReferenceCount as Integer

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The reference count for the internal object.
**Notes:**
Only for debugging.
(Read only property)
86.3.  CLASS CHROMIUMCOOKIEMBS

86.3  class ChromiumCookieMBS

86.3.1  class ChromiumCookieMBS

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The class for a cookie with WebKit on Windows.

86.3.2  Methods

86.3.3  Constructor

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The constructor.

86.3.4  Destructor

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The destructor.

86.3.5  Properties

86.3.6  CreationDate as Date

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The cookie creation date.
**Notes:**
This is automatically populated by the system on cookie creation.
(Read and Write property)

86.3.7  Domain as String

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The domain for this cookie.
**Notes:**
If domain is empty a host cookie will be created instead of a domain cookie. Domain cookies are stored with a leading "." and are visible to sub-domains whereas host cookies are not.
86.3.8 ExpirationDate as Date

Notes: Can be nil to have no expiration date.
(Read and Write property)

86.3.9 HTTPonly as Boolean

Notes: If httponly is true the cookie will only be sent for HTTP requests.
(Read and Write property)

86.3.10 LastAccessDate as Date

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: The cookie last access date.
Notes: This is automatically populated by the system on access.
(Read and Write property)

86.3.11 Name as String

Notes: (Read and Write property)

86.3.12 Path as String

Notes:
If path is non-empty only URLs at or below the path will get the cookie value.
(Read and Write property)

### 86.3.13  Scheme as String

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The scheme.
**Notes:**
Depends on secure setting only.
Can be "http://" or "https://".
(Read only property)

### 86.3.14  Secure as Boolean

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Whether this is a HTTPS only cookie.
**Notes:**
If secure is true the cookie will only be sent for HTTPS requests.
(Read and Write property)

### 86.3.15  URL as String

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The URL of the cookie.
**Notes:**
Build from Secure, Path and Domain.
(Read only property)

### 86.3.16  Value as String

MBS Win Plugin, Plugin Version: 15.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The cookie value.
**Notes:** (Read and Write property)
86.4 class ChromiumFrameMBS

86.4.1 class ChromiumFrameMBS

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The class for a webframe with WebKit on Windows.

**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

86.4.2 Methods

86.4.3 Constructor

86.4.4 copy

**Example:**

```vbnet
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS  
b>MainFrame.copy
```

86.4.5 cut

**Example:**

```vbnet
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS  
b.MainFrame.cut
```

86.4.6 delete

86.4. CLASS CHROMIUMFRAMEMBS

Example:

```vba
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b>MainFrame.delete
```

86.4.7 Destructor

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The destructor.

86.4.8 ExecuteJavaScript(jsCode as string, scriptUrl as string = "", startLine as Integer = 0)

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Execute a string of JavaScript code in this frame.

**Example:**

```vba
// go back to last page via javascript
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim m as ChromiumFrameMBS = b.mainFrame
m.ExecuteJavaScript "window.history.back();"
```

**Notes:** The scriptUrl parameter is the URL where the script in question can be found, if any. The renderer may request this URL to show the developer the source of the error. The startLine parameter is the base line number to use for error reporting.

86.4.9 LoadString(StringValue as string, URL as string)

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Load the contents of StringValue with the optional dummy target URL.

**Example:**

```vba
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim m as ChromiumFrameMBS = b.mainFrame
m.LoadString "<p>Hello</p>", "blank:about"
```
86.4.10 LoadURL(URL as string)

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Load the specified url.

**Example:**

```vbscript
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim m as ChromiumFrameMBS = b.mainFrame
m.LoadURL "http://www.macrumors.com"
```

86.4.11 paste

**Example:**

```vbscript
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
bMainFrame.paste
```

86.4.12 print

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Execute printing in the this frame. The user will be prompted with the print dialog appropriate to the operating system.

**Example:**

```vbscript
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b>MainFrame.print
```

**Notes:** Only supported for Chromium 2.x, but not 3.x.

86.4.13 redo

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Execute redo in this frame.

**Example:**

```vbscript
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b.MainFrame.redo
```
86.4.14 SelectAll

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Execute select all in this frame.

**Example:**
```vbnet
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim m as ChromiumFrameMBS = b.mainFrame
m.SelectAll
```

86.4.15 undo

**Example:**
```vbnet
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b.MainFrame.undo
```

86.4.16 ViewSource

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Save this frame’s HTML source to a temporary file and open it in the default text viewing application.

**Example:**
```vbnet
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim m as ChromiumFrameMBS = b.mainFrame
m.ViewSource
```

86.4.17 Properties

86.4.18 Browser as ChromiumBrowserMBS

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns the browser that this frame belongs to.
86.4.19 **Handle as Integer**

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The internal object reference. **Notes:** (Read only property)

86.4.20 **identifier as Int64**

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns the globally unique identifier for this frame. **Example:**

```vbnet
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim m as ChromiumFrameMBS = b.mainFrame
MsgBox str(m.identifier)
```

**Notes:** (Read only property)

86.4.21 **IsFocused as Boolean**

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if this is the focused frame. **Example:**

```vbnet
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim m as ChromiumFrameMBS = b.mainFrame
MsgBox str(m.IsFocused)
```

**Notes:** (Read only property)

86.4.22 **IsMain as Boolean**

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if this is the main (top-level) frame. **Example:**
86.4. **CLASS CHROMIUMFRAMEMBS**

```vbscript
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim m as ChromiumFrameMBS = b.mainFrame
MsgBox str(m.IsMain)
```

**Notes:** (Read only property)

### 86.4.23 Name as String

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns the name for this frame.

**Example:**

```vbscript
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim m as ChromiumFrameMBS = b.mainFrame
MsgBox m.Name
```

**Notes:**

If the frame has an assigned name (for example, set via the iframe "name" attribute) then that value will be returned. Otherwise a unique name will be constructed based on the frame parent hierarchy. The main (top-level) frame will always have an empty name value.

(Read only property)

### 86.4.24 Parent as HTMLViewer

**Notes:** (Read only property)

### 86.4.25 ParentFrame as ChromiumFrameMBS

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns the parent of this frame or nil if this is the main (top-level) frame.

**Notes:** (Read only property)
86.4.26 Source as String

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Returns this frame’s HTML source as a string.
**Example:**
```vbnet
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim f as ChromiumFrameMBS = b.MainFrame
dim s as string = f.Source
Break // view in debugger
```

**Notes:** (Read only property)

86.4.27 Text as String

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Returns this frame’s display text as a string.
**Example:**
```vbnet
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim f as ChromiumFrameMBS = b.MainFrame
dim s as string = f.Text
Break // view in debugger
```

**Notes:** (Read only property)

86.4.28 URL as String

MBS Win Plugin, Plugin Version: 14.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Returns the URL currently loaded in this frame.
**Example:**
```vbnet
dim b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
dim f as ChromiumFrameMBS = b.MainFrame
dim s as string = f.URL
MsgBox s
```

**Notes:** (Read only property)
86.5. class ChromiumWebPluginInfoMBS

86.5.1 class ChromiumWebPluginInfoMBS

MBS Win Plugin, Plugin Version: 16.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The class for details on installed plugins.  
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

86.5.2 Methods

86.5.3 Constructor

MBS Win Plugin, Plugin Version: 16.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The private constructor.

86.5.4 Destructor

MBS Win Plugin, Plugin Version: 16.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The destructor.

86.5.5 Plugins as ChromiumWebPluginInfoMBS()

MBS Win Plugin, Plugin Version: 16.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries list of plugins.  
**Notes:** Those are the plugins Chromium found on the Windows PC. e.g. 5 different versions of QuickTime Plugin.

86.5.6 Properties

86.5.7 Description as String

MBS Win Plugin, Plugin Version: 16.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** A description of the plugin from the version information.  
**Notes:** (Read only property)
86.5.8 Name as String

MBS Win Plugin, Plugin Version: 16.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The plugin name (i.e. Flash).
**Notes:** (Read only property)

86.5.9 Path as String

MBS Win Plugin, Plugin Version: 16.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The plugin file path (DLL/bundle/library).
**Notes:** (Read only property)

86.5.10 Version as String

MBS Win Plugin, Plugin Version: 16.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The version of the plugin (may be OS-specific).
**Notes:** (Read only property)
Chapter 87

iCloud

87.1 class NSComparisonPredicateMBS

87.1.1 class NSComparisonPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSComparisonPredicateMBS is a subclass of NSPredicateMBS that you use to compare expressions. **Example:**

```vba
' dim n1 as NSExpressionMBS = NSExpressionMBS.expressionForConstantValue(4)
' dim n2 as NSExpressionMBS = NSExpressionMBS.expressionForConstantValue(9)

' dim modifier as Integer = NSComparisonPredicateMBS.NSDirectPredicateModifier
' dim type as Integer = NSComparisonPredicateMBS.NSGreaterThanPredicateOperatorType
' dim options as Integer = 0

' dim c as new NSComparisonPredicateMBS(n1, n2, Modifier, type, options)

MsgBox c.predicateFormat
```

**Notes:**

You use comparison predicates to compare the results of two expressions. You create a comparison predicate with an operator, a left expression, and a right expression. You represent the expressions using instances of the NSExpressionMBS class. When you evaluate the predicate, it returns as a BOOL value the result of invoking the operator with the results of evaluating the expressions. Subclass of the NSPredicateMBS class.
87.1.2 Methods

87.1.3 comparisonPredicateModifier as Integer

Function: Returns the comparison predicate modifier for the receiver.

Notes:
Available in Mac OS X v10.4 and later.
The default value is NSDirectPredicateModifier.

87.1.4 Constructor(LeftExpression as NSExpressionMBS, rightExpression as NSExpressionMBS, modifier as UInt32, type as UInt32, options as UInt32)

Function: Initializes a predicate to a given type formed by combining given left and right expressions using a given modifier and options.

Example:

dim n1 as NSExpressionMBS = NSExpressionMBS.expressionForConstantValue(4)
dim n2 as NSExpressionMBS = NSExpressionMBS.expressionForConstantValue(9)

dim modifier as Integer = NSComparisonPredicateMBS.NSDirectPredicateModifier
dim type as Integer = NSComparisonPredicateMBS.NSGreaterThanPredicateOperatorType
dim options as Integer = 0

dim c as new NSComparisonPredicateMBS(n1, n2, Modifier, type, options)

MsgBox c.predicateFormat

Notes:
LeftExpression: The left hand expression.
rightExpression: The right hand expression.
modifier: The modifier to apply.
type: The predicate operator type.
options: The options to apply (see constants). For no options, pass 0.

The receiver, initialized to a predicate of type type formed by combining the left and right expressions using the modifier and options.
Available in Mac OS X v10.4 and later.
87.1.5  **leftExpression as NSExpressionMBS**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns the left expression for the receiver, or nil if there is none.

87.1.6  **options as Integer**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns the options that are set for the receiver.

87.1.7  **predicate(LeftExpression as NSExpressionMBS, rightExpression as NSExpressionMBS, modifier as UInt32, type as UInt32, options as UInt32) as NSPredicateMBS**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Creates and returns a predicate of a given type formed by combining given left and right expressions using a given modifier and options.

**Notes:**

LeftExpression: The left hand expression.
rightExpression: The right hand expression.
modifier: The modifier to apply.
type: The predicate operator type.
options: The options to apply (see "NSComparisonPredicate Options"). For no options, pass 0.

Returns a new predicate of type type formed by combining the given left and right expressions using the modifier and options.
Available in Mac OS X v10.4 and later.

87.1.8  **predicateOperatorType as Integer**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns the predicate type for the receiver.

87.1.9  **rightExpression as NSExpressionMBS**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns the right expression for the receiver, or nil if there is none.
87.1.10 Constants

87.1.11 NSAllPredicateModifier = 1

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the possible modifier types.
**Notes:**
A predicate to compare all entries in the destination of a to-many relationship. The left hand side must be a collection. The corresponding predicate compares each value in the left hand side with the right hand side, and returns false when it finds the first mismatch or true if all match. Available in Mac OS X v10.4 and later.

87.1.12 NSAnyPredicateModifier = 2

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the possible modifier types.
**Notes:**
A predicate to match with any entry in the destination of a to-many relationship. The left hand side must be a collection. The corresponding predicate compares each value in the left hand side against the right hand side and returns true when it finds the first match or false if no match is found. Available in Mac OS X v10.4 and later.

87.1.13 NSBeginsWithPredicateOperatorType = 8

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the comparison type constants.
**Notes:**
A begins-with predicate. Available in Mac OS X v10.4 and later.

87.1.14 NSBetweenPredicateOperatorType = 100

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the comparison type constants.
**Notes:**
A predicate to determine if the right hand side lies at or between bounds specified by the left hand side. Returns true if \[ \text{lhs between rhs} \] ; the right hand side must be an array in which the first element sets the lower bound and the second element the upper, inclusive. Comparison is performed using compare: or the class-appropriate equivalent. Available in Mac OS X v10.5 and later.
87.1. CLASS NSCOMPARISONPREDICATEMBS

87.1.15 NSCaseInsensitivePredicateOption = 1

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the constants for possible types of string comparison.

**Notes:**
A case-insensitive predicate.
You represent this option in a predicate format string using a \[ c \] following a string operation (for example, "NeXT" like \[ c \] "next").
Available in Mac OS X v10.4 and later.
These options are supported for LIKE as well as all of the equality/comparison operators.

87.1.16 NSContainsPredicateOperatorType = 99

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the comparison type constants.

**Notes:**
A predicate to determine if the left hand side contains the right hand side.
Returns true if \[ lhs contains rhs \] ; the left hand side must be an NSExpression object that evaluates to a collection
Available in Mac OS X v10.5 and later.

87.1.17 NSCustomSelectorPredicateOperatorType = 11

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the comparison type constants.

**Notes:**
A predicate that uses a custom selector that takes a single argument and returns a BOOL value.
The selector is invoked on the left hand side with the right hand side as the argument.
Available in Mac OS X v10.4 and later.

87.1.18 NSDiacriticInsensitivePredicateOption = 2

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the constants for possible types of string comparison.

**Notes:**
A diacritic-insensitive predicate.
You represent this option in a predicate format string using a \[ d \] following a string operation (for example, "nave" like \[ d \] "naive").
Available in Mac OS X v10.4 and later.
These options are supported for LIKE as well as all of the equality/comparison operators.
87.1.19  **NSDirectPredicateModifier** = 0

MBS MacCloud Plugin, Plugin Version: 11.3. **Function**: One of the possible modifier types. 
**Notes:**
A predicate to compare directly the left and right hand sides. Available in Mac OS X v10.4 and later.

87.1.20  **NSEndsWithPredicateOperatorType** = 9

MBS MacCloud Plugin, Plugin Version: 11.3. **Function**: One of the comparison type constants. 
**Notes:**
An ends-with predicate. Available in Mac OS X v10.4 and later.

87.1.21  **NSEqualToPredicateOperatorType** = 4

MBS MacCloud Plugin, Plugin Version: 11.3. **Function**: One of the comparison type constants. 
**Notes:**
An equal-to predicate. Available in Mac OS X v10.4 and later.

87.1.22  **NSGreaterThanOrEqualToPredicateOperatorType** = 3

MBS MacCloud Plugin, Plugin Version: 11.3. **Function**: One of the comparison type constants. 
**Notes:**
A greater-than-or-equal-to predicate. Available in Mac OS X v10.4 and later.

87.1.23  **NSGreaterThanPredicateOperatorType** = 2

MBS MacCloud Plugin, Plugin Version: 11.3. **Function**: One of the comparison type constants. 
**Notes:**
A greater-than predicate. Available in Mac OS X v10.4 and later.
87.1.24  NSInPredicateOperatorType = 10

MBS MacCloud Plugin, Plugin Version: 11.3.  **Function:** One of the comparison type constants.  
**Notes:**
A predicate to determine if the left hand side is in the right hand side.  
For strings, returns true if the left hand side is a substring of the right hand side.  
For collections, returns true if the left hand side is in the right hand side.  
Available in Mac OS X v10.4 and later.

87.1.25  NSLessThanOrEqualToPredicateOperatorType = 1

MBS MacCloud Plugin, Plugin Version: 11.3.  **Function:** One of the comparison type constants.  
**Notes:**
A less-than-or-equal-to predicate.  
Available in Mac OS X v10.4 and later.

87.1.26  NSLessThanPredicateOperatorType = 0

MBS MacCloud Plugin, Plugin Version: 11.3.  **Function:** One of the comparison type constants.  
**Notes:**
A less-than predicate.  
Available in Mac OS X v10.4 and later.

87.1.27  NSLikePredicateOperatorType = 7

MBS MacCloud Plugin, Plugin Version: 11.3.  **Function:** One of the comparison type constants.  
**Notes:**
A simple subset of the MATCHES predicate, similar in behavior to SQL LIKE.  
Available in Mac OS X v10.4 and later.

87.1.28  NSMatchesPredicateOperatorType = 6

MBS MacCloud Plugin, Plugin Version: 11.3.  **Function:** One of the comparison type constants.  
**Notes:**
A full regular expression matching predicate.  
Available in Mac OS X v10.4 and later.
87.1.29  **NSNormalizedPredicateOption = 4**

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the constants for possible types of string comparison.

**Notes:**

Indicates that the strings to be compared have been preprocessed.
This option supersedes NSCaseInsensitivePredicateOption and NSDiacriticInsensitivePredicateOption, and is intended as a performance optimization option.
You represent this option in a predicate format string using a \[ n \] following a string operation (for example, "WXYZlan" matches \[ n \ ].lan").
Available in Mac OS X v10.7 and later.
These options are supported for LIKE as well as all of the equality/comparison operators.

87.1.30  **NSNotEqualToPredicateOperatorType = 5**

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the comparison type constants.

**Notes:**

A not-equal-to predicate.
Available in Mac OS X v10.4 and later.
87.2. CLASS NSCOMPOUNDPREDICATEMBS

87.2 class NSCompoundPredicateMBS

87.2.1 class NSCompoundPredicateMBS

Function: NSCompoundPredicate is a subclass of NSPredicate used to represent logical "gate" operations (AND/OR/NOT) and comparison operations.

Example:

dim n1 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(true)
dim n2 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(false)

dim n as NSPredicateMBS = NSCompoundPredicateMBS.orPredicateWithSubpredicates(array(n1,n2))
MsgBox n.predicateFormat

Notes:

Comparison operations are based on two expressions, as represented by instances of the NSExpression class. Expressions are created for constant values, key paths, and so on.

In Mac OS X v10.5 and later and in iOS, you can use NSCompoundPredicate to create an AND or OR compound predicate (but not a NOT compound predicate) using an array with 0, 1, or more elements:

- An AND predicate with no subpredicates evaluates to TRUE.
- An OR predicate with no subpredicates evaluates to FALSE.
- A compound predicate with one or more subpredicates evaluates to the truth of its subpredicates.

Subclass of the NSPredicateMBS class.

87.2.2 Methods

87.2.3 andPredicateWithSubpredicates(predicates() as NSPredicateMBS) as NSPredicateMBS

Function: Returns a new predicate formed by AND-ing the predicates in a given array.

Example:

dim n1 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(true)
dim n2 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(false)
dim n as NSPredicateMBS = NSCompoundPredicateMBS.andPredicateWithSubpredicates(array(n1,n2))

MsgBox n.predicateFormat

Notes:

subpredicates: An array of NSPredicate objects.

Returns a new predicate formed by AND-ing the predicates specified by subpredicates. An AND predicate with no subpredicates evaluates to TRUE.

87.2.4 compoundPredicateType as Integer

87.2.5 Constructor(type as Integer, predicates() as NSPredicateMBS)

Example:

dim n1 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(true)
dim n2 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(false)

dim n as NSPredicateMBS = new NSCompoundPredicateMBS(NSCompoundPredicateMBS.kAnd, array(n1,n2))
MsgBox n.predicateFormat

Notes:

type: The type of the new predicate.
subpredicates: An array of NSPredicate objects.

87.2.6 notPredicateWithSubpredicate(predicate as NSPredicateMBS) as NSPredicateMBS

Notes:
predicate: A predicate.

Returns a new predicate formed by NOT-ing the predicate specified by predicate.

87.2.7 orPredicateWithSubpredicates(predicates() as NSPredicateMBS) as NSPredicateMBS

Function: Returns a new predicate formed by OR-ing the predicates in a given array.
Notes: subpredicates: An array of NSPredicate objects.

Returns a new predicate formed by OR-ing the predicates specified by subpredicates.

An OR predicate with no subpredicates evaluates to FALSE.

87.2.8 subpredicates as NSPredicateMBS()

Function: Returns the array of the receiver’s subpredicates.
Example:

dim n1 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(true)
dim n2 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(false)
dim n as new NSCompoundPredicateMBS(NSCompoundPredicateMBS.kAnd, array(n1,n2))

for each x as NSPredicateMBS in n.subpredicates
MsgBox x.predicateFormat
next

87.2.9 Constants

87.2.10 kAnd = 1

MBS MacCloud Plugin, Plugin Version: 11.3. Function: One of the compound predicate types.
Notes: A logical AND predicate.
87.2.11 kNot = 0

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the compound predicate types. **Notes:** A logical NOT predicate.

87.2.12 kOR = 2

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the compound predicate types. **Notes:** A logical OR predicate.
87.3. class NSExpressionMBS

87.3.1 class NSExpressionMBS

Function: NSExpression is used to represent expressions in a predicate.
Notes:
Comparison operations in an NSPredicate are based on two expressions, as represented by instances of the NSExpression class. Expressions are created for constant values, key paths, and so on.

Generally, anywhere in the NSExpression class hierarchy where there is composite API and subtypes that may only reasonably respond to a subset of that API, invoking a method that does not make sense for that subtype will cause an exception to be thrown.

See NSException class documentation on apple.com.

87.3.2 Methods

87.3.3 arguments as Variant()

Function: Returns the arguments for the receiver.
Example:

```vba
dim args() as Variant
args.Append 5.0
dim n as NSExpressionMBS = NSExpressionMBS.expressionForFunction("abs:", args)

// query arguments
dim theargs() as Variant = n.arguments
MsgBox theargs(0)
```

Notes:
Returns the arguments for the receiver that is, the array of expressions that will be passed as parameters during invocation of the selector on the operand of a function expression.

This method raises an exception if it is not applicable to the receiver.
87.3.4 constantValue as Variant

**Function:** Returns the constant value of the receiver.  
**Example:**

```vbnet
dim n as NSExpressionMBS = NSExpressionMBS.expressionForConstantValue(5)
dim v as Variant = n.constantValue
MsgBox v.StringValue ' shows 5
```

**Notes:**

This method raises an exception if it is not applicable to the receiver.  
Available in Mac OS X v10.4 and later.

87.3.5 Constructor(Type as Integer)

**Function:** Initializes the receiver with the specified expression type.  
**Notes:** Available in Mac OS X v10.4 and later.

87.3.6 expressionForAggregate(subexpressions() as NSExpressionMBS) as NSExpressionMBS

**Function:** Returns a new aggregate expression for a given collection.  
**Notes:**

collection: A collection object that contains further expressions.  
Returns a new expression that contains the expressions in collection.

87.3.7 expressionForConstantValue(value as Variant) as NSExpressionMBS

**Function:** Returns a new expression that represents a given constant value.  
**Example:**

```vbnet
dim n as NSExpressionMBS = NSExpressionMBS.expressionForConstantValue(5)
dim v as Variant = n.constantValue
MsgBox v.StringValue ' shows 5
```
87.3. **CLASS NSEXPRESSIONMBS**

**Notes:**

obj: The constant value the new expression is to represent.

Returns a new expression that represents the constant value, obj.
Available in Mac OS X v10.4 and later.

---

**87.3.8 expressionForEvaluatedObject as NSExpressionMBS**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new expression that represents the object being evaluated.
**Notes:** Available in Mac OS X v10.4 and later.

---

**87.3.9 expressionForFunction(FunctionName as string, arguments() as Variant) as NSExpressionMBS**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new expression that will invoke one of the predefined functions.
**Notes:**

name: The name of the function to invoke.
parameters: An array containing NSExpression objects that will be used as parameters during the invocation of selector.
For a selector taking no parameters, the array should be empty. For a selector taking one or more parameters, the array should contain one NSExpression object which will evaluate to an instance of the appropriate type for each parameter.
If there is a mismatch between the number of parameters expected and the number you provide during evaluation, an exception may be raised or missing parameters may simply be replaced by nil (which occurs depends on how many parameters are provided, and whether you have over- or underflow).

Returns a new expression that invokes the function name using the parameters in parameters.
The name parameter can be one of the following predefined functions.

See NSExpression class documentation on apple.com for details.

---

**87.3.10 expressionForIntersectSet(LeftExpression as NSExpressionMBS, rightExpression as NSExpressionMBS) as NSExpressionMBS**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new NSExpression object that represent the intersection of a given set and collection.
Notes:

LeftExpression: An expression that evaluates to an NSSet object.
rightExpression: An expression that evaluates to a collection object (an instance of NSArray, NSSet, or NSDictionary).

Returns a new NSExpression object that represents the intersection of left and right. Available in Mac OS X v10.5 and later.

87.3.11 expressionForKeyPath(name as string) as NSExpressionMBS

Function: Returns a new expression that invokes valueForKeyPath: with a given key path.
Notes:
keyPath: The key path that the new expression should evaluate.

Returns a new expression that invokes valueForKeyPath: with keyPath. Available in Mac OS X v10.4 and later.

87.3.12 expressionForMinusSet(LeftExpression as NSExpressionMBS, rightExpression as NSExpressionMBS) as NSExpressionMBS

Function: Returns a new NSExpression object that represent the subtraction of a given collection from a given set.
Notes:
LeftExpression: An expression that evaluates to an NSSet object.
rightExpression: An expression that evaluates to a collection object (an instance of NSArray, NSSet, or NSDictionary).

Returns a new NSExpression object that represents the subtraction of right from left. Available in Mac OS X v10.5 and later.

87.3.13 expressionForUnionSet(LeftExpression as NSExpressionMBS, rightExpression as NSExpressionMBS) as NSExpressionMBS

Function: Returns a new NSExpression object that represent the union of a given set and collection.
Notes:
87.3. CLASS NSEXPRESSIONMBS

LeftExpression: An expression that evaluates to an NSSet object.
rightExpression: An expression that evaluates to a collection object (an instance of NSArray, NSSet, or NSDictionary).

Returns a new NSExpression object that represents the union of left and right. Available in Mac OS X v10.5 and later.

87.3.14 expressionForVariable(name as string) as NSEXPRESSIONMBS

**Function:** Returns a new expression that extracts a value from the variable bindings dictionary for a given key.
**Notes:**

name: The key for the variable to extract from the variable bindings dictionary.

Returns a new expression that extracts from the variable bindings dictionary the value for the key string. Available in Mac OS X v10.4 and later.

87.3.15 expressionType as Integer

**Function:** Returns the expression type for the receiver.
**Example:**

```excel
dim n as NSEXPRESSIONMBS = NSEXPRESSIONMBS.expressionForVariable("hello")
MsgBox str(n.expressionType) // = NSVariableExpressionType
```

**Notes:** This method raises an exception if it is not applicable to the receiver.

87.3.16 expressionWithFormat(format as string) as NSEXPRESSIONMBS

**Function:** Creates an expression with the given format.
**See also:**

- 87.3.17 expressionWithFormat(format as string, arguments() as Variant) as NSEXPRESSIONMBS 14318
87.3.17 expressionWithFormat(format as string, arguments() as Variant) as NSExpressionMBS

Function: Creates an expression with the given format.
See also:

• 87.3.16 expressionWithFormat(format as string) as NSExpressionMBS

87.3.18 functionName as string

Function: Returns the function for the receiver.
Example:

dim args() as Variant
args.Append "World"
args.Append 5.0
dim n as NSExpressionMBS = NSExpressionMBS.expressionForFunction("Hello", args)
MsgBox n.functionName

Notes: This method raises an exception if it is not applicable to the receiver.

87.3.19 keyPath as string

Function: Returns the key path for the receiver.
Notes:
This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.4 and later.

87.3.20 leftExpression as NSExpressionMBS

Function: Returns the left expression of an aggregate expression.
Notes:
This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.5 and later.
87.3. CLASS NSExpressionMBS

87.3.21 operand as NSExpressionMBS

Function: Returns the operand for the receiver.
Notes:
The operand for the receiver that is, the object on which the selector will be invoked.
The object is the result of evaluating a key path or one of the defined functions. This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.4 and later.

87.3.22 predicate as NSPredicateMBS

Function: Return the predicate of a subquery expression.
Notes:
This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.5 and later.

87.3.23 rightExpression as NSExpressionMBS

Function: Returns the right expression of an aggregate expression.
Notes:
This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.5 and later.

87.3.24 variable as string

Function: Returns the variable for the receiver.
Example:
```dim n as NSExpressionMBS = NSExpressionMBS.expressionForVariable("hello")
MsgBox n.variable```
Notes:
This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.4 and later.
87.3.25  Properties

87.3.26  Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The internal reference to the NSExpression object. Notes: (Read and Write property)

87.3.27  Constants

87.3.28  NSAggregateExpressionType = 14

MBS MacCloud Plugin, Plugin Version: 11.3. Function: One of the expression type constants. Notes:
An expression that defines an aggregate of NSExpression objects. Available in Mac OS X v10.5 and later.

87.3.29  NSBlockExpressionType = 19

MBS MacCloud Plugin, Plugin Version: 11.3. Function: One of the expression type constants. Notes:
An expression that uses a Block. Available in Mac OS X v10.6 and later.

87.3.30  NSConstantValueExpressionType = 0

MBS MacCloud Plugin, Plugin Version: 11.3. Function: One of the expression type constants. Notes:
An expression that always returns the same value. Available in Mac OS X v10.4 and later.
87.3.31  **NSEvaluatedObjectExpressionType = 1**

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the expression type constants. **Notes:**
An expression that always returns the parameter object itself. Available in Mac OS X v10.4 and later.

87.3.32  **NSFunctionExpressionType = 4**

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the expression type constants. **Notes:**
An expression that returns the result of evaluating a function. Available in Mac OS X v10.4 and later.

87.3.33  **NSIntersectSetExpressionType = 6**

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the expression type constants. **Notes:**
An expression that creates an intersection of the results of two nested expressions. Available in Mac OS X v10.5 and later.

87.3.34  **NSKeyPathExpressionType = 3**

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the expression type constants. **Notes:**
An expression that returns something that can be used as a key path. Available in Mac OS X v10.4 and later.

87.3.35  **NSMinusSetExpressionType = 7**

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the expression type constants. **Notes:**
An expression that combines two nested expression results by set subtraction. Available in Mac OS X v10.5 and later.
87.3.36  **NSSubqueryExpressionType = 13**

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the expression type constants.  
**Notes:**  
An expression that filters a collection using a subpredicate.  
Available in Mac OS X v10.5 and later.

87.3.37  **NSUnionSetExpressionType = 5**

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the expression type constants.  
**Notes:**  
An expression that creates a union of the results of two nested expressions.  
Available in Mac OS X v10.5 and later.

87.3.38  **NSVariableExpressionType = 2**

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the expression type constants.  
**Notes:**  
An expression that always returns whatever value is associated with the key specified by variable' in the bindings dictionary.  
Available in Mac OS X v10.4 and later.
87.4. CLASS NSFILECOORDINATORMBS

87.4 class NSFileCoordinatorMBS

87.4.1 class NSFileCoordinatorMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for file coordinating.

**Notes:** Please also check the documentation from Apple for the NSFileCoordinator class.

87.4.2 Methods

87.4.3 addFilePresenter(filePresenter as NSFilePresenterMBS)

**Notes:**

If you invoke addFilePresenter: you have to do a balancing invocation of removeFilePresenter before the file presenter is deallocated, even in a garbage-collected application.

If your application reads an item and then registers a file presenter for it there is a possible race condition in which between those two steps another process does coordinated reading or writing of the item, without any messages sent to your not-quite-registered file presenter. This can leave your file presenter ignorant of the fact that what it knows about the item it just read is already out of date, or under the misconception that just because it hasn’t received a relinquish... method it owns the item. To avoid that race condition you can invoke addFilePresenter in the same block that you pass to coordinateReadingItemAtURL to read what the file presenter will present.

87.4.4 cancel

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Cancel all invocations of coordinate... and prepare... methods for the receiver.

**Notes:**

Any current invocation of one of those methods will stop waiting and return immediately, unless it has already invoked the passed-in block, in which case it will return when the passed-in block returns. Subsequent invocations of those methods will not invoke the blocks passed into them at all. When an invocation of coordinate... or prepare... returns without invoking the passed-in block because this method was invoked it instead returns an error whose domain is NSCocoaErrorDomain and whose code is NSUserCancelledError. Messages that have already been sent to NSFilePresenters will not be cancelled but the file coordination machinery will stop waiting for the replies.

This method this can be invoked from any thread. It always returns immediately, without waiting for any-
CHAPTER 87. ICLOUD

thing. Cancellation is racy; you usually cannot assume that no block passed into a coordinate... or prepare...
method is already being invoked, so the code inside those blocks typically still has to check for cancellation,
whatever that means in your application.

87.4.5 Constructor(filePresenter as NSFilePresenterMBS = nil)

Function: The constructor.
Notes:
The designated initializer. If an NSFilePresenter is provided then the receiver is considered to have been
created by that NSFilePresenter, or on its behalf.

NSFileCoordinator is meant to be instantiated on a per-file-operation basis, where a file operation is some-
thing like the opening or saving of a document, or the copying or moving of a batch of folders and files.
There is no benefit to keeping an instance of it alive in your application for much more time than it takes
to actually perform the file operation. Doing so can be harmful, or at least wasteful of memory, because
NSFileCoordinators may retain NSFilePresenters.

You pass an NSFilePresenter to this initializer when the operation whose file access is to be coordinated
is being performed by that NSFilePresenter. Associating an NSFileCoordinator with an NSFilePresenter
accomplishes a few important things:
- It prevents the NSFileCoordinator from sending messages to that NSFilePresenter, so the NSFilePresenter
does not have to somehow filter out messages about its own file operations. The exception to this rule is that
messages about versions of the presented item being added, remove, or resolved during coordinated writing
are sent to every relevant NSFilePresenter, even the one passed to Constructor.
- It allows the file coordination mechanism to determine when coordinated writing is being done in re-
sponse to an NSFilePresenter receiving a savePresentedItemChangesWithCompletionHandler message, and
not deadlock. Usually coordinated writing done by one NSFileCoordinator must wait for coordinated read-
ing of the same file or directory done by another NSFileCoordinator. But, for example, when coordinated
reading is begun with one NSFileCoordinator, and that causes an NSFilePresenter to do coordinated writing
using another NSFileCoordinator, the writing done with the second NSFileCoordinator should not wait for the
completion of the first NSFileCoordinator’s reading, it should instead happen while the first NSFileCo-
dinator is waiting to read.
- It allows the file coordination mechanism to handle a race condition that can occur when it has sent an
NSFilePresenter a presentedItemDidMoveToURL message in the NSFilePresenter’s operation queue but be-
fore that message is dequeued the NSFilePresenter enqueues, on a different queue, an operation using the
old URL. For this to be effective however the NSFileCoordinator must be initialized in the same operation
queue in which NSFilePresenter messages are received.
- It allows the file coordination mechanism to gracefully handle your application’s registration of an NS-
FilePresenter that at first returns nil when sent presentedItemURL but can later return non-nil at the end of
doing a coordinated write that creates the presented item in the file system for the very first time. AppKit
for example takes advantage of this by registering brand new untitled NSDocuments as NSFilePresenters
immediately, instead of waiting until after the first time the user causes the document to be saved to a file,
which would be more complicated.
For example, NSDocument creates a single NSFileCoordinator for all of the coordinated reading and writing it does during the saving of a document. It always creates the NSFileCoordinator in the main queue even when it is doing the actual coordinated reading and writing in a background queue to implement asynchronous saving.

### 87.4.6 coordinateReadingItemAtURL

**Function:** Initiates a read operation on a single file or directory using the specified options.

**Notes:**
- **file:** A URL identifying the file or directory to read. If other objects or processes are acting on the item at the URL, the actual URL passed to reader parameter may be different than the one in this parameter. The plugin converts the folderitem to an URL for you.
- **options:** One of the reading options (see constants). If you pass 0 for this parameter, the savePresentedItemChangesWithCompletionHandler method of relevant file presenters is called before your block executes.
- **Error:** If a file presenter encounters an error while preparing for this read operation, that error is returned in this parameter and the block in the reader parameter is not executed. If you cancel this operation before the reader block is executed, this parameter contains an error object on output.

The coordinateReadingItemAtURL event performs the file operations in a coordinated manner. This block receives an url and folderitem of the item and returns no value. Always use the URL/folderitem passed into the event instead of the value in the url parameter.

You use this method to perform read-related operations on a file or directory in a coordinated manner. This method executes synchronously, blocking the current thread until the reader event finishes executing. Before executing that event, though, the file coordinator waits until other relevant file presenter objects finish in-progress actions. Similarly, your read operation may cause pending actions for other file presenters to wait until your operations are complete. Whether or not the file coordinator waits depends on whether the item being read is a file or directory and also depends on other related operations.

If the url parameter specifies a file:

- This method waits for other writers of the exact same file to finish in-progress actions.
- This method waits if the file is a file package and other writers are writing to items in the package directory.
- This method does not wait for other readers of the file.
- This method does not wait for writers that are manipulating the parent directory of the file, unless one
of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingForMoving option.

If the url parameter specifies a directory:

- This method waits if other write operations are occurring on the exact same directory.
- This method does not wait if write operations are occurring on items inside the directory (but not on the directory itself).
- This method does not wait for other readers of the directory.
- This method does not wait for writers that are manipulating the parent directory of the directory, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingForMoving option.

This method calls the relinquishPresentedItemToReader method of any relevant file presenters. This method is called both for file presenters in the current process and in other processes. Depending on the options you specify, other methods of the file presenters may also be called. When reading a file package directory, file presenter objects that are currently reading the contents of that file package also receive these notifications. All of the called methods must return successfully before the file coordinator executes your block. If multiple file presenters are operating on the item, the order in which those presenters are notified is undefined.

Do not nest calls to file coordinator methods inside the event. If you call this method or any of the other file coordination methods from inside your event, the file coordinator object throws an exception. If you want to perform a write operation from inside a read block, use the coordinateWritingItemAtURL method instead. If you want to perform a batch read operation on multiple files, use the prepareForReadingItemsAtURLs method.

Available in Mac OS X v10.7 and later.

See also:

- 87.4.22 coordinateReadingItemAtURL(url as string, file as folderitem, tag as Variant)
- 87.4.7 coordinateReadingItemAtURL(URL as string, options as Integer, byref error as NSErrorMBS, tag as Variant = nil)

**87.4.7 coordinateReadingItemAtURL(URL as string, options as Integer, byref error as NSErrorMBS, tag as Variant = nil)**

Function: Initiates a read operation on a single file or directory using the specified options.

Notes:

url: A URL identifying the file or directory to read. If other objects or processes are acting on the item at the URL, the actual URL passed to reader parameter may be different than the one in this parameter.
options: One of the reading options (see constants). If you pass 0 for this parameter, the savePresentedItemChangesWithCompletionHandler method of relevant file presenters is called before your block executes.

Error: If a file presenter encounters an error while preparing for this read operation, that error is returned in this parameter and the block in the reader parameter is not executed. If you cancel this operation before the reader block is executed, this parameter contains an error object on output.

The coordinateReadingItemAtURL event performs the file operations in a coordinated manner. This block receives an url and folderitem of the item and returns no value. Always use the URL/folderitem passed into the event instead of the value in the url parameter.

You use this method to perform read-related operations on a file or directory in a coordinated manner. This method executes synchronously, blocking the current thread until the reader event finishes executing. Before executing that event, though, the file coordinator waits until other relevant file presenter objects finish in-progress actions. Similarly, your read operation may cause pending actions for other file presenters to wait until your operations are complete. Whether or not the file coordinator waits depends on whether the item being read is a file or directory and also depends on other related operations.

If the url parameter specifies a file:

- This method waits for other writers of the exact same file to finish in-progress actions.
- This method waits if the file is a file package and other writers are writing to items in the package directory.
- This method does not wait for other readers of the file.
- This method does not wait for writers that are manipulating the parent directory of the file, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingForMoving option.

If the url parameter specifies a directory:

- This method waits if other write operations are occurring on the exact same directory.
- This method does not wait if write operations are occurring on items inside the directory (but not on the directory itself).
- This method does not wait for other readers of the directory.
- This method does not wait for writers that are manipulating the parent directory of the directory, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingForMoving option.

This method calls the relinquishPresentedItemToReader method of any relevant file presenters. This method is called both for file presenters in the current process and in other processes. Depending on the options you specify, other methods of the file presenters may also be called. When reading a file package directory,
file presenter objects that are currently reading the contents of that file package also receive these notifications. All of the called methods must return successfully before the file coordinator executes your block. If multiple file presenters are operating on the item, the order in which those presenters are notified is undefined.

Do not nest calls to file coordinator methods inside the event. If you call this method or any of the other file coordination methods from inside your event, the file coordinator object throws an exception. If you want to perform a write operation from inside a read block, use the coordinateWritingItemAtURL method instead. If you want to perform a batch read operation on multiple files, use the prepareForReadingItemsAtURLs method.

Available in Mac OS X v10.7 and later.

See also:

- 87.4.6 coordinateReadingItemAtURL(File as folderitem, options as Integer, byref error as NSErrorMBS, tag as Variant = nil) 14325
- 87.4.22 coordinateReadingItemAtURL(url as string, file as folderitem, tag as Variant) 14337

87.4.8 coordinateReadingItemAtURLwritingItemAtURL(readingFile as folderitem, readingOptions as Integer, writingItemAtFile as folderitem, writingOptions as Integer, byref error as NSErrorMBS, tag as Variant = nil)

Function: Initiates a read operation that contains a follow-up write operation.

Notes:

readingFile: A URL identifying the file or directory to read. If other objects or processes are acting on the item at the URL, the actual URL passed to the block in the readerWriter parameter may be different than the one in this parameter.

readingOptions: One of the reading options (see constants). If you pass 0 for this parameter, the savePresentedItemChangesWithCompletionHandler: method of relevant file presenters is called before your block executes.

writingItemAtFile: A URL identifying the file or directory to write. If other objects or processes are acting on the item at the URL, the actual URL passed to the block in the readerWriter parameter may be different than the one in this parameter.

writingOptions: One of the writing options (see constants). The options you specify partially determine how file presenters are notified and how this file coordinator object waits to execute your block.

Error: If a file presenter encounters an error while preparing for this operation, that error is returned in this parameter and the event is not executed. If you cancel this operation before the readerWriter event is executed, this parameter contains an error object on output.

The coordinateReadingItemAtURLwritingItemAtURL event performs the read and write operations in a coordinated manner. This event receives URLs of the items to read and write and returns no value. Always use the URLs passed into the block instead of the values in the readingURL and writingURL parameters.
You use this method to perform a read operation that might also contain a write operation that needs to be coordinated. This method executes synchronously, blocking the current thread until the readerWriter event finishes executing. When performing the write operation, you may call the coordinateWritingItemAtURL method from your readerWriter block. This method does the canonical lock ordering that is required to prevent a potential deadlock of the file operations.

This method makes the same calls to file presenters, and has the same general wait behavior as the coordinateReadingItemAtURL method.

Available in Mac OS X v10.7 and later.

See also:

- 87.4.23 coordinateReadingItemAtURLwritingItemAtURL(readingURL as string, readingFile as folderitem, writingURL as string, writingFile as folderitem, tag as Variant)
- 87.4.9 coordinateReadingItemAtURLwritingItemAtURL(readingURL as string, readingOptions as Integer, writingItemAtURL as string, writingOptions as Integer, byref error as NSErrorMBS, tag as Variant = nil)

87.4.9 coordinateReadingItemAtURLwritingItemAtURL(readingURL as string, readingOptions as Integer, writingItemAtURL as string, writingOptions as Integer, byref error as NSErrorMBS, tag as Variant = nil)

Function: Initiates a read operation that contains a follow-up write operation.

Notes:

readingURL: A URL identifying the file or directory to read. If other objects or processes are acting on the item at the URL, the actual URL passed to the block in the readerWriter parameter may be different than the one in this parameter.

readingOptions: One of the reading options (see constants). If you pass 0 for this parameter, the savePresentedItemChangesWithCompletionHandler: method of relevant file presenters is called before your block executes.

writingItemAtURL: A URL identifying the file or directory to write. If other objects or processes are acting on the item at the URL, the actual URL passed to the block in the readerWriter parameter may be different than the one in this parameter.

writingOptions: One of the writing options (see constants). The options you specify partially determine how file presenters are notified and how this file coordinator object waits to execute your block.

Error: If a file presenter encounters an error while preparing for this operation, that error is returned in this parameter and the event is not executed. If you cancel this operation before the readerWriter event is executed, this parameter contains an error object on output.

The coordinateReadingItemAtURLwritingItemAtURL event performs the read and write operations in a coordinated manner. This event receives URLs of the items to read and write and returns no value. Always use the URLs passed into the block instead of the values in the readingURL and writingURL parameters.
You use this method to perform a read operation that might also contain a write operation that needs to be coordinated. This method executes synchronously, blocking the current thread until the readerWriter event finishes executing. When performing the write operation, you may call the coordinateWritingItemAtURL method from your readerWriter block. This method does the canonical lock ordering that is required to prevent a potential deadlock of the file operations.

This method makes the same calls to file presenters, and has the same general wait behavior as the coordinateReadingItemAtURL method.

Available in Mac OS X v10.7 and later.

See also:

- 87.4.8 coordinateReadingItemAtURLwritingItemAtURL(readingFile as folderitem, readingOptions as Integer, writingItemAtFile as folderitem, writingOptions as Integer, byref error as NSErrorMBS, tag as Variant = nil) 14328
- 87.4.23 coordinateReadingItemAtURLwritingItemAtURL(readingURL as string, readingFile as folderitem, writingURL as string, writingFile as folderitem, tag as Variant) 14337

87.4.10 coordinateWritingItemAtURL(File as folderitem, options as Integer, byref error as NSErrorMBS, tag as Variant = nil)

Function: Initiates a write operation on a single file or directory using the specified options.

Notes:

File: A URL identifying the file or directory to write. If other objects or processes are acting on the item at the URL, the actual URL passed to writer parameter may be different than the one in this parameter. (plugin converts from folderitem to URL for you)

options: One of the writing options (see constants). The options you specify partially determine how file presenters are notified and how this file coordinator object waits to execute your coordinateWritingItemAtURL event.

error: If a file presenter encounters an error while preparing for this write operation, that error is returned in this parameter and the event in the writer parameter is not executed. If you cancel this operation before the writer event is executed, this parameter contains an error object on output.

The coordinateWritingItemAtURL event performs the file operations in a coordinated manner. This event receives the file reference containing the URL of the item and returns no value. Always use the UR passed into the block instead of the value in the url parameter.

You use this method to perform write-related operations on a file or directory in a coordinated manner. This method executes synchronously, blocking the current thread until the writer block finishes executing. Before executing the block, though, the file coordinator waits until other relevant file presenter objects finish in-progress actions. Similarly, your write operation may cause pending actions for other file presenters to wait until your operations are complete. Whether or not the file coordinator waits depends on whether the
item being written is a file or directory and also depends on other related operations.

If the url parameter specifies a file:

- This method waits for other readers and writers of the exact same file to finish in-progress actions.
- This method waits if the file is a file package and other writers are reading or writing items in the package directory.
- This method does not wait for readers or writers that are manipulating the parent directory of the file, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingForMoving option.

If the url parameter specifies a directory:

- This method waits if other read or write operations are occurring on the exact same directory.
- This method does not wait if read or write operations are occurring on items inside the directory (but not on the directory itself).
- This method does not wait for readers or writers that are manipulating the parent directory of the directory, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingForMoving option.

This method calls the relinquishPresentedItemToWriter method of any relevant file presenters. This method is called both for file presenters in the current process and in other processes. Depending on the options you specify, other methods of the file presenters may also be called. When writing a file package directory, file presenter objects that are currently reading or writing the contents of that file package also receive these notifications. All of the called methods must return successfully before the file coordinator executes your block. If multiple file presenters are operating on the item, the order in which those presenters are notified is undefined.

Note: When deleting an item inside a file package using the NSFileCoordinatorWritingForDeleting option, the file coordinator does not call the accommodatePresentedItemDeletionWithCompletionHandler method of any file presenters monitoring the file package directory itself. Instead, the delete operation is treated as a write operation on the file package.

With one exception, do not nest calls to file coordinator methods inside the block you pass to this method. You may call the coordinateReadingItemAtURL method to read the file if you discover through modification-date checking that the contents of the file have changed. However, if you call this method from inside your block, the file coordinator object throws an exception.

Available in Mac OS X v10.7 and later.

- 87.4.24 coordinateWritingItemAtURL(url as string, file as folderitem, tag as Variant)
87.4.11 coordinateWritingItemAtURL(URL as string, options as Integer, byref error as NSErrorMBS, tag as Variant = nil)

**Function:** Initiates a write operation on a single file or directory using the specified options.

**Notes:**

url: A URL identifying the file or directory to write. If other objects or processes are acting on the item at the URL, the actual URL passed to writer parameter may be different than the one in this parameter.

options: One of the writing options (see constants). The options you specify partially determine how file presenters are notified and how this file coordinator object waits to execute your coordinateWritingItemAtURL event.

error: If a file presenter encounters an error while preparing for this write operation, that error is returned in this parameter and the event in the writer parameter is not executed. If you cancel this operation before the writer event is executed, this parameter contains an error object on output.

The coordinateWritingItemAtURL event performs the file operations in a coordinated manner. This event receives the file reference containing the URL of the item and returns no value. Always use the UR passed into the block instead of the value in the url parameter.

You use this method to perform write-related operations on a file or directory in a coordinated manner. This method executes synchronously, blocking the current thread until the writer block finishes executing. Before executing the block, though, the file coordinator waits until other relevant file presenter objects finish in-progress actions. Similarly, your write operation may cause pending actions for other file presenters to wait until your operations are complete. Whether or not the file coordinator waits depends on whether the item being written is a file or directory and also depends on other related operations.

If the url parameter specifies a file:

- This method waits for other readers and writers of the exact same file to finish in-progress actions.
- This method waits if the file is a file package and other writers are reading or writing items in the package directory.
- This method does not wait for readers or writers that are manipulating the parent directory of the file, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingForMoving option.

If the url parameter specifies a directory:

- This method waits if other read or write operations are occurring on the exact same directory.
This method does not wait if read or write operations are occurring on items inside the directory (but not on the directory itself).

This method does not wait for readers or writers that are manipulating the parent directory of the directory, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingForMoving option.

This method calls the relinquishPresentedItemToWriter method of any relevant file presenters. This method is called both for file presenters in the current process and in other processes. Depending on the options you specify, other methods of the file presenters may also be called. When writing a file package directory, file presenter objects that are currently reading or writing the contents of that file package also receive these notifications. All of the called methods must return successfully before the file coordinator executes your block. If multiple file presenters are operating on the item, the order in which those presenters are notified is undefined.

Note: When deleting an item inside a file package using the NSFileCoordinatorWritingForDeleting option, the file coordinator does not call the accommodatePresentedItemDeletionWithCompletionHandler method of any file presenters monitoring the file package directory itself. Instead, the delete operation is treated as a write operation on the file package.

With one exception, do not nest calls to file coordinator methods inside the block you pass to this method. You may call the coordinateReadingItemAtURL method to read the file if you discover through modification-date checking that the contents of the file have changed. However, if you call this method from inside your block, the file coordinator object throws an exception.

Available in Mac OS X v10.7 and later.

- 87.4.24 coordinateWritingItemAtURL(url as string, file as folderitem, tag as Variant) 14338

87.4.12 filePresenters as NSFilePresenterMBS()

87.4.13 FileURL(file as folderitem) as string

87.4.14 itemAtURLdidMoveToURL(oldURL as string, newURL as string)

Function: Announce that the item located by a URL is now located by another URL.

Notes:
This triggers the sending of messages to NSFilePresenters that implement the corresponding optional methods, even those in other processes, except the one specified when -initWithFilePresenter: was invoked:
- presentedItemDidMoveToURL: is sent to NSFilePresenters of the item.
- If the item is a directory then presentedItemDidMoveToURL is sent to NSFilePresenters of each item contained by it.
- presentedSubitemAtURL is sent to NSFilePresenters of each directory that contains the item, unless that method is not implemented but presentedItemDidChange is, and the directory is actually a file package, in which case presentedItemDidChange is sent instead.

Useless invocations of this method are harmless, so you don’t have to write code that compares NSURLs for equality, which is not straightforward. This method must be invoked from within the block passed to an invocation of coordinateWritingItemAtURL.

87.4.15 itemAtURLwillMoveToURL(oldURL as string, newURL as string)

Function: Announce that the item located by a URL is going to be located by another URL.

Notes:
Support for App Sandbox on OS X. Some applications can rename files while saving them. For example, when a user adds attachments to a rich text document, TextEdit changes the document’s extension from .rtf to .rtfd. A sandboxed application like TextEdit must ordinarily prompt the user for approval before renaming a document. You can invoke this method to make your process declare its intent to rename a document without user approval. After the renaming succeeds you must invoke itemAtURLdidMoveToURL, with the same arguments, for the process to keep access to the file with its new name and to give up access to any file that appears with the old name. If the renaming fails you should probably not invoke itemAtURLwillMoveToURL.

There is no reason to invoke this method from applications that do not use App Sandbox. Invoking it does nothing on iOS.

87.4.16 prepareForReadingItemsAtURLs(readingFiles() as folderitem, readingOptions as Integer, writingItemsAtFiles() as folderitem, writingOptions as Integer, byref error as NSErrorMBS, tag as Variant = nil)

Function: Prepare to read or write from multiple files in a single batch operation.

Notes:
87.4. CLASS NSFILECOORDINATORMBS

readingFiles: An array of folderitems identifying the items you want to read.
readingOptions: One of the reading options (see constants). If you pass 0 for this parameter, the savePresentedItemChangesWithCompletionHandler method of relevant file presenters is called before the prepareComplete event executes.
writingItemsAtFiles: An array of folderitems identifying the items you want to write.
writingOptions: One of the writing options (see constants). The options you specify partially determine how file presenters are notified and how this file coordinator object waits to execute your block.

Error: If a file presenter encounters an error while preparing for this operation, that error is returned in this parameter and the block in the writer parameter is not executed. If you cancel this operation before the batchAccessor block is executed, this parameter contains an error object on output.

The prepareComplete event is called and receives a completion handler that it must execute when it has finished its read and write calls.

You use this method to prepare the file coordinator for multiple read and write operations. This method executes synchronously, blocking the current thread until the prepareComplete event finishes executing. The event does not perform the actual operations itself but calls the coordinateReadingItemAtURL and coordinateWritingItemAtURL methods to perform them. The reason to call this method first is to improve performance when reading and writing large numbers of files or directories.

Because file coordination requires interprocess communication, it is much more efficient to batch changes to large numbers of files and directories than to change each item individually. The file coordinator uses the values in the readingURLs and writingURLs parameters together with reading and writing options to prepare any relevant file presenters for the upcoming operations. Specifically, it uses these parameters in the same way as the coordinateReadingItemAtURL and coordinateWritingItemAtURL methods to determine which file presenter methods to call.

Available in Mac OS X v10.7 and later.

87.4.25 `prepareComplete(Complete as NSFilePresenterHandlerMBS, tag as Variant)`

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called by `prepareForReadingItemsAtURLs`. **Notes:** You must call the complete handler when you are done.

87.4.26 Constants

87.4.27 `NSFileCoordinatorReadingResolvesSymbolicLink = 2`

MBS MacCloud Plugin, Plugin Version: 11.2. **Function:** One of the reading flag constants. **Notes:** Whether reading of an item that might be a symbolic link file causes the resolution of the link if it is. This affects the URL passed to the block passed to an invocation of one of the `coordinateReadingItemAtURL...` methods. This is not a valid option to use with `prepareForReadingItemsAtURLs`.

87.4.28 `NSFileCoordinatorReadingWithoutChanges = 1`

MBS MacCloud Plugin, Plugin Version: 11.2. **Function:** One of the reading flag constants. **Notes:** Whether reading does _not_ trigger sending of `savePresentedItemChangesWithCompletionHandler` to certain `NSFilePresenters` in the system and waiting for those `NSFilePresenters` to respond. The default behavior during coordinated reading is to send `savePresentedItemChangesWithCompletionHandler` to `NSFilePresenters`. 
87.4.29  NSFileCoordinatorWritingForDeleting = 1

MBS MacCloud Plugin, Plugin Version: 11.2. **Function:** One of the writing flag constants.
**Notes:**
Whether the writing to be done is actually the deletion of the item. This affects how the writing waits for previously scheduled coordinated reading and writing, how the writing causes subsequently scheduled reading and writing to wait, and what NSFilePresenter messaging is done. See the comments in the Single File Coordination section below. This option is how you trigger sending of accommodatePresentedItemDeletionWithCompletionHandler or accommodatePresentedSubitemDeletionAtURL messages to NSFilePresenters.

For example, Finder uses this when it’s emptying the trash to give NSFilePresenters a chance to close documents before their files disappear, or would disappear if the files weren’t still open.

87.4.30  NSFileCoordinatorWritingForMerging = 4

MBS MacCloud Plugin, Plugin Version: 11.2. **Function:** One of the writing flag constants.
**Notes:** Whether coordinated writing triggers sending of savePresentedItemChangesWithCompletionHandler to certain NSFilePresenters in the system and waiting for those NSFilePresenters to respond.

87.4.31  NSFileCoordinatorWritingForMoving = 2

MBS MacCloud Plugin, Plugin Version: 11.2. **Function:** One of the writing flag constants.
**Notes:**
Whether the writing to be done is actually the moving or renaming of the item. This affects how the writing waits for previously scheduled coordinated reading and writing, how the writing causes subsequently scheduled reading and writing to wait, and what NSFilePresenter messaging is done. See the comments in the Single File Coordination section below. This option has no effect when what’s being moved is a plain file so you can use it in code that moves file system items without checking whether the items are files or directories. Any such check would invite a race condition anyway.

For example, Finder uses this when it’s moving items that the user has dragged and dropped so as not to yank files contained by moved folders out from underneath applications that are reading or writing those files.

87.4.32  NSFileCoordinatorWritingForReplacing = 8

MBS MacCloud Plugin, Plugin Version: 11.2. **Function:** One of the writing flag constants.
**Notes:**
Whether the writing to be done is actually the replacement of the item with a different item. It causes the same behavior as NSFileCoordinatorWritingForDeleting except that when the item being written to is
renamed or moved while the writer is being made to wait the item is considered to have been a different item, so the writer is not passed an updated URL to reflect the renaming or moving. Use this when the moving or creation of an item will replace any item that gets in its way. To avoid a race condition use it regardless of whether there is actually an item in the way before the writing begins. Don’t use this when simply updating the contents of a file, even if the way you do that is writing the contents to another file and renaming it into place. This is not a valid option to use with prepareForReadingItemsAtURLs.

For example, NSDocument uses this for NSSaveAsOperation and NSSaveToOperation to announce that it is possibly overwriting an item with a brand new file or file package. This gives any NSFilePresenter of the overwritten item, including perhaps a different instance of NSDocument, perhaps in the same application, a chance to close itself before the item is overwritten.

For another example, the most accurate and safe way to coordinate a move is to invoke coordinateWritingItemAtURL using the NSFileCoordinatorWritingForMoving option with the source URL and NSFileCoordinatorWritingForReplacing with the destination URL.
87.5. class NSFileManagerMBS

87.5.1 class NSFileManagerMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The NSFileManager class enables you to perform many generic file-system operations and insulates an application from the underlying file system.

Notes:
In Real Studio you can do the same with folderitem. But for some iCloud related tasks you need to use this class.

In Cocoa applications, a file manager object is usually your first interaction with the file system. You use this object to locate, create, copy, and move files and directories. You also use this object to get information about files and directories, such as its size, modification date, and BSD permissions. You can also use a file manager object to change the values of many file and directory attributes.

The NSFileManagerMBS class supports both the folderitem and path string as ways to specify the location of a file or directory. The use of the folderitem is generally preferred for specifying file-system items because they can convert path information to a more efficient representation internally. You can also obtain a bookmark from an folderitem, which is similar to an alias and offers a more sure way of locating the file or directory later.

In iOS 5.0 and later and in Mac OS X v10.7 and later, NSFileManager includes methods for managing items stored in the cloud. Files and directories tagged for cloud storage are synced to the user’s MobileMe account so that they can be made available to the user’s iOS devices and Macintosh computers. Changes to an item in one location are propagated to all other locations to ensure the items stay in sync.

87.5.2 Methods

87.5.3 attributesOfItemAtPath(item as folderitem, byref error as NSErrorMBS) as Dictionary

Example:

```pascal
dim n as new NSFileManagerMBS
dim e as NSErrorMBS
dim d as Dictionary = n.attributesOfItemAtPath(SpecialFolder.Desktop, e)
break // check dictionary in debugger
```
Notes:

item: The folderitem of a file or directory.
Error: If an error occurs, this is set to an actual error object containing the error information.

Return a Dictionary object that describes the attributes (file, directory, symlink, and so on) of the file specified by path. The keys in the dictionary are described in File Attribute Keys. (see NSFile* shared methods)

Special Considerations
This method does not traverse symbolic links. If the item at the path is a symbolic link that is, the value of the NSFileType key in the attributes dictionary is NSFileTypeSymbolicLink you can use the destinationOfSymbolicLinkAtPath method to retrieve the path of the item pointed to by the link. You can also use the stringByResolvingSymlinksInPath method of NSString to resolve links in the path before retrieving the item’s attributes.

Available in Mac OS X v10.5 and later.
See also:

• 87.5.4 attributesOfItemAtPath(path as string, byref error as NSErrorMBS) as Dictionary

87.5.4 attributesOfItemAtPath(path as string, byref error as NSErrorMBS) as Dictionary

Function: Returns the attributes of the item at a given path.
Notes:

path: The path of a file or directory.
Error: If an error occurs, this is set to an actual error object containing the error information.

Return a Dictionary object that describes the attributes (file, directory, symlink, and so on) of the file specified by path. The keys in the dictionary are described in File Attribute Keys. (see NSFile* shared methods)

Special Considerations
This method does not traverse symbolic links. If the item at the path is a symbolic link that is, the value of the NSFileType key in the attributes dictionary is NSFileTypeSymbolicLink you can use the destinationOfSymbolicLinkAtPath method to retrieve the path of the item pointed to by the link. You can also use the stringByResolvingSymlinksInPath method of NSString to resolve links in the path before retrieving the item’s attributes.

Available in Mac OS X v10.5 and later.
See also:

• 87.5.3 attributesOfItemAtPath(item as folderitem, byref error as NSErrorMBS) as Dictionary
87.5.5  changeCurrentDirectory(folder as folderitem) as boolean

**Function:** Changes the path of the current working directory to the specified path.

**Example:**

```vbs
dim m as new NSFileManagerMBS
dim f as FolderItem = SpecialFolder.Applications
if m.changeCurrentDirectory(f) then
    MsgBox m.currentDirectory.AbsolutePath
end if
```

**Notes:**

- folder: The path of the directory to which to change.

  Returns true if successful, otherwise false.

  All relative pathnames refer implicitly to the current working directory. Changing the current working directory affects only paths created in the current process.

  See also:

  - 87.5.6 changeCurrentDirectory(path as string) as boolean

87.5.6  changeCurrentDirectory(path as string) as boolean

**Function:** Changes the path of the current working directory to the specified path.

**Example:**

```vbs
dim m as new NSFileManagerMBS
if m.changeCurrentDirectory("/Users") then
    MsgBox m.currentDirectoryPath
end if
```

**Notes:**

- path: The path of the directory to which to change.

  Returns true if successful, otherwise false.

  All relative pathnames refer implicitly to the current working directory. Changing the current working directory affects only paths created in the current process.
See also:

- 87.5.5 changeCurrentDirectory(folder as folderitem) as boolean

87.5.7 Constructor

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

87.5.8 containerFolderForSecurityApplicationGroupIdentifier(groupIdentifier as string) as folderItem

MBS MacCloud Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the container directory associated with the specified security application group ID. **Notes:**

As explained in App Sandbox Design Guide, groups of sandboxed apps that need to share files and other information can request a container directory as part of their entitlements. These directories are stored in `~/Library/Group Containers/`.

When called with a valid group identifier, this method returns the location of that directory as an folderItem. This method also creates the directory if it does not yet exist.

Important: Your app must have a com.apple.security.application-groups entitlement for the specified application group.

Available in OS X v10.8 and later.

87.5.9 containerURLForSecurityApplicationGroupIdentifier(groupIdentifier as string) as string

MBS MacCloud Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the container directory associated with the specified security application group ID. **Notes:**

As explained in App Sandbox Design Guide, groups of sandboxed apps that need to share files and other information can request a container directory as part of their entitlements. These directories are stored in `~/Library/Group Containers/`.

When called with a valid group identifier, this method returns the location of that directory as an URL. This method also creates the directory if it does not yet exist.
Important: Your app must have a com.apple.security.application-groups entitlement for the specified application group.

Available in OS X v10.8 and later.

**87.5.10 copyItem**

(source as folderItem, dest as folderItem, byref error as NSErrorMBS) as boolean

**Function:** Copies the item at the specified path to a new location synchronously.

**Notes:**

- **Source:** The path to the file or directory you want to move.
- **Dest:** The path at which to place the copy of srcPath. This path must include the name of the file or directory in its new location.
- **error:** If an error occurs, this is set to an actual error object containing the error information.

Returns true if the item was copied successfully or the file manager’s delegate aborted the operation deliberately. Returns false if an error occurred.

When copying items, the current process must have permission to read the file or directory at Source and write the parent directory of Dest. If the item at Source is a directory, this method copies the directory and all of its contents, including any hidden files. If a file with the same name already exists at Dest, this method aborts the copy attempt and returns an appropriate error. If the last component of srcPath is a symbolic link, only the link is copied to the new path.

Available in OS X v10.5 and later.

**87.5.11 copyItemMT**

(source as folderItem, dest as folderItem, byref error as NSErrorMBS) as boolean

**Function:** Copies the item at the specified path to a new location synchronously.

**Example:**

```dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim d as FolderItem = SpecialFolder.Desktop.Child("output.rtf")
dim e as NSErrorMBS
if not NSFileManagerMBS.copyItemMT(f,d,e) then```

if not NSFileManagerMBS.copyItemMT(f,d,e) then
MsgBox e.LocalizedDescription
else
MsgBox "OK"
end if

Notes:
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

Source: The path to the file or directory you want to move.
Dest: The path at which to place the copy of srcPath. This path must include the name of the file or directory in its new location.
error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if the item was copied successfully or the file manager’s delegate aborted the operation deliberately. Returns false if an error occurred.

When copying items, the current process must have permission to read the file or directory at Source and write the parent directory of Dest. If the item at Source is a directory, this method copies the directory and all of its contents, including any hidden files. If a file with the same name already exists at Dest, this method aborts the copy attempt and returns an appropriate error. If the last component of srcPath is a symbolic link, only the link is copied to the new path.

Available in OS X v10.5 and later.

87.5.12 createSymbolicLink(file as folderitem, destFile as folderitem, byref error as NSErrorMBS) as boolean

Function: Creates a symbolic link at the specified URL that points to an item at the given URL.
Example:

```
dim m as new NSFileManagerMBS
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim destfile as FolderItem = SpecialFolder.Desktop.Child("Notes.rtf")
dim error as NSErrorMBS

if m.createSymbolicLink(file, destfile, error) then
    MsgBox "OK"
else
    MsgBox "Error: " + error.localizedDescription
```
87.5.  CLASS NSFILEMANAGERMBS

end if

Notes:

file: The path at which to create the new symbolic link. The last path component is used as the name of
the link.
destFile: The path that contains the item to be pointed to by the link. In other words, this is the destination
of the link.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true if the symbolic link was created or false if an error occurred. This method also returns false if
a file, directory, or link already exists at path.

This method does not traverse symbolic links contained in either path or destPath.

Available in Mac OS X v10.5 and later.
As of Mac OS X 10.7 tests here, it seems like an alias file is created, not a symbolic link.
See also:

• 87.5.13 createSymbolicLink(path as string, destPath as string, byref error as NSErrorMBS) as boolean

87.5.13  createSymbolicLink(path as string, destPath as string, byref error as NSErrorMBS) as boolean

Function: Creates a symbolic link that points to the specified destination.
Notes:

path: The path at which to create the new symbolic link. The last path component is used as the name of
the link.
destPath: The path that contains the item to be pointed to by the link. In other words, this is the destination
of the link.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true if the symbolic link was created or false if an error occurred. This method also returns false if
a file, directory, or link already exists at path.

This method does not traverse symbolic links contained in either path or destPath.

Available in Mac OS X v10.5 and later.
As of Mac OS X 10.7 tests here, it seems like an alias file is created, not a symbolic link.
87.5.14  currentDirectory as folderitem

Function: Returns the path of the program’s current directory.
Example:

dim m as new NSFileManagerMBS
dim f as FolderItem = SpecialFolder.Applications
if m.changeCurrentDirectory(f) then
    MsgBox m.currentDirectory.AbsolutePath
end if

Notes:
Returns the path of the program’s current directory. If the program’s current working directory isn’t accessible, returns nil.

The string returned by this method is initialized to the current working directory; you can change the working directory by invoking changeCurrentDirectoryPath.

Relative pathnames refer implicitly to the current directory. For example, if the current directory is /tmp, and the relative pathname reports/info.txt is specified, the resulting full pathname is /tmp/reports/info.txt.

87.5.15  currentDirectoryPath as string

Function: Returns the path of the program’s current directory as string.
Example:

dim m as new NSFileManagerMBS
MsgBox m.currentDirectoryPath

Notes:
Returns the path of the program’s current directory. If the program’s current working directory isn’t accessible, returns "".
The string returned by this method is initialized to the current working directory; you can change the working directory by invoking changeCurrentDirectoryPath.

Relative pathnames refer implicitly to the current directory. For example, if the current directory is /tmp, and the relative pathname reports/info.txt is specified, the resulting full pathname is /tmp/reports/info.txt.

### 87.5.16 destinationOfSymbolicLinkAtPath(file as folderitem, byref error as NSErrorMBS) as string

**Function:** Returns the path of the item pointed to by a symbolic link.
**Notes:**

- file: The folderitem of a file or directory. Be aware that Xojo may already have resolved the symlink!
- error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns a string containing the path of the directory or file to which the symbolic link path refers, or "" upon failure. If the symbolic link is specified as a relative path, that relative path is returned.

See also:

- 87.5.17 destinationOfSymbolicLinkAtPath(path as string, byref error as NSErrorMBS) as string

### 87.5.17 destinationOfSymbolicLinkAtPath(path as string, byref error as NSErrorMBS) as string

**Function:** Returns the path of the item pointed to by a symbolic link.
**Example:**

```vbnet
dim f as new NSFileManagerMBS
dim e as NSErrorMBS

dim p as string = f.destinationOfSymbolicLinkAtPath("/tmp", e)

if e = nil then
    MsgBox p
else
    MsgBox e.LocalizedDescription
end if
```

**Notes:**

- path: The path of a file or directory.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns a string containing the path of the directory or file to which the symbolic link path refers, or "" upon failure. If the symbolic link is specified as a relative path, that relative path is returned.
See also:

- 87.5.16 destinationOfSymbolicLinkAtPath(file as folderitem, byref error as NSErrorMBS) as string

87.5.18 displayName(path as folderitem) as string

Function: Returns the display name of the file or directory at a specified path.
Notes:

path: The path of a file or directory.

The name of the file or directory at path in a localized form appropriate for presentation to the user. If there is no file or directory at path, or if an error occurs, returns path as is.

Display names are user-friendly names for files. They are typically used to localize standard file and directory names according to the user's language settings. They may also reflect other modifications, such as the removal of filename extensions. Such modifications are used only when displaying the file or directory to the user and do not reflect the actual path to the item in the file system. For example, if the current user’s preferred language is French, the following code fragment logs the name Bibliothèque and not the name Library, which is the actual name of the directory.

87.5.19 evictUbiquitousItem(item as folderitem, byref error as NSErrorMBS) as boolean

Function: Removes the local copy of the specified cloud-based item.
Notes:

item: Specify the file or directory in iCloud storage.
error: If an error occurs, this pointer is set to an NSError object containing information about the error.

Returns true if the local item was removed successfully or false if it was not. If false is returned, an NSError object describing the error is returned in the error parameter.

This method does not remove the item from the cloud. It removes only the local version. You can use this method to force iCloud to download a new version of the file or directory from the server.
87.5. CLASS NSFILEMANAGERMBS

To delete a file permanently from the user’s iCloud storage, use the regular NSFileManager routines for deleting files and directories. Remember that deleting items from iCloud cannot be undone. Once deleted, the item is gone forever.

Available in Mac OS X v10.7 and later.

87.5.20 fileExists(path as folderitem) as boolean

**Function:** Returns a Boolean value that indicates whether a file or directory exists at a specified path.

**Example:**

```vbnet
dim m as new NSFileManagerMBS
dim f as FolderItem = SpecialFolder.Desktop.Child("notes.rtf")

MsgBox "File exists: " + str(m.fileExists(f))
```

**Notes:**

- path: The path of the file or directory. I

Returns true if a file at the specified path exists or false if the file’s does not exist or its existence could not be determined.

If the file at path is inaccessible to your application, perhaps because one or more parent directories are inaccessible, this method returns false. If the final element in path specifies a symbolic link, this method traverses the link and returns true or false based on the existence of the file at the link destination.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior or race conditions. It’s far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle those errors gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see Race Conditions, File Operations, and Interprocess Communication in Secure Coding Guide.

See also:

- 87.5.21 fileExists(path as folderitem, byref isDirectory as boolean) as boolean
87.5.21  fileExists(path as folderitem, byref isDirectory as boolean) as boolean

**Function:** Returns a Boolean value that indicates whether a file or directory exists at a specified path. 
**Example:**

```vbnet
dim m as new NSFileManagerMBS
dim f as FolderItem = SpecialFolder.Desktop

dim directory as Boolean
MsgBox "File exists: " + str(m.fileExists(f, directory)) + " and is Directory: " + str(Directory)
```

**Notes:**
- **path:** The path of a file or directory. 
- **isDirectory:** Upon return, contains true if path is a directory or if the final path element is a symbolic link that points to a directory, otherwise contains false. If path doesn’t exist, the return value is undefined.

Returns true if a file at the specified path exists or false if the file’s does not exist or its existence could not be determined.

If the file at path is inaccessible to your application, perhaps because one or more parent directories are inaccessible, this method returns false. If the final element in path specifies a symbolic link, this method traverses the link and returns true or false based on the existence of the file at the link destination.

If you need to further determine if path is a package, use the isFilePackageAtPath method of NSWorkspaceMBS.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior or race conditions. It’s far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle those errors gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see Race Conditions, File Operations, and Interprocess Communication in Secure Coding Guide.

See also:
- 87.5.20 fileExists(path as folderitem) as boolean

87.5.22  FileForUbiquityContainerIdentifier(containerIdentifier as string) as folderitem

**Function:** Returns the iCloud directory associated with the specified container ID.  
**Notes:**
containerID: Specify the container ID of the cloud-based storage container. The string you specify must not contain wildcards and must be of the form <TEAMID>.<CONTAINER>, where <TEAMID> is your development team ID and <CONTAINER> describes the bundle identifier of the container you want to access. The container identifiers for your application must be declared in the com.apple.developer.ubiquity-container-identifiers entitlement.

If you specify "", this method returns the first container listed in the com.apple.developer.ubiquity-container-identifiers entitlement.

Returns a folderitem pointing to the specified container directory or nil if the container could not be located or if iCloud storage is unavailable for the current user or device.

You can use the folderitem returned by this method to build paths to files and directories in the user’s iCloud storage. Each application that syncs documents to the cloud must have at least one associated container directory in which to put those files. This container directory can be unique to the application or shared by multiple applications. You use this method to retrieve the folderitem for that container directory.

In addition to writing to its own container directory, an application can write to any container directory for which it has the appropriate permission. Each additional container directory should be listed as an additional value in the com.apple.developer.ubiquity-container-identifiers entitlement.

Note: The development team ID that precedes each container ID string is the unique identifier associated with your development team. You can find this string in the Member Center of the Apple Developer website (http://developer.apple.com/membercenter). From the Member Center home page, select the Your Account tab and then select Organization Profile from the column on the left of that tab. Your team’s identifier is in the Company/Organization ID field.

The first time you call this method for a given container directory, iOS extends your application sandbox to include that container directory. Thus, it is important that you call this method at least once before trying to search for files in iCloud. And if your application accesses multiple container directories, you should call the method once for each directory.

Available in Mac OS X v10.7 and later.

FileForUbiquityContainerIdentifier returns folderitem while URLForUbiquityContainerIdentifier returns URL string.

**87.5.23 isDeletableFile(path as folderitem) as boolean**

Function: Returns a Boolean value that indicates whether the invoking object appears able to delete a specified file.

Example:

```ruby
dim m as new NSFileManagerMBS
dim f as FolderItem = SpecialFolder.Desktop.Child("notes.rtf")
```
MsgBox "Can delete: " + str(m.isDeletableFile(f))

Notes:
path: A file path.

Returns true if the current process has delete privileges for the file at path; otherwise false if the process does not have delete privileges or the existence of the file could not be determined.

For a directory or file to be deletable, the current process must either be able to write to the parent directory of path or it must have the same owner as the item at path. If path is a directory, every item contained in path must be deletable by the current process.

If the file at path is inaccessible to your application, perhaps because it does not have search privileges for one or more parent directories, this method returns false. This method does not traverse symbolic links in the path.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior or race conditions. It’s far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle those errors gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see Race Conditions, File Operations, and Interprocess Communication in Secure Coding Guide.

87.5.24 \hspace{1em} isExecutableFile(path as folderitem) as boolean

Function: Returns a Boolean value that indicates whether the operating system appears able to execute a specified file.
Example:

```vba
dim m as new NSFileManagerMBS
dim f as FolderItem = SpecialFolder.Desktop.Child("notes.rtf")
MsgBox "Can execute: " + str(m.isExecutableFile(f))
```

Notes:
path: A file path.

Returns true if the current process has execute privileges for the file at path; otherwise false if the process does not have execute privileges or the existence of the file could not be determined.

If the file at path is inaccessible to your application, perhaps because it does not have search privileges for one or more parent directories, this method returns false. This method traverses symbolic links in the path. This method also uses the real user ID and group ID, as opposed to the effective user and group IDs, to determine if the file is executable.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior or race conditions. It’s far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle those errors gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see Race Conditions, File Operations, and Interprocess Communication in Secure Coding Guide:

87.5.25  isReadableFile(path as folderitem) as boolean

Function: Returns a Boolean value that indicates whether the invoking object appears able to read a specified file.  
Example:

dim m as new NSFileManagerMBS
dim f as FolderItem = SpecialFolder.Desktop.Child("notes.rtf")

MsgBox "Can read: "+str(m.isReadableFile(f))

Notes:

path: A file path.

Returns true if the current process has read privileges for the file at path; otherwise false if the process does not have read privileges or the existence of the file could not be determined.

If the file at path is inaccessible to your application, perhaps because it does not have search privileges for one or more parent directories, this method returns false. This method traverses symbolic links in the path. This method also uses the real user ID and group ID, as opposed to the effective user and group IDs, to determine if the file is readable.
Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior or race conditions. It’s far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle those errors gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see Race Conditions, File Operations, and Interprocess Communication in Secure Coding Guide.

87.5.26  isUbiquitousItem(item as folderitem) as boolean

Function: Returns a Boolean indicating whether the item is targeted for storage in iCloud.
Example:

dim m as new NSFileManagerMBS
dim f as FolderItem = SpecialFolder.Desktop.Child("notes.rtf")

MsgBox "Is in iCloud: " + str(m.isUbiquitousItem(f))

Notes:

item: Specify the folderitem for the file or directory whose status you want to check.

Returns true if the item is targeted for iCloud storage or false if it is not. This method also returns false if no item exists at url.

This method reflects only whether the item should be stored in iCloud because a call was made to the setUbiquitous method with a value of true for its flag parameter. This method does not reflect whether the file has actually been uploaded to any iCloud servers. To determine a file’s upload status, check the IsUploadedMBS function in the folderitem class.

Available in Mac OS X v10.7 and later.
See also:

• 87.5.27 isUbiquitousItem(URL as string) as boolean

87.5.27  isUbiquitousItem(URL as string) as boolean

Function: Returns a Boolean indicating whether the item is targeted for storage in iCloud.
Notes:

item: Specify the URL for the file or directory whose status you want to check.

Returns true if the item is targeted for iCloud storage or false if it is not. This method also returns false if no item exists at url.

This method reflects only whether the item should be stored in iCloud because a call was made to the setUbiquitous method with a value of true for its flag parameter. This method does not reflect whether the file has actually been uploaded to any iCloud servers. To determine a file’s upload status, check the IsUploadedMBS function in the folderitem class.

Available in Mac OS X v10.7 and later.
See also:

• 87.5.26 isUbiquitousItem(item as folderitem) as boolean

87.5.28  isWritableFile(path as folderitem) as boolean

Function: Returns a Boolean value that indicates whether the invoking object appears able to write to a specified file.
Example:

dim m as new NSFileManagerMBS
dim f as FolderItem = SpecialFolder.Desktop.Child("notes.rtf")

MsgBox "Can write: " + str(m.isWritableFile(f))

Notes:

path: A file path.

Returns true if the current process has write privileges for the file at path; otherwise false if the process does not have write privileges or the existence of the file could not be determined.

If the file at path is inaccessible to your application, perhaps because it does not have search privileges for one or more parent directories, this method returns false. This method traverses symbolic links in the path. This method also uses the real user ID and group ID, as opposed to the effective user and group IDs, to determine if the file is writable.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior or race conditions. It’s far better
to attempt an operation (such as loading a file or creating a directory), check for errors, and handle those
erors gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more
information on file system race conditions, see Race Conditions, File Operations, and Interprocess Commu-
nication in Secure Coding Guide:
Conditions.html# //apple_ref/doc/uid/TP40002585

87.5.29  lastPathComponent(pathOrURL as string) as string

MBS MacCloud Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the last path component of a file URL or file path.
Notes: Available in Mac OS X v10.6 and later.

87.5.30  linkItem(source as folderItem, dest as folderItem, byref error as NSErrorMBS) as boolean

Notes:
Source: The path that specifies the item you wish to link to. The value in this parameter must not be nil.
Dest: The path that identifies the location where the link will be created. The value in this parameter must
not be nil.
error: If an error occurs, this pointer is set to an actual error object containing the error information.
Returns true if the hard link was created or NO if an error occurred. This method also returns false if a file,
directory, or link already exists at dstPath.
Use this method to create hard links between files in the current file system. If Source is a directory, this
method creates a new directory at Dest and then creates hard links for the items in that directory. If Source is
(or contains) a symbolic link, the symbolic link is copied to the new location and not converted to a hard link.
Available in OS X v10.5 and later.

87.5.31  moveItem(source as folderItem, dest as folderItem, byref error as NSErrorMBS) as boolean

MBS MacCloud Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Moves the file or directory at the specified path to a new location synchronously.
Notes:
source: The path to the file or directory you want to move. This parameter must not be nil.
dest: The new path for the item in Source. This path must include the name of the file or directory in its
new location. This parameter must not be nil.
error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if the item was moved successfully or the file manager’s delegate aborted the operation deliber-
ately. Returns NO if an error occurred.

When moving items, the current process must have permission to read the item at Source and write the
parent directory of Dest. If the item at Source is a directory, this method moves the directory and all of
its contents, including any hidden files. If an item with the same name already exists at Dest, this method
aborts the move attempt and returns an appropriate error. If the last component of Source is a symbolic
link, only the link is moved to the new path; the item pointed to by the link remains at its current location.

If the source and destination of the move operation are not on the same volume, this method copies the item
first and then removes it from its current location. This behavior may trigger additional delegate notifica-
tions related to copying and removing individual items.

Available in OS X v10.5 and later.

87.5.32  NSFileAppendOnly as string

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes,
attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.
Notes:
The key in a file attribute dictionary whose value indicates whether the file is read-only.
The corresponding value is a number containing a Boolean value.
Available in Mac OS X v10.2 and later.

87.5.33  NSFileBusy as string

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes,
attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.
Notes:
The key in a file attribute dictionary whose value indicates whether the file is busy.
The corresponding value is a number containing a Boolean value.
Available in Mac OS X v10.4 and later.
87.5.34  **NSFileCreationDate as string**

MBS MacCloud Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath. **Notes:** The key in a file attribute dictionary whose value indicates the file’s creation date. The corresponding value is a date. Available in Mac OS X v10.2 and later.

87.5.35  **NSFileDeviceIdentifier as string**

MBS MacCloud Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath. **Notes:** The key in a file attribute dictionary whose value indicates the identifier for the device on which the file resides. The corresponding value is a number containing an Int32. Available in Mac OS X v10.0 and later.

87.5.36  **NSFileExtensionHidden as string**

MBS MacCloud Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath. **Notes:** The key in a file attribute dictionary whose value indicates whether the file’s extension is hidden. The corresponding value is a number containing a Boolean value. Available in Mac OS X v10.1 and later.

87.5.37  **NSFileGroupOwnerAccountID as string**

MBS MacCloud Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath. **Notes:** The key in a file attribute dictionary whose value indicates the file’s group ID. The corresponding value is a number containing an Int32.
87.5.38 **NSFileGroupOwnerAccountName as string**

**Function:** One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.
**Notes:**
The key in a file attribute dictionary whose value indicates the group name of the file’s owner.
The corresponding value is a string.
Available in Mac OS X v10.0 and later.

87.5.39 **NSFileHFSCreatorCode as string**

**Function:** One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.
**Notes:**
The key in a file attribute dictionary whose value indicates the file’s HFS creator code.
The corresponding value is a number containing an Int32. See "HFS File Types" for possible values.
Available in Mac OS X v10.1 and later.

87.5.40 **NSFileHFSTypeCode as string**

**Function:** One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.
**Notes:**
The key in a file attribute dictionary whose value indicates the file’s HFS type code.
The corresponding value is a number containing an Int32. See "HFS File Types" for possible values.
Available in Mac OS X v10.1 and later.

87.5.41 **NSFileImmutable as string**

**Function:** One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.
**Notes:**
The key in a file attribute dictionary whose value indicates whether the file is mutable. The corresponding value is a number containing a Boolean value. Available in Mac OS X v10.2 and later.

87.5.42 **NSFileModificationDate as string**

**Function:** One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.
**Notes:**
The key in a file attribute dictionary whose value indicates the file's last modified date. The corresponding value is a date. Available in Mac OS X v10.0 and later.

87.5.43 **NSFileOwnerAccountID as string**

**Function:** One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.
**Notes:**
The key in a file attribute dictionary whose value indicates the file's owner's account ID. The corresponding value is a number containing an Int32. Available in Mac OS X v10.2 and later.

87.5.44 **NSFileOwnerAccountName as string**

**Function:** One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.
**Notes:**
The key in a file attribute dictionary whose value indicates the name of the file's owner. The corresponding value is a string. Available in Mac OS X v10.0 and later.

87.5.45 **NSFilePosixPermissions as string**

**Function:** One of the keys to access file attribute values contained in dictionary used by setAttributes,
attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.

Notes:
The key in a file attribute dictionary whose value indicates the file's Posix permissions.
The corresponding value is a number.
Available in Mac OS X v10.0 and later.

87.5.46 NSFileReferenceCount as string

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes,
attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.
Notes:
The key in a file attribute dictionary whose value indicates the file's reference count.
The corresponding value is a number containing an Int32.
The number specifies the number of hard links to a file.
Available in Mac OS X v10.0 and later.

87.5.47 NSFileSize as string

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes,
attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.
Notes:
The key in a file attribute dictionary whose value indicates the file's size in bytes.
The corresponding value is a number containing an Int64.
Important If the file has a resource fork, the returned value does not include the size of the resource fork.

87.5.48 NSFileSystemFileNumber as string

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes,
attributesOfItemAtPath, createDirectoryAtPath, and createFileAtPath.
Notes:
The key in a file attribute dictionary whose value indicates the file's filesystem file number.
The corresponding value is a number containing an Int32. The value corresponds to the value of st_ino, as returned by stat(2).
Available in Mac OS X v10.0 and later.
87.5.49 NSFileSystemFreeNodes as string

**Function:** One of the keys to access the file attribute values contained in the dictionary object returned from the attributesOfFilesystemForPath function.
**Notes:**
The key in a file system attribute dictionary whose value indicates the number of free nodes in the file system.
The corresponding value is a number that specifies the number of free nodes in the file system.
Available in Mac OS X v10.0 and later.

87.5.50 NSFileSystemFreeSize as string

**Function:** One of the keys to access the file attribute values contained in the dictionary object returned from the attributesOfFilesystemForPath function.
**Notes:**
The key in a file system attribute dictionary whose value indicates the amount of free space on the file system.
The corresponding value is a number that specifies the amount of free space on the file system in bytes. The value is determined by statfs().
Available in Mac OS X v10.0 and later.

87.5.51 NSFileSystemNodes as string

**Function:** One of the keys to access the file attribute values contained in the dictionary object returned from the attributesOfFilesystemForPath function.
**Notes:**
The key in a file system attribute dictionary whose value indicates the number of nodes in the file system.
The corresponding value is a number that specifies the number of nodes in the file system.
Available in Mac OS X v10.0 and later.

87.5.52 NSFileSystemNumber as string

**Function:** One of the keys to access the file attribute values contained in the dictionary object returned from the attributesOfFilesystemForPath function.
**Notes:**
The key in a file system attribute dictionary whose value indicates the filesystem number of the file system.
The corresponding value is a number that specifies the filesystem number of the file system. The value corresponds to the value of \texttt{st.dev}, as returned by \texttt{stat(2)}.
Available in Mac OS X v10.0 and later.

87.5.53 \textbf{NSFileSystemSize as string}

\textbf{Function:} One of the keys to access the file attribute values contained in the dictionary object returned from the \texttt{attributesOfFileSystemForPath} function.
\textbf{Notes:}
The key in a file system attribute dictionary whose value indicates the size of the file system.
The corresponding value is a number that specifies the size of the file system in bytes. The value is determined by \texttt{statfs(\)}. Available in Mac OS X v10.0 and later.

87.5.54 \textbf{NSFileType as string}

\textbf{Function:} One of the keys to access file attribute values contained in dictionary used by \texttt{setAttributes}, \texttt{attributesOfItemAtPath}, \texttt{createDirectoryAtPath}, and \texttt{createFileAtPath}.
\textbf{Notes:}
The key in a file attribute dictionary whose value indicates the file's type.
The corresponding value is a string (see \texttt{NSFileType*} shared methods for possible values).
Available in Mac OS X v10.0 and later.

87.5.55 \textbf{NSFileTypeBlockSpecial as string}

\textbf{Function:} One of the possible \texttt{NSFileType} values.
\textbf{Example:}

```swift
// check first hard disc
dim e as NSErrorMBS
dim n as new NSFileManagerMBS
dim d as Dictionary = n.attributesOfItemAtPath("/dev/disk0", e)
MsgBox d.Value(n.NSFileType)
```
CHAPTER 87. ICLOUD

Notes: Block special file (e.g. hard disk)

87.5.56  **NSFileTypeCharacterSpecial as string**

MBS MacCloud Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible NSFileType values.  **Notes:** Character special file

87.5.57  **NSFileTypeDirectory as string**

MBS MacCloud Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible NSFileType values.  **Example:**

```plaintext
dim e as NSErrorMBS
dim n as new NSFileManagerMBS
dim d as Dictionary = n.attributesOfItemAtPath("/System", e)
MsgBox d.Value(n.NSFileType)
```

**Notes:** Directory

87.5.58  **NSFileTypeRegular as string**

MBS MacCloud Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible NSFileType values.  **Notes:** Regular file

87.5.59  **NSFileTypeSocket as string**

MBS MacCloud Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible NSFileType values.  **Notes:** Socket (a socket visible in file system as a file)

87.5.60  **NSFileTypeSymbolicLink as string**

MBS MacCloud Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible NSFileType values.
87.5.61 **NSFileTypeUnknown as string**

MBS MacCloud Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible NSFileType values. **Notes:** Unknown

87.5.62 **pathExtension(pathOrURL as string) as string**

MBS MacCloud Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the path extension of a file URL or file path. **Notes:** Available in Mac OS X v10.6 and later.

87.5.63 **removeItem(file as folderitem, byref error as NSErrorMBS) as boolean**

MBS MacCloud Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the file or directory at the specified path. **Notes:** path: A path string indicating the file or directory to remove. If the path specifies a directory, the contents of that directory are recursively removed. error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if the item was removed successfully or if path was nil. Returns false if an error occurred. If the delegate aborts the operation for a file, this method returns true. However, if the delegate aborts the operation for a directory, this method returns false.

Available in OS X v10.5 and later. See also:

- 87.5.64 **removeItem(path as string, byref error as NSErrorMBS) as boolean**

87.5.64 **removeItem(path as string, byref error as NSErrorMBS) as boolean**

MBS MacCloud Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the file or directory at the specified path. **Notes:**
CHAPTER 87. ICLOUD

path: A path string indicating the file or directory to remove. If the path specifies a directory, the contents of that directory are recursively removed.

error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if the item was removed successfully or if path was nil. Returns false if an error occurred. If the delegate aborts the operation for a file, this method returns true. However, if the delegate aborts the operation for a directory, this method returns false.

Available in OS X v10.5 and later.

See also:

- 87.5.63 removeItem(file as folderitem, byref error as NSErrorMBS) as boolean

87.5.65 setAttributes(attributesDic as dictionary, item as folderitem, byref error as NSErrorMBS) as boolean

Function: Sets the attributes of the specified file or directory.

Notes:

attributes: A dictionary containing as keys the attributes to set for path and as values the corresponding value for the attribute. You can set the following attributes: NSFileBusy, NSFileCreationDate, NSFileExtensionHidden, NSFileGroupOwnerAccountID, NSFileGroupOwnerAccountName, NSFileHFSCreatorCode, NSFileHFSFileTypeCode, NSFileImmutable, NSFileModificationDate, NSFileOwnerAccountID, NSFileOwnerAccountName, NSFilePosixPermissions. You can change single attributes or any combination of attributes; you need not specify keys for all attributes.

item: The folderitem of a file or directory.

error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if all changes succeed. If any change fails, returns false, but it is undefined whether any changes actually occurred.

Discussion

As in the POSIX standard, the application either must own the file or directory or must be running as superuser for attribute changes to take effect. The method attempts to make all changes specified in attributes and ignores any rejection of an attempted modification. If the last component of the path is a symbolic link it is traversed.

The NSFilePosixPermissions value must be initialized with the code representing the POSIX file-permissions bit pattern. NSFileHFSCreatorCode and NSFileHFSFileTypeCode will only be heeded when path specifies a file.

Available in Mac OS X v10.5 and later.

See also:
87.5.66  setAttributes(attributesDic as dictionary, path as string, byref error as NSErrorMBS) as boolean

Function: Sets the attributes of the specified file or directory.
Notes:
attributes: A dictionary containing as keys the attributes to set for path and as values the corresponding value for the attribute. You can set the following attributes: NSFileBusy, NSFile_creationDate, NSFileExtensionHidden, NSFileGroupOwnerAccountID, NSFileGroupOwnerAccountName, NSFileHFSCreatorCode, NSFileHFSTypeCode, NSFileImmutable, NSFileModificationDate, NSFileOwnerAccountID, NSFileOwnerAccountName, NSFilePosixPermissions. You can change single attributes or any combination of attributes; you need not specify keys for all attributes.
path: The path of a file or directory.
error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if all changes succeed. If any change fails, returns false, but it is undefined whether any changes actually occurred.

Discussion
As in the POSIX standard, the application either must own the file or directory or must be running as superuser for attribute changes to take effect. The method attempts to make all changes specified in attributes and ignores any rejection of an attempted modification. If the last component of the path is a symbolic link it is traversed.

The NSFilePosixPermissions value must be initialized with the code representing the POSIX file-permissions bit pattern. NSFileHFSCreatorCode and NSFileHFSTypeCode will only be heeded when path specifies a file.

Available in Mac OS X v10.5 and later.
See also:

• 87.5.65 setAttributes(attributesDic as dictionary, item as folderitem, byref error as NSErrorMBS) as boolean

87.5.67  setUbiquitous(flag as boolean, item as folderitem, destitem as folderitem, byref error as NSErrorMBS) as boolean

Function: Sets whether the item at the specified URL should be stored in the cloud.
Notes:

flag: Specify true to move the item to iCloud or false to remove it from iCloud (if it is there currently).

item: Specify the folderitem of the item (file or directory) that you want to store in iCloud.

destitem: Specify the location in iCloud at which to store the file or directory. This folderitem must be constructed from a folderitem returned by the URLForUbiquityContainerIdentifier method, which you use to retrieve the desired iCloud container directory. The folderitem you specify may contain additional subdirectories so that you can organize your files hierarchically in iCloud. However, you are responsible for creating those intermediate subdirectories (using the NSFileManagerMBS or folderitem class) in your iCloud container directory.

error: If an error occurs, this pointer is set to an NSError object containing information about the error. You may specify nil for this parameter if you do not want the error information.

Returns yes if the item’s status was updated successfully or false if an error occurred. If this method returns false and you specified a value for the error parameter, this method returns an error object.

Use this method to move a file from its current location to iCloud. For files located in an application’s sandbox, this involves physically removing the file from the sandbox directory. (The system extends your application’s sandbox privileges to give it access to files it moves to iCloud.) You can also use this method to move files out of iCloud and back into a local directory.

Your application must have an active file presenter object configured to monitor the specified file or directory before calling this method. When you specify true for the flag parameter, this method attempts to move the file or directory to the cloud and returns true if it is successful. This method also notifies your file presenter of the new location of the file so that your application can continue to operate on it.

Important: Do not call this method from your application’s main thread. This method performs a coordinated write operation on the file you specify, and calling this method from the main thread can trigger a deadlock with the file presenter you have monitoring the file. Instead, use a dispatch queue (other than the main thread queue) to perform the method call on a secondary thread. You can always message your main thread after the call finishes to update the rest of your application’s data structures.

Available in Mac OS X v10.7 and later.

- 87.5.68 setUbiquitous(flag as boolean, item as folderitem, destURL as string, byref error as NSErrorMBS) as boolean

87.5.68  setUbiquitous(flag as boolean, item as folderitem, destURL as string, byref error as NSErrorMBS) as boolean

Function: Sets whether the item at the specified URL should be stored in the cloud.

Notes:

flag: Specify true to move the item to iCloud or false to remove it from iCloud (if it is there currently).
item: Specify the `folderitem` of the item (file or directory) that you want to store in iCloud.

destitem: Specify the location in iCloud at which to store the file or directory. This `folderitem` must be constructed from a `folderitem` returned by the `URLForUbiquityContainerIdentifier` method, which you use to retrieve the desired iCloud container directory. The `folderitem` you specify may contain additional subdirectories so that you can organize your files hierarchically in iCloud. However, you are responsible for creating those intermediate subdirectories (using the `NSFileManagerMBS` or `folderitem` class) in your iCloud container directory.

error: If an error occurs, this pointer is set to an `NSError` object containing information about the error. You may specify nil for this parameter if you do not want the error information.

Returns yes if the item’s status was updated successfully or false if an error occurred. If this method returns false and you specified a value for the error parameter, this method returns an error object.

Use this method to move a file from its current location to iCloud. For files located in an application’s sandbox, this involves physically removing the file from the sandbox directory. (The system extends your application’s sandbox privileges to give it access to files it moves to iCloud.) You can also use this method to move files out of iCloud and back into a local directory.

Your application must have an active file presenter object configured to monitor the specified file or directory before calling this method. When you specify true for the flag parameter, this method attempts to move the file or directory to the cloud and returns true if it is successful. This method also notifies your file presenter of the new location of the file so that your application can continue to operate on it.

Important: Do not call this method from your application’s main thread. This method performs a coordinated write operation on the file you specify, and calling this method from the main thread can trigger a deadlock with the file presenter you have monitoring the file. Instead, use a dispatch queue (other than the main thread queue) to perform the method call on a secondary thread. You can always message your main thread after the call finishes to update the rest of your application’s data structures.

Available in Mac OS X v10.7 and later.

- 87.5.67 `setUbiquitous(flag as boolean, item as folderitem, destitem as folderitem, byref error as NSErrorMBS) as boolean` 14369

87.5.69 `startDownloadingUbiquitousItem(item as folderitem, byref error as NSErrorMBS) as boolean`

**Function:** Starts downloading (if necessary) the specified item to the local system.

**Notes:**

item: Specify the `folderitem` for the file or directory in the cloud that you want to download.

error: On input, a pointer to variable for an `NSError` object. If an error occurs, this pointer is set to an
NSError object containing information about the error. Y

Returns true if the download started successfully or was not necessary, otherwise false. If false is returned and error is not nil, an NSError object describing the error is returned in that parameter.

If a cloud-based file or directory has not been downloaded yet, calling this method starts the download process. If the item exists locally, calling this method synchronizes the local copy with the version in the cloud.

For a given folder item, you can determine if a file is downloaded by getting the value of the IsDownloaded method. You can also use related methods to determine the current progress in downloading the file.

Available in Mac OS X v10.7 and later.
See also:

- 87.5.69 startDownloadingUbiquitousItem(item as folderitem, byref error as NSErrorMBS) as boolean

87.5.70 startDownloadingUbiquitousItem(URL as string, byref error as NSErrorMBS) as boolean

Function: Starts downloading (if necessary) the specified item to the local system.
Notes:
item: Specify the URL for the file or directory in the cloud that you want to download.
error: On input, a pointer to variable for an NSError object. If an error occurs, this pointer is set to an NSError object containing information about the error. Y

Returns true if the download started successfully or was not necessary, otherwise false. If false is returned and error is not nil, an NSError object describing the error is returned in that parameter.

If a cloud-based file or directory has not been downloaded yet, calling this method starts the download process. If the item exists locally, calling this method synchronizes the local copy with the version in the cloud.

For a given folder item, you can determine if a file is downloaded by getting the value of the IsDownloaded method. You can also use related methods to determine the current progress in downloading the file.

Available in Mac OS X v10.7 and later.
See also:

- 87.5.69 startDownloadingUbiquitousItem(item as folderitem, byref error as NSErrorMBS) as boolean
87.5.71 `stringByAbbreviatingWithTildeInPath(path as string) as string`  

Function: Returns a new string that replaces the current home directory portion of the current path with a tilde (`textasciitilde`) character.  
Notes:  
A new string based on the current string object. If the new string specifies a file in the current home directory, the home directory portion of the path is replaced with a tilde (`textasciitilde`) character. If the string does not specify a file in the current home directory, this method returns a new string object whose path is unchanged from the path in the current string.  

Note that this method only works with file paths. It does not work for string representations of URLs.  

For sandboxed apps in OS X, the current home directory is not the same as the users home directory. For a sandboxed app, the home directory is the apps home directory. So if you specified a path of `/Users/<current_user>/file.txt` for a sandboxed app, the returned path would be unchanged from the original. However, if you specified the same path for an app not in a sandbox, this method would replace the `/Users/<current_user>`portion of the path with a tilde.

87.5.72 `stringByAppendingPathComponent(path as string, Component as string) as string`  

Function: Returns a new string made by appending to the receiver a given string.  
Notes:  
The following table illustrates the effect of this method on a variety of different paths, assuming that aString is supplied as scratch.tiff:  

<table>
<thead>
<tr>
<th>Receivers String Value</th>
<th>Resulting String</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/tmp</code></td>
<td><code>/tmp/scratch.tiff</code></td>
</tr>
<tr>
<td><code>/tmp/</code></td>
<td><code>/tmp/scratch.tiff</code></td>
</tr>
<tr>
<td><code>/</code></td>
<td><code>/scratch.tiff</code></td>
</tr>
<tr>
<td>(an empty string)</td>
<td><code>scratch.tiff</code></td>
</tr>
</tbody>
</table>

Note that this method only works with file paths (not, for example, string representations of URLs).
87.5.73  `stringByAppendingPathExtension(path as string, Extension as string)` as string

**Function:** Returns a new string made by appending to the receiver an extension separator followed by a given extension.
**Notes:**

The following table illustrates the effect of this method on a variety of different paths, assuming that ext is supplied as "tiff":

<table>
<thead>
<tr>
<th>Receivers String Value</th>
<th>Resulting String</th>
</tr>
</thead>
<tbody>
<tr>
<td>/tmp/scratch.old</td>
<td>/tmp/scratch.old.tiff</td>
</tr>
<tr>
<td>/tmp/scratch.</td>
<td>/tmp/scratch..tiff</td>
</tr>
<tr>
<td>/tmp/scratch</td>
<td>/tmp.tiff</td>
</tr>
<tr>
<td>scratch</td>
<td>scratch.tiff</td>
</tr>
</tbody>
</table>

Note that adding an extension to "/tmp/” causes the result to be "/tmp.tiff” instead of "/tmp/.tiff”. This difference is because a file named ".tiff” is not considered to have an extension, so the string is appended to the last nonempty path component.

Note that this method only works with file paths (not, for example, string representations of URLs).

**Special Considerations**

Prior to OS X v10.9 this method did not allow you to append file extensions to filenames starting with the tilde character (textasciitilde).

87.5.74  `stringByDeletingLastPathComponent(path as string)` as string

**Function:** Returns a new string made by deleting the last path component from the receiver, along with any final path separator.
**Notes:**

A new string made by deleting the last path component from the receiver, along with any final path separator. If the receiver represents the root path it is returned unaltered.

The following table illustrates the effect of this method on a variety of different paths:

Note that this method only works with file paths (not, for example, string representations of URLs).
87.5. stringByDeletingPathExtension(path as string) as string

Function: Returns a new string made by deleting the extension (if any, and only the last) from the receiver.

Notes:
A new string made by deleting the extension (if any, and only the last) from the receiver. Strips any trailing path separator before checking for an extension. If the receiver represents the root path, it is returned unaltered.

The following table illustrates the effect of this method on a variety of different paths:

<table>
<thead>
<tr>
<th>Receivers String Value</th>
<th>Resulting String</th>
</tr>
</thead>
<tbody>
<tr>
<td>/tmp/scratch.tiff</td>
<td>/tmp/scratch</td>
</tr>
<tr>
<td>/tmp/lock/</td>
<td>/tmp</td>
</tr>
<tr>
<td>/tmp/</td>
<td>/</td>
</tr>
<tr>
<td>/tmp</td>
<td>/</td>
</tr>
<tr>
<td>/</td>
<td>/</td>
</tr>
<tr>
<td>scratch.tiff</td>
<td>(an empty string)</td>
</tr>
</tbody>
</table>

Note that attempting to delete an extension from ".tiff" causes the result to be @".tiff" instead of an empty string. This difference is because a file named ".tiff" is not considered to have an extension, so nothing is deleted. Note also that this method only works with file paths (not, for example, string representations of URLs).

87.5.6 stringByExpandingTildeInPath(path as string) as string

Function: Returns a new string made by expanding the initial component of the receiver to its full path value.

Notes:
A new string made by expanding the initial component of the receiver, if it begins with textasciitilde  or
textasciitilde user, to its full path value. Returns a new string matching the receiver if the receivers initial component cant be expanded.

Note that this method only works with file paths (not, for example, string representations of URLs).

87.5.77 stringByResolvingSymlinksInPath(path as string) as string

Function: Returns a new string made from the receiver by resolving all symbolic links and standardizing path.
Notes:
A new string made by resolving all symbolic links, then removing extraneous path components. For absolute paths, all symbolic links are guaranteed to be removed. For relative paths, symbolic links that cant be resolved are left unresolved in the returned string.

Returns self if an error occurs.

Note that this method only works with file paths (not, for example, string representations of URLs).

87.5.78 stringByStandardizingPath(path as string) as string

Function: Returns a new string made by removing extraneous path components from the receiver.
Notes:
A new string made by performing the following operations:

- Expanding an initial tilde expression using stringByExpandingTildeInPath.
- Removing an initial component of /private/var/automount, /var/automount, or /private from the path, if the result still indicates an existing file or directory (checked by consulting the file system).
- Reducing empty components and references to the current directory (that is, the sequences // and ./.) to single path separators.
- Removing a trailing slash from the last component.
- For absolute paths only, resolving references to the parent directory (that is, the component ..) to the real parent directory if possible using stringByResolvingSymlinksInPath. For relative paths, references to the parent directory are left in place.
- Returns self if an error occurs.
Note that the path returned by this method may still have symbolic link components in it. Note also that this method only works with file paths (not, for example, string representations of URLs).

### 87.5.79 trashItem(file as folderItem, byref Resulting as folderItem, byref error as NSErrorMBS) as boolean

**Function:** Moves an item to the trash.

**Notes:**

Returns true if the item at url was successfully moved to the trash. Since the operation may require renaming the item to avoid a file name collision, this method returns, by reference, the resulting folderItem that the item was moved to.

If this method returns false, the item was not moved to the trash; the error parameter then contains information about the error.

Available in OS X v10.8 and later.

### 87.5.80 URLByAppendingPathComponent(URL as string, pathComponent as string) as string

**Function:** Returns a new URL made by appending a path component to the original URL.

**Notes:**

pathComponent: The path component to add to the URL.

Returns a new URL with pathComponent appended.

If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.

Available in Mac OS X v10.6 and later.

See also:

- 87.5.81 URLByAppendingPathComponent(URL as string, pathComponent as string, isDirectory as boolean) as string
87.5.81 URLByAppendingPathComponent(URL as string, pathComponent as string, isDirectory as boolean) as string

**Function:** Returns a new URL made by appending a path component to the original URL, along with a trailing slash if the component is designated a directory.

**Notes:**
- pathComponent: The path component to add to the URL.
- isDirectory: If true, a trailing slash is appended after pathComponent.
- Returns a new URL with pathComponent appended.

If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.

Available in Mac OS X v10.7 and later.

See also:
- 87.5.80 URLByAppendingPathComponent(URL as string, pathComponent as string) as string

87.5.82 URLByAppendingPathExtension(URL as string, pathExtension as string) as string

**Function:** Returns a new URL made by appending a path extension to the original URL.

**Notes:**
- pathExtension: The path extension to add to the URL.
- Returns a new URL with pathExtension appended.

If the original URL ends with one or more forward slashes, these are removed from the returned URL. A period is inserted between the two parts of the new URL.

Available in Mac OS X v10.6 and later.

87.5.83 URLByDeletingLastPathComponent(URL as string) as string

**Function:** Returns a new URL made by deleting the last path component from the original URL.

**Notes:**
- If the original URL represents the root path, the returned URL is identical. Otherwise, if the original URL...
has only one path component, the new URL is the empty string.
Available in Mac OS X v10.6 and later.

87.5.84 URLByDeletingPathExtension(URL as string) as string

**Function:** Returns a new URL made by deleting the path extension, if any, from the original URL.
**Notes:**
If the original URL represents the root path, the returned URL is identical. If the URL has multiple path extensions, only the last one is removed.
Available in Mac OS X v10.6 and later.

87.5.85 URLByResolvingSymlinksInPath(URL as string) as string

**Function:** Returns a new URL that points to the same resource as the original URL and includes no symbolic links.
**Notes:**
If the original URL has no symbolic links, the returned URL is identical to the original URL.
This method only works on URLs with the file: path scheme. This method will return an identical URL for all other URLs.
Available in Mac OS X v10.6 and later.

87.5.86 URLByStandardizingPath(URL as string) as string

**Function:** Returns a new URL that points to the same resource as the original URL and is an absolute path.
**Notes:**
This method only works on URLs with the file: path scheme. This method will return an identical URL for all other URLs.
Available in Mac OS X v10.6 and later.
CHAPTER 87. ICLOUD

87.5.87  URLForPublishingUbiquitousItem(item as folderitem, byref expirationDate as date, byref error as NSErrorMBS) as string

**Function:** Returns a URL that can be emailed to users to allow them to download a copy of a cloud-based item.

**Example:**

```dim m as new NSFileManagerMBS
dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim error as NSErrorMBS
dim exdate as date
dim url as string = m.URLForPublishingUbiquitousItem(f, exdate, error)
```

// always fails as desktop folder is not in cloud
if error<>nil then
    MsgBox error.localizedDescription
end if

**Notes:**

- url: Specify the URL of the item in the cloud that you want to share. The URL must be prefixed with the base URL returned from the URLForUbiquityContainerIdentifier method that corresponds to the item's location.
- expirationDate: On output, this parameter contains the date after which the item is no longer available at the returned URL.
- error: If an error occurs, this pointer is set to an NSError object containing information about the error.

Returns an URL with which users can download a copy of the item at url. Returns nil if the URL could not be created for any reason.

**Discussion**

This method creates a snapshot of the specified file and places that copy in a temporary iCloud location where it can be accessed by other users using the returned URL. The snapshot reflects the contents of the file at the time the URL was generated and is not updated when subsequent changes are made to the original file in the user's iCloud storage. The snapshot file remains available at the specified URL until the date specified in the outDate parameter, after which it is automatically deleted.

Your application must have access to the network for this call to succeed.
Available in Mac OS X v10.7 and later.

See also:

- 87.5.88 URLForPublishingUbiquitousItem(URL as string, byref expirationDate as date, byref error as NSErrorMBS) as string
87.5.88  URLForPublishingUbiquitousItem(URL as string, byref expirationDate as date, byref error as NSErrorMBS) as string

**Function:** Returns a URL that can be emailed to users to allow them to download a copy of a cloud-based item.

**Notes:**

- **url:** Specify the URL of the item in the cloud that you want to share. The URL must be prefixed with the base URL returned from the URLForUbiquityContainerIdentifier method that corresponds to the item’s location.
- **expirationDate:** On output, this parameter contains the date after which the item is no longer available at the returned URL.
- **error:** If an error occurs, this pointer is set to an NSError object containing information about the error.

Returns an URL with which users can download a copy of the item at url. Returns nil if the URL could not be created for any reason.

**Discussion**

This method creates a snapshot of the specified file and places that copy in a temporary iCloud location where it can be accessed by other users using the returned URL. The snapshot reflects the contents of the file at the time the URL was generated and is not updated when subsequent changes are made to the original file in the user’s iCloud storage. The snapshot file remains available at the specified URL until the date specified in the outDate parameter, after which it is automatically deleted.

Your application must have access to the network for this call to succeed.

Available in Mac OS X v10.7 and later.

See also:

- 87.5.87 URLForPublishingUbiquitousItem(item as folderitem, byref expirationDate as date, byref error as NSErrorMBS) as string

87.5.89  URLForUbiquityContainerIdentifier(containerIdentifier as string) as string

**Function:** Returns the iCloud directory associated with the specified container ID.

**Notes:**

- **containerID:** Specify the container ID of the cloud-based storage container. The string you specify must not contain wildcards and must be of the form `<TEAMID>..<CONTAINER>`, where `<TEAMID>` is your development team ID and `<CONTAINER>` describes the bundle identifier of the container you want to access. The container identifiers for your application must be declared in the com.apple.developer.ubiquity-container-identifiers entitlement.

If you specify "", this method returns the first container listed in the com.apple.developer.ubiquity-container-identifiers entitlement.
Returns a folderitem pointing to the specified container directory or nil if the container could not be located or if iCloud storage is unavailable for the current user or device.

You can use the folderitem returned by this method to build paths to files and directories in the user’s iCloud storage. Each application that syncs documents to the cloud must have at least one associated container directory in which to put those files. This container directory can be unique to the application or shared by multiple applications. You use this method to retrieve the folderitem for that container directory.

In addition to writing to its own container directory, an application can write to any container directory for which it has the appropriate permission. Each additional container directory should be listed as an additional value in the com.apple.developer.ubiquity-container-identifiers entitlement.

Note: The development team ID that precedes each container ID string is the unique identifier associated with your development team. You can find this string in the Member Center of the Apple Developer website (http://developer.apple.com/membercenter). From the Member Center home page, select the Your Account tab and then select Organization Profile from the column on the left of that tab. Your team’s identifier is in the Company/Organization ID field.

The first time you call this method for a given container directory, iOS extends your application sandbox to include that container directory. Thus, it is important that you call this method at least once before trying to search for files in iCloud. And if your application accesses multiple container directories, you should call the method once for each directory.

Available in Mac OS X v10.7 and later.

FileForUbiquityContainerIdentifier returns folderitem while URLForUbiquityContainerIdentifier returns URL string.

**87.5.90  Constants**

**87.5.91  NSDirectoryEnumerationSkipsHiddenFiles = 4**

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the option constants for enumerating the contents of directories with the contentsOfDirectoryAtURL method.

**Notes:**

Do not enumerate hidden files.

Available in Mac OS X v10.6 and later.

**87.5.92  NSDirectoryEnumerationSkipsPackageDescendants = 2**

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the option constants for enumerating the contents of directories with the contentsOfDirectoryAtURL method.

**Notes:**
Do not descend into packages.
Available in Mac OS X v10.6 and later.

87.5.93 NSDirectoryEnumerationSkipsSubdirectoryDescendants = 1

MBS MacCloud Plugin, Plugin Version: 11.3. Function: One of the option constants for enumerating the contents of directories with the contentsOfDirectoryAtURL method.
Notes:
Perform a shallow enumeration; do not descend into directories.
Available in Mac OS X v10.6 and later.

87.5.94 NSFileManagerItemReplacementUsingNewMetadataOnly = 1

MBS MacCloud Plugin, Plugin Version: 11.3. Function: One of the options constants to specify the replacement behavior in NSFileManagerItemReplacementWithoutDeletingBackupItem.
Notes:
Causes NSFileManagerItemReplacementWithoutDeletingBackupItem to use metadata from the new item only and not to attempt to preserve metadata from the original item.
Available in Mac OS X v10.6 and later.

87.5.95 NSFileManagerItemReplacementWithoutDeletingBackupItem = 2

MBS MacCloud Plugin, Plugin Version: 11.3. Function: One of the options constants to specify the replacement behavior in NSFileManagerItemReplacementWithoutDeletingBackupItem.
Notes:
Causes NSFileManagerItemReplacementWithoutDeletingBackupItem to leave the backup item in place after a successful replacement. The default behavior is to remove the item.
Available in Mac OS X v10.6 and later.

87.5.96 NSVolumeEnumerationProduceFileReferenceURLs = 4

MBS MacCloud Plugin, Plugin Version: 11.3. Function: One of the option constants for enumerating mounted volumes with the mountedVolumeURLsIncludingResourceValuesForKeys method.
Notes:
The enumeration produces file reference URLs rather than path-based URLs.
Available in Mac OS X v10.6 and later.
87.5.97  NSVolumeEnumerationSkipHiddenVolumes = 2

MBS MacCloud Plugin, Plugin Version: 11.3. **Function:** One of the option constants for enumerating mounted volumes with the mountedVolumeURLsIncludingResourceValuesForKeys method.  
**Notes:**  
The enumeration skips hidden volumes.  
Available in Mac OS X v10.6 and later.
87.6. CLASS NSFILEPRESENTERHANDLERMBS

87.6  class NSFilePresenterHandlerMBS

87.6.1  class NSFile Presenter HandlerMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The class for a callback. Notes: Some iCloud related functions in NSFileCoordinatorMBS or NSFilePresenterMBS require that you call a function to notify the caller that you are finished doing some work.

87.6.2  Methods

87.6.3  Destructor

87.6.4  Run(errorOrNil as NSErrorMBS = nil)

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Calls the callback. Notes: As some callbacks ask for an error object in case of an error, you can pass one. Other callbacks don’t take a parameter.
class NSFilePresenterMBS

Function: The plugin class to implement the NSFilePresenter protocol.
Notes:
A protocol to be implemented by objects that present the contents of files or directories to the user for viewing or editing. The objects can take an active role in operations that access those files or directories, even operations performed by other processes in the system. For an NSFilePresenter to be aware of such file access it must be "coordinated" file access. Starting in version 10.7 many components of Mac OS X use NSFileCoordinatorMBS, including AppKit, Finder, and various applications. NSDocument conforms to the NSFilePresenter protocol and has useful implementations of all of its methods. You are unlikely to have to implement NSFilePresenter yourself in an NSDocument-based application.

See the comments for NSFileCoordinator.Constructor for information about how an NSFilePresenter can avoid receiving messages about its own reading and writing.

You can consider "item" in method names in this header file to be an abbreviation of "fileOrDirectory." As always, a directory might actually be a file package.

Please also check the documentation from Apple for the NSFilePresenter protocol.

Methods

Constructor

Function: The constructor.

Destructor

Function: The destructor.
87.7. CLASS NSFILEPRESENTERMBS

87.7.5 Properties

87.7.6 Handle as Integer

87.7.7 Events

87.7.8 accommodatePresentedItemDeletionWithCompletionHandler(Complete as NSFilePresenterHandlerMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Tells your object that its presented item is about to be deleted. Notes: Complete: The complete handler object to call after updating your data structures. Pass nil to the run method’s errorOrNil parameter if you were able to successfully prepare for the deletion of the item. Pass an error object if your object could not prepare itself properly.

A file coordinator calls this method when your object’s presented item is about to be deleted. You can use this method to perform any actions that are needed to prepare for the deletion. For example, document objects typically use this method to close the document.

Important: If you implement this method, you must execute the run method in the complete parameter at the end of your implementation. The system waits for you to execute that method before allowing the other object to delete the file or directory. Therefore, failure to execute the method could stall threads in your application or other processes.

Available in Mac OS X v10.7 and later.

87.7.9 accommodatePresentedSubitemDeletionAtURL(URL as string, file as FolderItem, Complete as NSFilePresenterHandlerMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Tells the delegate that some entity wants to delete an item that is inside of a presented directory. (required) Notes: url: The URL of the item being deleted from the presented directory. The item need not be at the top level of the presented directory but may itself be inside a nested subdirectory.
file: URL as folderitem.

complete: The complete handler object to call after updating your data structures. Pass nil to the run method’s errorOrNil parameter if you were able to successfully prepare for the deletion of the item. Pass an error object if your object could not prepare itself properly.

This method is relevant for applications that present directories. This might occur if the delegate manages the contents of a directory or manages a file that is implemented as a file package. When called, your implementation of this method should take whatever actions needed to update your application to handle the deletion of the specified file.

Important: If you implement this method, you must execute the run method in the Complete parameter at the end of your implementation. The system waits for you to execute that method before allowing the other object to delete the item at the specified URL. Therefore, failure to execute the method could stall threads in your application or in other processes.

Available in Mac OS X v10.7 and later.

87.7.10 presentedItemDidChange

Function: This event is called when the item changed.

Notes: Be notified that the file or file package’s contents or attributes have been been written to. Because this method may be be invoked when the attributes have changed but the contents have not, implementations that read the contents must use modification date checking to avoid needless rereading. They should check that the modification date has changed since the receiver most recently read from or wrote to the item. To avoid race conditions, getting the modification date should typically be done within invocations of one of the NSFileCoordinatorMBS.coordinate... methods.

For example, NSDocument implements this method to react to both contents changes (like the user overwriting the document file with another application) and attribute changes (like the user toggling the "Hide extension" checkbox in a Finder info panel). It uses modification date checking as described above.

Not all programs use file coordination. Your NSFileProvider may be sent this message without being sent relinquishPresentedItemToWriter first. Make your application do the best it can in that case.

87.7.11 presentedItemDidGainVersion(version as NSFileVersionMBS)

Function: Be notified that something in the system has added a version of the file or file package.
87.7.12 presentedItemDidLoseVersion(version as NSFileVersionMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Be notified that something in the system has removed a version of the file or file package.

87.7.13 presentedItemDidMoveToURL(url as string, file as folderitem)

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Be notified that the file or directory has been moved or renamed, or a directory containing it has been moved or renamed.
**Notes:**
A typical implementation of this method will cause subsequent invocations of presentedItemURL to return the new URL.

The new URL may have a different file name extension than the current value of the presentedItemURL property.

For example, NSDocument implements this method to handle document file moving and renaming. A shoebox application would only implement this method to be robust against surprising things like the user moving its data directory while the application is running.

Not all programs use file coordination. Your NSFileProvider may be sent this message without being sent relinquishPresentedItemToWriter first. Make your application do the best it can in that case.

87.7.14 presentedItemDidResolveConflictVersion(version as NSFileVersionMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Be notified that something in the system has resolved a version of the file or file package.

87.7.15 presentedItemURL as string

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The URL that locates the file or directory that the receiver is presenting to the user.
**Notes:**
Implementations of this method must be prepared to be invoked by Cocoa in any queue, at any time, including from within invocations of NSFileCoordinator methods. A nil value is valid and means that the
presented item does not exist yet. An NSFilePresenter with a nil presentedItemURL will be asked for its presentedItemURL again when coordinated file access on behalf of that NSFilePresenter completes, in case the presented item was just created.

For example, NSDocument has a -presentedItemURL method that usually returns self.fileURL. In a shoebox application that stores the user’s data in files somewhere on the user’s computer you can implement this method to specify the directory that contains those files.

87.7.16 presentedSubitemAtURLdidGainVersion(URL as string, file as Folderitem, version as NSFileVersionMBS)

Function: Tells the delegate that the item inside the presented directory gained a new version. (required)
Notes:
url: The URL of the item inside the presented directory that gained a new version. The item need not be at the top level of the presented directory but may itself be inside a nested subdirectory.
file: url as folderitem.
version: The file version object containing information about the new file version.

Your delegate can use this method to determine how to incorporate data from the new version of the item. This might involve incorporating the version silently or asking the user about how to proceed.

Available in Mac OS X v10.7 and later.

87.7.17 presentedSubitemAtURLdidLoseVersion(URL as string, file as Folderitem, version as NSFileVersionMBS)

Function: Tells the delegate that the item inside the presented directory lost an existing version. (required)
Notes:
url: The URL of the item inside the presented directory that lost a version. The item need not be at the top level of the presented directory but may itself be inside a nested subdirectory.
file: URL as folderitem.
version: The file version object containing information about the version that was removed.

Your delegate can use this method to determine how to handle the loss of the specified file version. For an old version, you might not have to do anything. However, if your application is currently using the lost version, you would need to update your application’s user interface or prompt the user about how to proceed.
87.7.18  **presentedSubitemAtURLdidMoveToURL** (oldURL as string, newURL as string, oldFile as folderitem, newFile as folderitem)

**Function:** Tells the delegate that an item in the presented directory moved to a new location. (required) 
**Notes:**
oldURL: The original URL of the item inside the presented directory. The item need not be at the top level of the presented directory but may itself be inside a nested subdirectory.
newURL: The new URL for the item. This URL may or may not be located inside the presented directory.
oldFile: oldURL as folderitem.
newFile: newURL as folderitem.

This method is relevant for applications that present directories. This might occur if the delegate manages the contents of a directory or manages a file that is implemented as a file package. Your implementation of this method should take whatever actions necessary to handle the change in location of the specified item. For example, you might update references to the item in your application’s data structures and refresh your user interface.

If the presented directory is a file package, the system calls the presentedItemDidChange method if your delegate does not implement this method.

Available in Mac OS X v10.7 and later.

87.7.19  **presentedSubitemAtURLdidResolveConflictVersion** (URL as string, file as Folderitem, version as NSFileVersionMBS)

**Function:** Tells the delegate that the item inside the presented directory had a version conflict resolved by an outside entity. (required) 
**Notes:**
url: The URL of the item inside the presented directory that was in conflict. The item need not be at the top level of the presented directory but may itself be inside a nested subdirectory.
file: URL as folderitem.
version: The version object containing the conflicting change.

Your delegate can use this method to respond to the resolution of a version conflict by a different file presenter. This might occur if a version of your application running on another device resolves the conflict first. You might then use this method to update your user interface to indicate that there is no longer a conflict.
CHAPTER 87. ICLOUD

Available in Mac OS X v10.7 and later.

87.7.20 presentedSubitemDidAppearAtURL(URL as string, file as Folderitem)

Function: Tells the delegate that an item was added to the presented directory. (required)
Notes: url: The URL of the item being added to the presented directory. The item need not be at the top level of
the presented directory but may itself be inside a nested subdirectory.
file: URL as a folderitem.

This method is relevant for applications that present directories. This might occur if the delegate manages
the contents of a directory or manages a file that is implemented as a file package. Your implementation of
this method should take whatever actions necessary to incorporate the new file or directory into the pre-
sented content. For example, you might add the new item to your application’s data structures and refresh
your user interface.

If the presented directory is a file package, the system calls the presentedItemDidChange method if your
delegate does not implement this method.

Available in Mac OS X v10.7 and later.

87.7.21 presentedSubitemDidChangeAtURL(URL as string, file as Folderitem)

Function: Tells the delegate that the contents or attributes of the specified item changed. (required)
Notes: url: The URL of the item in the presented directory that changed. The item need not be at the top level of
the presented directory but may itself be inside a nested subdirectory.

This method is relevant for applications that present directories. This might occur if the delegate manages
the contents of a directory or manages a file that is implemented as a file package. Your implementation of
this method should take whatever actions necessary to handle the change in content or attributes of the
specified item.

If the presented directory is a file package, the system calls the presentedItemDidChange method if your
delegate does not implement this method.
87.7. CLASS NSFILEPRESENTERMBS

Available in Mac OS X v10.7 and later.

87.7.22 primaryPresentedItemURL as string

Function: The URL of a secondary item's primary presented file or directory. (read-only)
Notes:
This property supports App Sandbox in OS X.

Some apps require access to secondary files or directories with names that are related to the primary, user-selected file. For example, a subtitle file, by convention, has the same name as its corresponding movie file, but with a different filename extension. If a movie player is sandboxed, an NSOpenPanel object will grant access only to the user-selected movie file (the primary item) and not its associated subtitle file (the secondary item).

To gain access to a secondary item, first register an NSFilePresenter object for it. At any point in its existence, a secondary item must be able to return an NSURL object to its primary item. This is done by using this property. When done accessing the secondary item, unregister the file presenter object.

Available in OS X v10.8 and later.

87.7.23 reacquirer

Function: The reacquirer event.
Notes:
Called when you can reacquire an object.
e.g. called by relinquishPresentedItemToReader method.

87.7.24 relinquishPresentedItemToReader(reader as NSFilePresenterHandlerMBS)

Function: Notifies your object that another object or process wants to read the presented file or directory.
Notes:
reader: A handler object. The reacquirer event is called to notify when the reader is done. If your object does not need to be notified, it can pass nil for the reacquirer block.
CHAPTER 87. ICLOUD

You use this method to provide an appropriate response when another object wants to read from your presented URL. For example, when this method is called, you might temporarily stop making changes to the file or directory. After taking any appropriate steps, you must execute the block in the reader parameter to let the waiting object know that it may now proceed with its task. If you want to be notified when the reader has completed its task, pass your own block to the reader and use that block to reacquire the file or URL for your own uses.

Important: If you implement this method, you must execute the run method in the reader parameter as part of your implementation. The system waits for you to execute that method before allowing the reader to operate on the file. Therefore, failure to execute the method could stall threads in your application or other processes until the user takes corrective actions.

Your implementation of this method is executed using the queue in the presentedItemOperationQueue property. Your reacquirer event is executed on the queue associated with the reader.

Available in Mac OS X v10.7 and later.

87.7.25 relinquishPresentedItemToWriter(writer as NSFilePresenterHandlerMBS)

Function: Notifies your object that another object or process wants to write to the presented file or directory.

Notes:

writer: A complete handler object. The reacquirer event is called so that your object can be notified when the writer is done.

You use this method to provide an appropriate response when another object wants to write to your presented URL. For example, when this method is called, you would likely stop making changes to the file or directory. After taking any appropriate steps, you must execute the run method in the writer parameter to let the waiting object know that it may now proceed with its task.

Important: If you implement this method, you must execute the run method in the writer parameter at the end of your implementation. The system waits for you to execute that block before allowing the writer to operate on the file. Therefore, failure to execute the run method could stall threads in your application or other processes.

If the writer changes the file or directory, you do not need to incorporate those changes in your reacquirer block. Instead, implement the presentedItemDidChange method and use it to detect when a writer actually wrote its changes to disk.

Your implementation of this method is executed using the queue in the presentedItemOperationQueue property. Your reacquirer event is executed on the queue associated with the writer.
Available in Mac OS X v10.7 and later.

87.7.26  savePresentedItemChangesWithCompletionHandler(Complete as NSFilePresenterHandlerMBS)

**Function:** Tells your object to save any unsaved changes for the presented item.

**Notes:**

Complete: The handler object to call after you save your changes. If you saved your changes successfully, pass nil for the run’s `errorOrNil` parameter; otherwise, pass an error object indicating why the changes could not be saved.

The file coordinator calls this method to ensure that all objects trying to access the file or directory see the same contents. Implement this method if your object can change the presented item in a way that requires you to write those changes back to disk. If your presenter object does not make changes that need to be saved, you do not need to implement this method.

Important: If you implement this method, you must execute the run method in the `Complete` parameter at the end of your implementation. The system waits for you to execute that block before allowing other objects to operate on the file. Therefore, failure to execute the run method could stall threads in your application or other processes.

Available in Mac OS X v10.7 and later.
87.8 class NSFileVersionMBS

87.8.1 class NSFileVersionMBS

Function: The class for different file versions on Mac OS X 10.7.

Notes:

Instances of NSFileVersionMBS for the same version of the same file are equal, and instances of NSFileVersionMBS for different versions of the same file are not equal, but the equality of NSFileVersionMBSs for different files is undefined. Repeated invocations of the methods that return NSFileVersionMBSs do not necessarily return the exact same instance of NSFileVersionMBS.

An NSFileVersion object represents a snapshot of a file at a specific point in time. You use the NSFileVersion class to access and create and manage file revisions in your application. Each instance of this class contains meta information about a single revision, such as the location of the file containing the revision data, the modification date of the revision, and whether the revision is discardable.

In Mac OS X applications, you can use file version objects to track changes to a local file over time and to prevent the loss of data during editing. When managing local versions, the document architecture creates versions at specific points in the lifetime of your application. Your application can also create versions explicitly at times that your application designates as appropriate.

In addition to managing local files, the system also uses this class to manage cloud-based files. For files in the cloud, there is usually only one version of the file at any given time. However, additional file versions may be created in cases where two different computers attempt to save the file to the cloud at the same time. In that case, one file is chosen as the current version and any other versions are tagged as being in conflict with the original. Conflict versions are reported to the appropriate file presenter objects and should be resolved as soon as possible so that the corresponding files can be removed from the cloud.

Available on Mac OS X 10.7 or later.

Please also check the documentation from Apple for the NSFileVersion class.

Works also well with files in backup (Time Machine) to find older versions.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.
87.8. CLASS NSFILEVERSIONMBS

87.8.2 Methods

87.8.3 addVersionOfItemAtURL(url as string, withContentsOfURL as string, options as Integer, byref error as NSErrorMBS) as NSFileVersionMBS

**Function:** Add a new version of the file located by a URL, with the contents coming from a file located by either the same or a different URL, and return a new instance that represents the version if successful.

**Notes:**

If not successful, return false after setting Error to an NSErrorMBS that encapsulates why not.

You can add versions only on Mac OS X.

When adding or removing versions of a file you should do it as part of a "coordinated" write to the file, see NSFileCoordinatorMBS class. Using it properly ensures that NSFilePresenters of the file, or directories that contain the file, receive accurate notifications about versions being added or removed. For example, use NSFileCoordinatorMBS.coordinateWritingItemAtURL when the file URL and the contents url are the same. (NSFileVersion doesn't simply use NSFileCoordinator itself because that would be insufficient when the adding or removing of versions is part of a larger operation that should be treated as one coordinated file access.)

87.8.4 Conflict as boolean

**Function:** Whether the version was created as a result of the discovery of a conflict between two writers of the versioned file.

**Notes:** When two or more versions of a file are written at the same time, perhaps because the file is saved in the cloud and one or more of the writers were offline when they were writing, the system attempts to resolve the conflict automatically. It does this by picking one of the file versions to be the current file and setting this property to true for the other file version that are in conflict.

87.8.5 Constructor

**Function:** The private constructor.
87.8.6 currentVersionOfItemAtURL(file as folderitem) as NSFileVersionMBS

**Function:** Convenience variant of currentVersionOfItemAtURL which takes folderitem.  
**Example:**

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("Notes.rtf")
dim n as NSFileVersionMBS = NSFileVersionMBS.currentVersionOfItemAtURL(f)

MsgBox n.localizedName
```

See also:

- 87.8.7 currentVersionOfItemAtURL(url as string) as NSFileVersionMBS

87.8.7 currentVersionOfItemAtURL(url as string) as NSFileVersionMBS

**Function:** Return an NSFileVersionMBS that represents the contents of the file located by a URL, or nil if there is no such file.  
See also:

- 87.8.6 currentVersionOfItemAtURL(file as folderitem) as NSFileVersionMBS

87.8.8 File as folderitem

**Function:** The location of the receiver’s storage.  
**Notes:**  
Or possibly nil if the receiver’s storage has been deleted. The storage is read-only. The URL will have an arcane path. You must not derive user-presentable text from it.  
If the URL does not represent a folderitem, this function gives nil.

87.8.9 FileURL(file as folderitem) as string

**Function:** Returns URL for a folderitem.  
**Notes:** Call is method in case you need to provide an URL for a folderitem.
87.8.10 localizedName as string

**Function:** The user-presentable name of the version, or possibly "" if the receiver's storage has been deleted.

**Example:**

```vbscript
dim f as FolderItem = SpecialFolder.Desktop.Child("Notes.rtf")
dim n as NSFileVersionMBS = NSFileVersionMBS.currentVersionOfItemAtURL(f)
MsgBox n.localizedName
```

**Notes:** This will be different from the user-presentable name of the versioned file if, for example, the file has been renamed since the version was added.

87.8.11 localizedNameOfSavingComputer as string

**Function:** The user-presentable name of the computer on which the version was saved, or possibly "" if the receiver's storage has been deleted, or "" if no computer name was recorded.

**Notes:** The computer name is guaranteed to have been recorded only if the version is a conflict version. This will be different from that computer's current name if the computer's name has been changed since the version was retrieved from that computer.

87.8.12 modificationDate as date

**Function:** The modification date of the version, or possibly nil if the receiver's storage has been deleted.

**Example:**

```vbscript
dim f as FolderItem = SpecialFolder.Desktop.Child("Notes.rtf")
dim n as NSFileVersionMBS = NSFileVersionMBS.currentVersionOfItemAtURL(f)
MsgBox n.modificationDate.SQLDateTime
```

87.8.13 otherVersionsOfItemAtURL(file as folderitem) as NSFileVersionMBS()

**Function:** Convenience variant of otherVersionsOfItemAtURL taking a folderitem.

**Example:**
14400

CHAPTER 87. ICLOUD

dim f as FolderItem = SpecialFolder.Desktop.Child("Notes.rtf")
dim n() as NSFileVersionMBS = NSFileVersionMBS.otherVersionsOfItemAtURL(f)

// shows all time stamps of this file.
dim lines() as string
for each x as NSFileVersionMBS in n
    lines.Append x.modificationDate.SQLDateTime
next
MsgBox Join(lines,EndOfLine)

See also:

• 87.8.14 otherVersionsOfItemAtURL(url as string) as NSFileVersionMBS() 14400

87.8.14 otherVersionsOfItemAtURL(url as string) as NSFileVersionMBS()

Function: Return an array of NSFileVersionMBS objects associated with the file located by a URL, or an
empty array if there is no such file.
Notes: The array never contains an NSFileVersionMBS equal to what currentVersionOfItemAtURL would
return.
See also:

• 87.8.13 otherVersionsOfItemAtURL(file as folderitem) as NSFileVersionMBS() 14399

87.8.15 persistentIdentifier as MemoryBlock

Function: The identifier for this version of the file. (read-only)
Example:

// get a file version
dim f as FolderItem = SpecialFolder.Desktop.Child("Notes.rtf")
dim n as NSFileVersionMBS = NSFileVersionMBS.currentVersionOfItemAtURL(f)

// get persistent identifier
dim m as MemoryBlock = n.persistentIdentifier

// later find version again
dim x as NSFileVersionMBS = NSFileVersionMBS.versionOfItemAtURLforPersistentIdentifier(f, m)

// and show something
MsgBox x.localizedName
Notes:

You can save the value of this property persistently and use it to recreate the version object later. When recreating the version object using the versionOfItemAtURLforPersistentIdentifier method, the version object returned is equivalent to the current object.

The plugin encodes the identifier for you into a memoryblock, so you can store it somewhere in your preferences.

### 87.8.16 removeAndReturnError(byref error as NSErrorMBS) as boolean

**Function:** Delete the receiver's storage, and return true if successful.

**Notes:**

If not successful, return false after setting Error to an NSErrorMBS that encapsulates why not. Subsequent invocations of versionsOfItemAtURL won’t include an NSFileVersion for a successfully removed version.

You cannot use this method to delete the versioned file itself. This method always throws an exception when sent to the result of invoking currentVersionOfItemAtURL. Use NSFileManagerMBS.removeItemAtURL for that instead.

When removing versions of a file you should do it as part of a coordinated write to the file. The advice about this for addVersionOfItemAtURL applies here too.

### 87.8.17 removeOtherVersionsOfItemAtURL(file as folderitem, byref error as NSErrorMBS) as boolean

**Function:** Convenience variant of removeOtherVersionsOfItemAtURL which takes folderitem.

See also:

- 87.8.18 removeOtherVersionsOfItemAtURL(url as string, byref error as NSErrorMBS) as boolean

### 87.8.18 removeOtherVersionsOfItemAtURL(url as string, byref error as NSErrorMBS) as boolean

**Function:** Delete all of the versions associated with the file located by a URL, except for the current one, and return true if successful.

**Notes:**
If not successful, return false after setting error to an NSErrorMBS that encapsulates why not.

When removing versions of a file you should do it as part of a coordinated write to the file. The advice about this for addVersionOfItemAtURL applies here too.

See also:

- 87.8.17 removeOtherVersionsOfItemAtURL(file as folderitem, byref error as NSErrorMBS) as boolean

87.8.19 replaceItemAtURL(file as folderitem, options as Integer, byref error as NSErrorMBS) as string

Function: Convenience variant of replaceItemAtURL which takes a folderitem.
See also:

- 87.8.20 replaceItemAtURL(url as string, options as Integer, byref error as NSErrorMBS) as string

87.8.20 replaceItemAtURL(url as string, options as Integer, byref error as NSErrorMBS) as string

Function: If the passed-in URL locates a file, replace the file with a file whose contents are taken from the version but whose display name is taken from the file.
Notes:
If the passed-in URL does not locate a file then simply write one. If successful, return a URL that locates the resulting file; it may be different from the passed-in URL. The one exception to taking the display name from an existing file is if the version is of a different type than the overwritten file. In that case the file name extension will be taken from the version. (When file name extensions are being hidden in a user-friendly way this is not actually an exception.) If not successful, return false after setting *outError to an NSError that encapsulates why not.

When you use NSFileVersionReplacingByMoving you remove a version of the file, and should do it as part of a coordinated write to the file. The advice about this for addVersionOfItemAtURL applies here too. When you use it to promote a version to a separate file you actually write to two files, and should do it as part of a coordinated write to two files, using NSFileCoordinatorMBS.coordinateWritingItemAtURL, most likely using NSFileCoordinatorWritingForReplacing for the file you’re promoting the version to.
See also:

- 87.8.19 replaceItemAtURL(file as folderitem, options as Integer, byref error as NSErrorMBS) as string
87.8.21 temporaryDirectoryURLForNewVersionOfItemAtURL(url as string) as string

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Given a URL, create a new directory that is suitable for using as the container of a new temporary file that you will create and use with NSFileVersionAddingByMoving.

**Notes:** This is useful when you want to create a new version of a file out of something other than the file's current contents, for example, the contents in memory of a document that has not yet been saved to its file. You must remove this directory when you are done with it, using NSFileManagerMBS.removeItemAtPathURL for example.

87.8.22 unresolvedConflictVersionsOfItemAtURL(file as folderitem) as NSFileVersionMBS()

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return an array of NSFileVersionMBS that represent unresolved conflicts for the file located by a URL, or nil if there is no such file.

See also:

- 87.8.23 unresolvedConflictVersionsOfItemAtURL(url as string) as NSFileVersionMBS() 14403

87.8.23 unresolvedConflictVersionsOfItemAtURL(url as string) as NSFileVersionMBS()

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return an array of NSFileVersionMBS that represent unresolved conflicts for the file located by a URL, or nil if there is no such file.

See also:

- 87.8.22 unresolvedConflictVersionsOfItemAtURL(file as folderitem) as NSFileVersionMBS() 14403

87.8.24 URL as string

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The location of the receiver's storage.

**Notes:** Or possibly “” if the receiver’s storage has been deleted. The storage is read-only. The URL will have an arcane path. You must not derive user-presentable text from it.
87.8.25  `versionOfItemAtURLforPersistentIdentifier(file as folderitem, PersistentIdentifier as Memoryblock) as NSFileVersionMBS`

**Function:** Returns the version of the file that has the specified persistent ID.

**Notes:**

url: The URL of the file whose version you want.
persistentIdentifier: The persistent ID of the NSFileVersion object you want. The plugin decodes it for you from the memoryblock.

Returns the file version object with the specified ID or nil if no such version object exists.

See also:

- 87.8.26 `versionOfItemAtURLforPersistentIdentifier(URL as string, PersistentIdentifier as Memoryblock) as NSFileVersionMBS`

87.8.26  `versionOfItemAtURLforPersistentIdentifier(URL as string, PersistentIdentifier as Memoryblock) as NSFileVersionMBS`

**Function:** Returns the version of the file that has the specified persistent ID.

**Notes:**

url: The URL of the file whose version you want.
persistentIdentifier: The persistent ID of the NSFileVersion object you want. The plugin decodes it for you from the memoryblock.

Returns the file version object with the specified ID or nil if no such version object exists.

See also:

- 87.8.25 `versionOfItemAtURLforPersistentIdentifier(file as folderitem, PersistentIdentifier as Memoryblock) as NSFileVersionMBS`

87.8.27  **Properties**

87.8.28  **Handle as Integer**

**Function:** The internal reference to the NSFileVersion object.

**Notes:** (Read and Write property)
87.8.29 Discardable as boolean

**Function:** Whether the system is allowed to automatically delete the receiver’s storage in the future, at an unpredictable time.

**Notes:**
Setting this to true can fail so you must not depend on discarding for correct operation.

Once you have indicated that a version is discardable you cannot make it undiscardable again. Setting this to false causes an exception to be thrown.

You cannot make the versioned file itself discardable. Setting the value of this property always throws an exception when sent to the result of invoking currentVersionOfItemAtURL.

Versions can be discardable only on Mac OS X.
(Read and Write computed property)

87.8.30 Resolved as boolean

**Function:** If the version is a conflict version, whether the conflict has been resolved.

**Notes:**
If the version is not a conflict version, simply true.

The operating system’s reaction to your setting this to true is complicated and subject to change in future releases. One result however is that the version won’t appear in arrays returned by unresolvedConflictVersionsOfItemAtURL anymore, unless setting fails.

Once you have indicated that a conflict has been resolved you cannot make it unresolved again. Setting this to false causes an exception to be thrown.
(Read and Write computed property)

87.8.31 Constants

87.8.32 NSFileVersionAddingByMoving = 1

MBS MacCloud Plugin, Plugin Version: 11.2. **Function:** One of the constants for addVersionOfItemAtURL.

**Notes:** Whether addVersionOfItemAtURL can move the new version contents file into the version store
instead of copying it. Moving is much faster. See the comment for temporaryDirectoryURLForNewVersionOfItemAtURL for an example of when this useful.

87.8.33 NSFileVersionReplacingByMoving = 1

MBS MacCloud Plugin, Plugin Version: 11.2. **Function:** One of the constants for replaceItemAtURL. **Notes:** Whether replaceItemAtURL must move the version’s contents out of the version store instead of copying it. This is useful when you want to promote a version’s contents to a separate file. You wouldn’t use this to restore a version of a file.
87.9. class NSMetadataItemMBS

87.9.1 Class NSMetadataItemMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSMetadataItem class represents the metadata associated with a file, providing a simple interface to retrieve the available attribute names and values. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

87.9.2 Methods

87.9.3 attributeKeys as string()

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array containing the attribute names of the receiver’s values.

87.9.4 Constructor

87.9.5 DisplayName as string

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The display name of the item, which may be different then the file system name. **Notes:** Available in Mac OS X v10.7 and later.

87.9.6 File as folderitem

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The file reference. **Notes:** Available in Mac OS X v10.7 and later.
87.9.7  FileContentChangeDate as date

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The date and time that the file contents last changed.  
**Notes:** Available in Mac OS X v10.7 and later.

87.9.8  FileCreationDate as date

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The date and time that the file was created.  
**Notes:** Available in Mac OS X v10.7 and later.

87.9.9  FileName as string

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the item as seen in the file system.  
**Notes:** Available in Mac OS X v10.7 and later.

87.9.10  FileSize as UInt64

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The size (in bytes) of the file on disk.  
**Notes:** Available in Mac OS X v10.7 and later.

87.9.11  IsUbiquitous as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the item is stored in the cloud.  
**Notes:** Available in Mac OS X v10.7 and later.

87.9.12  NSMetadataItemDisplayNameKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible attribute keys that may be associated with an item.  
**Notes:** The value is a string with the display name of the item, which may be different then the file system name. Available in Mac OS X v10.7 and later.
87.9.13 NSMetadataItemFSContentChangeDateKey as string

Function: One of the possible attribute keys that may be associated with an item.
Notes:
The value is a date object that contains the date and time that the file contents last changed.
Available in Mac OS X v10.7 and later.

87.9.14 NSMetadataItemFSCreationDateKey as string

Function: One of the possible attribute keys that may be associated with an item.
Notes:
The value is a date object that contains the date and time that the file was created.
Available in Mac OS X v10.7 and later.

87.9.15 NSMetadataItemFSNameKey as string

Function: One of the possible attribute keys that may be associated with an item.
Notes:
The value is a string with the name of the item as seen in the file system.
Available in Mac OS X v10.7 and later.

87.9.16 NSMetadataItemFSSizeKey as string

Function: One of the possible attribute keys that may be associated with an item.
Notes:
The value is a number that indicates the size (in bytes) of the file on disk.
Available in Mac OS X v10.7 and later.
87.9.17 NSMetadataItemIsUbiquitousKey as string

**Function:** One of the possible attribute keys that describe cloud-related information about the item.
**Notes:**
The value is a boolean indicating whether the item is stored in the cloud.
Available in Mac OS X v10.7 and later.

87.9.18 NSMetadataItemPathKey as string

**Function:** One of the possible attribute keys that may be associated with an item.
**Notes:**
The value is a string object that contains the full path to the file.
Available in Mac OS X v10.7 and later.

87.9.19 NSMetadataItemURLKey as string

**Function:** One of the possible attribute keys that may be associated with an item.
**Notes:**
The value is an URL string that you can use to open the file.
Available in Mac OS X v10.7 and later.

87.9.20 NSMetadataUbiquitousItemHasUnresolvedConflictsKey as string

**Function:** One of the possible attribute keys that describe cloud-related information about the item.
**Notes:**
The value is a Boolean indicating whether the item is currently in conflict with another version of the file somewhere else.
Available in Mac OS X v10.7 and later.

87.9.21 NSMetadataUbiquitousItemIsDownloadedKey as string

**Function:** One of the possible attribute keys that describe cloud-related information about the item.
**87.9. CLASS NSMETADATAITEMMBS**

**Notes:**
The value is a Boolean indicating whether the current version of the item has been downloaded and is available locally.
Available in Mac OS X v10.7 and later.

**87.9.22 NSMetadataUbiquitousItemIsDownloadingKey as string**

**Function:** One of the possible attribute keys that describe cloud-related information about the item.
**Notes:**
The value is a Boolean indicating whether the item is currently being downloaded to the local device.
Available in Mac OS X v10.7 and later.

**87.9.23 NSMetadataUbiquitousItemIsUploadedKey as string**

**Function:** One of the possible attribute keys that describe cloud-related information about the item.
**Notes:**
The value is a Boolean indicating whether the item has been uploaded to the cloud.
Available in Mac OS X v10.7 and later.

**87.9.24 NSMetadataUbiquitousItemIsUploadingKey as string**

**Function:** One of the possible attribute keys that describe cloud-related information about the item.
**Notes:**
The value is a Boolean indicating whether the current version of the item is currently being uploaded to the cloud.
Available in Mac OS X v10.7 and later.

**87.9.25 NSMetadataUbiquitousItemPercentDownloadedKey as string**

**Function:** One of the possible attribute keys that describe cloud-related information about the item.
**Notes:**
The value is a number that contains the percentage of the file that has already been downloaded from the cloud. The value is a double in the range 0.0 to 100.0.
CHAPTER 87. ICLOUD

Available in Mac OS X v10.7 and later.

87.9.26 NSMetadataUbiquitousItemPercentUploadedKey as string

Function: One of the possible attribute keys that describe cloud-related information about the item. 
Notes: 
The value is a number that contains the percentage of the file that has already been uploaded to the cloud. 
The value is a double in the range 0.0 to 100.0. 
Available in Mac OS X v10.7 and later.

87.9.27 Path as string

Function: The file path. 
Notes: Available in Mac OS X v10.7 and later.

87.9.28 UbiquitousItemHasUnresolvedConflicts as boolean

Function: Whether the item is currently in conflict with another version of the file somewhere else. 
Notes: Available in Mac OS X v10.7 and later.

87.9.29 UbiquitousItemIsDownloaded as boolean

Function: Whether the current version of the item has been downloaded and is available locally. 
Notes: Available in Mac OS X v10.7 and later.

87.9.30 UbiquitousItemIsDownloading as boolean

Function: Whether the item is currently being downloaded to the local device. 
Notes: Available in Mac OS X v10.7 and later.
87.9. **CLASS NSMETADATAITEMMBS**

87.9.31 **UbiquitousItemIsUploaded as boolean**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the item has been uploaded to the cloud. **Notes:** Available in Mac OS X v10.7 and later.

87.9.32 **UbiquitousItemIsUploading as boolean**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the current version of the item is currently being uploaded to the cloud. **Notes:** Available in Mac OS X v10.7 and later.

87.9.33 **UbiquitousItemPercentDownloaded as Double**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The percentage of the file that has already been downloaded from the cloud. The value is a double in the range 0.0 to 100.0. **Notes:** Available in Mac OS X v10.7 and later.

87.9.34 **UbiquitousItemPercentUploaded as Double**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The percentage of the file that has already been uploaded to the cloud. The value is a double in the range 0.0 to 100.0. **Notes:** Available in Mac OS X v10.7 and later.

87.9.35 **URL as string**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The file URL. **Notes:** Available in Mac OS X v10.7 and later.

87.9.36 **valueForAttribute(key as string) as Variant**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s metadata attribute name specified by a given key. **Notes:**
key: The name of a metadata attribute.
Returns value as Variant.

87.9.37 valuesForAttributes(keys() as string) as dictionary

**Function:** Returns a dictionary containing the key-value pairs for the attribute names specified by a given array of keys.
**Notes:**

keys: An array containing strings that specify the names of a metadata attributes.

A dictionary containing the key-value pairs for the attribute names specified by keys.

87.9.38 Properties

87.9.39 Handle as Integer

**Function:** The internal reference to the metadata item.
**Notes:**

Available in Mac OS X v10.7 and later.
(Read and Write property)
87.10 class NSMetadataQueryMBS

87.10.1 class NSMetadataQueryMBS

**Function:** The NSMetadataQuery class encapsulates the functionality provided by the MDQuery opaque type for querying the Spotlight metadata.

**Notes:**
You may prefer MDQueryMBS class from our plugins. NSMetadataQueryMBS exists as it supports iCloud search.

NSMetadataQuery objects provide metadata query results in several ways:

- As individual attribute values for requested attributes.
- As value lists that contain the distinct values for given attributes in the query results.
- A result array proxy, containing all the query results. This is suitable for use with Cocoa bindings.
- As a hierarchical collection of results, grouping together items with the same values for specified grouping attributes. This is also suitable for use with Cocoa bindings.

Queries have two phases: the initial gathering phase that collects all currently matching results and a second live-update phase.

By default the receiver has no limitation on its search scope. Use setSearchScopes to customize.
By default, notification of updated results occurs at 1.0 seconds. Use setNotificationBatchingInterval to customize.
You must set a predicate with the setPredicate method before starting a query.

87.10.2 Methods

87.10.3 Constructor

**Function:** Initializes the NSMetadataQuery object.

87.10.4 Destructor

**Function:** The destructor.
87.10.5  disableUpdates

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Disables updates to the query results. Notes: You should invoke this method before iterating over query results that could change due to live updates.

87.10.6  enableUpdates

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Enables updates to the query results. Notes: You should invoke this method after you’re done iterating over the query results.

87.10.7  groupedResults as NSMetadataQueryResultGroupMBS()

87.10.8  groupingAttributes as string()

87.10.9  indexOfResult(item as NSMetadataItemMBS) as Integer

87.10.10  isGathering as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a Boolean value that indicates whether the receiver is in the initial gathering phase of the query. Notes: Returns true when the query is in the initial gathering phase; false otherwise.
87.10. **CLASS NSMETADATAQUERYMBS**

87.10.11  **isStarted as boolean**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver has started the query. **Notes:** Returns true when the receiver has executed the startQuery method; false otherwise.

87.10.12  **isStopped as boolean**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver has stopped the query. **Notes:** Returns true when the receiver has stopped the query, false otherwise.

87.10.13  **NSMetadataQueryDidFinishGatheringNotification as string**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the query notification names. **Notes:** Posted when the receiver has finished with the initial result-gathering phase of the query.

87.10.14  **NSMetadataQueryDidStartGatheringNotification as string**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the query notification names. **Notes:** Posted when the receiver begins with the initial result-gathering phase of the query.

87.10.15  **NSMetadataQueryDidUpdateNotification as string**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the query notification names. **Notes:** Posted when the receiver’s results have changed during the live-update phase of the query.

87.10.16  **NSMetadataQueryGatheringProgressNotification as string**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the query notification names. **Notes:** Posted as the receiver’s is collecting results during the initial result-gathering phase of the query.
87.10.17  **NSMetadataQueryLocalComputerScope as string**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the scope constants you can use with setSearchScopes.

87.10.18  **NSMetadataQueryNetworkScope as string**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the scope constants you can use with setSearchScopes.

**Notes:** Search all user-mounted remote volumes.

87.10.19  **NSMetadataQueryResultContentRelevanceAttribute as string**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** In addition to the requested metadata attributes, a query result also includes content relevance, accessed with this key.

**Notes:**
Key used to retrieve a number with a floating point value between 0.0 and 1.0 inclusive. The relevance value indicates the relevance of the content of a result object. The relevance is computed based on the value of the result itself, not on its relevance to the other results returned by the query. If the value is not computed, it is treated as an attribute on the item that does not exist.
Available in Mac OS X v10.4 and later.

87.10.20  **NSMetadataQueryUbiquitousDataScope as string**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the scope constants you can use with setSearchScopes.

**Notes:**
Search all files not in the Documents directories of the application’s iCloud container directories.
Available in Mac OS X v10.7 and later.

87.10.21  **NSMetadataQueryUbiquitousDocumentsScope as string**

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the scope constants you can use with setSearchScopes.

**Notes:**
Search all files in the Documents directories of the application’s iCloud container directories.
Available in Mac OS X v10.7 and later.
87.10.22  NSMetadataQueryUserHomeScope as string

**Function:** One of the scope constants you can use with setSearchScopes.
**Notes:** Search all local mounted volumes, including the user home directory. The user’s home directory is searched even if it is a remote volume.

87.10.23  resultAtIndex(index as Integer) as NSMetadataItemMBS

**Function:** Returns the query result at a specific index.
**Notes:**
index: Index of the desired result in the query result array.
Returns query result at the position specified by index.
For performance reasons, you should use this method when retrieving a specific result, rather than their array returned by results.

87.10.24  resultCount as Integer

**Function:** Returns the number of results returned by the receiver.
**Notes:** For performance reasons, you should use this method, rather than invoking count on results array.

87.10.25  results as NSMetadataItemMBS()

**Function:** Returns an array containing the result objects for the receiver.
**Notes:** The results array is a proxy object that is primarily intended for use with Cocoa bindings. While it is possible to copy the proxy array and receive a "snapshot" of the complete current query results, it is generally not recommended due to performance and memory issues. To access individual result array elements you should instead use the resultCount and resultAtIndex methods.
87.10.26 searchScopes as string()

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array containing the receiver’s search scopes. **Notes:** The array can contain strings that represent file system directories or the search scopes specified in Constants. An empty array indicates that there is no limitation on where the receiver searches.

87.10.27 setGroupingAttributes(attributeNames() as string)

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the receiver’s grouping attributes to specific attribute names. **Notes:** Invoking this method on a receiver while it’s running a query, stops the query and discards current results, and immediately starts a new query. Available in Mac OS X v10.4 and later.

87.10.28 setSearchScopes(folders() as folderitem)

MBS MacCloud Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Restrict the search scope of the receiver. **Notes:** You can pass paths as folderitem. See also:

- 87.10.29 setSearchScopes(paths() as string) 14420
- 87.10.30 setSearchScopes(paths() as string, folders() as folderitem) 14420

87.10.29 setSearchScopes(paths() as string)

MBS MacCloud Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Restrict the search scope of the receiver. **Notes:** You can pass paths as strings and with the string array also the special scope strings from this class. See also:

- 87.10.28 setSearchScopes(folders() as folderitem) 14420
- 87.10.30 setSearchScopes(paths() as string, folders() as folderitem) 14420

87.10.30 setSearchScopes(paths() as string, folders() as folderitem)

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Restrict the search scope of the receiver.
87.10. CLASS NSMETADATAQUERYMBS

Example:

```vba
dim m as new NSMetadataQueryMBS
dim paths() as string
dim folders() as FolderItem

// you can specify where to search either by path or by FolderItem
paths.Append "/Applications"
folders.Append SpecialFolder.Applications

m.setSearchScopes paths, folders
```

Notes: You can pass paths as strings, paths as folderItem and with the string array also the special scope strings from this class.
See also:

- 87.10.28 setSearchScopes(folders() as folderItem)
- 87.10.29 setSearchScopes(paths() as string)

87.10.31 setSortDescriptor(sortDescriptor as NSSortDescriptorMBS)

Function: Sets the sort descriptors to be used by the receiver.
Example:

```vba
dim m as new NSMetadataQueryMBS
m.setSortDescriptor NSSortDescriptorMBS.sortDescriptorWithKey(NSMetadataItemMBS.NSMetadataItemDisplayNameKey, true)
```

Notes: Invoking this method on the receiver running a query causes the existing query to stop, all current results are discarded, and a new query is started immediately.

87.10.32 setSortDescriptors(sortDescriptors() as NSSortDescriptorMBS)

Function: Sets the sort descriptors to be used by the receiver.
Notes: Invoking this method on the receiver running a query causes the existing query to stop, all current results are discarded, and a new query is started immediately.
87.10.33 sortDescriptors as NSSortDescriptorMBS()

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array containing the receiver’s sort descriptors. **Notes:** Available in Mac OS X v10.4 and later.

87.10.34 startQuery as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attempts to start the query. **Notes:**

Returns true when successful; false otherwise.

A query can’t be started if the receiver is already running a query or no predicate has been specified.

87.10.35 stopQuery

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops the receiver’s current query from gathering any further results. **Notes:**

The receiver first completes gathering any unprocessed results. If a query is stopped before the gathering phase finishes, it will not post an NSMetadataQueryDidStartGatheringNotification notification.

You would call this function to stop a query that is generating too many results to be useful but still want to access the available results. If the receiver is sent a startQuery message after performing this method, the existing results are discarded.

87.10.36 Properties

87.10.37 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSMetadataQuery object. **Notes:** (Read and Write property)
87.10. CLASS NSMETADATAQUERYMBS

87.10.38 notificationBatchingInterval as Double

**Function:** The interval that the receiver provides notification of updated query results.
**Notes:**
in seconds.
(Read and Write computed property)

87.10.39 predicate as NSPredicateMBS

**Function:** The predicate used by the receiver to filter the query results.
**Example:**
```null
dim m as new NSMetadataQueryMBS
m.predicate = NSPredicateMBS.predicateWithFormat("kMDItemContentType=""com.apple.application-bundle"")
```
**Notes:**
Setting the predicate on a receiver running a query causes the existing query to stop, all current results are discarded, and a new query is started immediately.
(Read and Write computed property)

87.10.40 Events

87.10.41 DidFinishGathering(n as NSNotificationMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** Called as the query has finished with the initial result-gathering phase of the query.

87.10.42 DidStartGathering(n as NSNotificationMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** Called as the query begins with the initial result-gathering phase of the query.
87.10.43 DidUpdate(n as NSNotificationMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called as the query’s results have changed during the live-update phase of the query.

87.10.44 GatheringProgress(n as NSNotificationMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called as the query is collecting results during the initial result-gathering phase of the query.
87.11. CLASS NSMETADATAQUERYRESULTGROUPMBS

87.11.1 class NSMetadataQueryResultGroupMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSMetadataQueryResultGroupMBS class represents a collection of grouped attribute results returned by an NSMetadataQueryMBS object. **Notes:** This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

87.11.2 Methods

87.11.3 attributeName as string

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the attribute name for the receiver's result group.

87.11.4 Constructor

87.11.5 resultAtIndex(index as Integer) as NSMetadataItemMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the query result at a specific index. **Notes:** index: The index of the desired result.

For performance reasons, you should use this method when retrieving a specific result, rather than they array returned by results.

87.11.6 resultCount as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of results returned by the receiver. **Notes:** For performance reasons, you should use this method, rather than invoking count on results.
87.11.7 results as NSMetadataItemMBS()

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array containing the result objects for the receiver. **Notes:** The results array is a proxy object that is primarily intended for use with Cocoa bindings. While it is possible to copy the proxy array to get a "snapshot" of the complete current query results, it is generally not recommended due to performance and memory issues. To access individual result array elements you should instead use the resultCount and resultAtIndex methods.

87.11.8 subgroups as NSMetadataQueryResultGroupMBS()

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array containing the subgroups of the receiver.

87.11.9 value as Variant

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value of the attribute name for the receiver.

87.11.10 Properties

87.11.11 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal handle to the NSMetadataQueryResultGroup object. **Notes:** (Read and Write property)
87.12. CLASS NSPREDICATEMBS

87.12 class NSPredicateMBS

87.12.1 class NSPredicateMBS

**Function:** The NSPredicate class is used to define logical conditions used to constrain a search either for a fetch or for in-memory filtering.

**Notes:**

You use predicates to represent logical conditions, used for describing objects in persistent stores and in-memory filtering of objects. Although it is common to create predicates directly from instances of NSComparisonPredicate, NSCompoundPredicate, and NSExpression, you often create predicates from a format string which is parsed by the class methods on NSPredicate. Examples of predicate format strings include:

- Simple comparisons, such as grade == "7" or firstName like "Shaffiq"
- Case and diacritic insensitive lookups, such as name contains [ cd ] "itroen"
- Logical operations, such as (firstName like "Mark") OR (lastName like "Adderley")
- In Mac OS X v10.5 and later, you can create between predicates such as date between { $ YESTERDAY, $ TOMORROW }.

You can create predicates for relationships, such as:

- group.name like "work*"
- ALL children.age >12
- ANY children.age >12

You can create predicates for operations, such as @sum.items.price <1000. For a complete syntax reference, refer to the Predicate Programming Guide:

87.12.2 Methods

87.12.3 Constructor(predicateFormat as string)

**Function:** Creates and returns a new predicate by substituting the values in a given array into a format string and parsing the result.

**Example:**
CHAPTER 87. ICLOUD

```vbs
Dim n As New NSPredicateMBS("kMDItemContentType=""com.apple.application-bundle"")
MsgBox n.predicateFormat
```

Notes:

predicateFormat: The format string for the new predicate.
arguments: Optional, the arguments to substitute into predicateFormat. Values are substituted into predicateFormat in the order they appear in the array.

You get a new predicate by substituting the values in arguments into predicateFormat, and parsing the result.

For details of the format of the format string and of limitations on variable substitution, see Predicate Format String Syntax:

Available in Mac OS X v10.4 and later.

See also:

- 87.12.4 Constructor(predicateFormat as string, arguments() as Variant) 14428
- 87.12.5 Constructor(value as boolean) 14429

### 87.12.4 Constructor(predicateFormat as string, arguments() as Variant)

**Function:** Creates and returns a new predicate by substituting the values in a given array into a format string and parsing the result.

**Example:**

```vbs
// we use one parameter here
Dim s() As Variant
s.Append "com.apple.application-bundle"

Dim n As New NSPredicateMBS("kMDItemContentType=% @", s)
```

// shows final string
MsgBox n.predicateFormat

Notes:

predicateFormat: The format string for the new predicate.
arguments: Optional, the arguments to substitute into predicateFormat. Values are substituted into predicateFormat in the order they appear in the array.
You get a new predicate by substituting the values in arguments into predicateFormat, and parsing the result.
For details of the format of the format string and of limitations on variable substitution, see Predicate Format String Syntax:

Available in Mac OS X v10.4 and later.
See also:

- 87.12.3 Constructor(predicateFormat as string)
- 87.12.5 Constructor(value as boolean)

87.12.5 Constructor(value as boolean)

Function: Creates and returns a predicate that always evaluates to a given value.
Example:

```vbscript
dim n as new NSPredicateMBS(true)
MsgBox n.predicateFormat
```

See also:

- 87.12.3 Constructor(predicateFormat as string)
- 87.12.4 Constructor(predicateFormat as string, arguments() as Variant)

87.12.6 description as string

Function: The descriptor for this event.
Example:

```vbscript
dim args() as Variant
args.Append NSMetadataItemMBS.NSMetadataItemFSNameKey
dim pred as NSPredicateMBS = NSPredicateMBS.predicateWithFormat("% K LIKE '*'", args)
MsgBox pred.description
```

Notes: This is a text representation for debugging.
CHAPTER 87. ICLOUD

87.12.7 predicateFormat as string

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s format string. **Notes:** The string returned by this method is not guaranteed to be the same as a string used to create the predicate.

87.12.8 predicateWithFormat(predicateFormat as string) as NSPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new predicate by substituting the values in a given array into a format string and parsing the result. **Example:**
```
dim n as NSPredicateMBS
n = NSPredicateMBS.predicateWithFormat("kMDItemContentType="’com.apple.application-bundle’")
MsgBox n.predicateFormat
```

**Notes:**
- **predicateFormat:** The format string for the new predicate.
- **arguments:** Optional, the arguments to substitute into predicateFormat. Values are substituted into predicateFormat in the order they appear in the array.

Returns a new predicate by substituting the values in arguments into predicateFormat, and parsing the result.

For details of the format of the format string and of limitations on variable substitution, see Predicate Format String Syntax: http://developer.apple.com/library/mac/documentation/Cocoa/Conceptual/Predicates/Articles/pSyntax.html#//apple_ref/doc/uid/TP40001795

Available in Mac OS X v10.4 and later.
See also:
- 87.12.9 predicateWithFormat(predicateFormat as string, arguments() as Variant) as NSPredicateMBS

87.12.9 predicateWithFormat(predicateFormat as string, arguments() as Variant) as NSPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new predicate by substituting the values in a given array into a format
87.12. CLASS NSPREDICATEMBS

string and parsing the result.

Example:

```vbscript
dim args() as Variant
args.Append NSMetadataItemMBS.NSMetadataItemFSNameKey
dim pred as NSPredicateMBS = NSPredicateMBS.predicateWithFormat("%K LIKE '*'", args)
MsgBox pred.description
```

Notes:

- **predicateFormat**: The format string for the new predicate.
- **arguments**: Optional, the arguments to substitute into predicateFormat. Values are substituted into predicateFormat in the order they appear in the array.

Returns a new predicate by substituting the values in arguments into predicateFormat, and parsing the result.

For details of the format of the format string and of limitations on variable substitution, see Predicate Format String Syntax:

Available in Mac OS X v10.4 and later.

See also:

- 87.12.8 predicateWithFormat(predicateFormat as string) as NSPredicateMBS

87.12.10 predicateWithValue(value as boolean) as NSPredicateMBS

**Function**: Creates and returns a predicate that always evaluates to a given value.

**Example**:

```vbscript
dim p as NSPredicateMBS = NSPredicateMBS.predicateWithValue(true)
MsgBox p.predicateFormat
```

87.12.11 Print

**Function**: Writes description for this event descriptor to the console.

**Notes**: You can see result in Console.app.
87.12.12 Properties

87.12.13 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal handle to the NSPredicate object. **Notes:** (Read and Write property)
87.13. class NSSortDescriptorMBS

87.13.1 class NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The cocoa class for sort descriptions.

**Example:**

```vba
dim n as new NSSortDescriptorMBS("Hello", true)
MsgBox str(n.key)
```

**Notes:**

An instance of NSSortDescriptor describes a basis for ordering objects by specifying the property to use to compare the objects, the method to use to compare the properties, and whether the comparison should be ascending or descending. Instances of NSSortDescriptor are immutable.

You construct an instance of NSSortDescriptor by specifying the key path of the property to be compared, the order of the sort (ascending or descending), and (optionally) a selector to use to perform the comparison. The three-argument constructor allows you to specify other comparison selectors such as caseInsensitiveCompare: and localizedCompare:. Sorting raises an exception if the objects to be sorted do not respond to the sort descriptor’s comparison selector.

Note: Many of the descriptions of NSSortDescriptor methods refer to ”property key”. This, briefly, is a string (key) that identifies a property (an attribute or relationship) of an object. You can find a discussion of this terminology in ”Object Modeling” in Cocoa Fundamentals Guide and in Key-Value Coding Programming Guide.

There are a number of situations in which you can use sort descriptors, for example:

- To sort an array (an instance of NSArray or NSMutableArray see sortedArrayUsingDescriptors and sortUsingDescriptors)
- To directly compare two objects (see compareObject method)
- To specify how the elements in a table view should be arranged (see sortDescriptors)
- To specify how the elements managed by an array controller should be arranged (see sortDescriptors)
- If you are using Core Data, to specify the ordering of objects returned from a fetch request (see sortDescriptors)
87.13.2 Methods

87.13.3 compareObject(obj1 as variant, obj2 as variant) as Integer

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compares two objects. **Notes:** Returns 1, -1 or 0 (zero for equal).

87.13.4 Constructor(key as string, ascending as boolean)

MBS Main Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an NSSortDescriptor object initialized with a given property key path and sort order, and with the default comparison selector. **Example:**

```vbs
dim n as new NSSortDescriptorMBS("Hello", true)
MsgBox str(n.key)
```

**Notes:**

key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

On success the handle property is not zero.
Available in Mac OS X v10.3 and later.
If you implement the Compare event, we use it on OS X 10.6 and newer.

See also:

- 87.13.5 Constructor(key as string, ascending as boolean, SelectorName as String)

87.13.5 Constructor(key as string, ascending as boolean, SelectorName as String)

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an NSSortDescriptor object initialized with a given property key path and sort order, and with the default comparison selector. **Notes:**

key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

On success the handle property is not zero.
87.13. **CLASS NSSORTDESCRIPTORMBS**

Please pass valid name of a selector for the objects. Wrong selector causes trouble, e.g. "localizedCompare:"

Available in Mac OS X v10.3 and later.

See also:

- 87.13.4 Constructor(key as string, ascending as boolean)

87.13.6 **reversedSortDescriptor as NSSortDescriptorMBS**

MBS Main Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns a copy of the receiver with the sort order reversed.

**Example:**

```plaintext
dim n as NSSortDescriptorMBS
n = NSSortDescriptorMBS.sortDescriptorWithKey("Hello", true)

dim x as NSSortDescriptorMBS = n.reversedSortDescriptor
MsgBox x.key+" " + str(x.ascending)
```

87.13.7 **sortDescriptorWithKey(key as string, ascending as boolean) as NSSortDescriptorMBS**

MBS Main Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates and returns an NSSortDescriptor with the specified key and ordering.

**Example:**

```plaintext
dim n as NSSortDescriptorMBS
n = NSSortDescriptorMBS.sortDescriptorWithKey("Hello", true)
MsgBox n.key
```

**Notes:**

key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.

ascending: True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering.

Available in Mac OS X 10.3 and newer.
CHAPTER 87. ICLOUD

87.13.8 sortDescriptorWithKeyComparator(key as string, ascending as boolean, Comparator as NSComparatorDelegateMBS, tag as Variant = nil) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSSortDescriptor object initialized to do with the given ordering and comparator delegate. **Notes:**

- key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding (see Key-Value Coding Programming Guide).
- ascending: true if the receiver specifies sorting in ascending order, otherwise false.
- Comparator: the comparator to use with delegate declaration “NSComparatorDelegateMBS(obj1 as Variant, obj2 as Variant, tag as Variant) as Integer”.

87.13.9 sortDescriptorWithKeyWithCaseInsensitiveCompare(key as string, ascending as boolean) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSSortDescriptor with the specified key and ordering. **Example:**

```dim n as NSSortDescriptorMBS
n = NSSortDescriptorMBS.sortDescriptorWithKeyWithCaseInsensitiveCompare(“Hello”, true)
MsgBox n.key```

**Notes:**

- key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
- ascending: True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering. With case insensitive string comparison.

Available in Mac OS X 10.3 and newer.

87.13.10 sortDescriptorWithKeyWithCompare(key as string, ascending as boolean) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSSortDescriptor with the specified key and ordering.
Example:

```vbnet
dim n as NSSortDescriptorMBS

n = NSSortDescriptorMBS.sortDescriptorWithKeyWithCompare("Hello", true)
MsgBox n.key
```

Notes:

key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering. Uses selector "compare:"
Available in Mac OS X 10.3 and newer.
See also:

- 87.13.11 sortDescriptorWithKeyWithCompare(key as string, ascending as boolean, Options as Integer) as NSSortDescriptorMBS

87.13.11 sortDescriptorWithKeyWithCompare(key as string, ascending as boolean, Options as Integer) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates and returns an NSSortDescriptor with the specified key and ordering.
**Example:**

```vbnet
dim n as NSSortDescriptorMBS

n = NSSortDescriptorMBS.sortDescriptorWithKeyWithCompare("Hello", true)
MsgBox n.key
```

Notes:

key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering. Uses selector "compare:options:"
Please pass options for NSString comparison. e.g. NSNumericSearch
Available in Mac OS X 10.3 and newer.
See also:
87.13.10 sortDescriptorWithKeyWithCompare(key as string, ascending as boolean) as NSSortDescriptorMBS

87.13.12 sortDescriptorWithKeyWithLocalizedCaseInsensitiveCompare(key as string, ascending as boolean) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSSortDescriptor with the specified key and ordering.

**Example:**

```vbnet
dim n as NSSortDescriptorMBS
n = NSSortDescriptorMBS.sortDescriptorWithKeyWithLocalizedCaseInsensitiveCompare("Hello", true)
MsgBox n.key
```

**Notes:**

- **key:** The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
- **ascending:** True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering. With localized string comparison. With case insensitive string comparison. Available in Mac OS X 10.3 and newer.

87.13.13 sortDescriptorWithKeyWithLocalizedCompare(key as string, ascending as boolean) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSSortDescriptor with the specified key and ordering.

**Example:**

```vbnet
dim n as NSSortDescriptorMBS
n = NSSortDescriptorMBS.sortDescriptorWithKeyWithLocalizedCompare("Hello", true)
MsgBox n.key
```

**Notes:**

- **key:** The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
- **ascending:** True if the receiver specifies sorting in ascending order, otherwise false.
Returns an NSSortDescriptorMBS object initialized with the specified key and ordering. With localized string comparison.
Available in Mac OS X 10.3 and newer.

87.13.14 sortDescriptorWithKeyWithSelector(key as string, ascending as boolean, SelectorName as String) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and returns an NSSortDescriptor with the specified selector, key and ordering.
Notes:
key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering. Please pass valid name of a selector for the objects. Wrong selector causes trouble, e.g. "localizedCompare:". Available in Mac OS X 10.3 and newer.

87.13.15 Properties

87.13.16 ascending as boolean

MBS Main Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a Boolean value that indicates whether the receiver specifies sorting in ascending order.
Example:
```plaintext
dim n as new NSSortDescriptorMBS("Hello", true)
MsgBox str(n.ascending)
```

Notes: (Read only property)

87.13.17 Handle as Integer

Notes: (Read and Write property)
87.13.18  key as string

MBS Main Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the receiver’s property key path.
**Example:**
```
dim n as new NSSortDescriptorMBS(“Hello”, true)
MsgBox str(n.key)
```

**Notes:**
This key path specifies the property that is compared during sorting.
(Read only property)

87.13.19  selector as String

MBS Main Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The selector used to sort.
**Notes:** (Read only property)

87.13.20  Events

87.13.21  Comparator(obj1 as Variant, obj2 as Variant) as Integer

MBS Main Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The compare event.
87.14.1 class NSUbiquitousKeyValueStoreMBS

**Function:** The iCloud class to store key value data.

**Notes:**
Size of data is limited to 64 KB per application and 4 KB per value.
Do not store data here. Better store some configuration data, bookmarks or highscores.

Please also check the documentation from Apple for the NSUbiquitousKeyValueStore class. Seems like you need your app to be signed with iCloud Storage Entitlements.

87.14.2 Methods

87.14.3 ArrayValue(key as string) as Variant()

**Function:** Get the value for this key as a variant.

**Example:**

```vbnet
dim values() as Variant

values.Append "Hello"
values.Append "World"

dim u as new NSUbiquitousKeyValueStoreMBS

u.ArrayValue("key")=values

// later read back
dim nvalues() as Variant = u.ArrayValue("key")
```

See also:

- 87.14.4 ArrayValue(key as string, assigns values() as Variant)

87.14.4 ArrayValue(key as string, assigns values() as Variant)

**Function:** Set the value for this key as a variant.
Example:

dim u as new NSUbiquitousKeyValueStoreMBS
dim nvalues() as Variant = u.ArrayValue("key")

See also:

- 87.14.3 ArrayValue(key as string) as Variant()

87.14.5 available as boolean

**Function:** Whether this class is available.

**Example:**

msgbox "iCloud Key Value Store available: " + str(NSUbiquitousKeyValueStoreMBS.available)

**Notes:** This does not tell you whether Apple switched on their servers.

87.14.6 Constructor

**Function:** The constructor.

87.14.7 defaultStore as NSUbiquitousKeyValueStoreMBS

**Function:** Returns a reference to the default key store.

87.14.8 Destructor

**Function:** The destructor.
87.14.9 dictionaryRepresentation as dictionary

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The key value store as a dictionary.

87.14.10 NSUbiquitousKeyValueStoreChangedKeysKey as string

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A key name for the userinfo dictionary when you receive the NSUbiquitousKeyValueStoreDidChangeExternallyNotification notification. **Notes:** Value for this key in the dictionary in an array of strings.

87.14.11 NSUbiquitousKeyValueStoreChangeReasonKey as string

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A key name for the userinfo dictionary when you receive the NSUbiquitousKeyValueStoreDidChangeExternallyNotification notification. **Notes:** Value for this key in the dictionary in an integer.

87.14.12 NSUbiquitousKeyValueStoreDidChangeExternallyNotification as string

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The notification name for the notification sent when the . **Notes:** You can observe this notification with the NSNotificationCenterMBS class or simply subclass NSUbiquitousKeyValueStoreMBS and use the DidChangeExternally event.

87.14.13 removeObjectForKey(key as string)

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the value for the key.

87.14.14 synchronize as boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Synchronizes the key value store. **Example:**
dim u as NSUbiquitousKeyValueStoreMBS = NSUbiquitousKeyValueStoreMBS.defaultStore

// safe something
u.StringValue("Font") = "Times"

if u.synchronize then
    MsgBox "OK"
else
    MsgBox "Failed"
end if

Notes: Returns true on success.

87.14.15 Properties

87.14.16 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The internal reference for this object. Notes: (Read and Write property)

87.14.17 BooleanValue(key as string) as Boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Get or set the value for this key as a boolean. Notes: (Read and Write computed property)

87.14.18 DataValue(key as string) as memoryblock

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Get or set the value for this key as a memoryblock. Notes: (Read and Write computed property)

87.14.19 DictionaryValue(key as string) as Dictionary

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Get or set the value for this key as a dictionary.
**87.14.20 DoubleValue(key as string) as Double**

*Function:* Get or set the value for this key as a double.

*Example:*

```vbnet
dim u as new NSUbiquitousKeyValueStoreMBS

u.DoubleValue("HighScore") = 3456
```

*Notes:* (Read and Write computed property)

---

**87.14.21 IntegerValue(key as string) as Int64**

*Function:* Get or set the value for this key as an integer.

*Example:*

```vbnet
dim u as new NSUbiquitousKeyValueStoreMBS

// query highscore value
MsgBox str(u.IntegerValue("HighScore"))
```

*Notes:* (Read and Write computed property)

---

**87.14.22 StringValue(key as string) as string**

*Function:* Get or set the string value for the given key.

*Example:*

```vbnet
dim u as NSUbiquitousKeyValueStoreMBS = NSUbiquitousKeyValueStoreMBS.defaultStore

// safe something
u.StringValue("Font") = "Times"
```
CHAPTER 87. ICLOUD

Notes: (Read and Write computed property)

**87.14.23 VariantValue(key as string) as Variant**

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Get or set the value for this key as a variant.

Notes: (Read and Write computed property)

**87.14.24 Events**

**87.14.25 DidChangeExternally(ChangeReason as Integer, ChangedKeys() as string, notification as Variant)**

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This event is called when the ubiquitous key value store changed.

Notes:

ChangeReason gives the reason.
Can be NSUbiquitousKeyValueStoreServerChange, NSUbiquitousKeyValueStoreInitialSyncChange or NSUbiquitousKeyValueStoreQuotaViolationChange.

**87.14.26 Constants**

**87.14.27 NSUbiquitousKeyValueStoreInitialSyncChange = 1**

MBS MacCloud Plugin, Plugin Version: 11.2. Function: One of the reasons for an external change to the key store.

**87.14.28 NSUbiquitousKeyValueStoreQuotaViolationChange = 2**

MBS MacCloud Plugin, Plugin Version: 11.2. Function: One of the reasons for an external change to the key store.

**87.14.29 NSUbiquitousKeyValueStoreServerChange = 0**

MBS MacCloud Plugin, Plugin Version: 11.2. Function: One of the reasons for an external change to the key store.
87.14. CLASS NSUBIQUITOUSKEYVALUESTOREMBS

14447
Chapter 88

Icon Service

88.1  Globals

88.1.1  CompositeIconsMBS(ForeGround as IconMBS, BackGround as IconMBS) as IconMBS

MBS Picture Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Combines two icons.

**Example:**

```vbs
dim i as IconMBS  // global
Sub Open()
    dim a,b as IconMBS
    b=new IconMBS(SpecialFolder.Desktop)
    a=new IconMBS(app.ApplicationFileMBS)
    i=CompositeIconsMBS(a,b)
End Sub

Sub Paint(g As Graphics)
    i.DrawIcon(g,0,0,128,128)
End Sub
```

**Notes:** Returns nil on any error (e.g. one of the two icons is invalid or nil).
88.1.2 NewIconFamilyMBS as IconFamilyMBS

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new empty IconFamily object.

**Example:**

dim i as IconFamilyMBS = NewIconFamilyMBS

**Notes:** Returns nil on any error.

88.1.3 NewIconFamilyMBSFromScrap as IconFamilyMBS

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new IconFamily object with the data of a "icns" resource from the clipboard.

**Example:**

// put the Finder Icon on the clipboard

dim i as new IconMBS("FNDR", "MACS")
i.IconFamily.PutOnScrap

// and get it back

dim n as IconFamilyMBS = NewIconFamilyMBSFromScrap
Backdrop = n.Thumbnail32BitData

**Notes:** Returns nil on any error.

88.1.4 IconStringToPictMBS(icon as String, bitDepth as Integer, size as Integer) as Picture

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: Yes. **Function:** Converts an icon into a Picture so that you can display it within the REALbasic environment.

**Example:**

dim icondata as string
dim p as Picture

p=IconStringToPictMBS(icondata, 8, 32)
Notes:
To see how it is used, look at the method DisplayTheFileIcon in the included REALbasic demo project. Currently this function only creates a Picture from the Icon’s Image, and does not consider the Icon Mask. The Mask is always right behind the Icon Image, in case you want to get that, too. Size is the width and height of the icon which must be equal. If you need something other, please ask.

88.2 class IconFamilyMBS

88.2.1 class IconFamilyMBS

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for an icon family on Mac OS.

88.2.2 Methods

88.2.3 close

MBS Picture Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The destructor.
**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you. (e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

88.2.4 GetIconImage(size as Integer, byref pic as picture, byref mask as picture) as boolean

MBS Picture Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns an icon with the given size.
**Example:**
```vbnet
dim p,m as Picture
dim s as IconFamilyMBS // your icon

if s.GetIconImage(512,p,m) then
    window1.Backdrop=p
    window2.Backdrop=m
end if
```
CHAPTER 88. ICON SERVICE

Notes:
Size may be 16, 32, 48, 128, 256 or 512.
Returns true on success and false on failure.
Works only on Mac OS X 10.5 or newer.

LastError is -50 if the given size is not available.
Added 1024 pixel support in 12.3 plugins.

88.2.5 Icon(width as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns an picture with the icon of the icon family for the given icon size.
Example:

```
dim i as new IconMBS(SpecialFolder.Desktop)
dim f as IconFamilyMBS = i.IconFamily
Backdrop = f.Icon(200)
```

Notes: The icon is adjusted to have the requested size if needed.

88.2.6 IconImage(width as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns an picture with the icon image of the icon family.
Example:

```
dim i as new IconMBS(SpecialFolder.Desktop)
dim f as IconFamilyMBS = i.IconFamily
// gives 256 pixel icon
Backdrop = f.IconImage(200)
```

Notes: The icon may be bigger or smaller if no such icon size exists.

88.2.7 IconMask(width as Integer) as picture

MBS Picture Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns an picture with the icon mask of the icon family.
Example:
88.2. CLASS ICONFAMILYMBS

```vba
dim i as new IconMBS(SpecialFolder.Desktop)
dim f as IconFamilyMBS = i.IconFamily
// gives 256 pixel icon
Backdrop = f.IconMask(200)
```

**Notes:** The icon may be bigger or smaller if no such icon size exists.

88.2.8 PutOnScrap

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Puts the Icon as an "icns" resource on the clipboard.

**Example:**

```vba
dim i as new IconMBS("FNDR", "MACS")
i.IconFamily.PutOnScrap
```

**Notes:** LastError is set.

88.2.9 Register(creator as string, type as string) as IconMBS

**Notes:**

- The current icon stored in the iconfamily is saved in the global icon list with the given type and creator combination.
- On success the new IconMBS object is returned. In case the IconMBS object is destroyed, the icon will automatically be removed from the icon list.
- Lasterror is set.

88.2.10 SetIconImage(pic as picture, mask as picture) as boolean

MBS Picture Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the icon data.

**Example:**

```vba
dim p as Picture // your picture
dim m as Picture // the mask for the picture
dim i as IconFamilyMBS // your icon family
```
CHAPTER 88. ICON SERVICE

// 512, 256, 128 Pixel images for Leopard
dim ps,ms as Picture
ps=p.ScaleMBS(512,512)
ms=m.ScaleMBS(512,512)
call i.SetIconImage(ps,ms)
ps=p.ScaleMBS(512,256)
ms=m.ScaleMBS(512,256)
call i.SetIconImage(ps,ms)
ps=p.ScaleMBS(512,128)
ms=m.ScaleMBS(512,128)
call i.SetIconImage(ps,ms)

Notes:
Size of the pictures may be 16, 32, 48, 128, 256 or 512.
pic and mask must not be nil.
pic.width, mask.width, pic.height and mask.height must all be same.
Returns true on success and false on failure.
Works only on Mac OS X 10.5 or newer.
Added 1024 pixel support in 12.3 plugins.

88.2.11 WriteFile(f as folderitem)

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the icon family into an icon file.

**Example:**

dim pict,mask as Picture
dim iconfamily as IconFamilyMBS
dim f as FolderItem

// create pictures
pict=NewPicture(128,128,32)
mask=NewPicture(128,128,32)
pict.Graphics.ForeColor=rgb(255,0,0)
pict.Graphics.FillOval 0,0,128,128

mask.Graphics.ForeColor=rgb(0,0,0)
mask.Graphics.FillOval 0,0,128,128

// make an icon family
iconfamily=NewIconFamilyMBS
iconfamily.Thumbnail32BitData=pict
iconfamily.Thumbnail8BitMask=mask
88.2.  CLASS ICONFAMILYMBS

' you may fill more like iconfamily.Large32BitData...

f=SpecialFolder.Desktop.Child(“test.icns”)

// Save *.ICNS file:
iconfamily.WriteFile f

if f.AddCustomIconMBS(iconfamily,false)=0 then
    // successfully added custom icon
end if

Notes: LastError is set.

88.2.12  Properties

88.2.13  Dither as boolean

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. Function:
whether on setting an icon the picture is dithered to the new color depth.
Notes:
Dithered pictures look normally better.
(Read and Write property)

88.2.14  Handle as Integer

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The Handle for this Icon family.
Notes:
Value is a IconFamilyHandle.
(Read and Write property)

88.2.15  LastError as Integer

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The last error code.
Notes:
The last function was successfull if lasterror is 0.
If the last function was not available on this machine, the value is set to -1.
CHAPTER 88. ICON SERVICE

Other values are Mac OS error codes.
(Read and Write property)

### 88.2.16 Release as boolean

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:**
whether to release the handle in the destructor.
**Notes:** (Read and Write property)

### 88.2.17 Valid as boolean

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
whether the icon family is valid.
**Notes:** (Read and Write property)

### 88.2.18 Data as string

MBS Picture Plugin, Plugin Version: 5.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The data of this icon in the ICNS format.
**Example:**

```vbs
dim g as FolderItem
dim i as IconMBS
dim f as IconFamilyMBS
dim s as string
dim b as BinaryStream

g=SpecialFolder.Desktop
i=new IconMBS(g) // get icon from desktop folder on Mac OS X
f=i.IconFamily
Backdrop=f.Thumbnail32BitData

s=f.Data
MsgBox str(lenb(s))+” bytes”

g=SpecialFolder.Desktop.Child(”Desktop folder icon.icns”)
b=g.CreateBinaryFile(”Icon”) // you need to define this type!
b.write s
b.close

g.launch // shows in preview the icns file
```
88.2. **CLASS ICONFAMILYMBS**

Notes:
Returns "" on low memory or any error.
(Read and Write computed property)

### 88.2.19 DataMemory as Memoryblock

MBS Picture Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The data of this icon in the ICNS format.
**Example:**
```vba
// get icon from desktop folder on Mac OS X
dim i as new IconMBS(SpecialFolder.Desktop)
dim f as IconFamilyMBS = i.IconFamily
dim m as memoryblock = f.DataMemory

MsgBox str(m.size) + " bytes"
```

Notes:
Returns nil on low memory or any error.
(Read and Write computed property)

### 88.2.20 Huge1BitData as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If such an icon is included in this icon family, this function returns it.
**Example:**
```vba
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Huge1BitData
```

Notes:
Lasterror is set.
(Read and Write computed property)
88.2.21 Huge1BitMask as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If such an icon is included in this icon family, this function returns it.

**Example:**

```vbscript
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Huge1BitMask
```

**Notes:**

Lasterror is set.
(Read and Write computed property)

---

88.2.22 Huge32BitData as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If such an icon is included in this icon family, this function returns it.

**Example:**

```vbscript
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Huge32BitData
```

**Notes:**

Lasterror is set.
(Read and Write computed property)

---

88.2.23 Huge4BitData as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If such an icon is included in this icon family, this function returns it.

**Example:**

```vbscript
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Huge4BitData
```

**Notes:**

Lasterror is set.
(Read and Write computed property)
**88.2.24 Huge8BitData as picture**

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If such an icon is included in this icon family, this function returns it. **Example:**

```vbnet
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Huge8BitData
```

**Notes:**
Lasterror is set.
(Read and Write computed property)

---

**88.2.25 Huge8BitMask as picture**

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If such an icon is included in this icon family, this function returns it. **Example:**

```vbnet
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Huge8BitMask
```

**Notes:**
Lasterror is set.
(Read and Write computed property)

---

**88.2.26 Large1BitData as picture**

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If such an icon is included in this icon family, this function returns it. **Example:**

```vbnet
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Large1BitData
```

**Notes:**
Lasterror is set.
(Read and Write computed property)

88.2.27 Large1BitMask as picture

Function:
If such an icon is included in this icon family, this function returns it.
Example:

```vbscript
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Large1BitMask
```

Notes:
Lasterror is set.
(Read and Write computed property)

88.2.28 Large32BitData as picture

Function:
If such an icon is included in this icon family, this function returns it.
Example:

```vbscript
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Large32BitData
```

Notes:
Lasterror is set.
(Read and Write computed property)

88.2.29 Large4BitData as picture

Function:
If such an icon is included in this icon family, this function returns it.
Example:

```vbscript
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Large4BitData
```
88.2. CLASS ICONFAMILYMBS

Notes:
Lasterror is set.
(Read and Write computed property)

88.2.30 Large8BitData as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If such an icon is included in this icon family, this function returns it.

**Example:**
```vbnet
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Large8BitData
```

Notes:
Lasterror is set.
(Read and Write computed property)

88.2.31 Large8BitMask as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If such an icon is included in this icon family, this function returns it.

**Example:**
```vbnet
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Large8BitMask
```

Notes:
Lasterror is set.
(Read and Write computed property)

88.2.32 Small1BitData as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If such an icon is included in this icon family, this function returns it.

**Example:**
```vbnet
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Small1BitData
```
Notes:
Lasterror is set.
(Read and Write computed property)

88.2.33 Small1BitMask as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If such an icon is included in this icon family, this function returns it.
**Example:**
```plaintext
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Small1BitMask
```

Notes:
Lasterror is set.
(Read and Write computed property)

88.2.34 Small32BitData as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If such an icon is included in this icon family, this function returns it.
**Example:**
```plaintext
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Small32BitData
```

Notes:
Lasterror is set.
(Read and Write computed property)

88.2.35 Small4BitData as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If such an icon is included in this icon family, this function returns it.
Example:

```vba
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Small4BitData
```

Notes:
Lasterror is set.
(Read and Write computed property)

88.2.36 Small8BitData as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If such an icon is included in this icon family, this function returns it.

**Example:**

```vba
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Small8BitData
```

Notes:
Lasterror is set.
(Read and Write computed property)

88.2.37 Small8BitMask as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If such an icon is included in this icon family, this function returns it.

**Example:**

```vba
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Small8BitMask
```

Notes:
Lasterror is set.
(Read and Write computed property)
88.2.38 Thumbnail32BitData as picture

MBS Picture Plugin, Plugin Version: 2.7. Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If such an icon is included in this icon family, this function returns it. **Example:**

```plaintext
// Example about a function to return a REALbasic picture with an icon and its
// mask.
//
// Function geticonpicture As picture
// You have to add more support, like for example for Huge and Small icons.

dim icon as IconMBS
dim p as picture
dim b as picture
dim m as picture

icon=new IconMBS("APPL","sbkt")

if icon.valid then
    dim i as IconFamilyMBS = icon.IconFamily

    p=newpicture(128,128,32)
    b=i.Thumbnail32BitData
    if b<>nil then
        p.mask.graphics.drawpicture b,0,0
        p.graphics.drawpicture i.thumbnail8BitMask,0,0
        return p
    end if

    m=i.Large1BitMask
    if m<>nil then
        b=i.Large32BitData
        if B=nil then
            b=i.Large8BitData
            end if
        if b=nil then
            b=i.Large4BitData
            end if
        if b=nil then
            b=i.large1BitData
            end if
        p.graphics.drawpicture b,0,0,128,128,0,0,32,32
        b=i.large8BitMask
        if b<>nil then
            m=b
    end if
```

end if
p.mask.graphics.drawpicture m,0,0,128,128,0,0,32,32
return p
end if
end if
End Function

Notes:
Lasterror is set.
(Read and Write computed property)

88.2.39 Thumbnail8BitMask as picture

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: If such an icon is included in this icon family, this function returns it.
Example:
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Thumbnail8BitMask

Notes:
Lasterror is set.
(Read and Write computed property)
88.3  class IconMBS

88.3.1  class IconMBS

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for an icon on Mac OS.

**Example:**

// A function which will try to return an icon for the given type/creator including the Mask.

Function GetIconPicture(macCreator as string, macType as string, size as Integer) As picture
dim icn as IconMBS
dim icf as IconFamilyMBS
dim pic, tmp as Picture

icn = new IconMBS(macType, macCreator)

if icn<>nil and icn.valid then
    icf = icn.IconFamily
    
end if

if icf<>nil and icf.Valid then
    pic = NewPicture(size, size, 32)

    // Try Thumbnail
    if size>32 then
        tmp = icf.Thumbnail32BitData
        if tmp<>nil then
            pic.Graphics.DrawPicture tmp, 0, 0, size, size, 0, 0, tmp.width,tmp.Height
        end if
        
        tmp = icf.Thumbnail8BitMask
        if tmp<>nil then
            pic.Mask.Graphics.DrawPicture tmp, 0, 0, size, size, 0, 0, tmp.width, tmp.Height
        end if
        
    end if
    
    Return pic
end if
end if

// Try Large Icon in 32 bit

tmp = icf.Large32BitData
if tmp<>nil then
    pic.Graphics.DrawPicture tmp, 0, 0, size, size, 0, 0, tmp.width,tmp.Height
end if

tmp = icf.Large8BitMask
if tmp<>nil then
    pic.Mask.Graphics.DrawPicture tmp, 0, 0, size, size, 0, 0, tmp.width, tmp.Height
end if

Return pic
end if

// Try Large Icon in 8 bit
tmp = icf.Large8BitData
if tmp<>nil then
    pic.Graphics.DrawPicture tmp, 0, 0, size, size, 0, 0, tmp.width,tmp.Height
end if

tmp = icf.Large1BitMask
if tmp<>nil then
    pic.Mask.Graphics.DrawPicture tmp, 0, 0, size, size, 0, 0, tmp.width, tmp.Height
end if
return pic
end if

// You may add more like e.g. Small or Huge Icons
end if

Exception // on any error, just return nil

// Call like:
// Backdrop=GetIconPicture("R*ch","TEXT",128)
End Function

88.3.2 Methods

88.3.3 Constructor(f as folderitem, NoBadge as boolean = false)

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Loads the icon for this file/folder/volume.

**Example:**

// in a paint event:

dim i as new IconMBS(SpecialFolder.Desktop)
i.DrawIcon(g, 0, 0, 128, 128)

**Notes:**

The example "GetIcon.rb" shows how to get the file icons.
A custom icon is preferred (ID -16455).
NoBadge can be set to true to have no badges on the icon.

See also:

- 88.3.4 Constructor(type as string, creator as string)
- 88.3.5 Constructor(type as string, creator as string, extension as string, mime as string)

### 88.3.4 Constructor(type as string, creator as string)

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Loads the icon for this type and creator code combination.

**Example:**

```vbscript
// in a paint event:

   dim i as new IconMBS("FNDR", "MACS")

   i.DrawIcon(g, 0, 0, 128, 128)
```

**Notes:** The example "GetIcon.rb" shows how to get the predefined icons from the system.

- 88.3.3 Constructor(f as folderitem, NoBadge as boolean = false)
- 88.3.5 Constructor(type as string, creator as string, extension as string, mime as string)

### 88.3.5 Constructor(type as string, creator as string, extension as string, mime as string)

MBS Picture Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Loads the icon base on the given information.

**Example:**

```vbscript
Sub Paint(g As Graphics)  // in a window paint event:

   dim i as IconMBS
   dim type, creator, extension, mime as string

   type=""
   creator=""
   extension="jpg"
   mime=""

   i=new iconmbs(type, creator, extension, mime)
```
88.3. **CLASS ICONMBS**  

```plaintext
// draws jpeg icon
i.DrawIcon(g,0,0,128,128)

type=""
creator=""
extension=""
mime="video/quicktime"

i=new iconmbs(type, creator, extension, mime)
// draws quicktime movie icon
i.DrawIcon(g,128,0,128,128)

type="TEXT"
creator="MSWD"
extension=""
mime=""

i=new iconmbs(type, creator, extension, mime)
// draws microsoft word text file icon
i.DrawIcon(g,0,128,128,128)

type=""
creator="GKON"
extension="jpg"
mime=""

i=new iconmbs(type, creator, extension, mime)
// draws graphic converter jpeg file icon
i.DrawIcon(g,128,128,128,128)

End Sub
```

**Notes:**

All parameters can be empty strings if you don’t know this information.
Requires Mac OS X 10.3 to work properly.
See also:

- 88.3.3 Constructor(f as folderitem, NoBadge as boolean = false) 14467

- 88.3.4 Constructor(type as string, creator as string) 14468
88.3.6 **DrawIcon(g as graphics, x as Integer, y as Integer, width as Integer, height as Integer)**

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Draws the icon.

**Example:**

```javascript
// in a paint event:

dim i as new IconMBS("FNDR", "MACS")

i.DrawIcon(g, 0, 0, 128, 128)
```

**Notes:**

DrawIcon with align and transform set to none.

Not supported for Cocoa. Please use DrawIconCGContext there.

See also:

- 88.3.7 **DrawIcon(g as graphics, x as Integer, y as Integer, width as Integer, height as Integer, align as Integer)**
- 88.3.8 **DrawIcon(g as graphics, x as Integer, y as Integer, width as Integer, height as Integer, align as Integer, transform as Integer)**

88.3.7 **DrawIcon(g as graphics, x as Integer, y as Integer, width as Integer, height as Integer, align as Integer)**

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Draws the icon.

**Example:**

```javascript
// in a paint event:

dim i as new IconMBS("FNDR", "MACS")

i.DrawIcon(g, 0, 0, 128, 128, 8)
```

**Notes:**

DrawIcon with transform set to none.

Not supported for Cocoa. Please use DrawIconCGContext there.

See also:
88.3. **CLASS ICONMBS**

- 88.3.6 DrawIcon(g as graphics, x as Integer, y as Integer, width as Integer, height as Integer)
- 88.3.8 DrawIcon(g as graphics, x as Integer, y as Integer, width as Integer, height as Integer, align as Integer, transform as Integer)

### 88.3.8 DrawIcon(g as graphics, x as Integer, y as Integer, width as Integer, height as Integer, align as Integer, transform as Integer)

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Draws the icon.

**Example:**

```javascript
// in a paint event:

dim i as new IconMBS("FNDR", "MACS")

i.DrawIcon(g, 0, 0, 128, 128, 0, & h4000)
```

**Notes:**

Align and Transform are optional parameters.

The coordinates inside the graphics objects are absolute to the picture or window where the graphics object came from.

Align constants:

Transform constants:

Not supported for Cocoa. Please use DrawIconCGContext there.

**See also:**

- 88.3.6 DrawIcon(g as graphics, x as Integer, y as Integer, width as Integer, height as Integer)
- 88.3.7 DrawIcon(g as graphics, x as Integer, y as Integer, width as Integer, height as Integer, align as Integer)

### 88.3.9 DrawIconCGContext(CGContextHandle as Integer, x as Integer, y as Integer, width as Integer, height as Integer, align as Integer, transform as Integer, flags as Integer, labelColor as color)

MBS Picture Plugin, Plugin Version: 8.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws the icon in a CoreGraphics Context.
None 0
VerticalCenter 1

Bottom 3
HorizontalCenter 4
AbsoluteCenter 5
CenterTop 6
CenterBottom 7
Left 8
CenterLeft 9
TopLeft 10
BottomLeft 11
Right 12
CenterRight 13
TopRight 14
BottomRight 15

Example:

Function GetIconImage(i as iconmbs, w as Integer, h as Integer) As picture
dim c as new CGPictureContextMBS(w,h)

const DrawNormal=0
const DrawNoImage=2
const DrawNoMask=4
const DrawSelected=& h8000

i.DrawIconCGContext(c.Handle, 0,0,w,0,h,0,DrawNoMask,& c000000)

c.Flush

Return c.CopyPicture
End Function

Notes:

You must make sure that the CGContext handle you pass in is valid. You can use CGContextMBS class for this and use GetCurrentCGContextMBS or Window.CGContextMBS to get a context. Please note that coordinates have the origin typically on the lower left.

Transform constants:

### 88.3.10 GetBackground as IconMBS

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the icon is a composited one, this function returns the icon used for the background.

**Notes:**
Returns nil on any error.
Lasterror ist set.

### 88.3.11 GetForeground as IconMBS

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the icon is a composited one, this function returns the icon used for the foreground.

**Notes:**
Returns nil on any error.
88.3.12 IconFamily as IconFamilyMBS

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the icon converted to an Iconfamily.

**Example:**

```vba
dim i as new IconMBS("FNDR", "MACS")
Backdrop = i.IconFamily.Thumbnail32BitData
```

88.3.13 IsIconRefMaskEmpty as boolean

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the mask of the icon is empty.

**Example:**

```vba
dim i as new IconMBS("FNDR", "MACS")
MsgBox str(i.IsIconRefMaskEmpty)
```
None 0  
Disabled 1

Label7 & h0700  
Selected & h4000  
SelectedDisabled & h4001  
SelectedOffline & h4002  
SelectedOpen & h4003

Notes: Lasterror is set.

88.3.14  PointInIcon(pointx as Integer, pointy as Integer, x as Integer, y as Integer, width as Integer, height as Integer, align as Integer) as boolean

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Tests whether a point is inside the icon’s picture. Notes: The coordinates for pointx/pointy and x/y must be in the same system.

Align constants:

88.3.15  RectInIcon(rectx as Integer, recty as Integer, rectwidth as Integer, rectheight as Integer, x as Integer, y as Integer, width as Integer, height as Integer, align as Integer) as boolean

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Tests whether a rectangle is inside the icon’s picture. Notes: The coordinates for both rectangles must be in the same coordinate system.

Align constants:
None 0
VerticalCenter 1
Top 2
Bottom 3
HorizontalCenter 4
AbsoluteCenter 5
CenterTop 6
CenterBottom 7
Left 8
CenterLeft 9
TopLeft 10
BottomLeft 11
Right 12
CenterRight 13
TopRight 14
BottomRight 15

This call may fail in some RB versions because of the count of parameters.

### 88.3.16 RetainCount as Integer

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** How many references to this icon are hold on this Mac.

**Example:**
```
dim i as new IconMBS("FNDR", "MACS") // Finder Icon
MsgBox str(i.RetainCount)
```

### 88.3.17 Properties

#### 88.3.18 handle as Integer

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle of this icon in memory.

**Example:**
```
dim i as new IconMBS("FNDR", "MACS") // Finder Icon
```

MsgBox str(i.handle)

**Notes:** (Read and Write property)

## 88.3.19 LastError as Integer

MBS Picture Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The last error code.

**Example:**

```vbnet
dim i as new IconMBS("FNDR", "MACS") // Finder Icon
```

MsgBox str(i.LastError)

**Notes:**

The last function was successfull if lasterror is 0.
If the last function was not available on this machine, the value is set to -1.
Other values are Mac OS error codes.
(Read and Write property)
88.3.20 Release as boolean

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** whether the destructor will release the handle.

**Example:**
```
dim i as new IconMBS("FNDR", "MACS") // Finder Icon
MsgBox str(i.Release)
```

**Notes:** (Read and Write property)

88.3.21 valid as boolean

MBS Picture Plugin, Plugin Version: 2.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Were the constructors successfull?

**Example:**
```
dim i as new IconMBS("FNDR", "MACS") // Finder Icon
MsgBox str(i.valid)
```

**Notes:** (Read and Write property)
Chapter 89

Image Capture

89.1 class ICCameraDeviceMBS

89.1.1 class ICCameraDeviceMBS

Function: ICCameraDeviceMBS is a concrete subclass of ICDeviceMBS class.

Notes:
ICDeviceBrowserMBS creates instances of this class.
Subclass of the ICDeviceMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.1.2 Methods

89.1.3 cancelDelete

Function: Cancels the current delete operation started by sending a requestDeleteFiles.

89.1.4 cancelDownload

Function: Cancels the current download operation.
89.1.5 Constructor

**Function:** The private constructor.

89.1.6 contents as ICCameraItemMBS()

**Function:** Contents of the camera.  
**Notes:** The structure of the elements in this array will reflect the folder structure of the storage reported by the camera. Each item in this array will correspond to a storage on the camera.

89.1.7 filesOfType(fileUTType as string) as ICCameraFileMBS()

**Function:** This method returns an array of files on the camera of type fileType.  
**Notes:**  
The fileType string is one of the following Uniform Type Identifier strings: kUTTypeImage, kUTTypeMovie, kUTTypeAudio, or kUTTypeData.  
See UTTypeMBS module.

89.1.8 ICCameraDeviceCanAcceptPTPCommands as string

**Function:** One of the constants used to describe capabilities of a camera.  
**Notes:** Indicates that the camera can accept PTP commands.

89.1.9 ICCameraDeviceCanDeleteAllFiles as string

**Function:** One of the constants used to describe capabilities of a camera.  
**Notes:** Indicates that the camera can delete all files in a single operation while it is connected.

89.1.10 ICCameraDeviceCanDeleteOneFile as string

**Function:** One of the constants used to describe capabilities of a camera.
89.1. **CLASS ICCAMERADEVICEMBS**

Notes: Indicates that the camera can delete a file at a time while it is connected.

89.1.11 **ICCameraDeviceCanReceiveFile as string**

**Function:** One of the constants used to describe capabilities of a camera.  
**Notes:** Indicates that the host can upload files to the camera.

89.1.12 **ICCameraDeviceCanSyncClock as string**

**Function:** One of the constants used to describe capabilities of a camera.  
**Notes:** Indicates that the camera can synchronize its date and time with that of the host computer.

89.1.13 **ICCameraDeviceCanTakePicture as string**

**Function:** One of the constants used to describe capabilities of a camera.  
**Notes:** Indicates that the camera can capture a picture while it is connected, if the client sends a request-TakePicture message to it.

89.1.14 **ICCameraDeviceCanTakePictureUsingShutterReleaseOnCamera as string**

**Function:** One of the constants used to describe capabilities of a camera.  
**Notes:** Indicates that the camera can capture a picture while it is connected, if the user presses the shutter release on the camera.

89.1.15 **ICDeleteAfterSuccessfulDownload as string**

**Function:** One of the keys for options dictionary.  
**Notes:** The value for this key should be a boolean value. If this value is true, the file will be deleted from the device after it is successfully downloaded.
89.1.16  **ICDownloadsDirectoryURL as string**

**Function:** One of the keys for options dictionary.  
**Notes:**  
The value for this key should be an CFURLMBS referencing a writable directory.  
The downloaded files will be saved in that directory.

89.1.17  **ICDownloadSidecarFiles as string**

**Function:** One of the keys for options dictionary.  
**Notes:** The value for this key should be a boolean value. If this value is true, all sidecar files will be downloaded along with the media file.

89.1.18  **ICOverwrite as string**

**Function:** One of the keys for options dictionary.  
**Notes:** The value for this key should be a boolean value. If this value is true, the downloaded file will overwrite an existing file with the same name and extension.

89.1.19  **ICSaveAsFilename as string**

**Function:** One of the keys for options dictionary.  
**Notes:** The value for this key should be a string containing the name to be used for the downloaded file.

89.1.20  **ICSavedAncillaryFiles as string**

**Function:** One of the keys for options dictionary.  
**Notes:** The value for this key will be an array containing names of files associated with the primary file that is downloaded. The options dictionary returned in `didDownloadFile` may have this key.
89.1. CLASS ICCAMERADEVICEMBS

89.1.21 ICSavedFilename as string

Function: One of the keys for options dictionary.
Notes: The value for this key will be a string containing the actual name of the saved file. The options
dictionary returned in didDownloadFile will have this key.

89.1.22 mediaFiles as ICCameraFileMBS()

Function: The property mediaFiles represents all image, movie and audio files on the camera.
Notes: These files are returned as a single array without regard to the folder hierarchy used to store these files on
the camera.

If no files show up, try again a second later as the framework may not yet have the list loaded.

89.1.23 requestDeleteFiles(files() as ICCameraFileMBS)

Function: Deletes files.

89.1.24 requestDisableTethering

Function: Send this message to disable tethered capture on the camera device if the camera has the 'IC-
CameraDeviceCanTakePicture' capability and if your process has already sent a 'requestEnableTethering'
to it.

89.1.25 requestDownloadFile(file as ICCameraFileMBS, options as dictionary
= nil)

Function: Download a file from the camera. Please refer to the top of this header for information about
the options.
Notes: Calls cameraDeviceDidDownloadFile event later.
The content of error returned should be examined to determine if the request completed successfully.
89.1.26 requestEnableTethering

**Function:** Send this message to enable tethered capture on the camera device if the camera has the 'IC-CameraDeviceCanTakePicture' capability.

89.1.27 requestReadDataFromFile(file as ICCameraFileMBS, offset as UInt64, Length as UInt64)

**Function:** This method asynchronously reads data of a specified length from a specified offset.
**Notes:**
Calls later ImageCaptureEventsMBS.cameraDeviceDidReadData event.
The content of error returned should be examined to determine if the request completed successfully.

89.1.28 requestSendPTPCommand(command as MemoryBlock, dataOut as MemoryBlock)

**Function:** This method asynchronously sends a PTP command to a camera.
**Notes:** The content of error returned should be examined to determine if the request completed successfully.

89.1.29 requestSyncClock

**Function:** Synchronize camera’s clock with the computer’s clock.
**Notes:** You should send this request only if the camera has the 'ICCameraDeviceCanSyncClock' capability.

89.1.30 requestTakePicture

**Function:** Capture a new image using the camera, the camera capabilities include 'ICCameraDeviceCanTakePicture'.
**Notes:** You MUST send ‘requestEnableTethering’ message to the camera before sending 'requestTakePicture' message.
89.1.31 requestUploadFile(file as folderitem, options as dictionary = nil)

Function: Upload a file at fileURL to the camera.
Notes:
The options dictionary is not used in this version.
Calls later ImageCaptureEventsMBS.cameraDeviceDidUploadFile event.
The content of error returned should be examined to determine if the request completed successfully.

89.1.32 Properties

89.1.33 batteryLevel as Integer

Function: Indicates the battery charge level.
Notes:
Its value ranges from 0 to 100.
(Read only property)

89.1.34 batteryLevelAvailable as Boolean

Function: Indicates if the device has reported battery charge level.
Notes: (Read only property)

89.1.35 contentCatalogPercentCompleted as Integer

Function: Indicates the percentage of content cataloging completed on the device.
Notes:
Its value ranges from 0 to 100.
(Read only property)

89.1.36 isAccessRestrictedAppleDevice as Boolean

Function: Set to true if the device is made by Apple and is pass-coded locked and connected to an untrusted
CHAPTER 89. IMAGE CAPTURE

host.

Notes: (Read only property)

89.1.37  mountPoint as String

Function: Filesystem mount point for a device with transportType of ICTransportTypeMassStorage.
Notes:
This will be "" for all other devices.
(Read only property)

89.1.38  tetheredCaptureEnabled as Boolean

Function: This property is set to YES when tethered capture is enabled on the device.
Notes:
Use 'requestEnableTethering' and 'requestDisableTethering' to enable or disable tethered capture on the device.
(Read only property)

89.1.39  timeOffset as Double

Function: Indicates the time offset, in seconds, between the camera’s clock and the computer’s clock.
Notes:
This value is positive if the camera’s clock is ahead of the computer’s clock. This property should be ignored if the camera’s capabilities property does not contain ICCameraDeviceCanSyncClock.
(Read only property)
89.2  **CLASS ICCAMERAFILEMBS**

89.2  **class ICCameraFileMBS**

89.2.1  **class ICCameraFileMBS**

**Function:** This class represents a file on an ICCameraDevice object.  
**Notes:**  
Subclass of the ICCameraItemMBS class.  
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.2.2  **Methods**

89.2.3  **Constructor**

**Function:** The private constructor.

89.2.4  **sidecarFiles as ICCameraFileMBS()**

**Function:** Returns array of sidecar files.  
**Notes:** This property is an empty array if there are no sidecar files associated with this file. Otherwise it is an array of ICCameraFile instances of sidecar files associated with this file. An example of a sidecar file is a file with the same base name as this file and having an extension XMP.

89.2.5  **Properties**

89.2.6  **Duration as Double**

**Function:** Duration of audio/video file in seconds.  
**Notes:** (Read only property)

89.2.7  **FileSize as UInt64**

**Function:** Size of file in bytes.
89.2.8 Orientation as Integer

Function: Desired orientation of image to use when it is downloaded.
Notes:
This property is set to ICEXIFOrientation1 initially. If the format of this file supports EXIF orientation tag, then this property will be updated to match the value of that tag, when the thumbnail or metadata for this file is received.

Possible values:

<table>
<thead>
<tr>
<th>ICEXIFOrientation</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>Normal</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>Flipped horizontally</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
<td>Rotated 180</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
<td>Flipped vertically</td>
</tr>
<tr>
<td>5</td>
<td>5</td>
<td>Rotated 90 CCW and flipped vertically</td>
</tr>
<tr>
<td>6</td>
<td>6</td>
<td>Rotated 90 CCW</td>
</tr>
<tr>
<td>7</td>
<td>7</td>
<td>Rotated 90 CW and flipped vertically</td>
</tr>
<tr>
<td>8</td>
<td>8</td>
<td>Rotated 90 CW</td>
</tr>
</tbody>
</table>

(Read and Write property)
89.3. class ICCameraFolderMBS

89.3.1 class ICCameraFolderMBS

Function: This class represents a folder on an ICCameraDevice object.
Notes:
Subclass of the ICCameraItemMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.3.2 Methods

89.3.3 Constructor

Function: The private constructor.

89.3.4 contents as ICCameraItemMBS() 

Function: A list of items contained by this folder.
89.4 class ICCameraItemMBS

89.4.1 class ICCameraItemMBS

Function: ICCameraItem is an abstract class that represents an item in an ICCameraDevice object.
Notes:
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.4.2 Methods

89.4.3 Constructor

Function: The private constructor.

89.4.4 Properties

89.4.5 addedAfterContentCatalogCompleted as Boolean

Function: This property is set if the file is captured on the device after the device’s content is fully enumerated.
Notes:
This does not apply to files added as a result of adding a new store to the device.
(Read only property)

89.4.6 CreationDate as Date

Function: Creation date of this file.
Notes:
This information is usually the same as the EXIF creation date.
(Read only property)
89.4.7 Device as ICCameraDeviceMBS

Function: Parent device of this folder.
Notes: (Read only property)

89.4.8 FileSystemPath as String

Function: The file system path of the item for items on a device with transportType of ICTransportType-MassStorage.
Notes: (Read only property)

89.4.9 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

89.4.10 InTemporaryStore as Boolean

Function: Indicates if this folder is in a temporary store.
Notes:
A temporary store may be used by the device when images are captures on the device when it is tethered to the computer.
(Read only property)

89.4.11 largeThumbnailIfAvailable as Variant

Function: Large thumbnail for the item if one is readily available.
Notes:
Value is a CGImageMBS.
If one is not readily available, accessing this property will send a message to the device requesting a thumbnail for the file. The ImageCaptureEventsMBS subclass will be notified via event cameraDevice-DidReceiveThumbnailForItem.
89.4.12 Locked as Boolean

Function: Indicates the protection state of this item.
Notes: It is locked if the storage card in the camera is locked.
(Read only property)

89.4.13 MetadataIfAvailable as Dictionary

Function: Metadata for the file if one is readily available.
Notes: If one is not readily available, accessing this property will send a message to the device requesting a thumbnail for the file. The ImageCaptureEventsMBS subclass will be notified via event cameraDeviceDidReceiveMetaDataForItem.
(Read only property)

89.4.14 ModificationDate as Date

Function: Modification date of this file.
Notes: This information is usually the same as the EXIF modification date.
(Read only property)

89.4.15 Name as String

Function: Name of this file or folder.
Notes: (Read only property)
89.4. **CLASS ICCAMERAITEMMBS**

### 89.4.16 ParentFolder as ICCameraFolderMBS

**Function:** Parent folder of this folder. The root folder’s parentFolder is nil.

**Notes:** (Read only property)

### 89.4.17 ptpObjectHandle as Integer

**Function:** PTP object handle value if the item is on a camera that uses PTP protocol.

**Notes:**

The value of this property is set to 0 if the camera does not use PTP protocol.

(Read only property)

### 89.4.18 Raw as Boolean

**Function:** Indicates if the file is a raw image file.

**Notes:** (Read only property)

### 89.4.19 thumbnailIfAvailable as Variant

**Function:** Thumbnail for the item if one is readily available.

**Notes:**

Value is a CGImageMBS.

If one is not readily available, accessing this property will send a message to the device requesting a thumbnail for the file. The ImageCaptureEventsMBS subclass will be notified via event cameraDevice-DidReceiveThumbnailForItem.

(Read only property)

### 89.4.20 UserData as Dictionary

**Function:** A mutable dictionary to store arbitrary key-value pairs associated with a camera item object.

**Notes:**

This can be used by view objects that bind to this object to store "house-keeping" information.

In Xojo, please query dictionary, modify it and assign back to this property.
89.4.21 UTI as String

Function: Item UTI.

Notes:
This is an Uniform Type Identifier string. It is one of: kUTTypeFolder, kUTTypeImage, kUTTypeMovie, kUTTypeAudio, or kUTTypeData.
See UTTypeMBS module.
(Read only property)
89.5. **CLASS ICDEVICEBROWSERMBS**

89.5  **class ICDeviceBrowserMBS**

89.5.1  **class ICDeviceBrowserMBS**

**Function:** The ICDeviceBrowser object is used to find devices such as digital cameras and scanners that are supported by Image Capture.

**Notes:** These device may be directly attached to the USB or FireWire bus on the host computer, shared by other computers, or available over a TCP/IP network. This object communicates with an Image Capture agent process asynchronously to accomplish this.

89.5.2  **Methods**

89.5.3  **Constructor**

**Function:** The constructor.

89.5.4  **Destructor**

**Function:** The destructor.

89.5.5  **devices as ICDeviceMBS()**

**Function:** All devices found by the browser.

**Notes:** This property will change as devices appear and disappear. This array is empty before the first invocation of the deviceBrowserDidAddDevice event.

89.5.6  **Start**

**Function:** This message tells the receiver to start looking for devices.

**Notes:** Please use ImageCaptureEventsMBS class to receive events.
89.5.7  Stop

Function: This method tells the receiver to stop looking for devices.
Notes: This will free all device instances that are not in use.

89.5.8  Properties

89.5.9  browsedDeviceTypeMask as Integer

Function: The device type mask.
Notes: A mask whose set bits indicate the type of device(s) being browsed after the receiver receives the start message. This property can be changed while the browser is browsing for devices. This property can be constructed by OR'd values of ICDeviceTypeMask with values of ICDeviceLocationTypeMask. (Read and Write property)

89.5.10  Browsing as Boolean

Function: Indicates whether the device browser is browsing for devices.
Notes: (Read only property)

89.5.11  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

89.5.12  preferredDevice as ICDeviceMBS

Function: This method returns a device object that should be selected by the client application when it is launched.
Notes: If the client application that calls this method is the auto-launch application associated with a device and that device is the last device attached (through USB, FireWire or network), then that device will be the
preferred device. The best place to call this method is in the event deviceBrowserDidAddDevice, if the "moreComing" parameter passed to the delegate is false; or in the event deviceBrowserDidEnumerateLocalDevices.

(Read only property)

89.5.13 Events

89.5.14 DeviceDidChangeName(device as ICDeviceMBS)

Function: This event is sent if the name of a device changes.

Notes: This happens if the device module overrides the default name of the device reported by the device’s transport layer, or if the name of the filesystem volume mounted by the device is changed by the user.

89.5.15 DeviceDidChangeSharingState(device as ICDeviceMBS)

Function: This event is sent when the sharing state of a device has changed.

Notes: Any Image Capture client application can choose to share the device over the network using the sharing or webSharing facility in Image Capture.

89.5.16 DidAddDevice(device as ICDeviceMBS, moreComing as boolean)

Function: This event is sent to inform that a device has been added.

Notes: If several devices are found during the initial search, then this event is sent once for each device with the value of 'moreComing' set to true in each event except the last one.

89.5.17 DidEnumerateLocalDevices

Function: This event is sent after the device browser completes sending deviceBrowser:didAddDevice event for all local devices.

Notes: Detecting locally connected devices (USB and FireWire devices) is faster than detecting devices connected using a network protocol. An Image Capture client application may use this event to update its user interface to let the user know that it has completed looking for locally connected devices and then start looking for network devices.
89.5.18  DidRemoveDevice(device as ICDeviceMBS, moreGoing as boolean)

**Function:** This event is sent to the delegate to inform that a device has been removed.

**Notes:** If several devices are removed at the same time, then this event is sent once for each device with the value of 'moreGoing' set to true in each event except the last one.

89.5.19  RequestsSelectDevice(device as ICDeviceMBS)

**Function:** This event is sent when an event that occurred on the device may be of interest to the client application.

**Notes:** In Mac OS X 10.6, this event is sent when a button is pressed on a device and the current application is the target for that button press. In the case of the button-press event, if a session is open on the device, this event will not be sent, instead the deviceDidReceiveButtonPress event is sent.
89.6. class ICDeviceMBS

89.6.1 class ICDeviceMBS

Function: ICDevice is an abstract class that represents a device supported by Image Capture.
Notes:
ImageCaptureCore defines two concrete subclasses of ICDeviceMBS, ICCameraDeviceMBS and ICScannerDeviceMBS. ICDeviceBrowserMBS creates instances of these two subclasses to represent cameras and scanners it finds.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.6.2 Methods

89.6.3 capabilities as Variant()

Function: The capabilities of the device as reported by the device module.

89.6.4 Constructor

Function: The private constructor.

89.6.5 ICBUTTONTYPECOPY as string

Function: One of the constants used to identify button-press on a device.
Notes: Indicates that the "Copy" button on the device was pressed.

89.6.6 ICBUTTONTYPEMAIL as string

Function: One of the constants used to identify button-press on a device.
Notes: Indicates that the "Mail" button on the device was pressed.
89.6.7  **ICButtonTypePrint as string**

**Function:** One of the constants used to identify button-press on a device.
**Notes:** Indicates that the "Print" button on the device was pressed.

89.6.8  **ICButtonTypeScan as string**

**Function:** One of the constants used to identify button-press on a device.
**Notes:** Indicates that the "Scan" button on the device was pressed.

89.6.9  **ICButtonTypeTransfer as string**

**Function:** One of the constants used to identify button-press on a device.
**Notes:** Indicates that the "Transfer" button on the device was pressed.

89.6.10  **ICButtonTypeWeb as string**

**Function:** One of the constants used to identify button-press on a device.
**Notes:** Indicates that the "Web" button on the device was pressed.

89.6.11  **ICDeviceCanEjectOrDisconnect as string**

**Function:** One of the constants used to describe capabilities of a device.
**Notes:** Indicates either the device is mounted as a mass-storage volume and can be ejected or the it is a remote device with an active connection that can be disconnected.

89.6.12  **ICDeviceLocationDescriptionBluetooth as string**

**Function:** This description is returned for locationDescription property of a device connected via Bluetooth.
89.6. **CLASS ICDEVICEMBS**

89.6.13 **ICDeviceLocationDescriptionFireWire as string**

Function: This description is returned for locationDescription property of a device connected to a FireWire port.

89.6.14 **ICDeviceLocationDescriptionMassStorage as string**

Function: This description is returned for locationDescription property of a device that is mounted as a mass-storage volume.

89.6.15 **ICDeviceLocationDescriptionUSB as string**

Function: This description is returned for locationDescription property of a device connected to a USB port.

89.6.16 **ICLocalizedStatusNotificationKey as string**

Function: One of the constants used for device status notifications.
Notes: Key for a localized notification string.

89.6.17 **ICStatusCodeKey as string**

Function: One of the constants used for device status notifications.
Notes: One of values defined in ICReturnCode.

89.6.18 **ICStatusNotificationKey as string**

Function: One of the constants used for device status notifications.
Notes: Key for a non-localized notification string.
89.6.19 ICTransportTypeBluetooth as string

**Function:** Indicates that the device uses Bluetooth transport.

89.6.20 ICTransportTypeFireWire as string

**Function:** Indicates that the device uses FireWire transport.

89.6.21 ICTransportTypeMassStorage as string

**Function:** Indicates that the device use mounts as a mass-storage volume.

89.6.22 ICTransportTypeTCPIP as string

**Function:** Indicates that the device uses TCP/IP transport.
**Notes:** These devices are discovered using Bonjour.

89.6.23 ICTransportTypeUSB as string

**Function:** Indicates that the device uses USB transport.

89.6.24 requestCloseSession

**Function:** This message requests to close a previously opened session on this device.
**Notes:** This request is completed when the ImageCaptureEventsMBS subclass receives a deviceDidCloseSessionWithError event.
89.6.25 requestEjectOrDisconnect

**Function:** Eject the media if permitted by the device, or disconnect from a remote device.

89.6.26 requestOpenSession

**Function:** This message requests to open a session on the device.
**Notes:**
A client MUST open a session on a device in order to use the device.
This request is completed when the ImageCaptureEventsMBS subclass receives a deviceDidOpenSessionWithError event. No more events will be sent to the delegate if this request fails.

89.6.27 requestSendMessage(messageCode as UInt32, data as MemoryBlock, maxReturnedDataSize as UInt64)

**Function:** This method asynchronously sends an arbitrary message with optional data to a device.
**Notes:**
This method allows developers to send a private message from a client application to a device module. This method is the functional equivalent of calling ICAObjectSendMessage() found in ImageCapture.framework, which has been deprecated in Mac OS X 10.6. The response to this command will be delivered using deviceDidSendMessage event.
The content of error returned should be examined to determine if the request completed successfully.
NOTE: This method SHOULD NOT BE USED to send PTP pass-through commands to a PTP camera. Please refer to requestSendPTPCommand defined in ICCameraDeviceMBS for sending PTP pass-through commands.

89.6.28 requestYield

**Function:** This message requests the device module in control of this device to yield control.
**Notes:** This message should be used only if the client is planning on communing with the device directly.
The device module may not yield control of the device if it has an open session.
89.6.29 Properties

89.6.30 AutolaunchApplicationPath as String

**Function:** Filesystem path of an application that is to be automatically launched when this device is added.
**Notes:** (Read and Write property)

89.6.31 BonjourServiceType as String

MBS AVFoundation Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Service type if device was found via Bonjour.
**Notes:** (Read only property)

89.6.32 BskonjourServiceName as String

MBS AVFoundation Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Service name if device was found via Bonjour.
**Notes:** (Read only property)

89.6.33 ButtonPressed as String

**Function:** A string object with one of the ICBButtonType* values defined above.
**Notes:** (Read only property)

89.6.34 canDeleteAllFiles as Boolean

**Function:** If all files can be deleted.
**Notes:** (Read only property)

89.6.35 canDeleteOneFile as Boolean

**Function:** Whether a file can be deleted.
89.6.36 canEject as Boolean

Function: Whether this device can be ejected.
Notes: (Read only property)

89.6.37 canReceiveFile as Boolean

Function: Whether this device can receive a file.
Notes: (Read only property)

89.6.38 canSyncClock as Boolean

Function: Whether this device can sync clock.
Notes: (Read only property)

89.6.39 canTakePicture as Boolean

Function: Whether this device can take pictures.
Notes: (Read only property)

89.6.40 fwGUID as Int64

Function: The FireWire GUID of a FireWire device in the IOKit registry.
Notes:
This will be 0 for non-FireWire devices.
(Read only property)
89.6.41 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

89.6.42 HasConfigurableWiFiInterface as Boolean

Function: Indicates whether the device can be configured for use on a WiFi network.
Notes: (Read only property)

89.6.43 HasOpenSession as Boolean

Function: Indicates whether the device has an open session.
Notes: (Read only property)

89.6.44 Icon as Variant

Function: Icon image for the device.
Notes:
Value is a CGImageMBS.
(Read only property)

89.6.45 IconPath as String

MBS AVFoundation Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Path to icon file.
Notes: (Read only property)

89.6.46 IPAddress as String

MBS AVFoundation Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: IP Address.
89.6.47  IsRemote as Boolean

Function: Indicates whether the device is a remote device published by Image Capture device sharing facility.
Notes: (Read only property)

89.6.48  IsShared as Boolean

Function: Indicates whether the device is shared using the Image Capture device sharing facility.
Notes: This value will change when sharing of this device is enabled or disabled.
(Read only property)

89.6.49  LocationDescription as String

Function: A non-localized location description string for the device.
Notes: The value returned in one of the location description strings defined above, or location obtained from the Bonjour TXT record of a network device.
(Read only property)

89.6.50  ModuleExecutableArchitecture as Integer

Function: Executable Architecture of the device module in control of this device.
Notes: Possible values:
(Read only property)
89.6.51 ModulePath as String

**Function:** Filesystem path of the device module that is associated with this device.
**Notes:**
Camera-specific capabilities are defined in ICCameraDeviceMBS class and scanner-specific capabilities are defined in ICScannerDeviceMBS class.
(Read only property)

89.6.52 ModuleVersion as String

**Function:** The bundle version of the device module associated with this device.
**Notes:**
This may change if an existing device module associated with this device is updated or a new device module for this device is installed.
(Read only property)

89.6.53 Name as String

**Function:** Name of the device as reported by the device module or by the device transport when a device module is not in control of this device.
**Notes:**
This name may change if the device module overrides the default name of the device reported by the device's transport, or if the name of the filesystem volume mounted by the device is changed by the user.
(Read only property)

89.6.54 PersistentIDString as String

**Function:** A string representation of the persistent ID of the device.
89.6. **CLASS ICDEVICEMBS**

**Notes:** (Read only property)

---

### 89.6.55  ProductKind as String

MBS AVFoundation Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Product kind.
**Notes:** (Read only property)

---

### 89.6.56  SerialNumberString as String

**Function:** The serial number of the device.
**Notes:**
This will be "" if the device does not provide a serial number.
(Read only property)

---

### 89.6.57  TransportType as String

**Function:** The transport type used by the device.
**Notes:**
The possible values are: ICTransportTypeUSB, ICTransportTypeFireWire, ICTransportTypeBluetooth, ICTransportTypeTCP/IP, or ICTransportTypeMassStorage.
(Read only property)

---

### 89.6.58  type as Integer

**Function:** The type of the device as defined by ICDeviceType OR’d with its ICDeviceLocationType.
**Notes:**
The type of this device can be obtained by AND’ing the value returned by this property with an appropriate ICDeviceTypeMask. The location type of this device can be obtained by AND’ing the value returned by this property with an appropriate ICDeviceLocationTypeMask.
(Read only property)
89.6.59 usbLocationID as Integer

Function: The USB location ID of a USB device in the IOKit registry.
Notes: This will be 0 for non-USB devices.
(Read only property)

89.6.60 usbProductID as Integer

Function: The USB product ID of a USB device in the IOKit registry.
Notes: This will be 0 for non-USB devices.
(Read only property)

89.6.61 usbVendorID as Integer

Function: The USB vendor ID of a USB device in the IOKit registry.
Notes: This will be 0 for non-USB devices.
(Read only property)

89.6.62 UserData as Dictionary

Function: A mutable dictionary to store arbitrary key-value pairs associated with a device object.
Notes: This can be used by view objects that bind to this object to store "house-keeping" information. In Xojo, please query dictionary, modify it and assign back to this property.
(Read and Write property)

89.6.63 UUIDString as String

Function: A string representation of the Universally Unique ID of the device.
89.6.64 Constants

89.6.65 ICDeviceLocationTypeBluetooth = & h00000800

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the device types. 
**Notes:** Device found as a paired Bluetooth device.

89.6.66 ICDeviceLocationTypeBonjour = & h00000400

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the device types. 
**Notes:** Device found over the network by searching for Bonjour services supported by Image Capture.

89.6.67 ICDeviceLocationTypeLocal = & h00000100

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the device types. 
**Notes:** Device found directly attached to the Macintosh via its USB or FireWire port.

89.6.68 ICDeviceLocationTypeMaskBluetooth = & h00000800

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the Image Capture Device Location Type Masks. 
**Notes:** Mask to detect paired Bluetooth device.

89.6.69 ICDeviceLocationTypeMaskBonjour = & h00000400

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the Image Capture Device Location Type Masks. 
**Notes:** Mask to detect a network device that publishes a Bonjour service.

89.6.70 ICDeviceLocationTypeMaskLocal = & h00000100

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the Image Capture Device Location Type Masks.
CHAPTER 89. IMAGE CAPTURE

Notes: Mask to detect a local (e.g., USB or FireWire) device.

89.6.71  ICDeviceLocationTypeMaskRemote = & h0000FE00

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the Image Capture Device Location Type Masks. 
Notes: Mask to detect a remote (shared, Bonjour, Bluetooth) device.

89.6.72  ICDeviceLocationTypeMaskShared = & h00000200

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the Image Capture Device Location Type Masks. 
Notes: Mask to detect a device by another Macintosh host.

89.6.73  ICDeviceLocationTypeShared = & h00000200

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the device types. 
Notes: Device found over the network by searching for devices shared by other Macintosh hosts.

89.6.74  ICDeviceTypeCamera = & h00000001

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the image capture device types. 
Notes: Camera device.

89.6.75  ICDeviceTypeMaskCamera = & h00000001

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the device type masks. 
Notes: Mask to detect a camera device.

89.6.76  ICDeviceTypeMaskScanner = & h00000002

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the device type masks. 
Notes: Mask to detect a scanner device.
89.6.77  ICDeviceTypeScanner = & h00000002

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the image capture device types. **Notes:** Scanner device.
89.7  class ICScannerBandDataMBS

89.7.1  class ICScannerBandDataMBS

Function: The class for band data from scanner.
Notes:
If image is too big to be transferred in one big block, it’s sent in little chunks using this class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.7.2  Methods

89.7.3  Constructor

Function: The private constructor.

89.7.4  Properties

89.7.5  bigEndian as Boolean

Function: Describes if the banded image data is reported in big endian.
Notes: (Read only property)

89.7.6  bitsPerComponent as UInt64

Function: Describes the number of bits per component for the banded image.
Notes: (Read only property)

89.7.7  bitsPerPixel as UInt64

Function: Describes the number of bits per pixel for banded the image.
Notes: (Read only property)
89.7.8  bytesPerRow as UInt64

Function: Describes how many bytes are in each image band row.
Notes: (Read only property)

89.7.9  colorSyncProfilePath as String

Function: Returns the path to the color profile matching the banded data.
Notes: (Read only property)

89.7.10  dataBuffer as Memoryblock

Function: The pointer to the data buffer object.
Notes: Plugin returns a copy of the data when you query this property.
(Read only property)

89.7.11  dataNumRows as UInt64

Function: Describes the number of rows contained in the image band.
Notes: (Read only property)

89.7.12  dataSize as UInt64

Function: Describes the actual data size of the image band buffer.
Notes: (Read only property)

89.7.13  dataStartRow as UInt64

Function: Describes the start row of the image band.
89.7.14  **fullImageHeight as UInt64**

**Function:** Describes the full image height of the banded image.
**Notes:** (Read only property)

89.7.15  **fullImageWidth as UInt64**

**Function:** Describes the full image width of the banded image.
**Notes:** (Read only property)

89.7.16  **Handle as Integer**

**Function:** The internal object reference.
**Notes:** (Read and Write property)

89.7.17  **numComponents as UInt64**

**Function:** Describes how many components are contained within the banded image.
**Notes:** (Read only property)

89.7.18  **pixelDataType as Integer**

**Function:** Type of pixel data that is contained in the band.
**Notes:**
See ICScannerFunctionalUnitMBS.ICScannerPixelDataType* constants.
(Read only property)
89.8. **CLASS ICSCANNERDEVICEMBS**

89.8  **class ICScannerDeviceMBS**

89.8.1  **class ICScannerDeviceMBS**

**Function:** The class for a scanner device.

**Notes:**

ICScannerDeviceMBS is a concrete subclass of IDeviceMBS class. IDeviceBrowserMBS creates instances of this class. In this release, an instance of ICScannerDeviceMBS class is intended to be used by the IKScannerDeviceViewMBS object. The IKScannerDeviceView class encapsulates the complexities of setting scan parameters, performing scans and saving the result. The developer should consider using IKScannerDeviceViewMBS instead of building their own views using the ICScannerDeviceMBS object.

Subclass of the IDeviceMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.8.2  **Methods**

89.8.3  **availableFunctionalUnitTypes as Integer()**

**Function:** An array of functional unit types available on this scanner device.

**Notes:** This is an array of numbers whose values are of type ICScannerFunctionalUnitType.

89.8.4  **cancelScan**

**Function:** Cancels the current scan operation started by sending a 'requestOverviewScan' or 'requestScan'.

89.8.5  **Constructor**

**Function:** The private constructor.

89.8.6  **ICSannerStatusRequestsOverviewScan as string**

**Function:** Constants used for device status notifications.

**Notes:** A non-localized notification string to indicate that the scanner is requesting an overview scan to be
performed.

89.8.7  ICScannerStatusWarmingUp as string

**Function:** Constants used for device status notifications.
**Notes:** A non-localized notification string to indicate that the scanner is warming up.

89.8.8  ICScannerStatusWarmUpDone as string

**Function:** Constants used for device status notifications.
**Notes:** A non-localized notification string to indicate that the scanner has warmed up.

89.8.9  requestOverviewScan

**Function:** Starts an overview scan on selectedFunctionalUnit.
**Notes:** When this request is completed, the delegate will be notified using the scannerDeviceDidCompleteOverviewScanWithError event. The content of error returned should be examined to determine if the request completed successfully.

89.8.10  requestScan

**Function:** Starts a scan on selectedFunctionalUnit.
**Notes:** When this request is completed, the delegate will be notified using the scannerDeviceDidCompleteScanWithError event. The content of error returned should be examined to determine if the request completed successfully.

89.8.11  requestSelectFunctionalUnit(type as Integer)

**Function:** Requests the scanner device to select a functional unit.
**Notes:** When this request is completed, the delegate will be notified using the scannerDeviceDidSelectFunctionalUnit event.
89.8.12 Properties

89.8.13 documentName as String

Function: The document name.
Notes: (Read and Write property)

89.8.14 documentUTI as String

Function: The document UTI.
Notes: Currently supported UTIs are: kUTTypeJPEG, kUTTypeJPEG2000, kUTTypeTIFF, kUTTypePNG etc.
see UTTypeMBS module.
(Read and Write property)

89.8.15 downloadsDirectory as String

Function: The downloads directory.
Notes: Download location can be provided as file URL with downloadsDirectory property or as folderitem with downloadsFolder property.
(Read and Write property)

89.8.16 downloadsFolder as FolderItem

Function: The downloads directory.
Notes: Download location can be provided as file URL with downloadsDirectory property or as folderitem with downloadsFolder property.
(Read and Write property)
89.8.17  \textit{maxMemoryBandSize} as \texttt{UInt64}

\textbf{Function:} The total maximum band size requested when performing a ICScannerTransferModeMemory-Based.  
\textbf{Notes:} (Read and Write property)

89.8.18  \textit{selectedFunctionalUnit} as \texttt{ICScannerFunctionalUnitMBS}

\textbf{Function:} The currently selected functional unit on the scanner device.  
\textbf{Notes:} (Read only property)

89.8.19  \textit{transferMode} as \texttt{Integer}

\textbf{Function:} The transfer mode for scanned document.  
\textbf{Notes:} (Read and Write property)

89.8.20  Constants

89.8.21  \texttt{ICScannerTransferModeFileBased} = 0

MBS AVFoundation Plugin, Plugin Version: 14.3.  \textbf{Function:} Transfer mode constants to be used when transferring scan data from the scanner functional unit.  
\textbf{Notes:} Save the scan as a file.

89.8.22  \texttt{ICScannerTransferModeMemoryBased} = 1

MBS AVFoundation Plugin, Plugin Version: 14.3.  \textbf{Function:} Transfer mode constants to be used when transferring scan data from the scanner functional unit.  
\textbf{Notes:} Transfer the scan as data.
89.9 class ICScannerFeatureBooleanMBS

89.9.1 class ICScannerFeatureBooleanMBS

Function: ICScannerFeatureBoolean object is used to represent a property of a scanner functional unit whose value can be true or false.
Notes:
Subclass of the ICScannerFeatureMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.9.2 Methods

89.9.3 Constructor

Function: The private constructor.

89.9.4 Properties

89.9.5 value as Boolean

Function: The value of this feature.
Notes: (Read and Write property)
89.10 class ICScannerFeatureEnumerationMBS

89.10.1 class ICScannerFeatureEnumerationMBS

**Function:** ICScannerFeatureEnumeration object is used to represent a feature of a scanner functional unit that can have one of several discrete values.
**Notes:**
Subclass of the ICScannerFeatureMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

**Methods**

89.10.2 Constructor

89.10.4 `menuItemLabels as String()`

89.10.5 `menuItemLabelsTooltips as String()`

89.10.6 `values as Variant()`
89.10.7 Properties

89.10.8 currentValue as Variant

Function: The current value.
Notes:
The current value can be set to one of the possible values in the "values" property below.
(Read and Write property)

89.10.9 defaultValue as Variant

Function: The default value.
Notes:
The default value can be set to one of the possible values in the "values" property below.
(Read only property)
89.11  class ICScannerFeatureMBS

89.11.1  class ICScannerFeatureMBS

Function: ICScannerFeature class is an abstract base class used to describe a scanner feature.
Notes:
ImageCaptureCore defines three concrete subclasses of ICScannerFeatureMBS: ICScannerFeatureEnumera-
tionMBS, ICScannerFeatureRangeMBS and ICScannerFeatureBooleanMBS.
The scanner functional units may have one or more instances of these classes to allow users to choose scanner-
specific settings or operations before performing a scan.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.11.2  Methods

89.11.3  Constructor

Function: The private constructor.

89.11.4  Properties

89.11.5  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

89.11.6  humanReadableName as String

Function: The human readable name of this feature.
Notes: (Read only property)

89.11.7  internalName as String

Function: The internal name of this feature.
89.11. **CLASS ICSCANNERFEATUREMBS**

**Notes:** (Read only property)

### 89.11.8  **tooltip as String**

**Function:** Tooltip text describing the feature.  
**Notes:** (Read only property)

### 89.11.9  **type as Integer**

**Function:** Scanner feature type.  
**Notes:** See ICScannerFeatureType* constants.  
(Read only property)

### 89.11.10  **Constants**

#### 89.11.11  **ICScannerFeatureTypeBoolean = 2**

MBS AVFoundation Plugin, Plugin Version: 14.3.  
**Function:** One of the feature type constants.  
**Notes:** The value of this feature can be true or false.

#### 89.11.12  **ICScannerFeatureTypeEnumeration = 0**

MBS AVFoundation Plugin, Plugin Version: 14.3.  
**Function:** One of the feature type constants.  
**Notes:** This feature can have one of several discrete values, strings or numbers.

#### 89.11.13  **ICScannerFeatureTypeRange = 1**

MBS AVFoundation Plugin, Plugin Version: 14.3.  
**Function:** One of the feature type constants.  
**Notes:** This value of this feature lies within a range.
89.11.14  ICScannerFeatureTypeTemplate = 3

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the feature type constants. **Notes:** A group of features.
class ICScannerFeatureRangeMBS

Function: ICScannerFeatureRange object is used to represent a property of a scanner functional unit whose value lies within a range.

Notes:
Subclass of the ICScannerFeatureMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

Methods

Constructor

Properties

currentValue as Double

Function: The current value.
Notes:
Attempting to set the current value to a value that is not coincident with a step will result in a value corresponding to the nearest step being assigned to the current value.
(Read only property)

defaultValue as Double

Function: The default value.
Notes:
Attempting to set the default value to a value that is not coincident with a step will result in a value corresponding to the nearest step being assigned to the default value.
(Read only property)
89.12.7  **maxValue as Double**

Function: The maximum value.
Notes: (Read only property)

89.12.8  **minValue as Double**

Function: The minimum value.
Notes: (Read only property)

89.12.9  **stepSize as Double**

Function: The step size.
Notes: (Read only property)
89.13. class ICScannerFeatureTemplateMBS

89.13.1 class ICScannerFeatureTemplateMBS

**Function:** ICScannerFeatureTemplate object is used to define a group of one or more rectangular scan areas that can be used with a scanner functional unit.
**Notes:**
Subclass of the ICScannerFeatureMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.13.2 Methods

89.13.3 Constructor

**Function:** The private constructor.

89.13.4 targets as ICScannerFeatureMBS()

**Function:** The target features.
CHAPTER 89. IMAGE CAPTURE

89.14 class ICScannerFunctionalUnitDocumentFeederMBS

89.14.1 class ICScannerFunctionalUnitDocumentFeederMBS

Function: ICScannerFunctionalUnitDocumentFeeder is a concrete subclass of ICScannerFunctionalUnit class.

Notes:
ICScannerDevice creates instances of this class.
This represents the document feeder unit on the scanner.
Subclass of the ICScannerFunctionalUnitMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

89.14.2 Methods

89.14.3 Constructor

Function: The private constructor.

89.14.4 Properties

89.14.5 documentLoaded as Boolean

Function: Indicates whether the feeder has documents to scan.

Notes:
This value will change when the document is loaded or removed from the feeder, if the scanner module has
the capability to detect this state.
(Read only property)

89.14.6 duplexScanningEnabled as Boolean

Function: Indicates whether duplex scanning is enabled.

Notes: (Read and Write property)
89.14.7 evenPageOrientation as Integer

Function: Desired orientation of the even pages of the scanned document.
Notes:
This property is set to ICEXIFOrientation1 initially.

Possible values:

<table>
<thead>
<tr>
<th>ICEXIFOrientation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Normal</td>
</tr>
<tr>
<td>2</td>
<td>Flipped horizontally</td>
</tr>
<tr>
<td>3</td>
<td>Rotated 180</td>
</tr>
<tr>
<td>4</td>
<td>Flipped vertically</td>
</tr>
<tr>
<td>5</td>
<td>Rotated 90 CCW and flipped vertically</td>
</tr>
<tr>
<td>6</td>
<td>Rotated 90 CCW</td>
</tr>
<tr>
<td>7</td>
<td>Rotated 90 CW and flipped vertically</td>
</tr>
<tr>
<td>8</td>
<td>Rotated 90 CW</td>
</tr>
</tbody>
</table>

(Read and Write property)

89.14.8 oddPageOrientation as Integer

Function: Desired orientation of the odd pages of the scanned document.
Notes:
This property is set to ICEXIFOrientation1 initially.

Possible values:

<table>
<thead>
<tr>
<th>ICEXIFOrientation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Normal</td>
</tr>
<tr>
<td>2</td>
<td>Flipped horizontally</td>
</tr>
<tr>
<td>3</td>
<td>Rotated 180</td>
</tr>
<tr>
<td>4</td>
<td>Flipped vertically</td>
</tr>
<tr>
<td>5</td>
<td>Rotated 90 CCW and flipped vertically</td>
</tr>
<tr>
<td>6</td>
<td>Rotated 90 CCW</td>
</tr>
<tr>
<td>7</td>
<td>Rotated 90 CW and flipped vertically</td>
</tr>
<tr>
<td>8</td>
<td>Rotated 90 CW</td>
</tr>
</tbody>
</table>

(Read and Write property)
CHAPTER 89. IMAGE CAPTURE

89.14.9 reverseFeederPageOrder as Boolean

Function: Indicates whether the document feeder reads pages from back to front.
Notes: (Read only property)

89.14.10 supportsDuplexScanning as Boolean

Function: Indicates whether duplex scanning is supported.
Notes: (Read only property)
89.15 class ICS scannerFunctionalUnitFlatbedMBS

89.15.1 class ICS scannerFunctionalUnitFlatbedMBS

**Function:** ICS scannerFunctionalUnitFlatbedMBS is a concrete subclass of ICS scannerFunctionalUnitMBS class.

**Notes:**
ICS scannerDevice creates instances of this class.
This represents the flatbed unit on the scanner.
Subclass of the ICS scannerFunctionalUnitMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.15.2 Methods

89.15.3 Constructor

**Function:** The private constructor.
89.16  class ICScannerFunctionalUnitMBS

89.16.1  class ICScannerFunctionalUnitMBS

Function: ICScannerFunctionalUnit is an abstract class that represents a scanner functional unit.
Notes:
ImageCaptureCore defines three concrete subclasses of ICScannerFunctionalUnit: ICScannerFunctionalUnitFlatbed, ICScannerFunctionalUnitPositiveTransparency, ICScannerFunctionalUnitNegativeTransparency and ICScannerFunctionalUnitDocumentFeeder. ICScannerDevice creates instances of these concrete subclasses.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.16.2  Methods

89.16.3  Constructor

Function: The private constructor.

89.16.4  templates as ICScannerFeatureTemplateMBS()

Function: An array of objects of type ICScannerFeatureTemplate.

89.16.5  vendorFeatures as ICScannerFeatureMBS()

Function: An array of objects of type ICScannerFeature.

89.16.6  Properties

89.16.7  acceptsThresholdForBlackAndWhiteScanning as Boolean

Function: Indicates if this functional unit accepts threshold value to be used when performing a scan in black & white.
89.16.8  **bitDepth as Integer**

**Function:** The bit depth to use when performing the final scan.

**Notes:**
This will always be one of the supported bit depths.
(Read and Write property)

89.16.9  **canPerformOverviewScan as Boolean**

**Function:** Indicates if this functional unit can perform an overview scan.

**Notes:**
Not all functional units can perform an overview scan. For example, a document feeder or a sheet feeder unit cannot perform an overview scan.
(Read only property)

89.16.10  **defaultThresholdForBlackAndWhiteScanning as Integer**

**Function:** Default threshold value used when performing a scan in black & white.

**Notes:**
This value is from 0 to 255.
(Read only property)

89.16.11  **documentSize as NSSizeMBS**

**Function:** Document size of the current document type expressed in current measurement unit.

**Notes:** (Read only property)
89.16.12 documentType as Integer

Function: Current document type.
Notes:
This will always be one of the supported document types.
(Read and Write property)

89.16.13 measurementUnit as Integer

Function: Current measurement unit. This will always be one of the supported measurement units.
Notes: (Read and Write property)

89.16.14 nativeXResolution as Integer

Function: Optical resolution along the X axis.
Notes: (Read only property)

89.16.15 nativeYResolution as Integer

Function: Optical resolution along the Y axis.
Notes: (Read only property)

89.16.16 overviewImage as Variant

Function: Overview scan image.
Notes:
This property will be nil for functional units that do not support overview scans.
Value is a CGImageMBS.
(Read only property)
89.16. **CLASS ICSCANNERFUNCTIONALUNITMBS**

**89.16.17 overviewResolution as Integer**

**Function:** Overview image resolution.  
**Notes:** Value assigned to this will be constrained by resolutions allowed by the device.  
(Read and Write property)

**89.16.18 overviewScanInProgress as Boolean**

**Function:** Indicates if an overview scan is in progress.  
**Notes:** (Read only property)

**89.16.19 physicalSize as NSSizeMBS**

**Function:** Physical size of the scan area in current measurement unit.  
**Notes:** (Read only property)

**89.16.20 pixelDataType as Integer**

**Function:** The pixel data type.  
**Notes:** See ICSnannerPixelDataType* constants.  
(Read and Write property)

**89.16.21 preferredResolutions as NSIndexSetMBS**

**Function:** Current scan resolution.  
**Notes:** This will always be one of the supported resolution values.  
(Read only property)
CHAPTER 89. IMAGE CAPTURE

89.16.22 preferredScaleFactors as NSIndexSetMBS

Function: Preferred scale factors in percentage.
Notes: (Read only property)

89.16.23 resolution as Integer

Function: Current scan resolution.
Notes:
This will always be one of the supported resolution values.
(Read and Write property)

89.16.24 scaleFactor as Integer

Function: Current scale factor.
Notes:
This will always be one of the supported scale factor values.
(Read only property)

89.16.25 scanArea as NSRectMBS

Function: This property along with scanAreaOrientation describes the area to be scanned.
Notes: (Read and Write property)

89.16.26 scanAreaOrientation as Integer

Function: Desired orientation of the scan area.
Notes:
This property along with scanArea describes the area to be scanned.
This property is set to ICEXIFOrientation1 initially. This property is not used by the ICScannerFunction-
alUnitDocumentFeeder subclass.
Possible values:

- ICEXIFOrientation1 1 Normal
- ICEXIFOrientation2 2 Flipped horizontally
- ICEXIFOrientation3 3 Rotated 180
- ICEXIFOrientation4 4 Flipped vertically
- ICEXIFOrientation5 5 Rotated 90 CCW and flipped vertically
- ICEXIFOrientation6 6 Rotated 90 CCW
- ICEXIFOrientation7 7 Rotated 90 CW and flipped vertically
- ICEXIFOrientation8 8 Rotated 90 CW

(Read and Write property)

**89.16.27 scanInProgress as Boolean**

**Function:** Indicates if a scan is in progress.

**Notes:** (Read only property)

**89.16.28 scanProgressPercentDone as Double**

**Function:** Indicates percentage of scan completed.

**Notes:** (Read only property)

**89.16.29 state as Integer**

**Function:** Indicates the current state of the functional unit.

**Notes:**

See ICScannerFunctionalUnitState* constants.

(Read only property)

**89.16.30 supportedBitDepths as NSIndexSetMBS**

**Function:** Supported bit depths.

**Notes:**
The values in this set are valid values defined by ICScannerBitDepth.
(Read only property)

89.16.31 supportedDocumentTypes as NSIndexSetMBS
Function: Supported document types.
Notes: The values in this set are valid values defined by ICScannerDocumentType.
(Read only property)

89.16.32 supportedMeasurementUnits as NSIndexSetMBS
Function: Supported measurement units. The values in this set are valid values defined by ICScannerMeasurementUnit.
Notes: (Read only property)

89.16.33 supportedResolutions as NSIndexSetMBS
Function: Supported scan resolutions in DPI.
Notes: (Read only property)

89.16.34 supportedScaleFactors as NSIndexSetMBS
Function: Supported scale factors in percentage.
Notes: (Read only property)

89.16.35 thresholdForBlackAndWhiteScanning as Integer
Function: Threshold value to be used when performing a scan in black & white.
Notes:
This value should be from 0 to 255.
(Read and Write property)

### 89.16.36 type as Integer

**Function:** Functional unit type.
**Notes:**
See ICScannerFunctionalUnitType* constants.
(Read only property)

### 89.16.37 usesThresholdForBlackAndWhiteScanning as Boolean

**Function:** Indicates if this functional unit uses threshold value to be used when performing a scan in black & white.
**Notes:** (Read only property)

### 89.16.38 Constants

#### 89.16.39 ICScannerBitDepth16Bits = 16

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the possible number of bits per channel in the scanned image.
**Notes:** Image with 16 bits per channel.

#### 89.16.40 ICScannerBitDepth1Bit = 1

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the possible number of bits per channel in the scanned image.
**Notes:** 1-bit image.

#### 89.16.41 ICScannerBitDepth8Bits = 8

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the possible number of bits per channel in the scanned image.
CHAPTER 89. IMAGE CAPTURE

Notes: Image with 8 bits per channel.

89.16.42  ICScannerColorDataFormatTypeChunky = 0

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the color data formats.
Notes:
For multi-channel data (e.g., RGB) data from all channels are interleaved.
Identifies color data formats. Only relevant for multi-channel data. Corresponds to "ICAP_PLANARCHUNKY"
of the TWAIN Specification.

89.16.43  ICScannerColorDataFormatTypePlanar = 1

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the color data formats.
Notes:
For multi-channel data (e.g., RGB) each channel is transferred sequentially.
Identifies color data formats. Only relevant for multi-channel data. Corresponds to "ICAP_PLANARCHUNKY"
of the TWAIN Specification.

89.16.44  ICScannerDocumentType10 = 25

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types.
Notes: A10, 26.00 mm x 37.00 mm

89.16.45  ICScannerDocumentType10R = 67

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types.
Notes: 10R, 10” x 12” 254.00 mm x 304.80 mm 5:6

89.16.46  ICScannerDocumentType110 = 72

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types.
Notes: Instamatic 110, 13.00 mm x 17.00 mm
89.16.47 ICScannerDocumentType11R = 69
MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** 11R, 11” x 14” 279.40 mm x 355.60 mm 11:14

89.16.48 ICScannerDocumentType12R = 70
MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** 12R, 12” x 15” 304.80 mm x 381.00 mm 4:5

89.16.49 ICScannerDocumentType135 = 76
MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** Standard 35 mm, 36.00 mm x 24.00 mm

89.16.50 ICScannerDocumentType2A0 = 18
MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** 2A0, 1189.00 mm x 1682.00 mm

89.16.51 ICScannerDocumentType3R = 61
MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** 3R, 3.5” x 5” 88.90 mm x 127.00 mm 7:10

89.16.52 ICScannerDocumentType4A0 = 17
MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** 4A0, 1682.00 mm x 2378.00 mm

89.16.53 ICScannerDocumentType4R = 62
MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** 4R, 4” x 6” 101.60 mm x 152.40 mm 2:3
89.16.54  ICScannerDocumentType5R = 63

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types.
Notes: 5R, 5″ x 7″ 127.00 mm x 177.80 mm 5:7

89.16.55  ICScannerDocumentType6R = 64

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types.
Notes: 6R, 6″ x 8″ 152.40 mm x 203.20 mm 3:4

89.16.56  ICScannerDocumentType8R = 65

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types.
Notes: 8R, 8″ x 10″ 203.20 mm x 254.00 mm 4:5

89.16.57  ICScannerDocumentTypeA0 = 19

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types.
Notes: A0, 841.00 mm x 1189.00 mm

89.16.58  ICScannerDocumentTypeA1 = 20

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types.
Notes: A1, 594.00 mm x 841.00 mm

89.16.59  ICScannerDocumentTypeA2 = 21

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types.
Notes: A2, 420.00 mm x 594.00 mm

89.16.60  ICScannerDocumentTypeA3 = 11

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types.
Notes: A3, 297.00 mm x 420.00 mm
89.16. CLASS ICSCANNERFUNCTIONALUNITMBS

89.16.61 ICScannerDocumentTypeA4 = 1

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** A4, 210.00 mm x 297.00 mm

89.16.62 ICScannerDocumentTypeA5 = 5

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** A5, 148.00 mm x 210.00 mm

89.16.63 ICScannerDocumentTypeA6 = 13

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** A6, 105.00 mm x 148.00 mm

89.16.64 ICScannerDocumentTypeA7 = 22

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** A7, 74.00 mm x 105.00 mm

89.16.65 ICScannerDocumentTypeA8 = 23

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** A8, 52.00 mm x 74.00 mm

89.16.66 ICScannerDocumentTypeA9 = 24

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** A9, 37.00 mm x 52.00 mm

89.16.67 ICScannerDocumentTypeAPSC = 74

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** APS Classic, 25.10 mm x 16.70 mm
89.16.68  ICScannerDocumentTypeAPSH = 73

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** APS High Definition, 30.20 mm x 16.70 mm

89.16.69  ICScannerDocumentTypeAPSP = 75

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** APS Panoramic, 30.20 mm x 9.50 mm

89.16.70  ICScannerDocumentTypeB5 = 2

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** B5/JIS B5, 182.00 mm x 257.00 mm

89.16.71  ICScannerDocumentTypeBusinessCard = 53

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** Business Card, 90.00 mm x 55.00 mm

89.16.72  ICScannerDocumentTypeC0 = 44

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** C0, 917.00 mm x 1297.00 mm

89.16.73  ICScannerDocumentTypeC1 = 45

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** C1, 648.00 mm x 917.00 mm

89.16.74  ICScannerDocumentTypeC10 = 51

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.
**Notes:** C10, 28.00 mm x 40.00 mm
89.16.75  ICScannerDocumentTypeC2 = 46

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.  
**Notes:** C2, 458.00 mm x 648.00 mm

89.16.76  ICScannerDocumentTypeC3 = 47

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.  
**Notes:** C3, 324.00 mm x 458.00 mm

89.16.77  ICScannerDocumentTypeC4 = 14

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.  
**Notes:** C4, 229.00 mm x 324.00 mm

89.16.78  ICScannerDocumentTypeC5 = 15

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.  
**Notes:** C5, 162.00 mm x 229.00 mm

89.16.79  ICScannerDocumentTypeC6 = 16

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.  
**Notes:** C6, 114.00 mm x 162.00 mm

89.16.80  ICScannerDocumentTypeC7 = 48

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.  
**Notes:** C7, 81.00 mm x 114.00 mm

89.16.81  ICScannerDocumentTypeC8 = 49

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.  
**Notes:** C8, 57.00 mm x 81.00 mm
89.16.82  ICScannerDocumentTypeC9 = 50

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types. Notes: C9, 40.00 mm x 57.00 mm

89.16.83  ICScannerDocumentTypeDefault = 0

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types. Notes: This is the platten size. Not valid for scanners without a platten.

89.16.84  ICScannerDocumentTypeE = 60

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types. Notes: Japanese E, 3.25” x 4.75” 82.55 mm x 120.65 mm 11:16

89.16.85  ICScannerDocumentTypeISOB0 = 26

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types. Notes: ISO B0, 1000.00 mm x 1414.00 mm

89.16.86  ICScannerDocumentTypeISOB1 = 27

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types. Notes: ISO B1, 707.00 mm x 1000.00 mm

89.16.87  ICScannerDocumentTypeISOB10 = 33

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types. Notes: ISO B10, 31.00 mm x 44.00 mm

89.16.88  ICScannerDocumentTypeISOB2 = 28

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the document types. Notes: ISO B2, 500.00 mm x 707.00 mm
89.16.89  ICScannerDocumentTypeISO B3 = 12

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** B3/ISO B3, 353.00 mm x 500.00 mm

89.16.90  ICScannerDocumentTypeISO B4 = 6

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** B4/ISO B4, 250.00 mm x 353.00 mm

89.16.91  ICScannerDocumentTypeISO B5 = 29

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** ISO B5, 176.00 mm x 250.00 mm

89.16.92  ICScannerDocumentTypeISO B6 = 7

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** B6/ISO B6, 125.00 mm x 176.00 mm

89.16.93  ICScannerDocumentTypeISO B7 = 30

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** ISO B7, 88.00 mm x 125.00 mm

89.16.94  ICScannerDocumentTypeISO B8 = 31

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** ISO B8, 62.00 mm x 88.00 mm

89.16.95  ICScannerDocumentTypeISO B9 = 32

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** ISO B9, 44.00 mm x 62.00 mm
89.16.96  ICScannerDocumentTypeJISB0 = 34
MBS AVFoundation Plugin, Plugin Version: 14.3.  **Function:** One of the document types.
**Notes:** JIS B0, 1030.00 mm x 1456.00 mm

89.16.97  ICScannerDocumentTypeJISB1 = 35
MBS AVFoundation Plugin, Plugin Version: 14.3.  **Function:** One of the document types.
**Notes:** JIS B1, 728.00 mm x 1030.00 mm

89.16.98  ICScannerDocumentTypeJISB10 = 43
MBS AVFoundation Plugin, Plugin Version: 14.3.  **Function:** One of the document types.
**Notes:** JIS B10, 32.00 mm x 45.00 mm

89.16.99  ICScannerDocumentTypeJISB2 = 36
MBS AVFoundation Plugin, Plugin Version: 14.3.  **Function:** One of the document types.
**Notes:** JIS B2, 515.00 mm x 728.00 mm

89.16.100  ICScannerDocumentTypeJISB3 = 37
MBS AVFoundation Plugin, Plugin Version: 14.3.  **Function:** One of the document types.
**Notes:** JIS B3, 364.00 mm x 515.00 mm

89.16.101  ICScannerDocumentTypeJISB4 = 38
MBS AVFoundation Plugin, Plugin Version: 14.3.  **Function:** One of the document types.
**Notes:** JIS B4, 257.00 mm x 364.00 mm

89.16.102  ICScannerDocumentTypeJISB6 = 39
MBS AVFoundation Plugin, Plugin Version: 14.3.  **Function:** One of the document types.
**Notes:** JIS B6, 128.00 mm x 182.00 mm
89.16.103  ICScannerDocumentTypeJISB7 = 40

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.  
**Notes:** JIS B7, 91.00 mm x 128.00 mm

89.16.104  ICScannerDocumentTypeJISB8 = 41

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types.  
**Notes:** JIS B8, 64.00 mm x 91.00 mm
89.16.105  ICScannerDocumentTypeJISB9 = 42

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function**: One of the document types.  
**Notes**: JIS B9, 45.00 mm x 64.00 mm

89.16.106  ICScannerDocumentTypeLF = 78

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function**: One of the document types.  
**Notes**: Large Format, 100.00 mm x 120.00 mm

89.16.107  ICScannerDocumentTypeMF = 77

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function**: One of the document types.  
**Notes**: Medium Format, 60.00 mm x 60.00 mm

89.16.108  ICScannerDocumentTypeS10R = 68

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function**: One of the document types.  
**Notes**: S10R, 10” x 15” 254.00 mm x 381.00 mm 2:3

89.16.109  ICScannerDocumentTypeS12R = 71

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function**: One of the document types.  
**Notes**: S12R, 12” x 18” 304.80 mm x 457.20 mm 2:3

89.16.110  ICScannerDocumentTypeS8R = 66

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function**: One of the document types.  
**Notes**: S8R 8” x 12” 203.20 mm x 304.80 mm 2:3

89.16.111  ICScannerDocumentTypeUSExecutive = 10

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function**: One of the document types.  
**Notes**: US Executive, 7.25” x 10.5”, 184.15 mm x 266.70 mm
89.16.112  ICScannerDocumentTypeUSLedger = 9

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** US Ledger, 11" x 17.0", 279.40 mm x 431.80 mm

89.16.113  ICScannerDocumentTypeUSLegal = 4

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** US Legal, 8.5" x 14.0", 215.90 mm x 355.60 mm

89.16.114  ICScannerDocumentTypeUSLetter = 3

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** US Letter, 8.5" x 11.0", 215.90 mm x 279.40 mm

89.16.115  ICScannerDocumentTypeUSStatement = 52

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the document types. **Notes:** US Statement, 5.5" x 8.5", 139.70 mm x 215.90 mm

89.16.116  ICScannerFunctionalUnitStateOverviewScanInProgress = 4

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** A flag to indicate the scanner functional unit’s state. **Notes:** The scanner functional unit is performing an overview scan.

89.16.117  ICScannerFunctionalUnitStateReady = 1

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** A flag to indicate the scanner functional unit’s state. **Notes:** The scanner functional unit is ready for operation.

89.16.118  ICScannerFunctionalUnitStateScanInProgress = 2

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** A flag to indicate the scanner functional unit’s state.
89.16.119  **ICScannerFunctionalUnitTypeDocumentFeeder = 3**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the Scanner Functional Unit Types.  
**Notes:** Document feeder functional unit.

89.16.120  **ICScannerFunctionalUnitTypeFlatbed = 0**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the Scanner Functional Unit Types.  
**Notes:** Flatbed functional unit.

89.16.121  **ICScannerFunctionalUnitTypeNegativeTransparency = 2**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the Scanner Functional Unit Types.  
**Notes:** Transparency functional unit for scanning negatives.

89.16.122  **ICScannerFunctionalUnitTypePositiveTransparency = 1**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the Scanner Functional Unit Types.  
**Notes:** Transparency functional unit for scanning positives.

89.16.123  **ICScannerMeasurementUnitCentimeters = 1**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the units of measurement used by the scanner.  
**Notes:** 1 cm = 1.00 cm or 1/2.54 inches

89.16.124  **ICScannerMeasurementUnitInches = 0**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the units of measurement used by the scanner.  
**Notes:** 1 inch = 2.54 cm
89.16.125  ICScannerMeasurementUnitPicas = 2

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the units of measurement used by the scanner.
**Notes:** 1 pica = .42333333 cm or 1/6 inches

89.16.126  ICScannerMeasurementUnitPixels = 5

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the units of measurement used by the scanner.

89.16.127  ICScannerMeasurementUnitPoints = 3

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the units of measurement used by the scanner.
**Notes:** 1 point = .0352777775 cm or 1/72 inches

89.16.128  ICScannerMeasurementUnitTwips = 4

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the units of measurement used by the scanner.
**Notes:** 1 twip = .0001763888 cm or 1/1440 inches

89.16.129  ICScannerPixelDataTypeBW = 0

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the pixel data types.
**Notes:** Monochrome 1 bit pixel image.

89.16.130  ICScannerPixelDataTypeCIEXYZ = 8

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the pixel data types.
**Notes:** Color image in CIEXYZ color space.
89.16.131  ICScannerPixelDataTypeCMY = 4

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the pixel data types. Notes: Color image in CMY color space.

89.16.132  ICScannerPixelDataTypeCMYK = 5

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the pixel data types. Notes: Color image in CMYK color space.

89.16.133  ICScannerPixelDataTypeGray = 1

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the pixel data types. Notes: 8 bit pixel Gray color space.

89.16.134  ICScannerPixelDataTypePalette = 3

89.16.135  ICScannerPixelDataTypeRGB = 2

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the pixel data types. Notes: Color image RGB color space.

89.16.136  ICScannerPixelDataTypeYUV = 6

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the pixel data types. Notes: Color image in YUV color space.

89.16.137  ICScannerPixelDataTypeYUVK = 7

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the pixel data types. Notes: Color image in YUVK color space.
89.17. class ICScannerFunctionalUnitNegativeTransparencyMBS

Function: ICScannerFunctionalUnitNegativeTransparencyMBS is a concrete subclass of ICScannerFunctionalUnitMBS class.
Notes:
ICScannerDeviceMBS creates instances of this class.
This represents the transparency unit on the scanner for scanning negatives.
Subclass of the ICScannerFunctionalUnitMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.17.2 Methods

89.17.3 Constructor

Function: The private constructor.
89.18 class ICScannerFunctionalUnitPositiveTransparencyMBS

89.18.1 class ICScannerFunctionalUnitPositiveTransparencyMBS

**Function:** ICScannerFunctionalUnitPositiveTransparencyMBS is a concrete subclass of ICScannerFunctionalUnitMBS class.
**Notes:**
ICScannerDeviceMBS creates instances of this class.
This represents the transparency unit on the scanner for scanning positives.
Subclass of the ICScannerFunctionalUnitMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

89.18.2 Methods

89.18.3 Constructor

**Function:** The private constructor.
89.19  control IKCameraDeviceViewControlMBS

89.19.1  control IKCameraDeviceViewControlMBS

Function: The Xojo control for a Camera Device View.
Notes: For Xojo with Cocoa target.

89.19.2  Properties

89.19.3  View as IKCameraDeviceViewMBS

Function: The camera device view used in this control.
Notes: (Read only property)

89.19.4  Events

89.19.5  BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the bounds, but not the frame, changed.

89.19.6  DidDownloadFile(CameraFile as ICCameraFileMBS, URL as string, File as folderItem, data as MemoryBlock, error as NSErrorMBS)

Function: This event is sent for each file that gets downloaded.
Notes: Based on the IKCameraDeviceViewDisplayMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

89.19.7  DidEncounterError(Error as NSErrorMBS)

Function: This event is sent every time the camera device reports an error.
89.19.8 EnableMenuItems

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** The event where you can enable menu items.

89.19.9 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** The event called when the frame changed.

89.19.10 GotFocus

**Function:** The control itself got focus.  
**Notes:** This only fires if the control itself got focus and not a sub control.

89.19.11 LostFocus

**Function:** The control lost focus.  
**Notes:** This only fires if the control itself lost focus and not a sub control.

89.19.12 MenuAction(HitItem as MenuItem) As Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Called when a menuitem is choosen.  
**Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

89.19.13 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** The mouse button was pressed inside the controls region at the location passed in to x, y.  
**Notes:** The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

89.19.14 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

89.19.15 MouseUp(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control’s boundaries.

89.19.16 ScaleFactorChanged(NewFactor as Double)

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

89.19.17 SelectionDidChange

Function: This event is sent when the user selection did change.
89.20  class IKCameraDeviceViewMBS

89.20.1  class IKCameraDeviceViewMBS

Function: Displays content of a Image Capture supported camera.
Notes: Subclass of the NSViewMBS class.

89.20.2  Methods

89.20.3  Constructor

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```vbs
dim x as new IKCameraDeviceViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 89.20.4 Constructor(Handle as Integer) 14562
- 89.20.5 Constructor(left as Double, top as Double, width as Double, height as Double) 14563

89.20.4  Constructor(Handle as Integer)

Function: Creates an object based on the given NSView handle.
Example:

```vbs
dim t as new IKCameraDeviceViewMBS(0, 0, 100, 100)
dim v as new IKCameraDeviceViewMBS(t.handle)
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a IKCameraDeviceView and the plugin retains this handle.
See also:

- 89.20.3 Constructor 14562
- 89.20.5 Constructor(left as Double, top as Double, width as Double, height as Double) 14563
89.20. CLASS IKCAMERADEVICEVIEWMBS

89.20.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new control with the given size and position.
Example:

```vbnet
dim left, top, width, height as Integer
// define rectangle
dim x as new IKCameraDeviceViewMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 89.20.3 Constructor
- 89.20.4 Constructor(Handle as Integer)

89.20.6 deleteSelectedItems

Function: Delete selected items.

89.20.7 downloadAllItems

Function: Download all items.

89.20.8 downloadSelectedItems

Function: Download selected items.

89.20.9 rotateLeft

Function: Rotate selected items left.
89.20.10 rotateRight

**Function:** Rotate selected items right.

89.20.11 selectIndexes(indexes as NSIndexSetMBS, extend as boolean)

**Function:** Setting current user selection.

89.20.12 Properties

89.20.13 cameraDevice as ICCameraDeviceMBS

**Function:** The camera device.
**Notes:** (Read and Write property)

89.20.14 canDeleteSelectedItems as Boolean

**Function:** Indicates if the user selected items can be deleted.
**Notes:** (Read only property)

89.20.15 canDownloadSelectedItems as Boolean

**Function:** Indicates if the user selected items can be downloaded.
**Notes:** (Read only property)

89.20.16 canRotateSelectedItemsLeft as Boolean

**Function:** Indicates if the user selected items can be rotated left.
**Notes:** (Read only property)
89.20.17 canRotateSelectedItemsRight as Boolean

**Function:** Indicates if the user selected items can be rotated right.
**Notes:** (Read only property)

89.20.18 displaysDownloadsDirectoryControl as Boolean

**Function:** Show a downloads directory control.
**Notes:** (Read and Write property)

89.20.19 displaysPostProcessApplicationControl as Boolean

**Function:** Show a postprocessing application control.
**Notes:** (Read and Write property)

89.20.20 downloadAllControlLabel as String

**Function:** Label for the 'Download All' control - allows for example renaming to 'Import All'.
**Notes:** (Read and Write property)

89.20.21 downloadsDirectory as String

**Function:** Downloads directory.
**Notes:**
Download location can be provided as file URL with downloadsDirectory property or as folderitem with downloadsFolder property.
(Read and Write property)

89.20.22 downloadSelectedControlLabel as String

**Function:** Label for the 'Download Selected' control.
89.20.23 downloadsFolder as FolderItem

Function: Downloads directory.
Notes: Download location can be provided as file URL with downloadsDirectory property or as folderitem with downloadsFolder property.
(Read and Write property)

89.20.24 hasDisplayModeIcon as Boolean

Function: Support icon view display mode.
Notes: (Read and Write property)

89.20.25 hasDisplayModeTable as Boolean

Function: Support table view display mode.
Notes: (Read and Write property)

89.20.26 iconSize as Integer

Function: in icon mode: size of the image thumbnails.
Notes: (Read and Write property)

89.20.27 mode as Integer

Function: Current display mode.
Notes: see IKCameraDeviceViewDisplayMode constants.
(Read and Write property)
89.20.28  postProcessApplication as String

Function: Postprocessing application.
Notes:
A file URL to application.
(Read and Write property)

89.20.29  selectedIndexes as NSIndexSetMBS

Function: Current user selection.
Notes: (Read only property)

89.20.30  transferMode as Integer

Function: Transfer mode either file based - or - in memory.
Notes:
See IKCameraDeviceViewTransferMode constants.
(Read and Write property)

89.20.31  Events

89.20.32  DidDownloadFile(CameraFile as ICCameraFileMBS, URL as string, File as folderItem, data as MemoryBlock, error as NSErrorMBS)

Function: This event is sent for each file that gets downloaded.
Notes: Based on the IKCameraDeviceViewDisplayMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

89.20.33  DidEncounterError(Error as NSErrorMBS)

Function: This event is sent every time the camera device reports an error.
89.20.34 SelectionDidChange

**Function:** This event is sent when the user selection did change.

89.20.35 Constants

89.20.36 IKCameraDeviceViewDisplayModeIcon = 1

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the display modes. 
**Notes:** Show Icons

89.20.37 IKCameraDeviceViewDisplayModeTable = 0

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the display modes. 
**Notes:** Show Table

89.20.38 IKCameraDeviceViewTransferModeFileBased = 0

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the transfer mode constants. 
**Notes:** File based download.

89.20.39 IKCameraDeviceViewTransferModeMemoryBased = 1

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the transfer mode constants. 
**Notes:** Memory based download.
89.21 control IKDeviceBrowserViewControlMBS

89.21.1 control IKDeviceBrowserViewControlMBS

**Function:** The Xojo control for a Device Browser View.
**Notes:** For Xojo with Cocoa target.

89.21.2 Properties

89.21.3 View as IKDeviceBrowserViewMBS

**Function:** The device browser view used in this control.
**Notes:** (Read only property)

89.21.4 Events

89.21.5 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function:** The event called when the bounds, but not the frame, changed.

89.21.6 DidEncounterError(error as NSErrorMBS)

**Function:** This event is sent every time the device browser reports an error.

89.21.7 EnableMenuItems

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The event where you can enable menu items.
89.21.8 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the frame changed.

89.21.9 GotFocus

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

89.21.10 LostFocus

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

89.21.11 MenuAction(HitItem as MenuItem) As Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

89.21.12 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was pressed inside the controls region at the location passed in to x, y.
Notes:
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.
89.21. CONTROL IKDEVICEBROWSERVIEWCONTROLMBS

89.21.13 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.

Function: This event fires continuously after the mouse button was pressed inside the Control.

Notes:
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

89.21.14 MouseUp(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.

Function: The mouse button was released.

Notes: Use the x and y parameters to determine if the mouse button was released within the control’s boundaries.

89.21.15 ScaleFactorChanged(NewFactor as Double)

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.

Function: The backing store scale factor has changed.

Notes: Please invalidate any cached bitmaps or other relevant state.

89.21.16 SelectionDidChange(device as ICDeviceMBS)

Function: This event is sent when the user selection did change.

Notes: The device may be a ICCameraDeviceMBS or a IScannerDeviceMBS.
89.22 class IKDeviceBrowserViewMBS

89.22.1 class IKDeviceBrowserViewMBS

Function: Displays Image Capture cameras and scanners.
Notes: Subclass of the NSViewMBS class.

89.22.2 Methods

89.22.3 Constructor

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```vba
dim x as new IKDeviceBrowserViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 89.22.4 Constructor(Handle as Integer) 14572
- 89.22.5 Constructor(left as Double, top as Double, width as Double, height as Double) 14573

89.22.4 Constructor(Handle as Integer)

Function: Creates an object based on the given NSView handle.
Example:

```vba
dim t as new IKDeviceBrowserViewMBS(0, 0, 100, 100)
dim v as new IKDeviceBrowserViewMBS(t.handle)
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a IKDeviceBrowserView and the plugin retains this handle.

- 89.22.3 Constructor 14572
- 89.22.5 Constructor(left as Double, top as Double, width as Double, height as Double) 14573
89.22. CLASS IKDEVICEBROWSERVIEWMBS

89.22.5 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: Creates a new control with the given size and position.
Example:

```vbnet
dim left, top, width, height as Integer
// define rectangle
dim x as new IKDeviceBrowserViewMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 89.22.3 Constructor
- 89.22.4 Constructor(Handle as Integer)

89.22.6 Properties

89.22.7 displaysLocalCameras as Boolean

Function: For device filtering - indicates that the IKDeviceBrowserView should include local cameras.
Notes: (Read and Write property)

89.22.8 displaysLocalScanners as Boolean

Function: For device filtering - indicates that the IKDeviceBrowserView should include local scanners.
Notes: (Read and Write property)

89.22.9 displaysNetworkCameras as Boolean

Function: For device filtering - indicates that the IKDeviceBrowserView should include network/shared cameras.
Notes: (Read and Write property)
89.22.10  displaysNetworkScanners as Boolean

Function: for device filtering - indicates that the IKDeviceBrowserView should include network/shared scanners.
Notes: (Read and Write property)

89.22.11  mode as Integer

Function: One of the supported display modes (table, outline, or icon mode).
Notes: (Read and Write property)

89.22.12  selectedDevice as ICDeviceMBS

Function: User selected device (ICCameraDevice or ICSnannerDevice).
Notes: (Read only property)

89.22.13  Events

89.22.14  DidEncounterError(error as NSErrorMBS)

Function: This event is sent every time the device browser reports an error.

89.22.15  SelectionDidChange(device as ICDeviceMBS)

Function: This event is sent when the user selection did change.
Notes: The device may be a ICCameraDeviceMBS or a ICSnannerDeviceMBS.
89.22.16 Constants

89.22.17 IKDeviceBrowserViewDisplayModeIcon = 2

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the display modes. **Notes:** Icon

89.22.18 IKDeviceBrowserViewDisplayModeOutline = 1

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the display modes. **Notes:** Outline

89.22.19 IKDeviceBrowserViewDisplayModeTable = 0

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the display modes. **Notes:** Table
89.23  control IKScannerDeviceViewControlMBS

89.23.1 control IKScannerDeviceViewControlMBS

Function: The Xojo control for a Scanner Device View.
Notes: For Xojo with Cocoa target.

89.23.2 Properties

89.23.3 View as IKScannerDeviceViewMBS

Function: The scanner view used in this control.
Notes: (Read only property)

89.23.4 Events

89.23.5 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the bounds, but not the frame, changed.

89.23.6 DidEncounterError(error as NSErrorMBS)

Function: This event is sent every time the scanner device reports an error.

89.23.7 DidScanToBandData(data as ICScannerBandDataMBS, scanInfo as Dictionary, error as NSErrorMBS)

Function: For memory a based transfer this event is sent for every time an image band of data was scanned.
Notes: The ‘data’ parameter describes the scanned image data. Note that rotation/cropping/image adjustments are not applied yet. The ‘scanInfo’ parameter contains additional information (rotation angle, ...) that should be applied once the scan is completed.
89.23.8  DidScanToURL(url as String, file as FolderItem, fileData as MemoryBlock, error as NSErrorMBS)

**Function:** For file based transfer this event is sent for each image that gets scanned.  
**Notes:** Based on the IKScannerDeviceViewTransferMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

89.23.9  EnableMenuItems

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** The event where you can enable menu items.

89.23.10  FrameChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** The event called when the frame changed.

89.23.11  GotFocus

**Function:** The control itself got focus.  
**Notes:** This only fires if the control itself got focus and not a sub control.

89.23.12  LostFocus

**Function:** The control lost focus.  
**Notes:** This only fires if the control itself lost focus and not a sub control.

89.23.13  MenuAction(HitItem as MenuItem) As Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Called when a menuitem is choosen.  
**Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.
89.23.14 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was pressed inside the controls region at the location passed in to x, y.
Notes:
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

89.23.15 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

89.23.16 MouseUp(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

89.23.17 ScaleFactorChanged(NewFactor as Double)

MBS AVFoundation Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.
89.24  class IKScannerDeviceViewMBS

89.24.1  class IKScannerDeviceViewMBS

Function: IKScannerDeviceView displays a UI to work with Image Capture supported scanners.
Notes: Subclass of the NSViewMBS class.

89.24.2  Methods

89.24.3  Constructor

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```vba
    dim x as new IKScannerDeviceViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 89.24.4 Constructor(Handle as Integer) 14579
- 89.24.5 Constructor(left as Double, top as Double, width as Double, height as Double) 14580

89.24.4  Constructor(Handle as Integer)

Function: Creates an object based on the given NSView handle.
Example:

```vba
    dim t as new IKScannerDeviceViewMBS(0, 0, 100, 100)
    dim v as new IKScannerDeviceViewMBS(t.handle)
    MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a IKScannerDeviceView and the plugin retains this handle.
See also:

- 89.24.3 Constructor 14579
- 89.24.5 Constructor(left as Double, top as Double, width as Double, height as Double) 14580
89.24.5 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new control with the given size and position.

**Example:**
```
dim left, top, width, height as Integer  
// define rectangle
dim x as new IKScannerDeviceViewMBS(left, top, width, height)
```

**Notes:** On success the handle property is not zero.
See also:
- 89.24.3 Constructor
- 89.24.4 Constructor(Handle as Integer)

89.24.6 Properties

89.24.7 displaysDownloadsDirectoryControl as Boolean

**Function:** Show a downloads directory control.
**Notes:** (Read and Write property)

89.24.8 displaysPostProcessApplicationControl as Boolean

**Function:** Show a postprocessing application control.
**Notes:** (Read and Write property)

89.24.9 documentName as String

**Function:** Document name.
**Notes:** (Read and Write property)
89.24. **CLASS IKSCANNERDEVICEVIEWMBS**

89.24.10 **downloadsDirectory as String**

**Function:** Downloads directory.  
**Notes:**  
Download location can be provided as file URL with downloadsDirectory property or as folderitem with downloadsFolder property.  
(Read and Write property)

89.24.11 **downloadsFolder as FolderItem**

**Function:** Downloads directory.  
**Notes:**  
Download location can be provided as file URL with downloadsDirectory property or as folderitem with downloadsFolder property.  
(Read and Write property)

89.24.12 **hasDisplayModeAdvanced as Boolean**

**Function:** Support advanced scanning UI.  
**Notes:** (Read and Write property)

89.24.13 **hasDisplayModeSimple as Boolean**

**Function:** Support a simple scanning UI.  
**Notes:** (Read and Write property)

89.24.14 **mode as Integer**

**Function:** Current display mode.  
**Notes:**  
See IKScannerDeviceViewDisplayMode constants.  
(Read and Write property)
89.24.15 overviewControlLabel as String

Function: Label for the 'Overview' control.
Notes: (Read and Write property)

89.24.16 postProcessApplication as String

Function: Postprocessing application.
Notes: (Read and Write property)

89.24.17 scanControlLabel as String

Function: label for the 'Scan' control.
Notes: (Read and Write property)

89.24.18 scannerDevice as IScannerDeviceMBS

Function: The scanner device.
Notes: (Read and Write property)

89.24.19 transferMode as Integer

Function: transfer mode either file based - or - in memory.
Notes: See IKScannerDeviceViewTransferMode constants.
(Read and Write property)
89.24. Events

89.24.21 DidEncounterError(error as NSErrorMBS)

**Function:** This event is sent every time the scanner device reports an error.

89.24.22 DidScanToBandData(data as ICScannerBandDataMBS, scanInfo as Dictionary, error as NSErrorMBS)

**Function:** For memory a based transfer this event is sent for every time an image band of data was scanned.  
**Notes:** The 'data' parameter describes the scanned image data. Note that rotation/cropping/image adjustments are not applied yet. The 'scanInfo' parameter contains additional information (rotation angle, ...) that should be applied once the scan is completed.

89.24.23 DidScanToURL(url as String, file as FolderItem, fileData as Memory-Block, error as NSErrorMBS)

**Function:** For file based transfer this event is sent for each image that gets scanned.  
**Notes:** Based on the IKScannerDeviceViewTransferMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

89.24. Constants

89.24.25 IKScannerDeviceViewDisplayModeAdvanced = 1

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the display mode constants.  
**Notes:** Advanced

89.24.26 IKScannerDeviceViewDisplayModeSimple = 0

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the display mode constants.  
**Notes:** Simple
89.24.27  IKScannerDeviceViewTransferModeFileBased = 0

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the transport modes.  
**Notes:** File based scan.

89.24.28  IKScannerDeviceViewTransferModeMemoryBased = 1

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the transport modes.  
**Notes:** Memory based scan.
89.25.  **CLASS IMAGECAPTUREEVENTSMBS**

89.25  **class ImageCaptureEventsMBS**

89.25.1  **class ImageCaptureEventsMBS**

**Function:** Central class for Image Capture events.
**Notes:**
Whenever you have an ICA object, the plugin will register a delegate for it and dispatch all events here.
For some view classes, events are in addition dispatched to the controls.

89.25.2  **Properties**

89.25.3  **Handle as Integer**

**Function:** The internal object reference.
**Notes:** (Read and Write property)

89.25.4  **Events**

89.25.5  **cameraDeviceDidAddItem(camera as ICCameraDeviceMBS, item as ICCameraItemMBS)**

**Function:** This event is sent when an object is added to the device.
**Notes:** The object may be an instance of ICCameraFolder or ICCameraFile class.

89.25.6  **cameraDeviceDidAddItems(camera as ICCameraDeviceMBS, items() as ICCameraItemMBS)**

**Function:** This event is sent when an object or objects are added to the device.
**Notes:**
Instead of receive one event per object, an array of objects is sent.
The objects may be instances of ICCameraFolder or ICCameraFile class.
89.25.7  cameraDeviceDidBecomeReadyWithCompleteContentCatalog(camera as ICCameraDeviceMBS)

Function: This event is sent when the camera device is done enumerating its content and is ready to receive requests.
Notes: A session must be opened on the device in order to enumerate its content and make it ready to receive requests.

89.25.8  cameraDeviceDidChangeCapability(camera as ICCameraDeviceMBS)

Function: This event is sent when the capability of a device changes.
Notes: This usually happens when the device module takes control or yields control of the device.

89.25.9  cameraDeviceDidCompleteDeleteFilesWithError(camera as ICCameraDeviceMBS, error as NSErrorMBS)

Function: Files have been deleted.
Notes: This event is sent after the camera device completes a delete operation initiated by sending a requestDeleteFiles event to that device.

89.25.10  cameraDeviceDidDownloadFile(file as ICCameraFileMBS, error as NSErrorMBS, options as Dictionary, device as ICCameraDeviceMBS)

Function: Download of file finished.

89.25.11  cameraDeviceDidReadData(data as Memoryblock, file as ICCameraFileMBS, error as NSErrorMBS, device as ICCameraDeviceMBS)

Function: Reading file data finished.
89.25.12 cameraDeviceDidReceiveDownloadProgressForFile(file as ICCameraFileMBS, downloadedBytes as UInt64, maxBytes as UInt64)

**Function:** This event is sent to the delegate to provide status of the download operation.

89.25.13 cameraDeviceDidReceiveMetadataForItem(camera as ICCameraDeviceMBS, item as ICCameraItemMBS)

**Function:** This event is sent when the metadata requested for an item on a device is available.

89.25.14 cameraDeviceDidReceivePTPEvent(camera as ICCameraDeviceMBS, eventData as MemoryBlock)

**Function:** This event is sent to the delegate to convey a PTP event.

89.25.15 cameraDeviceDidReceiveThumbnailForItem(camera as ICCameraDeviceMBS, item as ICCameraItemMBS)

**Function:** This event is sent when the thumbnail requested for an item on a device is available.

89.25.16 cameraDeviceDidRemoveItem(camera as ICCameraDeviceMBS, item as ICCameraItemMBS)

**Function:** This event is sent when an object is removed from the device.

**Notes:** The object may be an instance of ICCameraFolder or ICCameraFile class.

89.25.17 cameraDeviceDidRemoveItems(camera as ICCameraDeviceMBS, items() as ICCameraItemMBS)

**Function:** This event is sent when an object or objects are removed from the device.
Notes: The objects may be instances of ICCameraFolder or ICCameraFile class. This method supercedes cameraDeviceDidRemoveItem method described above.

89.25.18  cameraDeviceDidRenameItems(camera as ICCameraDeviceMBS, items() as ICCameraItemMBS)

Function: This event is sent when an object or objects are renamed on the device.
Notes: The objects may be instances of ICCameraFolder or ICCameraFile class.

89.25.19  cameraDeviceDidSendPTPCommand(command as Memoryblock, data as Memoryblock, response as MemoryBlock, error as NSErrorMBS, device as ICCameraDeviceMBS)

Function: Called when a requestSendPTPCommand event got a response or error.

89.25.20  cameraDeviceDidUploadFile(fileURL as string, file as FolderItem, error as NSErrorMBS, device as ICCameraDeviceMBS)

Function: A file upload was completed.

89.25.21  cameraDeviceViewDidDownloadFile(cameraDeviceView as IKCameraDeviceViewMBS, CameraFile as ICCameraFileMBS, URL as string, File as folderItem, data as MemoryBlock, error as NSErrorMBS)

Function: This event is sent for each file that gets downloaded.
Notes: Based on the IKCameraDeviceViewDisplayMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

89.25.22  cameraDeviceViewDidEncounterError(cameraDeviceView as IKCameraDeviceViewMBS, error as NSErrorMBS)

Function: This event is sent every time the camera device reports an error.
89.25.23 cameraDeviceViewSelectionDidChange(cameraDeviceView as IKCameraDeviceViewMBS)

Function: This event is sent when the user selection did change.

89.25.24 deviceBrowserDeviceDidChangeName(browser as ICDeviceBrowserMBS, device as ICDeviceMBS)

Function: This event is sent if the name of a device changes.
Notes: This happens if the device module overrides the default name of the device reported by the device’s transport layer, or if the name of the filesystem volume mounted by the device is changed by the user.

89.25.25 deviceBrowserDeviceDidChangeSharingState(browser as ICDeviceBrowserMBS, device as ICDeviceMBS)

Function: This event is sent when the sharing state of a device has changed.
Notes: Any Image Capture client application can choose to share the device over the network using the sharing or webSharing facility in Image Capture.

89.25.26 deviceBrowserDidAddDevice(browser as ICDeviceBrowserMBS, device as ICDeviceMBS, moreComing as boolean)

Function: This event is sent to the delegate to inform that a device has been added.
Notes: If several devices are found during the initial search, then this event is sent once for each device with the value of 'moreComing' set to true in each event except the last one.

89.25.27 deviceBrowserDidEnumerateLocalDevices(browser as ICDeviceBrowserMBS)

Function: This event is sent after the device browser completes sending deviceBrowserDidAddDevice event for all local devices.
Notes: Detecting locally connected devices (USB and FireWire devices) is faster than detecting devices
connected using a network protocol. An Image Capture client application may use this event to update its
user interface to let the user know that it has completed looking for locally connected devices and then start
looking for network devices.

89.25.28  deviceBrowserDidRemoveDevice(browser as ICDeviceBrowserMBS, de-
vice as ICDeviceMBS, moreGoing as boolean)

Function: This event is sent to the delegate to inform that a device has been removed.
Notes: If several devices are removed at the same time, then this event is sent once for each device with
the value of ‘moreGoing’ set to true in each event except the last one.

89.25.29  deviceBrowserRequestsSelectDevice(browser as ICDeviceBrowserMBS,
device as ICDeviceMBS)

Function: This event is sent when an event that occurred on the device may be of interest to the client
application.
Notes: In Mac OS X 10.6, this event is sent when a button is pressed on a device and the current application
is the target for that button press. In the case of the button-press event, if a session is open on the device,
this event will not be sent, instead the deviceDidReceiveButtonPress event is sent.

89.25.30  deviceBrowserViewDidEncounterError(deviceBrowserView as IKDe-
viceBrowserViewMBS, error as NSErrorMBS)

Function: This event is sent every time the device browser reports an error.

89.25.31  deviceBrowserViewSelectionDidChangeEvent(deviceBrowserView as IKDe-
viceBrowserViewMBS, device as ICDeviceMBS)

Function: This event is sent when the user selection did change.
Notes: The device may be a ICCameraDeviceMBS or a IScannerDeviceMBS.
89.25.32  deviceDidBecomeReady(device as ICDeviceMBS)

**Function:** This event is sent when the device is ready to receive requests.
**Notes:** A camera device is ready, when it is ready to receive requests. A scanner device is ready when its functional units are found and the default functional unit is selected for use and is ready to receive requests. The device will become ready to receive requests only after a session is opened.

89.25.33  deviceDidChangeName(device as ICDeviceMBS)

**Function:** This event is sent if the name of a device changes.
**Notes:** This happens if the device module overrides the default name of the device reported by the device’s transport layer, or if the name of the filesystem volume mounted by the device is changed by the user.

89.25.34  deviceDidChangeSharingState(device as ICDeviceMBS)

**Function:** This event is sent when the sharing state of a device has changes.
**Notes:** Any Image Capture client application can choose to share the device over the network using the sharing or webSharing facility in Image Capture.

89.25.35  deviceDidCloseSessionWithError(device as ICDeviceMBS, error as NSErrorMBS)

**Function:** This event is sent when a session is closed on a device.
**Notes:** This event completes the process initiated by the message ”requestCloseSession” sent to the device object. This event is also sent if the device module in control of the device ceases to control the device.

89.25.36  deviceDidEncounterError(device as ICDeviceMBS, error as NSErrorMBS)

**Function:** This event is sent to the device delegate when a camera or scanner device encounters an error.
89.25.37 deviceDidOpenSessionWithError(device as ICDeviceMBS, error as NSErrorMBS)

Function: This event is sent when a session is opened on a device.
Notes: This event completes the process initiated by the requestOpenSession sent to the device object.

89.25.38 deviceDidReceiveButtonPress(device as ICDeviceMBS, buttonType as String)

Function: This event is sent to the device delegate if a button is pressed on the device.
Notes: This event is sent only if a session is open on the device. The value of 'buttonType' argument is one of the ICBButtonType* values defined above.

89.25.39 deviceDidReceiveCustomNotification(device as ICDeviceMBS, notification as Dictionary, data as Memoryblock)

Function: This event is sent to the device delegate the device sends a custom notification 'notification' with an arbitrary byte buffer 'data'.
Notes: This event is sent only if a session is open on the device.

89.25.40 deviceDidReceiveStatusInformation(device as ICDeviceMBS, status as Dictionary)

Function: This event is sent when status information is received from a camera or a scanner.
Notes:
In Mac OS X 10.6 this event is not called for camera devices. This may change in the future releases of Mac OS X.
The 'status' dictionary contains two keys, ICStatusNotificationKey and ICLocalizedStatusNotificationKey, which are defined above. If type of 'device' is ICDeviceTypeScanner, the value of ICStatusNotificationKey will be one of the values defined in IScannerDevice.h (e.g., ICScannerStatusWarmingUp, ICScannerStatusWarmUpDone, or ICScannerStatusRequestsOverviewScan); the value of ICLocalizedStatusNotificationKey will be a localized status information string suitable for displaying to the user.
89.25.41  deviceDidRemove(device as ICDeviceMBS)

**Function:** This event is sent to the delegate to inform that a device has been removed.

89.25.42  deviceDidSendMessage(messageCode as UInt32, data as Memoryblock, error as NSErrorMBS, device as ICDeviceMBS)

**Function:** The call to requestSendMessage was successful.

89.25.43  scannerDeviceDidBecomeAvailable(scanner as ICScannerDeviceMBS)

**Function:** This event is sent when another client closes an open session on the scanner.
**Notes:** Scanners require exclusive access, only one client can open a session on a scanner. The scanner is available if it does not have a session opened by another client. Attempting to open a session on a scanner that already has an open session for another client will result in an error. A client that wants to open a session on a scanner as soon as it is available should implement this method and send "requestOpenSession" message to scanner object from that method.

89.25.44  scannerDeviceDidCompleteOverviewScanWithError(scanner as ICScannerDeviceMBS, error as NSErrorMBS)

**Function:** This event is sent after the scanner device completes an overview scan.

89.25.45  scannerDeviceDidCompleteScanWithError(scanner as ICScannerDeviceMBS, error as NSErrorMBS)

**Function:** This event is sent after the scanner device completes a scan.
CHAPTER 89. IMAGE CAPTURE

89.25.46 scannerDeviceDidScanToBandData(scanner as ICScannerDeviceMBS, Data as ICScannerBandDataMBS)

Function: This event is sent when the scanner device receives the requested scan progress notification and a band of data is sent for each notification received.
Notes: In memory transfer mode, this will send a band of size that has been selected by the client via the maxMemoryBandSize property.

89.25.47 scannerDeviceDidScanToURL(scanner as ICScannerDeviceMBS, URL as string, file as folderitem, data as MemoryBlock)

Function: This event is sent when the scanner device receives the requested scan.
Notes: If selectedFunctionalUnit is a document feeder, then this event will be sent once for each scanned page. This event is sent when the scanner device receives the requested scan. If selectedFunctionalUnit is a document feeder, then this event will be sent once for each scanned page.

89.25.48 scannerDeviceDidSelectFunctionalUnit(scanner as ICScannerDeviceMBS, functionalUnit as Variant, Error as NSErrorMBS)

Function: This event is sent when a functional unit is selected on the scanner device.
Notes: A functional unit is selected immediately after the scanner device is instantiated and in response to requestSelectFunctionalUnit method.

89.25.49 scannerDeviceViewDidEncounterError(scannerDeviceView as IKScannerDeviceViewMBS, error as NSErrorMBS)

Function: This event is sent every time the scanner device reports an error.
89.25.50 scannerDeviceViewDidScanToBandData(scannerDeviceView as IKScannerDeviceViewMBS, data as ICScannerBandDataMBS, scanInfo as Dictionary, error as NSErrorMBS)

**Function:** For memory a based transfer this event is sent for every time an image band of data was scanned.
**Notes:** The ‘data’ parameter describes the scanned image data. Note that rotation/cropping/image adjustments are not applied yet. The ‘scanInfo’ parameter contains additional information (rotation angle, ...) that should be applied once the scan is completed.

89.25.51 scannerDeviceViewDidScanToURL(scannerDeviceView as IKScannerDeviceViewMBS, url as String, file as FolderItem, fileData as MemoryBlock, error as NSErrorMBS)

**Function:** For file based transfer this event is sent for each image that gets scanned.
**Notes:** Based on the IKScannerDeviceViewTransferMode the downloaded file will be saved on disk using the ‘url’, or returned in memory as Memoryblock.

89.25.52 Constants

89.25.53 ICReturnCommunicationTimedOut = -9923

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.
**Notes:** Communication between different components of Image Capture timed out.

89.25.54 ICReturnDeleteFilesCanceled = -9942

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.
**Notes:** A request to delete files was canceled.

89.25.55 ICReturnDeleteFilesFailed = -9941

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.
**Notes:** A request to delete files failed.
CHAPTER 89. IMAGE CAPTURE

89.25.56  ICReturnDeviceFailedToCloseSession = -9928

MBS AVFoundation Plugin, Plugin Version: 14.3.  Function: One of the error constants.  Notes: Failed to close a session on a specified device.

89.25.57  ICReturnDeviceFailedToOpenSession = -9927

MBS AVFoundation Plugin, Plugin Version: 14.3.  Function: One of the error constants.  Notes: Failed to open a session on a specified device.

89.25.58  ICReturnDeviceFailedToTakePicture = -9944

MBS AVFoundation Plugin, Plugin Version: 14.3.  Function: One of the error constants.  Notes: Failed to take a tethered-capture picture on a camera device.

89.25.59  ICReturnDeviceIsPasscodeLocked = -9943

MBS AVFoundation Plugin, Plugin Version: 14.3.  Function: One of the error constants.  Notes: The device is locked with a passcode. Its contents cannot be seen unless it is unlocked.

89.25.60  ICReturnDeviceSoftwareInstallationCanceled = -9948

MBS AVFoundation Plugin, Plugin Version: 14.3.  Function: One of the error constants.  Notes: Software installation for the device has been canceled.

89.25.61  ICReturnDeviceSoftwareInstallationCompleted = -9947

MBS AVFoundation Plugin, Plugin Version: 14.3.  Function: One of the error constants.  Notes: Software installation for the device has completed successfully.

89.25.62  ICReturnDeviceSoftwareInstallationFailed = -9949

89.25.63  **ICReturnDeviceSoftwareIsBeingInstalled = -9946**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** Failed to open session because software to communicate with the device is being installed.

89.25.64  **ICReturnDeviceSoftwareNotAvailable = -9950**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** Software for the device is not available from Apple.

89.25.65  **ICReturnDeviceSoftwareNotInstalled = -9945**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** Failed to open session because software to communicate with the device is not installed.

89.25.66  **ICReturnDownloadCanceled = -9937**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** A download operation was canceled.

89.25.67  **ICReturnDownloadFailed = -9934**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** A non-specific error occurred while downloading a file.

89.25.68  **ICReturnFailedToCompletePassThroughCommand = -9936**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** Failed to complete a pass-through (e.g., PTP pass-through) command.

89.25.69  **ICReturnFailedToCompleteSendMessageRequest = -9940**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** A request to send a event to a device failed.
89.25.70  **ICReturnFailedToDisableTethering = -9939**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** Failed to disable tethered-capture on a camera device.

89.25.71  **ICReturnFailedToEnableTethering = -9938**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** Failed to enable tethered-capture on a camera device.

89.25.72  **ICReturnInvalidParam = -9922**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** An invalid parameter was found.

89.25.73  **ICReturnReceivedUnsolicitedScannerErrorInfo = -9933**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** An unsolicited error information was received from a scanner.

89.25.74  **ICReturnReceivedUnsolicitedScannerStatusInfo = -9932**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** An unsolicited status information was received from a scanner.

89.25.75  **ICReturnScannerFailedToCompleteOverviewScan = -9930**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** Overview scan operation failed to complete on the specified scanner.

89.25.76  **ICReturnScannerFailedToCompleteScan = -9931**

MBS AVFoundation Plugin, Plugin Version: 14.3. **Function:** One of the error constants.  
**Notes:** Scan operation failed to complete on the specified scanner.
89.25.77  ICReturnScannerFailedToSelectFunctionalUnit = -9929

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the error constants. Notes: Failed to select a functional unit on the specified scanner.

89.25.78  ICReturnScannerInUseByLocalUser = -9925

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the error constants. Notes: Scanner is being used by a remote user.

89.25.79  ICReturnScannerInUseByRemoteUser = -9926

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the error constants. Notes: Scanner is being used by a local user.

89.25.80  ICReturnScanOperationCanceled = -9924

MBS AVFoundation Plugin, Plugin Version: 14.3. Function: One of the error constants. Notes: The scan operation is canceled.

89.25.81  ICReturnSuccess = 0

89.25.82  ICReturnUploadFailed = -9935

89.26 class ImageCaptureMBS

89.26.1 class ImageCaptureMBS

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The base class to start with image capture.

**Example:**

```vcl
dim m as new ImageCaptureMBS
dim list as ImageCaptureObjectMBS = m.DeviceList

if List<>Nil then
    // look into properties
    dim dic as Dictionary = list.PropertyDictionary

    // take the devices array there
    if dic<>Nil and dic.HasKey(ImageCaptureObjectMBS.kICADevicesArrayKey) then
        dim a(-1) as Variant = dic.Value(ImageCaptureObjectMBS.kICADevicesArrayKey)

        // display device name
        for each properties as Dictionary in a
            MsgBox Properties.Value("ifil")
        next
    end if
end if
```

**Deprecated:** This item is deprecated and should no longer be used. You can use ICDDeviceMBS instead.

**Notes:**

Deprecated. Please stop using this class soon.

On Mac OS X 10.8 some functions stop working as Apple does no longer provide 32 bit libraries.

89.26.2 Methods

89.26.3 DeviceList as ImageCaptureObjectMBS

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the object with the device list.

**Example:**

```vcl
dim m as new ImageCaptureMBS
dim list as ImageCaptureObjectMBS = m.DeviceList

if List<>Nil then
```
// look into properties
dim dic as Dictionary = list.PropertyDictionary

// take the devices array there
if dic<>Nil and dic.HasKey(ImageCaptureObjectMBS.kICADevicesArrayKey) then
    dim a(-1) as Variant = dic.Value(ImageCaptureObjectMBS.kICADevicesArrayKey)

    // display device name
    for each properties as Dictionary in a
        MsgBox Properties.Value("ifil")
    next
end if
end if

Notes:
Returns nil on any error.
LastError is set.

89.26.4 ImportImage(flags as Integer) as string()

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This method displays a Common User Interface panel similar to the user interface of Image Capture Application.
Example:

dim m as new ImageCaptureMBS
dim flags as Integer = ImageCaptureObjectMBS.kICAAllowMultipleImages + ImageCaptureObjectMBS.kICADownloadAndReturnPathArray

    // do the import and allow all file types
    dim files(-1) as string = m.ImportImage(flags)

    for each path as string in files
    // show path
        MsgBox path
    next

    // open that picture file in preview
    dim f as FolderItem = GetFolderItem(path, FolderItem.PathTypeShell)
    f.Launch
next

Notes:
Use this method to allow the user to work a camera or a scanner.

The behavior:
(a) if no device is connected, a panel saying that there’s no device connected is displayed,
(b) if a single device is connected, an appropriate user interface to access that device will be displayed,
(c) if several devices are connected, a device selector panel will be displayed.

filetypes: Optional an array of file extension strings such as ”jpg”, ”tif”, etc., that are of interest to the calling application. If no array is provided, all files are displayed.

Flag values that can be used in ImportImage:

```
klCAAllowAnonymousImages = 1 Use this constant to allow users to select multiple images in the Import Image dialog.
klCADownloadAndReturnPathArray = 2 Use this constant to download the images to a temporary location and return an array of paths to the downloaded images.
```

Returns an array of Strings for the imported images if the klCADownloadAndReturnPathArray flag is not specified. Otherwise returns an array of Strings holding the paths of the images that are downloaded.

See also:

• 89.26.5 ImportImage(flags as Integer, filetypes() as string) as string()
for each path as string in files
// show path
MsgBox path

// open that picture file in preview
dim f as FolderItem = GetFolderItem(path, FolderItem.PathTypeShell)
f.Launch
next

Notes:
Use this method to allow the user to work a camera or a scanner.

The behavior:
(a) if no device is connected, a panel saying that there’s no device connected is displayed,
(b) if a single device is connected, an appropriate user interface to access that device will be displayed,
(c) if several devices are connected, a device selector panel will be displayed.

filetypes: Optional an array of file extension strings such as ”jpg”, ”tif”, etc., that are of interest to the calling application. If no array is provided, all files are displayed.

Flag values that can be used in ImportImage:

kICAAllowMultipleImages = 1 Use this constant to allow users to select multiple images in the Import Image dialog.
kICADownloadAndReturnPathArray = 2 Use this constant to download the images to a temporary location and return an array of paths to the downloaded images.

Returns an array of Strings for the imported images if the kICADownloadAndReturnPathArray flag is not specified. Otherwise returns an array of Strings holding the paths of the images that are downloaded.

CHAPTER 89. IMAGE CAPTURE

89.26.7  kICABluetoothTransportType as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the transport type constants.

89.26.8  kICADeviceBrowserDeviceRefKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the parameter dictionary for LoadDeviceModule.

89.26.9  kICADeviceIconPathKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the parameter dictionary for LoadDeviceModule.

89.26.10  kICADeviceModulePathKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the parameter dictionary for LoadDeviceModule.

89.26.11  kICAErrorKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.12  kICAFireWireGUIDKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the parameter dictionary for LoadDeviceModule.

89.26.13  kICAFireWireTransportType as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the transport type constants.
89.26.14 kICAIServicePathKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the parameter dictionary for LoadDeviceModule.

89.26.15 kICAIPAddressKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the parameter dictionary for LoadDeviceModule.

89.26.16 kICAIPGUIDKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the parameter dictionary for LoadDeviceModule.

89.26.17 kICAIPNameKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the parameter dictionary for LoadDeviceModule.

89.26.18 kICANotificationClassKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.19 kICANotificationClassProprietary as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the notification classes. **Notes:** A possible value for kICANotificationClassKey.

89.26.20 kICANotificationClassPTPStandard as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the notification classes.
89.26.21 kICANotificationClassPTPVendor as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. 

Function: One of the constants for the notification classes.

Notes: A possible value for kICANotificationClassKey.

89.26.22 kICANotificationDataCookieKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. 

Function: One of the keys for the notification dictionary.

89.26.23 kICANotificationDataKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. 

Function: One of the keys for the notification dictionary.

89.26.24 kICANotificationDataSizeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. 

Function: One of the keys for the notification dictionary.

89.26.25 kICANotificationDeviceICAObjectKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. 

Function: One of the keys for the notification dictionary.

89.26.26 kICANotificationDeviceListICAObjectKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. 

Function: One of the keys for the notification dictionary.
89.26.27  
**kICANotificationICAObjectKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.28  
**kICANotificationImageBytesPerRowKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.29  
**kICANotificationImageDataKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.30  
**kICANotificationImageDataSizeKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.31  
**kICANotificationImageHeightKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.32  
**kICANotificationImageKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.33  
**kICANotificationImageNumberOfRowsKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.
89.26.34 kICANotificationImageStartRowKey as string

89.26.35 kICANotificationImageWidthKey as string

89.26.36 kICANotificationNumberOfImagesRemainingKey as string

89.26.37 kICANotificationPercentDownloadedKey as string

89.26.38 kICANotificationRawEventKey as string

89.26.39 kICANotificationScannerButtonTypeKey as string

89.26.40 kICANotificationScannerDocumentNameKey as string

89.26.41 kICANotificationSubTypeDocumentLoaded as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.42 kICANotificationSubTypeDocumentNotLoaded as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.43 kICANotificationSubTypeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.44 kICANotificationSubTypePerformOverviewScan as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.45 kICANotificationSubTypeWarmUpDone as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.46 kICANotificationSubTypeWarmUpStarted as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.47 kICANotificationTypeCaptureComplete as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.
89.26.48  kICANotificationTypeDeviceAdded as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.49  kICANotificationTypeDeviceConnectionProgress as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.50  kICANotificationTypeDeviceInfoChanged as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.51  kICANotificationTypeDevicePropertyChanged as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.52  kICANotificationTypeDeviceRemoved as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.53  kICANotificationTypeDeviceStatusError as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.54  kICANotificationTypeDeviceStatusInfo as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.
89.26.55  kICANotificationTypeDeviceWasReset as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.56  kICANotificationTypeDownloadProgressStatus as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.57  kICANotificationTypeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary. **Notes:** The type of notification. See kICANotificationType* constants.

89.26.58  kICANotificationTypeObjectAdded as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.59  kICANotificationTypeObjectInfoChanged as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.60  kICANotificationTypeObjectRemoved as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.61  kICANotificationTypeProprietary as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.
CHAPTER 89. IMAGE CAPTURE

89.26.62 kICANotificationTypeRequestObjectTransfer as string

89.26.63 kICANotificationTypeScannerButtonPressed as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.64 kICANotificationTypeScannerOverviewOverlayAvailable as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.65 kICANotificationTypeScannerPageDone as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.66 kICANotificationTypeScannerScanDone as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.67 kICANotificationTypeScannerSessionClosed as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.

89.26.68 kICANotificationTypeScanProgressStatus as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification types for the notification event.
89.26.69  kICANotificationTypeStoreAdded as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification types for the notification event.

89.26.70  kICANotificationTypeStoreFull as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification types for the notification event.

89.26.71  kICANotificationTypeStoreInfoChanged as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification types for the notification event.

89.26.72  kICANotificationTypeStoreRemoved as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification types for the notification event.

89.26.73  kICANotificationTypeTransactionCanceled as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification types for the notification event.

89.26.74  kICANotificationTypeUnreportedStatus as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** One of the notification types for the notification event.

89.26.75  kICANotificationVendorErrorCodeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** One of the keys for the notification dictionary.
89.26.76  **kICARefconKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the notification dictionary.

89.26.77  **kICASCSITransportType as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the transport type constants.

89.26.78  **kICATCPIPTransportType as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the transport type constants.

89.26.79  **kICATransportTypeKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the parameter dictionary for LoadDeviceModule.

89.26.80  **kICAWAINDSPATHKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the parameter dictionary for LoadDeviceModule.

89.26.81  **kICAWAINTransportType as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the transport type constants.

89.26.82  **kICAUSBLocationIDKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the parameter dictionary for LoadDeviceModule.
89.26. **CLASS IMAGECAPTUREMBS**

89.26.83  **kICAUSBTransportType as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. *Function:* One of the transport type constants.

89.26.84  **kICAUserAssignedDeviceNameKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. *Function:* One of the device properties keys.
*Notes:* This key may be present in the property dictionary of a device if the device has a user-assigned name.

89.26.85  **LoadDeviceModule(params as dictionary)**

*Notes:* Typically, connecting a FireWire or an USB device will automatically load an appropriate device module. This API is needed only for loading a device module manually for devices that do not use a hot-plug interface, such as Bluetooth, SCSI, or TCP/IP.

Legal Key-Value pairs for populating paramDictionary:

<table>

89.26.86  **RegisterForEventNotification**(objectOfInterest as ImageCaptureObjectMBS, eventsOfInterest() as string, options as dictionary)

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Register with Image Capture framework to receive notification about events of interest.

89.26.87  **SendNotification**(notificationDictionary as dictionary) as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sends notification.  
**Notes:**  
Returns the reply code.  
Lasterror is set.

89.26.88  **SendNotificationAndWaitForReply**(notificationDictionary as dictionary) as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sends notification and wait for reply.  
**Notes:**  
Returns the reply code.  
Lasterror is set.

89.26.89  **ShowDeviceBrowser**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Displays a device browser user interface from any Image Capture client application.  
**Notes:**  
The device browser user interface allows the user to do the following:

- enable and disable sharing of locally connected cameras and scanners.
- connect to or disconnect from cameras and scanners shared by other computers.
- configure WiFi capable cameras for use over the WiFi network.

Lasterror is set.
89.26. **CLASS IMAGECAPTUREMBS**

89.26.90 **UnloadDeviceModule(deviceObject as ImageCaptureObjectMBS)**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Unloads a device module.

**Notes:**

The device module providing this object will be unloaded, if this is the last device object provided by the device module.

LastError is set.

89.26.91 **Properties**

89.26.92 **LastError as Integer**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**

The error code from the last function used.

**Notes:**

Value is 0 if the function was successful, -1 if the function is not available, one of the following values or a Mac OS error code:

Possible values:

- kICACommunicationErr = -9900
- kICADeviceNotFoundErr = -9901
- kICADeviceNotOpenErr = -9902
- kICAFailedToOpenDeviceErr = -9903
- kICAIOPendingErr = -9904
- kICAMalformedDataErr = -9905
- kICAMalformedPropertyErr = -9906
- kICAMalformedPropertyErr = -9907
- kICAPropertyTypeNotFoundErr = -9908
- kICAMalformedDeviceErr = -9909
- kICAMalformationErr = -9910
- kICAMalformedDeviceMemoryAllocationErr = -9911
- kICAMalformedDeviceInvalidParamErr = -9912
- kICAMalformedDeviceAlreadyOpenErr = -9913
- kICAMalformedDeviceLocationIDNotFoundErr = -9914
- kICAMalformedDeviceGUIDNotFoundErr = -9915
- kICAMalformedDeviceIOServicePathNotFoundErr = -9916
- kICAMalformedDeviceIOServicePathNotFoundErr = -9917
- kICAMalformedDeviceUnsupportedErr = -9918
- kICAMalformedDeviceUnsupportedErr = -9919
- kICAMalformedDeviceUnsupportedErr = -9920
- kICAMalformedDeviceUnsupportedErr = -9921
89.26.93 Events

89.26.94 Notification(notificationType as string, notificationDictionary as dictionary)

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The event called for all events coming from Image Capture.

**Notes:**
Use RegisterForEventNotification to register for events.

The Image Capture notification event will be called with a notificationDictionary that may contain one or more key-value pairs as defined below:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value Type</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>kICANotificationICAObjectKey</td>
<td>Number</td>
<td>An object associated with the notification.</td>
</tr>
<tr>
<td>kICANotificationDeviceICAObjectKey</td>
<td>Number</td>
<td>A device object associated with the notification.</td>
</tr>
<tr>
<td>kICANotificationClassKey</td>
<td>String</td>
<td>See below.</td>
</tr>
<tr>
<td>kICANotificationTypeKey</td>
<td>String</td>
<td>See below.</td>
</tr>
<tr>
<td>kICANotificationRawEventKey</td>
<td>Number</td>
<td>The unprocessed event code sent by a device.</td>
</tr>
<tr>
<td>kICANotificationDataKey</td>
<td>Data String</td>
<td>Data associated with the event.</td>
</tr>
<tr>
<td>kICANotificationDataSizeKey</td>
<td>Number</td>
<td>Size of data associated with the event. [Needed for backward compatibility with pre-Leopard device modules]</td>
</tr>
<tr>
<td>kICANotificationDataCookieKey</td>
<td>Number</td>
<td>A token identifying the data associated with this event. This data can be retrieved by calling SendMessage with messageType set to kICAMessageGetEventData, dataType set to value of kICANotificationDataCookieKey and dataSize set to value of kICANotificationDataSizeKey.</td>
</tr>
</tbody>
</table>

The following keys are present if the value of kICANotificationDataKey represents image data. The values of these keys are Numbers representing the width, height, bytes per row, start row, and number of rows of the image:

<table>
<thead>
<tr>
<th>Key</th>
<th>Dictionary</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>kICANotificationImageKey</td>
<td>Dictionary</td>
<td>A dictionary that describes an Image associated with the notification.</td>
</tr>
<tr>
<td>kICANotificationImageDataKey</td>
<td>Data String</td>
<td>Image data</td>
</tr>
<tr>
<td>kICANotificationImageWidthKey</td>
<td>Number</td>
<td>Image width in pixels</td>
</tr>
<tr>
<td>kICANotificationImageHeightKey</td>
<td>Number</td>
<td>Image height in pixels</td>
</tr>
<tr>
<td>kICANotificationImageBytesPerRowKey</td>
<td>Number</td>
<td>Bytes per row in image</td>
</tr>
<tr>
<td>kICANotificationImageStartRowKey</td>
<td>Number</td>
<td>Starting row number of the image.</td>
</tr>
<tr>
<td>kICANotificationImageNumberOfRowsKey</td>
<td>Number</td>
<td>Number of rows of image data sent in this notification.</td>
</tr>
</tbody>
</table>
89.27  class ImageCaptureObjectMBS

89.27.1  class ImageCaptureObjectMBS

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An image capture object.  
**Deprecated:** This item is deprecated and should no longer be used. You can use IDeviceMBS instead.

89.27.2  Methods

89.27.3  CloseSession

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Close a session on a camera device.  
**Notes:**  
Lasterror is set.  
For a scanner device use the ScannerCloseSession.

89.27.4  Constructor

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new image capture object.  
See also:

- 89.27.5 Constructor(handle as Integer)

89.27.5  Constructor(handle as Integer)

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new image capture object with the given handle.  
See also:

- 89.27.4 Constructor

89.27.6  CopyData(startByte as int64, requestedSize as int64) as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Get a copy of data associated with a file object.  
**Example:**

```
dim o as ImageCaptureObjectMBS // your object pointing to an image file.
```
`dim d2 as Dictionary = o.PropertyDictionary`  
`dim size as Integer = d2.Value(o.kICAPropertyImageSize)`  
`dim data as string = o.CopyData(0, size)`  

if lenb(data)>0 then  
    // you got the data, now process it.  
end if

Notes:

startByte: Starting byte offset of the data in the file object.  
requestedSize: Requested data size in bytes.

If you want to get all bytes of an object, pass startByte = 0 and requestedSize = filesize.  
LastError is set.

89.27.7 CopyThumbnail(format as string) as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**  
Get a thumbnail associated with an object.  
**Notes:**  
This is the recommended way to get the thumbnail of an object.

Use the constants for the format: kICAThumbnailFormatJPEG, kICAThumbnailFormatTIFF or kICAThumbnailFormatPNG  
LastError is set.

89.27.8 DownloadFile(dir as folderitem, flags as Integer, MacType as string, MacCreator as string, angle as Double) as folderitem

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**  
Downloads a file to disk.  
**Notes:**  
This API is a convenient way to download a file to disk. To receive the image data in memory use CopyObjectData.

Constants for flags:
kDeleteAfterDownload = 1 Delete file after a successful download.
kCreateCustomIcon = 2 Create a custom icon for Finder.
kAddMetaDataToFinderComment = 4 Add basic metadata to finder comment field.
kAdjustCreationDate = 8 Set creation date of the downloaded file same as the creation date for the file as reported by the device.
kSetFileTypeAndCreator = &h10 Set 4-char file type and creator code.
kEmbedColorSyncProfile = &h20 Embed ColorSync profile to the image if one was not already embedded.
kRotateImage = &h40 Rotate the image.
kDontEmbedColorSyncProfile = &h80 Do not embed ColorSync profile to the image.

LastError is set.

89.27.9  ImportImage(flags as Integer) as string()

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This method displays a Common User Interface panel similar to the user interface of Image Capture Application.

Notes:
Use this method to allow the user to work a camera or a scanner. The ImageCaptureObjectMBS object you use for this call, should point to a camera or scanner device.

filetypes: Optional an array of file extension strings such as "jpg", "tif", etc., that are of interest to the calling application. If no array is provided, all files are displayed.

Flag values that can be used in ImportImage:

kICAAllowMultipleImages = 1 Use this constant to allow users to select multiple images in the Import Image dialog.
kICADownloadAndReturnPathArray = 2 Use this constant to download the images to a temporary location and return an array of paths to the downloaded images.

Returns an array of Strings for the imported images if the kICADownloadAndReturnPathArray flag is not specified. Otherwise returns an array of Strings holding the paths of the images that are downloaded.

- 89.27.9 ImportImage(flags as Integer) as string()

89.27.11 kICABonjourServiceNameKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the keys in the dictionaries.

89.27.12 kICABonjourServiceTypeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the keys in the dictionaries.

89.27.13 kICABonjourTXTRecordKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the keys in the dictionaries.
89.27.14  kICACreationDateStringKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the keys in the dictionaries.

89.27.15  kICADataPropertyKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the keys in the dictionaries.

89.27.16  kICADataSizeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the keys in the dictionaries.

89.27.17  kICADataTypeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the keys in the dictionaries.

89.27.18  kICADeviceCapabilitiesKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the keys in the dictionaries.

89.27.19  kICADevicePropArtist as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.20  kICADevicePropBatteryLevel as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.
89.27.21  kICADevicePropBurstInterval as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.22  kICADevicePropBurstNumber as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.23  kICADevicePropCaptureDelay as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.24  kICADevicePropCompressionSetting as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.25  kICADevicePropContrast as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.26  kICADevicePropCopyrightInfo as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.27  kICADevicePropDateTime as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.
89.27.28 kICADevicePropDigitalZoom as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the device properties.

89.27.29 kICADevicePropEffectMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the device properties.

89.27.30 kICADevicePropExposureBiasCompensation as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the device properties.

89.27.31 kICADevicePropExposureIndex as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the device properties.

89.27.32 kICADevicePropExposureMeteringMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the device properties.

89.27.33 kICADevicePropExposureProgramMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the device properties.

89.27.34 kICADevicePropExposureTime as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the device properties.
89.27.35  kICADevicePropFlashMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: One of the constants for the device properties.

89.27.36  kICADevicePropFNumber as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: One of the constants for the device properties.

89.27.37  kICADevicePropFocalLength as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: One of the constants for the device properties.

89.27.38  kICADevicePropFocusDistance as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: One of the constants for the device properties.

89.27.39  kICADevicePropFocusMeteringMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: One of the constants for the device properties.

89.27.40  kICADevicePropFocusMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: One of the constants for the device properties.

89.27.41  kICADevicePropFunctionalMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: One of the constants for the device properties.
89.27.42  kICADevicePropImageSize as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.43  kICADevicePropRGBGain as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.44  kICADevicePropSharpness as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.45  kICADevicePropStillCaptureMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.46  kICADevicePropTimelapseInterval as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.47  kICADevicePropTimelapseNumber as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.

89.27.48  kICADevicePropUndefined as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the device properties.
89.27.49  kICADevicePropUploadURL as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the device properties.

89.27.50  kICADevicePropWhiteBalance as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the device properties.

89.27.51  kICADevicesArrayKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the keys in the dictionaries.

Example:

```vba
dim m as new ImageCaptureMBS
dim list as ImageCaptureObjectMBS = m.DeviceList
if List<>Nil then
    // look into properties
    dim dic as Dictionary = list.PropertyDictionary

    // take the devices array there
    if dic<>Nil and dic.HasKey(ImageCaptureObjectMBS.kICADevicesArrayKey) then
        dim a(-1) as Variant = dic.Value(ImageCaptureObjectMBS.kICADevicesArrayKey)

        // display device name
        for each properties as Dictionary in a
            MsgBox Properties.Value("ifil")
        next
    end if
end if
```

89.27.52  kICADeviceSharedKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: One of the constants for the keys in the dictionaries.
**89.27. **CLASS IMAGECAPTUREOBJECTMBS

**89.27.53  kICADeviceTypeCamera as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the device type constants.

**89.27.54  kICADeviceTypeKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the keys in the dictionaries.

**89.27.55  kICADeviceTypeScanner as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the device type constants.

**89.27.56  kICADeviceUsedKey as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for the keys in the dictionaries.

**Notes:**

Lasterror is set.
For a scanner device use the ScannerOpenSession method.

---

**89.27.74 PropertyDictionary as dictionary**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Get a dictionary containing all the properties for an object specified.

**Example:**

```vba
dim m as new ImageCaptureMBS
dim list as ImageCaptureObjectMBS = m.DeviceList

if List<>Nil then
    // look into properties
    dim dic as Dictionary = list.PropertyDictionary

    // take the devices array there
    if dic<>Nil and dic.HasKey(ImageCaptureObjectMBS.kICADevicesArrayKey) then
        dim a(-1) as Variant = dic.Value(ImageCaptureObjectMBS.kICADevicesArrayKey)

        // display device name
        for each properties as Dictionary in a
            MsgBox properties.Value("ifil")
        next

    end if
end if
```

**Notes:** Lasterror is set.

---

**89.27.75 PropertyDictionaryText as string**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Get a dictionary containing all the properties for an object specified.

**Example:**

```vba
dim m as new ImageCaptureMBS
dim list as ImageCaptureObjectMBS = m.DeviceList
```
if List<>Nil then
MsgBox List.PropertyDictionaryText
end if

Notes:
Lasterror is set.
This is for debugging and may be removed soon.
The format of the text is the plist file format.

89.27.76  ScannerCloseSession

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:**
Closes a session on a scanner device.
**Notes:**
Lasterror is set.
For a camera device use the CloseSession method.

89.27.77  ScannerGetParameters as dictionary

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:**
Query scanner parameters.
**Notes:**
Use this method to get information about the scanner such as resolution, scanning area, etc.
Lasterror is set.

89.27.78  ScannerInitialize

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:**
Initializes a scanner device.
**Notes:** Lasterror is set.

89.27.79  ScannerOpenSession(device as ImageCaptureObjectMBS)

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:**
Opens a session on a scanner device.
Notes:
Lasterror is set.
For a camera device use the OpenSession method.

89.27.80  ScannerSetParameters(dic as dictionary)

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Configures a scanner.

Notes:
Use this method to specify scan parameters that will be used when a scan is initiated via ScannerStart.
Lasterror is set.

89.27.81  ScannerStart

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Starts scanning.

Notes:
Use this method to start a scan based on the parameters that were specified in a previous ScannerSetParameters call.
Lasterror is set.

89.27.82  ScannerStatus as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the scanner status.

Notes: Lasterror is set.

89.27.83  SendMessageMemory(messageType as string, startByte as UInt32, data as memoryblock, dataType as string) as UInt32

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sends a message to a device object.

Notes:
Use this API to send a message to a device object. All devices do not respond to all the messages defined above.
messageType: A message type. e.g., kICAMessageCameraCaptureNewImage.
startByte: Offset in dataPtr from where data access for read/write should occur.
data: The data to send.
dataType: Data type.

LastError is set.
Returns the result from this message.

**89.27.84 SendMessageString**(messageType as string, startByte as UInt32, data as string, dataType as string) as UInt32

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sends a message to a device object.

**Notes:**
Use this API to send a message to a device object. All devices do not respond to all the messages defined above.

messageType: A message type. e.g., kICAMessageCameraCaptureNewImage.
startByte: Offset in dataPtr from where data access for read/write should occur.
data: The data to send.
dataType: Data type.

LastError is set.
Returns the result from this message.

**89.27.85 UploadFile**(file as folderitem, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Uploads a file to a device that supports this capability.

**Notes:**
The device chooses an appropriate destination location for the uploaded image and sends a kICANotificationTypeObjectAdded notification.

LastError is set.

Flag values that can be used in UploadFile:

- kICAUploadFileAsIs Use this constant to upload a file as is.
- kICAUploadFileScaleToFit Use this constant to upload a file after scaling to fit a specified bounding rect.
89.27.86 Properties

89.27.87 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The internal object handle. 
**Notes:** (Read and Write property)

89.27.88 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The error code from the last function used. 
**Notes:**

Value is 0 if the function was successfull, -1 if the function is not available, one of the following values or a Mac OS error code:

Possible values:

- kICACommunicationErr = -9900
- kICADeviceNotFoundErr = -9901
- kICADeviceNotOpenErr = -9902
- kICAFileCorruptedErr = -9903
- kICAIOPendingErr = -9904
- kICAInvalidObjectErr = -9905
- kICAInvalidPropertyErr = -9906
- kICAIndexOutOfRangeErr = -9907
- kICAPropertyTypeNotFoundErr = -9908
- kICACannotYieldDevice = -9909
- kICADataTypeNotFoundErr = -9910
- kICADeviceMemoryAllocationErr = -9911
- kICADeviceInternalErr = -9912
- kICADeviceInvalidParamErr = -9913
- kICADeviceAlreadyOpenErr = -9914
- kICADeviceLocationIDNotFoundErr = -9915
- kICADeviceGUIDNotFoundErr = -9916
- kICADeviceIOServicePathNotFoundErr = -9917
- kICADeviceUnsupportedErr = -9918
- kICAFrameworkInternalErr = -9919
- kICAExtensionInternalErr = -9920
- kICAInvalidSessionErr = -9921

(Read and Write property)
89.27.89  **ScannerSessionHandle as Integer**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The internal handle for a scanner session.  
**Notes:**  
Last error is set.  
(Read and Write property)

89.27.90  **SessionHandle as Integer**

MBS MacOSX Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The handle for the session.  
**Notes:** (Read and Write property)

89.27.91  **Constants**

89.27.92  **kAddMetaDataToFinderComment = 4**

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants for DownloadFile.  
**Notes:** Add basic metadata to finder comment field.

89.27.93  **kAdjustCreationDate = 8**

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants for DownloadFile.  
**Notes:** Set creation date of the downloaded file same as the creation date for the file as reported by the device.

89.27.94  **kCreateCustomIcon = 2**

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants for DownloadFile.  
**Notes:** Create a custom icon for Finder.

89.27.95  **kDeleteAfterDownload = 1**

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants for DownloadFile.  
**Notes:** Delete file after a successful download.
**89.27.96**  
\texttt{kDontEmbedColorSyncProfile = & h80}

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants for DownloadFile.  
**Notes:** Do not embed ColorSync profile to the image.

---

**89.27.97**  
\texttt{kEmbedColorSyncProfile = & h20}

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants for DownloadFile.  
**Notes:** Embed ColorSync profile to the image if one was not already embedded.

---

**89.27.98**  
\texttt{kICAAccessReadOnly = 1}

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant values for kICAPropertyCameraAccessCapability.  
**Notes:** Read-only without object deletion.

---

**89.27.99**  
\texttt{kICAAccessReadOnlyWithObjectDeletion = 2}

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant values for kICAPropertyCameraAccessCapability.  
**Notes:** Read-only with object deletion.

---

**89.27.100**  
\texttt{kICAAccessReadWrite = 0}

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant values for kICAPropertyCameraAccessCapability.  
**Notes:** Read-write.

---

**89.27.101**  
\texttt{kICAAllowMultipleImages = 1}

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants for ImportImage.  
**Notes:** Use this constant to allow users to select multiple images in the Import Image dialog.  
Seems like Image Capture in Mac OS X 10.6 ignores this flag and allows multiple images always.
89.27. Class ImageCaptureObjectMBS

89.27.102 kICAButtonCopy = "copy"
MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constants for scanner buttons. **Notes:** Copy button.

89.27.103 kICAButtonEMail = "mail"
MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constants for scanner buttons. **Notes:** Email button.

89.27.104 kICAButtonScan = "scan"
MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constants for scanner buttons. **Notes:** Scan button.
89.27.105  kICAButtonWeb = "web "

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constants for scanner buttons.  
**Notes:** Web button.

89.27.106  kICACameraPassThruNotUsed = 2

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants associated with Image Capture PassThru commands.  
**Notes:** Use this constant when using a pass-through command that doesn’t involve sending or receiving data.

89.27.107  kICACameraPassThruReceive = 1

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants associated with Image Capture PassThru commands.  
**Notes:** Use this constant when receiving data from a device using a pass-through command.

89.27.108  kICACameraPassThruSend = 0

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants associated with Image Capture PassThru commands.  
**Notes:** Use this constant when sending data to a device using a pass-through command.

89.27.109  kICACannotYieldDevice = -9909

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants.  
**Notes:** The device module cannot yield the specified device to the requestor.

89.27.110  kICACapabilityCanCameraCaptureNewImage = ”ccni”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the Camera capabilities constants.  
**Notes:** Can capture a new image using the camera.
89.27. CLASS IMAGECAPTUREOBJECTMBS

89.27.111 kICACapabilityCanCameraDeleteAll = ”dela”
MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the Camera capabilities constants. **Notes:** Can delete all images stored in the camera.

89.27.112 kICACapabilityCanCameraDeleteOne = ”del1”
MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the Camera capabilities constants. **Notes:** Can delete one image stored in the camera.

89.27.113 kICACapabilityCanCameraSyncClock = ”sclk”
MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the Camera capabilities constants. **Notes:** Can synchronize camera’s clock with the computer’s clock.

89.27.114 kICACapabilityCanCameraUploadData = ”load”
MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the Camera capabilities constants. **Notes:** Can upload data to the camera.

89.27.115 kICACapabilityMayStoreNewImagesInTempStore = ”temp”
MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the Camera capabilities constants.

89.27.116 kICACommunicationErr = -9900
MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants. **Notes:** An error occurred in communication between different components of Image Capture framework.

89.27.117 kICADataTypeNotFoundErr = -9910
MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants. **Notes:** Data with the specified data type is not found.
89.27.118 kICADevice = "icdv"

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the object types and subtypes constants. **Notes:** Object is a device supported by Image Capture framework.

89.27.119 kICADeviceAlreadyOpenErr = -9914

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants. **Notes:** The specified device is already open.

89.27.120 kICADeviceCamera = "cmra"

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the object types and subtypes constants. **Notes:** Object is a camera.

89.27.121 kICADeviceGUIDNotFoundErr = -9916

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants. **Notes:** The specified FireWire GUID is not found.

89.27.122 kICADeviceInternalErr = -9912

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants. **Notes:** The device module encountered an unspecified error.

89.27.123 kICADeviceInvalidParamErr = -9913

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants. **Notes:** At least one of the parameters passed to the device module is invalid.

89.27.124 kICADeviceIOServicePathNotFoundErr = -9917

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants. **Notes:** The specified IOService path is not found.
89.27. Class ImageCaptureObjectMBS

89.27.125 kICADeviceLocationIDNotFoundErr = -9915

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants. **Notes:** The specified USB Location ID is not found.

89.27.126 kICADeviceMemoryAllocationErr = -9911

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants. **Notes:** The device module encountered a memory allocation error.

89.27.127 kICADeviceMFP = "mfp"

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the object types and subtypes constants. **Notes:** Object is a multi-function peripheral.

89.27.128 kICADeviceNotFoundErr = -9901

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants. **Notes:** The specified device is not found.

89.27.129 kICADeviceNotOpenErr = -9902

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants. **Notes:** The specified device is not open.

89.27.130 kICADeviceOther = "doth"

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the object types and subtypes constants. **Notes:** Object is a device supported by Image Capture framework, but of unknown subtype.

89.27.131 kICADevicePDA = "pda"

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the object types and subtypes constants. **Notes:** Object is a personal digital assistant.
89.27.132  kICADevicePhone = "phon"

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the object types and subtypes constants.  
**Notes:** Object is a camera phone.

89.27.133  kICADeviceScanner = "scan"

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the object types and subtypes constants.  
**Notes:** Object is a scanner.

89.27.134  kICADeviceUnsupportedErr = -9918

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants.  
**Notes:** Device not supported.

89.27.135  kICADirectory = "dire"

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the object types and subtypes constants.  
**Notes:** Object is a directory.

89.27.136  kICADownloadAndReturnPathArray = 2

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants for ImportImage.  
**Example:**

```vbnet
dim m as new ImageCaptureMBS
dim flags as Integer = ImageCaptureObjectMBS.kICAAllowMultipleImages + ImageCaptureObjectMBS.kICADownloadAndReturnPathArray

// do the import and allow all file types
dim files(-1) as string = m.ImportImage(flags)

for each path as string in files
  // open that picture file in preview
  dim f as FolderItem = GetFolderItem(path, FolderItem.PathTypeShell)
f.Launch
next
```
Notes: Use this constant to download the images to a temporary location and return an array of paths to the downloaded images.

89.27.137 kICAExtensionInternalErr = -9920

89.27.138 kICAFile = ”file”

MBS MacOSX Plugin, Plugin Version: 10.1. Function: One of the object types and subtypes constants. Notes: Object is a file.

89.27.139 kICAFileAudio = ”audio”

MBS MacOSX Plugin, Plugin Version: 10.1. Function: One of the object types and subtypes constants. Notes: Object is an audio file.

89.27.140 kICAFileCorruptedErr = -9903

89.27.141 kICAFileFirmware = ”firm”

MBS MacOSX Plugin, Plugin Version: 10.1. Function: One of the object types and subtypes constants. Notes: Object is a firmware file.

89.27.142 kICAFileImage = ”imag”

MBS MacOSX Plugin, Plugin Version: 10.1. Function: One of the object types and subtypes constants. Notes: Object is an image file.
89.27.143  kICAFileMovie = ”moov”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the object types and subtypes constants. **Notes:** Object is a movie file.

89.27.144  kICAFileOther = ”othe”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the object types and subtypes constants. **Notes:** Object is a generic file.

89.27.145  kICAFilesystemDCF = 3

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constants values for kICAPROPERTYCameraFilesystemType. **Notes:** DCF-conformant.

89.27.146  kICAFilesystemGenericFlat = 1

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constants values for kICAPROPERTYCameraFilesystemType. **Notes:** Generic flat.

89.27.147  kICAFilesystemGenericHierarchical = 2

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constants values for kICAPROPERTYCameraFilesystemType. **Notes:** Generic hierarchical.

89.27.148  kICAFilesystemUndefined = 0

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constants values for kICAPROPERTYCameraFilesystemType. **Notes:** Undefined.

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
89.27. CLASS IMAGECAPTUREOBJECTMBS

Notes: Battery level. Property data type: UInt8; Property desc forms: Enum/Range.

89.27.177 kICAPropertyCameraBurstInterval = ”5019”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Burst interval. Property data type: UInt16; Property desc forms: Enum/Range.

89.27.178 kICAPropertyCameraBurstNumber = ”5018”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Burst number. Property data type: UInt16; Property desc forms: Enum/Range.

89.27.179 kICAPropertyCameraCaptureDelay = ”5012”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Capture delay. Property data type: UInt32; Property desc forms: Enum/Range.

89.27.180 kICAPropertyCameraCompressionSetting = ”5004”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Compression setting. Property data type: UInt8; Property desc forms: Enum/Range.

89.27.181 kICAPropertyCameraContrast = ”5014”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Contrast. Property data type: UInt8; Property desc forms: Enum/Range.

89.27.182 kICAPropertyCameraCopyrightInfo = ”501F”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
CHAPTER 89. IMAGE CAPTURE

Notes: Copyright info. Property data type: string; Property desc forms: none.

89.27.183  kICAPropertyCameraDateTime = ”5011”
Notes: Date & time. Property data type: string; Property desc forms: none.

89.27.184  kICAPropertyCameraDigitalZoom = ”5016”
Notes: Digital zoom. Property data type: UInt8; Property desc forms: Enum/Range.

89.27.185  kICAPropertyCameraEffectMode = ”5017”
Notes: Effect mode. Property data type: UInt16; Property desc forms: Enum.

89.27.186  kICAPropertyCameraExposureBiasCompensation = ”5010”
Notes: Exposure bias compensation. Property data type: UInt16; Property desc forms: Enum/Range.

89.27.187  kICAPropertyCameraExposureIndex = ”500F”
Notes: Exposure index. Property data type: UInt16; Property desc forms: Enum/Range.

89.27.188  kICAPropertyCameraExposureMeteringMode = ”500B”
Notes: Exposure Metering mode. Property data type: UInt16; Property desc forms: Enum.

89.27.189  kICAPropertyCameraExposureProgramMode = ”500E”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Exposure program mode. Property data type: UInt16; Property desc forms: Enum.

89.27.190  kICAPropertyCameraExposureTime = ”500D”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Exposure time. Property data type: UInt32; Property desc forms: Enum/Range.

89.27.191  kICAPropertyCameraFilesystemType = ”fsys”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** File system type. Data type: UInt16.

89.27.192  kICAPropertyCameraFlashMode = ”500C”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Flash mode. Property data type: UInt16; Property desc forms: Enum.

89.27.193  kICAPropertyCameraFNumber = ”5007”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** F-number. Property data type: UInt8; Property desc forms: Enum/Range.

89.27.194  kICAPropertyCameraFocalLength = ”5008”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
Notes: Focal length. Property data type: UInt32; Property desc forms: Enum/Range.

89.27.195  kICAPropertyCameraFocusDistance = ”5009”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Focus distance. Property data type: UInt16; Property desc forms: Enum.

89.27.196  kICAPropertyCameraFocusMeteringMode = ”501C”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Focus metering mode. Property data type: UInt16; Property desc forms: Enum.

89.27.197  kICAPropertyCameraFocusMode = ”500A”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Focus mode. Property data type: UInt16; Property desc forms: Enum.

89.27.198  kICAPropertyCameraFreeSpaceInBytes = ”fres”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Free space available on storage in bytes. Data type: UInt64.

89.27.199  kICAPropertyCameraFreeSpaceInImages = ”frei”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Number of images that may still be captured in to this store based on the current image capture settings on the camera. Data type: UInt32.
89.27. **CLASS IMAGECAPTUREOBJECTMBS**

89.27.200  **kICAPropertyCameraFunctionalMode = ”5002”**

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Functional mode. Property data type: UInt16; Property desc forms: Enum.

89.27.201  **kICAPropertyCameraIcon = ”icon”**

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constants for camera specific constants.
**Notes:** Camera icon in ICAThumbnail format.

89.27.202  **kICAPropertyCameraImageSize = ”5003”**

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Image size. Property data type: CFString; Property desc forms: Enum/Range.

89.27.203  **kICAPropertyCameraMaxCapacity = ”maxc”**

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Total storage capacity in bytes. Data type: UInt64.

89.27.204  **kICAPropertyCameraRGBGain = ”5006”**

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** RGB gain. Property data type: string; Property desc forms: Enum/Range.

89.27.205  **kICAPropertyCameraSharpness = ”5015”**

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Sharpness. Property data type: UInt8; Property desc forms: Enum/Range.
89.27.206  kICAPropertyCameraStillCaptureMode = ”5013”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Still capture mode. Property data type: UInt16; Property desc forms: Enum.

89.27.207  kICAPropertyCameraStorageDescription = ”stod”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Storage description. Data type: string.

89.27.208  kICAPropertyCameraStorageType = ”stor”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Storage type. Data type: UInt16.

89.27.209  kICAPropertyCameraSupportedMessages = ”msgs”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constants for camera specific constants.
**Notes:** Messages supported/understood by the camera.

89.27.210  kICAPropertyCameraTimelapseInterval = ”501B”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Timelapse interval. Property data type: UInt32; Property desc forms: Enum/Range.

89.27.211  kICAPropertyCameraTimelapseNumber = ”501A”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Timelapse number. Property data type: UInt16; Property desc forms: Enum/Range.
89.27.212  kICAPropertyCameraUploadURL = ”501D”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Upload URL. Property data type: string; Property desc forms: none.

89.27.213  kICAPropertyCameraVolumeLabel = ”voll”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** Volume label. Data type: string.

89.27.214  kICAPropertyCameraWhiteBalance = ”5005”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant for Standard camera properties.
**Notes:** White balance. Property data type: UInt16; Property desc forms: Enum.

89.27.215  kICAPropertyColorSpace = ”A001”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the keys for the properties dictionary.
**Notes:** Color space used to represent an image.

89.27.216  kICAPropertyColorSyncProfile = ”prof”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the keys for the properties dictionary.
**Notes:** ColorSync profile associated with an image.

89.27.217  kICAPropertyImageAperture = ”9202”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the keys for the properties dictionary.
**Notes:** Aperture used to capture an image.
89.27.218  kICAPropertyImageBitDepth = "0102"

89.27.219  kICAPropertyImageData = "idat"
MBS MacOSX Plugin, Plugin Version: 10.1. Function: One of the keys for the properties dictionary. Notes: Data of an image.

89.27.220  kICAPropertyImageDateDigitized = "9004"
MBS MacOSX Plugin, Plugin Version: 10.1. Function: One of the keys for the properties dictionary. Notes: Digitized date & time of an object; value associated with this property is a null-terminated string conforming to format "YYYY:MM:DD hh:mm:ss".

89.27.221  kICAPropertyImageDateOriginal = "9003"
MBS MacOSX Plugin, Plugin Version: 10.1. Function: One of the keys for the properties dictionary. Notes: Original date & time of an object; value associated with this property is a null-terminated string conforming to format "YYYY:MM:DD hh:mm:ss".

89.27.222  kICAPropertyImageDPI = "011A"
MBS MacOSX Plugin, Plugin Version: 10.1. Function: One of the keys for the properties dictionary. Notes: Image DPI.

89.27.223  kICAPropertyImageExposureTime = "829A"

89.27.224  kICAPropertyImageFilename = "ifil"
89.27.225  kICAPropertyImageFlash = ”9209”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the keys for the properties dictionary. **Notes:** Indicates whether flash was used to capture an image.

89.27.226  kICAPropertyImageFNumber = ”829D”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the keys for the properties dictionary. **Notes:** Image f-Number.

89.27.227  kICAPropertyImageHeight = ”0101”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the keys for the properties dictionary. **Notes:** Image height.

89.27.228  kICAPropertyImageShutterSpeed = ”9201”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the keys for the properties dictionary. **Notes:** Shutter speed used to capture an image.

89.27.229  kICAPropertyImageSize = ”isiz”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the keys for the properties dictionary. **Notes:** Size of an image in bytes.

89.27.230  kICAPropertyImageThumbnail = ”thum”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the keys for the properties dictionary. **Notes:** Thumbnail of an image.
89.27.231  kICAPropertyImageWidth = ”0100”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the keys for the properties dictionary. **Notes:** Image width.

89.27.232  kICAPropertyTypeNotFoundErr = -9908

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the image capture specific error constants. **Notes:** A property with the specified property type is not found.

89.27.233  kICAStorageFixedRAM = 3

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant values for kICAPropertyCameraStorageType. **Notes:** Fixed RAM.

89.27.234  kICAStorageFixedROM = 1

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant values for kICAPropertyCameraStorageType. **Notes:** Fixed ROM.

89.27.235  kICAStorageRemovableRAM = 4

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant values for kICAPropertyCameraStorageType. **Notes:** Removable RAM.

89.27.236  kICAStorageRemovableROM = 2

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant values for kICAPropertyCameraStorageType. **Notes:** Removable ROM.
89.27.237  kICAStorageUndefined = 0

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the constant values for kICAPROPERTYCameraStorageType.
**Notes:** Undefined.

89.27.238  kICAThumbnailFormatJPEG = ”jpeg”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the thumbnail format constants.
**Notes:** Use this constant to receive a thumbnail in JPEG format.

89.27.239  kICAThumbnailFormatPNG = ”png ”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the thumbnail format constants.
**Notes:** Use this constant to receive a thumbnail in PNG format.

89.27.240  kICAThumbnailFormatTIFF = ”tiff”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the thumbnail format constants.
**Notes:** Use this constant to receive a thumbnail in TIFF format.

89.27.241  kICATypeBoolean = ”bool”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the data type constants.
**Notes:** Boolean

89.27.242  kICATypeData = ”data”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the data type constants.

89.27.243  kICATypeFixed = ”sing”

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the data type constants.
**Notes:** IEEE 32-bit floating point.
89.27.244  kICATypeFloat = "float"

89.27.245  kICATypeSInt16 = "si16"

89.27.246  kICATypeSInt32 = "si32"

89.27.247  kICATypeSInt64 = "si64"

MBS MacOSX Plugin, Plugin Version: 10.1. Function: One of the data type constants. Notes: SInt64.

89.27.248  kICATypeString = "TEXT"

MBS MacOSX Plugin, Plugin Version: 10.1. Function: One of the data type constants. Notes: Char string.

89.27.249  kICATypeThumbnail = "thum"

89.27.250  kICATypeUInt16 = "ui16"

89.27. CLASS IMAGECAPTUREOBJECTMBS

89.27.251 kICATypeUInt32 = "ui32"

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the data type constants. 
**Notes:** UInt32.

89.27.252 kICATypeUInt64 = "ui64"

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the data type constants. 
**Notes:** UInt64.

89.27.253 kICATypeUInt8 = "ui08"

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the data type constants. 
**Notes:** UInt8.

89.27.254 kICAUploadFileAsIs = 0

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants for UploadFile. 
**Notes:** Use this constant to upload a file as is.

89.27.255 kICAUploadFileScaleToFit = 1

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants for UploadFile. 
**Notes:** Use this constant to upload a file after scaling to fit a specified bounding rect.

89.27.256 kRotateImage = & h40

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants for DownloadFile. 
**Notes:** Rotate the image.

89.27.257 kSetFileTypeAndCreator = & h10

MBS MacOSX Plugin, Plugin Version: 10.1. **Function:** One of the flag constants for DownloadFile. 
**Notes:** Set 4-char file type and creator code.
89.28 class WIADataCallbackMBS

89.28.1 class WIADataCallbackMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Provides an application callback mechanism during data transfers from Windows Image Acquisition (WIA) hardware devices to applications.

89.28.2 Properties

89.28.3 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The internal reference to the object.
**Notes:** (Read and Write property)

89.28.4 Events

89.28.5 BandedDataCallback(message as Integer, Status as Integer, PercentComplete as Integer, Offset as Integer, Length as Integer, Buffer as memoryblock) as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Provides data transfer status notifications.
**Notes:**
Windows Image Acquisition (WIA) data transfer methods of the WiaDataTransfer interface periodically call this method.

Message: Specifies a constant that indicates the reason for the callback. Can be one of the kMessage* constants.
Status: Specifies a constant that indicates the status of the WIA device. Can be set to a combination of the kStatus* constants.
PercentComplete: Specifies the percentage of the total data that has been transferred so far.
Offset: Specifies an offset, in bytes, from the beginning of the buffer where the current band of data begins.
Length: Specifies the length, in bytes, of the current band of data.
Buffer: The data buffer.

Lasterror is set.
Your application must provide the BandedDataCallback event. This event is periodically invoked by the data transfer methods of the WiaDataTransferMBS interface. It provides status messages to the application during the data transfer. By returning false, your program can also use this method to prematurely terminate the data transfer.

When this method is invoked, the Message parameter will contain the reason for the call. Not all parameters will contain data on all calls. For example, when BandedDataCallback is invoked with a message of kMessageTermination, it should not attempt to use the values in the Buffer, Offset, and Length parameters.

If the value of Message is kMessageData, the buffer contains a band of image data. The Offset parameter contains an offset in bytes from the beginning of the buffer where the current band of data begins. The Length parameter specifies the length in bytes of the current band of data.

During calls where Message is set to kMessageData or kMessageStatus, the Status parameter contains a valid value. Its contents should not be used when Message contains other values.

If Message is kMessageDataHeader, the Buffer parameter points to a WIA_DATA_CALLBACK_HEADER structure.

When an error has occurred during an image data transfer, the driver sets Message to IT_MSG_DEVICE_STATUS. The proxy callback object calls ReportStatus, which handles the error and displays messages to the user.

### 89.28.6 Constants

#### 89.28.7 kMessageData = 2

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for the message parameter in the BandedDataCallback callback.

**Notes:** The WIA system is transferring data to the application.

#### 89.28.8 kMessageDataHeader = 1

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for the message parameter in the BandedDataCallback callback.

**Notes:** The application is receiving a header prior to receiving the actual data.
89.28.9  \textit{kMessageFilePreviewData} = 6

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the constants for the message parameter in the BandedDataCallback callback.  
\textbf{Notes}: The WIA system is transferring preview data to the application.

89.28.10  \textit{kMessageFilePreviewDataHeader} = 7

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the constants for the message parameter in the BandedDataCallback callback.  
\textbf{Notes}: The application is receiving a header prior to receiving the actual preview data.

89.28.11  \textit{kMessageNewPage} = 5

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the constants for the message parameter in the BandedDataCallback callback.  
\textbf{Notes}: The data transfer is beginning a new page.

89.28.12  \textit{kMessageStatus} = 3

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the constants for the message parameter in the BandedDataCallback callback.  
\textbf{Notes}: This invocation of the callback is sending only status information.

89.28.13  \textit{kMessageTermination} = 4

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the constants for the message parameter in the BandedDataCallback callback.  
\textbf{Notes}: The data transfer is complete.

89.28.14  \textit{kStatusProcessingData} = 2

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the constants for the status parameter in the BandedDataCallback callback.  
\textbf{Notes}: Data is currently being processed.
89.28.15  $k_{\text{StatusTransferFromDevice}} = 1$

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for the status parameter in the BandedDataCallback callback.  
**Notes:** Data is currently being transferred from the WIA device.

89.28.16  $k_{\text{StatusTransferToClient}} = 4$

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for the status parameter in the BandedDataCallback callback.  
**Notes:** Data is currently being transferred to the client’s data buffer.
89.29 class WIADDataTransferInfoMBS

89.29.1 class WIADDataTransferInfoMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The WIADDataTransferInfoMBS class is used by applications to describe the buffer used to retrieve bands of data from Windows Image Acquisition (WIA) devices. **Notes:** It is primarily used in conjunction with the methods of the IWiaDataTransfer interface.

89.29.2 Properties

89.29.3 BufferSize as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The size in bytes of the buffer that is used for the data transfer. **Notes:** (Read and Write property)

89.29.4 DoubleBuffer as Boolean

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Contains true if the device is double buffered, false if the device is not double buffered. **Notes:** (Read and Write property)

89.29.5 Section as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies an optional handle to a shared section of memory allocated by the application. If this member is set to nil, GetBandedData allocates the shared memory itself. **Notes:** (Read and Write property)

89.29.6 Size as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Contains the size of this structure. **Notes:** (Read and Write property)
89.30 class WIADataTransferMBS

89.30.1 class WIADataTransferMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The WIADataTransferMBS interface is a high performance data transfer interface.

**Notes:**
This interface supports a shared memory window to transfer data from the device object to the application, and eliminates unnecessary data copies during marshalling. A callback mechanism is provided in the form of the WiaDataCallbackMBS interface. It enables applications to obtain data transfer status notification, transfer data from the Windows Image Acquisition (WIA) device to the application, and cancel pending data transfers.

For Windows Vista applications, use IWiaTransfer instead of IWiaDataTransfer.

89.30.2 Methods

89.30.3 EnumerateFormatInfo as WIAFormatInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns an enumerator for the format information.

**Notes:** Lasterror is set.

89.30.4 GetBandedData(DataTransInfo as WIADataTransferInfoMBS, DataCallback as WIADataCallbackMBS)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetBandedData method transfers a band of data from a hardware device to an application.

**Notes:**
For efficiency, applications retrieve data from Windows Image Acquisition (WIA) hardware devices in successive bands.
Lasterror is set.

89.30.5 GetDataFile(DataCallback as WIADataCallbackMBS) as folderitem

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetData method retrieves complete files from a Windows Image Acquisition (WIA) device.

**Notes:**
CHAPTER 89. IMAGE CAPTURE

Lasterror is set.
Returns the folderitem for the new file. Copy or load the file as this temporary file is deleted as soon as the object is destroyed.

89.30.6 GetDataPath(DataCallback as WIADataCallbackMBS) as string

Returns the folderitem for the new file. Copy or load the file as this temporary file is deleted as soon as the object is destroyed.

89.30.7 GetExtendedTransferInfo as WIAExtendedTransferInfoMBS

Lasterror is set.

89.30.8 QueryGetData as WIAFormatInfoMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The QueryGetData method is used by applications to query a Windows Image Acquisition (WIA) device to determine what types of data formats it supports. Notes: Lasterror is set.

89.30.9 Properties

89.30.10 Handle as Integer

89.30. CLASS WIADATATRANSFERMBS

Notes: (Read and Write property)

89.30.11 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.
**Notes:** (Read and Write property)
89.31 class WIADeviceCapabilitiesEnumeratorMBS

89.31.1 class WIADeviceCapabilitiesEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The WIADeviceCapabilitiesEnumeratorMBS class enumerates the currently available Windows Image Acquisition (WIA) hardware device capabilities.
Notes: Device capabilities include commands and events that the device supports.

89.31.2 Methods

89.31.3 Clone as WIADeviceCapabilitiesEnumeratorMBS

Notes: Lasterror is set.

89.31.4 Count as Integer

Notes: Lasterror is set.

89.31.5 NextItem as WIADeviceCapabilitiesMBS

Notes: Lasterror is set.

89.31.6 Reset

Notes: Lasterror is set.
**89.31.7 **Skip(celt as Integer)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Skips the given number of entries in the enumeration.
**Notes:** Lasterror is set.

**89.31.8 **Properties

**89.31.9 **Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The internal reference to the object.
**Notes:** (Read and Write property)

**89.31.10 **Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.
**Notes:** (Read and Write property)
89.32 class WIADeviceCapabilitiesMBS

89.32.1 class WIADeviceCapabilitiesMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class for device capabilities.

89.32.2 Properties

89.32.3 Commandline as String

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies a string that represents command line arguments. **Notes:** (Read and Write property)

89.32.4 Description as String

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies a string that contains a description of the capability that is displayed to the user. **Notes:** (Read and Write property)

89.32.5 Flags as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Flags for this capability **Notes:** (Read and Write property)

89.32.6 GUID as String

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies a GUID that identifies the device capability. **Notes:** This member can be set to any of the values specified in WIAItemMBS constants for Device Commands (kCommand*) or WIA Event Identifiers (kEvent*). (Read and Write property)
89.32. CLASS WIADEVICECAPABILITIESMBS

89.32.7 Icon as String

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies a string that represents the location and resource ID of the icon that represents this capability or handler.

**Notes:**

The string must be of the following form: drive:\path\module,n, where n is the icon’s negated resource ID (that is, if the resource ID of the icon is 100, then n is -100).
(Read and Write property)

89.32.8 Name as String

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies a string that contains a short version of the capability name.

**Notes:** (Read and Write property)
89.33 class WIADeviceInfoEnumeratorMBS

89.33.1 class WIADeviceInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The WIADeviceInfoEnumeratorMBS class enumerates the currently available Windows Image Acquisition (WIA) hardware devices and their properties. **Notes:** Device information properties describe the installation and configuration of WIA hardware devices.

89.33.2 Methods

89.33.3 Clone as WIADeviceInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a copy of the enumerator. **Notes:** Lasterror is set.

89.33.4 Count as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the number of items in the enumeration. **Notes:** Lasterror is set.

89.33.5 NextItem as WIAPropertyStorageMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the next item in the enumeration. **Notes:** Lasterror is set.

89.33.6 Reset

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Resets the enumeration. **Notes:** Lasterror is set.
89.33. **CLASS WIADEVICEINFOENUMERATORMBS**

89.33.7 **Skip(celt as Integer)**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Skips the given number of entries in the enumeration.
**Notes:** Lasterror is set.

89.33.8 **Properties**

89.33.9 **Handle as Integer**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The internal reference to the object.
**Notes:** (Read and Write property)

89.33.10 **Lasterror as Integer**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.
**Notes:** (Read and Write property)
89.34 class WIADeviceManager1MBS

89.34.1 class WIADeviceManager1MBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The WIADeviceManager1MBS interface is used to create and manage image acquisition devices and to register to receive device events. **Notes:** WIA 1.x is available on Windows 2000 and newer

89.34.2 Methods

89.34.3 Constructor

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new WIA 1.0 manager object. **Example:**

```vbs
Dim DeviceManager As New WIADeviceManager1MBS
If 0 = DeviceManager.Handle Then
    MsgBox "Failed to initialize device manager."
Else
    MsgBox "OK"
End If
```

89.34.4 CreateDevice(DeviceID as string) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a hierarchical tree of WIAItem objects for a Windows Image Acquisition device. **Notes:** DeviceID: Specifies the unique identifier of the WIA device. Lasterror is set. Applications use the CreateDevice method to create a device object for the WIA devices specified by the DeviceID parameter. Returns the WIAItemMBS object for the root item. Applications can use this tree of objects to control and retrieve data from the WIA device.
89.34.5 EnumDeviceInfo(flags as Integer = & h10) as WIADeviceInfoEnumer-
torMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Creates an enumerator of property information for each available Windows Image Acquisition device.

**Example:**

```vba
dim DeviceManager1 as new WIADeviceManager1MBS

// Enumerate all local devices
dim e as WIADeviceInfoEnumeratorMBS = DeviceManager1.EnumDeviceInfo(DeviceManager1.kEnumLocal)
if e<>Nil then

dim p as WIAPropertyStorageMBS = e.NextItem
while p<>Nil

// display the name of the device in a listbox
ListBox1.AddFolder p.Read(p.kDevicePropertyDevNameString)

p = e.NextItem
wend
end if
```

**Notes:**

Flags: Specifies the types of WIA devices to enumerate. Should be set to kEnumLocal. Lasterror is set.

89.34.6 GetImageDialog(parentWindow as window, DeviceType as Integer, Flags
as Integer, Intent as Integer, file as folderitem, rootitem as WIAItemMBS=nil)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The GetImageDialog method displays one or more dialog boxes that enable a user to acquire an image from
a Windows Image Acquisition (WIA) device and write the image to a specified file.

**Notes:**

Lasterror is set.

This method combines the functionality of SelectDeviceDialog to completely encapsulate image acquisition
within a single API call.

parentWindowHandle: Handle of the window that owns the Get Image dialog box.
DeviceType: Specifies which type of WIA device to use. Is set to kDeviceTypeDefault, kDeviceTypeScanner,
or kDeviceTypeDigitalCamera.

Flags: Specifies dialog box behavior. Can be set to the following constants: kSelectDeviceNoDefault, kDeviceDialogUseCommonUI and kDeviceDialogSingleImage.

Intent: Specifies what type of data the image is intended to represent. Use kIntent* constants.

rootitem: Returns the interface of the hierarchical tree of WiaItem objects returned by CreateDevice.

file: Specifies the name of the file to which the image data is written.

Invoking this method displays a dialog box that enables users to acquire images. It can also display the Select Device dialog box created by the SelectDeviceDlg method.

If the application passes nil for the value of the rootitem parameter, GetImageDlg displays the Select Device dialog box that lets the user select the WIA input device. If the application specifies a WIA input device by passing a pointer to the device’s item tree through the pItemRoot parameter, GetImageDlg does not display the Select Device dialog box. Instead, it will use the specified input device to acquire the image.

When using the Select Device dialog box, applications can specify types of WIA input devices. To do so, they must set the rootitem parameter to NULL and pass the appropriate constants through the DeviceType parameter. If more than one device of the specified type is present, the GetImageDlg displays the Select Device dialog box to let the user select which device will be used.

If GetImageDlg finds only one matching device, it will not display the Select Device dialog box. Instead, it will select the matching device. You can override this behavior and force GetImageDlg to display the Select Device dialog box by passing kSelectDeviceNoDefault as the value for the lFlags parameter.

It is recommended that applications make device and image selection available through a menu item named From scanner or camera on the File menu.

The dialog must have sufficient rights to the folder for file that it can save the file with a unique file name. The folder should also be protected with an access control list (ACL) because it contains user data.

89.34.8 SelectDeviceDialog(parentWindow as window, DeviceType as Integer, Flags as Integer) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Displays a dialog box that enables the user to select a hardware device for image acquisition.

**Example:**

```vbs
dim DeviceManager as new WIADeviceManager1MBS

if 0 = DeviceManager.Handle then
    MsgBox "Failed to initialize device manager."
else
    dim it as WIAItemMBS = DeviceManager.SelectDeviceDialog(window1, DeviceManager.kDeviceTypeDefault, DeviceManager.kSelectDeviceNoDefault)

    if it<>Nil then
        dim p as WIAPropertyStorageMBS = it.PropertyStorage
        dim name as string = p.Read(p.kItemPropertyItemNameString)
        MsgBox name
    end if
end if
```

**Notes:**

- **parentWindow:** Specifies the parent window of the Select Device dialog box.
- **DeviceType:** Specifies which type of WIA 2.0 device to use. See WIA Device Type Specifiers for a list of possible values.
- **Flags:** Specifies the behavior of the dialog box. The value can be one of the following constants: kSelectDeviceNoDefault
- **DeviceID:** Optional, On output, receives a string which contains the device’s identifier string. On input, pass the address of a pointer if this information is needed, or "" if it is not needed.

Returns the WIAItem which was selected.

Lasterror is set.

This method creates and displays the Select Device dialog box so the user can select a WIA device for image acquisition. If a device is successfully selected, the SelectDeviceDialog method creates a hierarchical tree of IWiaItem2 objects for the device. It returns the WiaItemMBS object of the root item.

The application can restrict the devices displayed to the user to particular types by specifying the device types through the DeviceType parameter. If only one device meets the specification, SelectDeviceDialog does not display the Select Device dialog box. Instead it returns the WiaItemMBS tree for the device. You can override this behavior and force SelectDeviceDialog to display the dialog box by specifying kSelectDeviceNoDefault as the value for the Flags parameter. If more than one WIA device matches the specification, all matching devices are displayed in the Select Device dialog box so the user may choose one.
It is recommended that applications make device and image selection available through a menu item named From scanner on the File menu.

89.34.12 SelectDeviceDialogID(parentWindow as window, DeviceType as Integer, Flags as Integer) as string

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Displays a dialog box that enables the user to select a hardware device for image acquisition. **Notes:**

Lasterror is set.

parentWindow: Specifies the parent window of the Select Device dialog box. DeviceType: Specifies which type of WIA device to use. See kDeviceType* constants. Flags: Specifies the behavior of the dialog box. You can pass the following constant: kSelectDeviceNoDefault

Returns the selected DeviceID.

This method creates and displays the Select Device dialog box so the user can select a WIA device for image acquisition. If a device is successfully selected, the SelectDeviceDialogID method returns its identifier string to the application.

The application can restrict the devices displayed to the user to particular types by specifying the device types through the DeviceType parameter. If only one device meets the specification, SelectDeviceDialogID does not display the Select Device dialog box. Instead it passes the device’s identifier string to the application without displaying the dialog box. You can override this behavior and force SelectDeviceDialogID to display the dialog box by passing kSelectDeviceNoDefault as the value for the IFlags parameter. If more than one WIA device matches the specification, all matching devices are displayed in the SelectDevice dialog box so the user may choose one.

Note It is recommended that applications make device and image selection available through a menu item named From scanner on the File menu. See also:

89.34.13 SelectDeviceDialogID(parentWindowHandle as Integer, DeviceType as Integer, Flags as Integer) as string

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Displays a dialog box that enables the user to select a hardware device for image acquisition. **Notes:**
parentWindow: Specifies the parent window of the Select Device dialog box.
DeviceType: Specifies which type of WIA device to use. See kDeviceType* constants.
Flags: Specifies the behavior of the dialog box. You can pass the following constant: kSelectDeviceNoDefault

Returns the selected DeviceID.

This method creates and displays the Select Device dialog box so the user can select a WIA device for image acquisition. If a device is successfully selected, the SelectDeviceDialogID method returns its identifier string to the application.

The application can restrict the devices displayed to the user to particular types by specifying the device types through the DeviceType parameter. If only one device meets the specification, SelectDeviceDialogID does not display the Select Device dialog box. Instead it passes the device's identifier string to the application without displaying the dialog box. You can override this behavior and force SelectDeviceDialogID to display the dialog box by passing kSelectDeviceNoDefault as the value for the Flags parameter. If more than one WIA device matches the specification, all matching devices are displayed in the SelectDevice dialog box so the user may choose one.

Note It is recommended that applications make device and image selection available through a menu item named From scanner on the File menu.

The internal reference to the object.
**Notes:**
The handle for WIA 1.x.
(Read and Write property)

**89.34.16 Lasterror as Integer**

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.
89.34.17 Constants

89.34.18 kDeviceDialogSingleImage = 2

Notes: Restrict image selection to a single image in the device image acquisition dialog box. Only for WIA 2.x.

89.34.19 kDeviceDialogUseCommonUI = 4

Notes: Use the system UI, if available, rather than the vendor-supplied UI. If the system UI is not available, the vendor UI is used. If neither UI is available, the function returns E_NOTIMPL.

89.34.20 kDeviceTypeDefault = 0

MBS Win Plugin, Plugin Version: 10.3. Function: One of the device type constants.

89.34.21 kDeviceTypeDigitalCamera = 2

MBS Win Plugin, Plugin Version: 10.3. Function: One of the device type constants.

89.34.22 kDeviceTypeScanner = 1

MBS Win Plugin, Plugin Version: 10.3. Function: One of the device type constants.

89.34.23 kDeviceTypeStreamingVideo = 3

MBS Win Plugin, Plugin Version: 10.3. Function: One of the device type constants.
89.34.24  kEnumAll = 15

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for EnumDeviceInfo flags parameter.
**Notes:** All devices are enumerated, both locally and remote, including inactive (disconnected) devices and legacy STI-only devices.

89.34.25  kEnumLocal = 16

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for EnumDeviceInfo flags parameter.
**Notes:** Only locally connected active scanner devices are enumerated.

89.34.26  kIntentBestPreview = & h40000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog.
**Notes:** Specifies the best quality preview.

89.34.27  kIntentImageTypeColor = 1

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog.
**Notes:** Preset properties for color content.

89.34.28  kIntentImageTypeGrayscale = 2

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog.
**Notes:** Preset properties for grayscale content.

89.34.29  kIntentImageTypeMask = & hF

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog.
**Notes:** Mask for all of the image type flags.
89.34.30  kIntentImageTypeText = 4

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog. **Notes:** Preset properties for text content.

89.34.31  kIntentMaximizeQuality = & h20000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog. **Notes:** Preset properties to maximize image quality.

89.34.32  kIntentMinimizeSize = & h10000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog. **Notes:** Preset properties to minimize image size.

89.34.33  kIntentNone = 0

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog. **Notes:** Default value. Do not preset any properties.

89.34.34  kIntentSizeMask = & hF0000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog. **Notes:** Mask for all of the size/quality flags.

89.34.35  kSelectDeviceNoDefault = 1

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for the GetImageDialog method. **Notes:**
Force this method to display the Select Device dialog box. Only for WIA 2.x.
89.35. class WIADeviceManager2MBS

89.35.1 class WIADeviceManager2MBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The WIADeviceManager2MBS interface is used to create and manage image acquisition devices and to register to receive device events. **Notes:** WIA 2.x is available on Windows Vista and newer.

89.35.2 Methods

89.35.3 Constructor

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new WIA 2.0 manager object. **Example:**

```vba
dim DeviceManager as new WIADeviceManager2MBS
if 0 = DeviceManager.Handle then
    MsgBox "Failed to initialize device manager."
else
    MsgBox "OK"
end if
```

89.35.4 CreateDevice(DeviceID as string) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a hierarchical tree of WiaItem objects for a Windows Image Acquisition device. **Notes:** DeviceID: Specifies the unique identifier of the WIA device.

Lasterror is set.

Applications use the CreateDevice method to create a device object for the WIA devices specified by the DeviceID parameter.

Returns the WIAItemMBS object for the root item. Applications can use this tree of objects to control and retrieve data from the WIA device.
89.35.5 EnumDeviceInfo(flags as Integer = &h10) as WIADeviceInfoEnumer-atorMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates an enumerator of property information for each available Windows Image Acquisition device. **Example:**

```vbs
dim DeviceManager2 as new WIADeviceManager2MBS

// Enumerate all local devices
dim e as WIADeviceInfoEnumeratorMBS = DeviceManager2.EnumDeviceInfo(DeviceManager2.kEnumLocal)
if e<>Nil then

dim p as WIAPropertyStorageMBS = e.NextItem
while p<>Nil
    // display the name of the device in a listbox
    ListBox1.AddFolder p.Read(p.kDevicePropertyDevNameString)
    p = e.NextItem
wend
endif
```

**Notes:**
Flags: Specifies the types of WIA devices to enumerate. Should be set to kEnumLocal or kEnumAll. Lasterror is set.

89.35.6 GetImageDialog(Flags as Integer, DeviceID as string, parentWindow as window, FolderName as String, Filename as String, byref item as WIAItemMBS) as string()

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The GetImageDialog method displays one or more dialog boxes that enable a user to acquire an image from a Windows Image Acquisition (WIA) 2.0 device and write the image to a specified file. This method extends the functionality of SelectDeviceDlg to encapsulate image acquisition within a single API call. **Notes:** Lasterror is set.

Flags: Specifies dialog box behavior. Can be set to the following values: kDeviceDialogUseCommonUI
DeviceID: Specifies the scanner to use.
parentWindowHandle: A handle of the window that owns the Get Image dialog box.
FolderName: Specifies the name of the folder to store the scanned files in.
Filename: Specifies the name of the file to write the image data to.
item: The variable to return the WiaItem that the images were scanned from.

Returns an array with paths to the files that have been scanned.

If the application passes an empty string for the value of the DeviceID parameter, GetImageDialog displays the Select Device dialog box so that the user can select the WIA 2.0 input device.

Use a menu item named From scanner on the File menu so that device and image selections are available in your application.

The dialog box must have sufficient rights to FolderName so that it can save the files with unique file names. Protect the folder with an access control list (ACL) because it contains user data.

See also:

- 89.35.7 GetImageDialog(Flags as Integer, DeviceID as string, parentWindowHandle as Integer, FolderName as String, Filename as String, byref item as WIAItemMBS) as string()
Use a menu item named From scanner on the File menu so that device and image selections are available in your application.

The dialog box must have sufficient rights to FolderName so that it can save the files with unique file names. Protect the folder with an access control list (ACL) because it contains user data.

See also:

- 89.35.6 GetImageDialog(Flags as Integer, DeviceID as string, parentWindow as window, FolderName as String, Filename as String, byref item as WIAItemMBS) as string()
- 89.35.8 SelectDeviceDialog(parentWindow as window, DeviceType as Integer, Flags as Integer) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Displays a dialog box that enables the user to select a hardware device for image acquisition.

**Example:**

```vba
dim DeviceManager as new WIADeviceManager2MBS

if 0 = DeviceManager.Handle then
    MsgBox "Failed to initialize device manager."
else
    dim it as WIAItemMBS = DeviceManager.SelectDeviceDialog(window1, DeviceManager.kDeviceTypeDefault, DeviceManager.kSelectDeviceNoDefault)

    if it<>Nil then
        dim p as WIAPropertyStorageMBS = it.PropertyStorage
        dim name as string = p.Read(p.kItemPropertyItemNameString)
        MsgBox name
    end if
end if
```

**Notes:**

parentWindow: Specifies the parent window of the Select Device dialog box.
DeviceType: Specifies which type of WIA 2.0 device to use. See WIA Device Type Specifiers for a list of possible values.
Flags: Specifies the behavior of the dialog box. The value can be one of the following constants: kSelectDeviceNoDefault
DeviceID: Optional, On output, receives a string which contains the device’s identifier string. On input, pass the address of a pointer if this information is needed, or "" if it is not needed.

Returns the WIAItem which was selected.
LastError is set.
This method creates and displays the Select Device dialog box so the user can select a WIA device for image acquisition. If a device is successfully selected, the SelectDeviceDialog method creates a hierarchical tree of IWiaItem2 objects for the device. It returns the WiaItemMBS object of the root item.

The application can restrict the devices displayed to the user to particular types by specifying the device types through the DeviceType parameter. If only one device meets the specification, SelectDeviceDialog does not display the Select Device dialog box. Instead it returns the WiaItemMBS tree for the device. You can override this behavior and force SelectDeviceDialog to display the dialog box by specifying kSelectDeviceNoDefault as the value for the Flags parameter. If more than one WIA device matches the specification, all matching devices are displayed in the Select Device dialog box so the user may choose one.

It is recommended that applications make device and image selection available through a menu item named From scanner on the File menu.

### 89.35.11 SelectDeviceDialog(parentWindowHandle as Integer, DeviceType as Integer, Flags as Integer, byref DeviceID as string) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Displays a dialog box that enables the user to select a hardware device for image acquisition. **Notes:**

- parentWindow: Specifies the parent window of the Select Device dialog box.
- DeviceType: Specifies which type of WIA 2.0 device to use. See WIA Device Type Specifiers for a list of possible values.
- Flags: Specifies the behavior of the dialog box. The value can be one of the following constants: kSelectDeviceNoDefault
- DeviceID: Optional, On output, receives a string which contains the device’s identifier string. On input, pass the address of a pointer if this information is needed, or ”” if it is not needed.

Returns the WIAItem which was selected.

Lasterror is set.

This method creates and displays the Select Device dialog box so the user can select a WIA device for image acquisition. If a device is successfully selected, the SelectDeviceDialog method creates a hierarchical tree of IWiaItem2 objects for the device. It returns the WiaItemMBS object of the root item.

The application can restrict the devices displayed to the user to particular types by specifying the device types through the DeviceType parameter. If only one device meets the specification, SelectDeviceDialog does not display the Select Device dialog box. Instead it returns the WiaItemMBS tree for the device. You can override this behavior and force SelectDeviceDialog to display the dialog box by specifying kSelectDeviceNoDefault as the value for the Flags parameter. If more than one WIA device matches the specification, all matching devices are displayed in the Select Device dialog box so the user may choose one.
CHAPTER 89. IMAGE CAPTURE

It is recommended that applications make device and image selection available through a menu item named From scanner on the File menu.

See also:

- 89.35.9 SelectDeviceDialog(parentWindow as window, DeviceType as Integer, Flags as Integer, byref DeviceID as string) as WIAItemMBS

- 89.35.10 SelectDeviceDialog(parentWindowHandle as Integer, DeviceType as Integer, Flags as Integer) as WIAItemMBS

89.35.12 SelectDeviceDialogID(parentWindow as window, DeviceType as Integer, Flags as Integer) as string

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Displays a dialog box that enables the user to select a hardware device for image acquisition.

**Notes:**

Lasterror is set.

parentWindow: Specifies the parent window of the Select Device dialog box.
DeviceType: Specifies which type of WIA device to use. See kDeviceType* constants.
Flags: Specifies the behavior of the dialog box. You can pass the following constant: kSelectDeviceNoDefault

Returns the selected DeviceID.

This method creates and displays the Select Device dialog box so the user can select a WIA device for image acquisition. If a device is successfully selected, the SelectDeviceDialogID method returns its identifier string to the application.

The application can restrict the devices displayed to the user to particular types by specifying the device types through the DeviceType parameter. If only one device meets the specification, SelectDeviceDialogID does not display the Select Device dialog box. Instead it passes the device's identifier string to the application without displaying the dialog box. You can override this behavior and force SelectDeviceDialogID to display the dialog box by passing kSelectDeviceNoDefault as the value for the lFlags parameter. If more than one WIA device matches the specification, all matching devices are displayed in the SelectDevice dialog box so the user may choose one.

Note It is recommended that applications make device and image selection available through a menu item named From scanner on the File menu.

89.35.13 SelectDeviceDialogID(parentWindowHandle as Integer, DeviceType as Integer, Flags as Integer) as string

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Displays a dialog box that enables the user to select a hardware device for image acquisition. **Notes:**
LastError is set.

- **parentWindow:** Specifies the parent window of the Select Device dialog box.
- **DeviceType:** Specifies which type of WIA device to use. See kDeviceType* constants.
- **Flags:** Specifies the behavior of the dialog box. You can pass the following constant: kSelectDeviceNoDefault

Returns the selected DeviceID.

This method creates and displays the Select Device dialog box so the user can select a WIA device for image acquisition. If a device is successfully selected, the SelectDeviceDialogID method returns its identifier string to the application.

The application can restrict the devices displayed to the user to particular types by specifying the device types through the DeviceType parameter. If only one device meets the specification, SelectDeviceDialogID does not display the Select Device dialog box. Instead it passes the device’s identifier string to the application without displaying the dialog box. You can override this behavior and force SelectDeviceDialogID to display the dialog box by passing kSelectDeviceNoDefault as the value for the IFlags parameter. If more than one WIA device matches the specification, all matching devices are displayed in the SelectDevice dialog box so the user may choose one.

Note It is recommended that applications make device and image selection available through a menu item named From scanner on the File menu.

89.35.14 Properties

89.35.15 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The internal reference to the object.
Notes:
The handle for WIA 2.x.
(Read and Write property)

89.35.16 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.
**Notes:** (Read and Write property)

89.35.17 Constants

89.35.18 kDeviceDialogSingleImage = 2

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for the GetImageDialog method.
**Notes:**
Restrict image selection to a single image in the device image acquisition dialog box.
Only for WIA 2.x.

89.35.19 kDeviceDialogUseCommonUI = 4

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for the GetImageDialog method.
**Notes:** Use the system UI, if available, rather than the vendor-supplied UI. If the system UI is not available, the vendor UI is used. If neither UI is available, the function returns E_NOTIMPL.

89.35.20 kDeviceTypeDefault = 0

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the device type constants.

89.35.21 kDeviceTypeDigitalCamera = 2

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the device type constants.
89.35.22  \texttt{kDeviceTypeScanner} = 1

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the device type constants.

89.35.23  \texttt{kDeviceTypeStreamingVideo} = 3

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the device type constants.

89.35.24  \texttt{kEnumAll} = 15

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the constants for \texttt{EnumDeviceInfo} flags parameter.
\textbf{Notes}: All devices are enumerated, both locally and remote, including inactive (disconnected) devices and legacy STI-only devices.

89.35.25  \texttt{kEnumLocal} = 16

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the constants for \texttt{EnumDeviceInfo} flags parameter.
\textbf{Notes}: Only locally connected active scanner devices are enumerated.

89.35.26  \texttt{kIntentBestPreview} = & h40000

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the intent constants for \texttt{GetImageDialog}.
\textbf{Notes}: Specifies the best quality preview.

89.35.27  \texttt{kIntentImageTypeColor} = 1

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the intent constants for \texttt{GetImageDialog}.
\textbf{Notes}: Preset properties for color content.

89.35.28  \texttt{kIntentImageTypeGrayscale} = 2

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function}: One of the intent constants for \texttt{GetImageDialog}.
\textbf{Notes}: Preset properties for grayscale content.
89.35.29  \texttt{kIntentImageTypeMask = \& \texttt{hF}}

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function:} One of the intent constants for GetImageDialog.  
\textbf{Notes:} Mask for all of the image type flags.

89.35.30  \texttt{kIntentImageTypeText} = 4

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function:} One of the intent constants for GetImageDialog.  
\textbf{Notes:} Preset properties for text content.

89.35.31  \texttt{kIntentMaximizeQuality = \& \texttt{h20000}}

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function:} One of the intent constants for GetImageDialog.  
\textbf{Notes:} Preset properties to maximize image quality.

89.35.32  \texttt{kIntentMinimizeSize = \& \texttt{h10000}}

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function:} One of the intent constants for GetImageDialog.  
\textbf{Notes:} Preset properties to minimize image size.

89.35.33  \texttt{kIntentNone} = 0

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function:} One of the intent constants for GetImageDialog.  
\textbf{Notes:} Default value. Do not preset any properties.

89.35.34  \texttt{kIntentSizeMask = \& \texttt{hF0000}}

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function:} One of the intent constants for GetImageDialog.  
\textbf{Notes:} Mask for all of the size/quality flags.

89.35.35  \texttt{kSelectDeviceNoDefault} = 1

MBS Win Plugin, Plugin Version: 10.3. \textbf{Function:} One of the constants for the GetImageDialog method.  
\textbf{Notes:} Force this method to display the Select Device dialog box.
89.36. **CLASS WIAEXTENDEDTRANSFERINFOMBS**

89.36  **class WIAExtendedTransferInfoMBS**

89.36.1  **class WIAExtendedTransferInfoMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The WIAExtendedTransferInfoMBS class specifies extended transfer information for the GetExtendedTransferInfo method. 
**Notes:** Requires Windows 2000 Professional, Windows XP or Windows Server 2003.

89.36.2  **Properties**

89.36.3  **MaxBufferSize as Integer**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Driver-recommended maximum buffer size the application could request in a call to GetBandedData. 
**Notes:** Going over this limit is not detrimental, however, the driver can simply not use the whole buffer and limit each band of data to this maximum size. (Read and Write property)

89.36.4  **MinBufferSize as Integer**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Minimum buffer size the application should request in a call to GetBandedData. 
**Notes:** (Read and Write property)

89.36.5  **NumBuffers as Integer**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This value is not used and should be ignored. 
**Notes:** (Read and Write property)

89.36.6  **OptimalBufferSize as Integer**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Driver-recommended buffer size the application should request in a call to GetBandedData. 
**Notes:** (Read and Write property)
89.36.7 Size as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Size of this structure.

**Notes:** (Read and Write property)
class WIAFormatInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Use the WIAFormatInfoEnumeratorMBS class to enumerate the format and media type information for a device.

**Methods**

**Clone as WIAFormatInfoEnumeratorMBS**

Clones this enumerator.

Notes: Lasterror is set.

**Count as Integer**

Returns the number of elements stored by this enumerator.

Notes: Lasterror is set.

**NextItem as WIAFormatInfoMBS**

Returns the next item in the enumeration.

**Reset**

Resets the enumerator.

Notes: Lasterror is set.

**Skip(celt as Integer)**

Skips the specified number of structures in the enumeration.
Notes: Lasterror is set.

### 89.37.8 Properties

### 89.37.9 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The internal reference to the object.
**Notes:** (Read and Write property)

### 89.37.10 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.
**Notes:** (Read and Write property)
89.38. CLASS WIAFORMATINFOMBS

89.38 class WIAFormatInfoMBS

89.38.1 class WIAFormatInfoMBS

89.38.2 Properties

89.38.3 FormatID as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** GUID that identifies the format. **Notes:** (Read and Write property)

89.38.4 Tymed as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The media type that corresponds to the guidFormatID member. **Notes:** (Read and Write property)
89.39 class WIAGUIDMBS

89.39.1 class WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a Windows unique ID.

**Example:**

```vbs
Dim w As WIAGUIDMBS = WIAPropertyStorageMBS.kImageFormatTIFF
MsgBox w.DisplayString
```

**Notes:** If you need to validate a GUID or UUID, please check the IsGUID function in our FAQ.

89.39.2 Methods

89.39.3 Constructor

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a GUID with only zeros.

**Example:**

```vbs
Dim g As New WIAGUIDMBS
MsgBox g.DisplayString
```

See also:

- 89.39.4 Constructor(value1 as Integer, value2 as Integer, value3 as Integer, value4 as Integer, value5 as Integer, value6 as Integer, value7 as Integer, value8 as Integer, value9 as Integer, value10 as Integer, value11 as Integer, value12 as Integer, value13 as Integer, value14 as Integer, value15 as Integer, value16 as Integer)

89.39.4 Constructor(value1 as Integer, value2 as Integer, value3 as Integer, value4 as Integer, value5 as Integer, value6 as Integer, value7 as Integer, value8 as Integer, value9 as Integer, value10 as Integer, value11 as Integer, value12 as Integer, value13 as Integer, value14 as Integer, value15 as Integer, value16 as Integer)

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new GUID with the given byte values.
89.39. **CLASS WIAGUIDMBS**

**Example:**

```vbscript
dim g as new WIAGUIDMBS(& h14, & h3e, & h4e, & h83, & h97, & h11, & hd2, & ha2, & h31, & h00, & hc0, & h4f, & ha3, & h18, & h09)

MsgBox g.DisplayString
```

See also:

- 89.39.3 Constructor

**89.39.5 DisplayString as string**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ID well formatted.  
**Example:**

```vbscript
dim w as WIAGUIDMBS = WIAPropertyStorageMBS.kImageFormatTIFF

MsgBox w.DisplayString
```

**89.39.6 Equal(other as WIAGUIDMBS) as boolean**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Checks whether two GUIDs are equal.  
**Example:**

```vbscript
dim w as WIAGUIDMBS = WIAPropertyStorageMBS.kImageFormatTIFF
dim v as WIAGUIDMBS = WIAPropertyStorageMBS.kImageFormatTIFF

if w.Equal(v) then
    MsgBox "Equal, right."
else
    MsgBox "not equal, a bug."
end if

v = WIAPropertyStorageMBS.kImageFormatBMP

if w.Equal(v) then
    MsgBox "Equal, a bug."
else
    MsgBox "not equal, right."
end if
```
Notes: Returns true if both items are equals.

89.39.7 Parse(GUID as String) as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Parses GUID string into a GUID object.

89.39.8 Properties

89.39.9 Byte(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Read or write the byte value.

**Example:**
```
dim g as new WIAGUIDMBS

g.Byte(1) = 65

MsgBox str(g.Byte(1)) // shows 65
```

Notes: (Read and Write computed property)

89.39.10 Data as string

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The UID as binary string.

**Example:**
```
dim w as WIAGUIDMBS = WIAPropertyStorageMBS.kImageFormatTIFF

MsgBox EncodeBase64(w.Data)
```

Notes: (Read and Write computed property)
89.40 class WIAItemEnumeratorMBS

89.40.1 class WIAItemEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The WIAItemEnumeratorMBS class is used by applications to enumerate WiaItemMBS objects in the tree’s current folder.

**Example:**

```vba
Sub EnumerateItems(root as WIAItemMBS)
    dim e as WIAItemEnumeratorMBS = Root.EnumerateChildItems
    if e<>Nil then
        dim it as WIAItemMBS = e.NextItem
        while it<>nil
            // do something with item
            it = e.NextItem
        wend
    end if
End Sub
```

**Notes:** The Windows Image Acquisition (WIA) run-time system represents every WIA hardware device to applications as a hierarchical tree of WiaItemMBS objects.

89.40.2 Methods

89.40.3 Clone as WIAItemEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Creates an additional instance of the WIAItemEnumeratorMBS object.

**Notes:** Lasterror is set.

89.40.4 Count as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Returns the number of elements stored by this enumerator.

**Notes:** Lasterror is set.
89.40.5  **NextItem as WIAItemMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the next item in the enumeration.  
**Example:**

```vba
Sub EnumerateItems(root as WIAItemMBS)
    dim e as WIAItemEnumeratorMBS = Root.EnumerateChildItems

    if e <> Nil then
        dim it as WIAItemMBS = e.NextItem

        while it <> nil
            // do something with item

            it = e.NextItem
       wend
    end if
End Sub
```

**Notes:** Lasterror is set.

---

89.40.6  **Reset**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Resets the enumeration.  
**Notes:** Lasterror is set.

---

89.40.7  **Skip(celt as Integer)**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Skips the specified number of items during an enumeration of available WiaItemMBS objects.  
**Notes:** Lasterror is set.
89.40.8 Properties

89.40.9 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference to the object.  
**Notes:**  
The handle for WIA 1.x or 2.x.  
(Read and Write property)

89.40.10 Handle1 as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference to the object.  
**Notes:**  
The handle for WIA 1.x.  
(Read and Write property)

89.40.11 Handle2 as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference to the object.  
**Notes:**  
The handle for WIA 2.x.  
(Read and Write property)

89.40.12 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.  
**Notes:**  
(Read and Write property)
89.41 class WIAItemMBS

89.41.1 class WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for an item.

**Notes:**
Each Windows Image Acquisition (WIA) hardware device is represented to an application as a hierarchical
tree of WiaItem objects. The WiaItem interface provides applications with the ability to query devices to
discover their capabilities. It also provides access to data transfer interfaces and item properties. In addition,
the WiaItem interface provides methods to enable applications to control the device.

This class encapsulates transparently the system classes for WIA 1.x and 2.x.

89.41.2 Methods

89.41.3 AnalyzeItem

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The AnalyzeItem method causes the Windows Image Acquisition (WIA) hardware device to acquire and try
to detect what data types are present.

**Notes:**
This method is used with scanners to detect what type of data is on a page. When an application calls this
method, the WIA hardware device driver scans and analyzes the current page. For each data type it detects,
it creates an WiaItem object to represent the region on the page the data occupies.

Image processing and OCR software can use this capability to detect graphics and text on a page. This
method adds the regions it creates into the WIA device’s WiaItem tree. The application can select the
individual regions and use the standard data transfer methods to acquire data from them.

If necessary, applications can override the regions created by this method.

Works only on WIA 1.x.
Lasterror is set.
89.41.4 CreateChildItem(ItemFlags as Integer, CreationFlags as Integer, ItemName as string, FullItemName as string) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The CreateChildItem method is used by applications to add WiaItem objects to the WiaItem tree of a device.

**Notes:**
- ItemFlags: Specifies the WIA item type.
- CreationFlags: Specifies how to create the new item. Only for WIA 2.x. Can be 0 to set the default values for the properties of the child. Can be &H40000000 to copy the values of all Read/Write properties from the parent.
- ItemName: Specifies the WIA item name, such as "Top". You can think of this parameter as being equivalent to a file name.
- FullItemName: Specifies the full WIA item name. You can think of this parameter as equivalent to a full path to a file, such as "003\Root\Top". Only for WIA 1.x.

Lasterror is set.
Returns nil on any error and the new item object on success.

Some WIA hardware devices allow applications to create new items in the WiaItem tree that represents the device. Applications must test the devices to see if they support this capability. Use the EnumerateDevice-Capabilities function to enumerate the current device’s capabilities.

If the device allows the creation of new items in the WiaItem tree, invoking CreateChildItem creates a new WiaItem that is a child of the current node.

89.41.5 DataTransfer as WIADataTransferMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a Data transfer object.

**Notes:**
- Lasterror is set.
- Only for WIA 1.x.
- Returns nil on any error.

89.41.6 DeleteItem

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Removes the current IWiaItem object from the object tree of the device.

**Notes:**
Lasterror is set.
Available on both WIA 1.x and 2.x.

The Windows Image Acquisition (WIA) run-time system represents each WIA hardware device connected to the user’s computer as a hierarchical tree of IWiaItem objects. A given WIA device may or may not allow applications to delete IWiaItem objects from its tree. Use the EnumerateDeviceCapabilities function to query the device for item deletion capability.

If the device supports item deletion in its WiaItem tree, invoke the DeleteItem method to remove the WiaItem object. Note that this method will only delete an object after all references to the object have been released.

### 89.41.7 DeviceCommand(command as WIAGUIDMBS) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Issues a command to a Windows Image Acquisition (WIA) hardware device.

**Example:**
```vbnet
dim targetItem as WIAItemMBS // your item
dim resultItem as WIAItemMBS
resultItem = targetItem.DeviceCommand(targetItem.kCommandTakePicture)
```

**Notes:**
Command: Specifies the command to send to the WIA 2.0 device. See kCommand* constants.
Works with WIA 1.x and 2.x.

Applications use this method to send WIA commands to hardware devices.

When the application sends the kCommandTakePicture command to the device, the WIA run-time system creates the WiaItem object to represent the image. The DeviceCommand method returns this new WIAItemMBS object.

### 89.41.8 DeviceDialog(Flags as Integer, Win as window, FolderName as string, Filename as string, paths() as string, items() as WIAItemMBS)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Displays a dialog box to the user to prepare for image acquisition.

**Notes:**
Lasterror is set.
Only for WIA 2.x.
89.41. CLASS WIAITEMMBS

Flags: Specifies a set of flags that control the dialog box's operation. The value can be either 0 to represent the default behavior or any of the following flags: kDeviceDialogSingleImage, kDeviceDialogUseCommonUI and kSelectDeviceNoDefault
Win: A handle to the parent window.
FolderName: Specifies the folder name where the files are to be transferred.
Filename: Specifies the template file name.
paths: An array to be filled with the file paths.
items: An array to be filled with the wia item objects.

This method displays a dialog box to the user that an application uses to gather all the information required for image acquisition. It is also used to specify image scan properties such as brightness and contrast.

After this method returns, the application can use the WiaTransferMBS class to acquire the image.
See also:

- 89.41.9 DeviceDialog(Flags as Integer, WindowHandle as Integer, FolderName as string, Filename as string, paths() as string, items() as WIAItemMBS)
- 89.41.10 DeviceDialog(Win as window, Flags as Integer, Intent as Integer) as WIAItemMBS()
- 89.41.11 DeviceDialog(WindowHandle as Integer, Flags as Integer, Intent as Integer) as WIAItemMBS()

89.41.9  DeviceDialog(Flags as Integer, WindowHandle as Integer, FolderName as string, Filename as string, paths() as string, items() as WIAItemMBS)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Displays a dialog box to the user to prepare for image acquisition.

**Notes:**
Lasterror is set.
Only for WIA 2.x.

Flags: Specifies a set of flags that control the dialog box's operation. The value can be either 0 to represent the default behavior or any of the following flags: kDeviceDialogSingleImage, kDeviceDialogUseCommonUI and kSelectDeviceNoDefault
WindowHandle: A handle to the parent window.
FolderName: Specifies the folder name where the files are to be transferred.
Filename: Specifies the template file name.
paths: An array to be filled with the file paths.
items: An array to be filled with the wia item objects.

This method displays a dialog box to the user that an application uses to gather all the information required for image acquisition. It is also used to specify image scan properties such as brightness and contrast.
After this method returns, the application can use the WiaTransferMBS class to acquire the image.

- 89.41.10 DeviceDialog(Win as window, Flags as Integer, Intent as Integer) as WIAItemMBS() 14718
- 89.41.11 DeviceDialog(WindowHandle as Integer, Flags as Integer, Intent as Integer) as WIAItemMBS() 14719

89.41.10 DeviceDialog(Win as window, Flags as Integer, Intent as Integer) as WIAItemMBS()

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The DeviceDialog method is used by applications to display a dialog box to the user to prepare for image acquisition.

**Notes:**

- win: Handle of the parent window of the dialog box.
- Flags: Specifies a set of flags that control the dialog box’s operation. Can be set to any of the following values: kDeviceDialogUseCommonUI and kDeviceDialogSingleImage.
- Intent: Specifies what type of data the image is intended to represent. For a list of image intent values, kIntent* constants.

Lasterror is set.

Only for WIA 1.x.

This method displays a dialog box to the user that an application uses to gather all the information required for image acquisition. For instance, this dialog box enables the user to select images to download from a camera. When using a scanner, it is also used to specify image scan properties such as brightness and contrast.

After this method returns, the application can use the WiaDataTransferMBS interface to acquire the image.

It is recommended that applications make device and image selection available through a menu item named From scanner or camera on the File menu.

89.41. **CLASS WIAITEMMBS**

- **89.41.11 DeviceDialog(WindowHandle as Integer, Flags as Integer, Intent as Integer) as WIAItemMBS()**

**89.41.11 DeviceDialog(WindowHandle as Integer, Flags as Integer, Intent as Integer) as WIAItemMBS()**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The DeviceDialog method is used by applications to display a dialog box to the user to prepare for image acquisition.

**Notes:**
- **WindowHandle:** Handle of the parent window of the dialog box.
- **Flags:** Specifies a set of flags that control the dialog box’s operation. Can be set to any of the following values: kDeviceDialogUseCommonUI and kDeviceDialogSingleImage.
- **Intent:** Specifies what type of data the image is intended to represent. For a list of image intent values, kIntent* constants.

Lasterror is set.
Only for WIA 1.x.

This method displays a dialog box to the user that an application uses to gather all the information required for image acquisition. For instance, this dialog box enables the user to select images to download from a camera. When using a scanner, it is also used to specify image scan properties such as brightness and contrast.

After this method returns, the application can use the WiaDataTransferMBS interface to acquire the image.

It is recommended that applications make device and image selection available through a menu item named From scanner or camera on the File menu.

**89.41.12 EnumerateChildItems(CategoryGUID as WIAGUIDMBS=nil) as WIAItemMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Creates and returns an enumerator object for non-empty folders in a WiaItem tree of a Windows Image
Acquisition (WIA) device.

**Example:**

```vbnet
Sub EnumerateItems(root as WIAItemMBS)
    Dim e as WIAItemEnumeratorMBS = Root.EnumerateChildItems
    If e <> Nil Then
        Dim it as WIAItemMBS = e.NextItem
        While it <> Nil
            // do something with item
            It = e.NextItem
        Wend
    End If
End Sub
```

**Notes:**

LastError is set.
Works for WIA 1.x and WIA 2.x.

CategoryGUID: Specifies a category for which child nodes are enumerated. If nil, then all child nodes are enumerated. This parameter is only used on WIA 2.x.

The WIA run-time system represents each WIA hardware device as a hierarchical tree of WiaItem objects. The EnumerateChildItems method enables applications to enumerate child items in the current item. However, it can only be applied to items that are folders.

If the folder is not empty, it contains a subtree of WiaItem objects. The EnumerateChildItems method enumerates all of the items contained in the folder.

**89.41.13 EnumerateDeviceCapabilities(Flags as Integer) as WIADeviceCapabilitiesEnumeratorMBS**

MBS Win Plug Win, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates an enumerator that is used to ascertain the commands and events a Windows Image Acquisition (WIA) device supports.

**Notes:**

Flags: Specifies a flag that selects the type of capabilities to enumerate. Can be a combination of kDe-
89.41. CLASS WIAITEMMBS
viceCommands and kDeviceEvents.
Works for both WIA 1.x and 2.x
Lasterror is set.
Use this method to create an enumerator object to obtain the set of commands and events that a WIA device
supports. You can use the Flags parameter to specify which kinds of device capabilities to enumerate.

89.41.14 FindItemByName(name as string) as WIAItemMBS
MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Searches an item’s tree of subitems using the name as the search key.
**Notes:**
name: Specifies the name fo the item to search for.
Lasterror is set.
Works with WIA 1.x and 2.x.
This method searches the current item’s tree of sub-items using the name as the search key. If FindItemBy-
Name finds the item specified by name, it reutrns the WiaItem object.

89.41.15 ItemCategory as WIAGUIDMBS
MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Gets an item’s category information.
**Notes:**
Lasterror is set. Only for WIA 2.x.
Every WiaItemMBS object in the hierarchical tree of objects associated with a Windows Image Acquisition
(WIA) 2.0 hardware device has a specific category. This method enables applications to identify the category
of any item in a hierarchical tree of item objects in a device.
Requires Windows Vista or Windows Server 2008.
89.41.16  **ItemType as Integer**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Gets an item’s type information.

**Example:**

```vba
dim it as WIAItemMBS // your item
if BitwiseAnd(it.ItemType,it.kTypeFolder)=it.kTypeFolder or BitwiseAnd(it.ItemType, it.kTypeHasAttachments)=it.kTypeHasAttachments then
    msgbox "may have children."
else
    msgbox "no children."
end if
```

**Notes:**

Works with WIA 1.x and 2.x.
Lasterror is set.

Every WiaItemMBS object in the hierarchical tree of objects associated with a Windows Image Acquisition (WIA) 2.0 hardware device has a specific data type. Item objects represent folders and files. Folders contain file objects. File objects contain data acquired by the device such as images and sounds. This method enables applications to identify the type of any item in a hierarchical tree of item objects in a device.

An item may have more than one type. For example, an item that represents an audio file will have the type attributes WiaItemTypeAudio bitwiseor WiaItemTypeFile.

89.41.17  **kCategoryFeeder as WIAGUIDMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
One of the WIA IPA item category constants

**Example:**

```vba
MsgBox WIAItemMBS.kCategoryFeeder.DisplayString
```

89.41.18  **kCategoryFeederBack as WIAGUIDMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
One of the WIA IPA item category constants

**Example:**

```vba
```
89.41. **CLASS WIAITEMMBS**

MsgBox WIAItemMBS.kCategoryFeederBack.DisplayString

### 89.41.19 **kCategoryFeederFront as WIAGUIDMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
One of the WIA IPA item category constants
**Example:**
MsgBox WIAItemMBS.kCategoryFeederFront.DisplayString

### 89.41.20 **kCategoryFilm as WIAGUIDMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
One of the WIA IPA item category constants
**Example:**
MsgBox WIAItemMBS.kCategoryFilm.DisplayString

### 89.41.21 **kCategoryFinishedFile as WIAGUIDMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
One of the WIA IPA item category constants
**Example:**
MsgBox WIAItemMBS.kCategoryFinishedFile.DisplayString

### 89.41.22 **kCategoryFlatbed as WIAGUIDMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
One of the WIA IPA item category constants
**Example:**
MsgBox WIAItemMBS.kCategoryFlatbed.DisplayString
89.41.23  **kCategoryFolder as WIAGUIDMBS**

**Function:** One of the WIA IPA item category constants  
**Example:**  
MsgBox WIAItemMBS.kCategoryFolder.DisplayString

89.41.24  **kCategoryRoot as WIAGUIDMBS**

**Function:** One of the WIA IPA item category constants  
**Example:**  
MsgBox WIAItemMBS.kCategoryRoot.DisplayString

89.41.25  **kCommandChangeDocument as WIAGUIDMBS**

**Function:** One of the WIA command constants.  
**Example:**  
MsgBox WIAItemMBS.kCommandChangeDocument.DisplayString

89.41.26  **kCommandDeleteAllItems as WIAGUIDMBS**

**Function:** One of the WIA command constants.  
**Example:**  
MsgBox WIAItemMBS.kCommandDeleteAllItems.DisplayString

89.41.27  **kCommandDiagnostic as WIAGUIDMBS**

**Function:** One of the WIA command constants.  
**Example:**  

89.41. CLASS WIAITEMMBS

MsgBox WIAItemMBS.kCommandDiagnostic.DisplayString

89.41.28 kCommandSynchronize as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
One of the WIA command constants.
**Example:**
MsgBox WIAItemMBS.kCommandSynchronize.DisplayString

89.41.29 kCommandTakePicture as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
One of the WIA command constants.

89.41.30 kCommandUnloadDocument as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
One of the WIA command constants.
**Example:**
MsgBox WIAItemMBS.kCommandUnloadDocument.DisplayString

89.41.31 ParentItem as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Gets the parent item in the tree that represents a Windows Image Acquisition (WIA) 2.0 hardware device.
**Notes:**
Works only in WIA 2.x. Lasterror is set.
Given any WiaItem object in the object tree of a WIA 2.0 hardware device, the application retrieves a
pointer to the parent item by calling this function.
PropertyStorage as WIAPropertyStorageMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries properties for this item.

**Example:**

```vbscript
Sub ListProperties(it as WIAItemMBS, plist as listbox)

    // enumerate properties into a given listbox
    // clear list
    PList.DeleteAllRows

    // get properties
    dim p as WIAPropertyStorageMBS = it.PropertyStorage
    if p<>Nil then
        dim e as WIAPropertyEnumeratorMBS = p.Enumerate

        if e<>nil then
            dim ps as WIAPropertyMBS = e.NextItem

            while ps<>Nil
                // read the property value
                dim v as Variant = p.Read(ps)

                // get some identifier string for the listbox, name or id
                dim k as string = ps.Name
                if len(k)=0 then
                    k = str(ps.ID)
                end if

                PList.AddRow k

                if v.Type = v.TypeObject then
                    if v isa WIAGUIDMBS then
                        dim g as WIAGUIDMBS = v
                        PList.Cell(PList.LastIndex,1)=g.DisplayString
                    else
                        PList.Cell(PList.LastIndex,1)="? some object" // should never happen
                    end if
                else
                    PList.Cell(PList.LastIndex,1)=v.StringValue
                end if

                ps = e.NextItem
            wend
        end if
    end if
end if
```
Notes:
Lasterror is set.
Returns nil on any error.

89.41.33 RootItem as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the root item of a tree of item objects used to represent a Windows Image Acquisition (WIA) hardware device.
**Notes:**
Lasterror is set.
Works with WIA 1.x and 2.x.

Given any WiaItem object in the object tree of a WIA hardware device, the application retrieves a pointer to the root item by calling this function.

89.41.34 Transfer as WIATransferMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a transfer object for this item.
**Notes:**
Only available on WIA 2.x.
Lasterror is set.
Returns nil on any error.

89.41.35 Properties

89.41.36 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference to the object.
**Notes:**
The handle for WIA 1.x or 2.x.
(Read and Write property)
89.41.37 Handle1 as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The internal reference to the object. Notes: The handle for WIA 1.x. (Read and Write property)

89.41.38 Handle2 as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The internal reference to the object. Notes: The handle for WIA 2.x. (Read and Write property)

89.41.39 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The last error code. Notes: (Read and Write property)

89.41.40 Constants

89.41.41 kDeviceCommands = 1

89.41.42 kDeviceDialogSingleImage = 2

MBS Win Plugin, Plugin Version: 10.3. Function: One of the DeviceDialog and ImageDialog flag constants. Notes: Only allow one image to be selected
89.41.43 kDeviceDialogUseCommonUI = 4

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the DeviceDialog and ImageDialog flag constants. **Notes:** Give preference to the system-provided UI, if available.

89.41.44 kDeviceEvents = 2

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the flag constants for the EnumerateDeviceCapabilities function. **Notes:** Enumerate device events.

89.41.45 kIntentBestPreview = & h40000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog. **Notes:** Specifies the best quality preview.

89.41.46 kIntentImageTypeColor = 1

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog. **Notes:** Preset properties for color content.

89.41.47 kIntentImageTypeGrayscale = 2

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog. **Notes:** Preset properties for grayscale content.

89.41.48 kIntentImageTypeMask = & hF

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog. **Notes:** Mask for all of the image type flags.

89.41.49 kIntentImageTypeText = 4

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog. **Notes:** Preset properties for text content.
89.41.50  kIntentMaximizeQuality = & h20000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog.  
**Notes:** Preset properties to maximize image quality.

89.41.51  kIntentMinimizeSize = & h10000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog.  
**Notes:** Preset properties to minimize image size.

89.41.52  kIntentNone = 0

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog.  
**Notes:** Default value. Do not preset any properties.

89.41.53  kIntentSizeMask = & hF0000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the intent constants for GetImageDialog.  
**Notes:** Mask for all of the size/quality flags.

89.41.54  kSelectDeviceNoDefault = 1

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the Select Device Dialog and Image Dialog flag constants.

89.41.55  kTypeAnalyze = & h00000010

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

89.41.56  kTypeAudio = & h00000020

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.
### 89.41.57 kTypeBurst = & h00000800

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

### 89.41.58 kTypeDeleted = & h00000080

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

### 89.41.59 kTypeDevice = & h00000040

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

### 89.41.60 kTypeDisconnected = & h00000100

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

### 89.41.61 kTypeFile = & h00000002

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

### 89.41.62 kTypeFolder = & h00000004

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

**Example:**

```vbs
Dim it As WIAItemMBS ' your item
If BitwiseAnd(it.ItemType, it.kTypeFolder) = it.kTypeFolder Or BitwiseAnd(it.ItemType, it.kTypeHasAttachments) = it.kTypeHasAttachments Then
    MsgBox "may have children."
Else
    MsgBox "no children."
End If
```

89.41.63  kTypeFree = & h00000000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

89.41.64  kTypeGenerated = & h00004000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

89.41.65  kTypeHasAttachments = & h00008000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

**Example:**

```vba
dim it as WIAItemMBS ' your item
if BitwiseAnd(it.ItemType, it.kTypeFolder)=it.kTypeFolder or BitwiseAnd(it.ItemType, it.kTypeHasAttachments)=it.kTypeHasAttachments then
msgbox "may have children."
else
msgbox "no children."
end if
```

89.41.66  kTypeHPanorama = & h00000200

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

89.41.67  kTypeImage = & h00000001

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

89.41.68  kTypeRoot = & h00000008

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.
89.41. CLASS WIAITEMMBS

89.41.69  kTypeStorage = & h00001000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

89.41.70  kTypeTransfer = & h00002000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

89.41.71  kTypeVideo = & h00010000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.

89.41.72  kTypeVPanorama = & h00000400

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA item type constants.
89.42 class WIAPROPERTYENUMERATORMBS

89.42.1 class WIAPROPERTYENUMERATORMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
The class for a property enumerator.

Example:

Sub ListProperties(it as WIAITEMMBS, plist as listbox)
// enumerate properties into a given listbox

// clear list
PList.DeleteAllRows

// get properties
dim p as WIAPROPERTYSTORAGEMBS = it.PropertyStorage
if p<>Nil then
    dim e as WIAPROPERTYENUMERATORMBS = p.Enumerate

if e<>nil then
    dim ps as WIAPROPERTYMBS = e.NextItem

while ps<>Nil
    // read the property value
    dim v as Variant = p.Read(ps)

    // get some identifier string for the listbox, name or id
    dim k as string = ps.Name
    if len(k)=0 then
        k = str(ps.ID)
    end if

    PList.AddRow k

    if v.Type = v.TypeObject then
        if v isa WIAGUIDMBS then
            dim g as WIAGUIDMBS = v
            PList.Cell(PList.LastIndex,1)=g.DisplayString
        else
            PList.Cell(PList.LastIndex,1)="? some object" // should never happen
        end if
    else
        PList.Cell(PList.LastIndex,1)=v.StringValue
    end if

    ps = e.NextItem
wend
89.42. CLASS WIAPROPERTYENUMERATORMBS

end if
end if
End Sub

89.42.2 Methods

89.42.3 Clone as WIAPROPERTYENUMERATORMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Creates a copy of the enumerator.
Notes: Lasterror is set.

89.42.4 NextItem as WIAPROPERTYMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Returns the next item.
Example:

Sub ListProperties(it as WIAItemMBS, plist as listbox)
// enumerate properties into a given listbox

// clear list
PList.DeleteAllRows

// get properties
dim p as WIAPROPERTYSTORAGEMBS = it.PropertyStorage
if p<>Nil then
dim e as WIAPROPERTYENUMERATORMBS = p.Enumerate

if e<>nil then
dim ps as WIAPROPERTYMBS = e.NextItem

while ps<>Nil
// read the property value
dim v as Variant = p.Read(ps)

// get some identifier string for the listbox, name or id
dim k as string = ps.Name
if len(k)=0 then
    k = str(ps.ID)
end if

PList.AddRow k
if v.Type = v.TypeObject then
if v isa WIAGUIDMBS then
dim g as WIAGUIDMBS = v
PList.Cell(PList.LastIndex,1)=g.DisplayString
else
PList.Cell(PList.LastIndex,1)="? some object" // should never happen
end if
else
PList.Cell(PList.LastIndex,1)=v.StringValue
end if
ps = e.NextItem
wend
end if
end if
End Sub

Notes: Lasterror is set.

89.42.5  Reset

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Resets the enumerator.
**Notes:** Lasterror is set.

89.42.6  Skip(celt as Integer)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Skips the next items.
**Notes:** Lasterror is set.

89.42.7  Properties

89.42.8  Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The internal reference to the object.
89.42. **CLASS WIAPROPERTYENUMERATORMBS**

*Notes:* (Read and Write property)

### 89.42.9 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.

*Notes:* (Read and Write property)
89.43 class WIAPropertyMBS

89.43.1 class WIAPropertyMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The WIAPropertyMBS class contains data about a single property in a property set. This data is the property ID and type tag, and the optional string name that may be associated with the property.

**Example:**

```vba
Sub ListProperties(it as WIAItemMBS, plist as listbox)
    // enumerate properties into a given listbox

    // clear list
    PList.DeleteAllRows

    // get properties
    dim p as WIAPropertyStorageMBS = it.PropertyStorage
    if p<>Nil then
        dim e as WIAPropertyEnumeratorMBS = p.Enumerate

        if e<>nil then
            dim ps as WIAPropertyMBS = e.NextItem

            while ps<>Nil
                // read the property value
                dim v as Variant = p.Read(ps)

                // get some identifier string for the listbox, name or id
                dim k as string = ps.Name
                if len(k)=0 then
                    k = str(ps.ID)
                end if

                PList.AddRow k

                if v.Type = v.TypeObject then
                    if v isa WIAGUIDMBS then
                        dim g as WIAGUIDMBS = v
                        PList.Cell(PList.LastIndex,1)=g.DisplayString
                    else
                        PList.Cell(PList.LastIndex,1)="? some object" // should never happen
                    end if
                else
                    PList.Cell(PList.LastIndex,1)=v.StringValue
                end if

                ps = e.NextItem
            wend
    end if
end Sub
```
89.43.2 Properties

89.43.3 ID as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A 32-bit identifier that uniquely identifies the property within the property set.

**Example:**

```vba
dim ps as WIAPropertyMBS // your property

dim k as string = ps.Name
if len(k)=0 then
    k = str(ps.ID)
end if

MsgBox k
```

**Notes:**

All properties within property sets must have unique property identifiers.

(Read and Write property)

89.43.4 Name as String

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string that contains the optional string name associated with the property

**Example:**

```vba
dim ps as WIAPropertyMBS // your property

dim k as string = ps.Name
if len(k)=0 then
    k = str(ps.ID)
end if

MsgBox k
```
Notes: (Read and Write property)

89.43.5 Type as Integer

Notes: (Read and Write property)
89.44. **CLASS WIAPROPERTYSTORAGEMBS**

89.44  **class WIAPropertyStorageMBS**

89.44.1  **class WIAPropertyStorageMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The WIAPropertyStorageMBS class manages the persistent properties of a single property set.

**Example:**

```vba
dim DeviceManager as new WIADeviceManager1MBS
if 0 = DeviceManager.Handle then
    MsgBox "Failed to initialize device manager."
else
    dim it as WIAItemMBS = DeviceManager.SelectDeviceDialog(window1, DeviceManager.kDeviceTypeDefault, DeviceManager.kSelectDeviceNoDefault)
    if it<>Nil then
        dim p as WIAPropertyStorageMBS = it.PropertyStorage
        dim name as string = p.Read(p.kItemPropertyItemNameString)
        MsgBox name
    end if
end if
```

**Notes:**

Persistent properties consist of information that can be stored persistently in a property set, such as the summary information associated with a file. This contrasts with run-time properties associated with Controls and Automation, which can be used to affect system behavior. Use the methods of the WIAPropertyStorageMBS interface to create or open a persistent property set. An instance of the WIAPropertyStorageMBS interface can manage zero or more WIAPropertyStorageMBS instances.

Each property within a property set is identified by a property identifier (ID), a integer value unique to that set. You can also assign a string name to a property through the WIAPropertyStorageMBS interface.

The automatic conversion to variant supports:
nil, integer, uint32, int64, uint64, single, double, boolean, string and WIAGUIDMBS.

The automatic conversion from variant supports:
integer, boolean, single, double, Int64, string and WIAGUIDMBS.
89.44.2 Methods

89.44.3 Commit(flags as Integer)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Saves changes made to a property storage object to the parent storage object.

**Notes:**
See kCommit* flags for the flags parameter.
Lasterror is set.

89.44.4 Count as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the number of properties stored in the property storage.

**Notes:** Lasterror is set.

89.44.5 Delete(id as Integer)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Deletes an item by ID.

**Notes:** Lasterror is set.
See also:

- 89.44.6 Delete(name as string)

89.44.6 Delete(name as string)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Deletes an item by name.

**Notes:** Lasterror is set.
See also:

- 89.44.5 Delete(id as Integer)

89.44.7 DeletePropertyName(id as Integer)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Deletes specified string names from the current property set.

**Notes:**
id: Property identifier for which string name are to be deleted.

For each property identifier in rgpropid, DeletePropertyName removes any corresponding name-to-property ID mapping. An attempt is silently ignored to delete the name of a property that either does not exist or does not currently have a string name associated with it. This method has no effect on the properties themselves.

89.44.8 Enumerate as WIAPROPERTYSTORAGEMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Enumerates the properties on this property storage. **Notes:** Returns nil on any error. Lasterror is set.

89.44.9 kAudioFormatAIFF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA audio format constants. **Example:**

MsgBox WIAPropertyStorageMBS.kAudioFormatAIFF.DisplayString

89.44.10 kAudioFormatMP3 as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA audio format constants. **Example:**

MsgBox WIAPropertyStorageMBS.kAudioFormatMP3.DisplayString

89.44.11 kAudioFormatWAV as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA audio format constants. **Example:**
89.44.12 **kAudioFormatWMA as WIAGUIDMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA audio format constants.

**Example:**
MsgBox WIAPropertyStorageMBS.kAudioFormatWMA_DisplayString

89.44.13 **kImageFormatASF as WIAGUIDMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA misc format constants.

**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatASF_DisplayString

89.44.14 **kImageFormatAVI as WIAGUIDMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA audio format constants.

**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatAVI_DisplayString

89.44.15 **kImageFormatBMP as WIAGUIDMBS**

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.

**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatBMP_DisplayString
89.44.16  kImageFormatCIFF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.
Example:
MsgBox WIAPropertyStorageMBS.kImageFormatCIFF.DisplayString

89.44.17  kImageFormatDPOF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA misc format constants.
Example:
MsgBox WIAPropertyStorageMBS.kImageFormatDPOF.DisplayString

89.44.18  kImageFormatEMF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.
Example:
MsgBox WIAPropertyStorageMBS.kImageFormatEMF.DisplayString

89.44.19  kImageFormatExec as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA misc format constants.
Example:
MsgBox WIAPropertyStorageMBS.kImageFormatExec.DisplayString

89.44.20  kImageFormatEXIF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.
Example:
89.44.21 kImageFormatFlashPix as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.

**Example:**

MsgBox WIAPropertyStorageMBS.kImageFormatFlashPix.DisplayString

89.44.22 kImageFormatGIF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.

**Example:**

MsgBox WIAPropertyStorageMBS.kImageFormatGIF.DisplayString

89.44.23 kImageFormatHTML as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA document format constants.

**Example:**

MsgBox WIAPropertyStorageMBS.kImageFormatHTML.DisplayString

89.44.24 kImageFormatICO as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.

**Example:**

MsgBox WIAPropertyStorageMBS.kImageFormatICO.DisplayString
89.44. CLASS WIAPROPERTYSTORAGEMBS

89.44.25 kImageFormatJPEG as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.  
**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatJPEG.DisplayString

89.44.26 kImageFormatJPEG2K as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.  
**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatJPEG2K.DisplayString

89.44.27 kImageFormatJPEG2KX as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.  
**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatJPEG2KX.DisplayString

89.44.28 kImageFormatMemoryBMP as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.  
**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatMemoryBMP.DisplayString

89.44.29 kImageFormatMPG as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA audio format constants.  
**Example:**
89.44.30  kImageFormatPhotoCD as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.
**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatPhotoCD.DisplayString

89.44.31  kImageFormatPICT as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.
**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatPICT.DisplayString

89.44.32  kImageFormatPNG as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.
**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatPNG.DisplayString

89.44.33  kImageFormatRawRGB as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.
**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatRawRGB.DisplayString
89.44. CLASS WIAPROPERTYSTORAGEMBS

89.44.34  kImageFormatRTF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA document format constants.  
**Example:**  
MsgBox WIAPropertyStorageMBS.kImageFormatRTF.DisplayString

89.44.35  kImageFormatScript as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA misc format constants.  
**Example:**  
MsgBox WIAPropertyStorageMBS.kImageFormatScript.DisplayString

89.44.36  kImageFormatTIFF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.  
**Example:**  
MsgBox WIAPropertyStorageMBS.kImageFormatTIFF.DisplayString

89.44.37  kImageFormatTXT as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA document format constants.  
**Example:**  
MsgBox WIAPropertyStorageMBS.kImageFormatTXT.DisplayString

89.44.38  kImageFormatUndefined as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** One of the WIA image format constants.  
**Example:**
89.44.39  kImageFormatUnicode16 as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
One of the WIA misc format constants.
**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatUnicode16.DisplayString

89.44.40  kImageFormatWMF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
One of the WIA image format constants.
**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatWMF.DisplayString

89.44.41  kImageFormatXML as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
One of the WIA document format constants.
**Example:**
MsgBox WIAPropertyStorageMBS.kImageFormatXML.DisplayString

89.44.42  Read(id as Integer) as Variant

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Reads a property by id.
**Notes:** Lasterror is set.
See also:
- 89.44.43 Read(name as string) as Variant
- 89.44.44 Read(p as WIAPropertyMBS) as Variant
89.44. **CLASS WIAPROPERTYSTORAGEMBS**

### 89.44.43 Read(name as string) as Variant

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a property by name.

**Example:**

```vba
dim DeviceManager as new WIADeviceManager1MBS
if 0 = DeviceManager.Handle then
    MsgBox "Failed to initialize device manager."
else
    dim it as WIAItemMBS = DeviceManager.SelectDeviceDialog(window1, DeviceManager.kDeviceTypeDefault, DeviceManager.kSelectDeviceNoDefault)
    if it<>Nil then
        dim p as WIAPropertyStorageMBS = it.PropertyStorage
        dim name as string = p.Read(p.kItemPropertyItemNameString)
        MsgBox name
    end if
end if
```

**Notes:** Lasterror is set.

See also:

- 89.44.42 Read(id as Integer) as Variant
- 89.44.44 Read(p as WIAPropertyMBS) as Variant

### 89.44.44 Read(p as WIAPropertyMBS) as Variant

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a property by a property specification.

**Notes:** Lasterror is set.

See also:

- 89.44.42 Read(id as Integer) as Variant
- 89.44.43 Read(name as string) as Variant

### 89.44.45 ReadPropertyName(id as Integer) as string

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves any existing string name for the specified property ID.

**Notes:** Lasterror is set.
CHAPTER 89. IMAGE CAPTURE

89.44.46 Revert

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Revert method discards all changes to the named property set since it was last opened or discards changes that were last committed to the property set.

**Notes:**
This method has no effect on a direct-mode property set.
Lasterror is set.

89.44.47 Write(id as Integer, value as Variant)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes a property by id.

**Notes:** Lasterror is set.
See also:

- 89.44.48 Write(name as string, value as Variant, id as Integer = 0) 14752
- 89.44.49 Write(p as WIAPropertyMBS, value as Variant) 14752

89.44.48 Write(name as string, value as Variant, id as Integer = 0)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes a property by name with optional id.

**Notes:** Lasterror is set.
See also:

- 89.44.47 Write(id as Integer, value as Variant) 14752
- 89.44.49 Write(p as WIAPropertyMBS, value as Variant) 14752

89.44.49 Write(p as WIAPropertyMBS, value as Variant)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes a property by property specification.

**Notes:** Lasterror is set.
See also:

- 89.44.47 Write(id as Integer, value as Variant) 14752
- 89.44.48 Write(name as string, value as Variant, id as Integer = 0) 14752
89.44. CLASS WIAPROPERTYSTORAGEMBS

89.44.50 WritePropertyName(id as Integer, name as string)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Assigns string names to a specified array of property IDs in the current property set.
**Notes:**
id: the property ID for which name is to be set.
name: The new name to be assigned to the corresponding property ID in the id parameter. This name may
not exceed 255 characters.

Lasterror is set.

89.44.51 Properties

89.44.52 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The internal reference to the object.
**Notes:** (Read and Write property)

89.44.53 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.
**Notes:** (Read and Write property)

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the WIA property constants.
89.45 class WIAStreamMBS

89.45.1 class WIAStreamMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The WIAStreamMBS interface lets you read and write data to stream objects.

**Example:**
```
dim ItemName as string = "Hello.jpg"
dim f as FolderItem = SpecialFolder.Desktop.Child(ItemName)
dim s as new WIAStreamMBS(WIAStreamMBS.kModeWrite + WIAStreamMBS.kModeCreate, f)
```

**Notes:** Stream objects contain the data in a structured storage object, where storages provide the structure. Simple data can be written directly to a stream but, most frequently, streams are elements nested within a storage object. They are similar to standard files.

89.45.2 Methods

89.45.3 Clone as WIAStreamMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The Clone method creates a new stream object with its own seek pointer that references the same bytes as the original stream.

**Notes:**
The Clone method creates a new stream object for accessing the same bytes but using a separate seek pointer. The new stream object sees the same data as the source-stream object. Changes written to one object are immediately visible in the other. Range locking is shared between the stream objects.

The initial setting of the seek pointer in the cloned stream instance is the same as the current setting of the seek pointer in the original stream at the time of the clone operation.

Lasterror is set.

89.45.4 Commit(flags as Integer)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The Commit method ensures that any changes made to a stream object open in transacted mode are reflected in the parent storage.

**Notes:**
If the stream object is open in direct mode, Commit has no effect other than flushing all memory buffers to the next-level storage object. The COM compound file implementation of streams does not support opening streams in transacted mode. Lasterror is set.

Possible flags: kCommitConsolidate, kCommitDangerouslyCommitMerelyToDiskCache, kCommitDefault, kCommitOnlyIfCurrent and kCommitOverwrite.

89.45.5 Constructor(mode as Integer, file as folderitem)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Opens or creates a file and retrieves a stream to read or write to that file.

Example:

```vbs
    dim ItemName as string = "Hello.jpg"
    dim f as FolderItem = SpecialFolder.Desktop.Child(ItemName)
    dim s as new WIAStreamMBS(WIAStreamMBS.kModeWrite + WIAStreamMBS.kModeCreate, f)
```

Notes:

mode: the flags. Use the kMode* constants.
path: the file path.

Lasterror is set.

See also:

- 89.45.6 Constructor(mode as Integer, path as string)

89.45.6 Constructor(mode as Integer, path as string)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Opens or creates a file and retrieves a stream to read or write to that file.

Notes:

mode: the flags. Use the kMode* constants.
path: the file path.

Lasterror is set.

See also:

- 89.45.5 Constructor(mode as Integer, file as folderitem)
89.45.7 CopyTo(other as WIAStreamMBS, length as UInt64)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The CopyTo method copies a specified number of bytes from the current seek pointer in the stream to the
current seek pointer in another stream.

**Notes:**
other: The destination stream. The stream pointed to by pstm can be a new stream or a clone of the source stream.
length: The number of bytes to copy from the source stream.
ReadSize: Optional, a variable where the actual number of bytes read from the source.
WriteSize: Optional, a variable where the actual number of bytes written to the destination.

Lasterror is set.

The CopyTo method copies the specified bytes from one stream to another. It can also be used to copy a
stream to itself. The seek pointer in each stream instance is adjusted for the number of bytes read or written.
This method is equivalent to reading cb bytes into memory using Read and then immediately writing them
to the destination stream using Write, although CopyTo will be more efficient.

The destination stream can be a clone of the source stream created by calling the Clone method.

If CopyTo returns an error, you cannot assume that the seek pointers are valid for either the source or destina-
tion. Additionally, the values of pcbRead and pcbWritten are not meaningful even though they are returned.

If CopyTo returns successfully, the actual number of bytes read and written are the same.

To copy the remainder of the source from the current seek pointer, specify the maximum large integer value
for the cb parameter. If the seek pointer is the beginning of the stream, this operation copies the entire
stream.

See also:
- 89.45.8 CopyTo(other as WIAStreamMBS, length as UInt64, byref ReadSize as UInt64, byref WriteSize
  as UInt64)

89.45.8 CopyTo(other as WIAStreamMBS, length as UInt64, byref ReadSize as UInt64, byref WriteSize
as UInt64)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The CopyTo method copies a specified number of bytes from the current seek pointer in the stream to the
current seek pointer in another stream.

**Notes:**
other: The destination stream. The stream pointed to by pstm can be a new stream or a clone of the source
89.45.  CLASS WIASTREAMMBS

stream.
length: The number of bytes to copy from the source stream.
ReadSize: Optional, a variable where the actual number of bytes read from the source.
WriteSize: Optional, a variable where the actual number of bytes written to the destination.

LastError is set.

The CopyTo method copies the specified bytes from one stream to another. It can also be used to copy a
stream to itself. The seek pointer in each stream instance is adjusted for the number of bytes read or written.
This method is equivalent to reading cb bytes into memory using Read and then immediately writing them
to the destination stream using Write, although CopyTo will be more efficient.

The destination stream can be a clone of the source stream created by calling the Clone method.

If CopyTo returns an error, you cannot assume that the seek pointers are valid for either the source or destination.
Additionally, the values of pcbRead and pcbWritten are not meaningful even though they are returned.

If CopyTo returns successfully, the actual number of bytes read and written are the same.

To copy the remainder of the source from the current seek pointer, specify the maximum large integer value
for the cb parameter. If the seek pointer is the beginning of the stream, this operation copies the entire
stream.
See also:

- 89.45.7 CopyTo(other as WIAStreamMBS, length as UInt64)

89.45.9  Revert

**Function:**
The Revert method discards all changes that have been made to a transacted stream since the last Commit
call.
**Notes:**
On streams open in direct mode and streams using the COM compound file implementation of Revert, this
method has no effect.
LastError is set.

89.45.10  Seek(value as Int64, Origin as Integer) as UInt64

**Function:**
The Seek method changes the seek pointer to a new location.
**Notes:**
CHAPTER 89. IMAGE CAPTURE

The new location is relative to either the beginning of the stream, the end of the stream, or the current seek pointer.

Value: The displacement to be added to the location indicated by the dwOrigin parameter. If dwOrigin is kSeekSet, this is interpreted as an unsigned value rather than a signed value.

Origin: The origin for the displacement specified in value. The origin can be the beginning of the file (kSeekSet), the current seek pointer (kSeekCur), or the end of the file (kSeekEnd). For more information about values, see the kSeek* constants.

Returns the new seek pointer from the beginning of the stream.

Seek changes the seek pointer so that subsequent read and write operations can be performed at a different location in the stream object. It is an error to seek before the beginning of the stream. It is not, however, an error to seek past the end of the stream. Seeking past the end of the stream is useful for subsequent write operations, as the stream byte range will be extended to the new seek position immediately before the write is complete.

You can also use this method to obtain the current value of the seek pointer by calling this method with the Origin parameter set to kSeekCur and the value parameter set to 0 so that the seek pointer is not changed. The current seek pointer is returned.

Lasterror is set.

89.45.11 SetSize(size as UInt64)

Notes:
SetSize changes the size of the stream object. Call this method to preallocate space for the stream. If the size parameter is larger than the current stream size, the stream is extended to the indicated size by filling the intervening space with bytes of undefined value. This operation is similar to the Write method if the seek pointer is past the current end of stream.

If the size parameter is smaller than the current stream, the stream is truncated to the indicated size.

The seek pointer is not affected by the change in stream size.

Calling SetSize can be an effective way to obtain a large chunk of contiguous space.
Lasterror is set.

### 89.45.12 Properties

#### 89.45.13 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference to the object. **Notes:** (Read and Write property)

#### 89.45.14 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code. **Notes:** (Read and Write property)

### 89.45.15 Constants

#### 89.45.16 kCommitConsolidate = 8

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the flags for commit. **Notes:** Windows 2000 and Windows XP: Indicates that a storage should be consolidated after it is committed, resulting in a smaller file on disk. This flag is valid only on the outermost storage object that has been opened in transacted mode. It is not valid for streams. The kCommitConsolidate flag can be combined with any other kCommit* flags.

#### 89.45.17 kCommitDangerouslyCommitMerelyToDiskCache = 4

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the flags for commit. **Notes:** Commits the changes to a write-behind disk cache, but does not save the cache to the disk. In a write-behind disk cache, the operation that writes to disk actually writes to a disk cache, thus increasing performance. The cache is eventually written to the disk, but usually not until after the write operation has already returned. The performance increase comes at the expense of an increased risk of losing data if a problem occurs before the cache is saved and the data in the cache is lost.

If you do not specify this value, then committing changes to root-level storage objects is robust even if a disk cache is used. The two-phase commit process ensures that data is stored on the disk and not just to
the disk cache.

89.45.18  kCommitDefault = 0

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the flags for commit.  
**Notes:** You can specify this condition with kCommitConsolidate, or some combination of the other three flags in this list of elements. Use this value to increase the readability of code.

89.45.19  kCommitOnlyIfCurrent = 2

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the flags for commit.  
**Notes:** Prevents multiple users of a storage object from overwriting each other’s changes. The commit operation occurs only if there have been no changes to the saved storage object because the user most recently opened it. Thus, the saved version of the storage object is the same version that the user has been editing. If other users have changed the storage object, the commit operation fails and returns the STG_E_NOTCURRENT value. To override this behavior, call the Commit method again using the kCommitDefault value.

89.45.20  kCommitOverwrite = 1

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the flags for commit.  
**Notes:**

The commit operation can overwrite existing data to reduce overall space requirements. This value is not recommended for typical usage because it is not as robust as the default value. In this case, it is possible for the commit operation to fail after the old data is overwritten, but before the new data is completely committed. Then, neither the old version nor the new version of the storage object will be intact.

You can use this value in the following cases:

- The user is willing to risk losing the data.
- The low-memory save sequence will be used to safely save the storage object to a smaller file.
- A previous commit returned STG_E_MEDIUMFULL, but overwriting the existing data would provide enough space to commit changes to the storage object.

Be aware that the commit operation verifies that adequate space exists before any overwriting occurs. Thus, even with this value specified, if the commit operation fails due to space requirements, the old data is safe. It is possible, however, for data loss to occur with the kCommitOverwrite value specified if the commit operation fails for any reason other than lack of disk space.
89.45.21 kModeConvert = & h20000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants for the file stream. **Notes:** Creates the new object while preserving existing data in a stream named "Contents". In the case of a storage object or a byte array, the old data is formatted into a stream regardless of whether the existing file or byte array currently contains a layered storage object. This flag can only be used when creating a root storage object. It cannot be used within a storage object; for example, in CreateStream. It is also not valid to use this flag and the kModeDeleteOnRelease flag simultaneously.

89.45.22 kModeCreate = & h1000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants for the file stream. **Notes:**

Indicates that an existing storage object or stream should be removed before the new object replaces it. A new object is created when this flag is specified only if the existing object has been successfully removed.

This flag is used when attempting to create:

- A storage object on a disk, but a file of that name exists.
- An object inside a storage object, but a object with the specified name exists.
- A byte array object, but one with the specified name exists.

89.45.23 kModeDeleteOnRelease = & h400000

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants for the file stream. **Notes:** Indicates that the underlying file is to be automatically destroyed when the root storage object is released. This feature is most useful for creating temporary files.

89.45.24 kModeFailIfThere = 0

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants for the file stream. **Notes:** Causes the create operation to fail if an existing object with the specified name exists. In this case, STG_E_FILEALREADYEXISTS is returned. This is the default creation mode; that is, if no other create flag is specified, kModeFailIfThere is implied.
89.45.25  \( \text{kModeRead} = 0 \)

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants for the file stream.  
**Notes:** Indicates that the object is read-only, meaning that modifications cannot be made.

89.45.26  \( \text{kModeReadWrite} = 2 \)

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants for the file stream.  
**Notes:** Enables access and modification of object data.

89.45.27  \( \text{kModeShareDenyExclusive} = \& \, \text{h10} \)

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants for the file stream.  
**Notes:** Prevents others from subsequently opening the object in any mode. Be aware that this value is not a simple bitwise OR operation of the kModeShareDenyRead and kModeShareDenyWrite values. In transacted mode, sharing of kModeShareDenyWrite or kModeShareDenyExclusive can significantly improve performance because they do not require snapshots. For more information about transactioning, see the Remarks section.

89.45.28  \( \text{kModeShareDenyNone} = \& \, \text{h40} \)

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants for the file stream.  
**Notes:** Specifies that subsequent openings of the object are not denied read or write access. If no flag from the sharing group is specified, this flag is assumed.

89.45.29  \( \text{kModeShareDenyRead} = \& \, \text{h30} \)

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants for the file stream.  
**Notes:** Prevents others from subsequently opening the object in STGM_READ mode. It is typically used on a root storage object.

89.45.30  \( \text{kModeShareDenyWrite} = \& \, \text{h20} \)

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants for the file stream.  
**Notes:** Prevents others from subsequently opening the object for kModeShareWrite or kModeShareReadWrite access. In transacted mode, sharing of kModeShareDenyWrite or kModeShareDenyExclusive can significantly improve performance because they do not require snapshots.
89.45. **CLASS WIASTREAMMBS**

89.45.31 **kModeWrite = 1**

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the mode constants for the file stream. **Notes:** Enables you to save changes to the object, but does not permit access to its data.

89.45.32 **kSeekCur = 1**

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the seek constants. **Notes:** The new seek pointer is an offset relative to the current seek pointer location. In this case, the dlibMove parameter is the signed displacement from the current seek position.

89.45.33 **kSeekEnd = 2**

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the seek constants. **Notes:** The new seek pointer is an offset relative to the end of the stream. In this case, the dlibMove parameter is the new seek position relative to the end of the stream.

89.45.34 **kSeekSet = 0**

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the seek constants. **Notes:** The new seek pointer is an offset relative to the beginning of the stream. In this case, the dlibMove parameter is the new seek position relative to the beginning of the stream.
89.46 class WIATransferCallbackMBS

89.46.1 class WIATransferCallbackMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The class for transferring data from the device into your application. Notes: This class is only used for WIA 2.x.

89.46.2 Properties

89.46.3 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The internal reference to the object. Notes: (Read and Write property)

89.46.4 Events

89.46.5 GetNextStream(ItemName as string, FullItemName as string) as WIAStreamMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Gets a new stream for the specified item. Notes: ItemName: Specifies the name of the item to create stream for. FullItemName: Specifies the full name of the item to create stream for. Returns a new WIAStreamMBS object or nil for an error.

When this method is implemented by an image processing filter, the Windows Image Acquisition (WIA) 2.0 minidriver calls it during image acquisition to get the destination stream from the client.

A filter’s WIATransferCallbackMBS.GetNextStream must delegate to the application’s callback method. The filter uses the stream returned by the application callback’s WIATransferCallbackMBS.GetNextStream implementation to create its own stream that it passes back to the WIA 2.0 service. The filtering is done when the filter’s stream calls the IStream::Write method.

The filter’s stream cannot make any assumptions on the number of bytes that are written to it on each write, since the unfiltered image data may come from the WIA 2.0 Preview Component rather than the driver.
The WIA 2.0 Preview Component always writes the whole unfiltered image data into the filter's stream only once, which means that the filter's stream has one source writing into it. If both the driver and the preview component write into the filter's stream, the filter's stream cannot assume, for example, that it will receive the full header the first time IStream::Write is called although its corresponding driver always writes the header data first in one write. Nor can it assume that a subsequent write contains exactly one scan line. So the filtering stream may have to count the number of bytes written to it to determine, for example, where the image data starts.

The image processing filter's WIATransferCallbackMBS.GetNextStream implementation should read the properties needed for its image processing from the item for which the image is being acquired. The filter does not read the properties directly from the pWiaItem2 passed into InitializeFilter. Instead the filter must call FindItemByName on this WIA 2.0 item to obtain the actual WIA 2.0 item. The reason for this is that the image being acquired may actually be a child item of pWiaItem2. For example, during a folder acquisition the filter uses pWiaItem2 to obtain pWiaItem2's child items in WIATransferCallbackMBS.GetNextStream (during a folder acquisition the driver returns the images represented by the child items of WiaItemMBS). The same is true when the WIA 2.0 Preview Component calls into the image processing filter passing a child WIA 2.0 item.

### 89.46.6 TransferCallback(w as WIATransferParamsMBS) as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Provides progress and other notifications during a transfer. **Notes:** Returns an error value or zero on success.
89.47 class WIATransferMBS

89.47.1 class WIATransferMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The WIATransferMBS class provides stream-based transfer of data.
**Notes:** This class is for WIA 2.x.

89.47.2 Methods

89.47.3 Cancel

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Cancels the current transfer operation.
**Notes:** Lasterror is set.

89.47.4 Download(TransferCallback as WIATransferCallbackMBS)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Initiates a data download to the caller.
**Notes:**
TransferCallback: The WIATransferCallbackMBS object to receive progress details and specify the destination.

If a folder is downloaded, then all the child items of that folder are also transferred. Each item is transferred in a separate stream.

Lasterror is set.

89.47.5 EnumerateFormatInfo as WIAFormatInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Creates an enumerator for the transfer formats that the Windows Image Acquisition (WIA) 2.0 device supports.
**Notes:** Lasterror is set.
89.47.6 Upload(Source as WIAStreamMBS, TransferCallback as WIATransferCallbackMBS)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Initiates a data upload of a single item from the caller.

**Notes:**
- Source: Specifies a pointer to the Stream data.
- TransferCallback: Specifies a pointer to the caller’s WIATransferCallbackMBS interface.

Lasterror is set.

89.47.7 Properties

89.47.8 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference to the object.

**Notes:** (Read and Write property)

89.47.9 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.

**Notes:** (Read and Write property)
89.48 class WIATransferParamsMBS

89.48.1 class WIATransferParamsMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class you subclass to get progress of the image transfer.  
**Notes:** The WiaTransferParams is transmitted to an application during a data transfer by the Windows Image Acquisition (WIA) run-time system to the WiaTransferCallbackMBS.TransferCallback method.

89.48.2 Properties

89.48.3 ErrorStatus as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The status, or error state, of the device set by the driver; for example, "warming up".  
**Notes:** (Read and Write property)

89.48.4 Message as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the status of the data transfer.  
**Notes:** See the kMessage* constants  
(Read and Write property)

89.48.5 PercentComplete as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the progress of the data transfer as a percentage.  
**Example:**
```vbnet
dim w as WIATransferParamsMBS // your parameters
ProgressBar1.maximum = 100
ProgressBar1.value = w.PercentComplete
```

**Notes:** (Read and Write property)
89.48. CLASS WIATRANSFERPARAMSMBS

89.48.6 TransferredBytes as UInt64

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the amount of data transferred. **Notes:** (Read and Write property)

89.48.7 Constants

89.48.8 kMessageDeviceStatus = 4

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the message constants.

89.48.9 kMessageEndOfStream = 2

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the message constants.

89.48.10 kMessageEndOfTransfer = 3

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the message constants.

89.48.11 kMessageNewPage = 5

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the message constants.

89.48.12 kMessageStatus = 1

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the message constants.
89.49 class WIAVideoMBS

89.49.1 class WIAVideoMBS

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The IWiaVideo interface provides methods that allow an application that uses Windows Image Acquisition (WIA) services to acquire still images from a streaming video device.
**Notes:** Note WIA does not support video devices in Windows Server 2003, Windows Vista, and later. For those versions of the Windows, use DirectShow to acquire images from video.

89.49.2 Methods

89.49.3 Constructor

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The constructor.
**Notes:** Requires Windows XP or Windows Server 2003.

89.49.4 CreateVideoByDevNum(DeviceNumber as Integer, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The CreateVideoByDevNum method creates a connection to a streaming video device with the device number obtained from a Directshow enumeration.
**Notes:**
DeviceNumber: Specifies the video device’s Directshow device number.
win: Specifies the window in which to display the streaming video.
StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to TRUE to cause immediate playback; set it to false to require a call to Play before video playback begins.

Lasterror is set.
By default, the video is displayed in the video device’s default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.

- 89.49.5 CreateVideoByDevNum(DeviceNumber as Integer, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean)
89.49.5  CreateVideoByDevNum(DeviceNumber as Integer, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The CreateVideoByDevNum method creates a connection to a streaming video device with the device number obtained from a Directshow enumeration.

**Notes:**
DeviceNumber: Specifies the video device’s Directshow device number.
WindowHandle: Specifies the window in which to display the streaming video.
StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to TRUE to cause immediate playback; set it to false to require a call to Play before video playback begins.

LastError is set.
By default, the video is displayed in the video device’s default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.
See also:
- 89.49.4 CreateVideoByDevNum(DeviceNumber as Integer, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

89.49.6  CreateVideoByName(FriendlyName as string, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The CreateVideoByName method creates a connection to a streaming video device with the friendly device name obtained from a Directshow enumeration.

**Notes:**
FriendlyName: Specifies the video device’s friendly name obtained from a Directshow device enumeration.
win: Specifies the window in which to display the streaming video.
StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to TRUE to cause immediate playback; set it to false to require a call to Play before video playback begins.

LastError is set.
By default, the video is displayed in the video device’s default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.
See also:
- 89.49.7 CreateVideoByName(FriendlyName as string, WindowHandle as Integer, StretchToFitParent
89.49.7 CreateVideoByName(FriendlyName as string, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The CreateVideoByName method creates a connection to a streaming video device with the friendly device name obtained from a Directshow enumeration.

**Notes:**
- FriendlyName: Specifies the video device's friendly name obtained from a Directshow device enumeration.
- win: Specifies the window in which to display the streaming video.
- StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
- AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to TRUE to cause immediate playback; set it to false to require a call to Play before video playback begins.

Lasterror is set.
By default, the video is displayed in the video device's default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.

See also:
- 89.49.6 CreateVideoByName(FriendlyName as string, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

89.49.8 CreateVideoByWiaDevID(WiaDeviceID as string, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The CreateVideoByWiaDevID method creates a connection to a streaming video device from its DeviceID.

**Notes:**
- WiaDeviceID: Specifies the value of the video device's DeviceID property.
- win: Specifies the window in which to display the streaming video.
- StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
- AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to true to cause immediate playback; set it to false to require a call to Play before video playback begins.

Lasterror is set.
By default, the video is displayed in the video device's default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.
In order for the function to succeed, the ImagesDirectory property must be specified first.

See also:

- 89.49.9 CreateVideoByWiaDevID(WiaDeviceID as string, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

89.49.9 CreateVideoByWiaDevID(WiaDeviceID as string, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The CreateVideoByWiaDevID method creates a connection to a streaming video device from its DeviceID.

**Notes:**

WiaDeviceID: Specifies the value of the video device’s DeviceID property.

win: Specifies the window in which to display the streaming video.

StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.

AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to true to cause immediate playback; set it to false to require a call to Play before video playback begins.

LastError is set.

By default, the video is displayed in the video device’s default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.

In order for the function to succeed, the ImagesDirectory property must be specified first.

See also:

- 89.49.8 CreateVideoByWiaDevID(WiaDeviceID as string, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

89.49.10 CurrentState as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the state of the video stream.

**Notes:** See the kState* constants.

89.49.11 DestroyVideo

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The DestroyVideo method shuts down the streaming video.

**Notes:**
CHAPTER 89. IMAGE CAPTURE

To restart video playback, the application must call one of the CreateVideo methods again. 
LastError is set.

Call this method only after a successful call to CreateVideoByWiaDevID, CreateVideoByDevNum, or CreateVideoByName.

89.49.12 Pause

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Pause method pauses video playback. 
**Notes:** Call this method only after a successful call to CreateVideoByWiaDevID, CreateVideoByDevNum, or CreateVideoByName. 
LastError is set.

89.49.13 Play

**Notes:** Call this method only after a successful call to CreateVideoByWiaDevID, CreateVideoByDevNum, or CreateVideoByName. 
LastError is set.

89.49.14 ResizeVideo(StretchToFitParent as boolean)

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ResizeVideo method resizes the video playback to the largest supported resolution that fits inside the parent window. 
**Notes:** Call this method whenever the parent window is moved or resized. 
By default, the video is displayed in a supported resolution smaller than the parent window. If bStretchToFitParent is set to true, the video display fills the window. 
LastError is set.
89.49. CLASS WIAVIDEOMBS

89.49.15 TakePicture as folderitem

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The TakePicture method extracts a still image from the video stream, and saves the image as a JPEG file. **Notes:** Returns the full path and filename of the JPEG file that this method creates. Lasterror is set.

The path and directory where the image file is saved are specified by the ImagesDirectory or ImageFolder property. See also:

- 89.49.16 TakePicture as string

89.49.16 TakePicture as string

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The TakePicture method extracts a still image from the video stream, and saves the image as a JPEG file. **Notes:** Returns the full path and filename of the JPEG file that this method creates. Lasterror is set.

The path and directory where the image file is saved are specified by the ImagesDirectory or ImageFolder property. See also:

- 89.49.15 TakePicture as folderitem

89.49.17 Properties

89.49.18 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference to the object. **Notes:** (Read and Write property)

89.49.19 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.
CHAPTER 89. IMAGE CAPTURE

Notes: (Read and Write property)

89.49.20 ImagesDirectory as string

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Specifies the full path and directory where images are stored when calling the TakePicture method.
Notes: Lasterror is set.
(Read and Write computed property)

89.49.21 ImagesFolder as folderitem

Notes: Lasterror is set.
(Read and Write computed property)

89.49.22 PreviewVisible as boolean

Notes: This does not affect the state of the video.
Lasterror is set.
(Read and Write computed property)

89.49.23 Constants

89.49.24 kStateCreatingVideo = 2

MBS Win Plugin, Plugin Version: 10.3. Function: One of the constants for the video state.
Notes: One of the WiaVideoMBS CreateVideo methods was called and WIA is in the process of creating the video stream.
89.49. **CLASS WIAVIDEOOMBS**

89.49.25  **kStateDestroyingVideo = 6**

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for the video state.  
**Notes:** The application called DestroyVideo method, and WIA is in the process of destroying the video stream.

89.49.26  **kStateNoVideo = 1**

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for the video state.  
**Notes:** No video stream exists. Call CreateVideoByWiaDevID, CreateVideoByDevNum, or CreateVideoByName to create a video.

89.49.27  **kStateVideoCreated = 3**

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for the video state.  
**Notes:** A video stream has been successfully created, but playback has not yet started.

89.49.28  **kStateVideoPaused = 5**

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for the video state.  
**Notes:** A video stream has been successfully created, and the video is paused. The application can now call the TakePicture method.

89.49.29  **kStateVideoPlaying = 4**

MBS Win Plugin, Plugin Version: 10.3. **Function:** One of the constants for the video state.  
**Notes:** A video stream has been successfully created, and the video is playing. The application can now call the TakePicture method.
Chapter 90

Image Magick

90.1 class ImageMagickQ16MBS

90.1.1 class ImageMagickQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The class for global functions from the Image Magick library
Notes:
Before using this class you need to load the ImageMagick dylib or dll.
Not all functions from the library are available through the plugin. If you need something special, please ask.
For Mac OS X you need the ImageMagick dylib/bundle and for Windows the normal ImageMagick installation with the DLL.
For more details please check the ImageMagick documentation.
The plugin implements three versions of this ImageMagick classes. One with Q8 for 8 bit quantum depth, one with Q16 for 16 bit depth and Q32 for 32 bit depth.

90.1.2 Methods

90.1.3 Copyright as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The copyright notice for this format.
Notes: For more details please check the ImageMagick documentation.

### 90.1.4 Features as String

**Function:** Returns the ImageMagick features.
**Notes:** For example whether library is compiled with OpenMP for faster performance.

### 90.1.5 HomeURL as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Returns the home url of the library.
**Notes:** For more details please check the ImageMagick documentation.

### 90.1.6 InitializeMagick(path as string = "")

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Initializes the ImageMagick environment.
**Example:**
```
    dim i as new ImageMagickQ16MBS
    i.InitializeMagick("")
```

**Notes:**
Path: The execution path of the current ImageMagick client.

For more details please check the ImageMagick documentation.
You need to call LoadLibrary functions to load the library before calling this.

### 90.1.7 IsMagickInstantiated as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Returns true if the ImageMagick environment is currently instantiated.
**Notes:**
In other words: True if InitializeMagick has been called before.
For more details please check the ImageMagick documentation.

### 90.1.8 LoadErrorString as string

**Function:** The last error message from loading the image magick library.

### 90.1.9 LoadLibrary(path as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Loads the dll/bundle on the give path.  
**Example:**
```
dim i as new ImageMagickQ16MBS
if TargetLinux then
  if i.LoadLibrary("libMagick.so.6") then
    //MsgBox "library loaded."
  else
    MsgBox "library failed."
  end if
else if TargetWin32 then
  if i.LoadLibrary("CORE_RL_magick_dll") then
    //MsgBox "library loaded."
  else
    MsgBox "library failed."
  end if
else
  // Mac OS X
  if i.LoadLibraryFile(GetFolderItem("ImageMagick.bundle")) then
    //MsgBox "library loaded."
  else
    MsgBox "The library failed to load."
  end if
end if
```

**Notes:**

In case the loading fails the library may be linked to some other libraries (e.g. X11) and you need to install them to get it working.

On Windows you can just pass the name of the library and the system will search it on the paths in the
environment variable "PATH" (or the Windows folder).

On Linux, pass the path or name of the library and the system will search for it.

For more details please check the ImageMagick documentation.

With plugin version 6.1 the Mac OS X part accepts a path to a dylib file, too. Changed to a shared method in plugin version 10.4.

### 90.1.10 LoadLibraryFile(path as folderitem) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Loads the dll/bundle on the give path.

**Example:**

```vbnet
Dim i as new ImageMagickQ16MBS

If TargetLinux Then
    If i.LoadLibrary("libMagick.so.6") Then
        //MsgBox "library loaded."
    Else
        MsgBox "library failed."
    End If
ElseIf TargetWin32 Then
    If i.LoadLibrary("CORE\RL\magick\_.dll") Then
        //MsgBox "library loaded."
    Else
        MsgBox "library failed."
    End If
Else
    // Mac OS X
    If i.LoadLibraryFile(GetFolderItem("ImageMagick.bundle")) Then
        //MsgBox "library loaded."
    Else
        MsgBox "The library failed to load."
    End If
End If
End If
```

**Notes:**

In case the loading fails the library may be linked to some other libraries (e.g. X11) and you need to install them to get it working.
This is the preferred way for Mac OS X as paths may not be unique.

For more details please check the ImageMagick documentation.

With plugin version 6.1 the Mac OS X part accepts a folderitem for a dylib file, too.
Changed to a shared method in plugin version 10.4.

**90.1.11  MagickInfoList as IMMagickInfoListQ16MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Returns the list of known image formats.
**Notes:**
Sets the last exception property.
For more details please check the ImageMagick documentation.

**90.1.12  MagickToMime(name as string) as string**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Returns the officially registered (or de facto) MIME media-type corresponding to a magick string.
**Notes:**
If there is no registered media-type, then the string "image/x-magick" (all lower case) is returned.

For more details please check the ImageMagick documentation.

**90.1.13  NewImageInfo as IMImageInfoQ16MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Creates a new ImageInfo object.
**Notes:**
Returns nil on low memory.
For more details please check the ImageMagick documentation.

**90.1.14  NewImageList as IMImageQ16MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Creates a new empty image list.
90.1.15  **PackageName as String**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The package name of the library.
**Notes:** For more details please check the ImageMagick documentation.

90.1.16  **QuantumDepth as String**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The Quantum Depth of the library.
**Notes:** For more details please check the ImageMagick documentation.

90.1.17  **QuantumDepthLibrary as Integer**

**Function:** The quantum depth used to compile the library.
**Notes:** QuantumDepthLibrary and QuantumDepthPlugin must be equal for the plugin to work correctly. Currently it is compiled for 16bit support.

90.1.18  **QuantumRange as String**

**Function:** The quantum range used by this library.
**Notes:** Should be a string like "Q16".

90.1.19  **ReadImage(info as IMImageInfoQ16MBS) as IMImageQ16MBS**

**Function:** Reads an image from a file.
**Notes:**
Sets the last exception property.
Returns nil on any error.
You need to pass in an info object to describe the image.
90.1. **CLASS IMAGEMAGICKQ16MBS**

For more details please check the ImageMagick documentation.

90.1.20 **ReadImageFromString(info as IMImageInfoQ16MBS, data as string) as IMImageQ16MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Reads an image from a string.
**Notes:**
Sets the last exception property.
Returns nil on any error.
You need to pass in an info object to describe the image.

For more details please check the ImageMagick documentation.

90.1.21 **ReadImageHeaderFromString(info as IMImageInfoQ16MBS, data as string) as IMImageQ16MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Reads the image header.
**Notes:**
Same as ReadImageFromString except the pixel data is not read.
Sets the last exception property.
For more details please check the ImageMagick documentation.

90.1.22 **ReleaseDate as String**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The release date of the library.
**Notes:** For more details please check the ImageMagick documentation.

90.1.23 **SetCurrentDirectory(path as folderitem) as boolean**

**Function:** Sets the current working directory.
**Notes:** This is needed for most installations to point to the folder with the libraries in order for LoadLibrary to find the dependencies.
CHAPTER 90. IMAGE MAGICK

90.1.24 Version as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The version of the library.
**Notes:** For more details please check the ImageMagick documentation.

90.1.25 Properties

90.1.26 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The last error code reported.
**Notes:**
If an exception is raised and it is not a warning exception, this exception code is saved in this property.
(Read and Write property)

90.1.27 LastException as IMExceptionQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The last exception thrown by the Image Magick library.
**Notes:**
You should check this value after every call to the library, process the error and set the property to nil.

For more details please check the ImageMagick documentation.
(Read and Write property)
90.2.  **CLASS IMAGEMAGICKQ32MBS**

90.2  **class ImageMagickQ32MBS**

90.2.1  **class ImageMagickQ32MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** The class for global functions from the Image Magick library

**Notes:**

Before using this class you need to load the ImageMagick dylib or dll.

Not all functions from the library are available through the plugin. If you need something special, please ask.

For Mac OS X you need the ImageMagick dylib/bundle and for Windows the normal ImageMagick installation with the DLL.

For more details please check the ImageMagick documentation.

The plugin implements three versions of this ImageMagick classes. One with Q8 for 8 bit quantum depth, one with Q16 for 16 bit depth and Q32 for 32 bit depth.

90.2.2  **Methods**

90.2.3  **Copyright as String**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** The copyright notice for this format.

**Notes:** For more details please check the ImageMagick documentation.

90.2.4  **Features as String**

**Function:** Returns the ImageMagick features.

**Notes:** For example whether library is compiled with OpenMP for faster performance.

90.2.5  **HomeURL as String**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Returns the home url of the library.
CHAPTER 90. IMAGE MAGICK

Notes: For more details please check the ImageMagick documentation.

90.2.6 InitializeMagick(path as string = "")

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Initializes the ImageMagick environment.
Example:

```vbnet
dim i as new ImageMagickQ32MBS
i.InitializeMagick(""
```

Notes:
Path: The execution path of the current ImageMagick client.

For more details please check the ImageMagick documentation.
You need to call LoadLibrary functions to load the library before calling this.

90.2.7 IsMagickInstantiated as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns true if the ImageMagick environment is currently instantiated.
Notes:
In other words: True if InitializeMagick has been called before.

For more details please check the ImageMagick documentation.

90.2.8 LoadErrorString as string

Function: The last error message from loading the image magick library.

90.2.9 LoadLibrary(path as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Loads the dll/bundle on the give path.
Example:
dim i as new ImageMagickQ32MBS

if TargetLinux then
    if i.LoadLibrary("libMagick.so.6") then
        //MsgBox "library loaded."
    else
        MsgBox "library failed."
    end if
elseif TargetWin32 then
    if i.LoadLibrary("CORE_RL_magick_dll") then
        //MsgBox "library loaded."
    else
        MsgBox "library failed."
    end if
else
    // Mac OS X
    if i.LoadLibraryFile(GetFolderItem("ImageMagick.bundle")) then
        //MsgBox "library loaded."
    else
        MsgBox "The library failed to load."
    end if
end if

Notes:
In case the loading fails the library may be linked to some other libraries (e.g. X11) and you need to install them to get it working.

On Windows you can just pass the name of the library and the system will search it on the paths in the environment variable "PATH" (or the Windows folder).

On Linux, pass the path or name of the library and the system will search for it.

For more details please check the ImageMagick documentation.

With plugin version 6.1 the Mac OS X part accepts a path to a dylib file, too.
Changed to a shared method in plugin version 10.4.

90.2.10 LoadLibraryFile(path as folderitem) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Loads the dll/bundle on the give path.
Example:

```vbnet
dim i as new ImageMagickQ32MBS

if TargetLinux then
    if i.LoadLibrary("libMagick.so.6") then
        //MsgBox "library loaded."
    else
        MsgBox "library failed."
    end if
elsif TargetWin32 then
    if i.LoadLibrary("CORE_RL_magick_.dll") then
        //MsgBox "library loaded."
    else
        MsgBox "library failed."
    end if
else
    // Mac OS X
    if i.LoadLibraryFile(GetFolderItem("ImageMagick.bundle")) then
        //MsgBox "library loaded."
    else
        MsgBox "The library failed to load."
    end if
end if
```

Notes:

In case the loading fails the library may be linked to some other libraries (e.g. X11) and you need to install them to get it working.

This is the preferred way for Mac OS X as paths may not be unique.

For more details please check the ImageMagick documentation.

With plugin version 6.1 the Mac OS X part accepts a folderitem for a dylib file, too. Changed to a shared method in plugin version 10.4.

**90.2.11 MagickInfoList as IMMagickInfoListQ32MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Returns the list of known image formats.

**Notes:**

Sets the last exception property.
90.2. CLASS IMAGEMAGICKQ32MBS

For more details please check the ImageMagick documentation.

90.2.12  MagickToMime(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Returns the officially registered (or de facto) MIME media-type corresponding to a magick string.

Notes:
If there is no registered media-type, then the string "image/x-magick" (all lower case) is returned.

For more details please check the ImageMagick documentation.

90.2.13  NewImageInfo as IMImageInfoQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Creates a new ImageInfo object.

Notes:
Returns nil on low memory.
For more details please check the ImageMagick documentation.

90.2.14  NewImageList as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Creates a new empty image list.

Notes: For more details please check the ImageMagick documentation.

90.2.15  PackageName as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: The package name of the library.

Notes: For more details please check the ImageMagick documentation.

90.2.16  QuantumDepth as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: The Quantum Depth of the library.
CHAPTER 90. IMAGE MAGICK

Notes: For more details please check the ImageMagick documentation.

90.2.17 QuantumDepthLibrary as Integer

Function: The quantum depth used to compile the library.
Notes: QuantumDepthLibrary and QuantumDepthPlugin must be equal for the plugin to work correctly. Currently it is compiled for 16bit support.

90.2.18 QuantumRange as String

Function: The quantum range used by this library.
Notes: Should be a string like "Q16".

90.2.19 ReadImage(info as IMImageInfoQ32MBS) as IMImageQ32MBS

Function: Reads an image from a file.
Notes:
Sets the last exception property.
Returns nil on any error.
You need to pass in an info object to describe the image.

For more details please check the ImageMagick documentation.

90.2.20 ReadImageFromString(info as IMImageInfoQ32MBS, data as string) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Reads an image from a string.
Notes:
Sets the last exception property.
Returns nil on any error.
You need to pass in an info object to describe the image.
90.2. CLASS IMAGEMAGICKQ32MBS

For more details please check the ImageMagick documentation.

90.2.21 ReadImageHeaderFromString(info as IMImageInfoQ32MBS, data as string) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Reads the image header.
Notes: Same as ReadImageFromString except the pixel data is not read.
Sets the last exception property.
For more details please check the ImageMagick documentation.

90.2.22 ReleaseDate as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The release date of the library.
Notes: For more details please check the ImageMagick documentation.

90.2.23 SetCurrentDirectory(path as folderitem) as boolean

Function: Sets the current working directory.
Notes: This is needed for most installations to point to the folder with the libraries in order for LoadLibrary
to find the dependencies.

90.2.24 Version as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The version of the library.
Notes: For more details please check the ImageMagick documentation.

90.2.25 Properties

90.2.26 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The last error code reported.
Notes:
If an exception is raised and it is not a warning exception, this exception code is saved in this property.  
(Read and Write property)

90.2.27  LastException as IMExceptionQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** The last exception thrown by the Image Magick library.  
**Notes:**
You should check this value after every call to the library, process the error and set the property to nil.  
For more details please check the ImageMagick documentation.  
(Read and Write property)
90.3.  CLASS IMAGEMAGICKQ8MBS

90.3  class ImageMagickQ8MBS

90.3.1  class ImageMagickQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
Function: The class for global functions from the Image Magick library
Notes: Before using this class you need to load the ImageMagick dylib or dll.

Not all functions from the library are available through the plugin. If you need something special, please ask.

For Mac OS X you need the ImageMagick dylib/bundle and for Windows the normal ImageMagick installation with the DLL.

For more details please check the ImageMagick documentation.

The plugin implements three versions of this ImageMagick classes. One with Q8 for 8 bit quantum depth, one with Q16 for 16 bit depth and Q32 for 32 bit depth.

90.3.2  Methods

90.3.3  Copyright as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
Function: The copyright notice for this format.
Notes: For more details please check the ImageMagick documentation.

90.3.4  Features as String

Function: Returns the ImageMagick features.
Notes: For example whether library is compiled with OpenMP for faster performance.

90.3.5  HomeURL as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
Function: Returns the home url of the library.
90.3.6  InitializeMagick(path as string = ")")

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Initializes the ImageMagick environment.

**Example:**

```vbs
    dim i as new ImageMagickQ8MBS
    i.InitializeMagick(""
```

**Notes:**

Path: The execution path of the current ImageMagick client.

For more details please check the ImageMagick documentation.
You need to call LoadLibrary functions to load the library before calling this.

90.3.7  IsMagickInstantiated as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Returns true if the ImageMagick environment is currently instantiated.

**Notes:**

In other words: True if InitializeMagick has been called before.

For more details please check the ImageMagick documentation.

90.3.8  LoadErrorString as string

**Function:** The last error message from loading the image magick library.

90.3.9  LoadLibrary(path as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Loads the dll/bundle on the give path.

**Example:**

```vbs
    dim i as new ImageMagickQ8MBS
    i.InitializeMagick(""
```
90.3. CLASS IMAGEMAGICKQ8MBS

\texttt{dim i as new ImageMagickQ8MBS}

\begin{verbatim}
if TargetLinux then
  if i.LoadLibrary("libMagick.so.6") then
    //MsgBox "library loaded."
  else
    MsgBox "library failed."
  end if
elseif TargetWin32 then
  if i.LoadLibrary("CORE_RL_magick_.dll") then
    //MsgBox "library loaded."
  else
    MsgBox "library failed."
  end if
else
  // Mac OS X
  if i.LoadLibraryFile(GetFolderItem("ImageMagick.bundle")) then
    //MsgBox "library loaded."
  else
    MsgBox "The library failed to load."
  end if
end if
\end{verbatim}

Notes:

In case the loading fails the library may be linked to some other libraries (e.g. X11) and you need to install them to get it working.

On Windows you can just pass the name of the library and the system will search it on the paths in the environment variable "PATH" (or the Windows folder).

On Linux, pass the path or name of the library and the system will search for it.

For more details please check the ImageMagick documentation.

With plugin version 6.1 the Mac OS X part accepts a path to a dylib file, too.

Changed to a shared method in plugin version 10.4.

90.3.10 \textbf{LoadLibraryFile(path as folderitem) as boolean}

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

\textbf{Function}: Loads the dll/bundle on the give path.
Example:

dim i as new ImageMagickQ8MBS

if TargetLinux then
if i.LoadLibrary("libMagick.so.6") then
  //MsgBox "library loaded."
else
  MsgBox "library failed."
end if
elseif TargetWin32 then
if i.LoadLibrary("CORE_RL_magick.dll") then
  //MsgBox "library loaded."
else
  MsgBox "library failed."
end if
else
  // Mac OS X
if i.LoadLibraryFile(GetFolderItem("ImageMagick.bundle")) then
  //MsgBox "library loaded."
else
  MsgBox "The library failed to load."
end if
end if

Notes:

In case the loading fails the library may be linked to some other libraries (e.g. X11) and you need to install them to get it working.

This is the preferred way for Mac OS X as paths may not be unique.

For more details please check the Image Magick documentation.

With plugin version 6.1 the Mac OS X part accepts a folderitem for a dylib file, too. Changed to a shared method in plugin version 10.4.

90.3.11 MagickInfoList as IMMagickInfoListQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the list of known image formats.
Notes:

Sets the last exception property.
90.3. CLASS IMAGEMAGICKQ8MBS

For more details please check the ImageMagick documentation.

90.3.12  MagickToMime(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Returns the officially registered (or de facto) MIME media-type corresponding to a magick string.
**Notes:**
If there is no registered media-type, then the string "image/x-magick" (all lower case) is returned.

For more details please check the ImageMagick documentation.

90.3.13  NewImageInfo as IMImageInfoQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Creates a new ImageInfo object.
**Notes:**
Returns nil on low memory.
For more details please check the ImageMagick documentation.

90.3.14  NewImageList as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Creates a new empty image list.
**Notes:** For more details please check the ImageMagick documentation.

90.3.15  PackageName as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The package name of the library.
**Notes:** For more details please check the ImageMagick documentation.

90.3.16  QuantumDepth as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The Quantum Depth of the library.
Notes: For more details please check the ImageMagick documentation.

90.3.17 QuantumDepthLibrary as Integer

Function: The quantum depth used to compile the library.
Notes: QuantumDepthLibrary and QuantumDepthPlugin must be equal for the plugin to work correctly. Currently it is compiled for 16bit support.

90.3.18 QuantumRange as String

Function: The quantum range used by this library.
Notes: Should be a string like "Q16".

90.3.19 ReadImage(info as IMImageInfoQ8MBS) as IMImageQ8MBS

Function: Reads an image from a file.
Notes:
Sets the last exception property.
Returns nil on any error.
You need to pass in an info object to describe the image.

For more details please check the ImageMagick documentation.

90.3.20 ReadImageFromString(info as IMImageInfoQ8MBS, data as string) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Reads an image from a string.
Notes:
Sets the last exception property.
Returns nil on any error.
You need to pass in an info object to describe the image.
90.3. **CLASS IMAGEMAGICKQ8MBS**

For more details please check the ImageMagick documentation.

### 90.3.21 **ReadImageHeaderFromString**

**Function:** Reads the image header.

**Notes:**
Same as ReadImageFromString except the pixel data is not read.
Sets the last exception property.
For more details please check the ImageMagick documentation.

### 90.3.22 **ReleaseDate as String**

**Function:** The release date of the library.

**Notes:** For more details please check the ImageMagick documentation.

### 90.3.23 **SetCurrentDirectory**

**Function:** Sets the current working directory.

**Notes:** This is needed for most installations to point to the folder with the libraries in order for LoadLibrary to find the dependencies.

### 90.3.24 **Version as String**

**Function:** The version of the library.

**Notes:** For more details please check the ImageMagick documentation.

### 90.3.25 **Properties**

### 90.3.26 **LastError as Integer**

**Function:** The last error code reported.
CHAPTER 90. IMAGE MAGICK

Notes:

If an exception is raised and it is not a warning exception, this exception code is saved in this property.
(Read and Write property)

90.3.27 LastException as IMExceptionQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The last exception thrown by the Image Magick library.
Notes:

You should check this value after every call to the library, process the error and set the property to nil.

For more details please check the ImageMagick documentation.
(Read and Write property)
90.4. CLASS IMCOLORQ16MBS

90.4. class IMColorQ16MBS

90.4.1. class IMColorQ16MBS

Function: The Image Magick class to represent a color.
Example:

    dim i as IMImageInfoQ16MBS
    dim c as IMColorQ16MBS

    c=i.BackgroundColor
    c.red=65535 // full red
    i.BackgroundColor=c

Notes:
As you see above the IMColorQ16MBS object does not reference the original values, but contains a copy, so
you must assign the modified color back to store it.
(Same as on the Realbasic Color class)

90.4.2. Methods

90.4.3. Constructor

Function: Creates a color object where all four properties are zero.
See also:

- 90.4.4 Constructor(c as color) 14843
- 90.4.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0) 14844

90.4.4. Constructor(c as color)

Function: Creates a new color value and fills it with the given Real Studio color.
See also:

- 90.4.3 Constructor 14843
- 90.4.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0) 14844
90.4.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0)

Function: Creates a new color object with the given values.
See also:

- 90.4.3 Constructor

- 90.4.4 Constructor(c as color)

90.4.6 Properties

90.4.7 Blue as UInt32

Function: The blue component.

Notes:
Value from 0 to 65535.
(Read and Write property)

90.4.8 ColorValue as Color

Function: The color as a Real Studio color.

Notes:
Please note that Real Studio colors are 8 bit. So for Q16 and Q32 classes the colors are scaled up or down. This reads/writes the red, green and blue property, but not the opacity property.
(Read and Write property)

90.4.9 Green as UInt32

Function: The green component.

Notes:
Value from 0 to 65535.
(Read and Write property)
90.4.  CLASS IMCOLORQ16MBS

90.4.10  Opacity as UInt32

**Function:** The opacity part of the color.
**Notes:**
Value from 0 to 65535.
(Read and Write property)

90.4.11  Red as UInt32

**Function:** The red component.
**Notes:**
Value from 0 to 65535.
(Read and Write property)
90.5 class IMColorQ32MBS

90.5.1 class IMColorQ32MBS

Function: The Image Magick class to represent a color.
Example:

```vbs
Dim i As IMImageInfoQ32MBS
Dim c As IMColorQ32MBS

c = i.BackgroundColor
C.Red = 65535 ' full red
i.BackgroundColor = c
```

Notes:
As you see above the IMColorQ32MBS object does not reference the original values, but contains a copy, so you must assign the modified color back to store it.
(Same as on the Realbasic Color class)

90.5.2 Methods

90.5.3 Constructor

Function: Creates a color object where all four properties are zero.
See also:

- 90.5.4 Constructor(c as color) 14846
- 90.5.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0) 14847

90.5.4 Constructor(c as color)

Function: Creates a new color value and fills it with the given Real Studio color.
See also:

- 90.5.3 Constructor 14846
- 90.5.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0) 14847
90.5. CLASS IMCOLORQ32MBS

90.5.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0)

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Creates a new color object with the given values. See also:

- 90.5.3 Constructor 14846
- 90.5.4 Constructor(c as color) 14846

90.5.6 Properties

90.5.7 Blue as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The blue component. Notes: Value from 0 to 65535. (Read and Write property)

90.5.8 ColorValue as Color

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The color as a Real Studio color. Notes: Please note that Real Studio colors are 8 bit. So for Q16 and Q32 classes the colors are scaled up or down. This reads/writes the red, green and blue property, but not the opacity property. (Read and Write property)

90.5.9 Green as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The green component. Notes: Value from 0 to 65535. (Read and Write property)
90.5.10 Opacity as UInt32

Function: The opacity part of the color.
Notes:
Value from 0 to 65535.
(Read and Write property)

90.5.11 Red as UInt32

Function: The red component.
Notes:
Value from 0 to 65535.
(Read and Write property)
90.6. CLASS IMCOLORQ8MBS

90.6  class IMColorQ8MBS

90.6.1  class IMColorQ8MBS

Function: The Image Magick class to represent a color.
Example:

dim i as IMImageInfoQ8MBS
dim c as IMColorQ8MBS

c=i.BackgroundColor

Example:

c.red=65535  // full red
i.BackgroundColor=c

Notes:
As you see above the IMColorQ8MBS object does not reference the original values, but contains a copy, so
you must assign the modified color back to store it.
(Same as on the Realbasic Color class)

90.6.2  Methods

90.6.3  Constructor

Function: Creates a color object where all four properties are zero.
See also:

• 90.6.4 Constructor(c as color) 14849

• 90.6.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0) 14850

90.6.4  Constructor(c as color)

Function: Creates a new color value and fills it with the given Real Studio color.
See also:

• 90.6.3 Constructor 14849

• 90.6.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0) 14850
### 90.6.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0)

**Function:** Creates a new color object with the given values.  
See also:

- 90.6.3 Constructor
- 90.6.4 Constructor(c as color)

### 90.6.6 Properties

#### 90.6.7 Blue as UInt32

**Function:** The blue component.  
**Notes:**  
Value from 0 to 65535.  
(Read and Write property)

#### 90.6.8 ColorValue as Color

**Function:** The color as a Real Studio color.  
**Notes:**  
Please note that Real Studio colors are 8 bit. So for Q16 and Q32 classes the colors are scaled up or down.  
This reads/writes the red, green and blue property, but not the opacity property.  
(Read and Write property)

#### 90.6.9 Green as UInt32

**Function:** The green component.  
**Notes:**  
Value from 0 to 65535.  
(Read and Write property)
90.6.  CLASS IMCOLORQ8MBS

90.6.10  Opacity as UInt32

Function: The opacity part of the color.
Notes:
Value from 0 to 65535.
(Read and Write property)

90.6.11  Red as UInt32

Function: The red component.
Notes:
Value from 0 to 65535.
(Read and Write property)
90.7 class IMExceptionQ16MBS

90.7.1 class IMExceptionQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The class for information about an Image Magick Exception.
Notes:
Some functions can throw an exception and you find this exception object after calling the function inside
the class. For Example after calling IMImageQ16MBS.resize, the IMImageQ16MBS.LastException property
will be nil for no exception or just contain the exception from the resize operation.

For more details please check the ImageMagick documentation.
Subclass of the RuntimeException class.

90.7.2 Methods

90.7.3 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The destructor.
Notes:
There is no need to call this method except you want to free all resources used by this object now without
waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

90.7.4 Properties

90.7.5 Description as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The description of the exception.
Notes:
For more details please check the ImageMagick documentation.
(Read and Write property)
90.7.6  Reason as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The reason of the exception.
**Notes:**
For more details please check the ImageMagick documentation.
(Read and Write property)

90.7.7  Severity as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The exception type.
**Notes:**
some usefull constants:
For more details please check the ImageMagick documentation.
(Read and Write property)

90.7.8  Signature as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The signature of the exception.
**Notes:**
For more details please check the ImageMagick documentation.
(Read and Write property)

90.8.  CLASS IMEXCEPTIONQ32MBS

90.8  class IMExceptionQ32MBS

90.8.1  class IMExceptionQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The class for information about an Image Magick Exception.
Notes:
Some functions can throw an exception and you find this exception object after calling the function inside
the class. For Example after calling IMImageQ32MBS.resize, the IMImageQ32MBS.LastException property
will be nil for no exception or just contain the exception from the resize operation.

For more details please check the ImageMagick documentation.
Subclass of the RuntimeException class.

90.8.2  Methods

90.8.3  Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The destructor.
Notes:
There is no need to call this method except you want to free all resources used by this object now without
waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

90.8.4  Properties

90.8.5  Description as String

90.10. CLASS IMIMAGEAFFINEMATRIXQ16MBS

90.10  class IMImageAffineMatrixQ16MBS

90.10.1  class IMImageAffineMatrixQ16MBS

**Function:** The class for an Image Magick affine transformation matrix.

90.10.2  Methods

90.10.3  Constructor

**Function:** Creates an identity matrix.

90.10.4  Properties

90.10.5  RX as Double

**Function:** The rotate x value.
**Notes:** (Read and Write property)

90.10.6  RY as Double

**Function:** The rotate y value.
**Notes:** (Read and Write property)

90.10.7  SX as Double

**Function:** The scale x value.
**Notes:** (Read and Write property)
90.10.8  SY as Double

Function: The scale y value.
Notes: (Read and Write property)

90.10.9  TX as Double

Function: The translate y value.
Notes: (Read and Write property)

90.10.10  TY as Double

Function: The translate y value.
Notes: (Read and Write property)
90.11. class IMImageAffineMatrixQ32MBS

90.11.1 class IMImageAffineMatrixQ32MBS

Function: The class for an Image Magick affine transformation matrix.

90.11.2 Methods

90.11.3 Constructor

Function: Creates an identity matrix.

90.11.4 Properties

90.11.5 RX as Double

Function: The rotate x value.
Notes: (Read and Write property)

90.11.6 RY as Double

Function: The rotate y value.
Notes: (Read and Write property)

90.11.7 SX as Double

Function: The scale x value.
Notes: (Read and Write property)
### 90.11.8 SY as Double

**Function:** The scale y value.
**Notes:** (Read and Write property)

### 90.11.9 TX as Double

**Function:** The translate y value.
**Notes:** (Read and Write property)

### 90.11.10 TY as Double

**Function:** The translate y value.
**Notes:** (Read and Write property)
90.12. CLASS IMIMAGEAFFINEMATRIXQ8MBS

90.12  class IMImageAffineMatrixQ8MBS

Function: The class for an Image Magick affine transformation matrix.

90.12.2  Methods

90.12.3  Constructor

Function: Creates an identity matrix.

90.12.4  Properties

90.12.5  RX as Double

Function: The rotate x value.
Notes: (Read and Write property)

90.12.6  RY as Double

Function: The rotate y value.
Notes: (Read and Write property)

90.12.7  SX as Double

Function: The scale x value.
Notes: (Read and Write property)
90.12.8 SY as Double

Function: The scale y value.
Notes: (Read and Write property)

90.12.9 TX as Double

Function: The translate y value.
Notes: (Read and Write property)

90.12.10 TY as Double

Function: The translate y value.
Notes: (Read and Write property)
90.13. class IMImageAttributeQ16MBS

90.13.1 class IMImageAttributeQ16MBS

Function: A class for an image attribute.
Notes:
Used only for reading the attributes.
Do not keep references over long times as memory of key/value pairs may be released.

90.13.2 Properties

90.13.3 Compression as Boolean

Function: Whether compression is used.
Notes: (Read only property)

90.13.4 Key as String

Function: The key of this attribute.
Notes:
String is in binary text encoding.
(Read only property)

90.13.5 Value as String

Function: The value of this attribute.
Notes:
String is in binary text encoding.
(Read only property)
90.14 class IMImageAttributeQ32MBS

90.14.1 class IMImageAttributeQ32MBS

Function: A class for an image attribute.
Notes:
Used only for reading the attributes.
Do not keep references over long times as memory of key/value pairs may be released.

90.14.2 Properties

90.14.3 Compression as Boolean

Function: Whether compression is used.
Notes: (Read only property)

90.14.4 Key as String

Function: The key of this attribute.
Notes:
String is in binary text encoding.
(Read only property)

90.14.5 Value as String

Function: The value of this attribute.
Notes:
String is in binary text encoding.
(Read only property)
90.15 class IMImageAttributeQ8MBS

90.15.1 class IMImageAttributeQ8MBS

**Function:** A class for an image attribute.

**Notes:**
Used only for reading the attributes.
Do not keep references over long times as memory of key/value pairs may be released.

90.15.2 Properties

90.15.3 Compression as Boolean

**Function:** Whether compression is used.

**Notes:** (Read only property)

90.15.4 Key as String

**Function:** The key of this attribute.

**Notes:**
String is in binary text encoding.
(Read only property)

90.15.5 Value as String

**Function:** The value of this attribute.

**Notes:**
String is in binary text encoding.
(Read only property)
90.16 class IMImageInfoQ16MBS

90.16.1 class IMImageInfoQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: A class for information about an image.
Notes: For more details please check the ImageMagick documentation.

90.16.2 Methods

90.16.3 Clone as IMImageInfoQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Clones the ImageInfo object.
Notes: For more details please check the ImageMagick documentation.

90.16.4 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The destructor.
Notes:
There is no need to call this method except you want to free all resources used by this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

90.16.5 DestroyImageInfo

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Destroys the image info and sets the handle to 0.
Notes:
For more details please check the ImageMagick documentation.
The destructor will call this for you if release=true.

90.16.6 HandleMemory as memoryblock

Function: The content of the whole ImageInfo structure copied into a memoryblock.
90.16.7 Properties

90.16.8 Adjoin as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Join images into a single multi-image file.
Notes:
For more details please check the ImageMagick documentation.
(Read and Write property)

90.16.9 Affirm as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Unknown.
Notes:
For more details please check the ImageMagick documentation.
(Read and Write property)

90.16.10 Antialias as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Control antialiasing of rendered Postscript and Postscript or TrueType fonts.
Notes:
Enabled by default.
For more details please check the ImageMagick documentation.
(Read and Write property)

90.16.11 Authenticate as String

Function: An undocumented property.
Notes: (Read and Write property)
90.16.12 BackgroundColor as IMColorQ16MBS

Function: Image background color.  
Notes: (Read and Write property)

90.16.13 BorderColor as IMColorQ16MBS

Function: Image border color.  
Notes: (Read and Write property)

90.16.14 Channel as Integer

Function: The channel to use.  
Notes: 

Constants for channel:

```
const UndefinedChannel = 0  
const RedChannel = & h0001  
const GrayChannel = & h0001  
const CyanChannel = & h0001  
const GreenChannel = & h0002  
const MagentaChannel = & h0002  
const BlueChannel = & h0004  
const YellowChannel = & h0004  
const AlphaChannel = & h0008  
const OpacityChannel = & h0008  
const BlackChannel = & h0020  
const IndexChannel = & h0020  
const AllChannels = & h7fffffff
```

(Read and Write property)

90.16.15 Colors as Integer

Function: An undocumented property.
90.16.16 ColorSpace as Integer

**Function:** Image pixel interpretation.

**Example:**

```plaintext
dim im as ImageMagickQ16MBS // global

Function IMPictureToString(p as picture, magick as string, quality as Integer) As string
dim image as new IMImageQ16MBS
dim imageinfo as IMImageInfoQ16MBS
dim s,data as string
dim impp as new IMMagickPixelPacketQ16MBS

// empty string for nil picture
if p = nil then
    Return ""
end if

// create a new picture info
imageinfo = im.NewImageInfo
imageinfo.ColorSpace=1
// only color space is needed. 1 for RGB.

// background color of image
impp.red = 0
impp.Green = 0
impp.Blue = 0

// creates a new image object
if not image.NewImage(imageinfo,p.Width,p.Height,impp) then
    Return ""
end if

// copy RB picture into IM Image at position 0/0
image.ColorSpace = 1
image.SetPicture(p,0,0)

// set compression data
imageinfo.Magick = magick
imageinfo.Quality = quality

// and rendering intent: 2=PerceptualIntent
```
'image.RenderingIntent = 2

// create image data
data = image.ImageToBlob(imageinfo)

// release memory
image.DestroyImage
imageinfo.DestroyImageInfo

// return result
Return data

Exception
// in case of an exception return nothing
Return ""

End Function

Notes:
If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If
it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

constants:

UndefinedColors 0
RGBColors 1
GRAYColors 2
TransparentColors 3
OHTAColors 4
LABColors 5
XYZColors 6
YCbCrColors 7
YCCColors 8
YIQColors 9
YPbPrColors 10
YUVColors 11
CMYKColors 12
sRGBColors 13
HSBColors 14
HSLCcolors 15
HWBColors 16
90.16.17 Compression as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Image compression type.

**Notes:**
useful constants:

```plaintext
class UndefinedCompression = 0
const NoCompression = 1
const BZipCompression = 2
const FaxCompression = 3
const Group4Compression = 4
const JPEGCompression = 5
const LosslessJPEGCompression = 6
const LZWCompression = 7
const RLECompression = 8
const ZipCompression = 9
```

The default is the compression type of the specified image file.
For more details please check the ImageMagick documentation.
(Read and Write property)

90.16.18 Density as String

**Function:** Vertical and horizontal resolution in pixels of the image.

**Notes:**
This option specifies an image density when decoding a Postscript or Portable Document page.
(Read and Write property)

90.16.19 Depth as Integer

**Function:** Image depth (8 or 16).

**Notes:**
QuantumLeap must be defined before a depth of 16 is valid.
(Read and Write property)
90.16.20  Dither as Boolean

**Function:** An undocumented property.
**Notes:** (Read and Write property)

90.16.21  Endian as Integer

**Function:** The endian setting to use.
**Notes:**

constants:

- UndefinedEndian 0
- LSBEndian 1 (Windows)
- MSBEndian 2 (Mac)

E.g. tiff files support different endian settings.
(Read and Write property)

90.16.22  Extract as String

**Function:** An undocumented property.
**Notes:** (Read and Write property)

90.16.23  Filename as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The file path/name.
**Notes:**

The string must be in the encoding of the library and is limited to 4000 bytes.
For more details please check the ImageMagick documentation.
(Read and Write property)
90.16.24 Font as String

Function: Text rendering font.
Notes:
If the font is a fully qualified X server font name, the font is obtained from an X server. To use a TrueType
font, precede the TrueType filename with an @. Otherwise, specify a Postscript font name (e.g. "helvetica").
(Read and Write property)

90.16.25 Group as Integer

Function: An undocumented property.
Notes: (Read and Write property)

90.16.26 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The handle used internally by the plugin.
Notes:
A pointer to a ImageInfo structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

90.16.27 HeaderOnly as Boolean

Function: True if only the header was read from the image data.
Notes: (Read and Write property)

90.16.28 Interlace as Integer

Function: The type of interlacing scheme (default NoInterlace).
Notes:
This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV.
NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane
interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files.
(e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.

constants:

- UndefinedInterlace 0 Unset value.
- NoInterlace 1 Don’t interlace image (RGBRGBRGBRGBRGBRGB...)
- LineInterlace 2 Use scanline interlacing (RRR...GGG...BBB...RRR...GGG...BBB...)
- PlaneInterlace 3 Use plane interlacing (RRRRRR...GGGGGG...BBBBBBB...)
- PartitionInterlace 4 Similar to plane interlacing except that the different planes are saved to individual files (e.g. image.R, image.G, and image.B)

(Read and Write property)

90.16.29 Magick as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Image encoding format (e.g. "GIF").

**Example:**

```plaintext
dim imageinfo as IMImageInfoQ16MBS
dim blob as string
dim image as IMImageQ16MBS

// Now lets convert to tiff
imageinfo.Filename = "image"
imageinfo.Magick="JPEG"
imageinfo.Quality = 10 //since we are displaying, lets use highest quality, lowest compression
blob = image.ImageToBlob(imageinfo)
```

**Notes:**

For more details please check the ImageMagick documentation.  
(Read and Write property)

90.16.30 MatteColor as IMColorQ16MBS

**Function:** Image matte (transparent) color.  
**Notes:** (Read and Write property)
90.16.31  Monochrome as Boolean

**Function:** Transform the image to black and white.
**Notes:** (Read and Write property)

90.16.32  Orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The image orientation.
**Notes:**

constants:

```
const UndefinedOrientation = 0
const TopLeftOrientation   = 1
const TopRightOrientation  = 2
const BottomRightOrientation = 3
const BottomLeftOrientation = 4
const LeftTopOrientation   = 5
const RightTopOrientation  = 6
const RightBottomOrientation = 7
const LeftBottomOrientation = 8
```

For more details please check the ImageMagick documentation.
(Read and Write property)

90.16.33  Page as String

**Function:** Equivalent size of Postscript page.
**Notes:** (Read and Write property)

90.16.34  PointSize as Double

**Function:** Text rendering font point size.
**Notes:** (Read and Write property)
90.16.35 Preview as Integer

Function: Image manipulation preview option.

Notes:
Used by 'display'.

constants:

UndefinedPreview 0
RotatePreview 1
ShearPreview 2
RollPreview 3
HuePreview 4
SaturationPreview 5
BrightnessPreview 6
GammaPreview 7
SpiffPreview 8
DullPreview 9
GrayscalePreview 10

OilPaintPreview 27
CharcoalDrawingPreview 28
JPEGPreview 29

(Read and Write property)
90.16.36  Quality as Integer

Function: JPEG/MIFF/PNG compression level.
Notes:
Default value is 75.
(Read and Write property)

90.16.37  Release as Boolean

Function: If true, the destructor will release the handle.
Notes: (Read and Write property)

90.16.38  ResolutionUnits as Integer

Function: Units of image resolution.
Notes:
constants:

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UndefinedResolution</td>
<td>0</td>
<td>Unset value.</td>
</tr>
<tr>
<td>PixelsPerInchResolution</td>
<td>1</td>
<td>Density specifications are specified in units of pixels per inch (english units).</td>
</tr>
<tr>
<td>PixelsPerCentimeterResolution</td>
<td>2</td>
<td>Density specifications are specified in units of pixels per centimeter (metric units).</td>
</tr>
</tbody>
</table>

(Read and Write property)

90.16.39  SamplingFactor as String

Function: An undocumented property.
Notes: (Read and Write property)
90.16.40 Scene as Integer

**Function:** An undocumented property.
**Notes:** (Read and Write property)

90.16.41 SceneCount as Integer

**Function:** An undocumented property.
**Notes:** (Read and Write property)

90.16.42 Scenes as String

**Function:** An undocumented property.
**Notes:** (Read and Write property)

90.16.43 ServerName as String

**Function:** X11 display to display to.
**Notes:**
- obtain fonts from, or to capture image from.
  (Read and Write property)

90.16.44 Size as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  **Function:** Width and height of a raw image (an image which does not support width and height information).
**Notes:**
- Size may also be used to affect the image size read from a multi-resolution format (e.g. Photo CD, JBIG, or JPEG.
  (Read and Write property)
90.16.45 **Temporary as Boolean**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

*Function*: Unknown.

*Notes:*

For more details please check the ImageMagick documentation.
(Read and Write property)

---

90.16.46 **Texture as String**

*Function*: Image filename to use as background texture.

*Notes:* (Read and Write property)

---

90.16.47 **Type as Integer**

*Function*: The Image type.

*Notes:*

constants:

- UndefinedType: 0
- BilevelType: 1
- GrayscaleType: 2
- GrayscaleMatteType: 3
- PaletteType: 4
- PaletteMatteType: 5
- TrueColorType: 6
- TrueColorMatteType: 7
- ColorSeparationType: 8
- ColorSeparationMatteType: 9
- OptimizeType: 10

(Read and Write property)

---

90.16.48 **Verbose as Boolean**

*Function*: Print detailed information about the image if True.
90.16.49 View as String

**Function:** FlashPix viewing parameters.

**Notes:** (Read and Write property)
90.17. **CLASS IMImageInfoQ32MBS**

90.17 **class IMImageInfoQ32MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** A class for information about an image.  
**Notes:** For more details please check the ImageMagick documentation.

90.17.2 **Methods**

90.17.3 **Clone as IMImageInfoQ32MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Clones the ImageInfo object.  
**Notes:** For more details please check the ImageMagick documentation.

90.17.4 **Close**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** The destructor.  
**Notes:**  
There is no need to call this method except you want to free all resources used by this object now without waiting for Realbasic to do it for you.  
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

90.17.5 **DestroyImageInfo**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Destroys the image info and sets the handle to 0.  
**Notes:**  
For more details please check the ImageMagick documentation.  
The destructor will call this for you if release=true.

90.17.6 **HandleMemory as memoryblock**

**Function:** The content of the whole ImageInfo structure copied into a memoryblock.
Notes: Returns nil on any error.

90.17.7 Properties

90.17.8 Adjoin as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Join images into a single multi-image file.
**Notes:**
For more details please check the ImageMagick documentation.
(Read and Write property)

90.17.9 Affirm as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Unknown.
**Notes:**
For more details please check the ImageMagick documentation.
(Read and Write property)

90.17.10 Antialias as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Control antialiasing of rendered Postscript and Postscript or TrueType fonts.
**Notes:**
Enabled by default.
For more details please check the ImageMagick documentation.
(Read and Write property)

90.17.11 Authenticate as String

**Function:** An undocumented property.
**Notes:** (Read and Write property)
90.17.12 **BackgroundColor as IMColorQ32MBS**

**Function:** Image background color.
**Notes:** (Read and Write property)

90.17.13 **BorderColor as IMColorQ32MBS**

**Function:** Image border color.
**Notes:** (Read and Write property)

90.17.14 **Channel as Integer**

**Function:** The channel to use.
**Notes:**

Constants for channel:

- `const UndefinedChannel = 0`
- `const RedChannel = & h0001`
- `const GrayChannel = & h0001`
- `const CyanChannel = & h0001`
- `const GreenChannel = & h0002`
- `const MagentaChannel = & h0002`
- `const BlueChannel = & h0004`
- `const YellowChannel = & h0004`
- `const AlphaChannel = & h0008`
- `const OpacityChannel = & h0008`
- `const BlackChannel = & h0020`
- `const IndexChannel = & h0020`
- `const AllChannels = & h7fffffff`

(Read and Write property)

90.17.15 **Colors as Integer**

**Function:** An undocumented property.
90.17.16 ColorSpace as Integer

Function: Image pixel interpretation.
Example:

```vba
dim im as ImageMagickQ32MBS // global

Function IMPictureToString(p as picture, magick as string, quality as Integer) As string
dim image as new IMImageQ32MBS
dim imageinfo as IMImageInfoQ32MBS
dim s, data as string
dim impp as new IMMagickPixelPacketQ32MBS

// empty string for nil picture
if p = nil then
    Return ""
end if

// create a new picture info
imageinfo = im.NewImageInfo
imageinfo.ColorSpace = 1
// only color space is needed. 1 for RGB.

// background color of image
impp.red = 0
impp.Green = 0
impp.Blue = 0

// creates a new image object
if not image.NewImage(imageinfo,p.Width,p.Height,impp) then
    Return ""
end if

// copy RB picture into IM Image at position 0/0
image.ColorSpace = 1
image.SetPicture(p,0,0)

// set compression data
imageinfo.Magick = magick
imageinfo.Quality = quality

// and rendering intent: 2=PerceptualIntent
```
'image.RenderingIntent = 2

// create image data
data = image.ImageToBlob(imageinfo)

// release memory
image.DestroyImage
imageinfo.DestroyImageInfo

// return result
Return data

Exception
// in case of an exception return nothing
Return ""

End Function

Notes:

If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

constants:

UndefinedColorsapce 0
RGBColorsapce 1
GRAYColorsapce 2
TransparentColorsapce 3
OHTAColorsapce 4
LABColorsapce 5
XYZColorsapce 6
YCbCrColorsapce 7
YCCCColorsapce 8
YIQColorsapce 9
YPbPrColorsapce 10
YUVColorsapce 11
CMYKColorsapce 12
sRGBColorsapce 13
HSBColorsapce 14
HSLColorsapce 15
HWBColorsapce 16
90.17.17 Compression as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Image compression type.
Notes:
useful constants:

const UndefinedCompression = 0
const NoCompression = 1
const BZipCompression = 2
const FaxCompression = 3
const Group4Compression = 4
const JPEGCompression = 5
const LosslessJPEGCompression = 6
const LZWCompression = 7
const RLECompression = 8
const ZipCompression = 9

The default is the compression type of the specified image file.
For more details please check the ImageMagick documentation.
(Read and Write property)

90.17.18 Density as String

Function: Vertical and horizontal resolution in pixels of the image.
Notes:
This option specifies an image density when decoding a Postscript or Portable Document page.
(Read and Write property)

90.17.19 Depth as Integer

Function: Image depth (8 or 16).
Notes:
QuantumLeap must be defined before a depth of 16 is valid.
(Read and Write property)
**90.17.20  Dither as Boolean**

**Function:** An undocumented property.  
**Notes:** (Read and Write property)

---

**90.17.21  Endian as Integer**

**Function:** The endian setting to use.  
**Notes:**

constants:

- UndefinedEndian 0
- LSBE endian 1 (Windows)
- MSBE endian 2 (Mac)

- e.g. tiff files support different endian settings.  
  (Read and Write property)

---

**90.17.22  Extract as String**

**Function:** An undocumented property.  
**Notes:** (Read and Write property)

---

**90.17.23  Filename as String**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** The file path/name.  
**Notes:**

- The string must be in the encoding of the library and is limited to 4000 bytes.  
- For more details please check the ImageMagick documentation.  
  (Read and Write property)
90.17.24 Font as String

**Function:** Text rendering font.

**Notes:**

If the font is a fully qualified X server font name, the font is obtained from an X server. To use a TrueType font, precede the TrueType filename with an @. Otherwise, specify a Postscript font name (e.g. "helvetica").

(Read and Write property)

90.17.25 Group as Integer

**Function:** An undocumented property.

**Notes:** (Read and Write property)

90.17.26 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** The handle used internally by the plugin.

**Notes:**

A pointer to a ImageInfo structure.

For more details please check the ImageMagick documentation.

(Read and Write property)

90.17.27 HeaderOnly as Boolean

**Function:** True if only the header was read from the image data.

**Notes:** (Read and Write property)

90.17.28 Interlace as Integer

**Function:** The type of interlacing scheme (default NoInterlace).

**Notes:**

This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files
(e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.

**constants:**

- UndefinedInterlace 0  Unset value.
- NoInterlace 1  Don’t interlace image (RGBRGBRGBRGBRGBRGB...)
- LineInterlace 2  Use scanline interlacing (RRR...GGG...BBB...RRR...GGG...BBB...)
- PlaneInterlace 3  Use plane interlacing (RRRRRR...GGGGGG...BBBBBBB...)
- PartitionInterlace 4  Similar to plane interlacing except that the different planes are saved to individual files (e.g. image.R, image.G, and image.B)

(Read and Write property)

**90.17.29  Magick as String**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Image encoding format (e.g, "GIF").

**Example:**

```vba
dim imageinfo as IMImageInfoQ32MBS
dim blob as string
dim image as IMImageQ32MBS

// Now lets convert to tiff
imageinfo.Filename = "image"
imageinfo.Magick="JPEG"
imageinfo.Quality = 10  //since we are displaying, lets use highest quality, lowest compression
blob = image.ImageToBlob(imageinfo)
```

**Notes:**

For more details please check the ImageMagick documentation.  
(Read and Write property)

**90.17.30  MatteColor as IMColorQ32MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Image matte (transparent) color.  
**Notes:** (Read and Write property)
90.17.31 Monochrome as Boolean

Function: Transform the image to black and white.
Notes: (Read and Write property)

90.17.32 Orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: The image orientation.
Notes:

constants:

const UndefinedOrientation = 0
const TopLeftOrientation = 1
const TopRightOrientation = 2
const BottomRightOrientation = 3
const BottomLeftOrientation = 4
const LeftTopOrientation = 5
const RightTopOrientation = 6
const RightBottomOrientation = 7
const LeftBottomOrientation = 8

For more details please check the ImageMagick documentation.
(Read and Write property)

90.17.33 Page as String

Function: Equivalent size of Postscript page.
Notes: (Read and Write property)

90.17.34 PointSize as Double

Function: Text rendering font point size.
Notes: (Read and Write property)
90.17.35 Preview as Integer

**Function:** Image manipulation preview option.

**Notes:**

Used by 'display'.

**constants:**

- UndefinedPreview 0
- RotatePreview 1
- ShearPreview 2
- RollPreview 3
- HuePreview 4
- SaturationPreview 5
- BrightnessPreview 6
- GammaPreview 7
- SpiffPreview 8
- DullPreview 9
- GrayscalePreview 10
- QuantizePreview 11
- DespecklePreview 12
- ReduceNoisePreview 13
- AddNoisePreview 14
- SharpenPreview 15
- BlurPreview 16
- ThresholdPreview 17
- EdgeDetectPreview 18
- SpreadPreview 19
- SolarizePreview 20
- ShadePreview 21
- RaisePreview 22
- SegmentPreview 23
- SwirlPreview 24
- ImplodePreview 25
- WavePreview 26
- OilPaintPreview 27
- CharcoalDrawingPreview 28
- JPEGPreview 29

(Read and Write property)
90.17.36 Quality as Integer

**Function:** JPEG/MIFF/PNG compression level.
**Notes:**
Default value is 75.
(Read and Write property)

90.17.37 Release as Boolean

**Function:** If true, the destructor will release the handle.
**Notes:** (Read and Write property)

90.17.38 ResolutionUnits as Integer

**Function:** Units of image resolution.
**Notes:**
constants:

- UndefinedResolution 0 Unset value.
- PixelsPerInchResolution 1 Density specifications are specified in units of pixels per inch (english units).
- PixelsPerCentimeterResolution 2 Density specifications are specified in units of pixels per centimeter (metric units).

(Read and Write property)

90.17.39 SamplingFactor as String

**Function:** An undocumented property.
**Notes:** (Read and Write property)
90.17.40 Scene as Integer

Function: An undocumented property.
Notes: (Read and Write property)

90.17.41 SceneCount as Integer

Function: An undocumented property.
Notes: (Read and Write property)

90.17.42 Scenes as String

Function: An undocumented property.
Notes: (Read and Write property)

90.17.43 ServerName as String

Function: X11 display to display to.
Notes:
obtain fonts from, or to capture image from.
(Read and Write property)

90.17.44 Size as String

Function: Width and height of a raw image (an image which does not support width and height information).
Notes:
Size may also be used to affect the image size read from a multi-resolution format (e.g. Photo CD, JBIG, or JPEG.
(Read and Write property)
90.17.45  Temporary as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Unknown.
Notes:
For more details please check the ImageMagick documentation.
(Read and Write property)

90.17.46  Texture as String

Function: Image filename to use as background texture.
Notes: (Read and Write property)

90.17.47  Type as Integer

Function: The Image type.
Notes:
constants:

- UndefinedType 0
- BilevelType 1
- GrayscaleType 2
- GrayscaleMatteType 3
- PaletteType 4
- PaletteMatteType 5
- TrueColorType 6
- TrueColorMatteType 7
- ColorSeparationType 8
- ColorSeparationMatteType 9
- OptimizeType 10

(Read and Write property)

90.17.48  Verbose as Boolean

Function: Print detailed information about the image if True.
90.17.49 View as String

**Function:** FlashPix viewing parameters. 
**Notes:** (Read and Write property)
90.18 class IMImageInfoQ8MBS

90.18.1 class IMImageInfoQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: A class for information about an image.
Notes: For more details please check the ImageMagick documentation.

90.18.2 Methods

90.18.3 Clone as IMImageInfoQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Clones the ImageInfo object.
Notes: For more details please check the ImageMagick documentation.

90.18.4 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The destructor.
Notes:
There is no need to call this method except you want to free all resources used by this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

90.18.5 DestroyImageInfo

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Destroys the image info and sets the handle to 0.
Notes:
For more details please check the ImageMagick documentation.
The destructor will call this for you if release=true.

90.18.6 HandleMemory as memoryblock

Function: The content of the whole ImageInfo structure copied into a memoryblock.
90.18.7 Properties

90.18.8 Adjoin as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Join images into a single multi-image file.
Notes:
For more details please check the ImageMagick documentation.
(Read and Write property)

90.18.9 Affirm as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Unknown.
Notes:
For more details please check the ImageMagick documentation.
(Read and Write property)

90.18.10 Antialias as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Control antialiasing of rendered Postscript and Postscript or TrueType fonts.
Notes:
Enabled by default.
For more details please check the ImageMagick documentation.
(Read and Write property)

90.18.11 Authenticate as String

Function: An undocumented property.
Notes: (Read and Write property)
90.18.12 BackgroundColor as IMColorQ8MBS

Function: Image background color.
Notes: (Read and Write property)

90.18.13 BorderColor as IMColorQ8MBS

Function: Image border color.
Notes: (Read and Write property)

90.18.14 Channel as Integer

Function: The channel to use.
Notes:

Constants for channel:

```cpp
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0001
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7fffffff
```

(Read and Write property)

90.18.15 Colors as Integer

Function: An undocumented property.
90.18.16  **ColorSpace as Integer**

**Function:** Image pixel interpretation.

**Example:**

```vbnet
dim im as ImageMagickQ8MBS  // global

Function IMPictureToString(p as picture, magick as string, quality as Integer) As string
dim image as new IMImageQ8MBS
dim imageinfo as IMImageInfoQ8MBS
dim s,data as string
dim impp as new IMMagickPixelPacketQ8MBS

    // empty string for nil picture
    if p = nil then
        Return ""
    end if

    // create a new picture info
    imageinfo = im.NewImageInfo
    imageinfo.ColorSpace=1
    // only color space is needed. 1 for RGB.

    // background color of image
    impp.red = 0
    impp.Green = 0
    impp.Blue = 0

    // creates a new image object
    if not image.NewImage(imageinfo,p.Width,p.Height,impp) then
        Return ""
    end if

    // copy RB picture into IM Image at position 0/0
    image.ColorSpace = 1
    image.SetPicture(p,0,0)

    // set compression data
    imageinfo.Magick = magick
    imageinfo.Quality = quality

    // and rendering intent: 2=PerceptualIntent
```
'image.RenderingIntent = 2

// create image data
data = image.ImageToBlob(imageinfo)

// release memory
image.DestroyImage
imageinfo.DestroyImageInfo

// return result
Return data

Exception
// in case of an exception return nothing
Return ""

End Function

Notes:
If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

constants:

UndefinedColorspace  0
RGBColorspace      1
GRAYColorspace    2
TransparentColorspace  3
OHTAColorspace   4
LABColorspace    5
XYZColorspace    6
YCbCrColorspace  7
YCCColorspace    8
YIQColorspace    9
YPbPrColorspace 10
YUVColorspace   11
CMYKColorspace  12
sRGBColorspace  13
HSBColorspace  14
HSLColorspace  15
HWBColorspace  16
90.18.17  Compression as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Image compression type.

Notes:

useful constants:

const UndefinedCompression = 0
const NoCompression = 1
const BZipCompression = 2
const FaxCompression = 3
const Group4Compression = 4
const JPEGCompression = 5
const LosslessJPEGCompression = 6
const LZWCompression = 7
const RLECompression = 8
const ZipCompression = 9

The default is the compression type of the specified image file.
For more details please check the ImageMagick documentation.

(Read and Write property)

90.18.18  Density as String

Function: Vertical and horizontal resolution in pixels of the image.

Notes:

This option specifies an image density when decoding a Postscript or Portable Document page.

(Read and Write property)

90.18.19  Depth as Integer

Function: Image depth (8 or 16).

Notes:

QuantumLeap must be defined before a depth of 16 is valid.

(Read and Write property)
90.18.20  Dither as Boolean

Function: An undocumented property.
Notes: (Read and Write property)

90.18.21  Endian as Integer

Function: The endian setting to use.
Notes:

constants:

UndefinedEndian  0
LSBE endian  1  (Windows)
MSBE endian  2  (Mac)

e.g. tiff files support different endian settings.
(Read and Write property)

90.18.22  Extract as String

Function: An undocumented property.
Notes: (Read and Write property)

90.18.23  Filename as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The file path/name.
Notes:
The string must be in the encoding of the library and is limited to 4000 bytes.
For more details please check the ImageMagick documentation.
(Read and Write property)
90.18.24  **Font as String**

Function: Text rendering font.
Notes:
If the font is a fully qualified X server font name, the font is obtained from an X server. To use a TrueType font, precede the TrueType filename with an @. Otherwise, specify a Postscript font name (e.g. "helvetica").
(Read and Write property)

90.18.25  **Group as Integer**

Function: An undocumented property.
Notes: (Read and Write property)

90.18.26  **Handle as Integer**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The handle used internally by the plugin.
Notes:
A pointer to a ImageInfo structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

90.18.27  **HeaderOnly as Boolean**

Function: True if only the header was read from the image data.
Notes: (Read and Write property)

90.18.28  **Interlace as Integer**

Function: The type of interlacing scheme (default NoInterlace).
Notes:
This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files.
(e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.

**constants:**

- **UndefinedInterlace** 0  Unset value.
- **NoInterlace** 1  Don’t interlace image (RRRRR...GGGG...BBBB...RRRRR...GGGG...BBBB...)
- **LineInterlace** 2  Use scanline interlacing (RRRRR...GGGG...BBBB...RRRRR...GGGG...BBBB...)
- **PlaneInterlace** 3  Use plane interlacing (RRRRR...GGGG...BBBB...)
- **PartitionInterlace** 4  Similar to plane interlacing except that the different planes are saved to individual files (e.g. image.R, image.G, and image.B)

(Read and Write property)

### 90.18.29 Magick as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Image encoding format (e.g. "GIF").  
**Example:**

```vbnet
dim imageinfo as IMImageInfoQ8MBS  
dim blob as string  
dim image as IMImageQ8MBS

// Now lets convert to tiff  
imageinfo.Filename = "image"  
imageinfo.Magick="JPEG"  
imageinfo.Quality = 10 //since we are displaying, lets use highest quality, lowest compression  
blob = image.ImageToBlob(imageinfo)
```

**Notes:**

For more details please check the ImageMagick documentation.  
(Read and Write property)

### 90.18.30 MatteColor as IMColorQ8MBS

**Function:** Image matte (transparent) color.  
**Notes:** (Read and Write property)
90.18.31 Monochrome as Boolean

**Function:** Transform the image to black and white.
**Notes:** (Read and Write property)

90.18.32 Orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The image orientation.
**Notes:**

constants:

```
const UndefinedOrientation = 0
const TopLeftOrientation = 1
const TopRightOrientation = 2
const BottomRightOrientation = 3
const BottomLeftOrientation = 4
const LeftTopOrientation = 5
const RightTopOrientation = 6
const RightBottomOrientation = 7
const LeftBottomOrientation = 8
```

For more details please check the ImageMagick documentation.
(Read and Write property)

90.18.33 Page as String

**Function:** Equivalent size of Postscript page.
**Notes:** (Read and Write property)

90.18.34 PointSize as Double

**Function:** Text rendering font point size.
**Notes:** (Read and Write property)
90.18.35 Preview as Integer

Function: Image manipulation preview option.

Notes:

Used by 'display'.

Constants:

- UndefinedPreview 0
- RotatePreview 1
- ShearPreview 2
- RollPreview 3
- HuePreview 4
- SaturationPreview 5
- BrightnessPreview 6
- GammaPreview 7
- SpiffPreview 8
- DullPreview 9
- GrayscalePreview 10
- QuantizePreview 11
- DespecklePreview 12
- ReduceNoisePreview 13
- AddNoisePreview 14
- SharpenPreview 15
- BlurPreview 16
- ThresholdPreview 17
- EdgeDetectPreview 18
- SpreadPreview 19
- SolarizePreview 20
- ShadePreview 21
- RaisePreview 22
- SegmentPreview 23
- SwirlPreview 24
- ImplodePreview 25
- WavePreview 26
- OilPaintPreview 27
- CharcoalDrawingPreview 28
- JPEGPreview 29

(Read and Write property)
90.18.36  Quality as Integer

**Function:** JPEG/MIFF/PNG compression level. 
**Notes:**  
Default value is 75.  
(Read and Write property)

90.18.37  Release as Boolean

**Function:** If true, the destructor will release the handle.  
**Notes:** (Read and Write property)

90.18.38  ResolutionUnits as Integer

**Function:** Units of image resolution.  
**Notes:**  
constants:

- UndefinedResolution 0  Unset value.  
- PixelsPerInchResolution 1  Density specifications are specified in units of pixels per inch (english units).  
- PixelsPerCentimeterResolution 2  Density specifications are specified in units of pixels per centimeter (metric units).

(Read and Write property)

90.18.39  SamplingFactor as String

**Function:** An undocumented property.  
**Notes:** (Read and Write property)
90.18.40  Scene as Integer

Function: An undocumented property.
Notes: (Read and Write property)

90.18.41  SceneCount as Integer

Function: An undocumented property.
Notes: (Read and Write property)

90.18.42  Scenes as String

Function: An undocumented property.
Notes: (Read and Write property)

90.18.43  ServerName as String

Function: X11 display to display to.
Notes:
obtain fonts from, or to capture image from.
(Read and Write property)

90.18.44  Size as String

Function: Width and height of a raw image (an image which does not support width and height information).
Notes:
Size may also be used to affect the image size read from a multi-resolution format (e.g. Photo CD, JBIG, or JPEG.
(Read and Write property)
90.18.45 Temporary as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Unknown.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

90.18.46 Texture as String

Function: Image filename to use as background texture.
Notes: (Read and Write property)

90.18.47 Type as Integer

Function: The Image type.
Notes:

constants:

- UndefinedType 0
- BilevelType 1
- GrayscaleType 2
- GrayscaleMatteType 3
- PaletteType 4
- PaletteMatteType 5
- TrueColorType 6
- TrueColorMatteType 7
- ColorSeparationType 8
- ColorSeparationMatteType 9
- OptimizeType 10

(Read and Write property)

90.18.48 Verbose as Boolean

Function: Print detailed information about the image if True.
Notes: (Read and Write property)

90.18.49 View as String

**Function:** FlashPix viewing parameters.  
**Notes:** (Read and Write property)
90.19. class IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** A class for an Image Magick Image in memory.
**Notes:**
Can exist with or without pixel data.

For more details please check the ImageMagick documentation.

---

90.19.2 Methods

90.19.3 AdaptiveThreshold(width as Integer, height as Integer, offset as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** AdaptiveThreshold selects an individual threshold for each pixel based on the range of intensity values in its local neighborhood.
**Notes:**
This allows for thresholding of an image whose global intensity histogram doesn’t contain distinctive peaks. Sets the last exception property.

width: The width of the local neighborhood.
height: The height of the local neighborhood.
offset: The mean offset.

For more details please check the ImageMagick documentation.

---

90.19.4 AddNoise(NoiseType as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Adds random noise to the image.
**Notes:**
Constants

For more details please check the ImageMagick documentation.
Sets the last exception property.
90.19.5 AffineTransformImage(matrix as IMImageAffineMatrixQ16MBS) as IMImageQ16MBS

**Function:** Transforms an image as dictated by the affine matrix.

90.19.6 AppendImageToList(img as IMImageQ16MBS)

**Function:** Adds an image to the image list.
**Notes:** For more details please check the ImageMagick documentation.

90.19.7 AutoGammaImage as Boolean

**Function:** AutoGammaImage extract the ‘mean’ from the image and adjust the image to try make set its gamma appropriately.
**Notes:** Returns true on success or false on failure.

90.19.8 AutoGammaImageChannel(ChannelType as Integer) as Boolean

**Function:** AutoGammaImage extract the ‘mean’ from the image and adjust the image to try make set its gamma appropriately.
**Notes:** Returns true on success or false on failure.
channelType: The channels to auto-level. If the special 'SyncChannels' flag is set all given channels is adjusted in the same way using the mean average of those channels.

Constants for channel:

```
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0001
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7fffffff
```

### 90.19.9 AutoLevelImage as Boolean

**Function:** AutoLevelImage adjusts the levels of a particular image channel by scaling the minimum and maximum values to the full quantum range.

**Notes:** Returns true on success or false on failure.

### 90.19.10 AutoLevelImageChannel(ChannelType as Integer) as Boolean

**Function:** AutoLevelImage adjusts the levels of a particular image channel by scaling the minimum and maximum values to the full quantum range.

**Notes:**

Returns true on success or false on failure.

ChannelType: The channels to auto-level. If the special 'SyncChannels' flag is set the min/max/mean value of all given channels is used for all given channels, to all channels in the same way.

Constants for channel:
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0001
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7fffffff

90.19.11 Average as IMImageQ16MBS

Function: The Average() method takes a set of images and averages them together.
Notes:
Each image in the set must have the same width and height. Average() returns a single image with each corresponding pixel component of each image averaged. On failure, a nil image is returned and exception describes the reason for the failure.
Sets the last exception property.

For more details please check the ImageMagick documentation.

90.19.12 BilevelChannel(channel as Integer, threshold as Double) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Changes the value of individual pixels based on the intensity of each pixel channel.
Notes:
The result is a high-contrast image.

channel: The channel type.
threshold: define the threshold values.

Constants for channel:

For more details please check the ImageMagick documentation.
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0001
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7fffffff

90.19.13 BlackThreshold(threshold as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** BlackThreshold is like Threshold but forces all pixels below the threshold into black while leaving all pixels above the threshold unchanged.

**Notes:**

No exceptions are generated.

threshold: Define the threshold value. (ASCII string)

For more details please check the ImageMagick documentation.

90.19.14 BlobSize as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** The expected size for this image written to a file.

**Notes:** For more details please check the ImageMagick documentation.

90.19.15 Blur(radius as Double, sigma as Double) as IMImageQ16MBS

**Function:** Blurs an image.

**Notes:**

We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, the radius should be larger than sigma. Use a radius of 0 and BlurImage selects a suitable radius for you.

radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Gaussian, in pixels.

For more details please check the ImageMagick documentation.

90.19.16 BlurImageChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Blurs an image.

**Notes:**

We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, the radius should be larger than sigma. Use a radius of 0 and BlurImageChannel selects a suitable radius for you.

channel: The channel type.

radius: The radius of the Gaussian, in pixels, not counting the center pixel.

sigma: The standard deviation of the Gaussian, in pixels.

Constants for channel:

```plaintext
const UndefinedChannel    = 0
const RedChannel          = & h0001
const GrayChannel         = & h0001
const CyanChannel         = & h0001
const GreenChannel        = & h0002
const MagentaChannel      = & h0002
const BlueChannel         = & h0004
const YellowChannel       = & h0004
const AlphaChannel        = & h0008
const OpacityChannel      = & h0008
const BlackChannel        = & h0020
const IndexChannel        = & h0020
const AllChannels         = & h7fffffff
```

For more details please check the ImageMagick documentation.
90.19.17 BorderImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS

**Function:** Surrounds the image with a border of the color defined by the bordercolor member of the image.
**Notes:** The width and height of the border are defined by the corresponding parameters.

90.19.18 BrightnessContrastImage(brightness as Double, contrast as Double) as Boolean

**Function:** Changes the brightness and/or contrast of an image. It converts the brightness and contrast parameters into slope and intercept and calls a polynomical function to apply to the image.
**Notes:**
Returns true on success or false on failure.

brightness: the brightness percent (-100 .. 100).
contrast: the contrast percent (-100 .. 100).

90.19.19 BrightnessContrastImageChannel(ChannelType as Integer, brightness as Double, contrast as Double) as Boolean

**Function:** Changes the brightness and/or contrast of an image. It converts the brightness and contrast parameters into slope and intercept and calls a polynomical function to apply to the image.
**Notes:**
Returns true on success or false on failure.

brightness: the brightness percent (-100 .. 100).
contrast: the contrast percent (-100 .. 100).
ChannelType: The channels to use.

Constants for channel:

90.19.20 Charcoal(radius as Double, sigma as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Charcoal creates a new image that is a copy of an existing one with the edge highlighted.
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0002
const GreenChannel = & h0001
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & hfffffff

Notes:
radius: the radius of the pixel neighborhood.
sigma: The standard deviation of the Gaussian, in pixels.

Returns nil on any error.
Sets the last exception property.

90.19.21 Chop(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS

Function: Chop removes a region of an image and collapses the image to occupy the removed portion.
Notes:
Returns nil on any error.
Sets the last exception property.

90.19.22 ClipPath(path as string, inside as boolean) as boolean

Function: Sets the image clip mask based any clipping path information if it exists.
Notes:
Returns true on success and false on any error.
pathname: name of clipping path resource. If name is preceded by #, use clipping path numbered by name.
inside: if true, later operations take effect inside clipping path. Otherwise later operations take effect outside clipping path.

90.19.23 Clone as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Creates a copy of this image object.
Notes: For more details please check the ImageMagick documentation.

90.19.24 CloneImageAttributes(image as IMImageAttributeQ16MBS) as Boolean

Function: CloneImageAttributes() clones one or more image attributes.
Notes: Returns false on any error.

90.19.25 CloneImageProfiles(SourceImage as IMImageQ16MBS) as boolean

Function: Clones one or more image profiles.
Notes: Returns false on any error and true on success.

90.19.26 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The destructor.
Notes:
There is no need to call this method except you want to free all resources used by this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

90.19.27 ClutImage(clutImage as IMImageQ16MBS) as Boolean

Function: Replaces each color value in the given image, by using it as an index to lookup a replacement
color value in a Color Look UP Table in the form of an image.

**Notes:**

The values are extracted along a diagonal of the CLUT image so either a horizontal or vertical gradient image can be used.

Typically this is used to either re-color a gray-scale image according to a color gradient in the CLUT image, or to perform a freeform histogram (level) adjustment according to the (typically gray-scale) gradient in the CLUT image.

When the 'channel' mask includes the matte/alpha transparency channel but one image has no such channel it is assumed that that image is a simple gray-scale image that will effect the alpha channel values, either for gray-scale coloring (with transparent or semi-transparent colors), or a histogram adjustment of existing alpha channel values. If both images have matte channels, direct and normal indexing is applied, which is rarely used.

ClutImage: the color lookup table image for replacement color values.

Returns true on success or false on failure.

### 90.19.28 ClutImageChannel(ChannelType as Integer, clutImage as IMImageQ16MBS) as Boolean

MBS GraphicsMagick Plugin. Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Replaces each color value in the given image, by using it as an index to lookup a replacement color value in a Color Look UP Table in the form of an image.

**Notes:**

The values are extracted along a diagonal of the CLUT image so either a horizontal or vertical gradient image can be used.

Typically this is used to either re-color a gray-scale image according to a color gradient in the CLUT image, or to perform a freeform histogram (level) adjustment according to the (typically gray-scale) gradient in the CLUT image.

When the 'channel' mask includes the matte/alpha transparency channel but one image has no such channel it is assumed that that image is a simple gray-scale image that will effect the alpha channel values, either for gray-scale coloring (with transparent or semi-transparent colors), or a histogram adjustment of existing alpha channel values. If both images have matte channels, direct and normal indexing is applied, which is rarely used.

ClutImage: the color lookup table image for replacement color values.
ChannelType: The channels to use.

Returns true on success or false on failure.

Constants for channel:

```plaintext
const UndefinedChannel = 0
const RedChannel   = & h0001
const GrayChannel  = & h0001
const CyanChannel  = & h0001
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel  = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7fffffff
```

90.19.29 CoalesceImages as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** CoalesceImages composites a set of images while respecting any page offsets and disposal methods.

**Notes:**

GIF, MIFF, and MNG animation sequences typically start with an image background and each subsequent image varies in size and offset. CoalesceImages() returns a new sequence where each image in the sequence is the same size as the first and composited with the next image in the sequence.

Returns nil on any error.

Sets the last exception property.

90.19.30 Colorize(opacity as string, PenColorRed as Integer, PenColorGreen as Integer, PenColorBlue as Integer, PenColorOpacity as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Method ColorizeImage creates a new image that is a copy of an existing one with the image
pixels colorized.

**Notes:**

The colorization is controlled with the pen color and the opacity levels.

opacity: A character string indicating the level of opacity as a percentage (0-100).

PenColorRed, PenColorGreen, PenColorBlue and PenColorOpacity define the pen color used.

Returns nil on any error.
Sets the last exception property.

### 90.19.31 Combine(channel as Integer) as IMImageQ16MBS

**Function:** Combines one or more images into a single image.

**Notes:**

The grayscale value of the pixels of each image in the sequence is assigned in order to the specified channels of the combined image. The typical ordering would be image 1 => Red, 2 => Green, 3 => Blue, etc.

The lastexception property is set.

### 90.19.32 CompareImageLayers(ImageLayerMethod as Integer) as IMImageQ16MBS

**Function:** CompareImageLayers() compares each image with the next in a sequence and returns the minimum bounding region of all the pixel differences (of the mageLayerMethod specified) it discovers.

**Notes:**

Images do NOT have to be the same size, though it is best that all the images are 'coalesced' (images are all the same size, on a flattened canvas, so as to represent exactly how an specific frame should look).

No GIF dispose methods are applied, so GIF animations must be coalesced before applying this image operator to find differences to them.

**ImageLayerMethod:**

the layers type to compare images with. Must be one of... CompareAnyLayer, CompareClearLayer, CompareOverlayLayer.

Can raise an exception.
90.19.33 Composite(CompositeOperator as Integer, Image as IMImageQ16MBS, x as Integer, y as Integer)

**Function:** Returns the second image composited onto the first at the specified offsets.

**Notes:**
- compose: Specifies an image composite operator.
- Image: The second image.
- x: An integer that specifies the column offset of the composited image.
- y: An integer that specifies the row offset of the composited image.

No error code and exception!

90.19.34 ConsolidateCMYKImages as IMImageQ16MBS

**Function:** Consolidates a sequence of CMYK images.

**Notes:**
- Returns nil on any error.
- Sets the last exception property.

90.19.35 ContrastImage(sharpen as boolean) as Boolean

**Function:** Enhances the intensity differences between the lighter and darker elements of the image.

**Notes:**
- Returns true on success or false on failure.
- Set sharpen to true to increase the image contrast otherwise the contrast is reduced.

90.19.36 CopyPicture as picture

**Function:** Copies the Image Magick Image and returns a Realbasic picture.

**Example:**
```realbasic
dim image as IMImageQ16MBS // your image
Canvas1.Backdrop=image.CopyPicture
```
CHAPTER 90. IMAGE MAGICK

Notes:
Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
See also:

* 90.19.37 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

90.19.37 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

Function: Copies a portion of the Image Magick Image and returns a Realbasic picture.
Example:

dim image as IMImageQ16MBS // your image
Canvas1.Backdrop=image.CopyPicture(0,0,image.Width,image.Height)

Notes:
Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
x and y are zero based.
See also:

* 90.19.36 CopyPicture as picture

90.19.38 CopyPictureMask as picture

Function: Copies the mask of the Image Magick Image and returns a Realbasic picture.
Example:

dim image as IMImageQ16MBS // your image
Canvas1.Backdrop=image.CopyPictureMask

Notes:
Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
See also:
90.19.  **CLASS IMIMAGEQ16MBS**

- 90.19.39  **CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture**

**90.19.39  CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture**

**Function:** Copies a portion of the mask of the Image Magick Image and returns a Realbasic picture.  
**Example:**

```basic
Dim image as IMImageQ16MBS // your image
Canvas1.Backdrop = image.CopyPictureMask(0, 0, image.Width, image.Height)
```

**Notes:**

Sets the last exception property.  
Returns nil on any error.  
This method works only for bitmap images.  
x and y are zero based.  
See also:

- 90.19.38  **CopyPictureMask as picture**

**90.19.40  CopyPixel(x as Integer, y as Integer) as IMColorQ16MBS**

**Function:** Copies a pixel.  
**Notes:**

Returns nil on any error.  
This method works only for bitmap images.  
x and y are zero based.

**90.19.41  CreateHBITMAP as Ptr**

MBS GraphicsMagick Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  
**Function:** Creates a HBITMAP for the image for use with Windows Declares.  
**Notes:** The HBITMAP returned needs to be freed when you are done with it or you risk having a memory leak.
90.19.42 **Crop** *(x as Integer, y as Integer, width as Integer, height as Integer)* as IMImageQ16MBS

**Function:** Crop extracts a region of the image starting at the offset defined by geometry.
**Notes:**
Returns nil on any error.
Sets the last exception property.

90.19.43 **CropImageToTiles** *(CropGeometry as string)* as IMImageQ16MBS

**Function:** Crops a single image, into a possible list of tiles.
**Notes:** This may include a single sub-region of the image. This basically applies all the normal geometry flags for Crop.

90.19.44 **CycleColormap** *(displace as Integer)* as boolean

**Function:** Displaces an image’s colormap by a given number of positions.
**Notes:**
If you cycle the colormap a number of times you can produce a psychodelic effect.
Returns true on success.
displace: displace the colormap this amount.

90.19.45 **DecipherImage** *(passkey as string)* as boolean

**Function:** Converts cipher pixels to plain pixels.
**Notes:**
Passkey: decipher cipher pixels with this passphrase.
Returns true on success.

90.19.46 **DeconstructImages** as IMImageQ16MBS

**Function:** DeconstructImages() compares each image with the next in a sequence and returns the minimum
bounding region of all differences from the first image.

**Notes:**
- Returns nil on any error.
- Sets the last exception property.

### 90.19.47 DeleteImageAttribute(key as string) as Boolean

**Function:** DeleteImageAttribute() deletes an attribute from the image.

**Notes:** Returns false on any error.

### 90.19.48 Despeckle() as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Reduces the speckle noise in an image while perserving the edges of the original image.

**Notes:**
- Sets the last exception property.
- For more details please check the ImageMagick documentation.

### 90.19.49 DestroyImage

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Releases the memory used for this image and sets handle to 0.

**Notes:**
- For more details please check the ImageMagick documentation.
- The destructor will call this for you if release=true.

### 90.19.50 DestroyImageAttributes

**Function:** Deallocates memory associated with the image attribute list.

### 90.19.51 DestroyImageList

**Function:** Destroys the image list and sets the handle to 0.
CHAPTER 90. IMAGE MAGICK

Notes:
For more details please check the ImageMagick documentation.
The destructor will call this for you if release=true.

90.19.52 DestroyImageProfiles

Function: Releases memory associated with an image profile map.

90.19.53 DistortImage(DistortImageMethod as Integer, values() as Double, best-fit as boolean) as IMImageQ16MBS

Function: DistortImage() distorts an image using various distortion methods, by mapping color lookups of the source image to a new destination image usually of the same size as the source image, unless 'bestfit' is set to true.
Notes:
If 'bestfit' is enabled, and distortion allows it, the destination image is adjusted to ensure the whole source 'image' will just fit within the final destination image, which will be sized and offset accordingly. Also in many cases the virtual offset of the source image will be taken into account in the mapping.

If the '-verbose' control option has been set print to standard error the equicelent '-fx' formula with coefficients for the function, if practical.

A description of each parameter follows:
self: the image to be distorted.
m: the method of image distortion. ArcDistortion always ignores source image offset, and always 'bestfit' the destination image with the top left corner offset relative to the polar mapping center. Affine, Perspective, and Bilinear, do least squares fitting of the distrotion when more than the minimum number of control point pairs are provided. Perspective, and Bilinear, fall back to a Affine distortion when less than 4 control point pairs are provided. While Affine distortions let you use any number of control point pairs, that is Zero pairs is a No-Op (viewport only) distortion, one pair is a translation and two pairs of control points do a scale-rotate-translate, without any shearing.
values: arguments given.
bestfit: Attempt to 'bestfit' the size of the resulting image. This also forces the resulting image to be a 'layered' virtual canvas image. Can be overridden using 'distort:viewport' setting.

Extra Controls from Image meta-data (artifacts)...

• `-verbose` Output to stderr alternatives, internal coefficients, and FX equivalents for the distortion
operation (if feasible). This forms an extra check of the distortion method, and allows users access to
the internal constants IM calculates for the distortion.

- "distort:viewport" Directly set the output image canvas area and offset to use for the resulting image,
  rather than use the original images canvas, or a calculated 'bestfit' canvas.

- "distort:scale" Scale the size of the output canvas by this amount to provide a method of Zooming,
  and for super-sampling the results.

Other settings that can effect results include

- 'interpolate' For source image lookups (scale enlargements)
- 'filter' Set filter to use for area-resampling (scale shrinking). Set to 'point' to turn off and use 'inter-
  polate' lookup instead

See also:

- 90.19.54 DistortImage(DistortImageMethod as Integer, values() as Double, bestfit as boolean) as IM-
  ImageQ16MBS

90.19.54  DistortImage(DistortImageMethod as Integer, values() as Double, best-
fit as boolean) as IMImageQ16MBS

Function: DistortImage() distorts an image using various distortion methods, by mapping color lookups of
the source image to a new destination image usually of the same size as the source image, unless 'bestfit' is
set to true.
Notes:

If 'bestfit' is enabled, and distortion allows it, the destination image is adjusted to ensure the whole source
'image' will just fit within the final destination image, which will be sized and offset accordingly. Also in
many cases the virtual offset of the source image will be taken into account in the mapping.

If the '-verbose' control option has been set print to standard error the equivalent '-fx' formula with coefficients
for the function, if practical.

A description of each parameter follows:
self: the image to be distorted.
m: the method of image distortion. ArcDistortion always ignores source image offset, and always 'bestfit' the
destination image with the top left corner offset relative to the polar mapping center. Affine, Perspective,
and Bilinear, do least squares fitting of the distortion when more than the minimum number of control point
pairs are provided. Perspective, and Bilinear, fall back to a Affine distortion when less than 4 control point
pairs are provided. While Affine distortions let you use any number of control point pairs, that is Zero
pairs is a No-Op (viewport only) distortion, one pair is a translation and two pairs of control points do a
scale-rotate-translate, without any shearing.
values: arguments given.
bestfit: Attempt to ‘bestfit’ the size of the resulting image. This also forces the resulting image to be a ‘layered’ virtual canvas image. Can be overridden using ‘distort:viewport’ setting.

Extra Controls from Image meta-data (artifacts)...

- "verbose" Output to stderr alternatives, internal coefficients, and FX equivalents for the distortion operation (if feasible). This forms an extra check of the distortion method, and allows users access to the internal constants IM calculates for the distortion.

- "distort:viewport" Directly set the output image canvas area and offset to use for the resulting image, rather than use the original images canvas, or a calculated ‘bestfit’ canvas.

- "distort:scale" Scale the size of the output canvas by this amount to provide a method of Zooming, and for super-sampling the results.

Other settings that can effect results include

- 'interpolate' For source image lookups (scale enlargements)

- 'filter' Set filter to use for area-resampling (scale shrinking). Set to ‘point’ to turn off and use ‘interpolate’ lookup instead

See also:

- 90.19.53 DistortImage(DistortImageMethod as Integer, values() as Double, bestfit as boolean) as IMImageQ16MBS

90.19.55 Edge(radius as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Finds edges in an image.
Notes:
Radius defines the radius of the convolution filter. Use a radius of 0 and Edge selects a suitable radius for you.
Sets the last exception property.

For more details please check the ImageMagick documentation.
90.19.56 Emboss(radius as Double, sigma as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns a grayscale image with a three-dimensional effect.
Notes:
We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and Emboss selects a suitable radius for you.
Sets the last exception property.
For more details please check the ImageMagick documentation.

90.19.57 EncipherImage(passkey as string) as boolean

Function: Converts pixels to cipher-pixels.
Notes:
passkey: encipher pixels with this passphrase.
Returns true on success.

90.19.58 EqualizeImage as Boolean

Function: Applies a histogram equalization to the image.
Notes:
Returns true on success or false on failure.
ChannelType: The channels to use.

90.19.59 EqualizeImageChannel(ChannelType as Integer) as Boolean

Function: Applies a histogram equalization to the image.
Notes:
Returns true on success or false on failure.
ChannelType: The channels to use.
Constants for channel:

```plaintext
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0001
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7fffffff
```

90.19.60 ExcerptImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS

**Function:** Returns a excerpt of the image as defined by the geometry.
**Notes:** Define the region of the image to extend with x, y, width, and height.

90.19.61 ExtentImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS

**Function:** Extends the image as defined by the geometry, gravity, and image background color.
**Notes:**
Define the region of the image to extend with x, y, width, and height.

Set the (x,y) offset of the geometry to move the original image relative to the extended image.

90.19.62 FlattenImages as IMImageQ16MBS

**Function:** Flatten composites all images from the current image pointer to the end of the image list and
returns a single flattened image.

Notes:
Returns nil on any error.
Sets the last exception property.

90.19.63 Flip as IMImageQ16MBS

Function: Flip creates a vertical mirror image by reflecting the pixels around the central x-axis.

Notes:
Returns nil on any error.
Sets the last exception property.

90.19.64 Flop as IMImageQ16MBS

Function: Flop creates a horizontal mirror image by reflecting the pixels around the central y-axis.

Notes:
Returns nil on any error.
Sets the last exception property.

90.19.65 FrameImage(x as Integer, y as Integer, width as Integer, height as Integer, innerBevel as Integer, OuterBevel as Integer) as IMImageQ16MBS

Function: Adds a simulated three-dimensional border around the image.

Notes: The color of the border is defined by the MatteColor of image. Width and height specify the border width of the vertical and horizontal sides of the frame. innerBevel and OuterBevel indicate the width of the inner and outer shadows of the frame.

90.19.66 FxImage(expression as string) as IMImageQ16MBS

Function: FxImage() applies a mathematical expression to the specified image.

Notes: Can raise an exception.
CHAPTER 90. IMAGE MAGICK

90.19.67 GaussianBlurChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Blurs an image.

**Notes:**

We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, the radius should be larger than sigma. Use a radius of 0 and GaussianBlur selects a suitable radius for you.

Sets the last exception property.

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
channel: The channel type.
sigma: the standard deviation of the Gaussian, in pixels.

Constants for channel:

```plaintext
const UndefinedChannel   = 0
const RedChannel         = & h0001
const GrayChannel        = & h0001
const CyanChannel        = & h0001
const GreenChannel       = & h0002
const MagentaChannel     = & h0002
const BlueChannel        = & h0004
const YellowChannel      = & h0004
const AlphaChannel       = & h0008
const OpacityChannel     = & h0008
const BlackChannel       = & h0020
const IndexChannel       = & h0020
const AllChannels        = & h7fffffff
```

For more details please check the ImageMagick documentation.

90.19.68 GetImageAttribute(key as string) as IMImageAttributeQ16MBS

**Function:** GetImageAttribute searches the list of image attributes and returns a reference to the attribute if it exists otherwise nil.
90.19.69 GetImageClippingPathAttribute as IMImageAttributeQ16MBS

Function: GetImageClippingPathAttribute searches the list of image attributes and returns a reference to a clipping path if it exists otherwise nil.

90.19.70 GetImageProfile(name as string) as string

Function: Gets a profile associated with an image by name.
Notes: Returns "" on any error.

90.19.71 GetNextImageAttribute as IMImageAttributeQ16MBS

Function: GetNextImageAttribute() gets the next image attribute.
Notes: Returns nil on any error.

90.19.72 GetNextImageProfile as string

Function: Gets the next profile name for an image.
Notes: Returns "" on any error.

90.19.73 HandleMemory as memoryblock

Function: The content of the whole Image structure copied into a memoryblock.
Notes: Returns nil on any error.

90.19.74 ImagesToBlob(info as IMImageInfoQ16MBS) as String

Function: ImagesToBlob implements direct to memory image formats.
Notes: It returns the image sequence as a string. The magick member of the ImageInfo structure determines the format of the returned blob (GIF, JPEG, PNG, etc.)
Note, some image formats do not permit multiple images to the same image stream (e.g. JPEG). in this instance, just the first image of the sequence is returned as a blob.

Sets the last exception property and returns "" on any error.
For more details please check the ImageMagick documentation.

**90.19.75 ImageToBlob(info as IMImageInfoQ16MBS) as String**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** ImagesToBlob implements direct to memory image formats.

**Example:**

```vbscript
dim im as ImageMagickQ16MBS // global

Function IMPictureToString(p as picture, magick as string, quality as Integer) As string
    dim image as new IMImageQ16MBS
    dim imageinfo as IMImageInfoQ16MBS
    dim s,data as string
    dim impp as new IMMagickPixelPacketQ16MBS

    // empty string for nil picture
    if p = nil then
        Return ""
    end if

    // create a new picture info
    imageinfo = im.NewImageInfo
    imageinfo.ColorSpace=1
    // only color space is needed. 1 for RGB.

    // background color of image
    impp.red = 0
    impp.Green = 0
    impp.Blue = 0

    // creates a new image object
    if not image.NewImage(imageinfo,p.Width,p.Height,impp) then
        Return ""
    end if

    // copy RB picture into IM Image at position 0/0
    image.ColorSpace = 1
    image.SetPicture(p,0,0)
```

/**
 * Set compression data
 * imageinfo.Magick = magick
 * imageinfo.Quality = quality
 *
 * // and rendering intent: 2=PerceptualIntent
 * image.RenderingIntent = 2
 *
 * // create image data
 * data = image.ImageToBlob(imageinfo)
 *
 * // release memory
 * image.DestroyImage
 * imageinfo.DestroyImageInfo
 *
 * // return result
 * Return data
 *
 * Exception
 * // in case of an exception return nothing
 * Return ""
 *
 * End Function
 *

Notes:
It returns the image sequence as a string. The magick member of the ImageInfo structure determines the
format of the returned blob (GIF, JPEG, PNG, etc.)

Note, some image formats do not permit multiple images to the same image stream (e.g. JPEG). in this
instance, just the first image of the sequence is returned as a blob.

Sets the last exception property and returns "" on any error.
For more details please check the ImageMagick documentation.

90.19.76  Implode(factor as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Method ImplodeImage creates a new image that is a copy of an existing one with the image
pixels "implode" by the specified percentage.
Notes:
factor: A double value that defines the extent of the implosion.
CHAPTER 90. IMAGE MAGICK

Returns nil on any error.
Sets the last exception property.

90.19.77  **IsBlobExempt as boolean**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Returns true if the blob is exempt.
**Notes:** For more details please check the ImageMagick documentation.

90.19.78  **IsBlobSeekable as boolean**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Returns true if the blob is seekable.
**Notes:** For more details please check the ImageMagick documentation.

90.19.79  **IsBlobTemporary as boolean**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Returns true if the blob is temporary.
**Notes:** For more details please check the ImageMagick documentation.

90.19.80  **Magnify as IMImageQ16MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** A convenience method that scales an image proportionally to twice its size.
**Notes:**
Sets the last exception property.
For more details please check the ImageMagick documentation.

90.19.81  **MedianFilter(radius as Double) as IMImageQ16MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Applies a digital filter that improves the quality of a noisy image.
**Notes:**
Each pixel is replaced by the median in a set of neighboring pixels as defined by radius.
Sets the last exception property.

For more details please check the ImageMagick documentation.

90.19.82  MergeImageLayers(ImageLayerMethod as Integer) as IMImageQ16MBS

Function: MergeImageLayers() composes all the image layers from the current given image onward to produce a single image of the merged layers.
Notes:
The initial canvas's size depends on the given ImageLayerMethod, and is initialized using the first images background color. The images are then composited onto that image in sequence using the given composition that has been assigned to each individual image.

ImageLayerMethod:
the method of selecting the size of the initial canvas.

MergeLayer: Merge all layers onto a canvas just large enough to hold all the actual images. The virtual canvas of the first image is preserved but otherwise ignored.

FlattenLayer: Use the virtual canvas size of first image. Images which fall outside this canvas is clipped. This can be used to 'fill out' a given virtual canvas.

MosaicLayer: Start with the virtual canvas of the first image, enlarging left and right edges to contain all images. Images with negative offsets will be clipped.

Can raise an exception.

90.19.83  Minify as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: A convenience method that scales an image proportionally to half its size.
Notes:
Sets the last exception property.
For more details please check the ImageMagick documentation.
90.19.84 MosaicImages as IMImageQ16MBS

**Function:** MosaicImages inlays an image sequence to form a single coherent picture.
**Notes:**
- It returns a single image with each image in the sequence composited at the location defined by the page member of the image structure.
- Returns nil on any error.
- Sets the last exception property.

90.19.85 MotionBlur(radius as Double, sigma as Double, angle as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Simulates motion blur.
**Notes:**
- We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and MotionBlur selects a suitable radius for you. Angle gives the angle of the blurring motion.
- Sets the last exception property.

For more details please check the ImageMagick documentation.

90.19.86 NegateImage(gray as boolean = false) as Boolean

**Function:** Negates the colors in the reference image.
**Notes:**
- Returns true on success or false on failure.
- The grayscale option means that only grayscale values within the image are negated.

gray: If true, only negate grayscale pixels within the image.

90.19.87 NegateImageChannel(ChannelType as Integer, gray as boolean = false) as Boolean

**Function:** Negates the colors in the reference image.
Notes:

Returns true on success or false on failure.
The grayscale option means that only grayscale values within the image are negated.

ChannelType: The channels to use.
gray: If true, only negate grayscale pixels within the image.

Constants for channel:

```
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0001
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7ffffff
```

90.19.88 NewImage(info as IMImageInfoQ16MBS, width as Integer, height as Integer, background as IMMagickPixelPacketQ16MBS) as boolean

**Function:** Creates a new image.

**Example:**

```plaintext
dim im as ImageMagickQ16MBS // global
dim p as picture
dim imageinfo as IMImageInfoQ16MBS
dim image as IMImageQ16MBS
dim b as new IMMagickPixelPacketQ16MBS
b.Blue=65535
b.ColorSpace=1 // RGB
b.Depth=16

imageinfo = im.NewImageInfo
imageinfo.Depth=16
imageinfo.ColorSpace=1
```
//this should read any image IM understands
image = new IMImageQ16MBS
if image.NewImage(imageinfo,500,500,b) then
p=NewPicture(300,300,32)
p.Graphics.ForeColor=Rgb(255,0,0)
p.Graphics.FillOval 0,0,300,300
image.SetPicture p,0,0
else
MsgBox "failed"
end if

Notes: Returns false on failure and true on success.

90.19.89 NormalizeImage as Boolean

Function: Enhances the contrast of a color image by mapping the darkest 2 percent of all pixel to black
and the brightest 1 percent to white.
Notes: Returns true on success or false on failure.

90.19.90 NormalizeImageChannel(.ChannelType as Integer) as Boolean

Function: Enhances the contrast of a color image by mapping the darkest 2 percent of all pixel to black
and the brightest 1 percent to white.
Notes: Returns true on success or false on failure.

ChannelType: The channels to auto-level. If the special 'SyncChannels' flag is set the min/max/mean value
of all given channels is used for all given channels, to all channels in the same way.

Constants for channel:

90.19.91 OilPaint(radius as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Method OilPaintImage creates a new image that is a copy of an existing one with each pixel
component replaced with the color of greatest frequency in a circular neighborhood.
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0002
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7fffffff

Notes:

radius parameter: radius of the circular neighborhood.
Returns nil on any error.
Sets the last exception property.

90.19.92 OptimizeImageLayers as IMImageQ16MBS

Function: OptimizeImageLayers() compares each image the GIF disposed forms of the previous image in
the sequence.
Notes:

From this it attempts to select the smallest cropped image to replace each frame, while preserving the results
of the GIF animation.

Can raise an exception.

90.19.93 OptimizeImageTransparency

Function: OptimizeImageTransparency() takes a frame optimized GIF animation, and compares the
overrayed pixels against the disposal image resulting from all the previous frames in the animation.
Notes:

Any pixel that does not change the disposal image (and thus does not effect the outcome of an overlay) is
made transparent.
WARNING: This modifies the current images directly, rather than generate a new image sequence.

Can raise an exception.

**90.19.94 OptimizePlusImageLayers as IMImageQ16MBS**

**Function:** OptimizeImagePlusLayers() is exactly as OptimizeImageLayers(), but may also add or even remove extra frames in the animation, if it improves the total number of pixels in the resulting GIF animation.

**Notes:** Can raise an exception.

**90.19.95 ProfileImage(name as string, ProfileData as string) as boolean**

**Function:** Adds or removes an ICC, IPTC, or generic profile from an image.

**Notes:**
If the ProfileData is "", it is removed from the image otherwise added. Use a name of "*" and a ProfileData of "" to remove all profiles from the image.

Returns false on any error and true on success.

**90.19.96 RadialBlur(angle as Double) as IMImageQ16MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** RadialBlur applies a radial blur to the image.

**Notes:**
angle: The angle of the radial blur.

Sets the last exception property.
For more details please check the ImageMagick documentation.

**90.19.97 RaiseImage(x as Integer, y as Integer, width as Integer, height as Integer, raise as boolean) as boolean**

**Function:** Creates a simulated three-dimensional button-like effect by lightening and darkening the edges
of the image.

Notes:

Width and height define the width of the vertical and horizontal edge of the effect.
raise: A value other than zero creates a 3-D raise effect, otherwise it has a lowered effect.

90.19.98 RandomThresholdChannel(channel as Integer, thresholds as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Changes the value of individual pixels based on the intensity of each pixel compared to a random threshold.

Notes:
The result is a low-contrast, two color image.

channel: The channel or channels to be thresholded.
thresholds: a geometry string containing low,high thresholds. If the string contains 2x2, 3x3, or 4x4, an ordered dither of order 2, 3, or 4 is performed instead. (ASCII string)

Sets the last exception property.

Constants for channel:

    const UndefinedChannel = 0
    const RedChannel = & h0001
    const GrayChannel = & h0001
    const CyanChannel = & h0001
    const GreenChannel = & h0002
    const MagentaChannel = & h0002
    const BlueChannel = & h0004
    const YellowChannel = & h0004
    const AlphaChannel = & h0008
    const OpacityChannel = & h0008
    const BlackChannel = & h0020
    const IndexChannel = & h0020
    const AllChannels = & h7fffffff

For more details please check the ImageMagick documentation.
90.19.99 ReduceNoise(radius as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Smooths the contours of an image while still preserving edge information.
**Notes:**
The algorithm works by replacing each pixel with its neighbor closest in value. A neighbor is defined by radius. Use a radius of 0 and ReduceNoise selects a suitable radius for you.

For more details please check the ImageMagick documentation.

90.19.100 RemoveDuplicateLayers

**Function:** Removes any image that is exactly the same as the next image in the given image list.
**Notes:**
Image size and virtual canvas offset must also match, though not the virtual canvas size itself.

No check is made with regards to image disposal setting, though it is the dispose setting of later image that is kept. Also any time delays are also added together. As such coalesced image animations should still produce the same result, though with duplicate frames merged into a single frame.

90.19.101 RemoveFirstImageFromList as IMImageQ16MBS

**Function:** Removes the first image from the image list and returns the image.
**Notes:**
Returns nil on any error.
For more details please check the ImageMagick documentation.

90.19.102 RemoveImageProfile(name as string) as string

**Function:** Removes a profile from the image-map by its name.
90.19.103 RemoveZeroDelayLayers

Function: Removes any image that as a zero delay time.
Notes:
Such images generally represent intermediate or partial updates in GIF animations used for file optimization. They are not meant to be displayed to users of the animation. Viewable images in an animation should have a time delay of 3 or more centi-seconds (hundredths of a second).

However if all the frames have a zero time delay, then either the animation is as yet incomplete, or it is not a GIF animation. This is a non-sensible situation, so no image will be removed and a 'Zero Time Animation' warning (exception) given.

No warning will be given if no image was removed because all images had an appropriate non-zero time delay set.

Due to the special requirements of GIF disposal handling, GIF animations should be coalesced first, before calling this function, though that is not a requirement.

90.19.104 ResetImageAttributeIterator

Function: ResetImageAttributeIterator() resets the image attributes iterator.
Notes: Use it in conjunction with GetNextImageAttribute() to iterate over all the values associated with an image.

90.19.105 ResetImageProfileIterator

Function: Resets the image profile iterator.
Notes: Use it in conjunction with GetNextImageProfile() to iterate over all the profiles associated with an image.

90.19.106 Resize(width as Integer, height as Integer, FilterID as Integer, blur as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Scales an image to the desired dimensions.
Notes:
Constants for the FilterID:

```plaintext
const PointFilter = 1
const BoxFilter = 2
const TriangleFilter = 3
const HermiteFilter = 4
const HanningFilter = 5
const HammingFilter = 6
const BlackmanFilter = 7
const GaussianFilter = 8
const QuadraticFilter = 9
const CubicFilter = 10
const CatromFilter = 11
const MitchellFilter = 12
const LanczosFilter = 13
const BesselFilter = 14
const SincFilter = 15
```

Most of the filters are FIR (finite impulse response), however, Bessel, Gaussian, and Sinc are IIR (infinite impulse response). Bessel and Sinc are windowed (brought down to zero) with the Blackman filter. Sets the last exception property.

### 90.19.107 RGBTransformImage(Colorspace as Integer) as boolean

**Function:** Method RGBTransformImage converts the reference image from RGB to an alternate colorspace.

**Notes:**
The transformation matrices are not the standard ones: the weights are rescaled to normalized the range of the transformed values to be \[ 0..\text{MaxRGB} \].

- **colorspace:** An integer value that indicates which colorspace to transform the image.

Returns false on any error and true on success.

**constants:**

### 90.19.108 Roll(x as Integer, y as Integer) as IMImageQ16MBS

**Function:** Roll offsets an image as defined by x and y.
90.19.  CLASS IMIMAGEQ16MBS

UndefinedColorspace  0
RGBColorspace       1
GRAYColorspace      2
TransparentColorspace 3
OHTAColorspace      4
LABColorspace       5
XYZColorspace       6
YCbCrColorspace     7
YCCColorspace       8
YIQColorspace       9
YPbPrColorspace    10
YUVColorspace       11
CMYKColorspace     12
sRGBColorspace     13
HSBColorspace      14
HSLColorspace      15
HWBColorspace     16

Notes:
Returns nil on any error.
Sets the last exception property.

90.19.109  Rotate(degrees as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Rotation of an image.
Notes:
Method RotateImage creates a new image that is a rotated copy of an existing one. Positive angles rotate counter-clockwise (right-hand rule), while negative angles rotate clockwise. Rotated images are usually larger than the originals and have 'empty' triangular corners. X axis. Empty triangles left over from shearing the image are filled with the color specified by the image background color. RotateImage allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Method RotateImage is based on the paper "A Fast Algorithm for General Raster Rotatation" by Alan W. Paeth. RotateImage is adapted from a similar method based on the Paeth paper written by Michael Halle of the Spatial Imaging Group, MIT Media Lab.

degrees: Specifies the number of degrees to rotate the image.

Sets the lastexception property.
Returns nil on low memory.
90.19.110  **Sample(width as Integer, height as Integer) as IMImageQ16MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Scales an image to the desired dimensions with pixel sampling.  
**Notes:**  
Unlike other scaling methods, this method does not introduce any additional color into the scaled image.  
For more details please check the ImageMagick documentation.  
Sets the last exception property.

90.19.111  **Scale(width as Integer, height as Integer) as IMImageQ16MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Changes the size of an image to the given dimensions.  
**Example:**  
```
  dim image as IMImageQ16MBS  // your image
  image=Image.Scale(100,80)
```

**Notes:**  
This method was designed by Bob Friesenhahn as a low cost thumbnail generator.

columns: The number of columns in the scaled image.  
rows: The number of rows in the scaled image.

Sets the last exception property.  
For more details please check the ImageMagick documentation.

90.19.112  **SetImageAttribute(key as string, value as string) as boolean**

**Function:** SetImageAttribute searches the list of image attributes and replaces the attribute value.  
**Notes:** If it is not found in the list, the attribute name and value is added to the list. If the attribute exists in the list, the value is concatenated to the attribute. SetImageAttribute returns True if the attribute is successfully concatenated or added to the list, otherwise False. If the value is "", the matching key is deleted from the list.
90.19.113  SetImageColorsspace(Colorspace as Integer) as boolean

**Function:** Sets the colorspace member of the Image structure.
**Notes:** Returns false on any error and true on success.

90.19.114  SetImageProfile(name as string, ProfileData as string) as boolean

**Function:** Adds a named profile to the image.
**Notes:**
If a profile with the same name already exists, it is replaced. This method differs from the ProfileImage() method in that it does not apply CMS color profiles.

name: The profile name.
profiledata: The binary data of the profile.

Returns false on any error and true on success.

90.19.115  SetPicture(pic as picture, x as Integer, y as Integer)

**Function:** Copies the pixels from a given Realbasic picture into the Image Magick Image at the given location.
**Example:**
```vbnet
dim image as IMImageQ16MBS // your image
dim p as picture
p=NewPicture(32,32,32)
p.Graphics.ForeColor=rgb(0,255,0)
p.Graphics.FillRect 0,0,32,32
image.SetPicture(p,30,30)
```

**Notes:**
Sets the last exception property.
The method will do nothing on bad bounds.
This method works only for bitmap images.
x and y are zero based.
90.19.116  **SetPictureMask(maskpic as picture, x as Integer, y as Integer)**

**Function:** Copies the pixels from a given Realbasic picture into the mask of the Image Magick Image at the given location.
**Example:**

```realbasic
dim i as IMImageQ16MBS // your image
dim p as picture

p=NewPicture(32,32,32)
p.Graphics.ForeColor=rgb(0,255,0)
p.Graphics.FillRect 0,0,32,32

i.SetPictureMask(p,30,30)
```

**Notes:**
- Sets the last exception property.
- The method will do nothing on bad bounds.
- This method works only for bitmap images.
- x and y are zero based.
- You may need to set matte=True after this.

90.19.117  **SetPixel(x as Integer, y as Integer, newPixel as IMColorQ16MBS)**

**Function:** Sets a pixel value.
**Example:**

```realbasic
dim image as IMImageQ16MBS // your image
dim co as IMColorQ16MBS

co=new IMColorQ16MBS
co.blue=65535 // max value
image.SetPixel 50,50,co // Makes Pixel 50/50 blue
```

**Notes:**
- The method will fail silently if the values are out of bounds or the image is not a bitmap image.
- This method works only for bitmap images.
x and y are zero based.

90.19.118 Shade(gray as boolean, azimuth as Double, elevation as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Shines a distant light on an image to create a three-dimensional effect.
Notes:
You control the positioning of the light with azimuth and elevation; azimuth is measured in degrees off the x axis and elevation is measured in pixels above the Z axis.
Sets the last exception property.

For more details please check the ImageMagick documentation.

90.19.119 SharpenChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sharpens one or more image channels.
Notes:
We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and Sharpen selects a suitable radius for you.

channel: The channel type.
radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Laplacian, in pixels.

Constants for channel:

Sets the last exception property.
For more details please check the ImageMagick documentation.

90.19.120 Shave(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS

Function: Shave shaves pixels from the image edges.
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0001
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7ffffff

Notes:
It allocates the memory necessary for the new Image structure and returns a pointer to the new image.
Returns nil on any error.
Sets the last exception property.

90.19.121 Shear(Xshear as Double, Yshear as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Method ShearImage creates a new image that is a shear image copy of an existing one.
Notes:
Shearing slides one edge of an image along the X or Y axis, creating a parallelogram. An X direction shear slides an edge along the X axis, while a Y direction shear slides an edge along the Y axis. The amount of the shear is controlled by a shear angle. For X direction shears, xshear is measured relative to the Y axis, and similarly, for Y direction shears yshear is measured relative to the X axis. Empty triangles left over from shearing the image are filled with the color defined by the pixel at location (0,0). ShearImage allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Xshear and Yshear specify the number of degrees to shear the image.

Sets the last exception property.
For more details please check the ImageMagick documentation.

90.19.122 Solarize(factor as Double) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Method SolarizeImage produces a 'solarization' effect seen when exposing a photographic film
to light during the development process.

**Notes:**

factor: An double value that defines the extent of the solarization.
Returns nil on any error.
Sets the last exception property.

---

**90.19.123 Splice(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS**

**Function:** Splice splices a solid color into the image as defined by the geometry.

**Notes:**

Returns nil on any error.
Sets the last exception property.

---

**90.19.124 Spread(radius as Double) as IMImageQ16MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** This is a special effects method that randomly displaces each pixel in a block defined by the radius parameter.

**Notes:**

radius: Choose a random pixel in a neighborhood of this extent.
Sets the last exception property.

For more details please check the ImageMagick documentation.

---

**90.19.125 Stegano(watermarkImage as IMImageQ16MBS) as IMImageQ16MBS**

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Method SteganoImage hides a digital watermark within the image.

**Notes:**

Returns nil on any error.
Sets the last exception property.
90.19.126  Stereo(otherImage as IMImageQ16MBS) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Method StereoImage combines two images and produces a single image that is the composite of a left and right image of a stereo pair.
Notes: The left image is converted to gray scale and written to the red channel of the stereo image. The right image is converted to gray scale and written to the blue channel of the stereo image. View the composite image with red-blue glasses to create a stereo effect.

left image = self
right image = otherImage parameter

Returns nil on any error.
Sets the last exception property.

90.19.127  Swirl(degrees as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Method SwirlImage creates a new image that is a copy of an existing one with the image pixels "swirl" at a specified angle.
Notes: degrees: An double value that defines the tightness of the swirling.

Returns nil on any error.
Sets the last exception property.

90.19.128  Thumbnail(width as Integer, height as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Changes the size of an image to the given dimensions.
Notes: Sets the last exception property.
This method was designed by Bob Friesenhahn as a low cost thumbnail generator.
For more details please check the ImageMagick documentation.
90.19.129 TransformImage(CropGeometry as string, ImageGeometry as string) as boolean

Function: TransformImage() is a convenience method that behaves like ResizeImage() or CropImage() but accepts scaling and/or cropping information as a region geometry specification. If the operation fails, the original image handle is left as is.
Notes:
This should only be used for single images.

CropGeometry: A crop geometry string. This geometry defines a subregion of the image to crop.
ImageGeometry: An image geometry string. This geometry defines the final size of the image.

Returns true on success.

90.19.130 TransformImages(CropGeometry as string, ImageGeometry as string) as boolean

Function: TransformImages() calls TransformImage() on each image of a sequence.
Notes:
TransformImage() is a convenience method that behaves like ResizeImage() or CropImage() but accepts scaling and/or cropping information as a region geometry specification. If the operation fails, the original image handle is left as is.

CropGeometry: A crop geometry string. This geometry defines a subregion of the image to crop.
ImageGeometry: An image geometry string. This geometry defines the final size of the image.

Returns true on success.

90.19.131 TransformRGBImage(Colorspace as Integer) as boolean

Function: Method TransformRGBImage converts the reference image from an alternate colorspace.
Notes:
The transformation matrices are not the standard ones: the weights are rescaled to normalized the range of the transformed values to be [ 0..MaxRGB ] .

colorspace: An integer value that indicates the colorspace the image is currently in. On return the image is
in the RGB color space.

Returns false on any error and true on success.

constants:

```
UndefinedColorspace  0
RGBColorspace      1
GRAYColorspace     2
TransparentColorspace  3
OHTAColorspace     4
LABColorspace      5
XYZColorspace      6
YCbCrColorspace    7
YCCColorspace      8
YIQColorspace      9
YPbPrColorspace   10
YUVColorspace      11
CMYKColorspace    12
sRGBColorspace    13
HSBColorspace     14
HSLColorspace     15
HWBColorspace     16
```

### 90.19.132 TransposeImage as IMImageQ16MBS

**Function:** TransposeImage() creates a horizontal mirror image by reflecting the pixels around the central y-axis while rotating them by 90 degrees.

### 90.19.133 TransverseImage as IMImageQ16MBS

**Function:** TransverseImage() creates a vertical mirror image by reflecting the pixels around the central x-axis while rotating them by 270 degrees.

### 90.19.134 Trim as IMImageQ16MBS

**Function:** Trim trims pixels from the image edges.
Notes:
It allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Returns nil on any error.
Sets the last exception property.

90.19.135 UnsharpMaskChannel(channel as Integer, radius as Double, sigma as Double, amount as Double, threshold as Double) as IMImageQ16MBS

Function: Sharpens one or more image channels.
Notes:
We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and UnsharpMask selects a suitable radius for you.

Constants for channel:

- const UndefinedChannel = 0
- const RedChannel = & h0001
- const GrayChannel = & h0001
- const CyanChannel = & h0001
- const GreenChannel = & h0002
- const MagentaChannel = & h0002
- const BlueChannel = & h0004
- const YellowChannel = & h0004
- const AlphaChannel = & h0008
- const OpacityChannel = & h0008
- const BlackChannel = & h0020
- const IndexChannel = & h0020
- const AllChannels = & h7fffffff

Sets the last exception property.
For more details please check the ImageMagick documentation.

90.19.136 Wave(amplitude as Double, wavelength as Double) as IMImageQ16MBS

Function: Method Wave creates a new image that is a copy of an existing one with the image pixels altered
along a sine wave.

**Notes:**

Parameters are double values that indicates the amplitude and wavelength of the sine wave.
Returns nil on any error.
Sets the last exception property.

### 90.19.137 WhiteThreshold(threshold as string) as boolean

**MBS GraphicsMagick Plugin, Plugin Version:** 5.1, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes.

**Function:** WhiteThreshold is like Threshold but forces all pixels above the threshold into white while leaving all pixels below the threshold unchanged.

**Notes:**

No exceptions are generated.
threshold: Define the threshold value. (ASCII string)
For more details please check the ImageMagick documentation.

### 90.19.138 WriteImage(info as IMImageInfoQ16MBS) as boolean

**MBS GraphicsMagick Plugin, Plugin Version:** 5.2, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes.

**Function:** Method WriteImage writes an image to a file as defined by image.filename.

**Notes:**

You can specify a particular image format by prefixing the file with the image type and a colon (i.e. ps:image) or specify the image type as the filename suffix (i.e. image.ps). The image may be modified to adapt it to the requirements of the image format. For example, DirectClass images must be color-reduced to PseudoClass if the format is GIF.

WriteImage returns True if the image is written. False is returned if there is a memory shortage or if the image file fails to write.

### 90.19.139 Properties

### 90.19.140 BackgroundColor as IMColorQ16MBS

**MBS GraphicsMagick Plugin, Plugin Version:** 5.2, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes.

**Function:** Image background color.

**Notes:** (Read and Write property)
90.19.141 Bias as Double

Function: An undocumented property.
Notes: (Read and Write property)

90.19.142 BlurFactor as Double

Function: Blur factor to apply to the image when zooming. Default is 1.0 (no blur).
Notes: (Read and Write property)

90.19.143 BorderColor as IMColorQ16MBS

Function: Image border color.
Notes: (Read and Write property)

90.19.144 Colors as Integer

Function: The desired number of colors.
Notes:
Used by Quantize().
(Read and Write property)

90.19.145 ColorSpace as Integer

Function: Image pixel interpretation.
Notes:
If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

constants:
## 90.19.146 Compression as Integer

**Function:** Image compression type.

**Notes:**

useful constants:

```plaintext
const UndefinedCompression = 0
const NoCompression = 1
const BZipCompression = 2
const FaxCompression = 3
const Group4Compression = 4
const JPEGCompression = 5
const LosslessJPEGCompression = 6
const LZWCompression = 7
const RLECompression = 8
const ZipCompression = 9
```

The default is the compression type of the specified image file.
For more details please check the ImageMagick documentation.

(Read and Write property)
90.19.147  Depth as Integer

**Function:** Image depth (8 or 16).
**Notes:**
QuantumLeap must be defined before a depth of 16 is valid.
(Read and Write property)

90.19.148  Directory as String

**Function:** Tile names from within an image montage.
**Notes:**
Only valid after calling MontageImages() or reading a MIFF file which contains a directory.
(Read and Write property)

90.19.149  Endian as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Console & Web:457.150  Filename as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The file path/name.
**Notes:**
The string must be in the encoding of the library and is limited to 4000 bytes.
For more details please check the ImageMagick documentation.

## Endian as Integer

**Constants:**

<table>
<thead>
<tr>
<th>Endian Type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>UndefinedEndian</td>
<td>0</td>
</tr>
<tr>
<td>LSBEndian</td>
<td>1     (Windows)</td>
</tr>
<tr>
<td>MSBEndian</td>
<td>2     (Mac)</td>
</tr>
</tbody>
</table>

e.g. tiff files support different endian settings.
(Read and Write property)
90.19.151 Filter as Integer

**Function:** Filter to use when resizing image.

**Notes:**

Constants:

- `const PointFilter = 1`
- `const BoxFilter = 2`
- `const TriangleFilter = 3`
- `const HermiteFilter = 4`
- `const HanningFilter = 5`
- `const HammingFilter = 6`
- `const BlackmanFilter = 7`
- `const GaussianFilter = 8`
- `const QuadraticFilter = 9`
- `const CubicFilter = 10`
- `const CatromFilter = 11`
- `const MitchellFilter = 12`
- `const LanczosFilter = 13`
- `const BesselFilter = 14`
- `const SincFilter = 15`

The reduction filter employed has a significant effect on the time required to resize an image and the resulting quality. The default filter is Lanczos which has been shown to produce high quality results when reducing most images.

(Read and Write property)

90.19.152 Fuzz as Double

**Function:** Colors within this distance are considered equal.

**Notes:**

A number of algorithms search for a target color. By default the color must be exact. Use this to match colors that are close to the target color in RGB space.

(Read and Write property)
90.19.153  Gamma as Double

**Function:** Gamma level of the image.
**Notes:**
The same color image displayed on two different workstations may look different due to differences in the display monitor. Use gamma correction to adjust for this color difference.
(Read and Write property)

90.19.154  Geometry as String

**Function:** Preferred size of the image when encoding.
**Notes:** (Read and Write property)

90.19.155  Gravity as Integer

**Function:** An undocumented property.
**Notes:** (Read and Write property)

90.19.156  Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The handle used internally by the plugin.
**Notes:**
A pointer to an Image structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

90.19.157  Height as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The height of the image in pixels.
**Notes:**
For more details please check the ImageMagick documentation.
(Read and Write property)
90.19.158 Interlace as Integer

**Function:** The type of interlacing scheme (default NoInterlace).

**Notes:**
This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files (e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.

**Constants:**

- UndefinedInterlace 0 Unset value.
- NoInterlace 1 Don’t interlace image (RGBRGBRGBRGBRGBRGB...)
- LineInterlace 2 Use scanline interlacing (RRR...GGG...BBB...RRR...GGG...BBB...)
- PlaneInterlace 3 Use plane interlacing (RRRRRR...GGGGGG...BBBBBB...)
- PartitionInterlace 4 Similar to plane interlacing except that the different planes are saved to individual files (e.g. image.R, image.G, and image.B)

(Read and Write property)

90.19.159 LastError as Integer

**Function:** The last error code reported.

**Notes:**
If an exception is raised and it is not a warning exception, this exception code is saved in this property.

(Read and Write property)

90.19.160 LastException as IMExceptionQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** The last exception thrown by the Image Magick library.

**Notes:**
You should check this value after every call to the library, process the error and set the property to nil.

For more details please check the ImageMagick documentation.

(Read and Write property)
90.19.161  Magick as String

Function: Image encoding format (e.g. "GIF").
Notes: (Read and Write property)

90.19.162  Matte as Boolean

Function: Whether an alpha channel is used/present.
Notes: Set to true to enable masks.
(Read and Write property)

90.19.163  MatteColor as IMColorQ16MBS

Function: Image matte (transparent) color.
Notes: (Read and Write property)

90.19.164  Montage as String

Function: Tile size and offset within an image montage. Only valid for montage images.
Notes: (Read and Write property)

90.19.165  Offset as Integer

Function: Number of initial bytes to skip over when reading raw image.
Notes: (Read and Write property)
**90.19.166 Orientation as Integer**

**Function:** The image orientation.

**Notes:**

**constants:**

\[
\begin{align*}
\text{const UndefinedOrientation} &= 0 \\
\text{const TopLeftOrientation} &= 1 \\
\text{const TopRightOrientation} &= 2 \\
\text{const BottomRightOrientation} &= 3 \\
\text{const BottomLeftOrientation} &= 4 \\
\text{const LeftTopOrientation} &= 5 \\
\text{const RightTopOrientation} &= 6 \\
\text{const RightBottomOrientation} &= 7 \\
\text{const LeftBottomOrientation} &= 8
\end{align*}
\]

For more details please check the ImageMagick documentation.
(Read and Write property)

**90.19.167 Quality as Integer**

**Function:** JPEG/MIFF/PNG compression level.

**Example:**

```vba
dim im as ImageMagickQ16MBS // global

Function TestJPEG(f as folderitem) As picture
    // Reads an image, compresses in memory to JPEG, decompresses using JPEGlib and returns the image
    // if quality setting works, you see it in the result.
    // no error checking included!

    // needs: im as ImageMagickQ16MBS ready initialized

    dim image as IMImageQ16MBS
    dim imageinfo as IMImageInfoQ16MBS
    dim s, blob as string
    dim p as Picture
    dim i as Integer

    if f = nil then
        Return nil
    end if
```
imageinfo = im.NewImageInfo

# if TargetWin32 then //do not use shellpath, if spaces, IM doesn’t like escaped paths
imageinfo.Filename = f.AbsolutePath
# else
imageinfo.Filename = f.UnixpathMBS
# endif

//this should read any image IM understands
image = im.ReadImage(imageinfo)
//check for error
if im.lastexception <> nil and im.LastException.Severity >= 400 then
s = ”LastError: ”+Format(im.LastError,”-0“)+” - Severity: ”+str(im.LastException.Severity)+EndOfLine+im.LastException.Reason
MsgBox s
Return nil
elseif image = nil then
MsgBox ”image=nil”
Return nil
end if

// Now lets convert to jpeg
imageinfo.Filename = ”image.jpg”
imageinfo.Quality = 10 // 100 is max
blob = image.ImageToBlob(imageinfo)

// It may fail
if blob.lenb = 0 then
Return nil
end if
p = JPEGStringToPictureMBS(blob,true)

image.DestroyImage
imageinfo.DestroyImageInfo

Return p
Exception
Return nil
End Function

Notes:
Default value is 75.
(Read and Write property)
90.19.168  Release as Boolean

Function: If true, the destructor will release the handle.
Notes: (Read and Write property)

90.19.169  RenderingIntent as Integer

Function: The rendering intent to use.
Notes: 
constants:

UndefinedIntent 0
SaturationIntent 1
PerceptualIntent 2
AbsoluteIntent 3
RelativeIntent 4

(Read and Write property)

90.19.170  ResolutionUnits as Integer

Function: Units of image resolution.
Notes: 
constants:

UndefinedResolution 0  Unset value.
PixelsPerInchResolution 1  Density specifications are specified in units of pixels per inch (english units).
PixelsPerCentimeterResolution 2  Density specifications are specified in units of pixels per centimeter (metric units).

(Read and Write property)
### 90.19.171 ResolutionX as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** The horizontal resolution of the image.

**Notes:**

The unit for resolution must be specified.
For more details please check the ImageMagick documentation.

(Read and Write property)

### 90.19.172 ResolutionY as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** The vertical resolution of the image.

**Notes:**

The unit for resolution must be specified.
For more details please check the ImageMagick documentation.

(Read and Write property)

### 90.19.173 Scene as Integer

**Function:** An undocumented property.

**Notes:** (Read and Write property)

### 90.19.174 StorageClass as Integer

**Function:** Image storage class.

**Notes:**

If DirectClass then the image packets contain valid RGB or CMYK colors. If PseudoClass then the image has a colormap referenced by pixel’s index member.

**Constants:**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UndefinedClass</td>
<td>0</td>
<td>Unset value.</td>
</tr>
<tr>
<td>DirectClass</td>
<td>1</td>
<td>Image is composed of pixels which represent literal color values.</td>
</tr>
<tr>
<td>PseudoClass</td>
<td>2</td>
<td>Image is composed of pixels which specify an index in a color palette.</td>
</tr>
</tbody>
</table>
90.19.175  Taint as Boolean

**Function:** Set to True if the image pixels have been modified.  
**Notes:** (Read and Write property)

90.19.176  Width as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** The width of the image in pixels.  
**Notes:**  
For more details please check the ImageMagick documentation.  
(Read and Write property)

90.19.177  Constants

90.19.178  kAffineDistortion = 1

MBS GraphicsMagick Plugin, Plugin Version: 12.5.  
**Function:** One of the distortion effect constants.

90.19.252  \texttt{kVoronoiColorInterpolate = & h00000012}

MBS GraphicsMagick Plugin, Plugin Version: 12.5. \textbf{Function:} One of the interpolate method constants. See also:

- 90.19.251 \texttt{kVoronoiColorInterpolate = & h00000012}
90.20  class IMImageQ32MBS

90.20.1  class IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: A class for an Image Magick Image in memory.
Notes:
Can exist with or without pixel data.

For more details please check the ImageMagick documentation.

90.20.2  Methods

90.20.3  AdaptiveThreshold(width as Integer, height as Integer, offset as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: AdaptiveThreshold selects an individual threshold for each pixel based on the range of intensity values in its local neighborhood.
Notes:
This allows for thresholding of an image whose global intensity histogram doesn’t contain distinctive peaks. Sets the last exception property.

width: The width of the local neighborhood.
height: The height of the local neighborhood.
offset: The mean offset.

For more details please check the ImageMagick documentation.

90.20.4  AddNoise(NoiseType as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds random noise to the image.
Notes:
Constants

For more details please check the ImageMagick documentation.
Sets the last exception property.
CHAPTER 90. IMAGE MAGICK

UndefinedNoise = 0
UniformNoise = 1
GaussianNoise = 2
MultiplicativeGaussianNoise = 3
ImpulseNoise = 4
LaplacianNoise = 5
PoissonNoise = 6

90.20.5 AffineTransformImage(matrix as IMImageAffineMatrixQ32MBS) as IMImageQ32MBS

Function: Transforms an image as dictated by the affine matrix.

90.20.6 AppendImageToList(img as IMImageQ32MBS)

Function: Adds an image to the image list.
Notes: For more details please check the ImageMagick documentation.

90.20.7 AutoGammaImage as Boolean

Function: AutoGammaImage extract the 'mean' from the image and adjust the image to try make set its gamma appropriatally.
Notes: Returns true on success or false on failure.

90.20.8 AutoGammaImageChannel(ChannelType as Integer) as Boolean

Function: AutoGammaImage extract the 'mean' from the image and adjust the image to try make set its gamma appropriatally.
Notes: Returns true on success or false on failure.
channelType: The channels to auto-level. If the special 'SyncChannels' flag is set all given channels is adjusted in the same way using the mean average of those channels.

Constants for channel:

```c
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0001
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7fffffff
```

90.20.9  AutoLevelImage as Boolean

**Function:** AutoLevelImage adjusts the levels of a particular image channel by scaling the minimum and maximum values to the full quantum range.
**Notes:** Returns true on success or false on failure.

90.20.10  AutoLevelImageChannel(ChannelType as Integer) as Boolean

**Function:** AutoLevelImage adjusts the levels of a particular image channel by scaling the minimum and maximum values to the full quantum range.
**Notes:** Returns true on success or false on failure.

ChannelType: The channels to auto-level. If the special 'SyncChannels' flag is set the min/max/mean value of all given channels is used for all given channels, to all channels in the same way.

Constants for channel:
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0001
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7fffffff

90.20.11 Average as IMImageQ32MBS

Function: The Average() method takes a set of images and averages them together.
Notes:
Each image in the set must have the same width and height. Average() returns a single image with each corresponding pixel component of each image averaged. On failure, a nil image is returned and exception describes the reason for the failure.
Sets the last exception property.

For more details please check the ImageMagick documentation.

90.20.12 BilevelChannel(channel as Integer, threshold as Double) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Changes the value of individual pixels based on the intensity of each pixel channel.
Notes:
The result is a high-contrast image.
channel: The channel type.
threshold: define the threshold values.

Constants for channel:

For more details please check the ImageMagick documentation.
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0001
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7fffffff

90.20.13  BlackThreshold(threshold as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** BlackThreshold is like Threshold but forces all pixels below the threshold into black while leaving all pixels above the threshold unchanged.
**Notes:**
No exceptions are generated.
threshold: Define the threshold value. (ASCII string)
For more details please check the ImageMagick documentation.

90.20.14  BlobSize as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The expected size for this image written to a file.
**Notes:** For more details please check the ImageMagick documentation.

90.20.15  Blur(radius as Double, sigma as Double) as IMImageQ32MBS

**Function:** Blurs an image.
**Notes:**
We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, the radius should be larger than sigma. Use a radius of 0 and BlurImage selects a suitable radius for you.

radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Gaussian, in pixels.

For more details please check the ImageMagick documentation.

90.20.16 BlurImageChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Blurs an image.

**Notes:**

We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, the radius should be larger than sigma. Use a radius of 0 and BlurImageChannel selects a suitable radius for you.

channel: The channel type.
radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Gaussian, in pixels.

Constants for channel:

```plaintext
const UndefinedChannel = 0
const RedChannel = & h0001
const GrayChannel = & h0001
const CyanChannel = & h0001
const GreenChannel = & h0002
const MagentaChannel = & h0002
const BlueChannel = & h0004
const YellowChannel = & h0004
const AlphaChannel = & h0008
const OpacityChannel = & h0008
const BlackChannel = & h0020
const IndexChannel = & h0020
const AllChannels = & h7fffffff
```

For more details please check the ImageMagick documentation.
90.20.17  BorderImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ32MBS

Function: Surrounds the image with a border of the color defined by the bordercolor member of the image.
Notes: The width and height of the border are defined by the corresponding parameters.

90.20.18  BrightnessContrastImage(brightness as Double, contrast as Double) as Boolean

Function: Changes the brightness and/or contrast of an image. It converts the brightness and contrast
parameters into slope and intercept and calls a polynomial function to apply to the image.
Notes:
Returns true on success or false on failure.

brightness: the brightness percent (-100 .. 100).
contrast: the contrast percent (-100 .. 100).

90.20.19  BrightnessContrastImageChannel(ChannelType as Integer, brightness as Double, contrast as Double) as Boolean
