MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.  
**Notes:**  
Adjusts the white balance of the live view image at the specified position  
This command is supported only in live view mode.

25.4.19  kEdsCameraCommand_DoEvfAf = & h00000102

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.  
**Notes:**  
 Controls auto focus in live view mode.  
This command is supported by the EOS 50D or EOS 5D Mark II or later cameras, and only in live view mode.

25.4.20  kEdsCameraCommand_DriveLensEvf = & h00000103

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.  
**Notes:**  
Drives the lens and adjusts focus  
This command is supported only in live view mode.

25.4.21  kEdsCameraCommand_EvfAf_OFF = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.

25.4.22  kEdsCameraCommand_EvfAf_ON = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.
25.4.23  kEdsCameraCommand_ExtendShutdownTimer = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.  **Notes:** Requests to extend the time for the auto shut-off timer. (Keep Device On)

25.4.24  kEdsCameraCommand_PressShutterButton = 4

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.  **Notes:**
Controls shutter button operations.
This command is supported by the EOS 50D or EOS 5D Mark II or later cameras.

25.4.25  kEdsCameraCommand_ShutterButton_Completely = 3

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.

25.4.26  kEdsCameraCommand_ShutterButton_Completely_NonAF = \& h00010003

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.

25.4.27  kEdsCameraCommand_ShutterButton_Halfway = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.

25.4.28  kEdsCameraCommand_ShutterButton_Halfway_NonAF = \& h00010001

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.

25.4.29  kEdsCameraCommand_ShutterButton_OFF = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.
25.4.30  kEdsCameraCommand_TakePicture = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.
**Notes:** Requests the camera to shoot.

25.4.31  kEdsCameraStatusCommand_EnterDirectTransfer = 2

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera status commands.

25.4.32  kEdsCameraStatusCommand_ExitDirectTransfer = 3

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera status commands.

25.4.33  kEdsCameraStatusCommandUILayout = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera status commands.

25.4.34  kEdsCameraStatusCommand_UIUnlock = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera status commands.

25.4.35  kEdsProgressOption_Done = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Progress Option Constants
**Notes:** Call a progress callback function when the progress reaches 100% .

25.4.36  kEdsProgressOption_NoReport = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Progress Option Constants
**Notes:** Do not call a progress callback function.
25.4.37  kEdsProgressOption_Periodically = 2

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Progress Option Constants
**Notes:** Call a progress callback function periodically.
25.5 class EdsCameraStateEventHandlerMBS

25.5.1 class EdsCameraStateEventHandlerMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class to receive camera state events.

25.5.2 Methods

25.5.3 Add(camera as EdsCameraMBS, CameraStateEvent as UInt32)

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Designate event for receiving events related to camera object states.
**Notes:** Lasterror is set.

25.5.4 Constructor

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates an event handler object.
**Notes:** You can later add objects to it.
See also:

- 25.5.5 Constructor(camera as EdsCameraMBS, CameraStateEvent as UInt32) 4146

25.5.5 Constructor(camera as EdsCameraMBS, CameraStateEvent as UInt32)

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Designate event for receiving events related to camera object states.
**Notes:** Lasterror is set.
See also:

- 25.5.4 Constructor 4146

25.5.6 Events

25.5.7StateChanged(StateEvent as UInt32, EventData as UInt32) as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Called when the state changed.
**Notes:**
StateEvent: Indicate the event type supplemented. Designate one of the event types subject to supplementation, as designated by Constructor/Add. Events that occur can be determined based on the event type.

Returns EDS_ERR_OK if successful. In other cases, see the EDS Error Lists.
25.6 class EdsDeviceInfoMBS

25.6.1 class EdsDeviceInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for device information.

25.6.2 Properties

25.6.3 DeviceDescription as String

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The device name. **Notes:** (Read and Write property)

25.6.4 deviceSubType as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The device subtype. **Notes:**

- Canon PTP cameras: 1
- Canon PTP-IP cameras: 2

If the camera involved in PTP communication is connected to a Windows computer on which WIA is installed, 0 is specified in DeviceSubType, representing standard Windows PTP. **(Read and Write property)**

25.6.5 PortName as String

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The port name. **Notes:** (Read and Write property)

25.6.6 reserved as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reserved for the future.
25.6. CLASS EDSDEVICEINFOMBS

Notes: (Read and Write property)
25.7 class EdsDirectoryItemInfoMBS

25.7.1 class EdsDirectoryItemInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This class represents directory item information for the memory card in the camera.

25.7.2 Properties

25.7.3 DateTime as UInt32

MBS Cameras Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The date and time value. **Notes:** New in 2.11 SDK. (Read and Write property)

25.7.4 FileName as String

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the directory name or file name if successful. **Notes:** Example: "_MG_0060.JPG" (Read and Write property)

25.7.5 Format as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the directory item type. **Notes:** See kEdsImageType* constants. (Read and Write property)

25.7.6 GroupID as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The group ID for this file.
25.7. CLASS EDSDIRECTORYITEMINFOMBS

Notes:
A non-zero integer. The same group ID is assigned to files that belong to the same group, such as RAW+JPEG images or RAW+AVI images.
(Read and Write property)

25.7.7 IsFolder as Boolean

Function: Whether this is a folder.
Notes:
If a folder: True
If not a folder: False
(Read and Write property)

25.7.8 Option as UInt32

Function: The option property.
Notes:
An option when a direct transfer request is received (a kEdsObjectEvent_DirItemRequestTransferDT event).
kEdsTransferOptionToDesktop is set when [Wallpaper] in the direct transfer is executed by means of camera operations.
Prohibit it under other timing conditions.
(Read and Write property)

25.7.9 Size as UInt64

Function: The file size.
Notes:
For folders, the file size is indicated as 0.
(Read and Write property)
25.7.10 Constants

25.7.11 kEdsImageType_CR2 = 6
MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the image type constants. **Notes:** CR2

25.7.12 kEdsImageType_CRW = 2
MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the image type constants. **Notes:** CRW

25.7.13 kEdsImageType_Jpeg = 1
MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the image type constants. **Notes:** JPEG

25.7.14 kEdsImageType_RAW = 4
MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the image type constants. **Notes:** RAW

25.7.15 kEdsImageType_Unknown = 0
MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the image type constants. **Notes:** Unknown
25.8. **CLASS EDSDIRECTORYITEMMBS**

25.8. **class EdsDirectoryItemMBS**

25.8.1. **class EdsDirectoryItemMBS**

**Function:** This object represents a file or folder on the camera.

**Notes:**

When files are downloaded from the camera, each file to be downloaded is treated as one of these objects.

Subclass of the EdsBaseMBS class.

25.8.2. **Methods**

25.8.3. **Child(index as UInt32) as EdsDirectoryItemMBS**

**Function:** Gets an indexed child object of the designated object.

**Notes:**

Index is 0 based and range from 0 to ChildCount-1.

Lasterror is set.

25.8.4. **DeleteDirectoryItem**

**Function:** Deletes a camera folder or file.

**Notes:**

If folders with subdirectories are designated, all files are deleted except protected files.

Don’t use the object after you deleted it.

Lasterror is set.

25.8.5. **DirectoryItemInfo as EdsDirectoryItemInfoMBS**

**Function:** Gets information about the directory or file objects on the memory card (volume) in a remote camera.

**Notes:**

Lasterror is set.

Returns nil on any error.
25.8.6 Download(ReadSize as UInt64, stream as EdsStreamMBS)

**Function:** Downloads a file on a remote camera (in the camera memory or on a memory card) to the host computer.
**Notes:**
The downloaded file is sent directly to a file stream created in advance.
When dividing the file being retrieved, call this API repeatedly. Also in this case, make the data block size a multiple of 512 (bytes), excluding the final block.

ReadSize: Designate the size in bytes to download.
stream: Specifies the destination stream.

Lasterror is set.

25.8.7 DownloadCancel

**Function:** Must be executed when downloading of a directory item is canceled.
**Notes:**
Calling this API makes the camera cancel file transmission. It also releases resources.
This operation need not be executed when using DownloadThumbnail.
Lasterror is set.
In applications that take locally released images on the camera and load them on host computer, if the application receives a file transfer request from the camera when the file is not needed (by means of kEdsObjectEvent.DirItemRequestTransfer or kEdsObjectEvent.DirItemRequestTransferDT), this API must be called to notify the camera that transmission has been canceled.
Normally, delete callback function registration at the moment an event is not needed.

25.8.8 DownloadComplete

**Function:** Must be called when downloading of directory items is complete.
**Notes:**
Executing this API makes the camera recognize that file transmission is complete.
This operation need not be executed when using DownloadThumbnail.
Lasterror is set.
If transfer of a file that was divided is canceled, call DownloadCancel instead of this API to notify the camera that downloading of the directory item has been canceled.

### 25.8.9 DownloadThumbnail(stream as EdsStreamMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Extracts and downloads thumbnail information from image files in a camera. **Notes:**

Thumbnail information in the camera’s image files is downloaded to the host computer. Downloaded thumbnails are sent directly to a file stream created in advance.

- **stream:** Designate the stream for saving extracted thumbnails.
- **Lasterror** is set.

### 25.8.10 Parent as EdsDirectoryItemMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the parent object of the designated object. **Notes:** Lasterror is set.

### 25.8.11 Properties

### 25.8.12 FileAttributes as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets attributes of files on a camera. **Example:**

```vbnet
dim d as EdsDirectoryItemMBS 'your directory item
dim a as Integer = d.FileAttributes
if bitwiseAnd(a, d.kEdsFileAttribute_ReadOnly)<>0 then
    msgbox "ReadOnly."
end if
```

**Notes:**

Returns the file attributes.

As for the file attributes, OR values of the value defined by kEdsFileAttribute* constants can be retrieved. Thus, when determining the file attributes, you must check if an attribute flag is set for target attributes.
Use BitwiseAnd to check for different flags. Lasterror is set.

If you assign value, this property changes attributes of files on a camera. (Read and Write computed property)

### 25.8.13 Constants

#### 25.8.14 kEdsFileAttribute_Archive = & h20

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file attribute constants. **Notes:** Archive attribute

#### 25.8.15 kEdsFileAttribute_Hidden = 2

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file attribute constants. **Notes:** Hidden attribute

#### 25.8.16 kEdsFileAttribute_Normal = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file attribute constants. **Notes:** A standard file

#### 25.8.17 kEdsFileAttribute_ReadOnly = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file attribute constants. **Notes:** Read-only

#### 25.8.18 kEdsFileAttribute_System = 4

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file attribute constants. **Notes:** System attribute
25.9. **CLASS EDSEVFIMAGEMBS**

25.9  **class EdsEvfImageMBS**

25.9.1  **class EdsEvfImageMBS**

**Function:** This object represents PC live view image data.

**Notes:**

When using a camera model that supports live view, live view image data set can be downloaded from the camera. Information such as zoom and histogram data is included with image data.

Subclass of the EdsBaseMBS class.

25.9.2  **Methods**

25.9.3  **Constructor(stream as EdsStreamMBS, OldSDK as boolean = false)**

**Function:** Creates an object used to get the live view image data set.

**Notes:**

Lasterror is set.

See EdsCreateEvfImageRef in the SDK documentation.

If you use 2.11 SDK, please pass OldSDK=false. If you use 2.10 SDK, please pass OldSDK=true. The two SDKs handle this function differently, so you need to tell the plugin which SDK you use. Using wrong value will likely lead to a crash.
25.10 class EdsFocusInfoMBS

25.10.1 class EdsFocusInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This class represents focus information. **Notes:** It stores kEdsPropID_FocusInfo property data.

25.10.2 Methods

25.10.3 FocusPoint(index as Integer) as EdsFocusPointMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The array of focus points. **Notes:** Index from 0 to 127, but of course lower than PointNumber.

25.10.4 Properties

25.10.5 ExecuteMode as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The execute mode. **Notes:** (Read and Write property)

25.10.6 ImageRect as EdsRectMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The rectangle of the image. **Notes:** (Read and Write property)

25.10.7 PointNumber as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Number of frames. **Notes:** (Read and Write property)
25.11. CLASS EDSFOCUSPOINTMBS

25.11  class EdsFocusPointMBS

25.11.1  class EdsFocusPointMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This class represents the AF frame information of focus information. **Notes:** It stores AF frame information of the kEdsPropID_FocusInfo property.

25.11.2  Properties

25.11.3  JustFocus as Boolean

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the frame is just focus. **Notes:** (Read and Write property)

25.11.4  Rect as EdsRectMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The rectangle of the frame. **Notes:** (Read and Write property)

25.11.5  Reserved as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reserved. **Notes:** (Read and Write property)

25.11.6  Selected as Boolean

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Wether the point is selected. **Notes:** (Read and Write property)
25.11.7 Valid as Boolean

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** True if the frame is valid.

**Notes:** (Read and Write property)
25.12. CLASS EDSIMAGEINFOMBS

25.12 class EdsImageInfoMBS

25.12.1 class EdsImageInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: This class represents various information found in image data.

25.12.2 Properties

25.12.3 componentDepth as UInt32

25.12.4 effectiveRect as EdsRectMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The effective image rectangle. Notes: This means the area excluding the black bands on the top and bottom of the thumbnail image. (Read and Write property)

25.12.5 height as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The image height in pixels. Notes: (Read and Write property)

25.12.6 numOfComponents as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Number of color components in image. Notes: (Read and Write property)
25.12.7 reserved1 as UInt32

Notes: (Read and Write property)

25.12.8 reserved2 as UInt32

Notes: (Read and Write property)

25.12.9 width as UInt32

Notes: (Read and Write property)
25.13. CLASS EDSIMAGEMBS

25.13 class EdsImageMBS

25.13.1 class EdsImageMBS

Function: This object represents image data.
Notes:
This data is obtained from image files. This object is used to retrieve and control information included with
an image such as thumbnails and parameters.
Subclass of the EdsBaseMBS class.

25.13.2 Methods

25.13.3 CacheImage(UseCache as boolean)

Function: Switches a setting on and off for creation of an image cache in the SDK for a designated image
object during extraction (processing) of the image data.
Notes:
Creating the cache increases the processing speed, starting from the second time.
UseCache: Image Cache on/off.
LastError is set.

25.13.4 Constructor(stream as EdsImageMBS)

Function: Creates an image object from an image file.
Notes:
Without modification, stream objects cannot be worked with as images. Thus, when extracting images from
image files, you must use this API to create image objects.
The image object created this way can be used to get image information (such as the height and width,
number of color components, and resolution), thumbnail image data, and the image data itself.
LastError is set.

25.13.5 DateTime as EdsTimeMBS

Function: Convenience function to query date and time values.
Notes:
Calls GetPropertyData for you with kEdsPropID_DateTime. Lasterror is set.

25.13.6 **FocusInfo as EdsFocusInfoMBS**

**Function:** Convenience function to query focus information.

**Notes:**
This queries kEdsPropID_FocusInfo with GetPropertyData for you and returns an EdsFocusInfoMBS object.

25.13.7 **Image(ImageSource as Integer, TargetImageType as Integer, Source as EdsRectMBS, Dest as EdsSizeMBS, DestStream as EdsStreamMBS)**

**Function:** Gets designated image data from an image file, in the form of a designated rectangle.

**Notes:**
Returns uncompressed results for JPEG compressed images and processed results in the designated pixel order (RGB, Top-down BGR, and so on) for RAW images. Additionally, by designating the input/output rectangle, it is possible to get reduced, enlarged, or partial images. However, because images corresponding to the designated output rectangle are always returned by the SDK, the SDK does not take the aspect ratio into account. To maintain the aspect ratio, you must keep the aspect ratio in mind when designating the rectangle. Lasterror is set.

**ImageSource:** Designate the type of image data to get from the image file (thumbnail, preview, and so on). Designate values as defined in kEdsImageSrc* constants.

**TargetImageType:** Designate the output image type. Because the output format of EdsGetImage may only be RGB, only kEdsTargetImageType_RGB or kEdsTargetImageType_RGB16 can be designated.

However, image types exceeding the resolution of ImageSource cannot be designated.

**Example:** Suppose the source image resolution (componentDepth) retrieved by means of ImageInfo() is 8 bits
- > The resolution that can be retrieved by means of Image () is also 8 bits
- > Thus, only kEdsTargetImageType_RGB is available.

**Source:** Designate the coordinates and size of the rectangle to be retrieved (processed) from the source image.
**Dest:** Designate the rectangle size for output.
**DestStream:** Designate the memory or file stream for output of the image.

Lasterror is set.
• To maintain the aspect ratio, you must keep the aspect ratio in mind when designating a rectangle.
• In calculating the data size of the output file, the original image data resolution is not used.

Instead, the resolution of the image type designated by inImageType is used. For example, the calculation for kEdsTargetImageType_RGB is \(3 \times (R, G, \text{and } B) \times 8\) (resolution) \(\times\) width \(\times\) height \(8\) (bytes). Similarly, kEdsTargetImageType_RGB16 is calculated by \(3 \times 16 \times\) width \(\times\) height \(8\) (bytes).

### 25.13.8 ImageInfo(ImageSource as Integer) as EdsImageInfoMBS

**Function:** Gets image information from a designated image object. 
**Notes:**
Here, image information means the image width and height, number of color components, resolution, and effective image area. Lasterror is set.

### 25.13.9 PictureStyleDesc as EdsPictureStyleDescMBS

**Function:** Convenience function to query Picture Style Description information. 
**Notes:**
Calls GetPropertyData for you with kEdsPropID_PictureStyleDesc and returns object with values. Lasterror is set.

### 25.13.10 ReflectImageProperty

**Function:** Incorporates image object property changes (effected by means of EdsSetPropertyData) in the stream. 
**Notes:** Lasterror is set.

### 25.13.11 SaveImage(TargetImageType as Integer, DestStream as EdsStreamMBS, JPEGQuality as Integer = 0, iccProfileStream as EdsStreamMBS)

**Function:** Saves as a designated image type after RAW processing. 
**Notes:**
TargetImageType: Designate the image type to produce. Designate the following image types. See kEdsTargetImageType* constants.
JPEGQuality: Image quality for JPEG compression
iccProfileStream: ICC profile stream.

Lasterror is set.

25.13.12 Constants

25.13.13 kEdsImageSrc_FullView = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the image source constants.
**Notes:** The image itself (a full-sized image)

25.13.14 kEdsImageSrc_Preview = 2

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the image source constants.
**Notes:** A preview image

25.13.15 kEdsImageSrc_RAWFullView = 4

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the image source constants.
**Notes:** A RAW full-sized image

25.13.16 kEdsImageSrc_RAWThumbnail = 3

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the image source constants.
**Notes:** A RAW thumbnail image

25.13.17 kEdsImageSrc_Thumbnail = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the image source constants.
**Notes:** A thumbnail image
25.13.18 kEdsTargetImageType_DIB = 11

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the target image type constants.  
**Notes:** Device Independent Bitmap

25.13.19 kEdsTargetImageType_JPEG = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the target image type constants.  
**Notes:** JPEG

25.13.20 kEdsTargetImageType_RGB = 9

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the target image type constants.  
**Notes:** 8-bit RGB, chunky format

25.13.21 kEdsTargetImageType_RGB16 = 10

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the target image type constants.  
**Notes:** 16-bit RGB, chunky format

25.13.22 kEdsTargetImageType_TIFF = 7

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the target image type constants.  
**Notes:** 8-bit TIFF

25.13.23 kEdsTargetImageType_TIFF16 = 8

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the target image type constants.  
**Notes:** 16-bit TIFF

25.13.24 kEdsTargetImageType_Unknown = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the target image type constants.  
**Notes:** Folder, or unknown image type
25.14 module EDSModuleMBS

25.14.1 module EDSModuleMBS

Function: The main module for the EDS SDK.
Notes:
Please get a copy of the SDK with the manual, so you can lookup some details.
The documentation coming with the plugin shows the classes and some specifics for Real Studio, but not all
the details.

Typically SDK functions return a EdsError value. The plugin gives you that value by lasterror properties.

25.14.2 Methods

25.14.3 GetCameraList as EdsCameraListMBS

Function: Gets camera list objects.
Notes:
Lasterror is set.
Returns the camera list object or nil.

25.14.4 GetEvent

Function: This function acquires an event.
Notes:
In console application, please call this function regularly to acquire the event from a camera.
Lasterror is set.

25.14.5 Initialize

Function: Initializes the libraries.
Notes:
When using the EDSDK libraries, you must call this API once before using EDSDK APIs.
Lasterror is set.
25.14.6 Lasterror as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last error code of any EDS function in all the classes.

25.14.7 LoadLibrary(file as folderitem, IsVersion2 as Boolean) as boolean

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads the SDK. **Example:**

```vba
dim file as FolderItem

// find DLL in application folder
if TargetWin32 then
    file = GetFolderItem("EDSDK.dll")
else if TargetMacOS then
    // find Framework in inside frameworks folder in app bundle

    file = frameworks.Child("EDSDK.framework")
else
    MsgBox "not supported."
end if

// load framework or DLL
if EDSModuleMBS.LoadLibrary(file) then
    // continue
end if
```

**Notes:**

Pass folderitem for framework on Mac or DLL on Windows. Returns true on success. After loading, you need to call Initialize method.

If you use 2.x SDK, please set IsVersion2 to true. For 3.x SDK, please set IsVersion2 to false. The 3.x SDK uses 64-bit integer, while the older one uses 32-bit integers. Using wrong switch, you get wrong numbers. See also:
25.14.8 LoadLibrary(path as string, IsVersion2 as Boolean) as boolean

**Function:** Loads the SDK.

**Notes:**
- Pass path for framework on Mac or DLL on Windows.
- Returns true on success.
- After loading, you need to call Initialize method.

If you use 2.x SDK, please set IsVersion2 to true.
For 3.x SDK, please set IsVersion2 to false.
The 3.x SDK uses 64-bit integer, while the older one uses 32-bit integers.
Using wrong switch, you get wrong numbers.
See also:

- 25.14.7 LoadLibrary(file as folderitem, IsVersion2 as Boolean) as boolean

25.14.9 Terminate

**Function:** Terminates use of the libraries.

**Notes:**
- Calling this function releases all resources allocated by the libraries.
- Lasterror is set.

25.15  CLASS EDSOBJECTEVENTHANDLERMBS

25.15  class EdsObjectEventHandlerMBS

25.15.1  class EdsObjectEventHandlerMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class to watch for object events.

25.15.2  Methods

25.15.3  Add(camera as EdsBaseMBS, ObjectEvent as UInt32)

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Registers event handler to listen for object events. **Notes:** Lasterror is set.

25.15.4  Constructor

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Constructor to create object event handler. **Notes:** You can add objects to watch for events later. See also:

• 25.15.5 Constructor(camera as EdsBaseMBS, ObjectEvent as UInt32)

25.15.5  Constructor(camera as EdsBaseMBS, ObjectEvent as UInt32)

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates object event handler and registers it to listen object events. **Notes:** Lasterror is set. See also:

• 25.15.4 Constructor

25.15.6  Events

25.15.7  ObjectChanged(EventCode as Integer, obj as EdsBaseMBS) as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when an object changed. **Notes:**
obj: The target object.

Return EDS_ERR_OK if successful. In other cases, see the EDS Error Lists.
25.16. **CLASS EDSPICTURERESTYLEDESCMBS**

### 25.16.1 class EdsPictureStyleDescMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Use this class when retrieving picture styles.

### 25.16.2 Properties

#### 25.16.3 ColorTone as Int32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Color tone.  
**Notes:** An integer from 4 to 4. (Read and Write property)

#### 25.16.4 Contrast as Int32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Contrast setting.  
**Notes:** An integer from 4 to 4. (Read and Write property)

#### 25.16.5 FilterEffect as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Monochrome filter effect  
**Notes:**  
0: None  
1: Yellow  
2: Orange  
3: Red  
4: Green  
& hFFFFFFFE: Unknown  
(Read and Write property)
25.16.6 Saturation as Int32

Function: The saturation value.
Notes: An integer from 4 to 4.
(Read and Write property)

25.16.7 sharpFineness as UInt32

Function: The sharp fineness value.
Notes: Only for 3.x SDK.
(Read and Write property)

25.16.8 Sharpness as UInt32

Function: The Sharpness value.
Notes: An integer from 0 to 7.
(Read and Write property)

25.16.9 sharpThreshold as UInt32

Function: The sharp threshold value.
Notes: Only for 3.x SDK.
(Read and Write property)

25.16.10 ToningEffect as UInt32

Function: Monochrome tone.
Notes:
0: None
1: Sepia
2: Blue
3: Violet
(Read and Write property)
25.17 class EdsPointMBS

25.17.1 class EdsPointMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This class is generally used to represent a set of coordinates.

25.17.2 Properties

25.17.3 X as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The x value.  
**Notes:** (Read and Write property)

25.17.4 Y as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The y value.  
**Notes:** (Read and Write property)
25.18. class EdsProgressMBS

25.18.1 class EdsProgressMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for progress event.  
**Notes:** Please make subclass or put it on a window to receive events.

25.18.2 Events

25.18.3 Progress(Percent as UInt32, byref Cancel as boolean) as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The progress event.  
**Notes:**  
Percent: Indicates the progress in a range of 0 - 100%.  
Cancel: To cancel processing in progress, set this variable to true.

For example, if this argument is set to true during file transfer from the camera, the EDSDK notifies the camera that file transfer has been canceled, and transfer of those files is canceled.

Return EDS_ERR_OK (0) if everything is okay.

25.18.4 Constants

25.18.5 kEdsProgressOption.Done = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Progress Option Constants  
**Notes:** Call a progress callback function when the progress reaches 100%.

25.18.6 kEdsProgressOption.NoReport = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Progress Option Constants  
**Notes:** Do not call a progress callback function.
25.18.7 kEdsProgressOption_Periodically = 2

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Progress Option Constants
**Notes:** Call a progress callback function periodically.
25.19. **CLASS EdsPropertyEventHandlerMBS**

25.19  **class EdsPropertyEventHandlerMBS**

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a property event handler.

25.19.2  **Methods**

25.19.3  **Add(camera as EdsCameraMBS, PropertyEvent as UInt32)**

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Registers this event handler to report property events for the given camera. **Notes:** Lasterror is set.

25.19.4  **Constructor**

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Constructor to create property event handler. **Notes:** You can add cameras to watch for properties later. See also:

- 25.19.5 Constructor(camera as EdsCameraMBS, PropertyEvent as UInt32)

25.19.5  **Constructor(camera as EdsCameraMBS, PropertyEvent as UInt32)**

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Constructor to create property event handler and registers this event handler to report property events for the given camera. **Notes:** Lasterror is set. See also:

- 25.19.4 Constructor
25.19.6 Events

25.19.7 PropertyChanged(PropertyEvent as UInt32, PropertyID as UInt32, Param as UInt32) as Integer

Notes:

PropertyEvent: Indicate the event type supplemented. Designate one of the event types subject to supplementation, as designated by EdsSetPropertyEventHandler. Events that occur can be determined based on the event type.

PropertyID: Returns the property ID created by the event.

Param: Used to identify information created by the event for custom function (CF) properties or other properties that have multiple items of information.

Returns EDS.ERR_OK if successful. In other cases, see the EDS Error Lists.
25.20  class EdsRationalMBS

25.20.1  class EdsRationalMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This class is generally used to represent fractions.  
**Notes:** It is used with many properties such as kEdsPropID_Av and kEdsPropID_Tv.

25.20.2  Properties

25.20.3  denominator as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The denominator part of the fraction.  
**Notes:** (Read and Write property)

25.20.4  numerator as Int32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The numerator part of the fraction.  
**Notes:** (Read and Write property)
25.21 class EdsRectMBS

25.21.1 class EdsRectMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: This class is generally used to indicate the coordinates of a rectangle.

25.21.2 Properties

25.21.3 Height as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The height of the rectangle. Notes: (Read and Write property)

25.21.4 Point as EdsPointMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Get or set the location of the rectangle. Notes: (Read and Write property)

25.21.5 Size as EdsSizeMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Get or set the size of the rectangle. Notes: (Read and Write property)

25.21.6 Width as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The width of the rectangle. Notes: (Read and Write property)

25.21.7 X as Integer

25.21. CLASS EDSRECTMBS

Notes: (Read and Write property)

25.21.8 Y as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The y position. **Notes:** (Read and Write property)
25.22 class EdsSizeMBS

25.22.1 class EdsSizeMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This class generally represents the width and height of a rectangle.

25.22.2 Properties

25.22.3 Height as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The height value.  
**Notes:** (Read and Write property)

25.22.4 Width as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width value.  
**Notes:** (Read and Write property)
25.23. class EdsStreamMBS

25.23.1 class EdsStreamMBS

**Function:** The class for a file/data stream.  
**Notes:**  
Use it to specify a destination for downloading image data or as source for reading data.  
Subclass of the EdsBaseMBS class.

25.23.2 Methods

25.23.3 Constructor(data as string)

**Function:** Creates a stream from the memory buffer you prepared.  
**Notes:**  
Unlike the buffer size of streams created by means of EdsCreateMemoryStream, the buffer size you prepare for streams created this way does not expand.

Lasterror is set.

See also:

- 25.23.4 Constructor(Memory as Memoryblock, size as Int64 = -1, offset as Integer = 0)  
- 25.23.5 Constructor(path as folderitem, CreateDisposition as Integer, DesiredAccess as Integer)  
- 25.23.6 Constructor(path as string, CreateDisposition as Integer, DesiredAccess as Integer)  
- 25.23.7 Constructor(size as UInt64)

25.23.4 Constructor(Memory as Memoryblock, size as Int64 = -1, offset as Integer = 0)

**Function:** Creates a stream from the memory buffer you prepare.  
**Notes:**  
Unlike the buffer size of streams created by means of CreateMemoryStream, the buffer size you prepare for streams created this way does not expand.

Lasterror is set.

See also:

- 25.23.3 Constructor(data as string)

Function: Creates a new file on a host computer (or opens an existing file) and creates a file stream for access to the file.

Notes:

If a new file is designated before executing this API, the file is actually created following the timing of writing by means of EdsWrite or the like with respect to an open stream.

path: Designate the file name of a new file or a file to open.

CreateDisposition: Designate how the file is handled (that is, its disposition) if it exists or does not exist. Designate a value defined in kEdsFileCreateDisposition*.

DesiredAccess: Pass kEdsAccess_Read, kEdsAccess_Write or kEdsAccess_ReadWrite. Lasterror is set.

See also:

- 25.23.3 Constructor(data as string) 4237
- 25.23.4 Constructor(Memory as Memoryblock, size as Int64 = -1, offset as Integer = 0) 4237
- 25.23.6 Constructor(path as string, CreateDisposition as Integer, DesiredAccess as Integer) 4238
- 25.23.7 Constructor(size as UInt64) 4239
25.23. **CLASS EDSSTREAMMBS**

Lasterror is set.

See also:

- 25.23.3 Constructor(data as string)
- 25.23.4 Constructor(Memory as Memoryblock, size as Int64 = -1, offset as Integer = 0)
- 25.23.5 Constructor(path as folderitem, CreateDisposition as Integer, DesiredAccess as Integer)
- 25.23.7 Constructor(size as UInt64)

25.23.7 **Constructor(size as UInt64)**

**Function:** Creates a stream in the memory of a host computer.

**Notes:**
In the case of writing in excess of the allocated buffer size, the memory is automatically extended.
Lasterror is set.

See also:

- 25.23.3 Constructor(data as string)
- 25.23.4 Constructor(Memory as Memoryblock, size as Int64 = -1, offset as Integer = 0)
- 25.23.5 Constructor(path as folderitem, CreateDisposition as Integer, DesiredAccess as Integer)
- 25.23.6 Constructor(path as string, CreateDisposition as Integer, DesiredAccess as Integer)

25.23.8 **CopyData(WriteSize as UInt64, outStream as EdsStreamMBS)**

**Function:** Copies data from the copy source stream to the copy destination stream.

**Notes:**
The read or write position of the data to copy is determined from the current file read or write position of the respective stream.
After this API is executed, the read or write positions of the copy source and copy destination streams are moved an amount corresponding to WriteSize in the positive direction.
Lasterror is set.

25.23.9 **CreateEvfImageRef as EdsEvfImageMBS**

**Function:** Creates an object used to get the live view image data set.

**Notes:**
Lasterror is set.
See EdsCreateEvfImageRef in the SDK documentation.

### 25.23.10 CreateFileStream(path as folderitem, CreateDisposition as Integer, DesiredAccess as Integer) as EdsStreamMBS

**Function:** Creates a new file on a host computer (or opens an existing file) and creates a file stream for access to the file.
**Notes:**
If a new file is designated before executing this API, the file is actually created following the timing of writing by means of EdsWrite or the like with respect to an open stream.

- **path:** Designate the file name of a new file or a file to open.
- **CreateDisposition:** Designate how the file is handled (that is, its disposition) if it exists or does not exist. Designate a value defined in kEdsFileCreateDisposition*.
- **DesiredAccess:** Pass kEdsAccess_Read, kEdsAccess_Write or kEdsAccess_ReadWrite.
- **Lasterror** is set.

See also:
- 25.23.11 CreateFileStream(path as string, CreateDisposition as Integer, DesiredAccess as Integer) as EdsStreamMBS

### 25.23.11 CreateFileStream(path as string, CreateDisposition as Integer, DesiredAccess as Integer) as EdsStreamMBS

**Function:** Creates a new file on a host computer (or opens an existing file) and creates a file stream for access to the file.
**Notes:**
If a new file is designated before executing this API, the file is actually created following the timing of writing by means of EdsWrite or the like with respect to an open stream.

- **path:** Designate the file name of a new file or a file to open.
- **CreateDisposition:** Designate how the file is handled (that is, its disposition) if it exists or does not exist. Designate a value defined in kEdsFileCreateDisposition*.
- **DesiredAccess:** Pass kEdsAccess_Read, kEdsAccess_Write or kEdsAccess_ReadWrite.
- **Lasterror** is set.

See also:
- 25.23.10 CreateFileStream(path as folderitem, CreateDisposition as Integer, DesiredAccess as Integer) as EdsStreamMBS
25.23. **CLASS EDSSTREAMMBS**

### 25.23.12 CreateImage as EdsImageMBS

**Function:** Creates an image object from an image file.

**Notes:**

Without modification, stream objects cannot be worked with as images. Thus, when extracting images from image files, you must use this API to create image objects.

The image object created this way can be used to get image information (such as the height and width, number of color components, and resolution), thumbnail image data, and the image data itself. Lasterror is set.

### 25.23.13 CreateMemoryStream(size as UInt32) as EdsStreamMBS

**Function:** Creates a stream in the memory of a host computer.

**Notes:**

In the case of writing in excess of the allocated buffer size, the memory is automatically extended. Lasterror is set.

### 25.23.14 CreateMemoryStreamFromMemoryblock(Memory as Memoryblock, size as Integer = -1, offset as Integer = 0) as EdsStreamMBS

**Function:** Creates a stream from the memory buffer you prepare.

**Notes:**

Unlike the buffer size of streams created by means of CreateMemoryStream, the buffer size you prepare for streams created this way does not expand. Lasterror is set.

### 25.23.15 CreateMemoryStreamFromString(data as string) as EdsStreamMBS

**Function:** Creates a stream from the memory buffer you prepared.

**Notes:**

Unlike the buffer size of streams created by means of CreateMemoryStream, the buffer size you prepare for streams created this way does not expand. Lasterror is set.
25.23.16 Length as UInt64

Function: Gets the stream size.
Notes:
Returns the number of bytes of the stream.
LastError is set.

25.23.17 Pointer as Ptr

Function: Gets the pointer to the start address of memory managed by the memory stream.
Notes:
As the EDSDK automatically resizes the buffer, the memory stream provides you with the same access methods as for the file stream. If access is attempted that is excessive with regard to the buffer size for the stream, data before the required buffer size is allocated is copied internally, and new writing occurs. Thus, the buffer pointer might be switched on an unknown timing. Caution in use is therefore advised.
LastError is set.

25.23.18 Position as UInt64

Function: Gets the current read or write position of the stream (that is, the file position indicator).
Notes:
Returns the current read or write position of the stream (that is, to the offset position from the beginning of the stream). (The beginning of the stream is 0.)
LastError is set.

The stream’s initial read or write position is 0. If Write or Read is used to write or read from the stream, the indicator is moved an amount corresponding to that size in the positive direction.
When intentionally changing the read or write position of the stream, use Seek.

25.23.19 Read(size as UInt64) as string

Function: Reads data with given maximum length into the buffer, starting at the current read or write position of the stream.
Notes:
The size of data actually read can be slower. Lasterror is set.

25.23.20 Seek(Offset as Int64, origin as Integer)

**Function:** Moves the read or write position of the stream (that is, the file position indicator). 
**Notes:**
- Offset: Designate the number of bytes to move the file position indicator. 
- Origin: Designate the origin for moving from the read or write position. Designate any of the following, as defined in constant kEdsSeek*.
- Lasterror is set.

25.23.21 Write(Data as string) as UInt64

**Function:** Writes data of a designated buffer to the current read or write position of the stream. 
**Notes:**
- Lasterror is set. 
- Returns number of bytes written.

25.23.22 Constants

25.23.23 kEdsAccess_Error = -1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file access constants. 
**Notes:** Error

25.23.24 kEdsAccess_Read = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file access constants. 
**Notes:** Open a read-only stream.
25.23.25  kEdsAccess_ReadWrite = 2

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file access constants.  
**Notes:** Allow reading and writing.

25.23.26  kEdsAccess_Write = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file access constants.  
**Notes:** Open a write-only stream.

25.23.27  kEdsFileCreateDisposition_CreateAlways = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file create disposition constants.  
**Notes:** Creates a new file. If the designated file already exists, that file is overwritten and existing attributes is erased.

25.23.28  kEdsFileCreateDisposition_CreateNew = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file create disposition constants.  
**Notes:** Creates a new file. An error occurs if the designated file already exists.

25.23.29  kEdsFileCreateDisposition_OpenAlways = 3

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file create disposition constants.  
**Notes:** If the file exists, it is opened. If the designated file does not exist, a new file is created.

25.23.30  kEdsFileCreateDisposition_OpenExisting = 2

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file create disposition constants.  
**Notes:** Opens a file. An error occurs if the designated file does not exist.

25.23.31  kEdsFileCreateDisposition_TruncateExisting = 4

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the file create disposition constants.  
**Notes:** Opens a file and sets the file size to 0 bytes.
25.23. CLASS EDSSTREAMMBS

25.23.32 kEdsSeek_Begin = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the seek origin constants.  
**Notes:** Moves the file position indicator from the beginning of the stream forward by inOffset bytes.

25.23.33 kEdsSeek_Cur = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the seek origin constants.  
**Notes:** Moves the file position indicator from the current position in the stream forward by inOffset bytes.

25.23.34 kEdsSeek_End = 2

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the seek origin constants.  
**Notes:**  
Moves the file position indicator from the end of the stream by offset bytes.  
To move toward the beginning, designate a negative value.  
Positive values will move the indicator beyond the end of the file.
25.24 class EdsTimeMBS

25.24.1 class EdsTimeMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This class represents the camera time or the shooting date of an image. **Notes:** It is used to store kEdsPropID_DateTime property data.

25.24.2 Methods

25.24.3 Date as Date

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convenience function to return the same date as a Real Studio date object.

25.24.4 Properties

25.24.5 Day as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The day value. **Notes:** Value from 1 to 31. (Read and Write property)

25.24.6 Hour as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The hour value. **Notes:** Value from 0 to 23. (Read and Write property)

25.24.7 Milliseconds as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The millisecond value.
25.24. **CLASS EDSTIMEMBS**

**Notes:** (Read and Write property)

### 25.24.8 Minute as UInt32

**Function:** The minute value.

**Notes:**
Value from 0 to 59.
(Read and Write property)

### 25.24.9 Month as UInt32

**Function:** The month value.

**Notes:**
1=January, 2=February, ...
Value from 1 to 12.
(Read and Write property)

### 25.24.10 Second as UInt32

**Function:** The second value.

**Notes:**
Value from 0 to 59.
(Read and Write property)

### 25.24.11 Year as UInt32

**Function:** The year value.

**Notes:**
This is a 4 digit year number.
(Read and Write property)
25.25 class EdsVolumeInfoMBS

25.25.1 class EdsVolumeInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for volume information.

25.25.2 Properties

25.25.3 Access as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The access rights.
**Notes:**
See kEdsAccess* constants.
(Read and Write property)

25.25.4 FreeSpaceInBytes as UInt64

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Available capacity (in bytes)
**Notes:** (Read and Write property)

25.25.5 MaxCapacity as UInt64

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Maximum size (in bytes)
**Notes:** (Read and Write property)

25.25.6 StorageType as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The storage type.
**Notes:**
See kEdsStorage* constants.
(Read and Write property)
25.25.7 VolumeLabel as String

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Volume name. **Notes:** (Read and Write property)

25.25.8 Constants

25.25.9 kEdsAccess_Error = -1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Access Mode Constants

25.25.10 kEdsAccess_Read = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Access Mode Constants

25.25.11 kEdsAccess_ReadWrite = 2

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Access Mode Constants

25.25.12 kEdsAccess_Write = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Access Mode Constants

25.25.13 kEdsStorageType_CF = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Storage Type Constants **Notes:** Compact flash

25.25.14 kEdsStorageType_HD = 4

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Storage Type Constants **Notes:** HD card
25.25.15 kEdsStorageType_Non = 0

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Storage Type Constants
**Notes:** No memory card inserted

25.25.16 kEdsStorageType_SD = 2

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the Storage Type Constants
**Notes:** SD card
25.26  class EdsVolumeMBS

Function: The class for a volume on the camera’s recording media

Notes:
This object represents the memory card inside the camera. If the camera model allows two memory cards
to be installed at once, the EdsVolumeRef object represents one memory card each. This object is used to
get an EdsDirectoryItemRef object, which is a child object, when performing operations on a file or folder
on the memory card.
Subclass of the EdsBaseMBS class.

25.26.2  Methods

25.26.3  Child(index as UInt32) as EdsDirectoryItemMBS

Function: Gets an indexed child object of the designated object.

Notes:
Index is 0 based and range from 0 to ChildCount-1.
LastError is set.

25.26.4  FormatVolume

Function: Formats volumes of memory cards in a camera.

Notes:
LastError is set.
Be careful to avoid doing this when the camera is not in the right mode. Lock the UI, for example.

25.26.5  Parent as EdsCameraMBS

Function: Gets the parent object of the designated object.

Notes: Lasterror is set.
25.26.6 VolumeInfo as EdsVolumeInfoMBS

**Function:** Gets volume information for a memory card in the camera.
**Notes:**
Lasterror is set.
Returns nil on any error.
Chapter 26

Carbon Events

26.1 class CarbonApplicationEventsMBS

26.1.1 class CarbonApplicationEventsMBS

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for receiving events sent to the application. **Notes:** Even if the name of the class includes Carbon, it works fine with Cocoa applications for most events.

26.1.2 Methods

26.1.3 CreateTypeStringWithOSType(ostype as string) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a type string object for the use in the ServiceGetTypes event.

26.1.4 Listen

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Starts listening for events sent to your application.
26.1.5 Properties

26.1.6 Available as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this events are firing.

**Notes:**
Still each event may have it’s own requirement.
(Read only property)

26.1.7 EventCount as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse event counter.

**Notes:**
Increases whenever one of the following events occurs:
MouseUp, MouseMoved, MouseDragged and MouseDown.
(Read and Write property)

26.1.8 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last reported Mac OS error code.

**Notes:**
0 if successful, -1 if function is not available.
(Read and Write property)

26.1.9 MouseButton as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse buttons used at the time of the last mouse event.

**Notes:**
Set by the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)
26.1.10 MouseChord as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse chord state at the time of the last mouse event. **Notes:** Set by the MouseDragged, the MouseDown and the MouseUp event. (Read and Write property)

26.1.11 MouseClickCount as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse click count at the time of the last mouse event. **Notes:** Set by the MouseDragged, the MouseDown and the MouseUp event. (Read and Write property)

26.1.12 MouseDeltaX as Single

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse movement at the time of the last mouse event. **Notes:** Set by the MouseMoved and the MouseDragged event. (Read and Write property)

26.1.13 MouseDeltaY as Single

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse movement at the time of the last mouse event. **Notes:** Set by the MouseMoved and the MouseDragged event. (Read and Write property)

26.1.14 MouseModifierKeys as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The modifier key state at the time of the last mouse event. **Notes:**
CHAPTER 26. CARBON EVENTS

Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.

The modifiers field contains information about the state of the modifier keys and the mouse button at the time the event was posted.

Each of the modifier keys is represented by a specific bit in the modifiers field. You can use these constants as masks to test the setting of various bits in the modifiers field:

- activeFlag: 1 set if window being activated or if mouse-down event caused foreground switch
- btnState: 128 set if mouse button up
- cmdKey: 256 set if Command key down
- shiftKey: 512 set if Shift key down
- alphaLock: 1024 set if Caps Lock key down
- optionKey: 2048 set if Option key down
- controlKey: 4096 set if Control key down
- rightshiftKey: 8192 set if right Shift key down
- rightoptionKey: 16384 set if right Option key down
- rightcontrolKey: 32768 set if right Control key down

If your application attaches special meaning to any of these keys in combination with other keys or when the mouse button is down, you can test the state of the modifiers field to determine the action your application should take. For example, you can use this information to determine whether the user pressed the Command key and another key to make a menu choice.

Some keyboards do not distinguish between the right or left Control, Shift, and Option keys; for example, the virtual key code for the right Shift key and left Shift key might be the same. For these keyboards, if the user presses the Control, Shift, or Option key, the Event Manager sets only the bits corresponding to the shiftKey, optionKey, and controlKey constants. For keyboards that do distinguish between these keys, the Event Manager sets the bits in the modifiers field to indicate whether the right or left Control, Shift, or Option keys were pressed. For example, the Event Manager sets bit 13 in the modifiers field if the user presses the right Shift key and sets bit 9 if the user presses the left Shift key. In most cases your application should not need to distinguish between the left and right Control, Shift, and Option keys.

(Read and Write property)

26.1.15 MouseX as Single

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse position at the time of the last mouse event.

**Notes:**

Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.

(Read and Write property)
26.1.16 MouseY as Single

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse position at the time of the last mouse event. **Notes:** Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event. (Read and Write property)

26.1.17 Tablet as Boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether you want to get the tablet event data. **Notes:** As not every application needs tablet event information, this is optional. Set to true to get the TabletPoint and TabletProximity parameters filled in the events. Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not). (Read and Write property)

26.1.18 TabletPoint as CarbonEventsTabletPointMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Saves the current tablet point object. **Notes:** Whenever an event is received and the tablet property is true and there is point information available, a reference to the CarbonEventsTabletPointMBS object (from the event) is stored in this property. So this property enables you to access the current state information of the tablet by just looking on the last state reported. Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not). (Read and Write property)

26.1.19 TabletProximity as CarbonEventsTabletProximityMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Saves the current tablet proximity object. **Notes:**
Whenever an event is received and the tablet property is true and there is proximity information available, a reference to the CarbonEventsTabletProximityMBS object (from the event) is stored in this property.

So this property enables you to access the current state information of the tablet by just looking on the last state reported.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not). (Read and Write property)

### 26.1.20 Events

#### 26.1.21 ApplicationActivated

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called whenever your application is actived.  
**Notes:** In older versions this event was misspelled: ApplicationActived

#### 26.1.22 ApplicationDeactivated

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called whenever your application is deactivated.  
**Notes:** In older versions this event was misspelled: ApplicationDeactived

#### 26.1.23 ApplicationGetDockTileMenu as Integer

MBS MacCF Plugin, Plugin Version: 3.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called whenever the system likes to know which menu to display in the dock tile.  
**Notes:** Create a menu using the MenuMBS class and return the handle property to this event as the result.

#### 26.1.24 ApplicationHidden

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The application was hidden.  
**Notes:** Only used on Mac OS X 10.2 and newer.
26.1. CLASS CARBONAPPLICATIONEVENTSMBS

26.1.25 ApplicationLaunched(ProcessSerial as memoryblock)

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever an application is launched.
**Notes:**
ProcessSerial is a memoryblock to 8 bytes defining the process serial number.
ProcessSerial may be nil on very low memory.

26.1.26 ApplicationQuit

MBS MacCF Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The application is requested to quit.
**Notes:** Current Realbasic versions seems to handle this event before the plugin can get it, so currently this
event does not fire. (tested with RB 5.5 and 2005r2)

26.1.27 ApplicationShown

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The application was shown.
**Notes:** Only used on Mac OS X 10.2 and newer.

26.1.28 ApplicationSwitched(ProcessSerial as memoryblock)

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever the frontmost application is changed.
**Example:**
```vba
sub ApplicationSwitched(ProcessSerial as memoryblock)
' This even works in built applications.
dim s as String
dim p as ProcessMBS
if ProcessSerial<>nil then
    p=new ProcessMBS
p.Update
    s=p.Name
end if
List.InsertRow 0,"Application switched to "+s+","nend sub
```
Notes:
ProcessSerial is a memoryblock to 8 bytes defining the process serial number. ProcessSerial may be nil on very low memory.

26.1.29 ApplicationSystemUIModeChanged(SystemUIMode as Integer)

26.1.30 ApplicationTerminated(ProcessSerial as memoryblock)

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Called whenever an application quits. Notes: ProcessSerial is a memoryblock to 8 bytes defining the process serial number. ProcessSerial may be nil on very low memory. Note that the process serial number may no longer be valid when this event is called.

26.1.31 GestureEnded(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This event is called when the gesture ends. Notes: GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.) Possible values for the key modifier:
activeFlag = 1 = & h000001
btnState = 128 = & h000080
cmdKey = 256 = & h000100
shiftKey = 512 = & h000200
alphaLock = 1024 = & h000400
optionKey = 2048 = & h000800
controlKey = 4096 = & h001000
rightShiftKey = 8192 = & h002000
rightOptionKey = 16384 = & h004000
rightControlKey = 32768 = & h008000
NumLock = 65536 = & h010000
Fn = 131072 = & h020000

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

26.1.32 GestureMagnify(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer, MagnificationAmount as Double) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This event is called several times while the magnify gesture is performed.
**Notes:**
MagnificationAmount the magnification amount.

GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.
26.1.33 GestureRotate(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer, RotationAmount as Double) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This event is called several times while the rotation gesture is performed.

**Notes:**
The RotationAmount in polar coordinates.

GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

<table>
<thead>
<tr>
<th>Key Modifier</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>activeFlag</td>
<td>1</td>
</tr>
<tr>
<td>btnState</td>
<td>128</td>
</tr>
<tr>
<td>cmdKey</td>
<td>256</td>

</tbody>
</table>
26.1. CLASS CARBONAPPLICATIONEVENTSMBS

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

26.1.34 GestureStarted(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This event is called when a gesture starts.

**Notes:**
GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

- activeFlag = 1 = & h000001
- btnState = 128 = & h000080
- cmdKey = 256 = & h000100
- shiftKey = 512 = & h000200
- alphaLock = 1024 = & h000400
- optionKey = 2048 = & h000800
- controlKey = 4096 = & h001000
- rightShiftKey = 8192 = & h002000
- rightOptionKey = 16384 = & h004000
- rightControlKey = 32768 = & h008000
- NumLock = 65536 = & h010000
- Fn = 131072 = & h020000

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.
CHAPTER 26. CARBON EVENTS

26.1.35  GestureSwipe(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer, SwipeDirectionX as Double, SwipeDirectionY as Double) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called for a swipe gesture. **Notes:**

SwipeDirectionX and SwipeDirectionY specify the swipe direction. GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

- activeFlag = 1 = & h000001
- btnState = 128 = & h000080
- cmdKey = 256 = & h000100
- shiftKey = 512 = & h000200
- alphaLock = 1024 = & h000400
- optionKey = 2048 = & h000800
- controlKey = 4096 = & h001000
- rightShiftKey = 8192 = & h002000
- rightOptionKey = 16384 = & h004000
- rightControlKey = 32768 = & h008000
- NumLock = 65536 = & h010000
- Fn = 131072 = & h020000

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer. If not supported with the current hardware, this event is never called.

26.1.36  HotKeyPressed(signature as Integer, id as Integer)

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The hotkey was pressed.
26.1.37  HotKeyReleased(signature as Integer, id as Integer)

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The hotkey was released.
**Notes:** Works not on Carbon inside Mac OS 9!

26.1.38  KeyboardRawKeyDown(maccharcode as Integer, keycode as Integer, modifiers as Integer, keyboardtype as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
A key was pressed.
**Notes:**
Does only work in Carbon target, not in Cocoa. Please use NSEventMonitorMBS class instead.
If you return true you tell the system that you handled the event.

Possible values for the key modifier:

- activeFlag = 1 = & h000001
- btnState = 128 = & h000080
- cmdKey = 256 = & h000100
- shiftKey = 512 = & h000200
- alphaLock = 1024 = & h000400
- optionKey = 2048 = & h000800
- controlKey = 4096 = & h001000
- rightShiftKey = 8192 = & h002000
- rightOptionKey = 16384 = & h004000
- rightControlKey = 32768 = & h008000
- NumLock = 65536 = & h010000
- Fn = 131072 = & h020000

26.1.39  KeyboardRawKeyModifiersChanged(modifierkeys as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The state of the modifier keys changed.
**Notes:**
Does only work in Carbon target, not in Cocoa. Please use NSEventMonitorMBS class instead.
If you return true you tell the system that you handled the event.

Possible values for the key modifier:
activeFlag = 1 = & h000001
btnState = 128 = & h000080
cmdKey = 256 = & h000100
shiftKey = 512 = & h000200
alphaLock = 1024 = & h000400
optionKey = 2048 = & h000800
controlKey = 4096 = & h001000
rightShiftKey = 8192 = & h002000
rightOptionKey = 16384 = & h004000
rightControlKey = 32768 = & h008000
NumLock = 65536 = & h010000
Fn = 131072 = & h020000

26.1.40 KeyboardRawKeyRepeat(maccharcode as Integer, keycode as Integer, modifiers as Integer, keyboardtype as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
A key is still down.

**Notes:**
Does only work in Carbon target, not in Cocoa. Please use NSEventMonitorMBS class instead.
If you return true you tell the system that you handled the event.

Possible values for the key modifier:

activeFlag = 1 = & h000001
btnState = 128 = & h000080
cmdKey = 256 = & h000100
shiftKey = 512 = & h000200
alphaLock = 1024 = & h000400
optionKey = 2048 = & h000800
controlKey = 4096 = & h001000
rightShiftKey = 8192 = & h002000
rightOptionKey = 16384 = & h004000
rightControlKey = 32768 = & h008000
NumLock = 65536 = & h010000
Fn = 131072 = & h020000

26.1.41 KeyboardRawKeyUp(maccharcode as Integer, keycode as Integer, modifiers as Integer, keyboardtype as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
A key was released.

**Notes:**
Does only work in Carbon target, not in Cocoa. Please use NSEventMonitorMBS class instead. If you return true you tell the system that you handled the event.

Possible values for the key modifier:

- activeFlag = 1 = & h000001
- btnState = 128 = & h000080
- cmdKey = 256 = & h000100
- shiftKey = 512 = & h000200
- alphaLock = 1024 = & h000400
- optionKey = 2048 = & h000800
- controlKey = 4096 = & h001000
- rightShiftKey = 8192 = & h002000
- rightOptionKey = 16384 = & h004000
- rightControlKey = 32768 = & h008000
- NumLock = 65536 = & h010000
- Fn = 131072 = & h020000

### 26.1.42 MenuPopulate(MenuHandle as Integer)

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The system asks the application to update the menu bar. **Notes:**

The application can change the menubar just a second before the user sees it.

This event is also sent whenever a command key is searched.

Works on CarbonLib 1.6 or newer.

Added MenuHandle parameter in v5.2.

### 26.1.43 MouseDown(x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event which fires when a mousebuton is down. **Notes:**

In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not).
CHAPTER 26. CARBON EVENTS

26.1.44 MouseDragged(x as single, y as single, modifierKeys as Integer, deltax as single, deltay as single, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event which fires when the mouse is dragged.

**Notes:**
In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not).

26.1.45 MouseMoved(x as single, y as single, modifierKeys as Integer, deltax as single, deltay as single) as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event which fires when the mouse is moved.

**Notes:**
In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not).

26.1.46 MouseUp(x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event which fires when a mousebutton is released.

**Notes:**
In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not).

26.1.47 MouseWheelMoved(modifierKeys as Integer, axis as Integer, delta as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called whenever the mouse wheel is moved.

**Example:**
function MouseWheelMoved(modifierKeys as Integer, axis as Integer, delta as Integer) as boolean

dim d as Integer
const cmdKey=256
const shiftKey=512
const alphaLock=1024
const optionKey=2048
const controlKey=4096
const rightShiftKey=8192
const rightOptionKey=16384
const rightControlKey=32768

const kEventMouseWheelAxisY=1
const kEventMouseWheelAxisX=0

if axis=kEventMouseWheelAxisY then
    d=delta

if BitwiseAnd(modifierKeys,optionkey)<0 then
    d=d*4 // scroll faster with option
end if

List.ScrollPosition=List.ScrollPosition-d
end if

List.InsertRow 0,"MouseWheelMoved"+str(delta)
end function

Notes:
Currently axis is only 0 or 1, but in future new input devices may have up to 32 axises.

Added a boolean function result in version 3.2. If you return true the event is handled by you. Else it's
passed to the next receiver of events.

26.1.48 ProcessCommand(AttributeFlags as Integer, CommandId as Integer, Handle as Integer, Index as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Called whenever a command is to process.
Notes:
Called for example when the DockTileMenu is used.
It seems like handle and index are optional.
Renamed Attributes parameter to AttributeFlags in plugin version 8.2.

### 26.1.49 ServiceCopy(Scrap as CarbonEventsScrapMBS) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called whenever a service needs something from you.  
**Notes:**  
You have to fill the scrap.  
Return true if you handled the event.

### 26.1.50 ServiceGetTypes(copytypes as CFMutableArrayMBS, pastetypes as CFMutableArrayMBS) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called whenever the Mac OS needs to know what types you can process. **Example:**

```objective-c
function ServiceGetTypes(copytypes as CFMutableArrayMBS, pastetypes as CFMutableArrayMBS) as boolean
    pastetypes.Append me.CreateTypeStringWithOSType("TEXT") // Speak text
    pastetypes.Append me.CreateTypeStringWithOSType("TIFF") // for Grab
    copytypes.Append me.CreateTypeStringWithOSType("TEXT")
end function
```

**Notes:**  
Fill the arrays with your content type codes.  
Use the CreateTypeStringWithOSType function to make strings with the type codes.  
Return true if you handled the event.

### 26.1.51 ServicePaste(Scrap as CarbonEventsScrapMBS) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called whenever a service gives something to you.  
**Notes:**  
You have to do something with the content of the scrap.  
Return true if you handled the event.
26.1.52 ServicePerform(Scrap as CarbonEventsScrapMBS, MessageName as CFStringMBS, UserData as CFStringMBS) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever you should perform a service.
**Notes:**
You have to do something with the content of the scrap.
Return true if you handled the event.

26.1.53 VolumeMounted(VolumeRefNum as Integer, VolumeRoot as FolderItem)

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever a volume is mounted.
**Example:**
```
sub VolumeMounted(VolumeRefNum as Integer)
    dim s as String
    dim f as FolderItem

    f=NewVolumeFolderItemMBS(VolumeRefNum)
    if f<>nil then
        s=f.DisplayName
    end if

    List.InsertRow 0,"A volume was mounted: " +s
end sub
```

**Notes:** VolumeRefNum is the number of the mounted volume. You may keep a list of mounted volumes if you need to know which was is unmounted later.

26.1.54 VolumeUnmounted(VolumeRefNum as Integer)

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever a volume is unmounted.
**Example:**
```
sub VolumeUnmounted(VolumeRefNum as Integer)
    // If you keep a list you can identify the volume...
    List.InsertRow 0,"A volume was unmounted."
end sub
```
Notes: VolumeRefNum is the number of the mounted volume. You may keep a list of mounted volumes if you need to know which was is unmounted later.
26.2. class CarbonEventsIdleTimerMBS

26.2.1 class CarbonEventsIdleTimerMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for an idle timer.
**Notes:** An idle timer is called whenever the user didn’t use the mouse or the keyboard for a given time period.

26.2.2 Methods

26.2.3 Constructor(delay as Double, interval as Double)

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Installs an idle timer.
**Notes:**
Idle timers are only called when there is no user activity occurring in the application. This means that the user is not actively clicking/typing, and is also not in the middle of tracking a control, menu, or window. TrackMouseLocation actually disables all idle timers automatically for you.

**Parameters:**

*delay:* The delay before firing this timer after a user input event has come in. For example, if you want to start your timer 2 seconds after the user stops typing, etc. you would pass 2.0 into this parameter. Each time the user types a key (or whatever), this timer is reset. If we are considered to be idle when an idle timer is installed, the first time it fires will be inDelay seconds from the time it is installed. So if you installed it in the middle of control tracking, say, it wouldn’t fire until the user stopped tracking. But if you installed it at app startup and the user hasn’t typed/clicked, it would fire in delay seconds.

*interval:* The timer interval (pass 0 for a one-shot timer, which executes once but does not repeat). You may also pass kEventDurationForever (-1) to create a one-shot timer.

In older plugins this was called Create, but later changed to Constructor to make usage easier.
26.2.4 Properties

26.2.5 Available as Boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if this timer can work.

**Notes:**
Should always be true on Mac OS X and false on Windows or Mac OS Classic.
(Read only property)

26.2.6 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code reported.

**Notes:**
0 for successful.
-1 for function not available.
else a Mac OS error code.
(Read and Write property)

26.2.7 Events

26.2.8 Action(state as Integer)

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when an idle timer fires.

**Notes:**

Constants for state:

The user has gone idle (not touched an input device) for the duration specified in your idle timer. This is the first message you will receive. Start your engines!

kEventLoopIdleTimerStarted = 1

If you specified an interval on your idle timer, your idle timer proc will be called with this message, letting you know it is merely firing at the interval specified. If you did not specify an interval, this message is not sent.

kEventLoopIdleTimerIdling = 2
26.2. **CLASS CARBONEVENTSIDLETIMERMBS**

The user is back! Stop everything! This is your cue to stop any processing if you need to.

\[ \text{kEventLoopIdleTimerStopped} = 3 \]
26.3 class CarbonEventsScrapMBS

26.3.1 class CarbonEventsScrapMBS

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a clipboard used for the carbon service events. **Notes:** This is Carbon API. You may want to prefer NSPasteboardMBS class for new projects.

26.3.2 Methods

26.3.3 AddData(FlavorType as string, data as string)

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds data to the scrap.

26.3.4 AddText(Text as string)

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds plain text to the scrap.

26.3.5 AddUnicodeText(Text as string)

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds 16bit unicode text to the scrap. **Notes:** Your string must be in 16 bit unicode. Else you may run into crashes.

26.3.6 clear

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the scrap.

26.3.7 DataAvailable(FlavorType as string) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Looks whether data is available or not for this type. **Notes:**
This function is much faster then if you use datasize.
Returns false on any error.

26.3.8 DataSize(FlavorType as string) as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the data size of an item in the scrap.
**Notes:**
Some data provider generate the data for the scrap only if you read it, so this function may be slower than just DataAvailable.
Returns 0 on any error.

26.3.9 FlavorCount as Integer

MBS MacCF Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The number of flavor in the clipboard.
**Notes:** Calling this function recreates the internal flavor list.

26.3.10 FlavorFlags(index as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the flags of the given flavor.
**Notes:**
Index goes from 0 to count-1.
Returns 0 on any error.
Flags are a combination of type values:
1 - private data (Sender only)
2 - translated data

26.3.11 FlavorType(index as Integer) as string

MBS MacCF Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the type of the given flavor.
**Notes:**
Index goes from 0 to count-1.
Returns "" on any error.
26.3.12GetData(FlavorType as string) as string

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the data of an item in the scrap.
**Notes:**
Some data provider generate the data for the scrap only if you read it, so this function may be slower than just DataAvailable.
Returns "" on any error.

26.3.13GetFile(byref file as folderitem) as boolean

MBS MacCF Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Tries to get a file reference from the scrap.
**Notes:**
Returns true on success and false on failure.
On newer Mac OS X versions with 12.4 plugin, we fixed this function. But there we can’t provide type, creator and flags.
See also:

- 26.3.14 GetFile(byref file as folderitem, byref type as string, byref creator as string, byref flags as Integer) as boolean

26.3.14GetFile(byref file as folderitem, byref type as string, byref creator as string, byref flags as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Tries to get a file reference from the scrap.
**Notes:**
Returns true on success and false on failure.
Type and Creator are the Mac OS 9 file types.
flags are the normal Finderflags as you get them if using GetFileFlagsMBS(file).

On newer Mac OS X versions with 12.4 plugin, we fixed this function. But there we can’t provide type, creator and flags.
See also:

- 26.3.13 GetFile(byref file as folderitem) as boolean
26.3.15  GetText as string

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the plain text from the scrap.
**Notes:**
Some data provider generate the data for the scrap only if you read it, so this function may be slower than just TextAvailable.
Returns "" on any error.

26.3.16  GetUnicodeText as string

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the unicode text from the scrap.
**Notes:**
Some data provider generate the data for the scrap only if you read it, so this function may be slower than just TextAvailable.
Returns "" on any error.

26.3.17  PictAvailable as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Looks whether Mac PICT data is available.
**Notes:** Returns false on any error.

26.3.18  TextAvailable as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Like Dataavailable, but just for text.
**Notes:**
This function is much faster then if you use Textsize.
Checks only for plain TEXT, not for unicode or styled text.
Returns false on any error.

26.3.19  TextSize as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Like DataSize, but just for text.
**Notes:**
CHAPTER 26. CARBON EVENTS

Checks only for plain TEXT, not for unicode or styled text.
Returns 0 on any error.

26.3.20  **UnicodeTextAvailable as boolean**

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
True if unicode text is available.
**Notes:**
This function is much faster then if you use UnicodeTextsize.
Returns false on any error.

26.3.21  **UnicodeTextSize as Integer**

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the number of available characters in the unicode string part of the scrap.
**Notes:** Returns 0 on any error.

26.3.22  **Properties**

26.3.23  **Handle as Integer**

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The handle to the scrap.
**Notes:** (Read and Write property)

26.3.24  **Release as Boolean**

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the destructor should destroy the handle later.
**Notes:** (Read and Write property)
26.4. class CarbonEventsTabletPointMBS

26.4.1. class CarbonEventsTabletPointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for details about the current point information.

26.4.2. Properties

26.4.3. AbsX as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Absolute x coordinate in tablet space at full tablet resolution.
**Notes:** (Read and Write property)

26.4.4. AbsY as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Absolute y coordinate in tablet space at full tablet resolution.
**Notes:** (Read and Write property)

26.4.5. AbsZ as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Absolute z coordinate in tablet space at full tablet resolution.
**Notes:** (Read and Write property)

26.4.6. Buttons as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Which buttons are pressed.
**Notes:**
One bit per button - bit 0 is first button - 1 = closed.
(Read and Write property)
26.4.7  DeviceID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
System-assigned unique device ID - matches to deviceID field in proximity event.
**Notes:** (Read and Write property)

26.4.8  Pressure as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Scaled pressure value.
**Notes:**
MAXPRESSURE=(2^16)-1, MINPRESSURE=0.
(Read and Write property)

26.4.9  Rotation as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Fixed-point representation of device rotation in a 10.6 format.
**Notes:** (Read and Write property)

26.4.10  TangentialPressure as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Tangential pressure on the device; range same as tilt.
**Notes:** (Read and Write property)

26.4.11  TiltX as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Scaled tilt x value.
**Notes:**
range is -(2^15)-1 to (2^15)-1 (-32767 to 32767)
(Read and Write property)
26.4.12  TiltY as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Scaled tilt y value. Notes:

range is -((2^15)-1) to (2^15)-1 (-32767 to 32767). (Read and Write property)

26.4.13  Vendor1 as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Vendor-defined signed 16-bit integer. Notes: (Read and Write property)

26.4.14  Vendor2 as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Vendor-defined signed 16-bit integer. Notes: (Read and Write property)

26.4.15  Vendor3 as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Vendor-defined signed 16-bit integer. Notes: (Read and Write property)
26.5 class CarbonEventsTabletProximityMBS

26.5.1 class CarbonEventsTabletProximityMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for the tablet proximity details.

26.5.2 Properties

26.5.3 CapabilityMask as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Mask representing the capabilities of the device.
**Notes:**
Unsigned 32 bit integer.
(Read and Write property)

26.5.4 DeviceID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
System-assigned unique device ID - matches to deviceID field in tablet event.
**Notes:**
Unsigned 16 bit integer.
(Read and Write property)

26.5.5 EnterProximity as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the pen entered or was leaving.
**Notes:**
non-zero = entering; zero = leaving
(Read and Write property)

26.5.6 PointerID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Vendor-defined ID of the specific pointing device.
26.5. **CLASS CARBONEVENTSTABLETPROXIMITYMBS**

Notes:
Unsigned 16 bit integer.
(Read and Write property)

### 26.5.7 PointerSerialNumber as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Vendor-defined serial number of the specific pointing device.
**Notes:**
Unsigned 32 bit integer.
(Read and Write property)

### 26.5.8 PointerType as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Type of pointing device.
**Notes:**
No values defined for this function by Apple.
Unsigned 8 bit integer.
(Read and Write property)

### 26.5.9 SystemTabletID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
System-assigned unique tablet ID.
**Notes:**
Unsigned 16 bit integer.
(Read and Write property)

### 26.5.10 TabletID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Vendor-defined tablet ID - typically will be USB product ID for the tablet.
**Notes:**
Unsigned 16 bit integer.
(Read and Write property)
26.5.11 UniqueID as Memoryblock

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Vendor-defined unique ID for this pointer.  
**Notes:**  
A 64bit integer value stored in an eight byte memoryblock.  
(Read and Write property)

26.5.12 VendorID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Vendor-defined ID - typically will be USB vendor ID.  
**Notes:**  
Unsigned 16 bit integer.  
(Read and Write property)

26.5.13 VendorPointerType as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Vendor-defined pointer type.  
**Notes:**  
Unsigned 16 bit integer.  
(Read and Write property)
26.6. class CarbonEventsTimerMBS

26.6.1 class CarbonEventsTimerMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a Carbon timer.
**Notes:** Compare to a REALbasic timer, the CarbonEventsTimerMBS will fire more often, for example if a menu is open.

26.6.2 Methods

26.6.3 Constructor

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new timer.
**Notes:**
Lasterror is set.
In older plugins this was called Create, but later changed to Constructor to make usage easier.

26.6.4 Properties

26.6.5 Available as Boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the time can fire.
**Notes:**
Should be true in Carbon applications.
(Read only property)

26.6.6 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The last error code reported.
**Notes:**
0 for successfull.
-1 for function not available.
else a Mac OS error code.
(Read and Write property)
26.6.7 Mode as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The timer mode.

**Notes:**
Like a RB timer: 0 - off, 1 - single, 2 - multiple.
The timer may fire directly when set.
(Read and Write property)

26.6.8 Period as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The period of the timer in milliseconds.

**Notes:**
Added to make it compatible to normal RB code.
(Read and Write property)

26.6.9 PeriodSeconds as Double

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The period of the timer in seconds.

**Notes:**
Set to 1 to fire the timer every second.
If you set this to 0.000001, you can get something like 13500 events per second. See Timer Benchmark example project.
(Read and Write property)

26.6.10 Events

26.6.11 Action

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever the timer fires.

**Notes:**
There seems to be a bug in some RB versions:
If you draw into a window in this timer’s action event, you may draw not in the window graphics port, but in the current graphics port. If you click on the menu bar to open a menu, you draw over this menu.
To work around this you can add a line before drawing: TheWindow.Show
26.7. **CLASS CARBONHOTKEYMBS**

### 26.7 class CarbonHotKeyMBS

**Function:**
A class for creating hot keys.

**Example:**

```batch
const activeFlag = 1
const btnState = 128
const cmdKey = 256
const shiftKey = 512
const alphaLock = 1024
const optionKey = 2048
const controlKey = 4096
const rightShiftKey = 8192
const rightOptionKey = 16384
const rightControlKey = 32768

dim MyEvents1 as CarbonApplicationEventsMBS
// use a global property to store your instance of your subclass
dim p as CarbonHotKeyMBS // this should also be global

MyEvents1.Listen

p=new CarbonHotKeyMBS
p.AddKey(& h24, optionKey, OSTypeFromStringMBS("MBSG"), 5)

if p.LastError<>0 then
MsgBox "The Hotkey could not be registered!"
end if

// key will be released when p is destroyed on closing the window.
```

**Notes:** The CarbonHotKeyMBS has carbon in the name, but works fine with Cocoa, too. The Cocoa event handling system is based internally on the Carbon event handling. If you need to catch NSEvents, please use NSEventMonitorMBS class.
26.7.2 Methods

26.7.3 AddKey(keycode as Integer, keymodifier as Integer, hotkeysignature as Integer, hotkeyid as Integer)

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates a hot key binding.
Notes: Please use only one CarbonHotKeyMBS object for each hotkey you want to use.

Keycode is the same keycode as for the sprite surface.

Possible values for the key modifier:
- activeFlag = 1
- btnState = 128
- cmdKey = 256
- shiftKey = 512
- alphaLock = 1024
- optionKey = 2048
- controlKey = 4096
- rightShiftKey = 8192
- rightOptionKey = 16384
- rightControlKey = 32768

The Signature should be unique. Best if you use your application's creator code.
The ID is for your application to check which hot key was pressed in the HotKey events of the CarbonApplicationEventsMBS class.

Some keycode values:

26.7.4 RemoveKey

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Removes the hot key binding.
Notes: Called by the destructor if you don't call it.
26.7. CLASS CARBONHOTKEYMBS

26.7.5 Properties

26.7.6 HotKeyID as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID used for this hotkey. **Notes:** (Read only property)

26.7.7 HotKeyRef as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle for this hotkey. **Notes:** Used internally for releasing it later. (Read only property)

26.7.8 HotKeySignature as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Signature used for this hotkey. **Notes:** The signature should be the creator code of your application to make it unique. (Read only property)

26.7.9 KeyCode as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The keycode used for this hotkey. **Notes:** (Read only property)

26.7.10 KeyModifier as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The KeyModifier used for this hotkey. **Notes:** (Read only property)
26.7.11 LastError as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last Mac OS error code reported from one of the functions. **Notes:** (Read only property)

26.8 class CarbonMonitorEventsMBS

26.8.1 class CarbonMonitorEventsMBS

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for receiving events sent to the application while monitoring events.

**Notes:**

The CarbonMonitorEventsMBS class is a special class used to monitor user input events across all processes. When such a class is listening, the Carbon Event Manager examines the event type for user input event types, such as mouse-down, mouse-up, key-down, and so forth. It then requests that the WindowServer make copies of any of these events that are sent to any process, and deliver them to the current process also. These events are queued into the main thread’s event queue, and during normal event dispatching are sent directly to the event handlers installed on the event monitor class. Monitored events are not sent through the normal event dispatching path for the current process; they will pass through the event dispatcher target, and will then be sent directly to the event monitor target.

Handlers installed on the event monitor class will only receive events when the current application is inactive. When the current application is active, all event flow occurs through the event dispatcher target, and no events are sent to the event monitor target.

Currently, the event monitor supports the following event kinds: kEventRawKeyDown, kEventRawKeyUp, kEventRawKeyRepeat, kEventRawKeyModifiersChanged, kEventMouseDown, kEventMouseUp, kEventMouseMove, kEventMouseDragged, kEventMouseWheelMoved, kEventTabletPoint, and kEventTabletProximity.

Note that both Carbon and Cocoa password edit text controls enable a secure input mode while the focus is on the control, which prevents keyboard events from being passed to other applications. This prevents the monitoring event target from being used to sniff password keystrokes.

For added security, GetEventMonitorTarget requires that "Enable access for assistive devices" be checked in the Universal Access preference pane in order to monitor RawKeyDown, RawKeyUp, and RawKeyRepeat events. If this control is not checked, you can still install handlers for these events on the event monitor class, but no events of these types will be sent to your handler. Administrator privileges are required to enable this feature.

Accessibility made need to be turned on. On Mac OS X 10.9 this may not work in debug apps, but only in build apps after second launch.
26.8.** CLASS CARBONMONITOREVENTSMBS**

**26.8.2 Methods**

**26.8.3 Listen**

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Starts listening for events send to your application.

**26.8.4 Properties**

**26.8.5 Available as Boolean**

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this events are firing.

**Notes:**
Still each event may have it’s own requirement.
(Read only property)

**26.8.6 EventCount as Integer**

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse event counter.

**Notes:**
Increases whenever one of the following events occurs:
MouseUp, MouseMoved, MouseDragged and MouseDown.
(Read and Write property)

**26.8.7 Lasterror as Integer**

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last reported Mac OS error code.

**Notes:**
0 if successful, -1 if function is not available.
(Read and Write property)
26.8.8 MouseButton as Integer

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse buttons used at the time of the last mouse event. **Notes:** Set by the MouseDragged, the MouseDown and the MouseUp event. (Read and Write property)

26.8.9 MouseChord as Integer

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse chord state at the time of the last mouse event. **Notes:** Set by the MouseDragged, the MouseDown and the MouseUp event. (Read and Write property)

26.8.10 MouseClickCount as Integer

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse click count at the time of the last mouse event. **Notes:** Set by the MouseDragged, the MouseDown and the MouseUp event. (Read and Write property)

26.8.11 MouseDeltaX as Single

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse movement at the time of the last mouse event. **Notes:** Set by the MouseMoved and the MouseDragged event. (Read and Write property)

26.8.12 MouseDeltaY as Single

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse movement at the time of the last mouse event. **Notes:**
Set by the MouseMoved and the MouseDragged event.
(Read and Write property)

26.8.13 MouseModifierKeys as Integer

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The modifier key state at the time of the last mouse event.

**Notes:**
Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.

The modifiers field contains information about the state of the modifier keys and the mouse button at the
time the event was posted.

Each of the modifier keys is represented by a specific bit in the modifiers field. You can use these constants
as masks to test the setting of various bits in the modifiers field:

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>activeFlag</td>
<td>1</td>
<td>set if window being activated or if mouse-down event caused foreground switch</td>
</tr>
<tr>
<td>btnState</td>
<td>128</td>
<td>set if mouse button up</td>
</tr>
<tr>
<td>cmdKey</td>
<td>256</td>
<td>set if Command key down</td>
</tr>
<tr>
<td>shiftKey</td>
<td>512</td>
<td>set if Shift key down</td>
</tr>
<tr>
<td>alphaLock</td>
<td>1024</td>
<td>set if Caps Lock key down</td>
</tr>
<tr>
<td>optionKey</td>
<td>2048</td>
<td>set if Option key down</td>
</tr>
<tr>
<td>controlKey</td>
<td>4096</td>
<td>set if Control key down</td>
</tr>
<tr>
<td>rightshiftKey</td>
<td>8192</td>
<td>set if right Shift key down</td>
</tr>
<tr>
<td>rightoptionKey</td>
<td>16384</td>
<td>set if right Option key down</td>
</tr>
<tr>
<td>rightcontrolKey</td>
<td>32768</td>
<td>set if right Control key down</td>
</tr>
</tbody>
</table>

If your application attaches special meaning to any of these keys in combination with other keys or when the
mouse button is down, you can test the state of the modifiers field to determine the action your application
should take. For example, you can use this information to determine whether the user pressed the Command
key and another key to make a menu choice.

Some keyboards do not distinguish between the right or left Control, Shift, and Option keys; for example,
the virtual key code for the right Shift key and left Shift key might be the same. For these keyboards, if
the user presses the Control, Shift, or Option key, the Event Manager sets only the bits corresponding to
the shiftKey, optionKey, and controlKey constants. For keyboards that do distinguish between these keys,
the Event Manager sets the bits in the modifiers field to indicate whether the right or left Control, Shift,
or Option keys were pressed. For example, the Event Manager sets bit 13 in the modifiers field if the user
presses the right Shift key and sets bit 9 if the user presses the left Shift key. In most cases your application
should not need to distinguish between the left and right Control, Shift, and Option keys.
(Read and Write property)
26.8.14 MouseX as Single

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The mouse position at the time of the last mouse event.
**Notes:**
Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

26.8.15 MouseY as Single

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The mouse position at the time of the last mouse event.
**Notes:**
Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

26.8.16 Tablet as Boolean

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether you want to get the tablet event data.
**Notes:**
As not every application needs tablet event information, this is optional.
Set to true to get the TabletPoint and TabletProximity parameters filled in the events.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not).
(Read and Write property)

26.8.17 TabletPoint as CarbonEventsTabletPointMBS

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Saves the current tablet point object.
**Notes:**
Whenever an event is received and the tablet property is true and there is point information available, a reference to the CarbonEventsTabletPointMBS object (from the event) is stored in this property.

So this property enables you to access the current state information of the tablet by just looking on the last state reported.
Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not). (Read and Write property)

### 26.8.18 TabletProximity as CarbonEventsTabletProximityMBS

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Saves the current tablet proximity object.  
**Notes:**  
Whenever an event is received and the tablet property is true and there is proximity information available, a reference to the CarbonEventsTabletProximityMBS object (from the event) is stored in this property.  
So this property enables you to access the current state information of the tablet by just looking on the last state reported.  
Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not). (Read and Write property)

### 26.8.19 Events

#### 26.8.20 KeyboardRawKeyDown(maccharcode as Integer, keycode as Integer, modifiers as Integer, keyboardtype as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A key was pressed.  
**Notes:**  
If you return true you tell the system that you handled the event.  
Possible values for the key modifier:  

For added security, GetEventMonitorTarget requires that ”Enable access for assistive devices” be checked in the Universal Access preference pane in order to monitor RawKeyDown, RawKeyUp, and RawKeyRepeat events. If this control is not checked, you can still install handlers for these events on the event monitor class, but no events of these types will be sent to your handler. Administrator privileges are required to enable this feature.
activeFlag = 1 = & h000001
btnState = 128 = & h000080
cmdKey = 256 = & h000100
shiftKey = 512 = & h000200
alphaLock = 1024 = & h000400
optionKey = 2048 = & h000800
controlKey = 4096 = & h001000
rightShiftKey = 8192 = & h002000
rightOptionKey = 16384 = & h004000
rightControlKey = 32768 = & h008000
NumLock = 65536 = & h010000
Fn = 131072 = & h020000

26.8.21 KeyboardRawKeyModifiersChanged(modifierkeys as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The state of the modifier keys changed.

**Notes:**
If you return true you tell the system that you handled the event.

Possible values for the key modifier:

activeFlag = 1 = & h000001
btnState = 128 = & h000080
cmdKey = 256 = & h000100
shiftKey = 512 = & h000200
alphaLock = 1024 = & h000400
optionKey = 2048 = & h000800
controlKey = 4096 = & h001000
rightShiftKey = 8192 = & h002000
rightOptionKey = 16384 = & h004000
rightControlKey = 32768 = & h008000
NumLock = 65536 = & h010000
Fn = 131072 = & h020000

For added security, GetEventMonitorTarget requires that ”Enable access for assistive devices” be checked in
the Universal Access preference pane in order to monitor RawKeyDown, RawKeyUp, and RawKeyRepeat
events. If this control is not checked, you can still install handlers for these events on the event monitor
class, but no events of these types will be sent to your handler. Administrator privileges are required to
enable this feature.
26.8.22  KeyboardRawKeyRepeat(maccharcode as Integer, keycode as Integer, modifiers as Integer, keyboardtype as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
A key is still down.
**Notes:**
If you return true you tell the system that you handled the event.

Possible values for the key modifier:

<table>
<thead>
<tr>
<th>Modifier</th>
<th>Value</th>
<th>Hex</th>
</tr>
</thead>
<tbody>
<tr>
<td>activeFlag</td>
<td>1</td>
<td>&amp;h000001</td>
</tr>
<tr>
<td>btnState</td>
<td>128</td>
<td>&amp;h000080</td>
</tr>
<tr>
<td>cmdKey</td>
<td>256</td>
<td>&amp;h000100</td>
</tr>
<tr>
<td>shiftKey</td>
<td>512</td>
<td>&amp;h000200</td>
</tr>
<tr>
<td>alphaLock</td>
<td>1024</td>
<td>&amp;h000400</td>
</tr>
<tr>
<td>optionKey</td>
<td>2048</td>
<td>&amp;h000800</td>
</tr>
<tr>
<td>controlKey</td>
<td>4096</td>
<td>&amp;h001000</td>
</tr>
<tr>
<td>rightShiftKey</td>
<td>8192</td>
<td>&amp;h002000</td>
</tr>
<tr>
<td>rightOptionKey</td>
<td>16384</td>
<td>&amp;h004000</td>
</tr>
<tr>
<td>rightControlKey</td>
<td>32768</td>
<td>&amp;h008000</td>
</tr>
<tr>
<td>NumLock</td>
<td>65536</td>
<td>&amp;h010000</td>
</tr>
<tr>
<td>Fn</td>
<td>131072</td>
<td>&amp;h020000</td>
</tr>
</tbody>
</table>

For added security, GetEventMonitorTarget requires that "Enable access for assistive devices" be checked in the Universal Access preference pane in order to monitor RawKeyDown, RawKeyUp, and RawKeyRepeat events. If this control is not checked, you can still install handlers for these events on the event monitor class, but no events of these types will be sent to your handler. Administrator privileges are required to enable this feature.

26.8.23  KeyboardRawKeyUp(maccharcode as Integer, keycode as Integer, modifiers as Integer, keyboardtype as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
A key was released.
**Notes:**
If you return true you tell the system that you handled the event.

Possible values for the key modifier:

For added security, GetEventMonitorTarget requires that "Enable access for assistive devices" be checked in the Universal Access preference pane in order to monitor RawKeyDown, RawKeyUp, and RawKeyRepeat events.
events. If this control is not checked, you can still install handlers for these events on the event monitor class, but no events of these types will be sent to your handler. Administrator privileges are required to enable this feature.

### 26.8.24 MouseDown(x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event which fires when a mousebutton is down. **Notes:**

In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not).

### 26.8.25 MouseDragged(x as single, y as single, modifierKeys as Integer, deltax as single, deltay as single, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event which fires when the mouse is dragged. **Notes:**

In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not).
26.8.26 MouseMoved(x as single, y as single, modifierKeys as Integer, deltax as single, deltay as single) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event which fires when the mouse is moved.

**Notes:**
In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not).

26.8.27 MouseUp(x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event which fires when a mousebutton is released.

**Notes:**
In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not).

26.8.28 MouseWheelMoved(modifierKeys as Integer, axis as Integer, delta as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called whenever the mouse wheel is moved.

**Example:**

```plaintext
function MouseWheelMoved(modifierKeys as Integer, axis as Integer, delta as Integer) as boolean
    dim d as Integer
    const cmdKey=256
    const shiftKey=512
    const alphaLock=1024
    const optionKey=2048
    const controlKey=4096
    const rightShiftKey=8192
    const rightOptionKey=16384
    const rightControlKey=32768
    const kEventMouseWheelAxisY=1
    const kEventMouseWheelAxisX=0
```
if axis=kEventMouseWheelAxisY then
  d=delta

  if BitwiseAnd(modifierKeys,optionkey)<>0 then
    d=d*4 // scroll faster with option
  end if

  List.ScrollPosition=List.ScrollPosition-d
end if

List.InsertRow 0,"MouseWheelMoved "+str(delta)
end function

Notes:

Currently axis is only 0 or 1, but in future new input devices may have up to 32 axises.

Added a boolean function result in version 3.2. If you return true the event is handled by you. Else it’s passed to the next receiver of events.
26.9. class CarbonSystemEventsMBS

26.9.1 class CarbonSystemEventsMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for receiving system events sent to the application.

26.9.2 Methods

26.9.3 Listen

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Starts listening for events send to your application.

26.9.4 Properties

26.9.5 Available as Boolean

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this events are firing.

**Notes:**
Still each event may have it’s own requirement.
(Read only property)

26.9.6 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last reported Mac OS error code.

**Notes:**
0 if successful, -1 if function is not available.
(Read and Write property)
26.9.7 Events

26.9.8 DisplayReconfigured

MBS MacCF Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Notification that the Display configuration has changed.

**Notes:**
This event is sent to all handlers registered for it on the application event target. When this event is received, applications may wish to update geometry and color depth usage or perform a redraw based on the new configuration.

Sent in Mac OS X 10.5 and newer.

26.9.9 DisplaysAsleep

MBS MacCF Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** All connected displays have gone to sleep.

**Notes:** Sent in Mac OS X 10.4 and newer.

26.9.10 DisplaysAwake

MBS MacCF Plugin, Plugin Version: 9.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** All connected displays have awoken.

**Notes:** Sent in Mac OS X 10.4 and newer.

26.9.11 TimeDateChanged

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The system time and/or date has changed via the preferences panel.

**Notes:**
Requires Mac OS X 10.3 or newer.
The RB date class may not recognize the case when just the time zone changed.

26.9.12 UserSessionActivated

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The current user login session has been activated.

**Notes:**
Requires Mac OS X 10.3 or newer.

From Apple's documentation:

When a user switch occurs, Mac OS X generates events for all interested applications. Events are sent to applications in a login session whenever the login session is activated or deactivated. If a login session is not being activated or deactivated, it receives no events. You can use the activation events to perform the following kinds of tasks:

- Halt or restart sound playback
- Halt or restart animations
- Give up or acquire shared resources
- Put your application into a quiescent state to improve overall system performance

Event Timing

User switch notifications are sent to applications at the same time the switch occurs. Because the switch occurs relatively quickly, this is normally not a problem. However, it is possible for an application to receive its activation event before other applications have received their deactivation events. This could lead to potential race conditions between applications releasing and acquiring shared resources.

To avoid race conditions, applications in the session being deactivated should continue to release any shared resources as soon as possible. Applications in the session being activated should delay the acquisition of any shared resources until those resources are actually used. Not only can this help avoid potential race conditions, it can also improve overall system performance. If your application needs a particular resource right away but encounters errors while trying to acquire it, set a timer and try to acquire the resource again a short time later.

26.9.13 UserSessionDeactivated

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The current user login session has been deactivated.

**Notes:**
Requires Mac OS X 10.3 or newer.

From Apple’s documentation:

When a user switch occurs, Mac OS X generates events for all interested applications. Events are sent to applications in a login session whenever the login session is activated or deactivated. If a login session is not being activated or deactivated, it receives no events. You can use the activation events to perform the
following kinds of tasks:

- Halt or restart sound playback
- Halt or restart animations
- Give up or acquire shared resources
- Put your application into a quiescent state to improve overall system performance

Event Timing

User switch notifications are sent to applications at the same time the switch occurs. Because the switch occurs relatively quickly, this is normally not a problem. However, it is possible for an application to receive its activation event before other applications have received their deactivation events. This could lead to potential race conditions between applications releasing and acquiring shared resources. To avoid race conditions, applications in the session being deactivated should continue to release any shared resources as soon as possible. Applications in the session being activated should delay the acquisition of any shared resources until those resources are actually used. Not only can this help avoid potential race conditions, it can also improve overall system performance. If your application needs a particular resource right away but encounters errors while trying to acquire it, set a timer and try to acquire the resource again a short time later.
26.10. class CarbonWindowsEventsMBS

26.10.1 class CarbonWindowsEventsMBS

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for receiving events sent to a window. **Notes:** Only for Carbon target. Will not work with Cocoa windows.

26.10.2 Methods

26.10.3 Listen(win as window)

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Starts listening for events send to the given window.

26.10.4 ListenOnWindowsHandle(windowHandle as Integer)

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Starts listening for events send to the given window. **Notes:** You can use the WindowHandle from the CocoaColorPanel class.

26.10.5 Properties

26.10.6 Available as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** whether this events are firing. **Notes:** (Read only property)

26.10.7 EventCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse event counter. **Notes:** Increases whenever one of the following events occurs: MouseUp, MouseMoved, MouseDragged and MouseDown. (Read and Write property)
26.10.8 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last reported Mac OS error code. **Notes:**
0 if successful, -1 if function is not available. (Read and Write property)

26.10.9 MouseButton as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse buttons used at the time of the last mouse event. **Notes:**
Set by the MouseDragged, the MouseDown and the MouseUp event. (Read and Write property)

26.10.10 MouseChord as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse chord state at the time of the last mouse event. **Notes:**
Set by the MouseDragged, the MouseDown and the MouseUp event. (Read and Write property)

26.10.11 MouseClickCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse click count at the time of the last mouse event. **Notes:**
Set by the MouseDragged, the MouseDown and the MouseUp event. (Read and Write property)

26.10.12 MouseDeltaX as Single

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse movement at the time of the last mouse event. **Notes:**
26.10.13  MouseDeltaY as Single

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The mouse movement at the time of the last mouse event.
**Notes:**
Set by the MouseMoved and the MouseDragged event.
(Read and Write property)

26.10.14  MouseModifierKeys as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The modifier key state at the time of the last mouse event.
**Notes:**
Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.
The modifiers field contains information about the state of the modifier keys and the mouse button at the
time the event was posted.

Each of the modifier keys is represented by a specific bit in the modifiers field. You can use these constants
as masks to test the setting of various bits in the modifiers field:

- activeFlag 1  set if window being activated or if mouse-down event caused foreground switch
- btnState 128  set if mouse button up
- cmdKey 256  set if Command key down
- shiftKey 512  set if Shift key down
- alphaLock 1024  set if Caps Lock key down
- optionKey 2048 set if Option key down
- controlKey 4096 set if Control key down
- rightshiftKey 8192  set if right Shift key down
- rightoptionKey 16384 set if right Option key down
- rightcontrolKey 32768  set if right Control key down

If your application attaches special meaning to any of these keys in combination with other keys or when the
mouse button is down, you can test the state of the modifiers field to determine the action your application
should take. For example, you can use this information to determine whether the user pressed the Command
key and another key to make a menu choice.
Some keyboards do not distinguish between the right or left Control, Shift, and Option keys; for example, the virtual key code for the right Shift key and left Shift key might be the same. For these keyboards, if the user presses the Control, Shift, or Option key, the Event Manager sets only the bits corresponding to the shiftKey, optionKey, and controlKey constants. For keyboards that do distinguish between these keys, the Event Manager sets the bits in the modifiers field to indicate whether the right or left Control, Shift, or Option keys were pressed. For example, the Event Manager sets bit 13 in the modifiers field if the user presses the right Shift key and sets bit 9 if the user presses the left Shift key. In most cases your application should not need to distinguish between the left and right Control, Shift, and Option keys.

(Read and Write property)

### 26.10.15 MouseX as Single

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse position at the time of the last mouse event. **Notes:**

Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event. (Read and Write property)

### 26.10.16 MouseY as Single

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The mouse position at the time of the last mouse event. **Notes:**

Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event. (Read and Write property)

### 26.10.17 Tablet as Boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether you want to get the tablet event data. **Notes:**

As not every application needs tablet event information, this is optional.

Set to true to get the TabletPoint and TabletProximity parameters filled in the events.

Tablet functions may or may not work in Realbasic's debug mode (some RB versions work and some not). (Read and Write property)
26.10.18 TabletPoint as CarbonEventsTabletPointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Saves the current tablet point object.

**Notes:**
Whenever an event is received and the tablet property is true and there is point information available, a reference to the CarbonEventsTabletPointMBS object (from the event) is stored in this property.

So this property enables you to access the current state information of the tablet by just looking on the last state reported.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not). (Read and Write property)

26.10.19 TabletProximity as CarbonEventsTabletProximityMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Saves the current tablet proximity object.

**Notes:**
Whenever an event is received and the tablet property is true and there is proximity information available, a reference to the CarbonEventsTabletProximityMBS object (from the event) is stored in this property.

So this property enables you to access the current state information of the tablet by just looking on the last state reported.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not). (Read and Write property)

26.10.20 Events

26.10.21 GestureEnded(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called when the gesture ends.

**Notes:**
GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the
handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the
window relative position. The WindowPartCode specifies which part of the window was hit. (See Window-
PartCode definition in Apple documentation.)

Possible values for the key modifier:

<table>
<thead>
<tr>
<th>Modifier</th>
<th>Value</th>
<th>Hex</th>
</tr>
</thead>
<tbody>
<tr>
<td>activeFlag</td>
<td>1</td>
<td>&amp; h000001</td>
</tr>
<tr>
<td>btnState</td>
<td>128</td>
<td>&amp; h000080</td>
</tr>
<tr>
<td>cmdKey</td>
<td>256</td>
<td>&amp; h000100</td>
</tr>
<tr>
<td>shiftKey</td>
<td>512</td>
<td>&amp; h000200</td>
</tr>
<tr>
<td>alphaLock</td>
<td>1024</td>
<td>&amp; h000400</td>
</tr>
<tr>
<td>optionKey</td>
<td>2048</td>
<td>&amp; h000800</td>
</tr>
<tr>
<td>controlKey</td>
<td>4096</td>
<td>&amp; h001000</td>
</tr>
<tr>
<td>rightShiftKey</td>
<td>8192</td>
<td>&amp; h002000</td>
</tr>
<tr>
<td>rightOptionKey</td>
<td>16384</td>
<td>&amp; h004000</td>
</tr>
<tr>
<td>rightControlKey</td>
<td>32768</td>
<td>&amp; h008000</td>
</tr>
<tr>
<td>NumLock</td>
<td>65536</td>
<td>&amp; h010000</td>
</tr>
<tr>
<td>Fn</td>
<td>131072</td>
<td>&amp; h020000</td>
</tr>
</tbody>
</table>

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

26.10.22 GestureMagnify(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer, MagnificationAmount as Double) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This event is called several times while the magnify gesture is performed.
**Notes:**
MagnificationAmount the magnification amount.

GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the
handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the
window relative position. The WindowPartCode specifies which part of the window was hit. (See Window-
PartCode definition in Apple documentation.)

Possible values for the key modifier:
26.10. CLASS CARBONWINDOWSEVENTSMBS

activeFlag = 1 = & h000001
btnState = 128 = & h000080
cmdKey = 256 = & h000100
shiftKey = 512 = & h000200
alphaLock = 1024 = & h000400
optionKey = 2048 = & h000800
controlKey = 4096 = & h001000
rightShiftKey = 8192 = & h002000
rightOptionKey = 16384 = & h004000
rightControlKey = 32768 = & h008000
NumLock = 65536 = & h010000
Fn = 131072 = & h020000

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

26.10.23 GestureRotate(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer, RotationAmount as Double) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called several times while the rotation gesture is performed.
**Notes:**
The RotationAmount in polar coordinates.

GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.
26.10.24 GestureStarted(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This event is called when a gesture starts.
**Notes:**
GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>activeFlag</td>
<td>1</td>
</tr>
<tr>
<td>btnState</td>
<td>128</td>
</tr>
<tr>
<td>cmdKey</td>
<td>256</td>
</tr>
<tr>
<td>shiftKey</td>
<td>512</td>
</tr>
<tr>
<td>alphaLock</td>
<td>1024</td>
</tr>
<tr>
<td>optionKey</td>
<td>2048</td>
</tr>
<tr>
<td>controlKey</td>
<td>4096</td>
</tr>
<tr>
<td>rightShiftKey</td>
<td>8192</td>
</tr>
<tr>
<td>rightOptionKey</td>
<td>16384</td>
</tr>
<tr>
<td>rightControlKey</td>
<td>32768</td>
</tr>
<tr>
<td>NumLock</td>
<td>65536</td>
</tr>
<tr>
<td>Fn</td>
<td>131072</td>
</tr>
</tbody>
</table>

Return true if you handled the event.
Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

**26.10.25 GestureSwipe**

```
GestureSwipe(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer, SwipeDirectionX as Double, SwipeDirectionY as Double) as boolean
```

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**

This event is called for a swipe gesture.

**Notes:**

SwipeDirectionX and SwipeDirectionY specify the swipe direction.

GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

- `activeFlag` = 1 = & h000001
- `btnState` = 128 = & h000080
- `cmdKey` = 256 = & h000100
- `shiftKey` = 512 = & h000200
- `alphaLock` = 1024 = & h000400
- `optionKey` = 2048 = & h000800
- `controlKey` = 4096 = & h001000
- `rightShiftKey` = 8192 = & h002000
- `rightOptionKey` = 16384 = & h004000
- `rightControlKey` = 32768 = & h008000
- `NumLock` = 65536 = & h010000
- `Fn` = 131072 = & h020000

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.
26.10.26 MouseDown(x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event which fires when a mouse button is down.

26.10.27 MouseDragged(x as single, y as single, modifierKeys as Integer, deltax as single, deltay as single, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event which fires when the mouse is dragged.

**Notes:**
In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not).

26.10.28 MouseMoved(x as single, y as single, modifierKeys as Integer, deltax as single, deltay as single) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event which fires when the mouse is moved.

**Notes:**
In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not).

26.10.29 MouseUp(x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event which fires when a mouse button is released.

**Notes:**
In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Realbasic’s debug mode (some RB versions work and some not).
26.10.30  MouseWheelMoved(modifierKeys as Integer, axis as Integer, delta as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called whenever the mouse wheel is moved with the mouse cursor within your window.  

**Example:**

```vbnet
function MouseWheelMoved(modifierKeys as Integer, axis as Integer, delta as Integer) as boolean
    dim d as Integer
    const cmdKey=256
    const shiftKey=512
    const alphaLock=1024
    const optionKey=2048
    const controlKey=4096
    const rightShiftKey=8192
    const rightOptionKey=16384
    const rightControlKey=32768
    const kEventMouseWheelAxisY=1
    const kEventMouseWheelAxisX=0

    if axis=kEventMouseWheelAxisY then
        d=delta
        if BitwiseAnd(modifierKeys,optionkey)<0 then
            d=d*4 // scroll faster with option
        end if
        List.ScrollPosition=List.ScrollPosition-d
    end if

    List.InsertRow 0,"MouseWheelMoved "+str(delta)
end function
```

**Notes:** Currently axis is only 0 or 1, but in future new input devices may have up to 32 axises.

26.10.31  WindowBoundsChanging(original as object, previous as object, current as object, flags as Integer)
26.10.32 WindowClickCloseRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This event is called when the close button area of the window was clicked.

**Notes:**
ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
X and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

26.10.33 WindowClickCollapseRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This event is called when the collapse button area of the window was clicked.

**Notes:**
ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
X and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.
26.10.34 WindowClickContentRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called when the content area of the window was clicked.

**Notes:**

ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
x and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

26.10.35 WindowClickDragRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called when the drag area of the window was clicked.

**Notes:**

ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
x and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.
26.10.36  WindowClickProxyIconRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This event is called when the proxy icon area of the window was clicked.

**Notes:**
- ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
- UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
- globalX and globalY: Global mouse coordinates.
- X and Y: Mouse coordinates relative to window.
- modifierKeys: Which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
- button: Which mouse button was pressed.
- clickcount: Whether this is a single click, double click, etc.
- MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

26.10.37  WindowClickResizeRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This event is called when the resize widget area of the window was clicked.

**Notes:**
- ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
- UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
- globalX and globalY: Global mouse coordinates.
- X and Y: Mouse coordinates relative to window.
- modifierKeys: Which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
- button: Which mouse button was pressed.
- clickcount: Whether this is a single click, double click, etc.
- MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.
26.10. CLASS CARBONWINDOWSEVENTSMBS

26.10.38 WindowClickStructureRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This event is called when the window structure area of the window was clicked.
**Notes:**
- ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
- UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
- globalX and globalY: global mouse coordinates.
- X and Y: mouse coordinates relative to window.
- modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
- button: Which mouse button was pressed.
- clickcount: Whether this is a single click, double click, etc.
- MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

26.10.39 WindowClickToolbarButtonRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This event is called when the toolbar button area of the window was clicked.
**Notes:**
- ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
- UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
- globalX and globalY: global mouse coordinates.
- X and Y: mouse coordinates relative to window.
- modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
- button: Which mouse button was pressed.
- clickcount: Whether this is a single click, double click, etc.
- MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.
26.10.40 WindowClickZoomRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
This event is called when the zoom button area of the window was clicked.

**Notes:**
- ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
- UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
- globalX and globalY: global mouse coordinates.
- X and Y: mouse coordinates relative to window.
- modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
- button: Which mouse button was pressed.
- clickcount: Whether this is a single click, double click, etc.
- MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

26.10.41 WindowClose as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever the window should close.

**Notes:**
- Return false to run the default handler.
- Return true to tell the system that you handled this event.

26.10.42 WindowCloseAll as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever all windows should close.

**Notes:**
- Return false to run the default handler.
- Return true to tell the system that you handled this event.

26.10.43 WindowCollapse as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called when the window is going to collapse.
26.10. CLASS CARBONWINDOWSEVENTSMBS

Notes:
Return false to run the default handler.
Return true to tell the system that you handled this event.

26.10.44 WindowCollapseAll as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called when all windows are going to collapse.
Notes:
Return false to run the default handler.
Return true to tell the system that you handled this event.

26.10.45 WindowCollapsed as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever the window is collapsed.
Notes:
Return false to run the default handler.
Return true to tell the system that you handled this event.

26.10.46 WindowCollapsing as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called while the window is collapsing.
Notes:
Return false to run the default handler.
Return true to tell the system that you handled this event.

26.10.47 WindowExpand as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever the window should expand.
Notes:
Return false to run the default handler.
Return true to tell the system that you handled this event.
26.10.48  WindowExpandAll as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever all windows should expand.
**Notes:**
Return false to run the default handler.
Return true to tell the system that you handled this event.

26.10.49  WindowExpanded as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever the window is expanded.
**Notes:**
Return false to run the default handler.
Return true to tell the system that you handled this event.

26.10.50  WindowExpanding as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called while the window is expanding.
**Notes:**
Return false to run the default handler.
Return true to tell the system that you handled this event.

26.10.51  WindowHidden as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever the window is hidden.
**Notes:**
Return false to run the default handler.
Return true to tell the system that you handled this event.

26.10.52  WindowHiding as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called while the window is hiding.
**Notes:**
26.10. CLASS CARBONWINDOWSEVENTSMBS

Return false to run the default handler.
Return true to tell the system that you handled this event.

26.10.53 WindowRestoreFromDock as boolean

MBS MacCF Plugin, Plugin Version: 7.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called when the minimized window is clicked to be restored.
**Notes:** Return true to block this or return false to allow the restore to go on.

26.10.54 WindowShowing as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called while the window is showing.
**Notes:**
Return false to run the default handler.
Return true to tell the system that you handled this event.

26.10.55 WindowShown as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever the window is shown.
**Notes:**
Return false to run the default handler.
Return true to tell the system that you handled this event.

26.10.56 WindowToolbarButtonClicked as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Called whenever the toolbar button is pressed.
**Notes:** Return true to tell the system that you handled this event. Else you may get this event two tims on a metal window. (Boolean result added in plugin version 4.1)
26.10.57  \textbf{WindowTransitionCompleted}(TransitionAction as Integer, TransactionEffect as Integer)

26.10.58  \textbf{WindowTransitionStarted}(TransitionAction as Integer, TransactionEffect as Integer)

26.10.59  \textbf{WindowZoom} as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Called whenever the window should zoom.  
\textbf{Notes:} 
Return false to run the default handler.  
Return true to tell the system that you handled this event.

26.10.60  \textbf{WindowZoomAll} as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Called whenever all windows should zoom.  
\textbf{Notes:} 
Return false to run the default handler.  
Return true to tell the system that you handled this event.

26.10.61  \textbf{WindowZoomed} as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: No, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Called whenever the window was zoomed.  
\textbf{Notes:} 
Return false to run the default handler.  
Return true to tell the system that you handled this event.
Chapter 27

Catalog Search

27.1  class CatSearchMBS

27.1.1  class CatSearchMBS

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Allows you to search fast on your harddisk.

**Example:**

dim cs as new CatSearchMBS

if cs.Search(volume(0), true) then

  // set search params

  cs.Name = "REALbasic"
  cs.PartialName = true

  dim response as Integer
  do
    response = cs.SearchNext
    if response = 0 then // still searching

      if cs.Result<>nil then // did we find something?
        Listbox1.AddRow cs.Result.Name

      if Listbox1.ListCount = 100 then
        Return // stop after 100 entries
    end if
  end if

end if
CHAPTER 27. CATALOG SEARCH

end
loop until response <0
end if

Notes:
Depending on what and how you want to search, you can decide whether MDQueryMBS or CatSearchMBS is the better choice.

This class implements the PBCatSearch function of the Mac OS File Manager. This is a very fast routine to find specific types of files on a volume. The MacOS tool Sherlock (aka Find File) uses this function to its quick search on local volumes.

There are some restrictions to CatSearchMBS: Is it not supported on every volume! Whether it is supported or not depends on the File System format used on the Volume: HFS, HFS+ and most File Servers support it, while Floppy Disks, ISO 9660 and UDF formatted disks, used on some CDs and on most DVD-ROMs, might not support it.

This version of this plugin can now handle those cases where CatSearchMBS is not supported, too: If a volume does not support CatSearchMBS, you can choose to fall back to the classic recursive directory search, which is much slower, but gives you the same results.

(This new feature is achieved by using a C library called "MoreFiles", written by Jim Luther, one of Apple’s File System ”gurus".)

27.1.2 Methods

27.1.3 close

Function: The destructor.
Notes:
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)
27.1. CLASS CATSEARCHMBS

27.1.4 Search(volume as FolderItem, allowRecursiveSearch as Boolean) as Boolean

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the Search engine.

**Notes:**

Call this to initiate a search a volume. If the returned value is false, then an error has occurred (either there is not enough free memory or the volume wasn’t valid). If the returned value is true, everything is okay.

The volume parameter can be anything that identifies the volume, including any file or folder on it.

If allowRecursiveSearch is true and the volume is a folder you search only the folder on this volume, but using recursive directory search.

The allowRecursiveSearch parameter determines whether the search shall use the slower recursive directory scan method if the volume does not support CatSearchMBS. If you pass false for a volume that does not support CatSearchMBS, this method will fail, and return false.

Update: Newer plugin versions (4.x?) allow to search folders if allowRecursiveSearch=true.

27.1.5 SearchNext as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Searches for the next matching file

**Example:**

// Here's an example of a proper search loop:

dim cs as CatSearchMBS
// ....

dim response as Integer
do
If UserCancelled then
exit
end
response = cs.SearchNext
if response = 0 then
// ... read cs.result and process the found item
end
loop until response <0
Notes:
Once the search criteria has been set, call this function repeatedly as long as it returns non-negative values.
Once the result is negative, the search is finished and CatSearchClose should be called.

These are the possible non-negative return values:

0  a match has been found, and the found item can be inquired by calling Result.
1  a certain amount of time has passed (see ResponseTimeout). You can ignore this result and continue to search.
2  files or folders were added or removed to the volume. You may ignore this error by simply continuing the search.
-39 (eofErr)  end of search, no more matches

27.1.6 Properties

27.1.7 BackupDateEnd as Integer

Function: The end of the backup date search range.
Notes:
This value is an unsigned integer. If you assign a double from a date totalseconds property, please move it to the matching range like in the example project "Find stuff from today".
(Read and Write property)

27.1.8 BackupDateStart as Integer

Function: The start of the backup date search range.
Notes:
This value is an unsigned integer. If you assign a double from a date totalseconds property, please move it to the matching range like in the example project "Find stuff from today".
(Read and Write property)

27.1.9 CreationDateEnd as Integer

Function: The end of the creation date search range.
27.1. CLASS CATSEARCHMBS

Notes:
This value is an unsigned integer. If you assign a double from a date totalseconds property, please move it to the matching range like in the example project "Find stuff from today".
(Read and Write property)

27.1.10 CreationDateStart as Integer

Notes:
This value is an unsigned integer. If you assign a double from a date totalseconds property, please move it to the matching range like in the example project "Find stuff from today".
(Read and Write property)

27.1.11 creator as String

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
dim c as CatSearchMBS
   c.Creator="ttxt"
' will look for files created by the SimpleText application.
Notes:
The above Creator property allows you to specify the search criteria. Without setting any property from this class, a search will find nothing.

Note: If you set one of this properties, all criterias must match to get a match back from a call to SearchNext.
(Read and Write property)

27.1.12 FileFlags as Integer

Example:
dim c as CatSearchMBS
c.FileFlags=& H4000 // Invisible
c.FileFlagsMask=& H4000 // only look on the invisible flag

Notes:
CHAPTER 27. CATALOG SEARCH

The above FileFlags property allows you to specify the search criteria. Without setting any property from this class, a search will find nothing.

Note: If you set one of this properties, all criteria must match to get a match back from a call to SearchNext.

There is a FileFlags and a FileFlagsMask property which must be used together: bits set in FileFlagsMask specify which bits of FileFlags shall be tested. Those bits will then be compared to the corresponding bits of the files’ (and folders’) flags on the searched volume. If they are identical, you have a match.

The meaning of the flags are as follows (you can use BitwiseOr or + to combine them):

- bit 15, value & H8000: isAlias
- bit 14 value & H4000: isInvisible
- bit 13, value & H2000: hasBundle (has a BNDL resource)
- bit 12, value & H1000: nameLocked
- bit 11, value & H0800: isStationary
- bit 10, value & H0400: hasCustomIcon
- bit 8, value & H0100: hasBeenInitiated (Finder has seen the file since it has been created)
- bit 7, value & H0080: hasNoINITs (there is no INIT rsrc in the Extension file)
- bit 6, value & H0040: isShared
- bits 1-3, value & H000E: color (as a 3-bit value from 0-7)

For example, to find only invisible files, use & H4000 for the FileFlagsMask and the same value for the FileFlags, or to find only visible files, use the same FileFlagsMask, but 0 for the FileFlags. To find stationaries that do not have a custom icon, use & H0C00 (=& H0800+& H0400) for the FileFlagsMask and & H0800 for the FileFlags.
(Read and Write property)

### 27.1.13 FileFlagsMask as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The file flags mask to search for.

**Example:**

```vba
dim c as CatSearchMBS
c.FileFlags=& H4000 ' Invisible
c.FileFlagsMask=& H4000 ' only look on the invisible flag
```

**Notes:**

The above FileFlagsMask property allows you to specify the search criteria. Without setting any property from this class, a search will find nothing.
27.1. CLASS CATSEARCHMBS

Note: If you set one of this properties, all criterias must match to get a match back from a call to SearchNext.

There is a FileFlags and a FileFlagsMask property which must be used together: bits set in FileFlagsMask specify which bits of FileFlags shall be tested. Those bits will then be compared to the corresponding bits of the files’ (and folders’) flags on the searched volume. If they are identical, you have a match.

The meaning of the flags are as follows (you can use BitwiseOr or + to combine them):

- bit 15, value & H8000: isAlias
- bit 14 value & H4000: isInvisible
- bit 13, value & H2000: hasBundle (has a BNDL resource)
- bit 12, value & H1000: nameLocked
- bit 11, value & H0800: isStationary
- bit 10, value & H0400: hasCustomIcon
- bit 8, value & H0100: hasBeenInited (Finder has seen the file since it has been created)
- bit 7, value & H0080: hasNoINITs (there is no INIT rsrc in the Extension file)
- bit 6, value & H0040: isShared
- bits 1-3, value & H000E: color (as a 3-bit value from 0-7)

For example, to find only invisible files, use & H4000 for the FileFlagsMask and the same value for the FileFlags, or to find only visible files, use the same FileFlagsMask, but 0 for the FileFlags. To find stationaries that do not have a custom icon, use & H0C00 (=& H0800+& H0400) for the FileFlagsMask and & H0800 for the FileFlags.

(Read and Write property)

27.1.14 FileType as String

Example:

```vbnet
dim c as CatSearchMBS
c.FileType="TEXT"
' will look for plain Text files.
```

Notes:

The above Creator property allows you to specify the search criteria. Without setting any property from this class, a search will find nothing.
Note: If you set one of this properties, all criterias must match to get a match back from a call to SearchNext.
(Read and Write property)

### 27.1.15 LogicalDataForkSizeEnd as UInt64

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum logical data fork file size.

**Example:**

```vbnet
dim c as CatSearchMBS
c.LogicalDataForkSizeStart=0
c.LogicalDataForkSizeEnd=102400 // search for files <= 100 KB.
```

**Notes:**
You can assign -1 to have no upper limit.
(Read and Write property)

### 27.1.16 LogicalDataForkSizeStart as UInt64

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum logical data fork file size.

**Example:**

```vbnet
dim c as CatSearchMBS
c.LogicalDataForkSizeStart=0
c.LogicalDataForkSizeEnd=102400 // search for files <= 100 KB.
```

**Notes:** (Read and Write property)

### 27.1.17 LogicalResForkSizeEnd as UInt64

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum logical resource fork file size.

**Example:**

```vbnet
dim c as CatSearchMBS
c.LogicalResForkSizeStart=0
c.LogicalResForkSizeEnd=102400 // search for files <= 100 KB.
```
Notes:
You can assign -1 to have no upper limit.
(Read and Write property)

27.1.18 LogicalResForkSizeStart as UInt64

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum logical resource fork file size.
**Example:**
```vbnet
dim c as CatSearchMBS
c.LogicalResForkSizeStart=0
c.LogicalResForkSizeEnd=102400 // search for files <= 100 KB.
```

Notes: (Read and Write property)

27.1.19 ModificationDateEnd as Integer

MBS MacClassic Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The end of the modification date search range.
**Notes:**
This value is an unsigned integer. If you assign a double from a date totalseconds property, please move it to the matching range like in the example project "Find stuff from today".
(Read and Write property)

27.1.20 ModificationDateStart as Integer

MBS MacClassic Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The start of the modification date search range.
**Notes:**
This value is an unsigned integer. If you assign a double from a date totalseconds property, please move it to the matching range like in the example project "Find stuff from today".
(Read and Write property)
27.1.21 name as String

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Set's the name for the search.

**Example:**

```plaintext
dim c as CatSearchMBS
c.Name="Apple"
c.partialname=true
```

**Notes:**

The above name property allows you to specify the search criteria. Without setting any property from this class, a search will find nothing.

Note: If you set one of this properties, all criterias must match to get a match back from a call to SearchNext.

If you pass true to the partialname property, you'll get a match any time the item's name contains the searched name. Otherwise, the entire name must match.

This property is encoded with system encoding. You need to convert strings from an editfield in RB 5 to match the system encoding which is not UTF8.

(Read and Write property)

27.1.22 PartialName as boolean

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** whether or not the name property contains only a partial file name.

**Example:**

```plaintext
dim c as CatSearchMBS
c.Name="Apple"
c.partialname=true
```

**Notes:**

If you pass true to the partialname property, you'll get a match any time the item's name contains the searched name. Otherwise, the entire name must match.

(Read and Write property)
27.1. **CLASS CATSEARCHMBS**

27.1.23  **PhysicalDataForkSizeEnd as UInt64**

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum physical data fork file size.

**Example:**

```vba
dim c as CatSearchMBS
c.PhysicalDataForkSizeStart=0
c.PhysicalDataForkSizeEnd=102400 // search for files <= 100 KB.
```

**Notes:**

You can assign -1 to have no upper limit.
(Read and Write property)

27.1.24  **PhysicalDataForkSizeStart as UInt64**

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum physical data fork file size.

**Example:**

```vba
dim c as CatSearchMBS
c.PhysicalDataForkSizeStart=0
c.PhysicalDataForkSizeEnd=102400 // search for files <= 100 KB.
```

**Notes:** (Read and Write property)

27.1.25  **PhysicalResForkSizeEnd as UInt64**

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum physical resource fork file size.

**Example:**

```vba
dim c as CatSearchMBS
c.PhysicalResForkSizeStart=0
c.PhysicalResForkSizeEnd=102400 // search for files <= 100 KB.
```

**Notes:**

You can assign -1 to have no upper limit.
(Read and Write property)
27.1.26 PhysicalResForkSizeStart as UInt64

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum physical resource fork file size.

**Example:**

```plaintext
dim c as CatSearchMBS
  c.PhysicalResForkSizeStart=0
  c.PhysicalResForkSizeEnd=102400 // search for files <= 100 KB.
```

**Notes:** (Read and Write property)

27.1.27 ResponseTimeout as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the timeout for the search.

**Example:**

```plaintext
dim c as CatSearchMBS
  c.ResponseTimeout=1000 // one second
```

**Notes:**

Sets the maximum time that may pass before SearchNext shall return even if no item has been found yet. The default is 15ms.

If you set the timeout to 0, then SearchNext will only return if an item has been found or if the search is finished.

**Background:**

Searching for a file or folder, especially if the volume does not support CatSearchMBS, can take a lot of time. While the search is in progress, you might want the user to give still access to your app’s user interface. If SearchNext would only return once an item is found, the user interface might not be responsive for several seconds, up to minutes. RB’s threads would not help here. To solve this, SearchNext returns in timely intervals even when it has nothing found yet. At that time, RB can respond to any user interaction, if necessary. This happens then automatically. All you have to do is to call SearchNext again.

(Read and Write property)
27.1.28 Result as folderitem

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current file and returns nil if none was found.

**Notes:**
After CatSearchNext has returned zero, this function returns the found item else nil.
(Read and Write property)

27.1.29 UsedCatSearchForLastSearch as Boolean

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** whether the last search used the fast catalog search or the slow directory search.

**Notes:** (Read and Write property)

27.1.30 UseIndexedSearch as Boolean

MBS MacClassic Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Forces the class to use indexed search.

**Notes:** (Read and Write property)
Chapter 28

ChartDirector

28.1  class CDAngularAxisMBS

28.1.1 class CDAngularAxisMBS

Function: The AngularAxis class represents angular axes in polar charts. The angular axis is the axis representing the angular component of a polar coordinate.

Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.1.2 Methods

28.1.3 addLabel(pos as Double, label as string)

Function: Adds an extra label on the axis.

Notes:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos</td>
<td>(Mandatory)</td>
<td>The position on the axis to add the label.</td>
</tr>
<tr>
<td>label</td>
<td>(Mandatory)</td>
<td>The text label to add.</td>
</tr>
</tbody>
</table>

4343
28.1.4 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addZone method, but uses color instead of integer data type for passing color values.

See also:

- 28.1.5 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1)
- 28.1.6 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as color, edgeColor as color)
- 28.1.7 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as Integer, edgeColor as Integer)

28.1.5 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1)

**Function:** Adds an angular zone to the polar chart.

**Notes:**

This method is just a short cut to AngularAxis.addZone, in which the starting radius is always 0, and ending radius is the radius of the polar plot region. In other words, the angular zone is a sector on the polar chart.

**Parameters:**

- **startValue** (Mandatory) The data value that marks the start angular position of the zone.
- **endValue** (Mandatory) The data value that marks the end angular position of the zone.
- **fillColor** (Mandatory) The fill color of the zone.
- **edgeColor** -1 The edge color of the zone. The default is the same as the fill color.

See also:

- 28.1.4 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color)
- 28.1.6 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as color, edgeColor as color)
- 28.1.7 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as Integer, edgeColor as Integer)
28.1.6 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addZone method, but uses color instead of integer data type for passing color values.

**See also:**
- 28.1.4 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color)
- 28.1.5 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1)
- 28.1.7 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as Integer, edgeColor as Integer)

28.1.7 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as Integer, edgeColor as Integer)

**Function:** Adds an angular zone to the polar chart.

**Notes:**
An angular zone marks an angular region that spans from a start angle to an end angle, where the angles are specified as data values on the angular axis scale. The addZone method allows you to specify a starting and ending radius in pixels for drawing the zone.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startValue</td>
<td>(Mandatory)</td>
<td>The data value that marks the start angular position of the zone.</td>
</tr>
<tr>
<td>endValue</td>
<td>(Mandatory)</td>
<td>The data value that marks the end angular position of the zone.</td>
</tr>
<tr>
<td>startRadius</td>
<td>(Mandatory)</td>
<td>The starting radius of the zone in pixels.</td>
</tr>
<tr>
<td>endRadius</td>
<td>(Mandatory)</td>
<td>The ending radius of the zone in pixels.</td>
</tr>
<tr>
<td>fillColor</td>
<td>(Mandatory)</td>
<td>The fill color of the zone.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>-1</td>
<td>The edge color of the zone. The default is the same as the fill color.</td>
</tr>
</tbody>
</table>

**See also:**
- 28.1.4 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color)
- 28.1.5 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1)
- 28.1.6 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as color, edgeColor as color)
28.1.8 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The private constructor.

28.1.9 getAxisImageMap

```
(noOfSegments as Integer, mapWidth as Integer, url as string, queryFormat as string = "", extraAttr as string = "", offsetX as Integer = 0, offsetY as Integer = 0) as string
```

**Function:** Generates an HTML image map for the axis itself.

**Notes:**
This method is similar to AngularAxis.getHTMLImageMap. The difference is instead of generating an image map for the labels, it generates an image map for the axis itself. The axis will be divided into a number of segments, with an image map entry created for each segment.

**Parameters:**
- `noOfSegments` (Mandatory): The number of segments to divide the axis into.
- `mapWidth` (Mandatory): The width of the axis used for the purpose of generating the image map.
- `url` (Mandatory): The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.
- `queryFormat` "": A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported. The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default. Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.
- `extraAttr` "": A text string to specify additional attributes to add to the `<area>` tag. Parameter Substitution and Formatting is supported.
- `offsetX` 0: An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
- `offsetY` 0: An offset to be added to all y coordinates in the image map. See offsetX above for description.

**Return Value**
A text string containing the image map generated.
28.1. CLASS CDANGULARAXISMBS

28.1.10  getHTMLImageMap(url as string, queryFormat as string = "", extraAttr as string = "", offsetX as Integer = 0, offsetY as Integer = 0) as string

**Function:** Generates an HTML image map for the axis labels. 
**Notes:** 
This method should be called only after creating the chart image (eg. using BaseChart.makeChart). The image map cannot be determined without creating the chart image first. This method accepts a URL as its argument. When generating an image map, it appends query parameters to the URL to indicate which legend entry the user has clicked. 

The following is an example image map generated for an axis with 3 labels.

```html
area shape="rect" coords="30,220,70,239" href="handler.asp?value=0& label=John"
area shape="rect" coords="70,220,110,239" href="handler.asp?value=1& label=Mary"
area shape="rect" coords="110,220,150,239" href="handler.asp?value=2& label=Peter"
```

The image map consists of multiple `<area>` tags, one for each label. In the `href` attributes, query parameters are appended to the URL to provide information on the label clicked. 

The image map produced by ChartDirector does not include the `<map>` and `</map>` tag. This is intentional so that you can add additional custom `<area>` tags to the image map, or append multiple image maps together. 

The format of the appended URL parameters is determined using the `queryFormat` argument, which by default is:

```
value= { value } & label= { label }
```

The texts in curly brackets (i.e. { value }, { label }) will be replaced by the actual values when generating the image map. For example, { label } will be replaced by the label text. Please refer to Parameter Substitution and Formatting on all available parameters and how to format them. 

In addition to customizing the query parameters, ChartDirector supports additional HTML attributes in the `<area>` tags using the `extraAttr` argument. For example, the following `extraAttr` will add a "title" HTML attribute to every `<area>` tag. The "title" attribute will be displayed as "tool tip" when the mouse moves over the image map.

```
title='Click me for details on { label }'
```

Another common usage of the `extraAttr` argument is to add "onmouseover" and "onmouseout" HTML attributes to handle user interaction using Javascript on the browser. 

**Return Value**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL to be used in the &quot;href&quot; attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.</td>
</tr>
<tr>
<td>queryFormat</td>
<td>A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported. The special keyword &quot;{ default }&quot; represents the default query parameters. This is useful for specifying appending to the default. Note that an empty string means to use the default query parameters. To specify no query parameter, use a space character.</td>
</tr>
<tr>
<td>extraAttr</td>
<td>A text string to specify additional attributes to add to the &lt;area&gt; tag. Parameter Substitution and Formatting is supported.</td>
</tr>
<tr>
<td>offsetX</td>
<td>An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.</td>
</tr>
<tr>
<td>offsetY</td>
<td>An offset to be added to all y coordinates in the image map. See offsetX above for description.</td>
</tr>
</tbody>
</table>

A text string containing the image map generated.

### 28.1.11 setLabelGap(d as Integer)

**Function:** Sets the distance between the axis labels and the axis.

**Notes:**

**Parameters:**

- **d** (Mandatory) The distance between the axis label and axis in pixels.

### 28.1.12 setLabels(labels() as Double, formatString as string = "") as CD-TextBoxMBS

**Function:** Sets the numeric labels to be used on the axis.

**Notes:**

This method is typically used to set the angular axis to enumerated scale. For more details on what is enumerated axis scale, please refer to AngularAxis.setLabels. In some cases, it may be desirable to skip some labels. If you want to leave a label position empty, use kNoValue as the axis label.

**Return Value**

A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of
28.1. CLASS CDANGULARAXISMBS

Parameter       Default       Description
labels          (Mandatory)   An array of numbers to be used as the axis labels.
formatString    ""            A format string to specified how to format the labels into human readable
                          form. Please refer to Axis.setLabelFormat for the syntax of the format string.
                          An empty string means the format will be automatically determined.

See also:

- 165.2.1 setLabels(labels() as string) as CDTextBoxMBS

28.1.13 setLabels(labels() as string) as CDTextBoxMBS

Function: Sets the text labels to be used on the axis.

Notes:

Parameter       Default       Description
lowerLimit      (Mandatory)   The lower bound of the axis.
upperLimit      (Mandatory)   The upper bound of the axis.
labels          (Mandatory)   An array of text strings to be used as the labels on the axis. ChartDirector
                          will distribute the labels evenly on the axis.

This method is typically used in radar charts to set the angular axis to enumerated scale.
In enumerated scale, the labels are laid out evenly on the perimeter of the polar plot area. It is like the
labels are at on the vertices of an n-side polygon, where n is the number of labels. Radial grid lines are
drawn from the center to the vertices.
The angular coordinates of the data points are determined based on their position in the data array. The
first data point will be at the same angular coordinate as the first vertex, the second data point at the second
vertex, and so on.
Internally, ChartDirector will assign a value of 0 to the first axis label, 1 to the second axis label, and so on.
These values are not visible. Only the axis labels are visible. However, these values may be useful for some
ChartDirector features that need to reference the axis position by value, such as adding extra labels using
AngularAxis.addLabel.

Parameter       Default       Description
text            (Mandatory)   An array of strings containing the text of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of
the obj.
See also:

- 28.1.12 setLabels(labels() as Double, formatString as string = "") as CDTextBoxMBS
setLabelStyle(font as string = "bold", fontsize as Double = 8, fontcolor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

**Function:** Sets the font style used to for the axis labels.

**Notes:**

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>&quot;bold&quot;</td>
<td>The font used to draw the labels.</td>
</tr>
<tr>
<td>fontSize</td>
<td>10</td>
<td>The font size used to draw the labels in points.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The color used to draw the labels.</td>
</tr>
<tr>
<td>fontAngle</td>
<td>0</td>
<td>The rotation angle of the labels.</td>
</tr>
</tbody>
</table>

**Return Value**

A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:

http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

setLinearScale(lowerLimit as Double, upperLimit as Double, labels() as string)

**Function:** Sets the axis to use the given linear scale and the given labels.

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lowerLimit</td>
<td>(Mandatory)</td>
<td>The lower bound of the axis.</td>
</tr>
<tr>
<td>upperLimit</td>
<td>(Mandatory)</td>
<td>The upper bound of the axis.</td>
</tr>
<tr>
<td>labels</td>
<td>(Mandatory)</td>
<td>An array of text strings to be used as the labels on the axis. ChartDirector will distribute the labels evenly on the axis.</td>
</tr>
</tbody>
</table>

See also:

- 165.4.6 setLinearScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0)

**Function:** Sets the axis to use the given linear scale.

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lowerLimit</td>
<td>(Mandatory)</td>
<td>The lower bound of the axis.</td>
</tr>
<tr>
<td>upperLimit</td>
<td>(Mandatory)</td>
<td>The upper bound of the axis.</td>
</tr>
<tr>
<td>majorTickInc</td>
<td>0</td>
<td>Adds major ticks to the axis, where the major ticks are separated by majorTickInc in value. Each major tick will have an associated text label for the value if the axis at the tick. The default value of 0 means no major tick is used.</td>
</tr>
<tr>
<td>minorTickInc</td>
<td>0</td>
<td>Adds minor ticks to the axis, where the minor ticks are separated by minorTickInc in value. The default value of 0 means no minor tick is used.</td>
</tr>
</tbody>
</table>

See also:

- 28.1.15 setLinearScale(lowerLimit as Double, upperLimit as Double, labels() as string)
28.2 class CD AngularMeterMBS

28.2.1 class CD AngularMeterMBS

**Function:** The AngularMeter class represents angular meters.

**Example:**

```csharp
// The value to display on the meter
const value = 27.48

// Create an AngularMeter object of size 200 x 115 pixels, with silver background
// color, black border, 2 pixel 3D border border and rounded corners
dim m as new CD AngularMeterMBS(200, 115, CDBaseChartMBS.silverColor, & h000000 , 2)
m.setRoundedFrame

// Set the meter center at (100, 100), with radius 85 pixels, and span from -90
// to +90 degrees (semi-circle)
m.setMeter(100, 100, 85, -90, 90)

// Meter scale is 0 - 100, with major tick every 20 units, minor tick every 10
// units, and micro tick every 5 units
m.setScale(0, 100, 20, 10, 5)

// Set 0 - 60 as green (66FF66) zone
m.addZone(0, 60, 0, 85, & h66ff66)

// Set 60 - 80 as yellow (FFFF33) zone
m.addZone(60, 80, 0, 85, & hffff33)

// Set 80 - 100 as red (FF6666) zone
m.addZone(80, 100, 0, 85, & hff6666)

// Add a text label centered at (100, 60) with 12 pts Arial Bold font
call m.addText(100, 60, "PSI", "arialbd.ttf", 12, CDBaseChartMBS.kTextColor, CDBaseChartMBS.kCenter)

// Add a text box at the top right corner of the meter showing the value
// formatted to 2 decimal places, using white text on a black background, and
// with 1 pixel 3D depressed border
m.addText(156, 8, m.formatValue(value, "2"), "arial.ttf", 8, & hffffff).setBackground(& h000000 , 0, -1)

// Add a semi-transparent blue (40666699) pointer with black border at the
// specified value
call m.addPointer(value, & h40666699, & h000000)

// Output the chart
Backdrop=m.makeChartPicture
```
Notes: Subclass of the CDBaseMeterMBS class.

28.2.2 Methods

28.2.3 addGlare

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds glare effect to the meter.
Notes:
The glare effect is created by brightening part of the meter face.
The face is divided by an arc, of which one part is brightened. The glare effect works best for meters with
dark background.
All parameters are optional.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>radius</td>
<td>NoValue</td>
<td>The radius of the face of the meter. The default is the meter scale radius as set by AngularMeter.setMeter.</td>
</tr>
<tr>
<td>span</td>
<td>135</td>
<td>The angular span of the arc that divides the face into two parts. The dividing arc intersects with the face border at two points. The angular span is defined as center angle of these two points (that is, the angle subtended at the meter center by these two points).</td>
</tr>
<tr>
<td>rotate</td>
<td>0</td>
<td>By default, the glare will be symmetrically with respect to the vertical axis. This argument can be used to rotate the glare clockwise in degrees.</td>
</tr>
<tr>
<td>glareRadius</td>
<td>NoValue</td>
<td>The radius of the arc that divides the face into two parts. A positive value means the arc will result in a convex glare, while a negative means concave glare. The default is equal to 1.5 times of the face radius.</td>
</tr>
<tr>
<td>intensity</td>
<td>0.13</td>
<td>The intensity of the glare, which must be from 0 to 1. A value of 0 means no glare, while a value of 1 means the glare will be 100% white.</td>
</tr>
</tbody>
</table>

#### 28.2.6 addPointer(value as Double, fillColor as color, edgeColor as color = &cFFFFFFFF, pointerType as Integer = 6) as CDMeterPointerMBS

**MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Adds a new style pointer to the meter.

**Notes:**

When compared to classical pointers (added by CDBaseMeterMBS.addPointer), new style pointers are thinner. They are designed to be used with the new style meter cap (see CDAngularMeterMBS.setCap2). They are also designed to have their base and tip movable in the radial direction, which means they can be detached from the center, and can even points from the outside inwards.

Parameters are optional and colors can be passed as Integer or color values.

Return a MeterPointer object representing the pointer. You may use this object to fine-tune the appearance of the pointer.

See also:

- 28.2.7 addPointer(value as Double, fillColor as color, edgeColor as color, pointerType as Integer, startOffset as Double) as CDMeterPointerMBS
- 28.2.8 addPointer(value as Double, fillColor as color, edgeColor as color, pointerType as Integer, startOffset as Double, endOffset as Double) as CDMeterPointerMBS
- 28.2.9 addPointer(value as Double, fillColor as color, edgeColor as color, pointerType as Integer, startOffset as Double, endOffset as Double, widthRatio as Double) as CDMeterPointerMBS
28.2.10 addPointer(value as Double, fillColor as Integer, edgeColor as Integer = -1, pointerType as Integer = 6) as CDMeterPointerMBS

28.2.11 addPointer(value as Double, fillColor as Integer, edgeColor as Integer, pointerType as Integer, startOffset as Double) as CDMeterPointerMBS

28.2.12 addPointer(value as Double, fillColor as Integer, edgeColor as Integer, pointerType as Integer, startOffset as Double, endOffset as Double) as CDMeterPointerMBS

28.2.13 addPointer(value as Double, fillColor as Integer, edgeColor as Integer, pointerType as Integer, startOffset as Double, endOffset as Double, widthRatio as Double) as CDMeterPointerMBS

28.2.7 addPointer(value as Double, fillColor as color, edgeColor as color, pointerType as Integer, startOffset as Double) as CDMeterPointerMBS

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Adds a new style pointer to the meter.

Notes:

When compared to classical pointers (added by CDBaseMeterMBS.addPointer), new style pointers are thinner. They are designed to be used with the new style meter cap (see CDAngularMeterMBS.setCap2). They are also designed to have their base and tip movable in the radial direction, which means they can be detached from the center, and can even point from the outside inwards.

Parameters are optional and colors can be passed as Integer or color values.

Return a MeterPointer object representing the pointer. You may use this object to fine-tune the appearance of the pointer.

### 28.2.8 addPointer(value as Double, fillColor as color, edgeColor as color, pointerType as Integer, startOffset as Double, endOffset as Double) as CD-MeterPointerMBS

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Adds a new style pointer to the meter.

**Notes:**

When compared to classical pointers (added by CDBaseMeterMBS.addPointer), new style pointers are thinner. They are designed to be used with the new style meter cap (see CDAngularMeterMBS.setCap2). They
are also designed to have their base and tip movable in the radial direction, which means they can be detached from the center, and can even point from the outside inwards.
Parameters are optional and colors can be passed as Integer or color values.

CHAPTER 28. CHARTDIRECTOR

### Argument Default Description

- **value** (Mandatory) The value that the pointer points to.
- **fillColor** (Mandatory) The fill color of the pointer.
- **edgeColor** -1 The edge color of the pointer. -1 means the edge color is the same as the fill color.
- **pointerType** TriangularPointer2 The pointer shape. Please refer to MeterPointer.setShapeAndOffset for the available shapes.
- **startOffset** NoValue The distance between the starting point of the pointer with the meter center, expressed as a ratio to the scale radius. NoValue means the radius is automatically determined. Please refer to MeterPointer.setShapeAndOffset for more information about this argument.
- **endOffset** NoValue The distance between the ending point of the pointer with the meter center, expressed as a ratio to the scale radius. NoValue means the radius is automatically determined. Please refer to MeterPointer.setShapeAndOffset for more information about this argument.
- **widthRatio** NoValue The width of the pointer relative to the default width. NoValue means the width is automatically determined.

- 28.2.8 addPointer(value as Double, fillColor as color, edgeColor as color, pointerType as Integer, startOffset as Double, endOffset as Double) as CDMeterPointerMBS
- 28.2.9 addPointer(value as Double, fillColor as color, edgeColor as color, pointerType as Integer, startOffset as Double, endOffset as Double, widthRatio as Double) as CDMeterPointerMBS
- 28.2.10 addPointer(value as Double, fillColor as Integer, edgeColor as Integer = -1, pointerType as Integer = 6) as CDMeterPointerMBS
- 28.2.11 addPointer(value as Double, fillColor as Integer, edgeColor as Integer, pointerType as Integer, startOffset as Double) as CDMeterPointerMBS
- 28.2.12 addPointer(value as Double, fillColor as Integer, edgeColor as Integer, pointerType as Integer, startOffset as Double, endOffset as Double) as CDMeterPointerMBS

28.2.14  addRing(startRadius as Integer, endRadius as Integer, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other addRing method, but uses color instead of integer data type for passing color values.

See also:

- 28.2.15 addRing(startRadius as Integer, endRadius as Integer, fillColor as Integer, edgeColor as Integer = -1)
28.2.15  addRing(startRadius as Integer, endRadius as Integer, fillColor as Integer, edgeColor as Integer = -1)

Function: Adds a circular ring or a circle to the meter.
Notes:
A ring is the region between two concentric circles. This method is most often used for adding circular borders and backgrounds for the meter, and for some other decorative purposes. For example, one can add a circle with a metallic background color as the 'face' of the meter meter using this method.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startRadius</td>
<td>(Mandatory)</td>
<td>The starting radius of the ring in pixels. To add a circle, set the start radius to 0.</td>
</tr>
<tr>
<td>endRadius</td>
<td>(Mandatory)</td>
<td>The ending radius of the ring in pixels.</td>
</tr>
<tr>
<td>fillColor</td>
<td>(Mandatory)</td>
<td>The fill color of the ring.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>-1</td>
<td>The edge color of the ring. The default is the same as the fill color.</td>
</tr>
</tbody>
</table>

See also:
- 28.2.14 addRing(startRadius as Integer, endRadius as Integer, fillColor as color, edgeColor as color)

28.2.16  addRingSector(startRadius as Integer, endRadius as Integer, a1 as Double, a2 as Double, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addRingSector method, but uses color instead of integer data type for passing color values.
See also:
- 28.2.17 addRingSector(startRadius as Integer, endRadius as Integer, a1 as Double, a2 as Double, fillColor as Integer, edgeColor as Integer = -1)

28.2.17  addRingSector(startRadius as Integer, endRadius as Integer, a1 as Double, a2 as Double, fillColor as Integer, edgeColor as Integer = -1)

Function: Adds a ring sector or a sector to the meter.
Notes:
This method is similar to the AngularMeter.addRing method, except that the ring it adds does not span the complete circle, but just part of the circle.
Parameter | Default (Mandatory) | Description
---|---|---
startRadius | The starting radius of the ring sector in pixels. To add a sector, set the starting radius to 0.
endRadius | The ending radius of the ring sector in pixels.
a1 | The starting angle of the ring sector in degrees. The angle is measured in degrees clockwise, with 0 being the upward pointing direction.
a2 | The ending angle of the ring sector in degrees. The angle is measured in degrees clockwise, with 0 being the upward pointing direction.
fillColor | The fill color of the ring sector.
edgeColor | The edge color of the ring sector. The default is the same as the fill color.

See also:

- 28.2.16 addRingSector(startRadius as Integer, endRadius as Integer, a1 as Double, a2 as Double, fillColor as color, edgeColor as color)

### 28.2.18 addScaleBackground(bgRadius as Integer, fillColor as color, edgeWidth as Integer = 0, edgeColor as color = & cFFFFFFFF, scaleRadius as Integer = -2147483647)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Adds a background to the meter scale.  
**Notes:**  
The scale background is a circle segment (a circle with a part cut-off by a chord). Its radius is usually configured as larger than that of the meter scale. In this case, its angular span will also be larger than that of the meter scale. In the above sample, the meter scale spans 180 degrees. The scale background spans more than 180 degrees so that it can maintain a margin at the bottom side (the chord side). Most arguments are optional and colors can be passed as Integer or color value.  
See also:

- 28.2.19 addScaleBackground(bgRadius as Integer, fillColor as color, edgeWidth as Integer, edgeColor as color, scaleRadius as Integer, startAngle as Double, endAngle as Double)

- 28.2.20 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer = 0, edgeColor as Integer = -1, scaleRadius as Integer = -2147483647)

- 28.2.21 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer, edgeColor as Integer, scaleRadius as Integer, startAngle as Double, endAngle as Double)

28.2.19 addScaleBackground(bgRadius as Integer, fillColor as color, edgeWidth as Integer, edgeColor as color, scaleRadius as Integer, startAngle as Double, endAngle as Double)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Adds a background to the meter scale.

Notes:

The scale background is a circle segment (a circle with a part cut-off by a chord). Its radius is usually configured as larger than that of the meter scale. In this case, its angular span will also be larger than that of the meter scale. In the above example, the meter scale spans 180 degrees. The scale background spans more than 180 degrees so that it can maintain a margin at the bottom side (the chord side).

Most arguments are optional and colors can be passed as Integer or color value.

- 28.2.18 addScaleBackground(bgRadius as Integer, fillColor as color, edgeWidth as Integer = 0, edgeColor as color = & cFFFFFFF, scaleRadius as Integer = -2147483647)
- 28.2.20 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer = 0, edgeColor as Integer = -1, scaleRadius as Integer = -2147483647)
28.2.21 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer, edgeColor as Integer, scaleRadius as Integer, startAngle as Double, endAngle as Double)

28.2.20 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer = 0, edgeColor as Integer = -1, scaleRadius as Integer = -2147483647)

The scale background is a circle segment (a circle with a part cut-off by a chord). Its radius is usually configured as larger than that of the meter scale. In this case, its angular span will also be larger than that of the meter scale. In the above sample, the meter scale spans 180 degrees. The scale background spans more than 180 degrees so that it can maintain a margin at the bottom side (the chord side).

Most arguments are optional and colors can be passed as Integer or color value.

- 28.2.18 addScaleBackground(bgRadius as Integer, fillColor as color, edgeWidth as Integer = 0, edge-Color as color = & cFFFFFFFF, scaleRadius as Integer = -2147483647)  4366
- 28.2.19 addScaleBackground(bgRadius as Integer, fillColor as color, edgeWidth as Integer, edgeColor as color, scaleRadius as Integer, startAngle as Double, endAngle as Double)  4367
- 28.2.20 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer = 0, edgeColor as Integer = -1, scaleRadius as Integer = -2147483647)  4368

#### 28.2.22 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other addZone method, but uses color instead of integer data type for passing color values.

See also:

- 28.2.23 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1)  4371
- 28.2.24 addZone(startValue as Double, endValue as Double, startRadius as Integer, endRadius as Integer, fillColor as color, edgeColor as color)  4371
28.2.23 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1)

**Function:** Adds a colored zone to the meter.

**Notes:**
This method is just a short cut to AngularMeter.addZone, in which the starting radius is always 0, and ending radius is the radius of the meter scale. In other words, the zone is a sector on the meter.

<table>

28.2.26 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other Constructor method, but uses color instead of integer data type for passing color values.
**See also:**

- 28.2.27 Constructor(width as Integer, height as Integer, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0) 4372

28.2.27 Constructor(width as Integer, height as Integer, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

**Function:** Creates a new AngularMeter object.
**Notes:**

See also:
28.2. CLASS CDANGULARMETERMBS

Parameter  Default  Description
width      (Mandatory)  The width of the chart in pixels.
height     (Mandatory)  The height of the chart in pixels.
bgColor    BackgroundColor  The background color of the chart.
edgeColor  Transparent  The edge color of the chart.
raisedEffect  0  The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

- 28.2.26 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

28.2.28 relativeLinearGradient(gradient() as Double, angle as Double = 0.0, radius as Double = -1.0) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function:  Creates a linear gradient color relative to the meter center and radius.

Notes:
A general linear gradient color can be created by CDBaseChartMBS.linearGradientColor, which involves specifying the x and y coordinates of the starting and ending points and the color stops. The relativeLinearGradient simplifies creating a linear gradient by assuming the gradient line passes through the meter center at a configurable angle.

The linear gradient is defined using an array of numbers, in which each pair of numbers represents the relative distance and its associated color. The relative distance is the ratio of the absolute distance to the reference radius, which defaults to the meter scale radius (set by AngularMeter.setMeter).

For example, to define a linear gradient with blue (0000FF) at the bottom-left of reference radius, green (00FF00) at the center, and red (FF0000) at the top-right of the reference radius, the angle should be set to 45 degrees, and the array of numbers should be:

-1.0, & H0000ff, 0.0, & H00ff00, 1.0, & Hff0000

The relative distances in the array should be arranged in increasing order. It is possible to define a relative linear gradient shorter or longer than the reference radius by using a relative distance of magnitude smaller or greater than 1. A negative relative distance means the distance is measured at the opposite side of center.

Returns a 32-bit integer representing the linear gradient color.
## 28.2.29 relativeRadialGradient(gradient() as Double, radius as Double = -1.0) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Creates a radial gradient color relative to the meter center and radius.

**Notes:**

A general radial gradient color can be created by CDBaseChartMBS.radialGradientColor, which involves specifying the center x and y coordinates, horizontal and vertical radii, and the color stops. The relativeRadialGradient simplifies creating a radial gradient by assuming the center of the radial gradient to be the meter center, and the radial pattern is circular (so that the vertical and horizontal radii are the same), and default to using the meter scale radius (set by AngularMeter.setMeter) as the reference radius.

The radial gradient is defined using an array of numbers, in which each pair of numbers represents the relative radius and its associated color. The relative radius is the ratio of the absolute radius to the reference radius.

For example, to define a radial gradient with blue (0000FF) at the center, green (00FF00) at the mid-point between the center and the reference radius, and red at the reference radius, the numbers should be:

0.0, & H0000ff, 0.5, & H00ff00, 1.0, & Hff0000

The relative radii in the array must be arranged in increasing order. It is possible to define a relative radial gradient smaller or larger than the reference radius by using a relative radius smaller or greater than 1.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gradient</td>
<td>(Mandatory)</td>
<td>An numeric array defining the color stops. Please refer to the description above for details.</td>
</tr>
<tr>
<td>angle</td>
<td>0</td>
<td>The direction of the linear gradient line. It is specified as a clockwise angle in degrees, with 0 being the upward pointing direction.</td>
</tr>
<tr>
<td>radius</td>
<td>-1</td>
<td>The reference radius to define the relative distance. The default is the meter scale radius (set by CDAngularMeterMBS.setMeter).</td>
</tr>
</tbody>
</table>

Returns a 32-bit integer representing the radial gradient color.
28.2.30  setCap(radius as Integer, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Set the radius and color of the pointer cap.
**Notes:**

The pointer cap is a circle at the center of the meter above the meter pointer. By default, it is a small circle 3 pixels in radius, so it looks like a "pivot" for the pointer for it to rotate about the center.

You may change the radius and colors of this circle using this method to achieve other visual effects.

<table>

See also:

- 28.2.31 setCap(radius as Integer, fillColor as Integer, edgeColor as Integer = & hffff0001)

28.2.31  setCap(radius as Integer, fillColor as Integer, edgeColor as Integer = & hffff0001)

**Function:** Set the radius and color of the pointer cap.
**Notes:**

The pointer cap is a circle at the center of the meter above the meter pointer. By default, it is a small circle 3 pixels in radius, so it looks like a "pivot" for the pointer for it to rotate about the center.

You may change the radius and colors of this circle using this method to achieve other visual effects.

- 28.2.30 setCap(radius as Integer, fillColor as color, edgeColor as color)
28.2.32  setCap2(backcolor as Color = & c888888, frontColor as Color = & c000000, frontEdgeColor as Color = & c888888)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Configures the meter to use new style pointer cap.

**Notes:**

The new style pointer cap is a circular object covering the center of the meter. It is designed to be used with new style pointers (added with AngularMeter.addPointer2). The cap consists of two circles, one at the background below the pointer, and one covering the pointer. The pointer will appear to be sandwiched between these two circles.

Arguments are optional and colors can be passed as Integer or color value.

28.2.43 Screenshots

28.2.44 squareameter.jpg

**Function:** A meter created using ChartDirector with the CDAngularMeterMBS class.
28.3   class CDAreaLayerMBS

28.3.1   class CDAreaLayerMBS

Function: The AreaLayer class represents area layers.

Example:

// The data for the area chart
dim data0(-1) as Double = array(42, 49, 33, 38, 51, 46, 29, 41, 44, 57, 59, 52, 37, 34, 51, 56, 56, 60, 70, 76, 63, 67, 75, 64, 51.0)
dim data1(-1) as Double = array(50, 45, 47, 34, 42, 49, 63, 62, 73, 59, 56, 50, 64, 60, 67, 67, 58, 59, 73, 77, 84, 82, 80, 84, 89.0)
dim data2(-1) as Double = array(61, 79, 85, 66, 53, 39, 24, 21, 37, 56, 37, 22, 21, 33, 13, 17, 4, 23, 16, 25, 9, 10, 5, 7, 16.0)

// Create a XYChart object of size 500 x 300 pixels
dim c as new CDXYChartMBS(500, 300)

// Set the plotarea at (90, 30) and of size 300 x 240 pixels.
call c.setPlotArea(90, 30, 300, 240)

// Add a legend box at (405, 100)
call c.addLegend(405, 100)

// Add a title to the chart
call c.addTitle("Daily System Load")

// Add a title to the y axis. Draw the title upright (font angle = 0)
c.yAxis.setTitle("Database"+endofline.unix+"Queries"+endofline.unix+"(per sec)" ).setFontAngle(0)

// Set the labels on the x axis.
call c.xAxis.setLabels(labels)

// Display 1 out of 2 labels on the x-axis. Show minor ticks for remaining labels.
c.xAxis.setLabelStep(2, 1)

// Add an area layer
dim layer as CDAreaLayerMBS
layer = c.addAreaLayer

// Draw the area layer in 3D
layer.set3D

// Add the three data sets to the area layer
28.3. CLASS CDAREALAYERMBS

```java
call layer.addDataSet(data0, -1, "Server # 1")
call layer.addDataSet(data1, -1, "Server # 2")
call layer.addDataSet(data2, -1, "Server # 3")
```

// Output the chart
Backdrop=c.makeChartPicture

Notes:
Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.3.2 Methods

28.3.3 setGapColor(fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setGapColor method, but uses color instead of integer data type for passing color values.
See also:
- 28.3.4 setGapColor(fillColor as Integer)

28.3.4 setGapColor(fillColor as Integer)

Function: Sets the color used to fill the area under kNoValue data points.
Notes:
By default, if there are kNoValue data points, ChartDirector will interpolate using the remaining data points.
The area will remain continuous.
This method can be used to set up an alternative color to represent the area at kNoValue data point positions. In particular, if the fillColor argument is set to Transparent, the kNoValue data points will result in gaps in the area.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fillColor</td>
<td>(Mandatory)</td>
<td>The color used to fill the area region at kNoValue data point positions.</td>
</tr>
</tbody>
</table>

See also:
28.3.5 setMinLabelSize(s as Integer)

Function: Sets the minimum height (or width if x and y axes are swapped) of an area below which data labels will be hidden.

Notes:

In ChartDirector, for an area layer, data labels (Layer.setDataLabelStyle) are drawn internal to the area, while the aggregate labels (Layer.setAggregateLabelStyle) are drawn external to the area.

ChartDirector will disable data labels if the area height (or width if x and y axes are swapped) is too small to contain the data label.

By default, ChartDirector will automatically determine what is meant by "too small". The setMinLabelSize method can be used to manually defined the threshold for "too small".

Sometimes it may be desirable to display the data label even though it cannot be contained within the area. In this case, the setMinLabelSize can be used to set the threshold to 0.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s</td>
<td>(Mandatory)</td>
<td>The minimum height (or width if x and y axes are swapped) of an area below which data labels will be hidden.</td>

</tbody>
</table>
28.4  class CDArrayMBS

28.4.1  class CDArrayMBS

**Function:** The CDArrayMBS class is a utility class used to perform array computations.

28.4.2  Methods

28.4.3  abs

**Function:** Replaces each element of the CDArrayMBS object by its absolute value.

28.4.4  acc

**Function:** Replaces each element of the CDArrayMBS object by the accumulated total of its previous element (including itself).

28.4.5  addArray(value as CDArrayMBS)

**Function:** The array will be added by adding the each array element to the corresponding element of the CDArrayMBS object.  
**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Values</td>
<td>(Mandatory)</td>
<td>A CDArrayMBS with numbers to be added to the CDArrayMBS object.</td>
</tr>
</tbody>
</table>

This method does not append a new value to the array.  
See also:

- 28.4.6 addArray(value() as Double)

28.4.6  addArray(value() as Double)

**Function:** The array will be added by adding the each array element to the corresponding element of the
CDArrayMBS object.

**Example:**

```vba
dim src(-1) as Double = Array( 63.1, 10.15, 6.15, 2.88 )
dim data As New CDArrayMBS(array(1.0, 1.0, 1.0, 1.0))

data.addArray( src )

dim lines(-1) as string

lines.Append str(data.count) + " values:"
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))

MsgBox Join(lines, EndOfLine)
```

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>(Mandatory)</td>
<td>An array of numbers to be added to the CDArrayMBS object.</td>
</tr>
</tbody>
</table>

This method does not append a new value to the array.

See also:

- 28.4.5 addArray(value as CDArrayMBS)

**28.4.7 addValue(value as Double)**

**Function:** Adds a number to every element of the CDArrayMBS object.

**Example:**

```vba
dim data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
data.addValue(5)

dim lines(-1) as string

lines.Append str(data.count) + " values:"
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
```
28.4. CLASS CDARRAYMBS

lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))
MsgBox Join(lines, EndOfLine)

Notes:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>(Mandatory)</td>
<td>A number to be added to every element of the CDArrayMBS object.</td>
</tr>
</tbody>
</table>

This method does not append a new value to the array.

28.4.8 aggregate(srcArray() as Double, aggregateMethod as Integer, param as Double = 50.0) as CDArrayMBS

**Function:** Aggregates a data array by merging groups of elements, similar to the GROUP BY clause in SQL statements.

**Notes:**

This primary usage of this method is for changing data resolution, such as to convert a daily data into weekly data.

If the data is from a database, aggregation can often be more efficiently and conveniently performed by using the GROUP BY clause of SQL. This method should only be used when the data are not coming from a database, or the aggregation method are not supported by the database used.

In this method, the CDArrayMBS object represents the delimiters used to group elements in the srcArray. The positions of all non-NoValue elements in the CDArrayMBS object will be used as delimiters positions.

For example, if the CDArrayMBS object consists of an array of 50 elements, and only the elements at 0, 10, 20, 30, 40 are not NoValue, then the groups will be defined as positions 0 - 9, 10 - 19, 20 - 29, 30 - 39 and 40 - 49.

Note that a group includes the starting delimiter position but excludes the ending delimiter position.

The CDArrayMBS object is typically created by applying CDArrayMBS.selectStartOfHour, CDArrayMBS.selectStartOfDay, CDArrayMBS.selectStartOfWeek, CDArrayMBS.selectStartOfMonth, CDArrayMBS.selectStartOfYear or CDArrayMBS.selectRegularSpacing to a data array.
For example, to group daily data into weekly data, one may create a CDArrayMBS object with the dates of the daily data, then CDArrayMBS.selectStartOfWeek to select only the elements representing the start of a week. The resulting CDArrayMBS object can then be used to aggregate daily data into weekly data.

Due to aggregation, the length of the output array will usually be shorter than, and never be longer than, the length of the input array.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcArray</td>
<td>(Mandatory)</td>
<td>The array to be aggregated.</td>

<td>(Mandatory)</td>
<td>The method to aggregate the data, which must be one of AggregateSum, AggregateAvg, AggregateStdDev, AggregateMin, AggregateMed, AggregateMax, AggregatePercentile, AggregateFirst, AggregateLast, AggregateCount.</td>
</tr>
<tr>
<td>param</td>
<td>50</td>
<td>The aggregation parameter, if needed. Currently, only AggregatePercentile needs a parameter to specify the percentile used.</td>
</tr>
</tbody>
</table>

28.4.9 aggregateValues(srcArray() as Double, aggregateMethod as Integer, param as Double = 50.0) as Double()

MBS ChartDirector Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Aggregates a data array by merging groups of elements, similar to the GROUP BY clause in SQL statements. Notes: This primary usage of this method is for changing data resolution, such as to convert a daily data into weekly data. If the data is from a database, aggregation can often be more efficiently and conveniently performed by using the GROUP BY clause of SQL. This method should only be used when the data are not coming from a database, or the aggregation method are not supported by the database used. In this method, the CDArrayMBS object represents the delimiters used to group elements in the srcArray. The positions of all non-kNoValue elements in the CDArrayMBS object will be used as delimiters positions. For example, if the CDArrayMBS object consists of an array of 50 elements, and only the elements at 0, 10, 20, 30, 40 are not NoValue, then the groups will be defined as positions 0 - 9, 10 - 19, 20 - 29, 30 - 39 and 40 - 49. Note that a group includes the starting delimiter position but excludes the ending delimiter position. The CDArrayMBS object is typically created by applying CDArrayMBS.selectStartOfDay, CDArrayMBS.selectStartOfWeek, CDArrayMBS.selectStartOfMonth, CDArrayMBS.selectStartOfYear or CDArrayMBS.selectRegularSpacing to a data array.
For example, to group daily data into weekly data, one may create an CDArrayMBS object with the dates of the daily data, then CDArrayMBS.selectStartOfWeek to select only the elements representing the start of a week. The resulting CDArrayMBS object can then be used to aggregate daily data into weekly data.

Due to aggregation, the length of the output array will usually be shorter than, and never be longer than, the length of the input array.

<td>The aggregation parameter, if needed. Currently, only AggregatePercentile needs a parameter to specify the percentile used.</td>
</tr>
</tbody>
</table>

### 28.4.10 avg as Double

**Function:** Gets the avg value of the elements of the CDArrayMBS object.

**Example:**

```plaintext
dim data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
MsgBox str(data.avg) // shows 2.5
```

### 28.4.11 Constructor

**Function:** The dummy constructor doing nothing.

See also:

- 28.4.12 Constructor(a as CDArrayMBS) 4397
- 28.4.13 Constructor(data() as Double) 4398

### 28.4.12 Constructor(a as CDArrayMBS)

**Function:** Creates an CDArrayMBS object and initialize it with the given array.

See also:
28.4.13 Constructor(data() as Double)

Function: Creates an CDArrayMBS object and initialize it with the given array.
See also:

- 28.4.11 Constructor
- 28.4.12 Constructor(a as CDArrayMBS)

28.4.14 count as Integer

Function: Returns the number of elements in this array object.
Example:

```vbs
dim data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
MsgBox str(data.count) // shows 4
```

28.4.15 delta(offset as Integer = 1)

Function: Subtracts each element of the CDArrayMBS object by an earlier element in the same CDArrayMBS object.
Notes:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>offset</td>
<td>1</td>
<td>The difference in position between an element and the earlier element to be subtracted from it.</td>
</tr>
</tbody>
</table>

28.4.16 divArray(value as CDArrayMBS)

Function: Divides the CDArrayMBS object by the given array.
Notes:
28.4. CLASS CDARRAYMBS

The CDArrayMBS object will be divided by dividing each of its elements by the corresponding element in the given array.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Values</td>
<td>(Mandatory)</td>
<td>A CDArrayMBS with numbers used as divisors to divide the CDArrayMBS object.</td>
</tr>
</tbody>
</table>

See also:

- 28.4.17 divArray(value() as Double)

28.4.17 divArray(value() as Double)

**Function:** Divides the CDArrayMBS object by the given array.

**Example:**

```vbs
dim src(-1) as Double = Array( 63.1, 10.15, 6.15, 2.88 )
dim data As New CDArrayMBS(array(2.0, 2.0, 2.0, 2.0))

data.divArray( src )

dim lines(-1) as string

lines.Append str(data.count)+" values:"
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))

MsgBox Join(lines,EndOfLine)
```

**Notes:**

The CDArrayMBS object will be divided by dividing each of its elements by the corresponding element in the given array.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>(Mandatory)</td>
<td>An array of numbers used as divisors to divide the CDArrayMBS object.</td>
</tr>
</tbody>
</table>

See also:
28.4.18 divValue(value as Double)

**Function:** Divides every element of the CDArrayMBS object by the given number.

**Example:**

```vbnet
dim data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))

data.divValue(5)

dim lines(-1) as string

lines.Append str(data.count)+" values:"
lines.Append ">"
lines.Append str(data.getvalue(0))
lines.Append str(data.getvalue(1))
lines.Append str(data.getvalue(2))
lines.Append str(data.getvalue(3))

MsgBox Join(lines,EndOfLine)
```

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>(Mandatory)</td>
<td>A number to be used as divisor to divide every element of the CDArrayMBS object.</td>
</tr>
</tbody>
</table>

28.4.19 expAvg(smoothingFactor as Double)

**Function:** Replaces each element of the CDArrayMBS object by its exponential average.

**Notes:**

The exponential average is computed by:

\[
\text{avg}(n) = \text{value}(n) \times \text{smoothingFactor} + \text{avg}(n - 1) \times (1 - \text{smoothingFactor})
\]

where \( \text{avg}(n) \) is the exponential average of the \( n \)th element, and \( \text{value}(n) \) is the value of the \( n \)th element.

For the first element \((n = 0)\), its exponential average is assumed to be equal to its original value.
28.4. CLASS CDARRAYMBS

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>smoothingFactor</td>
<td>(Mandatory)</td>
<td>The smoothing factor used for computing exponential average. It should be between 0 - 1.</td>
</tr>
</tbody>
</table>

### 28.4.20 financeDiv(values() as Double, zeroByZeroValue as Double)

**Function:** Divides the CDArrayMBS object by the given array, with special handling of the case of zero divided by zero.

**Notes:**

In many financial formulas, it is possible to have cases of zero divided by zero. For example, the Relative Strength Index is defined as the ratio between positive price changes and absolute value of all price changes over a period of time. In case the price does not change at all during that period, and the RSI will become zero divided by zero.

Traditionally, under the above case, the RSI will be consider as 50% .

To handle these special cases, the financeDiv method has an argument specifying what value to assume in case the division is zero divided by zero.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>(Mandatory)</td>
<td>An array of numbers used as divisors to divide the CDArrayMBS object.</td>
</tr>
<tr>
<td>zeroByZeroValue</td>
<td>(Mandatory)</td>
<td>The value to use if the division is zero divided by zero.</td>
</tr>
</tbody>
</table>

### 28.4.21 getvalue(index as Integer) as Double

**Function:** Returns the value with the given index.

**Notes:** Returns zero if the value does not exist.

### 28.4.22 insert(value as Double, len as Integer, insertPoint as Integer = -1)

**Function:** Inserts some constant elements to the CDArrayMBS object.

**Notes:**

See also:
## 28.4.23 insert(value() as Double, insertPoint as Integer = -1)

**Function:** Inserts the elements of an array to the CDArrayMBS object.

### Notes:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>(Mandatory)</td>
<td>An array to be inserted to the CDArrayMBS object.</td>
</tr>
<tr>
<td>insertPoint</td>
<td>-1</td>
<td>The position of the insertion point. The new elements will be inserted just before the insertion point. -1 means inserting elements at the end of the array.</td>
</tr>
</tbody>
</table>

See also:

- 28.4.22 insert(value as Double, len as Integer, insertPoint as Integer = -1)

## 28.4.24 lowess(smoothness as Double = 0.25, iteration as Integer = 0)

**Function:** Fits a curve through the data points in the CDArrayMBS object using the LOWESS algorithm.

### Example:

```plaintext
// generate some values
dim values() as Double
dim x as Double
for i as Integer = 1 to 10
    x = x + rnd - 0.5
    values.Append x
next

// make array
dim c as new CDArrayMBS(values)
dim oldValues() as Double = c.Values

// now run Algorithm
c.lowess(1.0) // 1.0 so we see it
```
// now get new values
dim newValues() as Double = c.Values

// the rest is for displaying in MsgBox:
dim oldValueStrings() as string
dim newValueStrings() as string

for each v as Double in oldValues
    oldValueStrings.Append str(v)
next

for each v as Double in newValues
    newValueStrings.Append str(v)
next

MsgBox join(oldValueStrings, " ")+EndOfLine+EndOfLine+join(newValueStrings, " ")

Notes:
The full name of LOWESS is "Robust locally weighted regression and smoothing scatterplots". It is a commonly used algorithm for drawing a smooth curve through a number of points.

LOWESS works by assuming a small segment of any curve can be approximated by a straight line. For each data point, LOWESS finds the n nearest points to that data point (n is configurable), and performs weighted linear regression using a tricube weighting function. It then adjust the coordinates of the data point based on the result of the weighted linear regression.

LOWESS can run in multiple iterations, in which case it should converge to a stable curve - thus it is called "robust".

In most cases, LOWESS behaves better than many other smoothing algorithms, such as moving average, moving median, exponential average. Curves draw using LOWESS look smoother, yet they track the data points better. Also, LOWESS behaves well at the end points. On the other hand, methods based on moving windows (e.g. moving averages) do not work on the first few data points, because they need sufficient data points to fill the moving window first.

In this method, each element of the CDArrayMBS object will be replaced by the corresponding value computed using the LOWESS algorithm.

For LOWESS to have any smoothing effect at all, n must be at least 3. You may need to use a large smoothness factor if you only have a few data points.
CHAPTER 28. CHARTDIRECTOR

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>smoothness</td>
<td>0.25</td>
<td>The smoothness factor. It must be between 0 - 1. It is the portion of points used in finding the n nearest points. In other words, ( n = \text{smoothness} \times \text{no_of_points} ). A larger value will result in a smoother the curve. A smaller value will result in the curve tracking the data points better.</td>
</tr>
</tbody>
</table>

iteration 0 The number of additional iteration used in the LOWESS algorithm. Unless your data is extremely noisy, in most case no additional iteration is necessary.

See also:

- 28.4.25 lowess(values() as Double, smoothness as Double = 0.25, iteration as Integer = 0) 4404

28.4.25 lowess(values() as Double, smoothness as Double = 0.25, iteration as Integer = 0)

**Function:** Fits a curve through the data points in the CDArrayMBS object using the LOWESS algorithm, where the spacing of the data points is supplied by the given array.

**Notes:**

Please refer to CDArrayMBS.lowess for a brief description of the LOWESS algorithm.

In this method, each element of the CDArrayMBS object will be replaced by the corresponding value computed using the LOWESS algorithm.

<table>
<thead>
<tr>
<th>Parameter</th>

28.4. CLASS CDARRAYMBS

iteration 0 The number of additional iteration used in the LOWESS algorithm. Unless your data is extremely noisy, in most case no additional iteration is necessary.

28.4.26 max as Double

Function: Gets the maximum value of the elements of the CDArrayMBS object.
Example:

```vbs
dim data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
MsgBox str(data.max) // shows 4.0
```

28.4.27 maxIndex as Integer

Function: Gets the index of the maximum value element of the CDArrayMBS object.

28.4.28 med as Double

Function: Gets the med value of the elements of the CDArrayMBS object.
Example:

```vbs
dim data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0, 1.0))
MsgBox str(data.med) // shows 2.0
MsgBox str(data.avg) // shows 2.2
```

28.4.29 min as Double

Function: Gets the minimum value of the elements of the CDArrayMBS object.
Example:

```vbs
dim data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
MsgBox str(data.min) // shows 1.0
```
28.4.30  \texttt{minIndex as Integer}

\textbf{Function:} Gets the index of the minimum value element of the CDArrayMBS object.

28.4.31  \texttt{movAvg(interval as Integer)}

\textbf{Function:} Replaces each element of the CDArrayMBS object by its moving average.
\textbf{Notes:}

The interval parameter specifies the window size for computing moving average. The moving average is computed as the average of the current element with the previous \((\text{interval} - 1)\) elements. No moving average can be computed for the first \((\text{interval} - 1)\) elements, because there are insufficient previous elements. So the first \((\text{interval} - 1)\) elements will be replaced with \texttt{kNoValue}.

\begin{tabular}{lll}
\textbf{Parameter} & \textbf{Default} & \textbf{Description} \\
\hline
interval & (Mandatory) & The window size.
\end{tabular}

28.4.32  \texttt{movCorr(interval as Integer, value() as Double)}

\textbf{Function:} Replaces each element of the CDArrayMBS object by the moving correlation with another array or with itself.
\textbf{Notes:}

The interval parameter specifies the window size for computing moving correlation. The moving correlation is computed as the correlation coefficient between the CDArrayMBS object and the other array, where only the current element and the previous \((\text{interval} - 1)\) elements are considered in the computation.

If the other array is not provided, it is assumed to be the sequence of numbers 0, 1, 2, 3, 4,... This is equivalent to checking if the elements of the CDArrayMBS object is linear.

No moving correlation can be computed for the first \((\text{interval} - 1)\) elements, because there are insufficient previous elements. So the first \((\text{interval} - 1)\) elements will be replaced with \texttt{kNoValue}.

\begin{tabular}{lll}
\textbf{Parameter} & \textbf{Default} & \textbf{Description} \\
\hline
interval & (Mandatory) & The window size.  \\
\texttt{[Empty\_Array]} & & The array to be correlated with the CDArrayMBS object. If this argument is an empty array, the sequence of numbers 0, 1, 2, 3, 4 ... will be used instead.
\end{tabular}
28.4.33 movMax(interval as Integer)

**Function:** Replaces each element of the CDArrayMBS object by its moving maximum.

**Notes:**
The interval parameter specifies the window size for computing moving average. The moving average is computed as the maximum of the current element with the previous (interval - 1) elements. No moving maximum can be computed for the first (interval - 1) elements, because there are insufficient previous elements. So the first (interval - 1) elements will be replaced with kNoValue.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>(Mandatory)</td>
<td>The window size.</td>
</tr>
</tbody>
</table>

28.4.34 movMed(interval as Integer)

**Function:** Replaces each element of the CDArrayMBS object by its moving median.

**Notes:**
The interval parameter specifies the window size for computing moving average. The moving average is computed as the median of the current element with the previous (interval - 1) elements. No moving median can be computed for the first (interval - 1) elements, because there are insufficient previous elements. So the first (interval - 1) elements will be replaced with kNoValue.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>(Mandatory)</td>
<td>The window size.</td>
</tr>
</tbody>
</table>

28.4.35 movMin(interval as Integer)

**Function:** Replaces each element of the CDArrayMBS object by its moving minimum.

**Notes:**
The interval parameter specifies the window size for computing moving average. The moving average is computed as the minimum of the current element with the previous (interval - 1) elements. No moving minimum can be computed for the first (interval - 1) elements, because there are insufficient previous elements. So the first (interval - 1) elements will be replaced with kNoValue.
### 28.4.36 movPercentile(interval as Integer, percentile as Double)

**Function:** Replaces each element of the CDArrayMBS object by its moving percentile.

**Notes:**

The interval parameter specifies the window size for computing moving average. The moving average is computed as the percentile of the current element with the previous (interval - 1) elements. No moving percentile can be computed for the first (interval - 1) elements, because there are insufficient previous elements. So the first (interval - 1) elements will be replaced with kNoValue.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>(Mandatory)</td>
<td>The window size.</td>
</tr>
<tr>
<td>percentile</td>
<td>(Mandatory)</td>
<td>The percentile to be computed. It should be between 0 - 100.</td>
</tr>
</tbody>
</table>

### 28.4.37 movStdDev(interval as Integer)

**Function:** Replaces each element of the CDArrayMBS object by its moving standard deviation.

**Notes:**

The interval parameter specifies the window size for computing moving average. The moving average is computed as the standard deviation of the current element with the previous (interval - 1) elements. No moving standard deviation can be computed for the first (interval - 1) elements, because there are insufficient previous elements. So the first (interval - 1) elements will be replaced with kNoValue.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>(Mandatory)</td>
<td>The window size.</td>
</tr>
</tbody>
</table>

### 28.4.38 mulArray(value as CDArrayMBS)

**Function:** Multiplies an array to the CDArrayMBS object.

**Notes:**

The array will be multiplied by multiplying each array element with the corresponding element of the CDArrayMBS object.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>(Mandatory)</td>
<td>The window size.</td>
</tr>
</tbody>
</table>
Parameter | Default | Description
---|---|---
Values | (Mandatory) | A CDArrayMBS with numbers to be multiplied to the CDArrayMBS object.

See also:

- 28.4.39 mulArray(value() as Double)

### 28.4.39 mulArray(value() as Double)

**Function:** Multiplies an array to the CDArrayMBS object.

**Example:**

```vba
dim src(-1) as Double = Array( 63.1, 10.15, 6.15, 2.88 )
dim data As New CDArrayMBS(array(2.0, 2.0, 2.0, 2.0))
data.mulArray( src )
dim lines(-1) as string
lines.Append str(data.count)+" values:"
lines.Append ""
lines.Append str(data.getvalue(0))
lines.Append str(data.getvalue(1))
lines.Append str(data.getvalue(2))
lines.Append str(data.getvalue(3))
MsgBox Join(lines,EndOfLine)
```

**Notes:**

The array will be multiplied by multiplying each array element with the corresponding element of the CDArrayMBS object.

Parameter | Default | Description
---|---|---
b | (Mandatory) | An array of numbers to be multiplied to the CDArrayMBS object.

See also:

- 28.4.38 mulArray(value as CDArrayMBS)
### 28.4.40 mulValue(value as Double)

**Function:** Multiplies a number to every element of the CDArrayMBS object.

**Example:**

```vbs
dim data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))

data.mulValue(5)

dim lines(-1) as string

lines.Append str(data.count) + " values:"
lines.Append ""
lines.Append str(data.getvalue(0))
lines.Append str(data.getvalue(1))
lines.Append str(data.getvalue(2))
lines.Append str(data.getvalue(3))

MsgBox Join(lines, EndOfLine)
```

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>(Mandatory)</td>
<td>A number to be multiplied to every element of the CDArrayMBS object.</td>

</tbody>
</table>

### 28.4.41 percentile(p as Double)

**Function:** Gets the required percentile value of the elements of the CDArrayMBS object.

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>(Mandatory)</td>
<td>The percentile to get. It should be between 0 - 100.</td>
</tr>
</tbody>
</table>

### 28.4.42 rate(offset as Integer = 1)

**Function:** Divides each element of the CDArrayMBS object by an earlier element in the same CDArrayMBS object.

**Notes:**
28.4. CLASS CDARRAYMBS

Parameter Default Description
offset 1 The difference in position between an element and the earlier element to divide it.

28.4.43 replace(a as Double, b as Double)

Function: Finds elements that are equal to a given value and replace it with another value.
Notes:

Parameter Default Description
a (Mandatory) The value to be replaced.
b (Mandatory) The replacing value.

28.4.44 result as memoryblock

Function: Gets the content of the CDArrayMBS object as a memoryblock.

28.4.45 selectEQZ

Function: Selects the elements of the CDArrayMBS object by checking if the elements of the given decisionArray is equal to zero.
Notes:
The selected elements will be left unchanged. The remaining elements will be replaced by the given fillValue.

If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter Default Description
decisionArray [ Empty_Array ] An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue 0 The value used to replace the elements that are not selected.

See also:

• 28.4.46 selectEQZ(decisionArray() as Double, fillValue as Double = 0)
28.4.46 \texttt{selectEQZ(\texttt{decisionArray()} as Double, fillValue as Double = 0)}

\textbf{Function}: Selects the elements of the CDArrayMBS object by checking if the elements of the given decisionArray is equal to zero.
\textbf{Notes}:
The selected elements will be left unchanged. The remaining elements will be replaced by the given fillValue.

If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

See also:

- 28.4.55 selectNEZ

28.4.57 selectRegularSpacing(majorTickStep as Integer, minorTickStep as Integer = 0, initialMargin as Integer = 0)

**Function:** Selects an evenly spaced subset of elements of the CDArrayMBS object.
28.4. CLASS CDARRAYMBS

Notes:
The primary purpose of this method is to select the regularly spaced elements as ticks on an enumerated axis.

For example, if the majorTickStep is 10, and minorTickStep is 5, this method will select one out of 10 elements as major tick elements, and one out of 5 elements as minor tick elements.

Major tick elements will remain intact. The remaining minor ticks elements will have their values replaced with MinorTickOnly. Non-selected elements will have their values replaced with kNoValue, so they will not appear on the axis. The resulting array can be used directly in Axis.setLabels.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>majorTickStep</td>
<td>(Mandatory)</td>
<td>The spacing between major ticks.</td>
</tr>
<tr>
<td>minorTickStep</td>
<td>0</td>
<td>The spacing between minor ticks. The default value of 0 means no minor tick will be used.</td>
</tr>
<tr>
<td>initialMargin</td>
<td>0</td>
<td>The position of the first tick.</td>
</tr>
</tbody>
</table>

28.4.58 selectStartOfDay(majorTickStep as Integer = 1, initialMargin as Double = 10800.0)

Function: Selects the elements of the CDArrayMBS object that represents a different day from the previous element.

Notes:
This method assumes the elements of the CDArrayMBS object are dates/times.

The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see Axis.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per day (or one tick per multiple days). This is by selecting the dates/times in the data array only if it is not the same day as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by kNoValue. The resulting array can be used directly in Axis.setLabels.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the day it represents. By default, near means within 3 hours (10800 seconds). This is configurable using the initialMargin argument.
Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using Layer.setXData and Axis.setDateScale.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>majorTickStep</td>
<td>1</td>
<td>The tick step. The default value of 1 means one tick per day. A value of n means one tick per n days.</td>
</tr>
<tr>
<td>initialMargin</td>
<td>10800</td>
<td>The margin for the first data point. The first data point will be selected if it is within initialMargin number of seconds from beginning of the day it represents. The default is 3 hours (10800 seconds).</td>
</tr>
</tbody>
</table>

28.4.59 selectStartOfHour(majorTickStep as Integer = 1, initialMargin as Double = 300.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Selects the elements of the CDArrayMBS object that represents a different hour from the previous element. **Notes:**

This method assumes the elements of the CDArrayMBS object are dates/times.

The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see Axis.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per hour (or one tick per multiple hours). This is by selecting the dates/times in the data array only if it is not the same hour as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by kNoValue. The resulting array can be used directly in Axis.setLabels2.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the hour it represents. By default, near means within 300 seconds. This is configurable using the initialMargin argument.
28.4. CLASS CDARRAYMBS

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using Layer.setXData and Axis.setDateScale.

<table>

</tbody>
</table>

28.4.60 selectStartOfMinute(majorTickStep as Integer = 1, initialMargin as Double = 5.0)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Selects the elements of the array that represents a different minute from the previous element.

Notes:

This method assumes the elements of the ArrayMath object are dates/times.

The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see CDAxisMBS.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per minute (or one tick per multiple minutes). This is by selecting the dates/times in the data array only if it is not the same minute as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by kNoValue. The resulting array can be used directly in CDAxisMBS.setLabels2.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the minute it represents. By default, near means within 5 seconds. This is configurable using the initialMargin argument.

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.
CHAPTER 28. CHARTDIRECTOR

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using CDLayerMBS.setXData and CDAxisMBS.setDateScale3 (or CDAxisMBS.setDateScale or CDAxisMBS.setDateScale2).

<table>
<thead>
<tr>

<td>The margin for the first data point. The first data point will be selected if it is within initialMargin number of seconds from beginning of the minute it represents. The default is 5 seconds.</td>
</tr>
</tbody>
</table>

28.4.61 selectStartOfDay(majorTickStep as Integer = 1, initialMargin as Double = 432000.0)

**Function:** Selects the elements of the CDArrayMBS object that represents a different month from the previous element.

**Notes:**
This method assumes the elements of the CDArrayMBS object are dates/times.

The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see Axis.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per month (or one tick per multiple months). This is by selecting the dates/times in the data array only if it is not the same month as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by kNoValue. The resulting array can be used directly in Axis.setLabels.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the month it represents. By default, near means within 5 days (432000 seconds). This is configurable using the initialMargin argument.

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.
However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using Layer.setXData and Axis.setDateScale.

### Parameter Default Description

- **majorTickStep**: 1
  - The tick step. The default value of 1 means one tick per month. A value of n means one tick per n months.

- **initialMargin**: 432000
  - The margin for the first data point. The first data point will be selected if it is within initialMargin number of seconds from beginning of the month it represents. The default is 5 days (432000 seconds).

#### 28.4.62 selectStartOfSecond(majorTickStep as Integer = 1, initialMargin as Double = 0.1)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Selects the elements of the ArrayMath object that represents a different second from the previous element.

**Notes:**

This method assumes the elements of the ArrayMath object are dates/times.

The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see CDAxisMBS.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per second (or one tick per multiple seconds). This is by selecting the dates/times in the data array only if it is not the same second as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by NoValue. The resulting array can be used directly in CDAxisMBS.setLabels2.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the second it represents. By default, near means within 0.1 second. This is configurable using the initialMargin argument.

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using CDLayerMBS.setXData and CDAxisMBS.set-
CHAPTER 28. CHARTDIRECTOR

DateScale3 (or CDAxisMBS.setDateScale or CDAxisMBS.setDateScale2).

<table>

</tbody>
</table>

28.4.63 selectStartOfWeek(majorTickStep as Integer = 1, initialMargin as Double = 172800.0)

**Function:** Selects the elements of the CDArrayMBS object that represents a different week from the previous element.

**Notes:**

This method assumes the elements of the CDArrayMBS object are dates/times.

The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see Axis.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per week (or one tick per multiple weeks). This is by selecting the dates/times in the data array only if it is not the same week as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by kNoValue. The resulting array can be used directly in Axis.setLabels.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the week it represents. By default, near means within 2 days (172800 seconds). This is configurable using the initialMargin argument.

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using Layer.setXData and Axis.setDateScale.

</tr>
</tbody>
</table>

### 28.4.64 selectStartOfYear(majorTickStep as Integer = 1, initialMargin as Double = 5184000.0)

**Function:** Selects the elements of the CDArrayMBS object that represents a different year from the previous element.

**Notes:**

This method assumes the elements of the CDArrayMBS object are dates/times. The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see Axis.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per year (or one tick per multiple years). This is by selecting the dates/times in the data array only if it is not the same year as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by kNoValue. The resulting array can be used directly in Axis.setLabels.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the year it represents. By default, near means within 60 days (5184000 seconds). This is configurable using the initialMargin argument.

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using Layer.setXData and Axis.setDateScale.
Parameter | Default | Description
--- | --- | ---
majorTickStep | 1 | The tick step. The default value of 1 means one tick per year. A value of \( n \) means one tick per \( n \) years.
initialMargin | 5184000 | The margin for the first data point. The first data point will be selected if it is within initialMargin number of seconds from beginning of the year it represents. The default is 60 days (5184000 seconds).

28.4.65 \( \text{shift}(\text{offset as Integer } = 1) \)

**Function:** Shifts the array "rightwards".

**Notes:**

If the array does not have any kNoValue data points, this method will shift the point at position "\( n \)" to "\( n + \text{offset} \)". On the "right" side of the array (the side with the largest index), points that are shifted outside the array will be discarded. On the "left" side of the array, fillValue data points will be shifted in.

If the array contains kNoValue data points, these points are not shifted. Conceptually, one can imagine the non-NoValue points being shifted to the next non-NoValue positions, and the process repeats offset number of times.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>offset</td>
<td>1</td>
<td>The number of positions to shift the array &quot;rightwards.&quot;</td>
</tr>
<tr>
<td>fillValue</td>
<td>kNoValue</td>
<td>The new value to be shifted into the array.</td>
</tr>
</tbody>
</table>

See also:

- 28.4.66 \( \text{shift}(\text{offset as Integer, fillValue as Double}) \)

28.4.66 \( \text{shift}(\text{offset as Integer, fillValue as Double}) \)

**Function:** Shifts the array "rightwards".

**Notes:**

If the array does not have any kNoValue data points, this method will shift the point at position "\( n \)" to "\( n + \text{offset} \)". On the "right" side of the array (the side with the largest index), points that are shifted outside the array will be discarded. On the "left" side of the array, fillValue data points will be shifted in.

If the array contains kNoValue data points, these points are not shifted. Conceptually, one can imagine the non-NoValue points being shifted to the next non-NoValue positions, and the process repeats offset number of times.
28.4. CLASS CDARRAYMBS

Parameter | Default | Description
----------|---------|------------------
offset     | 1       | The number of positions to shift the array "rightwards."
fillValue  | kNoValue| The new value to be shifted into the array.

See also:

- 28.4.65 shift(offset as Integer = 1)

28.4.67 stdDev as Double

**Function:** Gets the stdDev value of the elements of the CDArrayMBS object.

**Example:**

```plaintext
dim data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
MsgBox str(data.stdDev) // shows 1.118034
```

28.4.68 subArray(value as CDArrayMBS)

**Function:** Subtracts an array from the CDArrayMBS object.

**Notes:**

The array will be subtracted by subtracting each array element from the corresponding element of the CDArrayMBS object.

Parameter | Default | Description
----------|---------|------------------
Values     | (Mandatory) | A CDArrayMBS with numbers to be subtracted from the CDArrayMBS object.

See also:

- 28.4.69 subArray(value() as Double)

28.4.69 subArray(value() as Double)

**Function:** Subtracts an array from the CDArrayMBS object.

**Example:**

```plaintext
dim src(-1) as Double = Array( 63.1, 10.15, 6.15, 2.88 )
dim data As New CDArrayMBS(array(1.0, 1.0, 1.0, 1.0))
```

```vbnet
data.subArray( src )

dim lines(-1) as string

lines.Append str(data.count)+" values:")
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))

MsgBox Join(lines,EndOfLine)
```

**Notes:**

The array will be subtracted by subtracting each array element from the corresponding element of the CDArrayMBS object.

<table>
<thead>
<tr>

<td>An array of numbers to be subtracted from the CDArrayMBS object.</td>
</tr>
</tbody>
</table>

See also:

- 28.4.68 subArray(value as CDArrayMBS)

**28.4.70 subValue(value as Double)**

**Function:** Subtracts a number from every element of the CDArrayMBS object.

**Example:**

```vbnet
dim data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
data.subValue(5)

dim lines(-1) as string

lines.Append str(data.count)+" values:")
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))
```
28.4. **CLASS CDARRAYMBS**

MsgBox Join(lines,EndOfLine)

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>(Mandatory)</td>
<td>A number to be subtracted from every element of the CDArrayMBS object.</td>
</tr>
</tbody>
</table>

### 28.4.71 sum as Double

**MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Gets the sum value of the elements of the CDArrayMBS object.

**Example:**

```vbnet
dim data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
MsgBox str(data.sum) // shows 10.0
```

### 28.4.72 trim(startIndex as Integer = 0, len as Integer = -1)

**MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Trims the CDArrayMBS object by keeping only some elements in the middle.

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startIndex</td>
<td>0</td>
<td>The index for the first element to keep.</td>
</tr>
<tr>
<td>len</td>
<td>-1</td>
<td>The number of elements to keep. -1 means keeping all elements from the startIndex to the end of the array.</td>
</tr>
</tbody>
</table>

### 28.4.73 Values as Double()

**MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Copies all the values of this array object into a REALbasic array.

**Notes:** On error the array returned is empty.
### 28.5 class CDAxisMBS

#### 28.5.1 class CDAxisMBS

**Function:** The Axis class represents x and y axes in XY charts.  
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

### 28.5.2 Methods

#### 28.5.3 addLabel(pos as Double, label as string)

**Function:** Adds an extra label on the axis.  
**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos</td>
<td>(Mandatory)</td>
<td>The position on the axis to add the label.</td>
</tr>
<tr>
<td>label</td>
<td>(Mandatory)</td>
<td>The text label to add.</td>
</tr>
</tbody>
</table>

#### 28.5.4 addMark(value as Double, lineColor as color, text as string = "", font as string = "", fontsize as Double = 8) as CDMarkMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Same as the other addMark method, but uses color instead of integer data type for passing color values.  
**See also:**

- 28.5.5 addMark(value as Double, lineColor as Integer, text as string = "", font as string = "", fontsize as Double = 8) as CDMarkMBS

#### 28.5.5 addMark(value as Double, lineColor as Integer, text as string = "", font as string = "", fontsize as Double = 8) as CDMarkMBS

**Function:** Adds a mark line to the chart.  
**Notes:**  
A mark line is a line drawn on the plot area. This line is usually used to indicate some special values, such as a "target value", "threshold value", "target date", etc.
A mark line attached to the horizontal axis will be vertical across the plot area. A mark line drawn using the vertical axis will be horizontal across the plot area. In either case, the mark line label will be added to the axis at the mark line position.

The location of the mark line label can be changed by using TextBox.setAlignment. For example, by setting the alignment to TopCenter, the mark line label will be drawn on the top center of the mark line.

By default, the mark line is drawn at the front of the chart layers. You may change it to draw at the back of the plot area (that is, like grid lines) using Mark.setDrawOnTop.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(Mandatory)</td>
<td>The value on the axis to draw the mark line.</td>
</tr>
<tr>
<td>lineColor</td>
<td>(Mandatory)</td>
<td>The color of the mark line.</td>
</tr>
<tr>
<td>text</td>
<td>&quot;&quot;</td>
<td>The text label for the mark line. An empty string means there is no text label. By default, the text label and the tick on the axis will be drawn using the same color as the mark line. You can modify the colors by using the Mark.setMarkColor method.</td>
</tr>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font used to draw the text label.</td>
</tr>
<tr>
<td>fontSize</td>
<td>8</td>
<td>The font size used to draw the text label in points.</td>
</tr>
</tbody>
</table>

See also:

- 28.5.4 addMark(value as Double, lineColor as color, text as string = "", font as string = "", fontsize as Double = 8) as CDMarkMBS

28.5.6 addZone(startValue as Double, endValue as Double, colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addZone method, but uses color instead of integer data type for passing color values.

See also:

- 28.5.7 addZone(startValue as Double, endValue as Double, colorvalue as Integer)
A zone is a range of values. For example, "10 to 20" is a zone. Typically, zones are used to classify data ranges. For example, you may classify 0 - 60 as the normal zone, 60 - 90 as the warning zone, and 90 - 100 as the critical zone.

A zone based on a horizontal axis will be drawn as a vertical band. A zone based on a vertical axis will be drawn as a horizontal band. Zones are always drawn at the back of the plot area.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startValue</td>
<td>(Mandatory)</td>
<td>The start value (the lower bound) for the zone.</td>
</tr>
<tr>
<td>endValue</td>
<td>(Mandatory)</td>
<td>The end value (the upper bound) for the zone.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the zone.</td>
</tr>
</tbody>
</table>

See also:

- 28.5.6 addZone(startValue as Double, endValue as Double, colorvalue as color)

28.5.8 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

28.5.9 copyAxis(axis as CDAxisMBS)

Function: Copies the scale and labels from another axis.
Notes:
This method is typically used to ensure the axes on different charts are identical. For example, if multiple charts are drawn and are stacked up, and you want the x-axes of the charts to be the same for easy comparison, you may copy the x-axis from one chart to the other charts.

The differences between copyAxis and Axis.syncAxis are:

Axis.syncAxis relates the axes with a linear relationship, so the axes may not be exact copies of one another.

Axis.syncAxis synchronizes axis scale and copies only scale related labels, such as the labels generated by auto-scaling, Axis.setLinearScale, Axis.setLogScale or Axis.setDateScale.

copyAxis copies all labels, including labels created using Axis.setLabels, which may be arbitrary text.
28.5. CLASS CDAXISMBS

Parameter | Default | Description
---|---|---
axis | (Mandatory) | The axis to copy from.

28.5.10 getAlignment as Integer

Function: Gets the side of the plot area that the axis is associated with.
Notes: This method is only applicable to XYChart objects.

28.5.11 getAxisImageMap(noOfSegments as Integer, mapWidth as Integer, url as string, queryFormat as string = "", extraAttr as string = "", offsetX as Integer = 0, offsetY as Integer = 0) as string

Function: Generates an HTML image map for the axis itself.
Notes:
This method is similar to Axis.getHTMLImageMap. The difference is instead of generating an image map for the labels, it generates an image map for the axis itself. The axis will be divided into a number of segments, with an image map entry created for each segment.

Parameter | Default | Description
---|---|---
noOfSegments | (Mandatory) | The number of segments to divide the axis into.
mapWidth | (Mandatory) | The width of the axis used for the purpose of generating the image map.
url | (Mandatory) | The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.
queryFormat | "" | A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported. The special keyword "{ default }" represents the default query parameters. This is useful for specifying appending to the default. Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.
extraAttr | "" | A text string to specify additional attributes to add to the <area> tag. Parameter Substitution and Formatting is supported.
offsetX | 0 | An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY | 0 | An offset to be added to all y coordinates in the image map. See offsetX above for description.
28.5.12  getCoor(value as Double) as Integer

Function: Gets the geometric coordinates given the data value.

28.5.13  getFormattedLabel(v as Double, options as string = "") as string

Function: Gets the label at the specified position on the axis, formatting one if necessary.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>v (Mandatory)</td>
<td></td>
<td>The position specified as a value on the axis scale.</td>
</tr>
<tr>
<td>formatString</td>
<td>&quot;&quot;</td>
<td>The format string used to format a label if necessary. Please refer to Axis.setLabelFormat for the syntax of the format string. An empty string means the format will be automatically determined.</td>
</tr>
</tbody>
</table>

28.5.14  getHTMLImageMap(url as string, queryFormat as string = "", extraAttr as string = "", offsetX as Integer = 0, offsetY as Integer = 0) as string

Function: Generates an HTML image map for the axis labels.
Notes:

This method should be called only after creating the chart image (eg. using BaseChart.makeChart). The image map cannot be determined without creating the chart image first.

This method accepts a URL as its argument. When generating an image map, it appends query parameters to the URL to indicate which legend entry the user has clicked.

The following is an example image map generated for an axis with 3 labels.

```html
<area shape="rect" coords="30,220,70,239" href="handler.asp?value=0&label=John">
<area shape="rect" coords="70,220,110,239" href="handler.asp?value=1&label=Mary">
<area shape="rect" coords="110,220,150,239" href="handler.asp?value=2&label=Peter">
```

The image map consists of multiple <area> tags, one for each label. In the "href" attributes, query parameters are appended to the URL to provide information on the label clicked.
28.5. **CLASS CDAXISMBS**

The image map produces by ChartDirector does not include the `<map>` and `</map>` tag. This is intentional so that you can add additional custom `<area>` tags to the image map, or append multiple image maps together.

The format of the appended URL parameters is determined using the queryFormat argument, which by default is:

```
value={value} & label={label}
```

The texts in curly brackets (i.e. `{value}`, `{label}`) will be replaced by the actual values when generating the image map. For example, `{label}` will be replaced by the label text.

Please refer to Parameter Substitution and Formatting on all available parameters and how to format them.

In addition to customizing the query parameters, ChartDirector supports additional HTML attributes in the `<area>` tags using the extraAttr argument.

For example, the following extraAttr will add a "title" HTML attribute to every `<area>` tag. The "title" attribute will be displayed as "tool tip" when the mouse moves over the image map.

```
title='Click me for details on {label} '
```

Another common usage of the extraAttr argument is to add "onmouseover" and "onmouseout" HTML attributes to handle user interaction using Javascript on the browser.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(Mandatory)</td>
<td>The URL to be used in the &quot;href&quot; attribute of the image map.</td>
</tr>
</tbody>
</table>

Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.

### 28.5.15 `getLabel(i as Double) as string`

**Function:** Gets the label at the specified position on the axis.

**Notes:**

Return Value

Returns the label at the specified position, or a "" string if there is no label at that position.
queryFormat ""  A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported. The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default. Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.

extraAttr ""  A text string to specify additional attributes to add to the <area> tag. Parameter Substitution and Formatting is supported.

offsetX 0  An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.

offsetY 0  An offset to be added to all y coordinates in the image map. See offsetX above for description.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>(Mandatory)</td>
<td>The position specified as a value on the axis scale.</td>
</tr>
</tbody>
</table>

### 28.5.16 getLabelTable as CDMLTableMBS

**Function:** Gets the CDML table created by CDAxisMBS.makeLabelTable.

### 28.5.17 getMaxValue as Double

**Function:** Gets the upper bound of the axis.  
**Notes:** The upper bound of an axis is known only after auto-scaling. So this method should be called only after ChartDirector has finished auto-scaling (e.g. after calling BaseChart.layout to explicitly auto-scale the axis).

### 28.5.18 getMinValue as Double

**Function:** Gets the lower bound of the axis.  
**Notes:** The lower bound of an axis is known only after auto-scaling. So this method should be called only after ChartDirector has finished auto-scaling (e.g. after calling BaseChart.layout to explicitly auto-scale the axis).
28.5.19 getThickness as Integer

Function: Gets the thickness of the axis.

Notes:

The axis can be considered as a line, with one side facing the internal of the plot area, and the other side not facing the plot area. By default, the latter side includes the axis labels and axis title (although ChartDirector allows the axis to be configured so that the labels and titles are internal to the plot area).

The thickness of an axis only refers to the thickness of the side not facing the plot area. For a vertical axis, it is the width of the bounding box of that side, including the axis ticks, labels and title if they are on that side. For a horizontal axis, it is the height of the bounding box.

The intention of this method is to allow the chart to be adjusted to leave enough space for the axis labels and title.

This method should be called only after axis layout (after calling CXYChartMBS.layoutAxes, CDBaseChartMBS.layout or CXYChartMBS.packPlotArea).

Arguments:
None

Return Value
The thickness of the axis in pixels.

28.5.20 getTicks as CDArrayMBS

Function: Gets the values of the ticks.

Notes:

Return Value
An array of numbers representing the values of the ticks.

28.5.21 getX as Integer

Function: Gets the x-coordinate of starting point of the axis.

Notes: For an XYChart object, the starting point of a horizontal axis is its left end point, and the starting point of a vertical axis is its bottom end point. For a PolarChart object, the starting point of a radial axis
is the origin. For other types of charts, the starting point of an axis is undefined.

28.5.22 getY as Integer

Function: Gets the y-coordinate of starting point of the axis.

Notes: For an XYChart object, the starting point of a horizontal axis is its left end point, and the starting point of a vertical axis is its bottom end point. For a PolarChart object, the starting point of a radial axis is the origin. For other types of charts, the starting point of an axis is undefined.

28.5.23 makeLabelTable as CDMLTableMBS

Function: Creates a CDML table and docks it to the axis, with one row (for horizontal axis) or column (for vertical axis) containing the axis labels.

Notes: Before calling this method, it is necessarily to set the labels on the axis first using CDAxisMBS.setLabels. You should only use this method on a label based axis with no label stepping.

This method will automatically indent the axis (see CDAxisMBS.setIndent), and set the tick offset to 0.5 (see CDAxisMBS.setTickOffset). This is to ensure the plot area grid lines align with the table grid lines (instead of align with the labels).

You may use the returned CDMLTableMBS object to insert additional rows and/or columns to the table. A common application of this method is to insert the data values to the table, so the chart will have a data table docked to the axis, aligned with the chart contents.

Arguments:
None

Return Value
A CDMLTable object containing the axis labels.

28.5.24 setAngle(angle as Double)

Function: Sets the angular coordinates of the data points.
28.5.25  

```plaintext
setAutoScale(topExtension as Double = 0.1, bottomExtension as Double = 0.1, zeroAffinity as Double = 0.8)
```

**Function:**
Sets the margins at the two ends of the axis during auto-scaling, and whether to start the axis from zero.

**Notes:**
During auto-scaling, it is often desirable to leave some margins at the ends of the axis. For example, suppose in a bar chart, the longest bar is 10 units. If auto-scaling chooses 0 - 10 as the scale, the longest bar will touch the top edge of the plot area. In many cases, the chart will look better if there is some margin so that the longest bar does not touch the top edge.

The setAutoScale can be used to reserve some margins at the ends of the axis by using a scale that is larger than necessary. For example, in the above case, if a scale of 0 - 12 is used, then the longest bar will not touch the top edge.

Other common reasons for reserving margins at the ends of the axis include making sure the data labels (which may be drawn on top of the data points) will not go outside the plot area, and that objects put at the top or bottom of the plot area (such as legend box and custom text box) will not overlap with the data points.

Note that there is an alternative way to reserve space at the ends of the axis - the Axis.setMargin method.

In the setAutoScale method, the amount of margins reserved is controlled by the topExtension and bottomExtension arguments. These arguments determine the portion of the axis where no data point can reach. For example, a topExtension of 0.2 will ensure no data point can fall within the top 20% of the axis.

Note that ChartDirector will not extend the scale across the 0 point.

For example, suppose the data range is 0.1 - 9.9. If 10% margin is added to the bottom end of the axis, the bottom end may become negative. In this case, ChartDirector will extend the bottom end to 0 at most.

In other words, if the data range is completely positive, ChartDirector will not extend the axis to negative, as it would be undesirable in most applications. The same applies if the data range is completely negative.

For a purely positive axis, the bottom end has "zero affinity". That means ChartDirector will tend to choose 0 as the bottom end because zero is a natural starting point for the axis. However, if the data range is too extreme (e.g. the data is in the range 10000 - 10005), it may be "unreasonable" to choose 0 as the axis starting point. In this case, ChartDirector will not use 0 as the axis starting point.

ChartDirector will determine that it is "unreasonable" to use 0 as the axis starting point if the data fluctuation (the difference between the maximum and minimum data values) is too small compare with the data value. ChartDirector test the "too small" condition using the formula:
maxDataValue * zeroAffinity < minDataValue

where zeroAffinity by default is 0.8.

Similar "zero affinity" mechanism applies to the top end of the axis for a purely negative axis. If the data range contains both positive and negative values, the zero point is always included.

The zeroAffinity argument of the setAutoScale method allows you to modify the zero affinity when performing auto-scaling. Zero affinity should be between 0 and 1. A large value encourages ChartDirector to start the axis from zero.

A zero affinity of 1 means the axis always includes the zero point. A zero affinity of 0 means that the axis is scaled purely according to the data range, without any preference for the zero point.

Note that zero affinity is ignored for log scale axis as log scale axis cannot contain 0.

<table>

</table>

The value 30 * 86400 will be assume to mean one month (which actually contains a variable number of seconds), and 60 * 86400 will be assumed to mean 2 months and so on. The value 360 * 86400 therefore
28.5. **CLASS CDAxisMBS**

means 12 months, or 1 year.

The default value of 0 means no minor tick is used.

See also:

- 28.5.28 setDateScale(formatString as string = "")
- 28.5.29 setDateScale(lowerLimit as Double, upperLimit as Double, labels() as string)

**28.5.31 setFormatCondition(condition as string, operand as Double = 0)**

**Function:** Specifies the condition that subsequent Axis.setLabelFormat and Axis.setMultiFormat will become applicable.

**Notes:**

In some applications, the axis range can vary greatly. For example, for a date/time axis, the ticks on the axis can be hourly ticks if the duration is short, or daily ticks (or even monthly or yearly) if the duration is long. One can always use a universal axis format that is applicable in all cases (such as "mmm dd, yyyy<br>hh:mm:ss"), or one can leave ChartDirector to automatically come up with a suitable axis format.

Sometimes it may be desirable to explicitly specify different axis formats depending on tick types. For example, one may want to specify a certain format if the ticks are hourly, and another format if the ticks are daily.

If it is possible to predict which kind of ticks will be on the axis, one can always use "if" statements to specify different axis formats for various cases.

The setFormatCondition method is for cases in which it is difficult to predict which type of ticks would appear on the axis. For example, in an auto-scaled axis in which the duration can vary continuously, in some marginal cases, it is difficult to predict if auto-scaling will choose hourly or daily ticks.

The setFormatCondition method allows you to specify a condition to be tested against the auto-scaling result, so that subsequent Axis.setLabelFormat or Axis.setMultiFormat will be applicable only if the condition is true.

The types of condition supported are:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
"align"  Test if all the ticks are aligned to the operand. Use 3600 for testing hourly alignment, 86400 (1 day = 86400) for daily alignment, 30 * 86400 for monthly alignment and 360 * 86400 for yearly alignment. (Note: The values for monthly and yearly alignments are special values recognized by ChartDirector. They work even if a month or year is not exactly 30 or 360 days.)

">"  Test if the maximum absolute value of the ticks is larger than the operand. This is useful when one needs to apply different formats to large numbers (eg. use scientific formats if the axis range exceed certain values).

">="  Test if the maximum absolute value of the ticks is larger than or equal to the operand.

"<"  Test if the maximum absolute value of the ticks is less than the operand.

"<="  Test if the maximum absolute value of the ticks is less than or equal to the operand.

"=="  Test if the maximum absolute value of the ticks is equal to the operand.

"="  Same as "==" above.

"!="  Test if the maximum absolute value of the ticks is not equal to the operand.

"<>"  Same as "!=" above.

"else"  This condition is true if and only if the previous condition is false.

"true"  This condition is always true. It is useful as a "catch all" condition.

"false"  This condition is always false.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>condition</td>
<td>(Mandatory)</td>
<td>The type of condition to test. Must be one of the condition types in the above table. This text string is case sensitive.</td>
</tr>
<tr>
<td>operand</td>
<td>0</td>
<td>The operand for condition types that need an operand.</td>
</tr>
</tbody>
</table>

28.5.32  setIndent(indent as boolean)

**Function:** Specifies if the axis should be "indented" or not.

**Notes:**

Normally, the x-axis is automatically scaled so that x coordinate of first data point is at the beginning of the x-axis, and the x coordinate last data point is at the end of the axis. If a line layer is drawn, the line will span from the left border of the plot area to the right border of the plot area.

However, for bar layer, if the x-axis is scaled as above, half of the first bar and half of the last bar will be outside the plot area. The same applies to HLOC layers, candlestick layers and box-whisker layers.

When the axis is "indented", some margins will be reserved at the ends of the axis, so that all data representation are within the plot area.
By default, "indented" mode is automatically used in x-axis for charts that contain bar, HLOC, candlestick or box-whisker layers.

The setIndent method allows you to manually configure whether "indented" mode is used or not. One common usage is to align the x-axes in different charts.

For example, suppose a web page contains a bar chart and a line chart. The bar chart will be using "indented" mode x-axis, while the line chart will be using "non-indented" mode. If the two charts are on top of one another for ease of comparison (common for finance style charts), it is desirable that their x-axes should align. In this case, the setIndent method can be used to force the line chart to use indented mode x-axis.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>indent</td>
<td>(Mandatory)</td>
<td>A true value sets the axis to indented mode. A false value sets the axis to non-indented mode.</td>
</tr>
</tbody>
</table>

28.5.33 setLabelAlignment(alignment as Integer, minLabelSpace as Integer = 3)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Sets the label alignment.

28.5.34 setLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Sets the format for numeric or date/time axis labels.

Example:

dim c as CDAxisMBS

// you can use label formats like this:

c.setLabelFormat("<block,halign=left><font=timesbi.ttf,size=12,underline=1>{ label } <*/font*> <br> US$ { value } K ( { percent } % )")

// we can reduce that to this:

c.setLabelFormat(" { label } { value } { percent } % ")

// and it shows 3 numbers. With | 1 after the variable name, we define the decimals after dot:
c.setLabelFormat(" { label } { value | 1 } { percent | 1 } % ")

// and

c.setLabelFormat(" { label } { value | 1., } { percent | 1., } % ")

// uses dot for thousands and comma for decimal separator.

Notes:

By default, ChartDirector will try to guess if the axis represents numbers or dates. If the axis represents numbers, it will use " { value } " as the default format. If the axis represents dates, it will guess the format based on resolution of the dates (e.g. whether the dates contain hourly data or monthly data, etc). It may use formats such as { value | mm/dd/yy<*br*>hh:mm:ss }, { value | mm/dd/yy hh:mm:ss }, { value | mm/dd/yyyy }, { value | mm/yyyy } or { value | yyyy }.

Please refer to Parameter Substitution and Formatting on all available parameters and how to format them.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatString</td>
<td>(Mandatory)</td>
<td>The format string.</td>
</tr>
</tbody>
</table>

### 28.5.35 setLabelGap(d as Integer)

**Function:** Sets the distance between the axis labels and the ticks on the axis.

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
<td>(Mandatory)</td>
<td>The distance between the axis label and the tick in pixels.</td>
</tr>
</tbody>
</table>

### 28.5.36 setLabelOffset(offset as Double)

**Function:** Shifts the axis labels from its default position along the axis.

**Notes:**

This method expects the offset along the axis being a value on the axis scale. The Box.setPos method of the axis label prototype (obtained using Axis.setLabelStyle) can also be used to shift the labels, with the offsets specified in pixel units.
28.5. CLASS CDAXISMBS

Parameter | Default | Description
offset | (Mandatory) | The distance to shift the labels along the axis as a value on the axis scale.

28.5.37 setLabels(labels() as Double, formatString as string = "") as CDTextBoxMBS

Function: Sets the numeric/date/time labels to be used on the axis.

Notes:
This method is typically used to set the x-axis to enumerated scale. For more details on what is enumerated axis scale, please refer to Axis.setLabels.

This method assumes the labels are in their "native" form (that is, not formatted). Please refer to Date Representation for the native date/time formats supported in ChartDirector.

If the labels are already formatted into human readable form (that is, they are text strings), use Axis.setLabels instead.

One common issue is that there may be too many labels on the axis. In this case, the Axis.setLabelStep method may be used show only a regularly spaced subset of labels on the axis.

For date/time labels, another alternative is to use Axis.setMultiFormat, which uses filters to select important dates/times (such as dates/times representing the start of a month) for display as labels.

A third method to avoid too many labels is to remove some labels by replacing them with kNoValue before passing them to ChartDirector. If you want to remove the label text but leave a minor tick, use MinorTick-Only as the label value.

labels (Mandatory) An array of numbers/dates to be used as the axis labels.
formatString "" A format string to specified how to format the labels into human readable form. Please refer to Axis.setLabelFormat for the syntax of the format string. An empty string means the format will be automatically determined.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.
See also:

• 28.5.38 setLabels(labels() as string) as CDTextBoxMBS
28.5.38 setLabels(labels() as string) as CDTextBoxMBS

Function: Sets the text labels to be used on the axis.

Notes:

This method is typically used to set the x-axis to enumerated scale. In enumerated scale, the data points are associated with the x-axis by position. The first data point will be plotted at the first label position on the x-axis, the second data point at the second label position, and so on.

Enumerated axis is a very flexible axis type. It is most suitable for chart types where the data points are evenly spaced on the x-axis. The axis labels can be any text. They do not need to be numbers or dates. If they are numbers or dates, you can format them in any way you like before calling this method.

Internally, ChartDirector will assign a value of 0 to the first axis label, 1 to the second axis label, and so on. These values are not visible. Only the axis labels are visible. However, these values may be useful for some ChartDirector features that need to reference the axis position by value, such as adding mark lines using Axis.addMark.

By default, all axis labels will be associated major ticks. To associate a label with a minor tick, use '-' as the first character of the label. To draw a label without any tick at all, use 'textasciitilde' as the first character of the label.

Leading '-' or 'textasciitilde' characters are tick specification characters and will not appear on the labels. They just specify the the tick style to be associated with the labels. If you want have a label that actually begins these characters, add '\\' as the first character as the escape character.

One common issue is that there may be too many labels on the axis. In this case, the Axis.setLabelStep method may be used show only a regularly spaced subset of labels on the axis.

Another method is to remove some labels is to replace them with empty strings before passing them to ChartDirector. If you want to remove the label text but leave a major tick, use a space character " " as the label text. If you want to remove the label text but leave a major tick, use "-" as the label text.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>(Mandatory)</td>
<td>An array of strings containing the text of the labels.</td>
</tr>
</tbody>
</table>

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

28.5. **CLASS CDAXISMBS**

- 28.5.37 `setLabels(labels() as Double, formatString as string = "") as CDTextBoxMBS 4445

28.5.39 `setLabelStep(majorTickStep as Integer, minorTickStep as Integer = 0, majorTickOffset as Integer = 0, minorTickOffset as Integer = -2147483647)`

**Function:** Shows a regularly spaced subset of the axis labels on the axis.

**Notes:**

This method is typically used in conjunction with `Axis.setLabels`. These two methods define the full set of labels on the axis, one for each data point in a data set. In many cases, there may be too many labels and the axis may become overcrowded with labels. The `setLabelStep` method will cause the axis to show a regularly spaced subset of labels instead all labels.

<table>
<thead>
<tr>

• 28.5.47 setLogScale(lowerLimit as Double, upperLimit as Double, labels() as string)

• 28.5.48 setLogScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0)

28.5.47 setLogScale(lowerLimit as Double, upperLimit as Double, labels() as string)

Function: Sets the axis to use the given logarithmic scale and the given labels.

Notes:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lowerLimit</td>
<td>(Mandatory)</td>
<td>The lower bound of the axis.</td>
</tr>
<tr>
<td>upperLimit</td>
<td>(Mandatory)</td>
<td>The upper bound of the axis.</td>
</tr>
<tr>
<td>labels</td>
<td>(Mandatory)</td>
<td>An array of text strings to be used as the labels on the axis. ChartDirector will distribute the labels evenly on the axis. By default, all labels are associated with major ticks. These can be modified by using ‘‘ or ‘‘ as the first character. Please refer to Axis.setLabels for details.</td>
</tr>
</tbody>
</table>

See also:

• 28.5.46 setLogScale(formatString as string = "")

• 28.5.48 setLogScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0)
28.5.48 setLogScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0)

**Function:** Sets the axis to use the given logarithmic scale.

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lowerLimit</td>
<td>(Mandatory)</td>
<td>The lower bound of the axis.</td>
</tr>
<tr>
<td>upperLimit</td>
<td>(Mandatory)</td>
<td>The upper bound of the axis.</td>
</tr>
<tr>
<td>majorTickInc</td>
<td>0</td>
<td>Adds major ticks to the axis, where the major ticks are separated by majorTickInc in ratio. For example, a value of 10 means each tick will be 10 times the value of the previous tick. Each major tick will have an associated text label for the value if the axis at the tick. The special predefined constant LogTick (= 1.6e308) means the tick increment will be using the non-regular ratio 1, 2, 5, 10, 20, 50, 100, .... The default value of 0 means the major ticks will be automatically determined. In this case, the lowerLimit and upperLimit may be automatically adjusted to align with the ticks. Use kNoValue to disable major ticks.</td>
</tr>
<tr>
<td>minorTickInc</td>
<td>0</td>
<td>Adds minor ticks to the axis, where the minor ticks are separated by minorTickInc in ratio.</td>
</tr>
</tbody>
</table>

The special constant LogTick means the tick increment will be using the non-regular ratio 1, 2, 5, 10, 20, 50, 100, ....

The default value of 0 means no minor tick is used.

See also:

- 28.5.46 setLogScale(formatString as string = "") 4450
- 28.5.47 setLogScale(lowerLimit as Double, upperLimit as Double, labels() as string) 4450

28.5.49 setMargin(topMargin as Integer, bottomMargin as Integer = 0)

**Function:** Reserve margins at the ends of the axis.

**Notes:**

This method is usually used to reserve space in the plot area. For example, if some margin is reserved at the top of the vertical y-axis, the top of the plot area will contain no data points. It is because this region would be outside the active range of the y-axis. If anything is put at the top of the plot area (such as a legend box or custom text), it will not overlap with the data points.

Note if auto-scaling is used, there is an alternative way to reserve space at the top and/or bottom of the plot area - the Axis.setAutoScale method.
Parameter | Default | Description
--- | --- | ---
topMargin | (Mandatory) | The margin reserved at the top end (or right end for horizontal axis) of the axis in pixels.
bottomMargin | 0 | The margin reserved at the bottom end (or left end for horizontal axis) of the axis in pixels.

### 28.5.50 setMinTickInc(value as Double)

**Function:** Sets the minimum distance between two ticks on the axis for auto-scaled axis.

**Notes:**
The most common use of this method is to ensure the ticks are of integer values (the minimum distance set to 1).

ChartDirector auto-scaling will automatically determine the optimal number of ticks and labels on the axis. However, in some cases, the nature of the data may be such that the ticks should assume only certain discrete values (such as must be integers). This method will inform ChartDirector for this constraint when performing auto-scaling.

For a log scale axis, because the axis ticks are unevenly spaced, the minimum distance will be handled as the minimum value allowed for the axis scale.

### Parameter Default Description

- **inc** (Mandatory) The minimum distance between two ticks on the axis as a data value.

### 28.5.51 setMultiFormat(filter as Integer, format as string, labelSpan as Integer = 1, promoteFirst as boolean=true)

**Function:** Adds one filter and format string to the multi-format lists.

**Notes:**
Please refer to Axis.setMultiFormat on how to use this method.

See also:

- 28.5.52 setMultiFormat(filter1 as Integer, format1 as string, filter2 as Integer, format2 as string, labelSpan as Integer = 1, promoteFirst as boolean=true)
### 28.5. CLASS CDAXISMBS

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filterId</td>
<td>(Mandatory)</td>
<td>The filter that defines a subset of labels.</td>
</tr>
<tr>
<td>formatString</td>
<td>(Mandatory)</td>
<td>The format string for formatting the subset defined by the above filter.</td>
</tr>
<tr>
<td>labelSpan</td>
<td>1</td>
<td>The number of label positions that are claimed by one label. If a label occupies more than 1 position, ChartDirector will not put labels on nearby positions, even if they meet the filter criteria.</td>
</tr>
<tr>
<td>promoteFirst</td>
<td>true</td>
<td>If set to true, the first label will be promoted to a higher filter category in the multi-format list.</td>
</tr>
</tbody>
</table>

### 28.5.52 setMultiFormat(filter1 as Integer, format1 as string, filter2 as Integer, format2 as string, labelSpan as Integer = 1, promoteFirst as boolean=true)

**Function:** Sets multiple formats for numeric or date/time axis labels.

**Notes:**

This method is typically used to format date/time labels. For example, for an axis that spans 90 days, this method can be used to format the first labels of each month in bold as "mmm-dd", while other labels are shown in normal font as "dd".

The multiple formats are defined as a list of filters and format strings. If the label value satisfies the first filter, it will be formatted using the first format string. Otherwise if the label value satisfies the second filter, it will be formatted using the second format string, and so on. If a label value does not satisfy any filter, it will be discarded.

In the above example, the first filter can be a "start of month" filter (created using Chart::StartOfMonthFilter), and the first format string can be "\{ value | mmm-dd \}". The second filter can be the "all pass" filter (created using Chart::AllPassFilter), and the format string can be "\{ value | dd \}".

Supported filters in ChartDirector include:

For the format strings, please refer to Parameter Substitution and Formatting on their syntax.

A single setMultiFormat method supports two filters and two format strings. You can use multiple setMultiFormat methods to add more filters and format strings.

One common issue in putting labels on the axis is that there may be too many labels on the axis. The setMultiFormat method supports a labelSpan argument that specifies how many label positions a single label will occupy. If a label occupies more than 1 position, ChartDirector will not put labels on nearby positions, even if they meet the filter criteria.
CHAPTER 28. CHARTDIRECTOR

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chart::StartOfHourFilter</td>
<td>Creates a data filter that matches date/times that represent the start of a new hour in a date/time series.</td>
</tr>
<tr>
<td>Chart::StartOfDayFilter</td>
<td>Creates a data filter that matches date/times that represent the start of a new day in a date/time series.</td>
</tr>
<tr>
<td>Chart::StartOfWeekFilter</td>
<td>Creates a data filter that matches date/times that represent the start of a new week in a date/time series.</td>
</tr>
<tr>
<td>Chart::StartOfMonthFilter</td>
<td>Creates a data filter that matches date/times that represent the start of a new month in a date/time series.</td>
</tr>
<tr>
<td>Chart::StartOfYearFilter</td>
<td>Creates a data filter that matches date/times that represent the start of a new year in a date/time series.</td>
</tr>
<tr>
<td>Chart::RegularSpacingFilter</td>
<td>Creates a data filter that matches 1 out of every N elements.</td>
</tr>
<tr>
<td>Chart::AllPassFilter</td>
<td>Creates a data filter that matches every element.</td>
</tr>
<tr>
<td>Chart::NonePassFilter</td>
<td>Creates a data filter that matches no element.</td>
</tr>
<tr>
<td>Chart::SelectItemFilter</td>
<td>Creates a data filter that matches one specified item.</td>
</tr>
</tbody>
</table>

The setMultiFormat method supports special handling of the first label on the axis. For example, in the above example, we may want to show the first label as "mmm-dd", even if it is not actually the "start of month". The promoteFirst argument, if set to true, will cause the first label to be promoted to a higher filter category in the multi-format list. For example, if the first label satisfies only the second filter, it will be formatted as if it satisfies the first filter.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter1</td>
<td>(Mandatory)</td>
<td>The filter that defines the first kind of labels.</td>
</tr>
<tr>
<td>format1</td>
<td></td>
<td>The format string for the first kind of labels.</td>
</tr>
<tr>
<td>filter2</td>
<td>(Mandatory)</td>
<td>The filter that defines the second kind of labels.</td>
</tr>
<tr>
<td>format2</td>
<td>(Mandatory)</td>
<td>The format string for the second kind of labels.</td>
</tr>
<tr>
<td>labelSpan</td>
<td>1</td>
<td>The number of label positions that are claimed by one label. If a label occupies more than 1 position, ChartDirector will not put labels on nearby positions, even if they meet the filter criteria.</td>
</tr>
<tr>
<td>promoteFirst</td>
<td>true</td>
<td>If set to true, the first label will be promoted to a higher filter category in the multi-format list.</td>
</tr>
</tbody>
</table>

See also:

- 28.5.51 setMultiFormat(filter as Integer, format as string, labelSpan as Integer = 1, promoteFirst as boolean=true)

28.5.53 setOffset(x as Integer, y as Integer)

Function: Sets the positional offset of the axis.

Notes:

By default, ChartDirector draws horizontal axes at the top/bottom borders of the plot area, and vertical
28.5. **CLASS CDAXISMBS**

axes at the left/right borders of the plot area.

This method can be used to shift an axis from its standard position.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x offset in pixels.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y offset in pixels.</td>
</tr>
</tbody>
</table>

### 28.5.54 setReverse(value as boolean=true)

**Function:** Reverse the axis.

**Notes:**

For a normal vertical axis, the axis starts from the bottom and increase its value towards the top. For a normal horizontal axis, the axis starts from the left and increase its value towards the right. The setReverse method can be used to reverse the direction of the axis.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>true</td>
<td>A true value means the axis is reversed. A false value means the axis is not reversed.</td>
</tr>
</tbody>
</table>

### 28.5.55 setRounding(roundMin as boolean, roundMax as boolean)

**Function:** Controls whether to round the ends of the axis to align with tick positions.

**Notes:**

For example, if the axis is from 0.33 - 9.7, ChartDirector may round it to 0 - 10 so that the ends 0 and 10 are properly aligned with the ticks.

By default, ChartDirector will round the axis ends for the y-axis, but not for the x-axis. An exception is a chart containing a scatter layer, where both x and y axes will be rounded.
### 28.5.56 setTickColor(majorTickColor as color, minorTickColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setTickColor method, but uses color instead of integer data type for passing color values.

See also:
- 28.5.57 setTickColor(majorTickColor as Integer, minorTickColor as Integer = -1)

### 28.5.57 setTickColor(majorTickColor as Integer, minorTickColor as Integer = -1)

**Function:** Sets the colors of the axis ticks.

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>majorTickColor</td>
<td>(Mandatory)</td>
<td>The color of the major ticks.</td>
</tr>
<tr>
<td>minorTickColor</td>
<td>-1</td>
<td>The color of the major ticks. -1 means the color is the same as majorTickColor</td>
</tr>
</tbody>
</table>

See also:
- 28.5.56 setTickColor(majorTickColor as color, minorTickColor as color)

### 28.5.58 setTickDensity(majorTickSpacing as Integer, minorTickSpacing as Integer = -1)

**Function:** Sets the density of the axis ticks.

**Notes:**

Tick density is the desired distance between two ticks in pixels. When ChartDirector performs auto-scaling, it will decide how many ticks to put on the axis based on tick density.

Note that the actual tick density chosen in auto-scaling may not be exactly the same as the desired tick density. It is because ChartDirector may have other constraints in choosing the ticks, such as the ticks and axis range should be neat numbers, and the axis must contain an integral number of ticks, etc. ChartDirector
may use a tick distance that is larger than suggested, but never smaller.

Parameter | Default | Description
---|---|---
majorTickSpacing | (Mandatory) | Specify the desired distance between two major ticks in pixels.
minorTickSpacing | -1 | Specify the desired distance between two minor ticks in pixels. -1 means minor ticks are not used.

### 28.5.59 setTickLength(majorTickLen as Integer)

**Function:** Sets the length of the axis ticks.

**Notes:**
A positive tick length means the ticks are drawn outside the plot area. A negative tick length means the ticks are drawn inside the plot area.

Parameter | Default | Description
---|---|---
majorTickLen | (Mandatory) | The length of the major ticks in pixels. The length of the minor ticks will automatically be set to half the length of the major ticks.

See also:
- 28.5.60 setTickLength(majorTickLen as Integer, minorTickLen as Integer)

### 28.5.60 setTickLength(majorTickLen as Integer, minorTickLen as Integer)

**Function:** Sets the length of the major and minor axis ticks.

**Notes:**
A positive tick length means the ticks are drawn outside the plot area. A negative tick length means the ticks are drawn inside the plot area.

Parameter | Default | Description
---|---|---
majorTickLen | (Mandatory) | The length of the major ticks in pixels.
minorTickLen | (Mandatory) | The length of the minor ticks in pixels.

See also:
- 28.5.59 setTickLength(majorTickLen as Integer)
28.5.61 setTickOffset(offset as Double)

**Function:** Shifts the position of the ticks along the axis.

**Notes:**

By default, ChartDirector draws the ticks at the label position. This method is typically used to shift the ticks so that the ticks are between two labels, rather than aligned with the label.

The offset is specified as a value on the axis scale. For a label based axis (configured using Axis.setLabels), shifting with an offset of 0.5 means shifting half the label interval. This will achieve the effect of putting the ticks in between the labels.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>offset</td>
<td>(Mandatory)</td>
<td>The distance to shift the ticks along the axis as a value on the axis scale.</td>
</tr>
</tbody>
</table>

28.5.62 setTickWidth(majorTickWidth as Integer, minorTickWidth as Integer = -1)

**Function:** Sets the width of the axis ticks.

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>majorTickWidth</td>
<td>(Mandatory)</td>
<td>The width of the major ticks in pixels.</td>
</tr>
<tr>
<td>minorTickWidth</td>
<td>-1</td>
<td>The width of the minor ticks in pixels. -1 means the width is the same as majorTickWidth.</td>
</tr>
</tbody>
</table>

28.5.63 setTitle(text as string, font as string = "", fontsize as Double = 8, fontcolor as Integer = &hffff0002) as CDTextBoxMBS

**Function:** Adds a title to the axis.

**Notes:**

See Font Specification for details on various font attributes.

**Return Value**

A TextBox object representing the axis title. This may be used to fine-tune the appearance of the axis title.

See font specification here:
### 28.5. CLASS CDAXISMBS

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>(Mandatory)</td>
<td>The title text.</td>
</tr>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font used to draw the title. If no font is specified, the default is &quot;bold&quot;.</td>
</tr>
<tr>
<td>fontSize</td>
<td>8</td>
<td>The size of the font in points.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The color used to draw the title text.</td>

</tbody>
</table>

http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:

- 28.5.64 setTitle(text as string, font as string, fontsize as Double, fontcolor as color) as CDTextBoxMBS

### 28.5.64 setTitle(text as string, font as string, fontsize as Double, fontcolor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setTitle method, but uses color instead of integer data type for passing color values.

See also:

- 28.5.63 setTitle(text as string, font as string = "", fontsize as Double = 8, fontcolor as Integer = &hffff0002) as CDTextBoxMBS

### 28.5.65 setTitlePos(alignment as Integer, titleGap as Integer = 3)

**Function:** Sets the position of the axis title relative to the axis.

**Notes:**

- By default, the axis title will be drawn at the middle of the axis outside the plot area. You may change the location of the title. For example, instead of drawing the y-axis title at the middle of the axis, you may want draw it at the top of the axis.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alignment</td>
<td>(Mandatory)</td>
<td>The position of the title relative to the axis.</td>
</tr>
<tr>
<td>titleGap</td>
<td>3</td>
<td>The distance between the axis title and the axis in pixels.</td>
</tr>
</tbody>
</table>

### 28.5.66 setWidth(width as Integer)

**Function:** Sets the line width of the axis.

**Notes:**
Parameter | Default | Description
--- | --- | ---
width | (Mandatory) | The line width of the axis in pixels.

### 28.5.67 syncAxis(axis as CDAxisMBS, slope as Double = 1.0, intercept as Double = 0.0)

**Function:** Synchronizes this axis with another axis using a linear formula.

**Notes:**
This method is typically used if the two axes represent the same quantity but in different units. For example, one axis may represent temperature in Celsius, and the other in Fahrenheit, or they may represent lengths in meters and feet.

The scale of this axis (value) will be related to the scale of the another axis (value2) using the following formula:

\[ \text{value} = \text{value2} \times \text{slope} + \text{intercept} \]

Typically, one of the axis will be for actual charting, and its scale will be determined in the standard way using auto or manual scaling. Then the second axis is set to synchronize with the first axis.

Parameter | Default | Description
--- | --- | ---
axis | (Mandatory) | The axis to synchronize to.
slope | 1 | The slope for synchronizing this axis to the other axis.
intercept | 0 | The intercept parameter for synchronizing this axis to the other axis.
28.6. class CDBarLayerMBS

28.6.1 class CDBarLayerMBS

Function: The BarLayer class represents bar layers. BarLayer is a subclass of Layer.

Notes:

Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.6.2 Methods

28.6.3 setBarGap(barGap as Double)

Function: Sets the gap between the bars in a bar chart layer.

Notes:

In the setBarGap method, the gap between the bars is expressed as the portion of the space between the bars. For example, a bar gap of 0.2 means 20% of the distance between two adjacent bars is the gap between the bars.

A bar gap of 0 means there is no gap in between the bars. The bar gap can be negative. In this case, the bars will overlap. The predefined constant TouchBar ( = -1.7E-100) means the bars will ”touch”, that is, the bar borders overlap, so two adjacent bars will share the same border.

For multi-bar layers (bar layers using the Side data combine method, or for stacked bar layers with multiple data groups), barGap refers to the portion of the space between bar groups, while subBarGap refers to the portion of the space between bars within the bar group.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>barGap</td>
<td></td>
<td>The portion of the space between the bars (or between bar groups for multi-bar layers).</td>
</tr>
<tr>
<td>subBarGap</td>
<td>0.2</td>
<td>This argument only applies to multi-bar charts. It is the portion of the space between the bars in a bar group.</td>
</tr>
</tbody>
</table>

See also:

- 28.6.4 setBarGap(barGap as Double, subBarGap as Double)
28.6.4  setBarGap(barGap as Double, subBarGap as Double)

Function: Sets the gap between the bars in a bar chart layer.
Notes:

In the setBarGap method, the gap between the bars is expressed as the portion of the space between the bars. For example, a bar gap of 0.2 means 20% of the distance between two adjacent bars is the gap between the bars.

A bar gap of 0 means there is no gap in between the bars. The bar gap can be negative. In this case, the bars will overlap. The predefined constant TouchBar (= -1.7E-100) means the bars will "touch", that is, the bar borders overlap, so two adjacent bars will share the same border.

For multi-bar layers (bar layers using the Side data combine method, or for stacked bar layers with multiple data groups), barGap refers to the portion of the space between bar groups, while subBarGap refers to the portion of the space between bars within the bar group.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>barGap</td>
<td>(Mandatory)</td>
<td>The portion of the space between the bars (or between bar groups for multi-bar layers).</td>
</tr>
<tr>
<td>subBarGap</td>
<td>0.2</td>
<td>This argument only applies to multi-bar charts. It is the portion of the space between the bars in a bar group.</td>
</tr>
</tbody>
</table>

See also:

- 28.6.3 setBarGap(barGap as Double) 4461

28.6.5  setBarShape(shape as Integer, dataGroup as Integer = -1, dataItem as Integer = -1)

Function: Sets the shape of the bar(s) using built-in shapes.
Notes:

See also:

- 28.6.6 setBarShape(shape() as Integer, dataGroup as Integer = -1, dataItem as Integer = -1) 4462

28.6.6  setBarShape(shape() as Integer, dataGroup as Integer = -1, dataItem as Integer = -1)

Function: Sets the shape of the bar(s) to a custom shape defined using an array of (x, y) coordinates.
28.6. **CLASS CDBARLAYERMBS**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shape</td>
<td>(Mandatory)</td>
<td>The bar shape to use. Please refer to Shape Specification on how shapes are specified.</td>
</tr>
<tr>
<td>dataGroup</td>
<td>-1</td>
<td>The index of the data group that the shape applies to. In a multi-stacked bar, the data sets that are stacked up into a single bar forms a data group. In a multi-bar chart, each data set is a data group by itself. The default value of -1 means the shape applies to all data groups.</td>
</tr>
<tr>
<td>dataItem</td>
<td>-1</td>
<td>The index of the data points that the shape applies to. For example, if set to 3, the shape will only apply to the 4th bar (index starts from 0) in each data series. The default value of -1 means the shape applies to all data points.</td>
</tr>
</tbody>
</table>

**Notes:**

- 28.6.5 setBarShape(shape as Integer, dataGroup as Integer = -1, dataItem as Integer = -1) 4462

**28.6.7 setBarWidth(barWidth as Integer, subBarWidth as Integer = -1)**

**Function:** Sets the width of the bars. 
**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>barWidth</td>
<td>(Mandatory)</td>
<td>The width of the bars (or bar groups for multi-bar layers) in pixels.</td>
</tr>
<tr>
<td>subBarWidth</td>
<td>-1</td>
<td>This argument only applies to multi-bar charts. It is the width of the bars in a bar group in pixels.</td>
</tr>
</tbody>
</table>

**28.6.8 setIconSize(height as Integer, width as Integer = -1)**

**Function:** Sets the size of the icon(s) to be used in legend box.
Notes:

By default, if a legend box is available on the chart, ChartDirector will insert an legend entry for any named data sets in the legend box. The icons for the data sets will be the shape of the bars. The size of the icons will be determined using the key size settings of the legend box (see LegendBox.setKeySize).

This method can be used to override the legend box settings to specify a custom width/height for the icons of the current BarLayer.

If the icon size is set to 0, a square color box will be used as the icon without regarding the shape of the bar.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the icon in pixels.</td>
</tr>
<tr>
<td>width</td>
<td>-1</td>
<td>The width of the icon in pixels. The default value of -1 means the width is the same as the height.</td>
</tr>
</tbody>
</table>

28.6.9  setMinImageMapSize(s as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the minimum height (or width if the x-axis and y-axis are swapped with CDXYChartMBS.swapXY) of the hot spots defined by the image map.

**Notes:**

By default, the hot spots defined by image map exactly cover the bars. For very short bars, the hot spots may be very small, and it may become difficult to move the mouse over the hot spots.

This method ensures the hot spots are at least of certain size, even if the bars are shorter. The default is 5 pixels.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>size</td>
<td>(Mandatory)</td>
<td>The minimum height (or width if the x-axis and y-axis are swapped with CDXYChartMBS.swapXY) of the hot spots defined by the image map.</td>
</tr>
</tbody>
</table>

28.6.10  setMinLabelSize(s as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the minimum height (or width for horizontal bars) of the bar segments below which data labels will be hidden.

**Notes:**
In ChartDirector, for a bar layer, data labels (Layer.setDataLabelStyle) are drawn internal to the bar segment, while the aggregate labels (Layer.setAggregateLabelStyle) are drawn external to the bar.

ChartDirector will disable data labels for a bar segment if the bar segment is too short to contain the data label.

By default, ChartDirector will automatically determine what is meant by "too short". The setMinLabelSize method can be used to manually defined the threshold for "too short".

Sometimes it may be desirable to display the data label even though it cannot be contained within the bar segment. In this case, the setMinLabelSize can be used to set the threshold to 0.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setMinLabelSize</td>
<td>(Mandatory)</td>
<td>The minimum length of the bar segments in pixels, below which data labels will be hidden.</td>
</tr>
</tbody>
</table>

### 28.6.11 setOverlapRatio(overlapRatio as Double, firstOnTop as boolean=true)

**Function:** Sets overlapping among bars in within a bar group in a multi-bar chart.

**Notes:**

By default, in a multi-bar chart, the bars are not overlapped, but are separated with a gap in between. This method can be used to set an alternative style, where the bars partially overlap.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>overlapRatio</td>
<td>(Mandatory)</td>
<td>The overlapping ratio between adjacent bars in a bar group. Should be between 0 to 1.</td>
</tr>
<tr>
<td>firstOnTop</td>
<td>true</td>
<td>If this value is true, the first data set will be on top of the second data during overlapping, and the second data set will be on top of the third data set, and so on. If this value is false, then the overlapping order will be reversed.</td>
</tr>
</tbody>
</table>

### 28.6.12 setRoundedCorners

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Configures rounded corners for rectangular bars.

**Notes:**

A rectangular bar has 4 corners. Two of them are at the base of the bar, while the other two are at the "data end" of the bar. Note that the base of the bar can be any side of the bar, depending on whether the
bar is positive or negative, vertical or horizontal.

For the 2 base corners, one of them is at the negative x direction while the other is at the positive x direction. The same applies to the two data end corners.

This method accepts 0, 1, 2 or 4 radius values. The usage of these values depend how many values are provided as follows.

<table>
<thead>
<tr>
<th>Values Provided</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The radii of the data end corners are automatically determined. The radii of the base corners are set to 0.</td>
</tr>
<tr>
<td>1</td>
<td>The radii of the data end corners are set to the specified value. The radii of the base corners are set to 0.</td>
</tr>
<tr>
<td>2</td>
<td>The radii of the data end corners are set to the first value. The radii of the base corners are set to the second value.</td>
</tr>
<tr>
<td>4</td>
<td>The radius of the data end corner at the negative x direction is set to the first value. The radius of the data end corner at the positive x direction is set to the second value. The radius of the base corner at the negative x direction is set to the third value. The radius of the base corner at the positive x direction is set to the fourth value.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>-&amp; h7fffffff</td>
<td>The first radius. See description above on how this radius value is used.</td>

- 28.6.12 setRoundedCorners
28.7  class CDBaseBoxLayerMBS

28.7.1  class CDBaseBoxLayerMBS

Function:
The BaseBoxLayer class is the base class for layers that uses isolated symbols to represent multiple data
sets. These include BoxWhiskerLayer, HLOCLayer and CandleStickLayer.
Notes:
Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin
functions.

28.7.2  Methods

28.7.3  setDataGap(gap as Double)

Function: Sets the symbol width by specifying the gap ratio between adjacent symbols.
Notes:
Parameter Default Description
--- ----------- ------------------------------------
gap (Mandatory) The gap between two adjacent symbols as the portion of the space between the
midpoints of the elements. The gap must be in the range 0 - 1. A value of 0 (the default) means there is no gap between two adjacent symbols.

28.7.4  setDataWidth(width as Integer)

Function: Sets the symbol width by specifying the pixel width of the symbols.
Notes:
Parameter Default Description
--- ----------- ------------------------------------
width (Mandatory) The width of the symbols in pixels.

28.7.5  setMinImageMapSize(size as Integer)

Function: Sets the minimum height (or width if the x-axis and y-axis are swapped with CDXY-
Chapter \ref{chartmbs.swapxy} of the hot spots defined by the image map.

\textbf{Notes:}

By default, the hot spots defined by image map exactly cover the bars. For very short bars, the hot spots may be very small, and it may become difficult to move the mouse over the hot spots. This method ensures the hot spots are at least of certain size, even if the bars are shorter. The default is 5 pixels.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>size</td>
<td>(Mandatory)</td>
<td>The minimum height (or width if the x-axis and y-axis are swapped with \texttt{CDXYChartMBS.swapXY}) of the hot spots defined by the image map.</td>
</tr>
</tbody>
</table>

\section{setRoundedCorners(r1 as Integer)}

\textbf{MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.}

\textbf{Function:} Configures rounded corners for the boxes.

\textbf{Notes:}

This method currently is only supported by the BoxWhiskerLayer.

A box has 4 corners, two of them are at "box-top", and two of them are at "box-bottom". Note that "box-top" and "bottom-bottom" refer to the sides of the box representing the boxTop and boxBottom parameters in \texttt{CDXYChartMBS.addBoxWhiskerLayer} or \texttt{CDXYChartMBS.addBoxLayer}. Note that they are not necessarily the geometric top or bottom of the box. For example, if the y-axis is reversed (such as configured using \texttt{CDAxisMBS.setReverse}), the top and bottom side may be reversed. For horizontal boxes (with \texttt{CDXYChartMBS.swapXY} in effect), the box-top and box-bottom sides may actually be the right and left sides.

Of the 2 box-top corners, one of them is at the negative x direction while the other is at the positive x direction. The same applies to the box-bottom corners.

This method accepts 0, 1, 2 or 4 radius values. The usage of these values depend how many values are provided as follows.

See also:

- \ref{setRoundedCorners(r1 as Integer, r2 as Integer, r3 as Integer = -2147483647, r4 as Integer = -2147483647)}
Values Provided | Description
--- | ---
0 | The radii of all the box corners are automatically determined.
1 | The radii of all the box corners are set to the specified value.
2 | The radii of the box-top corners are set to the first value. The radii of the box-bottom corners are set to the second value.
4 | The radius of the box-top corner at the negative x direction is set to the first value. The radius of the box-top corner at the positive x direction is set to the second value. The radius of the box-bottom corner at the negative x direction is set to the third value. The radius of the box-bottom corner at the positive x direction is set to the fourth value.

Argument | Default | Description
--- | --- | ---
r1 | -0x7fffffff | The first radius. See description above on how this radius value is used.
r2 | -0x7fffffff | The second radius. See description above on how this radius value is used.
r3 | -0x7fffffff | The third radius. See description above on how this radius value is used.
r4 | -0x7fffffff | The fourth radius. See description above on how this radius value is used.

28.7.7 setRoundedCorners(r1 as Integer, r2 as Integer, r3 as Integer = -2147483647, r4 as Integer = -2147483647)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Configures rounded corners for the boxes.
**Notes:**
This method currently is only supported by the BoxWhiskerLayer.

A box has 4 corners, two of them are at "box-top", and two of them are at "box-bottom". Note that "box-top" and "bottom-bottom" refer to the sides of the box representing the boxTop and boxBottom parameters in CDXYChartMBS.addBoxWhiskerLayer or CDXYChartMBS.addBoxLayer. Note that they are not necessarily the geometric top or bottom of the box. For example, if the y-axis is reversed (such as configured using CDAxisMBS.setReverse), the top and bottom side may be reversed. For horizontal boxes (with CDXYChartMBS.swapXY in effect), the box-top and box-bottom sides may actually be the right and left sides.

Of the 2 box-top corners, one of them is at the negative x direction while the other is at the positive x direction. The same applies to the box-bottom corners.

This method accepts 0, 1, 2 or 4 radius values. The usage of these values depend how many values are provided as follows.

Values Provided      Description
0                     The radii of all the box corners are automatically determined.
1                     The radii of all the box corners are set to the specified value.
2                     The radii of the box-top corners are set to the first value. The radii of the
                      box-bottom corners are set to the second value.
4                     The radius of the box-top corner at the negative x direction is set to the first
                      value. The radius of the box-top corner at the positive x direction is set to the
                      second value. The radius of the box-bottom corner at the negative x direction
                      is set to the third value. The radius of the box-bottom corner at the positive
                      x direction is set to the fourth value.

Argument     Default     Description
r1           -0x7fffffff The first radius. See description above on how this radius value is used.
r2           -0x7fffffff The second radius. See description above on how this radius value is used.
r3           -0x7fffffff The third radius. See description above on how this radius value is used.
r4           -0x7fffffff The fourth radius. See description above on how this radius value is used.

• 28.7.6 setRoundedCorners(r1 as Integer)
28.8 class CDBaseChartMBS

28.8.1 class CDBaseChartMBS

**Function:** The BaseChart class is an abstract class containing methods that are common to all chart types.  
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.8.2 Methods

28.8.3 addExtraField(numbers() as Double)

**Function:** Adds an array of numbers/dates to be used as an extra field in various places.  
**Notes:** This method merely stores the data inside the chart object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>

### 28.8.6 addLegend(x as Integer, y as Integer, noOfCols as Integer, font as string = "", fontsize as Double = 10) as CDLegendBoxMBS

**MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Adds a legend box to the chart with grid layout.

**Notes:**
In grid layout, the legend box will be divided into a table in which all cells are of the same width. The legend entries will fill the cells from left to right, top to bottom.

The number of columns can be specified using the noOfCols argument. If this argument is set to the special constant AutoGrid (= -2), the number of columns will be automatically determined based on the longest legend entry. If this argument is 0, the legend box will use a flow layout (from left to right and then top to bottom, in which the entries may not be vertically aligned).

In any case, the number of rows in the table is automatically determined so as to have enough cells for all legend entries.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x coordinate of the reference point of the legend box. By default, the reference point is the top-left corner of the box, but can be configured by using TextBox.setAlignment.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y coordinate of the reference point of the legend box. By default, the reference point is the top-left corner of the box, but can be configured by using TextBox.setAlignment.</td>
</tr>
<tr>
<td>noOfCols</td>
<td>(Mandatory)</td>
<td>The number of columns in the legend box. The special value AutoGrid (= -2) means the number of columns is automatically determined. If this argument is 0, the legend box will use a flow layout (from left to right and then top to bottom, in which the entries may not be vertically aligned).</td>
</tr>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font name of the font for drawing the legend text. The default is &quot;normal&quot;. See Font Specification for details on various font attributes.</td>
</tr>
<tr>
<td>fontSize</td>
<td>10</td>
<td>The font size of the legend text.</td>
</tr>
</tbody>
</table>

Return Value
A LegendBox object representing the legend box. You may use this object to fine-tune the appearance of the legend box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:

- 28.8.7 addLegend(x as Integer, y as Integer, vertical as boolean=true, font as string = "", fontsize as Double = 10) as CDLegendBoxMBS

28.8.7 addLegend(x as Integer, y as Integer, vertical as boolean=true, font as string = "", fontsize as Double = 10) as CDLegendBoxMBS

Function: Adds a legend box to the chart.
Notes:
The entries in the legend box will flow from top to bottom (one line per entry), or from left to right and then top to bottom (like flowing text), depending on the vertical argument. For grid layout, use BaseChart.addLegend2.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x coordinate of the reference point of the legend box. By default, the reference point is the top-left corner of the box, but can be configured by using TextBox.setAlignment.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y coordinate of the reference point of the legend box. By default, the reference point is the top-left corner of the box, but can be configured by using TextBox.setAlignment.</td>
</tr>
<tr>
<td>vertical</td>
<td>true</td>
<td>A true value means the legend keys are laid out vertically (one line per entry). A false value means the legend keys are laid out horizontal and flow like text (from left to right, top to bottom).</td>
</tr>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font name of the font for drawing the legend text. The default is &quot;normal&quot;. See Font Specification for details on various font attributes.</td>
</tr>
<tr>
<td>fontSize</td>
<td>10</td>
<td>The font size of the legend text.</td>
</tr>
</tbody>
</table>

Return Value
A LegendBox object representing the legend box. You may use this object to fine-tune the appearance of the legend box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 28.8.6 addLegend(x as Integer, y as Integer, noOfCols as Integer, font as string = "", fontsize as Double = 10) as CDLegendBoxMBS

28.8.8 addLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, colorvalue as color, lineWidth as Integer = 1) as CDLineMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other addLine method, but uses color instead of integer data type for passing color values.
See also:

- 28.8.9 addLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, colorvalue as Integer = & hffff0001, lineWidth as Integer = 1) as CDLineMBS
28.8.9 addLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, colorValue as Integer = & hffff0001, lineWidth as Integer = 1) as CDLineMBS

**Function**: Adds a line to the chart.

**Notes**:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x1</td>
<td>(Mandatory)</td>
<td>The x coordinate of the first endpoint of the line.</td>
</tr>
<tr>
<td>y1</td>
<td>(Mandatory)</td>
<td>The y coordinate of the first endpoint of the line.</td>
</tr>
<tr>
<td>x2</td>
<td>(Mandatory)</td>
<td>The x coordinate of the second endpoint of the line.</td>
</tr>
<tr>
<td>y2</td>
<td>(Mandatory)</td>
<td>The y coordinate of the second endpoint of the line.</td>
</tr>
<tr>
<td>color</td>
<td>LineColor</td>
<td>The color of the line.</td>
</tr>
<tr>
<td>lineWidth</td>
<td>1</td>
<td>The width of the line.</td>
</tr>
</tbody>
</table>

**Return Value**

A Line object representing the line added. You may use this object to fine-tune the appearance of the line.

**See also**:

- 28.8.8 addLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, colorValue as color, lineWidth as Integer = 1) as CDLineMBS

28.8.10 addTable(x as Integer, y as Integer, alignment as Integer, col as Integer, row as Integer) as CDMLTableMBS

**Function**: Adds a CDML table to the chart.

**Notes**:

**Arguments**:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x-coordinate of the reference point used to position the table.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y-coordinate of the reference point used to position the table.</td>
</tr>
<tr>
<td>alignment</td>
<td>(Mandatory)</td>
<td>The alignment of the table with respect to the reference point. For example, a value of kTopLeft means the reference point is the top-left corner of the table. See Alignment Specification for supported alignment types.</td>
</tr>
<tr>
<td>col</td>
<td>(Mandatory)</td>
<td>The number of columns in the table.</td>
</tr>
<tr>
<td>row</td>
<td>(Mandatory)</td>
<td>The number of rows in the table.</td>
</tr>
</tbody>
</table>

Returns a CDMLTableMBS object representing the CDML table added.
28.8.11 addText(x as Integer, y as Integer, text as string, font as string = "", fontsize as Double = 8, fontcolor as Integer = & hffff0002, alignment as Integer = 7, angle as Double = 0, vertical as boolean=false) as CDTextBoxMBS

Function: Adds a text box to the chart.

Notes:
By default, only the text is visible, the box is transparent. This method returns a TextBox object that can be used to change the appearance of the text box.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x coordinate of the left of the text box.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y coordinate of the top of the text box.</td>
</tr>
<tr>
<td>text</td>
<td>(Mandatory)</td>
<td>The text to shown in the text box. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.</td>
</tr>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font used to draw the text. See Font Specification for details on various font attributes.</td>
</tr>
<tr>
<td>fontSize</td>
<td>8</td>
<td>The font size used to draw the text.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The color used to draw the text.</td>
</tr>
<tr>
<td>alignment</td>
<td>TopLeft</td>
<td>The alignment of the text within the text box. See Alignment Specification for supported alignment types.</td>
</tr>
<tr>
<td>angle</td>
<td>0</td>
<td>The rotation angle of the text within the text box.</td>
</tr>
<tr>
<td>vertical</td>
<td>false</td>
<td>Indicate whether the text should be laid out vertically (from top to bottom) or horizontally (from left to right).</td>
</tr>
</tbody>
</table>

Return Value
A TextBox object representing the text box. This may be used to fine-tune the appearance of the text box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:

- 28.8.12 addText(x as Integer, y as Integer, text as string, font as string, fontsize as Double, fontcolor as color, alignment as Integer = 7, angle as Double = 0, vertical as boolean=false) as CDTextBoxMBS

28.8.12 addText(x as Integer, y as Integer, text as string, font as string, fontsize as Double, fontcolor as color, alignment as Integer = 7, angle as Double = 0, vertical as boolean=false) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other addText method, but uses color instead of integer data type for passing color
values.
See also:

- 28.8.11 addText(x as Integer, y as Integer, text as string, font as string = "", fontsize as Double = 8, fontcolor as Integer = & hffff0002, alignment as Integer = 7, angle as Double = 0, vertical as boolean=false) as CDTextBoxMBS

28.8.13 addTitle(alignment as Integer, text as string, font as string = "", fontsize as Double = 12, fontColor as Integer = & hffff0002, bgColor as Integer = & hff000000, edgeColor as Integer = & hff000000) as CDTextBoxMBS

**Function:** Adds a title to the chart.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alignment</td>
<td>(Mandatory)</td>
<td>The position on the title on the chart. See Alignment Specification for supported alignment types.</td>
</tr>
<tr>
<td>text</td>
<td>(Mandatory)</td>
<td>The text for the title. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.</td>
</tr>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font used to draw the title text. The default is &quot;bold&quot;. See Font Specification for details on various font attributes.</td>
</tr>
<tr>
<td>fontSize</td>
<td>12</td>
<td>The font size in points for the title text.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The color of the title text.</td>
</tr>
<tr>
<td>bgColor</td>
<td>Transparent</td>
<td>The background color of the title box.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>Transparent</td>
<td>The border color of the title box.</td>
</tr>
</tbody>
</table>

**Return Value**

A TextBox object representing the title box. This may be used to fine-tune the appearance of the title box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:

- 89.31.10 addTitle(alignment as Integer, text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS

- 28.8.15 addTitle(text as string, font as string = "", fontsize as Double = 12, fontColor as Integer = & hffff0002, bgColor as Integer = & hff000000, edgeColor as Integer = & hff000000) as CDTextBoxMBS

- 28.8.16 addTitle(text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS
28.8.14 addTitle(alignment as Integer, text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other addTitle method, but uses color instead of integer data type for passing color values.

See also:

- 28.8.13 addTitle(alignment as Integer, text as string, font as string = "", fontsize as Double = 12, fontColor as Integer = & hff000002, bgColor as Integer = & hff000000, edgeColor as Integer = & hff000000) as CDTextBoxMBS
- 28.8.15 addTitle(text as string, font as string = "", fontsize as Double = 12, fontColor as Integer = & hff000002, bgColor as Integer = & hff000000, edgeColor as Integer = & hff000000) as CDTextBoxMBS
- 28.8.16 addTitle(text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS

28.8.15 addTitle(text as string, font as string = "", fontsize as Double = 12, fontColor as Integer = & hff000002, bgColor as Integer = & hff000000, edgeColor as Integer = & hff000000) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a title at the top center of the chart.

**Notes:**
The title is contained within a box, of which the width is the same as the width of the chart, and the height is automatically adjusted to fit the text. The box is initially invisible, but can be made visible by setting the bgColor and edgeColor.

28.8.16  addTitle(text as string, font as string, fontsize as Double, fontColor as 
          color, bgColor as color, edgeColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addTitle method, but uses color instead of integer data type for passing color
values.
See also:

- 28.8.13 addTitle(alignment as Integer, text as string, font as string = "", fontsize as Double = 12, 
  fontColor as Integer = & hffff0002, bgColor as Integer = & hff000000, edgeColor as Integer = & 
  hff000000) as CDTextBoxMBS

- 89.31.10 addTitle(alignment as Integer, text as string, font as string, fontsize as Double, fontColor as 
  color, bgColor as color, edgeColor as color) as CDTextBoxMBS

- 28.8.15 addTitle(text as string, font as string = "", fontsize as Double = 12, fontColor as Integer = & 
  hff000002, bgColor as Integer = & hff000000, edgeColor as Integer = & hff000000) as CDTextBoxMBS

28.8.17  adjustBrightness(ColorValue as color, brightness as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other adjustBrightness method, but uses color instead of integer data type for 
passing color values.
See also:

- 28.8.18 adjustBrightness(ColorValue as Integer, brightness as Double) as Integer

28.8.18  adjustBrightness(ColorValue as Integer, brightness as Double) as Integer

Function: Creates a color that is a darkened or brightened version of the given color.
Notes:
A brightness less than 1 means the color is darkened, while a brightness greater than 1 means the color is 
brightened. For example, a brightness of 0.5 means the color is half as bright as the original color. If the 
original color is red, the color will become dark red. Conversely, a brightness of 2 means the color is twice 
as bright as the original color. If the original color is red, the color will become light red.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>(Mandatory)</td>
<td>The given color.</td>
</tr>
<tr>
<td>brightness</td>
<td>(Mandatory)</td>
<td>A non-negative number represent the factor to darken or brighten the color.</td>
</tr>
</tbody>
</table>

Return Value
A 32-bit integer representing the darkened or brightened color.
See also:

- 89.34.22 adjustBrightness(ColorValue as color, brightness as Double) as Integer

28.8.19 AllPassFilter as Integer

Function: Creates a data filter that matches every element.
Notes:
This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 as a "catch all" filter.

Return Value
An integer filter id representing the filter.

28.8.20 ArrowShape(angle as Double = 0.0, widthRatio as Double = 1, stemWidthRatio as Double = 0.5, stemLengthRatio as Double = 0.5) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Gets the shape id that represents an arrow shape.
Notes:
Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Returns an integer shape id representing the arrow shape.
28.8.21  **barLighting**(startBrightness as Double = 0.75, endBrightness as Double = 1.5) as Integer

**Function:** A special shading effect for rectangular and polygonal bars on a CDBarLayerMBS.

**Notes:**

It shades all surfaces of a 2D or 3D bar with gradient colors.

For the front surface of a bar, the gradient is from base line of the bar to the end of the bar. For example, for a vertical bar pointing upwards, the gradient is from bottom to the top. Similarly, for a horizontal bar pointing rightwards, the gradient is from left to right.

For a 3D bar, the gradient for the top surface of a vertical bar or the right surface of a horizontal bar is from front to back. The gradients for the side surfaces are the same as for the front surface.

The gradient is specified with two brightness values at the gradient end points. A brightness less than 1 means the color is darkened, while a brightness greater than 1 means the color is brightened. For example, a brightness of 0.5 means the color is half as bright as the original color. If the original color is red, the color will become dark red. Conversely, a brightness of 2 means the color is twice as bright as the original color. If the original color is red, the color will become light red.

The followings are some examples demonstrating this effect.

The barLighting method returns an integer representing this effect. The integer can be used as the second argument to CDLayerMBS.setBorderColor for CDBarLayerMBS objects to apply the effect to bars.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startBrightness</td>
<td>0.75</td>
<td>The brightness at the starting point.</td>
</tr>
<tr>
<td>endBrightness</td>
<td>1.5</td>
<td>The brightness at the ending point.</td>
</tr>
</tbody>
</table>
28.8. **CLASS CDBASECHARTMBS**

Return Value
An integer representing the bar lighting effect.

### 28.8.22 blueMetalGradient as Integer()

**Function:** A constant array of integers to represent a gradient that looks like a blue metallic color.

**Notes:**

The array is in a format that can be directly used in BaseChart.gradientColor2 and DrawArea.gradientColor2. Its contents (in hex) is:

```
00 9898E0 60 F0F0FF B0 D8D8F0 100 9898E0
```

See Color Specification on how colors are represented in ChartDirector.

### 28.8.23 brushedGoldColor(texture as Integer = 2, angle as Integer = 90) as Integer

**Function:** Creates a brushed golden color, most commonly used as a background color.

**Notes:**

This method is a short cut to the CDBaseChartMBS.brushedMetalColor method, using yellow (FFEE44 in hex) as the base color.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>texture</td>
<td>2</td>
<td>The strength of the brushed texture. Must be 0, 1, 2 or 3 for no texture, light texture, medium texture and strong texture.</td>
</tr>
<tr>
<td>angle</td>
<td>90</td>
<td>The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.</td>
</tr>
</tbody>
</table>

**Return Value:**

A 32-bit integer representing the brushed golden color.
28.8.24 brushedMetalColor(c as Integer, texture as Integer = 2, angle as Integer = 90) as Integer

**Function:** Creates a color by modulates the brightness of another color to create brushed metallic shiny effects.
**Notes:**
The brightness of the color will vary smoothly across the image in a given a direction, so as to produce a shiny effect. The color will then be modulated with a horizontal texture to create the brushed effect. The modulation period will be the same as the size of the image, so this method is best use to create background colors.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>(Mandatory)</td>
<td>The color to be modulated.</td>
</tr>
<tr>
<td>texture</td>
<td>2</td>
<td>The strength of the brushed texture. Must be 0, 1, 2 or 3 for no texture, light texture, medium texture and strong texture.</td>
</tr>
<tr>
<td>angle</td>
<td>90</td>
<td>The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.</td>
</tr>
</tbody>
</table>

**Return Value:**
A 32-bit integer representing the brushed metallic color.

28.8.25 brushedSilverColor(texture as Integer = 2, angle as Integer = 90) as Integer

**Function:** Creates a brushed silver color, most commonly used as a background color.
**Notes:**
This method is a short cut to the CDBaseChartMBS.brushedMetalColor method, using grey (DDDDDD in hex) as the base color.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>texture</td>
<td>2</td>
<td>The strength of the brushed texture. Must be 0, 1, 2 or 3 for no texture, light texture, medium texture and strong texture.</td>
</tr>
<tr>
<td>angle</td>
<td>90</td>
<td>The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.</td>
</tr>
</tbody>
</table>
28.8. **CLASS CDBASECHARTMBS**

Return Value
A 32-bit integer representing the brushed silver color.

### 28.8.26 bSearch(values() as Double, value as Double) as Double

**MBS ChartDirector Plugin, Plugin Version:** 12.3, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes.

**Function:** Uses binary search to search for a value in an array.

**Notes:**
This method returns the array index of the value in the array, which must be sorted in ascending order.

If the value is in between two elements of the array, this method returns a non-integer that interpolates the indexes of the two elements. For example, suppose the array consists of 3 elements [4, 6, 10]. If this method is used to search for the value 7, it will return 1.25.

If the value is smaller or larger than all the elements in the array, this method returns the nearest index, which must be either 0 or the index of the last element of the array.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>(Mandatory)</td>
<td>The array to be searched.</td>
</tr>
<tr>
<td>v</td>
<td>(Mandatory)</td>
<td>The value to search for.</td>
</tr>
</tbody>
</table>

Returns the index of the value within the array. If the value is in between two elements of the array, this method returns a non-integer that interpolates the indexes of the two elements. If the value is smaller or larger than all the elements in the array, this method returns the nearest index.

### 28.8.27 chartTime(t as Integer) as Double

**MBS ChartDirector Plugin, Plugin Version:** 8.2, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes.

**Function:** Converts a UNIX time (seconds elapsed since 01-01-1970 00:00:00 GMT) to the date/time format used by ChartDirector.

**Notes:**
The UNIX time will be converted assuming based on local time zone (the time zone settings of the operating system).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
<td>(Mandatory)</td>
<td>A time represented as seconds elapsed since 01-01-1970 00:00:00 GMT.</td>
</tr>
</tbody>
</table>

Return Value
CHAPTER 28. CHARTDIRECTOR

The second elapsed since 01-01-0001 00:00:00 to the given time.

See also:

- 28.8.28 chartTime(year as Integer, month as Integer, day as Integer, hour as Integer = 0, minute as Integer = 0, second as Integer = 0) as Double

28.8.28 chartTime(year as Integer, month as Integer, day as Integer, hour as Integer = 0, minute as Integer = 0, second as Integer = 0) as Double

Function: Obtain the second elapsed since 01-01-0001 00:00:00 to the given time, which is the date/time format used by ChartDirector.

Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The year component of the given time.</td>
</tr>
<tr>
<td>m</td>
<td>(Mandatory)</td>
<td>The month component of the given time</td>
</tr>
<tr>
<td>d</td>
<td>(Mandatory)</td>
<td>The day of month component of the given time</td>
</tr>
<tr>
<td>h</td>
<td>0</td>
<td>The hour component of the given time.</td>
</tr>
<tr>
<td>n</td>
<td>0</td>
<td>The minute component of the given time.</td>
</tr>
<tr>
<td>s</td>
<td>0</td>
<td>The second component of the given time.</td>
</tr>
</tbody>
</table>

Return Value
The second elapsed since 01-01-0001 00:00:00 to the given time.

See also:

- 28.8.27 chartTime(t as Integer) as Double

28.8.29 ClearTypeColor(gamma as Double = 0) as Integer

Function: Gets a value to represent that standard ClearType or a similar technology be used for font rendering.

Notes:

This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.

ClearType is a Microsoft font rendering technology that renders text more accurately with subpixel rendering. Similar technologies include Quartz in Mac OS X, Adobe CoolType and other unnamed algorithms. Although this API uses ClearType in its name, ChartDirector may use ClearType or a similar technology depending on the operating system and programming language.

In most modern flat panel displays, a pixel is consisted of 3 sub-pixels R, G and B for the red, green and blue colors, typically arranged horizontally. So a row of pixels is actually a sequence of subpixels like RG-
BRGBRGBRGB... To display a white pixel, the display hardware turns on the RGB subpixels.

It happens a white dot can also be made by turning on the GB subpixels of one pixel, and the R subpixel of the next pixel to the right. This will result in 3 consecutive subpixels GBR, which is also white. This white dot will be in between the two pixels, with 2/3 on the left pixel, and 1/3 on the right pixel. In other words, it is possible to position a white dot in between two pixels without blurring it. ClearType uses this effect to render text with subpixel accuracy.

Apart from subpixel rendering, ClearType may adjust the glyph shapes to fit the pixel grid (technically called hinting) differently from classical rendering. As a result, the glyph shapes and sizes in ClearType may be different from classical rendering.

One issue with ClearType is that it is hardware dependent. To work perfectly, it needs to know the subpixels ordering of the display. In many applications, the charts are rendered on one computer, but viewed using another computer. For example, in a web application, the charts can be rendered on the server but displayed on the browser computer. The chart generating computer may not know the subpixel configuration of the viewing computer. If ClearType is used, there is a risk that the text may look suboptimal on the viewing computer.

To address the above issues, ChartDirector supports a hardware independent ClearType method, represented by ClearTypeMono. This is basically ClearType with subpixel rendering disabled. The resulting text has no color distortion. Black and white text will not be as sharp as standard ClearType, but is still better than classical anti-alias. The charts rendered can be viewed equally well with different types of displays. This is especially useful for applications in which the charts are rendered and viewed by different computers.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gamma</td>
<td>0</td>
<td>Specifies the level of gamma correction used for ClearType font rendering. This is usually a number between 1 to 2.5. A value of 0 means the default gamma level.</td>
</tr>
</tbody>
</table>

**28.8.30 ClearTypeMono(gamma as Double = 0) as Integer**

**Function:** Gets a value to represent that hardware independent ClearType or a similar technology be used for font rendering.

**Notes:**

This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.

Please refer to ClearTypeColor on the detail explanation of what is standard ClearType and hardware independent ClearType.
CHAPTER 28. CHARTDIRECTOR

28.8.31 ColorToInteger(c as color, alpha as Integer = 0) as Integer

Function: Converts a REALbasic color object to an integer for ChartDirector.

28.8.32 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

28.8.33 Cross2Shape(width as Double = 0.5) as Integer

Function: Gets the shape id that represents a 'X' shape.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The percentage width of the arms of the a 'X' relative to the entire shape. Must be between 0 and 1.</td>
</tr>
</tbody>
</table>

Return Value
An integer shape id representing the a 'X' shape.

28.8.34 CrossShape(width as Double = 0.5) as Integer

Function: Gets the shape id that represents a '+' shape.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gamma</td>
<td>0</td>
<td>Specifies the level of gamma correction used for ClearType font rendering. This is usually a number between 1 to 2.5. A value of 0 means the default gamma level.</td>
</tr>
</tbody>
</table>
28.8. CLASS CDBASECHARTMBS

Argument Default Description
width (Mandatory) The percentage width of the arms of the a ’+’ relative to the entire shape. Must be between 0 and 1.

Return Value
An integer shape id representing the a ’+’ shape.

28.8.35 cylinderEffect(orientation as Integer = 5, ambientIntensity as Double = 0.5, diffuseIntensity as Double = 0.5, specularIntensity as Double = 0.75, shininess as Integer = 8) as Integer

Function: A special shading effect that emulates the lighting of a cylinder surface.

Notes:
This effect adjusts the brightness of the color of a rectangular box to make it look like cylindrical. The brightness is adjusted according to the Phong lighting model, in which the light source is from the viewer direction and is far away.

The cylinderEffect method returns an integer representing this effect. The integer can be used as the third argument to CDBoxMBS.setBackground to apply the effect to Box objects (including derived objects such as CDTextBoxMBS objects).

This effect is automatically used for cylindrical bars in a CDBarLayerMBS. You may use this method to adjust the lighting parameters by using its return value as the second argument to CDLayerMBS.setBorderColor.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orientation</td>
<td>kCenter</td>
<td>The orientation of the cylinder. A value of kTop or kBottom means the cylinder is vertical. A value of kLeft or kRight means the cylinder is horizontal. A value of kCenter means the orientation is automatically determined. For a CDBarLayerMBS, the orientation will be the same as the orientation of the bars. For other objects (eg. CDTextBoxMBS objects), if the object height is bigger than its width, the cylinder will be treated as vertical, otherwise it will be treated as horizontal.</td>
</tr>
<tr>
<td>ambientIntensity</td>
<td>0.5</td>
<td>The ambient reflection coefficient of the Phong lighting model.</td>
</tr>
<tr>
<td>diffuseIntensity</td>
<td>0.5</td>
<td>The diffuse reflection coefficient of the Phong lighting model.</td>
</tr>
<tr>
<td>specularIntensity</td>
<td>0.75</td>
<td>The specular reflection coefficient of the Phong lighting model.</td>
</tr>
<tr>
<td>shininess</td>
<td>8</td>
<td>The shininess coefficient of the Phong lighting model.</td>
</tr>
</tbody>
</table>
Return Value
An integer representing the cylinder effect.

28.8.36  dashLineColor(colorvalue as color, patternCode as Integer = & h0505) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other dashLineColor method, but uses color instead of integer data type for passing color values.
See also:

- 28.8.37 dashLineColor(colorvalue as Integer, patternCode as Integer = & h0505) as Integer

28.8.37  dashLineColor(colorvalue as Integer, patternCode as Integer = & h0505) as Integer

Function: A constant equals to 0505 (in hex) to represent a dash line pattern for use in dash colors.
Notes: See Color Specification on how colors are represented in ChartDirector.
See also:

- 28.8.36 dashLineColor(colorvalue as color, patternCode as Integer = & h0505) as Integer

28.8.38  defaultPalette as Integer()

MBS ChartDirector Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the default palette.

28.8.39  Destructor

Function: The destructor for the base chart.

28.8.40  enableVectorOutput

Function: Enables true vector graphics output.
Notes:
By default, when creating the output image, ChartDirector draws directly onto an output buffer representing the bitmap of the image. For example, for a chart 800 x 600 pixels in size, the output buffer may represent a 800 x 600 bitmap. The output buffer size is unchanged no matter how many items are drawn onto it. Even if the output contains 1 million elements (e.g. 1 million symbols), the size of the output buffer is still the same.

On the other hand, a true vector output is indefinitely scalable and can be considered as having infinite resolution. To produce a true vector output, it is necessary to remember the graphics operations for every element in the output buffer. The output buffer size is therefore proportional to the number of elements to draw.

This method tells ChartDirector that it needs to remember the graphics operations to prepare for true vector output. If true vector output is needed, this method should be called immediately after creating the BaseChart object.

If this method is not called, and a vector graphics output format is used (such as SVG), instead of a true vector output, ChartDirector will output a raster image using the vector graphics format. (Most vector graphics formats support embedded raster images.)

28.8.41 flatBorder(thickness as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Specifies a flat border of a given width.

Notes:

The flatBorder method returns an integer representing this effect. The integer can be used as the third argument to Box.setBackground to apply the effect to Box objects (including derived objects such as TextBox objects). It may also be used as the second argument to Layer.setBorderColor for BarLayer or BoxWhiskerLayer objects to apply the effect to bars or boxes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The border width. A positive value means the border is drawn inside the box or bar. A negative value means the border is outside the box or bar.</td>
</tr>
</tbody>
</table>

Returns an integer representing using flat border of the specified width.

28.8.42 formatValue(value as Double, formatstring as string) as string

Function: Formats a number/date using the ChartDirector formatting syntax as is in Parameter Substitution and Formatting.

Notes:
CHAPTER 28. CHARTDIRECTOR

Argument Default Description
value (Mandatory) The value to be formatted.
formatString (Mandatory) The format string, using `{ value }` to denote the value. For example, `$ `{ value | 2, }` can be used to format the value to 2 decimal points, using ",," as the thousand separator, and with a `'$'` sign in front.

28.8.43 getAbsOffsetX as Integer

Function: Gets the x offset of the chart relative to the outermost MultiChart container.
Notes: Returns an integer representing the x offset in pixels relative to the outermost MultiChart container, or 0 if the chart is not within a MultiChart container.

28.8.44 getAbsOffsetY as Integer

Function: Gets the y offset of the chart relative to the outermost MultiChart container.
Notes: Returns an integer representing the y offset in pixels relative to the outermost MultiChart container, or 0 if the chart is not within a MultiChart container.

28.8.45 getChartMetrics as string

Function: Gets the chart metrics for passing to CChartViewer to support view ports.
Notes:
The format of the chart metrics is not published.
Return Value
A text string representing the chart metrics.

28.8.46 getChartWeekDay(t as Double) as Integer

Function: Gets the weekday represented by a ChartDirector date/time.
Notes:
Argument Default Description
t (Mandatory) A ChartDirector date/time, that is, a number representing seconds elapsed since 01-01-0001 00:00:00.
28.8. **CLASS CDBASECHARTMBS**

**Return Value**
An integer from 0 - 6 representing Sun - Sat.

### 28.8.47 getChartYMD(t as Double) as Integer

**Function:** Gets the year, month and day represented by a ChartDirector date/time.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
<td>(Mandatory)</td>
<td>A ChartDirector date/time, that is, a number representing seconds elapsed since 01-01-0001 00:00:00.</td>
</tr>
</tbody>
</table>

**Return Value**
An integer which when represented in decimal notation is yyyyymmdd, where yyyy is the year, mm is the month (1 - 12), and dd is the day (1 - 31).

### 28.8.48 getColor(index as Integer) as Integer

**Function:** Gets the color at the specified position of the palette.

**Notes:**
See Color Specification on how colors are represented in ChartDirector.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paletteEntry</td>
<td>(Mandatory)</td>
<td>An index to the palette.</td>
</tr>
</tbody>
</table>

**Return Value**
The requested color.

### 28.8.49 getCopyright as string

**Function:** Returns the copyright string of the ChartDirector library.

**Example:**
MsgBox CDBaseChartMBS.getCopyright
// displays "Copyright (c) 2006 Advanced Software Engineering Limited"
### 28.8.50 `getDescription` as string

**Function:** Returns the library description.

**Example:**

```vbnet
MsgBox CDBaseChartMBS.getDescription // displays "ChartDirector"
```

### 28.8.51 `getDrawArea` as CDDrawAreaMBS

**Function:** Retrieves the internal DrawArea object that is used to draw the chart.

**Notes:**

The most common reason of accessing the internal DrawArea object is to add custom drawings (lines, texts, shapes, etc) to the chart.

If the custom drawings are drawn before drawing the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart or BaseChart.makeChart3), the custom drawings will be at the background of the chart.

**Return Value**

A DrawArea object that can be used to add custom text and shapes to the chart.

### 28.8.52 `getHeight` as Integer

**Function:** Gets the height of the chart.

### 28.8.53 `getHTMLImageMap(url as string, queryFormat as string = ", extraAttr as string = ", offsetX as Integer = 0, offsetY as Integer = 0) as string

**Function:** Generates an HTML image map for the chart.

**Notes:**

This method generates an image map to represent all data points on the chart. It does not include legend box, title box or custom text box. Please use LegendBox.getHTMLImageMap or Box.getImageCoor to pro-
duce image maps for these objects.

This method should be called only after creating the chart image (e.g. using BaseChart.makeChart, BaseChart.makeChart or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

This method accepts a URL as its argument. When generating an image map, it appends query parameters to the URL to indicate which data point the user has clicked.

The following is an example image map generated for a bar chart with 3 bars.

```html
<area shape="rect" coords="34,219,63,139" href="myurl.cpp?x=0& xLabel=Mon& dataSet=0& dataSetName=Revenue& value=100" />
<area shape="rect" coords="74,219,103,119" href="myurl.cpp?x=1& xLabel=Tue& dataSet=0& dataSetName=Revenue& value=125" />
<area shape="rect" coords="114,219,143,22" href="myurl.cpp?x=2& xLabel=Wed& dataSet=0& dataSetName=Revenue& value=245.78" />
```

The image map consists of multiple `<area>` tags, one for each bar in the chart. In the "href" attributes, query parameters are appended to the URL to provide information on the bar clicked.

The image map produces by ChartDirector does not include the `<map>` and `</map>` tag. This is intentional so that you can add additional custom `<area>` tags to the image map, or append multiple image maps together.

The type of query parameters to append to the URL depends on the chart type and layer type. The default query parameters are as follows.

**Chart/Layer Type**

- **Default Query Format**

<table>
<thead>
<tr>
<th>Type</th>
<th>Query Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pie chart</td>
<td><code>sector={\text{sector}}&amp;label={\text{label}}&amp;value={\text{value}}&amp;percent={\text{percent}}</code></td>
</tr>
<tr>
<td>Bar, Line, Spline, Step Line, Area and Scatter layers</td>
<td><code>x={\text{x}}&amp;xLabel={\text{xLabel}}&amp;dataSet={\text{dataSet}}&amp;dataSetName={\text{dataSetName}}&amp;value={\text{value}}</code></td>
</tr>
<tr>
<td>Percentage Bar and Percentage Area layers</td>
<td><code>x={\text{x}}&amp;xLabel={\text{xLabel}}&amp;dataSet={\text{dataSet}}&amp;dataSetName={\text{dataSetName}}&amp;value={\text{value}}&amp;percent={\text{percent}}</code></td>
</tr>
<tr>
<td>HLOC and CandleStick layers</td>
<td><code>x={\text{x}}&amp;xLabel={\text{xLabel}}&amp;high={\text{high}}&amp;low={\text{low}}&amp;open={\text{open}}&amp;close={\text{close}}</code></td>
</tr>
<tr>
<td>Box-Whisker layer</td>
<td><code>x={\text{x}}&amp;xLabel={\text{xLabel}}&amp;top={\text{top}}&amp;bottom={\text{bottom}}&amp;max={\text{max}}&amp;min={\text{min}}&amp;med={\text{med}}</code></td>
</tr>
<tr>
<td>Trend layer</td>
<td><code>dataSetName={\text{dataSetName}}</code></td>
</tr>
<tr>
<td>Vector layer and Polar Vector layer</td>
<td><code>x={\text{x}}&amp;xLabel={\text{xLabel}}&amp;dataSetName={\text{dataSetName}}&amp;value={\text{value}}&amp;dir={\text{dir}}&amp;len={\text{len}}</code></td>
</tr>
<tr>
<td>Polar Line, Area, Spline Line and Spline Area layers</td>
<td>&quot;x={\text{x}}&amp;label={\text{label}}&amp;name={\text{name}}&amp;value={\text{value}}&quot;</td>
</tr>
</tbody>
</table>

The texts in curly brackets (e.g. `{ sector }`, `{ dataSet }`, etc.) will be replaced by the actual values when
CHAPTER 28. CHARTDIRECTOR

4496

generating the image map. For example, \{ sector \} will be replaced by the sector number of the sector.

ChartDirector allows developers to modify the query parameters by using the queryFormat argument. For example, if \"x= { x } & v= { value } \" is used as the queryFormat for a XYChart, only the x position and the value of the data point will be included in query parameters.

Please refer to Parameter Substitution and Formatting on all available parameters and their meanings.

In addition to customizing the query parameters, ChartDirector supports additional HTML attributes in the <area> tags by using the extraAttr argument.

For example, the following extraAttr will add an "title" HTML attribute to every <area> tag. The attribute which will contain the x-axis label and the value of the data point. The "title" attribute will be displayed as "tool tip" when the mouse moves over the image map.

title=' \{ xlabel \} : \{ value \} '

Another common usage of the extraAttr argument is to add "onmouseover" and "onmouseout" HTML attributes to handle user interaction using Javascript on the browser.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(Mandatory)</td>
<td>The URL to be used in the &quot;href&quot; attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.</td>
</tr>
<tr>
<td>queryFormat</td>
<td>&quot;&quot;</td>
<td>A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.</td>
</tr>
</tbody>
</table>

The special keyword \" \{ default \} \" represents the default query parameters. This is useful for specifying appending to the default.

Note that an empty string means to use the default query parameters. To specify no query parameter, use a space character.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extraAttr</td>
<td>&quot;&quot;</td>
<td>A text string to specify additional attributes to add to the &lt;area&gt; tag. Parameter Substitution and Formatting is supported.</td>
</tr>
<tr>
<td>offsetX</td>
<td>0</td>
<td>An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.</td>
</tr>
<tr>
<td>offsetY</td>
<td>0</td>
<td>An offset to be added to all y coordinates in the image map. See offsetX above for description.</td>
</tr>
</tbody>
</table>
28.8. **CLASS CDBASECHARTMBS**

Return Value
A text string containing the image map generated.

---

28.8.54 **getLegend as CDLegendBoxMBS**

**Function:** Gets the LegendBox object representing the legend box in the chart.

**Notes:**
The LegendBox obtained using this method is not fixed. This allows you to add more keys to the legend box, and change the legend box fonts, etc. However, this also means that the legend box size (Box.getWidth and Box.getHeight) is undefined.

To obtain the width and height of the legend box, use BaseChart.layoutLegend.

**Return Value**
The LegendBox object representing the legend box in the chart.

---

28.8.55 **GetPath(path as folderitem) as string**

**Function:** Gets a path string for a folderitem.

**Notes:** Returns the path in the UTF8 format as ChartDirector needs them.

---

28.8.56 **getVersion as Integer**

**Function:** Gets ChartDirector version information.

**Example:**
```
dim v as Integer = CDBaseChartMBS.getVersion

dim v1 as Integer = Bitwise.BitAnd( Bitwise.ShiftRight(v, 24), 255)
dim v2 as Integer = Bitwise.BitAnd( Bitwise.ShiftRight(v, 16), 255)
dim v3 as Integer = Bitwise.BitAnd( v, 65535)

MsgBox str(v1)+"."+str(V2)+"."+str(V3)
```

**Notes:**
The version number is encoded as a 32-bit integer. The most significant 8 bits is the major version number. The next 8 bits are the minor version number. The least significant 16 bits are the build number.
Return Value
The version information encoded in a 32-bit integer.

28.8.57 getWidth as Integer

**Function:** Gets the width of the chart.

28.8.58 glassEffect(glareSize as Integer = 3, glareDirection as Integer = 8, raisedEffect as Integer = 5) as Integer

**Function:** A complex shading effect that emulates tinted glass or semi-transparent plastic material.  
**Notes:**
This effect involves glare and variation of lighting caused by reflection and refraction inside the material. It is best explained by viewing the examples.

**Example**

**Location of lighting effect**

- **Error Line Chart**
  The title is shaded using glass effect, with NormalGlare, lighting from Top, and raised effect of 5 pixels.
- **Donut Chart**
  Both the title and the sector labels are shaded using glass effect with ReducedGlare, lighting from Top, and raised effect of 5 pixels.
- **Glass Multi-Bar Chart**
  The bars are shaded using glass effect, with NormalGlare, lighting from Left, and raised effect of 5 pixels.

Currently, this effect only works well for long, thin objects, such as title bars, text boxes and bars in bar charts.

The glassEffect method returns an integer representing this effect. The integer can be used as the third argument to Box.setBackground to apply the effect it objects derived from Box (such as labels and titles represented by TextBox). It may also be used as the second argument to Layer.setBorderColor for BarLayer objects to apply the effect to bars.

Usually, NormalGlare is best for thin objects with lightly colored background, while ReducedGlare is best for dark background objects or not-so-thin objects (eg. text boxes using white text on a dark background, or with more than 1 line of text).

Return Value
28.8. **CLASS CDBASECHARTMBS**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glareSize</td>
<td>NormalGlare</td>
<td>The amount of glare. Must be one of the predefined constants NormalGlare, ReducedGlare or NoGlare. With NormalGlare and ReducedGlare, the glare will cover around 50% and 35% of the object. If NoGlare is used, there will be no glare and the effect will not look like glass at all, but is equivalent to the CDBaseChartMBS.softLighting effect.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>glareDirection</th>
<th>Top</th>
<th>The direction of the glare, which must be one of the predefined constants Top, Right, Bottom, Left.</th>
</tr>
</thead>
<tbody>
<tr>
<td>raisedEffect</td>
<td>5</td>
<td>With glass shading effect, the object will appear to have some 3D depth. The raisedEffect argument controls the amount of 3D depth in pixels.</td>
</tr>
</tbody>
</table>

An integer representing the glass effect.

28.8.59 **goldColor(angle as Integer = 90) as Integer**

**Function:** Creates a golden color, most commonly used as a background color.  
**Notes:**  
This method is a short cut to the CDBaseChartMBS.metalColor method, using yellow (FFEE44 in hex) as the base color.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>angle</td>
<td>90</td>
<td>The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.</td>
</tr>
</tbody>
</table>

**Return Value**  
A 32-bit integer representing the golden color.

28.8.60 **goldGradient as Integer()**

**Function:** A constant array of integers to represent a gradient that looks like a golden color.  
**Notes:**  
The array is in a format that can be directly used in BaseChart.gradientColor and DrawArea.gradientColor. Its contents (in hex) is:
See Color Specification on how colors are represented in ChartDirector.

28.8.61  \texttt{gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer}

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
\textbf{Function:} Same as the other \texttt{gradientColor} method, but uses \texttt{color} instead of integer data type for passing color values.
See also:

- 28.8.62 \texttt{gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer} 4500
- 28.8.63 \texttt{gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer} 4501
- 28.8.64 \texttt{gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer} 4501

28.8.62  \texttt{gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer}

\textbf{Function:} Creates a multi-point linear gradient color.
\textbf{Notes:}
This method is for backward compatibility. Use BaseChart linearGradientColor2 instead.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colorArray</td>
<td>(Mandatory)</td>
<td>An array defining the positions and colors of the pixels along the reference gradient line segment.</td>
</tr>
<tr>
<td>angle</td>
<td>90</td>
<td>The direction of the reference gradient line segment in degrees, measured clockwise, with 0 degree as the upward pointing direction. The default direction is horizontal from left to right (90 degrees).</td>
</tr>
<tr>
<td>scale</td>
<td>1.0</td>
<td>The scaling factor for the reference gradient line segment. By default, the reference gradient line segment is 256 pixels in length. The scaling factor can be used to stretch or compress the gradient line segment.</td>
</tr>
<tr>
<td>startX</td>
<td>0</td>
<td>The x coordinate of the starting point of the reference gradient line segment.</td>
</tr>
<tr>
<td>startY</td>
<td>0</td>
<td>The y coordinate of the starting point of the reference gradient line segment.</td>
</tr>
</tbody>
</table>

\textbf{Return Value}
A 32-bit integer representing the linear gradient color.
See also:
28.8. **CLASS CDBASECHARTMBS**

- 28.8.61 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

- 28.8.63 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer

- 28.8.64 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer

**28.8.63 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Same as the other gradientColor method, but uses color instead of integer data type for passing color values.  
**See also:**

- 28.8.61 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

- 28.8.62 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

- 28.8.64 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer

**28.8.64 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer**

**Function:** Creates a two-point linear gradient color.  
**Notes:**

This method is for backward compatibility. Use BaseChart.linearGradientColor instead.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startX</td>
<td>(Mandatory)</td>
<td>The x coordinate of the starting point of the reference gradient line segment.</td>
</tr>
<tr>
<td>startY</td>
<td>(Mandatory)</td>
<td>The y coordinate of the starting point of the reference gradient line segment.</td>
</tr>
<tr>
<td>endX</td>
<td>(Mandatory)</td>
<td>The x coordinate of the ending point of the reference gradient line segment.</td>
</tr>
<tr>
<td>endY</td>
<td>(Mandatory)</td>
<td>The y coordinate of the ending point of the reference gradient line segment.</td>

<td>(Mandatory)</td>
<td>The color at the starting point of the reference gradient line segment.</td>
</tr>
<tr>
<td>endColor</td>
<td>(Mandatory)</td>
<td>The color at the ending point of the reference gradient line segment.</td>
</tr>
</tbody>
</table>

**Return Value**

A 32-bit integer representing the linear gradient color.  
**See also:**
• 28.8.61 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 4500
• 28.8.62 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 4500
• 28.8.63 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer 4501

28.8.65 greenMetalGradient as Integer()

Function: A constant array of integers to represent a gradient that looks like a green metallic color.
Notes:
The array is in a format that can be directly used in BaseChart.gradientColor2 and DrawArea.gradientColor2. Its contents (in hex) is:

00 98E098 60 F0FFF0 B0 D8F0D8 100 98E098
See Color Specification on how colors are represented in ChartDirector.

28.8.66 halfColor(c as Integer) as Integer

Function: Creates a color that is half the intensity of the given color.
Notes:
Argument Default Description
--- --- ---
\(c\) (Mandatory) The given color.

Return Value
A 32-bit integer representing the half intensity color.

28.8.67 initDynamicLayer as CDDrawAreaMBS

Function: Initializes a dynamic layer for drawing text and shapes.
Notes:
This method clears the existing dynamic layer, or creates a new one if there is no existing dynamic layer. This method returned a DrawArea object that can be used to draw on the dynamic layer. The dynamic layer can later be removed using BaseChart.removeDynamicLayer.
The design of the dynamic layer is for drawing small, rapidly updatable contents for desktop applications. For example, the dynamic layer can be used to implement a cross-hair mouse cursor, with text showing the location of the mouse cursor. To do this, in the mouse move event handler, BaseChart.initDynamicLayer can be used to create or clear the dynamic layer. The returned DrawArea object can then be used to draw the cross hair cursor (as two straight lines) and the text. When the mouse cursor leaves the chart, BaseChart.removeDynamicLayer can be used in the mouse out event handler to remove the cross-hair cursor and the text.

Note that as long as the dynamic layer is not removed with BaseChart.removeDynamicLayer, only the returned DrawArea object should be used to draw things on the dynamic layer. No other objects should be used to draw on the chart.

Returns a DrawArea object that can be used to add text and shapes to the dynamic layer.

28.8.68  kDataBound as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A constant equals to -1.7E-100 to represent that the interpolated z values should not exceed the minimum or maximum values of the original data. **Notes:** This constant is used in ContourLayer.setZBounds.

28.8.69  kLinearTick as Double

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A constant equals to +1.5E+308 to represent that the ticks in a log scale axis should be 1 - 2 - 3 - 4 - 5 - 6 - 7 - 8 - 9 - 10 style increments.

28.8.70  kLogTick as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A constant equals to +1.6e308 to represent that the ticks in a log scale axis should be 1 - 2 - 5 - 10 style increments. **Notes:** This constant is used in Axis.setLogScale.

28.8.71  kMicroTickOnly as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A constant equals to -1.6e308 to represent that the label position should contain a micro tick only.
Notes: This constant is used in Axis.setLabels and BaseMeter.setScale.

28.8.72 kMinorTickOnly as Double

Function: A constant equals to -1.7e308 to represent that the label position should contain a minor tick only.
Notes: This constant is used in Axis.setLabels.

28.8.73 kNoValue as Double

Function: A constant equals to 1.7E+308 to represent missing values in ChartDirector.
Notes: Please refer to No Value Specification for more details.

28.8.74 kTickInc as Double

Function: A constant equals to +1E+200 to represent the distance between major ticks.
Notes: This constant is used in CDAxisMBS.setLogScale.

28.8.75 kTouchBar as Double

Function: A constant equals to -1.7e-100 to represent that the bars in a bar layer should touch each others with no gap in between.
Notes: This constant is used in BarLayer.setBarGap.

28.8.76 layout

Function: Perform auto-scaling of the axis and compute the positions of the various objects in the chart.
Notes:
BaseChart.layout is automatically called when drawing the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart or BaseChart.makeChart3). There is usually no need to call BaseChart.layout explicitly.
However, if you would like to add custom objects to the chart whose positions depend on the axis scales or position of other objects, you may need to call BaseChart.layout explicit to auto-scaling the axis. An example is to draw a custom label at the maximum value point of a data line.

### 28.8.77 layoutLegend as CDLegendBoxMBS

**Function:** Lays out and gets the LegendBox object representing the legend box in the chart.  
**Notes:** Once the legend box has been laid out, the width and height is known and can be obtained using Box.getWidth and Box.getHeight. However, you may not perform actions that may affect the legend box sizes, such as changing the fonts or adding more data. You may still move the legend box around by using Box.setPos.  

The most common use of this method is to position the legend box based on its actual size.  
**Return Value**  
The LegendBox object representing the legend box in the chart.

### 28.8.78 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Same as the other linearGradientColor method, but uses color instead of integer data type for passing color values.  
**See also:**  
- 28.8.79 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer 4505  
- 28.8.80 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 4507  
- 28.8.81 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 4507

### 28.8.79 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer

**Function:** Creates a multi-point linear gradient color.  
**Notes:**
In this method, the color points are defined as an array of positions and colors along a reference line segment, in the following format:

position0, color0, position1, color1, ..., positionN, colorN

The positions are specified as a number from 0 - 256 (0 - 100 in hex), in which 0 represents the starting point of the reference line segment, and 256 (100 in hex) represents the ending point of the reference line segment.

For example, the array (in hex):

000000, FF0000, 000080, FFFF00, 000100, 00FF00

means the starting point (000000) is red (FF0000), the mid-point (000080 in hex) is yellow (FFFF00), and the ending point (000100 in hex) is green (00FF00).

One common usage of multi-point gradient colors is to define colors that have metallic look and feel. ChartDirector comes from several predefined gradient color arrays as follows.

NameValue (in Hex)

goldGradient 000000, FFE743, 000060, FFFFE0, 0000B0, FFF0B0, 000100, FFE743
silverGradient 000000, CSC8C8, 000060, F8F8F8, 0000B0, E0E0E0, 000100, CSC8C8
redMetalGradient 000000, E09898, 000060, F0FFF0, 0000B0, F0D8D8, 000100, E09898
greenMetalGradient 000000, 98E098, 000060, F0FFF0, 0000B0, D8F0D8, 000100, 98E098
blueMetalGradient 000000, 9898E0, 000060, F0F0FF, 0000B0, D8D8F0, 000100, 9898E0

Argument Default Description
startX (Mandatory) The x coordinate of the starting point of the reference gradient line segment.
startY (Mandatory) The y coordinate of the starting point of the reference gradient line segment.
endX (Mandatory) The x coordinate of the ending point of the reference gradient line segment.
endY (Mandatory) The y coordinate of the ending point of the reference gradient line segment.
colorArray (Mandatory) An array defining the positions and colors of the pixels along the reference gradient line segment.
periodic false Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie beyond the end points of the gradient line segment will assume the colors of the end points.

Return Value
A 32-bit integer representing the linear gradient color.
See also:

• 28.8.78 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer 4505
28.8. \textit{CLASS CDBASECHARTMBS}

- 28.8.80 \texttt{linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer} 4507

28.8.82 makeChart as CDDrawAreaMBS

**Function:** Generates the chart in internal format and return a DrawArea object to allow adding custom drawings on top of the chart.
**Notes:**
If you want to add custom drawings at the background of the chart, use the BaseChart.getDrawArea method to obtain the DrawArea instead.

After finish adding custom drawings, the resulting chart can then be output using other chart output methods.
**Return Value**
A DrawArea object that can be used to add custom text and shapes to the chart.
**See also:**
- 28.8.83 makeChart(format as Integer) as string 4508
- 28.8.84 makeChart(path as folderitem) as boolean 4509

28.8.83 makeChart(format as Integer) as string

**Function:** Generates the chart as an image in memory.
**Notes:**
This method is most often used to output the chart directly to an HTTP stream.

ChartDirector supports PNG, JPG, GIF, WBMP and BMP formats, denoted by the following predefined constants:

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>

For vector output (SVG), please call enableVectorOutput early.
28.8. CLass CDBaseChartMBS

| PNG  | 0 | The PNG format.          |

<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>(Mandatory)</td>
<td>A constant representing the format of the image.</td>
</tr>
</tbody>
</table>

Return Value
A memory block containing the binary image of the chart in the requested format.
See also:

- 28.8.82 makeChart as CDDrawAreaMBS
- 28.8.83 makeChart(format as Integer) as string

28.8.84 makeChart(path as folderitem) as boolean

Function: Generates the chart image and save it into a file.
Notes:
ChartDirector supports PNG, JPG, GIF, WBMP and BMP. The format used are selected based on file extension, which should be png, jpg, jpeg, gif, wbmp, wmp or bmp.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>(Mandatory)</td>
<td>The name of the file to save the image.</td>
</tr>
</tbody>
</table>

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.
See also:

- 28.8.82 makeChart as CDDrawAreaMBS
- 28.8.83 makeChart(format as Integer) as string
28.8.85 makeChartPicture as picture

**Function:** Generates the chart as a picture.  
**Notes:** Returns nil on any error.

28.8.86 metalColor(c as Integer, angle as Integer = 90) as Integer

**Function:** Creates a color by modulates the brightness of another color to create metallic shiny effects.  
**Notes:**  
The brightness of the color will vary smoothly across the image in a given a direction, so as to produce a shiny effect. The modulation period will be the same as the size of the image, so this method is best use to create background colors.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>(Mandatory)</td>
<td>The color to be modulated.</td>
</tr>
<tr>
<td>angle</td>
<td>90</td>
<td>The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.</td>
</tr>
</tbody>
</table>

**Return Value**

A 32-bit integer representing the metallic color.

28.8.87 NonePassFilter as Integer

**Function:** Creates a data filter that matches no element.  
**Notes:**  
This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 as a "deny all" filter.  
**Return Value**

An integer filter id representing the filter.

28.8.88 patternColor(colorvalues() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Same as the other patternColor method, but uses color instead of integer data type for passing color values.  
**See also:**
28.8. **CLASS CDBASECHARTMBS**

- 28.8.89 `patternColor(colorvalues() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer`
- 28.8.90 `patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer`
- 28.8.91 `patternColor(pic as picture, startX as Integer = 0, startY as Integer = 0) as Integer`

### 28.8.89 `patternColor(colorvalues() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer`

**Description:**
**Function:** Creates a pattern color using an array of colors as the bitmap pattern.
**Notes:**
A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

**Argument Default Description**
- `colorArray` *(Mandatory)*: An array of colors representing the colors of the bitmap pixels. The color of the pixel at \((x, y)\) should correspond to index \((x + y * \text{width} - 1)\) of the array.
- `height` *(Mandatory)*: The height of the bitmap in pixels. (The width is automatically computed as the size of the color array divided by the height.)
- `startX`: 0 The x coordinate of a reference point to align with the top-left corner the pattern.
- `startY`: 0 The y coordinate of a reference point to align with the top-left corner the pattern.

**Return Value**
A 32-bit integer representing the pattern color.

**See also:**
- 28.8.88 `patternColor(colorvalues() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer`
- 28.8.90 `patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer`
- 28.8.91 `patternColor(pic as picture, startX as Integer = 0, startY as Integer = 0) as Integer`

### 28.8.90 `patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer`

**Description:**
**Function:** Creates a pattern color by loading the pattern from an image file.
**Notes:**

...
A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

<table>
<thead>
<tr>

</table>

**28.8.93 Polygon2Shape(slide as Integer) as Integer**

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the shape id that represents a polygon in an alternative orientation. **Notes:**

Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>side</td>
<td>(Mandatory) The number of sides the polygon has.</td>
<td></td>
</tr>
</tbody>
</table>
Return Value
An integer shape id representing the polygon in an alternative orientation.

28.8.94 PolygonShape(slide as Integer) as Integer

**Function:** Gets the shape id that represents a polygon.
**Notes:**
Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>side</td>
<td>(Mandatory)</td>
<td>The number of sides the polygon has.</td>
</tr>
</tbody>
</table>

Return Value
An integer shape id representing the polygon.

28.8.95 PolynomialRegression(n as Integer) as Integer

**Function:** Sets the degree of the polynomial regression to be used in a trend layer.
**Notes:**
This method is used to specify the polynomial regression type in CDTrendLayerMBS.setRegressionType.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>(Mandatory)</td>
<td>The degree of the polynomial.</td>
</tr>
</tbody>
</table>

Return Value
An integer representing a polynomial regression of degree n to be used as an argument to CDTrendLayerMBS.setRegressionType.

28.8.96 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer

**Function:** Creates a multi-point radial gradient color.
Notes:
In this method, the color points are defined as an array of radial distances and colors, in the following format:

distance0, color0, distance1, color1, ..., distanceN, colorN
The distances are specified as a number from 0 - 256 (0 - 100 in hex), in which 0 represents the center of the gradient defining ellipse, and 256 (100 in hex) represents the perimeter of the gradient defining ellipse.

For example, the array (in hex):

000000, FF0000, 000080, FFFF00, 000100, 00FF00
means the center (000000) is red (FF0000), the mid-point (000080 in hex) is yellow (FFFF00), and the perimeter (000100 in hex) is green (00FF00).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cx</td>
<td>(Mandatory)</td>
<td>The x coordinate of the center of the radial gradient.</td>
</tr>
<tr>
<td>cy</td>
<td>(Mandatory)</td>
<td>The y coordinate of the center of the radial gradient.</td>
</tr>
<tr>
<td>rx</td>
<td>(Mandatory)</td>
<td>The horizontal radius of the radial gradient defining ellipse.</td>
</tr>
<tr>
<td>ry</td>
<td>(Mandatory)</td>
<td>The vertical radius of the radial gradient defining ellipse.</td>
</tr>
<tr>
<td>colorArray</td>
<td>(Mandatory)</td>
<td>An array defining the radial distances and colors.</td>
</tr>
<tr>
<td>periodic</td>
<td>false</td>
<td>Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie outside the gradient defining ellipse will assume the color at the perimeter of the gradient defining ellipse.</td>
</tr>
</tbody>
</table>

Return Value
A 32-bit integer representing the radial gradient color.

See also:
- 28.8.97 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer

28.8.98 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer

28.8.97 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other radialGradientColor method, but uses color instead of integer data type for passing color values.

See also:
28.8.98 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer

**Function:** Creates a two-point radial gradient color.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cx</td>
<td>(Mandatory)</td>
<td>The x coordinate of the center of the radial gradient.</td>
</tr>
<tr>
<td>cy</td>
<td>(Mandatory)</td>
<td>The y coordinate of the center of the radial gradient.</td>

</tr>
<tr>
<td>ry</td>
<td>(Mandatory)</td>
<td>The vertical radius of the radial gradient defining ellipse.</td>
</tr>
<tr>
<td>startColor</td>
<td>(Mandatory)</td>
<td>The color at the center of the gradient defining ellipse.</td>
</tr>
<tr>
<td>endColor</td>
<td>(Mandatory)</td>
<td>The color at the perimeter of the gradient defining ellipse.</td>
</tr>
<tr>
<td>periodic</td>
<td>false</td>
<td>Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie outside the gradient defining ellipse will assume the color at the perimeter of the gradient defining ellipse.</td>
</tr>
</tbody>
</table>

**Return Value**
A 32-bit integer representing the radial gradient color.

See also:

- 28.8.96 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer 4514
- 28.8.97 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 4515

28.8.99 redMetalGradient as Integer()

**Function:** A constant array of integers to represent a gradient that looks like a red metallic color.

**Notes:**

The array is in a format that can be directly used in BaseChart.gradientColor and DrawArea.gradientColor. Its contents (in hex) is:
See Color Specification on how colors are represented in ChartDirector.

### 28.8.100 RegularSpacingFilter(labelStep as Integer = 1, initialMargin as Integer = 0) as Integer

**MBS ChartDirector Plugin, Plugin Version:** 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Creates a data filter that matches 1 out of every N elements.  
**Notes:**  
This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific elements for formatting as axis labels.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>labelStep</td>
<td>1</td>
<td>Picks 1 out of every &quot;labelStep&quot; number of elements. For example, if this argument is 3, only 1 of every 3 elements will be selected.</td>
</tr>
<tr>
<td>initialMargin</td>
<td>0</td>
<td>Adds an offset when determining the elements to be selected. For example, if the labelStep is 3, the selected indexes should be 0, 3, 6, 9, ... If initialMargin is set to 1, the indexes becomes 1, 4, 7, 10, ...</td>
</tr>
</tbody>
</table>

**Return Value**  
An integer filter id representing the filter.

### 28.8.101 removeDynamicLayer

**MBS ChartDirector Plugin, Plugin Version:** 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Removes the dynamic layer if any.

### 28.8.102 RGB(r as Integer, g as Integer, b as Integer, a as Integer = 0) as Integer

**MBS ChartDirector Plugin, Plugin Version:** 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Creates a RGB color.
28.8.103 SelectItemFilter(item as Integer) as Integer

Function: Creates a data filter that matches the specified item.
Notes:
This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select a specific element for special formatting.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>(Mandatory)</td>
<td>The index of the specified item.</td>
</tr>
</tbody>
</table>

Return Value
An integer filter id representing the filter.

28.8.104 setAMPM(am as string, pm as string)

Function: Sets the names to be used to denote morning and afternoon.
Notes:
The default is to use "am" and "pm".

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>am</td>
<td>(Mandatory)</td>
<td>The name used to denote morning.</td>
</tr>
<tr>
<td>pm</td>
<td>(Mandatory)</td>
<td>The name used to denote afternoon.</td>
</tr>
</tbody>
</table>

28.8.105 setAntiAlias(shapeAntiAlias as Boolean, textAntiAlias as Integer)

Function: Controls whether anti-alias is used when drawing lines, shapes and text.
Notes:
For anti-aliasing text, ChartDirector supports the following modes.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>

Currently, ChartDirector will anti-alias only large or bold fonts. For small fonts, assuming it is of high quality, anti-alias is unnecessary. It is because high quality fonts are normally designed to be sharp and clear at low resolution. Anti-aliasing will blur the fonts and make them look worse.
28.8. CLASS CDBASECHARTMBS

NoAntiAlias 0 Disable anti-alias when drawing text
AntiAlias 1 Always use anti-alias when drawing text
AutoAntiAlias 2 Automatically determine if anti-alias should be used for the text. This is the default.

However, for complicated fonts (e.g. some fonts with oriental characters), or for lower quality fonts (e.g. some freeware fonts), anti-alias may be necessary. In this case, it may be needed to force anti-aliasing of all fonts using AntiAlias mode.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shapeAntiAlias</td>
<td>true</td>
<td>A true value enables anti-alias when drawing lines and shapes. A false value</td>
</tr>
<tr>
<td></td>
<td></td>
<td>disables anti-alias when drawing lines and shapes</td>
</tr>
<tr>
<td>textAntiAlias</td>
<td>AutoAntiAlias</td>
<td>The text anti-alias mode, which must be one of AutoAntiAlias, AntiAlias or</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NoAntiAlias.</td>
</tr>
</tbody>
</table>

28.8.106 setBackground(colorvalue as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setBackground method, but uses color instead of integer data type for passing color values.

See also:

- 28.8.107 setBackground(colorvalue as Integer, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

28.8.107 setBackground(colorvalue as Integer, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

**Function:** Sets the background color, border color and 3D border effect of the chart.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The background color of the chart.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>Transparent</td>
<td>The border color of the chart.</td>
</tr>
<tr>
<td>raisedEffect</td>
<td>0</td>
<td>The 3D border width. For positive values, the border will appear raised. For</td>
</tr>
<tr>
<td></td>
<td></td>
<td>negative values, the border will appear depressed. A zero value means the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>border will appear flat.</td>
</tr>
</tbody>
</table>

See also:
28.8.106 setBackground(colorvalue as color, edgeColor as color, raisedEffect as Integer = 0)

28.8.108 setBgImage(img as string, align as Integer = 5)

**Function:** Uses the image from the specified file as the background image of the chart.
**Notes:**
ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>img</td>
<td>(Mandatory)</td>
<td>The image file that is used as the background image of the chart.</td>

<tr>
<td>align</td>
<td>Center</td>
<td>The alignment of the background image relative to the chart. See Alignment</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Specification for supported alignment types.</td>
</tr>
</tbody>
</table>

28.8.109 setBorder(colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setBorder method, but uses color instead of integer data type for passing color values.
See also:

- 28.8.110 setBorder(colorvalue as Integer)

28.8.110 setBorder(colorvalue as Integer)

**Function:** Deprecated. Use SetBackground instead.
See also:

- 28.8.109 setBorder(colorvalue as color)

28.8.111 setColor(paletteEntry as Integer, colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setColor method, but uses color instead of integer data type for passing color values.
See also:
28.8. **CLASS CDBASECHARTMBS**

- 28.8.112 `setColor(paletteEntry as Integer, colorvalue as Integer)`

### 28.8.112 setColor(paletteEntry as Integer, colorvalue as Integer)

**Function:** Change the color at the specified position in the palette.

**Notes:**
See Color Specification on how colors are represented in ChartDirector.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

28.8.117 setDefaultColors(paletteEntry as Integer = 0)

**Function:** Sets the default colors.
28.8.118  

**setDefaultFonts(normal as string, bold as string, italic as string, boldItalic as string)**

**Function:** Sets the defaults for normal, bold, italic and bold-italic fonts.

**Notes:**

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default (Mandatory)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>The default normal font. This is the same as the first font in the font table.</td>
<td></td>
</tr>
<tr>
<td>bold</td>
<td>&quot;&quot;</td>
<td>The default bold font. This is the same as the second font in the font table. An empty string means the default is unchanged.</td>
</tr>
<tr>
<td>italic</td>
<td>&quot;&quot;</td>
<td>The default italic font. This is the same as the third font in the font table. An empty string means the default is unchanged.</td>
</tr>
<tr>
<td>boldItalic</td>
<td>&quot;&quot;</td>
<td>The default bold-italic font. This is the same as the fourth font in the font table. An empty string means the default is unchanged.</td>
</tr>
</tbody>
</table>

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

28.8.119  

**setDropShadow(ColorValue as color, OffsetX as Integer = 5, OffsetY as Integer = & h7fffffff, blurRadius as Integer = 5)**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setDropShadow method, but uses color instead of integer data type for passing color values.

See also:

- 28.8.120 setDropShadow(ColorValue as Integer = & hAAAAAA, OffsetX as Integer = 5, OffsetY as Integer = & h7fffffff, blurRadius as Integer = 5)

28.8.120  

**setDropShadow(ColorValue as Integer = & hAAAAAA, OffsetX as Integer = 5, OffsetY as Integer = & h7fffffff, blurRadius as Integer = 5)**

**Function:** Adds a drop shadow to the chart.

**Notes:**

The drop shadow effect is created using a single color representation of the non-transparent part of the chart, offsetted by an amount, and put under the chart. The drop shadow can be blurred to create a soft drop
shadow effect.

Note that adding a drop shadow will increase the width and height of the chart image so as to accommodate the drop shadow.

Because the drop shadow is located exterior to the original chart, it uses an exterior background color different from the background color of the original chart. The exterior background color is by default white, and can be configured with CDBaseChartMBS.setRoundedFrame.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>AAAAAA</td>
<td>The color of the drop shadow.</td>
</tr>
<tr>
<td>offsetX</td>
<td>5</td>
<td>The x offset of the drop shadow.</td>
</tr>
<tr>
<td>offsetY</td>
<td>7fffffff</td>
<td>The y offset of the drop shadow. 7fffffff means it is the same as the x offset.</td>
</tr>
<tr>
<td>blurRadius</td>
<td>5</td>
<td>The blur radius of the drop shadow.</td>
</tr>
</tbody>
</table>

See also:

- 28.8.119 setDropShadow(ColorValue as color, OffsetX as Integer = 5, OffsetY as Integer = 7fffffff, blurRadius as Integer = 5)

28.8.121 SetFontSearchPath(path as folderitem)

Example:

```pascal
dim FontFolder as folderitem = SpecialFolder.Desktop.Child("fonts")
CDBaseChartMBS.SetFontSearchPath FontFolder
```

Notes:

This method can be used to configure the font search path. You may set your own font search path, or add additional search path before or after the default search path. The usage us like:

```pascal
CDBaseChartMBS.setFontSearchPath("myPath1;myPath2;% PATH% ;myPath3;myPath4");
```

In the above % PATH% (case sensitive) represents the default search path. This method must be called before the ChartDirector font system is used. It is suggested it be called before any ChartDirector methods. Once ChartDirector tries to look for the fonts (eg. to get font metrics so as to layout a chart), the search
path cannot be changed without restarting the process.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

See also:

- 28.8.122 SetFontSearchPath(path as string)

28.8.122 SetFontSearchPath(path as string)

Function: Sets the font search path.

Example:

```pascal
if TargetLinux then
  CDBaseChartMBS.SetFontSearchPath "'/usr/share/fonts/truetype"
else
  // on Mac and Windows we use system fonts.
end if
```

Notes:

This method can be used to configure the font search path. You may set your own font search path, or add additional search path before or after the default search path. The usage us like:

```pascal
CDBaseChartMBS.setFontSearchPath("myPath1;myPath2;% PATH% ;myPath3;myPath4");
```

In the above % PATH% (case sensitive) represents the default search path. This method must be called before the ChartDirector font system is used. It is suggested it be called before any ChartDirector methods. Once ChartDirector tries to look for the fonts (eg. to get font metrics so as to layout a chart), the search path cannot be changed without restarting the process.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

See also:

- 28.8.121 SetFontSearchPath(path as folderitem)

28.8.123 setFontTable(index as Integer, font as string)

Function: Sets an entry in the font table to the specified font name.

Notes:
The first 4 fonts in the font table have special significance. They are the defaults for normal, bold, italic and bold-italic fonts.

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>(Mandatory)</td>
<td>An index to the font table, starting from 0.</td>
</tr>
<tr>
<td>font</td>
<td>(Mandatory)</td>
<td>The font name to be put into the font table.</td>
</tr>
</tbody>
</table>

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

28.8.124 **setLicenseCode(n as string, enddate as Integer, v1 as Integer, v2 as Integer)**

**Function:** Registers the chartdirector plugin and library.

28.8.125 **setMonthNames(names() as string)**

**Function:** Sets the names of the months for date/time formatting purposes.
**Notes:**
The default is to use the first 3 characters of the English month names (Jan, Feb, Mar ...).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>names</td>
<td>(Mandatory)</td>
<td>An array of 12 text strings to be used as the month names.</td>
</tr>
</tbody>
</table>

28.8.126 **setNumberFormat(thousandSeparator as string = ”", textasciitilde ”, decimalPointChar as string = ".", signChar as string = "-")**

**Function:** Sets the characters used for thousand separator, decimal point, and negative sign.
**Notes:**
28.8. **CLASS CDBASECHARTMBS**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>thousandSeparator</td>
<td>'textasciitilde'</td>
<td>The thousand separator. Use 'textasciitilde' to mean no thousand separator.</td>
</tr>
<tr>
<td>textasciitilde</td>
<td></td>
<td></td>
</tr>
<tr>
<td>decimalPointChar</td>
<td>'.'</td>
<td>The decimal point character.</td>
</tr>
<tr>
<td>signChar</td>
<td>'-'</td>
<td>The negative sign character.</td>
</tr>
</tbody>
</table>

### 28.8.127 setOutputOptions(options as string)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Sets output format options for the next chart output. Currently, only SVG, SVGZ and PDF output formats support output options.

**Notes:**

An output option can be a flag (such as "compress") or an attribute-value pair (such as "width=800"). Multiple output options can be joined using semicolons as delimiters.

#### SVG Options

<table>
<thead>
<tr>
<th>SVG Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>compress</td>
<td>Flag</td>
<td>Compressed the SVG, that is, output SVGZ.</td>
</tr>
<tr>
<td>bitmap</td>
<td>Flag</td>
<td>Render the chart as a bitmap and output the bitmap as SVG.</td>
</tr>
<tr>
<td>noxmldecl</td>
<td>Flag</td>
<td>Do not include the xml declaration line &quot;&lt;xml version=&quot;1.0&quot; .... &gt;&quot; in the SVG.</td>
</tr>
<tr>
<td>nodoctype</td>
<td>Flag</td>
<td>Do not include the document type declaration line &quot;&lt;!DOCTYPE svg PUBLIC .... &gt;&quot; in the SVG.</td>
</tr>
<tr>
<td>width</td>
<td>Flag / Attribute</td>
<td>Specifies the width attribute of the SVG. By default, ChartDirector will not include the width or height attribute in the SVG output. In this case, the SVG is variable in size and would assume the size of its container. For example, if the SVG is inside a &lt;DIV&gt; block in a web page, it will assume the size of the DIV block. If the &quot;width&quot; option is used as a flag, ChartDirector will include the width attribute in the SVG and set it to the chart width. If the &quot;width&quot; option is used as an attribute (such as &quot;width=800&quot;), ChartDirector will include the width attribute in the SVG and set it to the specified value. The specified value should be some text that is valid as SVG width. Examples are &quot;100&quot; and &quot;75%&quot;.</td>
</tr>
<tr>
<td>height</td>
<td>Flag / Attribute</td>
<td>Specifies the height attribute of the SVG. See the description on &quot;width&quot; above on how to use it.</td>
</tr>
</tbody>
</table>

#### PDF Options

### 28.8.128 setRoundedFrame(extColor as color, r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setRoundedFrame method, but uses color instead of integer data type for
PDF Option | Type     | Description                                   
-----------|----------|-----------------------------------------------
bitmap     | Flag     | Render the chart as a bitmap and output the bitmap as PDF. 
width      | Attribute| The width of the chart in the PDF in pixel unit. By default, ChartDirector will use the pixel width of the chart as the width of the chart in PDF. The "width" attribute can be used to specify an alternative value. The value must be a number. 
height     | Attribute| The width of the chart in the PDF in pixel unit. See the description on "width" above for how to use it. 
pagewidth  | Attribute| The page width in pixel unit. By default, ChartDirector will set the page width to the same width as the chart. The "pagewidth" attribute can be used to specify an alternative value. The value must be a number. 
pageheight | Attribute| The page height in pixel unit. By default, ChartDirector will set the page height to the same height as the chart. The "pageheight" attribute can be used to specify an alternative value. The value must be a number. 
leftx      | Attribute| The x coordinate of the left side of the chart within the page in pixel unit. By default, ChartDirector will center the chart in the page. The "leftx" attribute can be used to specify an alternative horizontal position. The coordinate must be a number. 
topy       | Attribute| The y coordinate of the top side of the chart within the page in pixel unit. By default, ChartDirector will center the chart in the page. The "topy" attribute can be used to specify an alternative vertical position. The coordinate must be a number. 
dpi        | Attribute| Specify the factor for conversion from pixel to physical unit. The PDF viewer will convert the pixel unit into physical unit (eg. inches) so that it can be layout on paper or other physical media. The default conversion factor for the chart is 96 pixels per inch. The "dpi" attribute can be used to specify an alternative value. The value must be a number. 

Argument | Default | Description
-----------|---------|-----------------------------------------------
options    | (Mandatory) | A list of options delimited by semicolons.

passing color values.  
See also:

- 28.8.129 setRoundedFrame(extColor as Integer = & hFFFFFFF, r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1)

28.8.129 setRoundedFrame(extColor as Integer = & hFFFFFFF, r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1)

**Function:** Sets the border style of the chart to rounded corners.  
**Notes:**  
The underlying drawing surface for a chart is always rectangular. When rounded corners are used, part
of the drawing surface (the regions external to the rounded corners) will be outside the chart border. The extColor argument specifies the color to be used for the external regions. Typically, it is set to the same color as the background the container that will be hosting the chart.

For example, in a web page, the extColor may be set to the same color as the web page background.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extColor</td>
<td>FFFFFF</td>
<td>The exterior background color.</td>
</tr>
<tr>
<td>r1</td>
<td>10</td>
<td>The radius of the top-left rounded corner in pixels.</td>
</tr>
<tr>
<td>r2</td>
<td>-1</td>
<td>The radius of the top-right rounded corner in pixels. The default value of -1 means it is the same as the radius of the top-left corner.</td>
</tr>
<tr>
<td>r3</td>
<td>-1</td>
<td>The radius of the bottom-right rounded corner in pixels. The default value of -1 means it is the same as the radius of the top-left corner.</td>
</tr>
<tr>
<td>r4</td>
<td>-1</td>
<td>The radius of the bottom-left rounded corner in pixels. The default value of -1 means it is the same as the radius of the top-left corner.</td>
</tr>
</tbody>
</table>

See also:

- 28.8.128 setRoundedFrame(extColor as color, r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1)

28.8.130 setSearchPath(path as string)

**Function:** Sets the file system search path for loading image files.

**Notes:**

The plugin uses folderItems for most file operations, so this method is not needed for most operations.

Several ChartDirector operations involve loading image files. Examples are wallpapers (BaseChart.setWallpaper), background images (BaseChart.setBgImage and PlotArea.setBackgroundColor), user-defined symbols (DataSet.setDataSymbol2) or for embedding images in text using ChartDirector Mark Up Language.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>(Mandatory)</td>
<td>A list of directories, separated with the path separator of your operating system (&quot;;&quot; for Windows, &quot;:&quot; for Linux/UNIX).</td>
</tr>
</tbody>
</table>

28.8.131 setSize(width as Integer, height as Integer)

**Function:** Sets the size of the chart.
### 28.8.132 setThickFrame(thickness as Integer, frameColor as Integer = -1, outerEdgeColor as Integer = -1, innerEdgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Sets a thick frame around the chart.

**Notes:**

The thick frame can have 3 colors for the frame itself, the outer edge and the inner edge.

In some applications, the frame color may be similar to the external background color. An common example is a "silver" frame (which is actually a light grey gradient) against a white background. In this case, the frame effect may look less than optimal. An outer edge of different color (such as darker grey) can often help to highlight the frame. Similarly, if the frame color is similar to the chart background, an inner edge of different color may help to improve the frame effect.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>thickness</td>
<td>(Mandatory)</td>
<td>The frame thickness.</td>
</tr>
<tr>
<td>frameColor</td>
<td>-1</td>
<td>The frame color. The default value of -1 means the frame color is the same as the outer edge color.</td>
</tr>
<tr>
<td>outerEdgeColor</td>
<td>-1</td>
<td>The outer edge color. The default value of -1 means the outer edge color is the same as the current edge color, which can be set in the chart constructor or in BaseChart.setBackground.</td>
</tr>
<tr>
<td>innerEdgeColor</td>
<td>-1</td>
<td>The inner edge color. The default value of -1 means the inner edge color is the same as the frame color.</td>
</tr>
</tbody>
</table>

### 28.8.133 setTransparentColor(c as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setTransparentColor method, but uses color instead of integer data type for passing color values.

**See also:**

- 28.8.134 setTransparentColor(c as Integer)
28.8.134  setTransparentColor(c as Integer)

**Function:** Specifies a certain color to mean transparent when creating the image output, or to include alpha transparency channel in the output.

**Notes:**

Alpha transparency: In addition to red, green and blue levels, there is a transparency level associated with each pixel, which can range from completely transparent to completely opaque. The data associated with the transparency information is called the alpha channel.

Single color transparency: The image itself has no alpha channel, but a certain color is used to mean completely transparent. For internal drawing, ChartDirector always use alpha transparency. However, when outputting the image as an image file, ChartDirector by default will remove the alpha channel to reduce image size. It is because many image displaying software do not support alpha transparency. For example, the IE browser only supports single color transparency but not alpha transparency.

If you want to use single color transparency in the output, you may specify the transparent color as the argument to the setTransparentColor method. Note that only GIF and PNG can support single color transparency. JPEG, BMP and WBMP cannot support transparency at all.

If you do want to keep the alpha channel in final output, you may pass -1 as the argument to setTransparentColor. Note that the only image format that can support alpha transparency is PNG.

One important thing to note is that the IE browser (and possibly many image displaying software) only supports single color transparency for palette based images with up to 256 colors, but not for true color images. For this reason, if single color transparency is used, ChartDirector will automatically reduce the image to 256 colors if it has more than 256 colors. This may result in lost of image quality, especially if the image contains gradient colors.

Therefore, due to the limitations of the current generations of image displaying software, for highest image quality, sometimes it may be beneficial to not using transparency in image output, but to set the image background color to the same color as the container background.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>(Mandatory)</td>
<td>The color that is designated as the transparent color. If -1 is used, the full alpha transparency channel will be included in the final output.</td>
</tr>
</tbody>
</table>

See also:

- 28.8.133 setTransparentColor(c as color)
28.8.135  setTransparentColors(paletteEntry as Integer = 0)

**Function:** Sets the color palette to transparent colors.

28.8.136  setWallpaper(img as folderitem)

**Function:** Uses the image from the specified file as the wallpaper to repetitively fill the background of the chart.
**Notes:**
ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>img</td>
<td>(Mandatory)</td>
<td>The image file that is used as the background wallpaper of the chart.</td>
</tr>
</tbody>
</table>

28.8.137  setWeekDayNames(names() as string)

**Function:** Sets the names of the week days for date/time formatting purposes.
**Notes:**
The default is to use the first 3 characters of the English week day names (Sun, Mon, Tue, ...).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>names</td>
<td>(Mandatory)</td>
<td>An array of 7 text strings to be used as the week day names.</td>
</tr>
</tbody>
</table>

28.8.138  setWhiteOnBlackColors(paletteEntry as Integer = 0)

**Function:** Sets the color palette to white on black colors.
28.8.139  silverColor(angle as Integer = 90) as Integer

Function: Creates a silver color, most commonly used as a background color.
Notes: This method is a short cut to the CDBaseChartMBS.metalColor method, using grey (CCCCCC in hex) as the base color.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>angle</td>
<td>90</td>
<td>The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.</td>
</tr>
</tbody>
</table>

Return Value
A 32-bit integer representing the silver color.

28.8.140  silverGradient as Integer()

Function: A constant array of integers to represent a gradient that looks like a silver color.
Notes: The array is in a format that can be directly used in BaseChart.gradientColor2 and DrawArea.gradientColor2. Its contents (in hex) is:

00 C8C8C8 60 F8F8F8 B0 E0E0E0 100 C8C8C8

See Color Specification on how colors are represented in ChartDirector.

28.8.141  softLighting(direction as Integer = 8, raisedEffect as Integer = 4) as Integer

Function: A special shading effect that looks like gradient coloring.
Notes: This effect is best explained by viewing the examples.

ExampleLocation of lighting effect

The softLighting method returns an integer representing this effect. The integer can be used as the third argument to Box.setBackground to apply the effect it objects derived from Box (such as labels and titles.
Soft Multi-Bar Chart: The bars are shaded using soft lighting effect, with light direction from Top, and raised effect of 4 pixels.

Soft Bar Shading: The bars are shaded using soft lighting effect, with light direction from Left, and raised effect of 4 pixels.

Spline Line Chart: The title is shaded using soft lighting effect, with light direction from Right, and raised effect of 4 pixels.

represented by TextBox). It may also be used as the second argument to Layer.setBorderColor for BarLayer objects to apply the effect to bars.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>direction</td>
<td>Top</td>
<td>The direction of the lighting, which must be one of the predefined constants Top, Bottom, Right or Left.</td>
</tr>
<tr>
<td>raisedEffect</td>
<td>4</td>
<td>With soft lighting effect, the object will appear to have some 3D depth. The raisedEffect argument controls the amount of 3D depth in pixels.</td>
</tr>
</tbody>
</table>

Return Value
An integer representing the soft lighting effect.

28.8.142 StarShape(slide as Integer) as Integer

Function: Gets the shape id that represents a star shape.
Notes:
Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>side</td>
<td>(Mandatory)</td>
<td>The number of points the polygon has.</td>
</tr>
</tbody>
</table>

Return Value
An integer shape id representing the star shape.

28.8.143 StartOfDayFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

Function: Creates a data filter that matches date/times that represent the start of a new day in a date/time
### 28.8. **CLASS CDBASECHARTMBS**

In a date/time series, an element is considered that start of a new day if it is of a different day than the previous element. It does not need to be at exactly the starting instance of the day.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new day if it is "near" the exact starting instance of the current day, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the day duration.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>labelStep</td>
<td>1</td>
<td>For dates/times that matches the start of day criteria, picks only 1 out of every &quot;labelStep&quot; number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of day will be selected.</td>
</tr>
<tr>
<td>initialMargin</td>
<td>0.05</td>
<td>If the first label is &quot;near&quot; the exact starting instance of the current day to within the ratio specified in the initial margin, it will be considered to have matched the start of day criteria.</td>
</tr>
</tbody>
</table>

**Return Value**

An integer filter id representing the filter.

#### 28.8.144 **StartOfDayFilter**(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new hour if it is "near" the exact starting instance of the current hour, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the hour duration.
CHAPTER 28. CHARTDIRECTOR

**Argument Default Description**

- **labelStep**: 1
  For dates/times that matches the start of hour criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of hour will be selected.

- **initialMargin**: 0.05
  If the first label is "near" the exact starting instance of the current hour to within the ratio specified in the initial margin, it will be considered to have matched the start of hour criteria.

**Return Value**

An integer filter id representing the filter.

---

**28.8.145 StartOfMinuteFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer**

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Creates a data filter that matches date/times that represent the start of a new minute in a date/time series.

**Notes:**

This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new minute if it is of a different minute than the previous element. It does not need to be at exactly the starting instance of the minute.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new minute if it is "near" the exact starting instance of the current minute, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the minute duration.

**Argument Default Description**

- **labelStep**: 1
  For dates/times that matches the start of minute criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of minute will be selected.

- **initialMargin**: 0.05
  If the first label is "near" the exact starting instance of the current minute to within the ratio specified in the initial margin, it will be considered to have matched the start of minute criteria.

**Returns:**

An integer filter id representing the filter.
### StartOfMonthFilter

**Function:** Creates a data filter that matches date/times that represent the start of a new month in a date/time series.

**Notes:**

This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new month if it is of a different month than the previous element. It does not need to be at exactly the starting instance of the month.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new month if it is "near" the exact starting instance of the current month, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the month duration.

</tbody>
</table>

**Return Value**

An integer filter id representing the filter.

### StartOfSecondFilter

**MBS ChartDirector Plugin**, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Creates a data filter that matches date/times that represent the start of a new second in a date/time series.

**Notes:**

This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new second if it is of a different second than the previous element. It does not need to be at exactly the starting instance of the second.
For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new second if it is "near" the exact starting instance of the current second, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the second duration.

</tbody>
</table>

Returns an integer filter id representing the filter.

28.8.148 StartOfWeekFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

**Function:** Creates a data filter that matches date/times that represent the start of a new week in a date/time series.  
**Notes:**  
This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new week if it is of a different week than the previous element. It does not need to be at exactly the starting instance of the week.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new week if it is "near" the exact starting instance of the current week, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the week duration.

Return Value
28.8. CLASS CDBASECHARTMBS

An integer filter id representing the filter.

28.8.149 StartOfYearFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

Function: Creates a data filter that matches date/times that represent the start of a new year in a date/time series.

Notes:
This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new year if it is of a different year than the previous element. It does not need to be at exactly the starting instance of the year.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new year if it is "near" the exact starting instance of the current year, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the year duration.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>labelStep</td>
<td>1</td>
<td>For dates/times that matches the start of year criteria, picks only 1 out of every &quot;labelStep&quot; number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of year will be selected.</td>
</tr>
<tr>
<td>initialMargin</td>
<td>0.05</td>
<td>If the first label is &quot;near&quot; the exact starting instance of the current year to within the ratio specified in the initial margin, it will be considered to have matched the start of year criteria.</td>
</tr>
</tbody>
</table>

Return Value
An integer filter id representing the filter.

28.8.150 testFont(font as string, fontIndex as Integer, fontHeight as Double, fontWidth as Double, angle as Double, byref buffer as string) as boolean

Function: A diagnostic function to perform a font loading test.

Example:

```vba
dim buffer as string
call CDBaseChartMBS.testFont("arial.ttf", 0, 12, 12, 0, buffer)
```
Notes:

From experience, the most common issue for font loading is unable to access server side fonts using anonymous user account for a web application, probably due to security restrictions. This diagnostic function can return the cause of problem to aid trouble-shooting.

Other uses of this function is to trace out where does ChartDirector search for the fonts, and the substitution font in case the request font is not available.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>(Mandatory)</td>
<td>The font name. See Font Specification for details on various font attributes.</td>
</tr>
<tr>
<td>fontIndex</td>
<td>(Mandatory)</td>
<td>The font index if the font name refers to a font collection. An index of 0 means the first font.</td>
</tr>
<tr>
<td>fontHeight</td>
<td>(Mandatory)</td>
<td>The font height in points. This parameter will not affect font loading if the exact font exists, but will affect which substitution font to use if the font does not exist.</td>
</tr>
<tr>
<td>fontWidth</td>
<td>(Mandatory)</td>
<td>The font width in points. This parameter will not affect font loading if the exact font exists, but will affect which substitution font to use if the font does not exist.</td>
</tr>
<tr>
<td>angle</td>
<td>(Mandatory)</td>
<td>The rotation angle of the text. The angle is measured in degrees in clockwise direction. This parameter will not affect font loading if the exact font exists, but will affect which substitution font to use if the font does not exist.</td>
</tr>
<tr>
<td>buffer</td>
<td>(Mandatory)</td>
<td>A string to hold the result of the font loading test.</td>
</tr>
</tbody>
</table>

See font specification here:

28.8.151 transparentPalette as Integer()

MBS ChartDirector Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Returns the default transparent palette.

28.8.152 whiteOnBlackPalette as Integer()

MBS ChartDirector Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Returns the default white on black palette.
28.8. CLASS CDBASECHARTMBS

28.8.153 Properties

28.8.154 ScaleFactor as Double

**Function:** Scale factor for charts.

**Notes:**
When the plugin internally passes a pixel number to ChartDirector library, we multiply by this factor. When numbers come back we divide by factor.
Default is 1.
(Read and Write property)

28.8.155 Constants

28.8.156 kAggregateAvg = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent using the average as the aggregated value in CDArrayMBS.aggregate.

28.8.157 kAggregateCount = 9

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 9 to represent using the item count as the aggregated value in CDArrayMBS.aggregate.

28.8.158 kAggregateFirst = 7

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 7 to represent using the first value as the aggregated value in CDArrayMBS.aggregate.

28.8.159 kAggregateLast = 8

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 8 to represent using the last value as the aggregated value in CDArrayMBS.aggregate.
28.8.160  kAggregateMax = 5

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 5 to represent using the maximum value as the aggregated value in CDArrayMBS.aggregate.

28.8.161  kAggregateMed = 4

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 4 to represent using the median value as the aggregated value in CDArrayMBS.aggregate.

28.8.162  kAggregateMin = 3

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 3 to represent using the minimum value as the aggregated value in CDArrayMBS.aggregate.

28.8.163  kAggregatePercentile = 6

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 6 to represent using the percentile value as the aggregated value in CDArrayMBS.aggregate.

28.8.164  kAggregateStdDev = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent using the standard deviation as the aggregated value in CDArrayMBS.aggregate.

28.8.165  kAggregateSum = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 0 to represent using the sum as the aggregated value in CDArrayMBS.aggregate.

28.8.166  kAltDashLine = \& h0A050505

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 0A050505 (in hex) to represent a alternating long/short dash line pattern for use in dash colors.

**Notes:** See Color Specification on how colors are represented in ChartDirector.
28.8. **CLASS CDBASECHARTMBS**

28.8.167  **kAngularAxisScale = 1**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent that the size is measured using the angular-axis scale.
**Notes:** This constant is used in PolarLayer.setSymbolScale.

28.8.168  **kAntiAlias = 1**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent that text should be drawn with anti-alias.
**Notes:** This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.

28.8.169  **kArrowPointer = 2**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent the arrow style meter pointer.
**Notes:** This constant is used in MeterPointer.setShape.

28.8.170  **kArrowPointer2 = 3**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 3 to represent the alternative arrow style meter pointer.
**Notes:** This constant is used in MeterPointer.setShape.

28.8.171  **kAutoAntiAlias = 2**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent that text should be drawn with anti-alias if necessary based on font attributes.
**Notes:** This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.

28.8.172  **kAutoGrid = -2**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to -2 to represent that the number of columns in the legend box with grid layout is automatically determine.
**Notes:** This constant is used in BaseChart.addLegend and LegendBox.setCols.
28.8.173  **kBackgroundColor = & hFFFF0000**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to FFFF0000 (in hex) to represent the background color.  
**Notes:** See Color Specification on how colors are represented in ChartDirector.

28.8.174  **kBesselFilter = 13**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 13 to represent a Bessel graphical re-sampling filter.  
**Notes:** Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

28.8.175  **kBlackmanFilter = 12**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 12 to represent a Blackman graphical re-sampling filter.  
**Notes:** Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

28.8.176  **kBMP = 4**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 4 to represent the BMP image format.  
**Notes:** The BMP format.  
This constant is used in BaseChart.makeChart.

28.8.177  **kBOTTOM = 2**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent the bottom position.  
**Notes:** See Alignment Specification for supported alignment types.

28.8.178  **kBOTTOMCENTER = 2**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent the bottom center position.
28.8.179  \texttt{kBottomLeft} = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function}: A constant equals to 1 to represent the bottom left position.
\textbf{Notes}: See Alignment Specification for supported alignment types.

28.8.180  \texttt{kBottomLeft2} = 12

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function}: A constant equals to 12 to represent the alternative exterior bottom left position.
\textbf{Notes}: See Alignment Specification for supported alignment types.

28.8.181  \texttt{kBottomRight} = 3

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function}: A constant equals to 3 to represent the bottom right position.
\textbf{Notes}: See Alignment Specification for supported alignment types.

28.8.182  \texttt{kBottomRight2} = 13

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function}: A constant equals to 13 to represent the alternative exterior bottom right position.
\textbf{Notes}: See Alignment Specification for supported alignment types.

28.8.183  \texttt{kBoxFilter} = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function}: A constant equals to 0 to represent a Box graphical re-sampling filter.
\textbf{Notes}: Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

28.8.184  \texttt{kBSplineFilter} = 3

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function}: A constant equals to 3 to represent a B-spline graphical re-sampling filter.
Notes: Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

28.8.185 \textbf{kCatromFilter} = 5

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function:} A constant equals to 5 to represent a Catrom graphical re-sampling filter.  
\textbf{Notes:} Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

28.8.186 \textbf{kCenter} = 5

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function:} A constant equals to 5 to represent the center position.  
\textbf{Notes:} See Alignment Specification for supported alignment types.

28.8.187 \textbf{kChartBackZ} = \& h100

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function:} A constant equals to 100 (in hex) to represent the z-order of the back surface of the chart.  
\textbf{Notes:} This constant is used in Box.setZOrder, Line.setZOrder and MeterPointer.setZOrder.

28.8.188 \textbf{kChartDir\_AllPassFilterTag} = 7

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function:} One of the filter tag constants.

28.8.189 \textbf{kChartDir\_ArrowSymbol} = 18

MBS ChartDirector Plugin, Plugin Version: 15.1. \textbf{Function:} The constant for the arrow symbol.

28.8.190 \textbf{kChartDir\_CustomSymbol} = 14

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function:} One of the symbol constants.
28.8.191 kChartDir_NonePassFilterTag = 8

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the filter tag constants.

28.8.192 kChartDir_Polygon2Symbol = 12

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the symbol constants.

28.8.193 kChartDir_PolygonSymbol = 11

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the symbol constants.

28.8.194 kChartDir-RegularSpacingFilterTag = 6

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the filter tag constants.

28.8.195 kChartDir_SelectItemFilterTag = 9

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the filter tag constants.

28.8.196 kChartDir_StarSymbol = 13

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the symbol constants.

28.8.197 kChartDir_StartOfDayFilterTag = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the filter tag constants.

28.8.198 kChartDir_StartOfHourFilterTag = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the filter tag constants.
28.8.199  \text{kChartDir\_StartOfMinuteFilterTag} = 10

MBS ChartDirector Plugin, Plugin Version: 15.1. \textbf{Function:} One of the filter tag constants.

28.8.200  \text{kChartDir\_StartOfMonthFilterTag} = 4

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function:} One of the filter tag constants.

28.8.201  \text{kChartDir\_StartOfSecondFilterTag} = 11

MBS ChartDirector Plugin, Plugin Version: 15.1. \textbf{Function:} One of the filter tag constants.

28.8.202  \text{kChartDir\_StartOfWeekFilterTag} = 3

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function:} One of the filter tag constants.

28.8.203  \text{kChartDir\_StartOfYearFilterTag} = 5

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function:} One of the filter tag constants.

28.8.204  \text{kChartFrontZ} = \& hffff

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function:} A constant equals to ffff (in hex) to represent the z-order of the front surface of the chart.  
\textbf{Notes:} This constant is used in Box.setZOrder, Line.setZOrder and MeterPointer.setZOrder.

28.8.205  \text{kCircleLayout} = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function:} A constant equals to 1 to represent the circular label layout method for pie/donut charts.  
\textbf{Notes:} This constant is used in PieChart.setLabelLayout.
28.8. **CLASS CDBASECHARTMBS**

### 28.8.206 kCircleShape = 7

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 7 to represent a circle. **Notes:** Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

### 28.8.207 kCircleShapeNoShading = 10

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 10 to represent a circle with no shaping. **Notes:** Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

### 28.8.208 kCircleSymbol = 7

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the symbol constants.

### 28.8.209 kClearType = 3

MBS ChartDirector Plugin, Plugin Version: 12.3. **Function:** One of the anti alias modes.

### 28.8.210 kCompatAntiAlias = 6

MBS ChartDirector Plugin, Plugin Version: 12.3. **Function:** A constant equals to 6 to represent that text should be drawn with an automatically determined anti-alias method that behaves the same way as in ChartDirector 5.0.x or earlier versions. **Notes:** This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.

### 28.8.211 kConcaveShading = 4

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 4 to represent concave sector shading style.
28.8.212  \textit{kConstrainedLinearRegression} = 0

MBS ChartDirector Plugin, Plugin Version: 9.2. \textbf{Function}: A constant equals to 0 to represent that constrained linear regression be used to draw a trend line.

28.8.213  \textit{kCross2Symbol} = 9

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function}: One of the symbol constants.

28.8.214  \textit{kCrossSymbol} = 8

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function}: One of the symbol constants.

28.8.215  \textit{kDashLine} = \& h0505

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function}: A constant equals to 00000505 (in hex) to represent a dash line pattern for use in dash colors.
\textbf{Notes}: See Color Specification on how colors are represented in ChartDirector.

28.8.216  \textit{kDataColor} = \& hFFFFFF008

MBS ChartDirector Plugin, Plugin Version: 8.2. \textbf{Function}: A constant equals to FFFF0008 (in hex) to represent the starting index of automatic data color.
\textbf{Notes}:
The array is in a format that can be directly used in BaseChart.setColors and DrawArea.setColorTable.

See Color Specification on how colors are represented in ChartDirector.

28.8.217  \textit{kDefaultShading} = 0

MBS ChartDirector Plugin, Plugin Version: 9.2. \textbf{Function}: A constant equals to 0 to represent default sector shading style.
28.8. CLASS CDBASECHARTMBS

28.8.218  kDepth = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent the "Depth" data representation method for multiple data sets.
**Notes:** This constant is used in XYChart.addBarLayer, XYChart.addAreaLayer, and Layer.setDataCombineMethod.

28.8.219  kDiamondPointer = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 0 to represent the diamond style meter pointer.
**Notes:** This constant is used in MeterPointer.setShape.

28.8.220  kDiamondShape = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent a diamond shape.
**Notes:** Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

28.8.221  kDiamondSymbol = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the symbol constants.

28.8.222  kDirectionHorizontal = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 0 to represent that the zoom and/or scroll orientation is horizontal.
**Notes:** This constant is used in CChartViewer.setZoomDirection and CChartViewer.setScrollDirection.

28.8.223  kDirectionHorizontalVertical = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent that the zoom and/or scroll orientation can be both horizontal and vertical.
**Notes:** This constant is used in CChartViewer.setZoomDirection and CChartViewer.setScrollDirection.
28.8.224 kDirectionVertical = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent that the zoom and/or scroll orientation is vertical.
**Notes:** This constant is used in CChartViewer.setZoomDirection and CChartViewer.setScrollDirection.

28.8.225 kDotDashLine = & h05050205

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 05050205 (in hex) to represent a dot-dash line pattern for use in dash colors.
**Notes:** See Color Specification on how colors are represented in ChartDirector.

28.8.226 kDotLine = & h0202

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 00000202 (in hex) to represent a dot-line pattern for use in dash colors.
**Notes:** See Color Specification on how colors are represented in ChartDirector.

28.8.227 kEndPoints = 3

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 3 to represent that the vector lengths and directions are measured by specifying the end points.

28.8.228 kErrorDiffusion = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent that the error diffusion dithering method should be used if dithering is required.
**Notes:** This constant is used in DrawArea.setDitherMethod.

28.8.229 kExponentialRegression = -1

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to -1 to represent that exponential regression be used to draw a trend line.
**28.8. CDBASECHARTMBS**

**28.8.230  kFlatShading = 1**

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 1 to represent flat sector shading style.

**28.8.231  kForcePalette = 1**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent that palette based image format should always be used (dither the image if necessary). **Notes:** This constant is used in DrawArea.setPaletteMode.

**28.8.232  kGaussianFilter = 9**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 9 to represent a Gaussian graphical re-sampling filter. **Notes:** Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

**28.8.233  kGIF = 1**

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent the GIF image format. **Notes:** The GIF format. This constant is used in BaseChart.makeChart.

**28.8.234  kGlassSphere2Shape = 16**

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 16 to represent a bright glass sphere.

**28.8.235  kGlassSphereShape = 15**

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 15 to represent a glass sphere.
28.8.236 kGlobalGradientShading = 3

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 3 to represent global gradient sector shading style.

28.8.237 kGridLinesZ = & h2000

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2000 (in hex) to represent the z-order of the grid lines of the chart.  
**Notes:** This constant is used in Box.setZOrder, Line.setZOrder and MeterPointer.setZOrder.

28.8.238 kHammingFilter = 11

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 11 to represent a Hamming graphical re-sampling filter.  
**Notes:** Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

28.8.239 kHanningFilter = 10

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 10 to represent a Hanning graphical re-sampling filter.  
**Notes:** Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

28.8.240 kHermiteFilter = 4

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 4 to represent a Hermite graphical re-sampling filter.  
**Notes:** Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

28.8.241 kHLOCDefault = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 0 to represent that the HLOC symbols should be drawn using the same color.  
**Notes:** This constant is used in XYChart.addHLOCLayer and HLOCLayer.setColorMethod.
28.8.242  kHLOCOpenClose = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent that the HLOC symbols should be drawn using two alternative colors based on whether the closing price is higher than the opening price.

**Notes:** This constant is used in XYChart.addHLOCLayer and HLOCLayer.setColorMethod.

28.8.243  kHLOCUpDown = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent that the HLOC symbols should be drawn using two alternative colors based on whether the closing price is higher than the previous closing price.

**Notes:** This constant is used in XYChart.addHLOCLayer and HLOCLayer.setColorMethod.

28.8.244  kInvertedTriangleShape = 6

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 6 to represent a triangle pointing downwards.

**Notes:** Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

28.8.245  kInvertedTriangleSymbol = 6

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the symbol constants.

28.8.246  kJPG = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent the JPG image format.

**Notes:**
The JPEG format.
This constant is used in BaseChart.makeChart.

28.8.247  kLanczosFilter = 8

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 8 to represent a Lanczos graphical re-sampling filter.
Notes: Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

28.8.248  kLeft = 4

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 4 to represent the left position.
**Notes:** See Alignment Specification for supported alignment types.

28.8.249  kLeftTriangleShape = 5

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 5 to represent a triangle pointing leftwards.
**Notes:** Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

28.8.250  kLeftTriangleSymbol = 5

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the symbol constants.

28.8.251  kLinearFilter = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent a Linear graphical re-sampling filter.
**Notes:** Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

28.8.252  kLinearRegression = 1

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 1 to represent that linear regression be used to draw a trend line.

28.8.253  kLineColor = & hFFFF0001

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to FFFF0001 (in hex) to represent the default line color.
**Notes:** See Color Specification on how colors are represented in ChartDirector.
28.8. **CLASS CDBASECHARTMBS**

### 28.8.254  *kLinePointer = 4*

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 4 to represent the line style meter pointer.  
**Notes:** This constant is used in MeterPointer.setShape.

### 28.8.255  *kLinePointer2 = 7*

MBS ChartDirector Plugin, Plugin Version: 15.1. **Function:** A constant equals to 7 to represent the line style meter pointer.  
**Notes:** This constant is used in MeterPointer.setShape.

### 28.8.256  *kLocalGradientShading = 2*

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 2 to represent local gradient sector shading style.

### 28.8.257  *kLogarithmicRegression = -2*

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to -2 to represent that logarithmic regression be used to draw a trend line.  
**Notes:** This constant is used in CDTrendLayerMBS.setRegressionType.

### 28.8.258  *kMitchellFilter = 6*

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 6 to represent a Mitchell graphical re-sampling filter.  
**Notes:** Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

### 28.8.259  *kMonotonicAuto = 4*

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 4 to represent that the system will automatically determine whether to constrained a spline curve to not overshooting or undershooting in the x-axis direction and/or the y-axis direction.
**28.8.260**  kMonotonicNone = 0

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 0 to represent that a spline curve is not constraint to flow in any direction.

**28.8.261**  kMonotonicX = 1

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 1 to represent that a spline curve is constrained to not overshooting or undershooting in the x-axis direction.

**28.8.262**  kMonotonicXY = 3

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 3 to represent that a spline curve is constrained to not overshooting or undershooting in both the x-axis direction and the y-axis direction.

**28.8.263**  kMonotonicY = 2

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 2 to represent that a spline curve is constrained to not overshooting or undershooting in the y-axis direction.

**28.8.264**  kNoAntiAlias = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 0 to represent that text should be drawn without using anti-alias.  
**Notes:** This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.

**28.8.265**  kNoGlare = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent disabling the glare in CDBaseChartMBS.glassEffect shading style.

**28.8.266**  kNoLegend = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent that no legend keys should be added to the legend box.
28.8.  CLASS CDBASECHARTMBS

Notes: This constant is used in Layer.setLegendOrder.

28.8.267  kNoPalette = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent that true color image format should always be used.
**Notes:** This constant is used in DrawArea.setPaletteMode.

28.8.268  kNormalGlare = 3

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 3 to represent using normal glare strength in CDBaseChartMBS.glassEffect shading style.

28.8.269  kNormalLegend = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 0 to represent that the legend keys order should follow the creation order of the data sets.
**Notes:** This constant is used in Layer.setLegendOrder.

28.8.270  kNoShape = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** The constant to specify that no shape is used.

28.8.271  kNoSymbol = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the symbol constants.

28.8.272  kOrderedDither = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent that the ordered dithering method should be used if dithering is required.
**Notes:** This constant is used in DrawArea.setDitherMethod.
28.8.273  kOverlay = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 0 to represent the "Overlay" data representation method for multiple data sets.
**Notes:** This constant is used in XYChart.addBarLayer, XYChart.addAreaLayer, and Layer.setDataCombineMethod.

28.8.274  kPalette = & hFFFF0000

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to FFFF0000 (in hex) to represent the starting index of the color palette.
**Notes:** See Color Specification on how colors are represented in ChartDirector.

28.8.275  kPDF = 7

MBS ChartDirector Plugin, Plugin Version: 15.1. **Function:** A constant equals to 7 to represent the AGF image format.
**Notes:** The PDF format.

28.8.276  kPencilPointer = 5

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 5 to represent the pencil style meter pointer.
**Notes:** This constant is used in MeterPointer.setShape.

28.8.277  kPercentage = 4

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 4 to represent the "Percentage" data representation method for multiple data sets.
**Notes:** This constant is used in XYChart.addBarLayer, XYChart.addAreaLayer and Layer.setDataCombineMethod.

28.8.278  kPixelScale = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 0 to represent that the size is measured in pixels.
Notes: This constant is used in LineLayer.setSymbolScale, PolarLayer.setSymbolScale, XYChart.addVectorLayer, PolarChart.addVectorLayer, VectorLayer.setVector and PolarVectorLayer.setVector.

28.8.279 kPlotAreaZ = & h1000

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1000 (in hex) to represent the z-order of the plot area back surface of the chart.
**Notes:** This constant is used in Box.setZOrder, Line.setZOrder and MeterPointer.setZOrder.

28.8.280 kPNG = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 0 to represent the PNG image format.
**Notes:**
The PNG format.
This constant is used in BaseChart.makeChart.

28.8.281 kQTIMG = 9

MBS ChartDirector Plugin, Plugin Version: 15.1. **Function:** A constant equals to 9 to represent the AGF image format.
**Notes:** The QT Image format.

28.8.282 kQuadraticFilter = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent a Quadratic graphical re-sampling filter.
**Notes:** Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

28.8.283 kQuantize = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 0 to represent that the quantize dithering method should be used if dithering is required.
**Notes:** This constant is used in DrawArea.setDitherMethod.
28.8.284 \( \text{kRadialAxisScale} = 2 \)

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent that the size is measured using the radial-axis scale. **Notes:** This constant is used in PolarLayer.setSymbolScale, PolarChart.addVectorLayer and PolarVectorLayer.setVector.

28.8.285 \( \text{kRadialShading} = 7 \)

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 7 to represent radial sector shading style.

28.8.286 \( \text{kRectangularFrame} = 4 \)

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 4 to represent rectangular frame only surface shading style.

28.8.287 \( \text{kRectangularShading} = 2 \)

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 2 to represent rectangular surface shading style.

28.8.288 \( \text{kReducedGlare} = 2 \)

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent using reduced glare strength in CDBaseChartMBS.glassEffect shading style.

28.8.289 \( \text{kReverseLegend} = 1 \)

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent that the legend keys order is the reverse of the creation order of the data sets. **Notes:** This constant is used in Layer.setLegendOrder.
28.8. CLASS CDBASECHARTMBS

28.8.290  kRight = 6

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 6 to represent the right position.  
**Notes:** See Alignment Specification for supported alignment types.

28.8.291  kRightTriangleShape = 4

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 4 to represent a triangle pointing rightwards.  
**Notes:** Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

28.8.292  kRightTriangleSymbol = 4

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the symbol constants.

28.8.293  kRingShading = 8

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 8 to represent ring sector shading style.

28.8.294  kRoundedEdgeNoGlareShading = 5

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** One constant for shadings.

28.8.295  kRoundedEdgeShading = 6

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 6 to represent rounded edge sector shading style.

28.8.296  kSameAsMainColor = & hFFFF0007

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to FFF0007 (in hex) to represent the current main color.
Notes: See Color Specification on how colors are represented in ChartDirector.

28.8.297 kSide = 3

MBS ChartDirector Plugin, Plugin Version: 8.2. Function: A constant equals to 3 to represent the "Side" data representation method for multiple data sets.
Notes: This constant is used in XYChart.addBarLayer, XYChart.addAreaLayer and Layer.setDataCombineMethod.

28.8.298 kSideLayout = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. Function: A constant equals to 0 to represent the side label layout method for pie/donut charts.
Notes: This constant is used in PieChart.setLabelLayout.

28.8.299 kSincFilter = 7

MBS ChartDirector Plugin, Plugin Version: 8.2. Function: A constant equals to 7 to represent a Sinc graphical re-sampling filter.
Notes: Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

28.8.300 kSmoothShading = 0

MBS ChartDirector Plugin, Plugin Version: 9.2. Function: A constant equals to 0 to represent smooth surface shading style.

28.8.301 kSolidSphereShape = 17

MBS ChartDirector Plugin, Plugin Version: 9.2. Function: A constant equals to 17 to represent a solid sphere.

28.8.302 kSquareShape = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. Function: A constant equals to 1 to represent a square.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDi-
28.8. **CLASS CDBASECHARTMBS**

rector.

### 28.8.303 kSquareSymbol = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the symbol constants.

### 28.8.304 kStack = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent the "Stack" data representation method for multiple data sets. **Notes:** This constant is used in XYChart.addBarLayer, XYChart.addAreaLayer and Layer.setDataCombineMethod.

### 28.8.305 kSVG = 5

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 5 to represent the SVG image format. **Notes:** The SVG format.

### 28.8.306 kSVGZ = 6

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 5 to represent the compressed SVG image format. **Notes:** The compressed SVG format.

### 28.8.307 kTextColor = & hFFFF0002

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to FFFF0002 (in hex) to represent the default text color. **Notes:** See Color Specification on how colors are represented in ChartDirector.

### 28.8.308 kTop = 8

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 8 to represent the top position.
Notes: See Alignment Specification for supported alignment types.

28.8.309 kTopCenter = 8

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 8 to represent the top center position.
*Notes:* See Alignment Specification for supported alignment types.

28.8.310 kTopLeft = 7

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 7 to represent the top left position.
*Notes:* See Alignment Specification for supported alignment types.

28.8.311 kTopLeft2 = 10

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 10 to represent the alternative exterior top left position.
*Notes:* See Alignment Specification for supported alignment types.

28.8.312 kTopRight = 9

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 9 to represent the top right position.
*Notes:* See Alignment Specification for supported alignment types.

28.8.313 kTopRight2 = 11

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 11 to represent the alternative exterior top right position.
*Notes:* See Alignment Specification for supported alignment types.

28.8.314 kTransparent = &hFF000000

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to FF000000 (in hex) to represent the transparent color.
28.8.315  kTriangleShape = 3

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 3 to represent a triangle pointing upwards.
**Notes:** Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

28.8.316  kTriangleSymbol = 3

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** One of the symbol constants.

28.8.317  kTriangularFrame = 3

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 3 to represent triangular frame only surface shading style.

28.8.318  kTriangularPointer = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent the triangular style meter pointer.
**Notes:** This constant is used in MeterPointer.setShape.

28.8.319  kTriangularPointer2 = 6

MBS ChartDirector Plugin, Plugin Version: 15.1. **Function:** A constant equals to 6 to represent the new triangular style meter pointer.

28.8.320  kTriangularShading = 1

MBS ChartDirector Plugin, Plugin Version: 9.2. **Function:** A constant equals to 1 to represent triangular surface shading style.
28.8.321  kTryPalette = 0

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 0 to represent that palette based image format should be used if the image contains 256 colors or less.
**Notes:** This constant is used in DrawArea.setPaletteMode.

28.8.322  kWMP = 3

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 3 to represent the WAP bitmap image format.
**Notes:**
The WAP bitmap format.
This constant is used in BaseChart.makeChart.

28.8.323  kXAxisAtOrigin = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent that the x-axis should intersect with the zero point of the y-axis if it exists on the chart.
**Notes:** This constant is used in XYChart.setAxisAtOrigin.

28.8.324  kXAxisScale = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent that the size is measured using the x-axis scale.
**Notes:** This constant is used in LineLayer.setSymbolScale, XYChart.addVectorLayer and VectorLayer.setSizeVector.

28.8.325  kXAxisSymmetric = 1

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 1 to represent that the x-axis should be symmetrical about the origin.
**Notes:** This constant is used in XYChart.setAxisAtOrigin.

28.8.326  kXAxisSymmetricIfNeeded = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent that the x-axis should be symmetrical about the origin if the data contain both positive and negative values.
28.8. **CLASS CDBASECHARTMBS**

**Notes:** This constant is used in `XYChart.setAxisAtOrigin`.

### 28.8.327 kXYAxisAtOrigin = 3

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 3 to represent that the x-axis and y-axis should intersect at the origin if it exists on the chart.

**Notes:** This constant is used in `XYChart.setAxisAtOrigin`.

### 28.8.328 kXYAxisSymmetric = 16

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 16 to represent that the x-axis and y-axis should be symmetrical about the origin.

**Notes:** This constant is used in `XYChart.setAxisAtOrigin`.

### 28.8.329 kXYAxisSymmetricIfNeeded = 32

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 32 to represent that the x-axis and y-axis should be symmetrical about the origin if the data contain both positive and negative values.

**Notes:** This constant is used in `XYChart.setAxisAtOrigin`.

### 28.8.330 kYAxisAtOrigin = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent that the y-axis should intersect with the zero point of the x-axis if it exists on the chart.

**Notes:** This constant is used in `XYChart.setAxisAtOrigin`.

### 28.8.331 kYAxisScale = 2

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 2 to represent that the size is measured using y-axis scale.

**Notes:** This constant is used in `LineLayer.setSymbolScale`, `XYChart.addVectorLayer` and `VectorLayer.setVector`.
28.8.332 kYAxisSymmetric = 4

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 4 to represent that the y-axis should be symmetrical about the origin.
**Notes:** This constant is used in XYChart.setAxisAtOrigin.

28.8.333 kYAxisSymmetricIfNeeded = 8

MBS ChartDirector Plugin, Plugin Version: 8.2. **Function:** A constant equals to 8 to represent that the y-axis should be symmetrical about the origin if the data contain both positive and negative values.
**Notes:** This constant is used in XYChart.setAxisAtOrigin.
28.9. **CLASS CDBASEMETERMBS**

28.9 **class CDBaseMeterMBS**

28.9.1 **class CDBaseMeterMBS**

**Function:** The BaseMeter class represents a generic meter.

**Notes:**

Subclass of the CDBaseChartMBS class.

This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.9.2 **Methods**

28.9.3 **addColorScale(colorStops() as Double, startPos as Integer = -2147483647, startDate as Integer = -2147483647, endPos as Integer = -2147483647, endWidth as Integer = -2147483647, edgeColor as Integer = -1)**

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Adds a color scale to the meter.

**Notes:**

A color scale is similar to a meter scale. Instead of using labels to denote the values, a color scale uses different colors for different values. The colors can vary continuously or in discrete steps. The width of the color scale can also vary based on the value. There can be multiple more than one color scale in a meter.

A color scale is defined with an array of numbers. For a continuous color scale, each pair of numbers represents a value and its associated color. For example, to define a continuous color scale in which 0 is blue (0000FF), 50 is yellow (FFFF00) and 100 is red (FF0000), the numbers should be:

0.0, & h0000ff, 50.0, & hffff00, 100.0, & hff0000

For a step color scale, the number of colors would be one less than the number of values. For example, to define a step color scale in which 0 to 50 is red (FF0000), and 50 to 100 is green (00FF00), the numbers will be:

0.0, & hff0000, 50.0, & h00ff00, 100.0

See also:

- 28.9.4 **addColorScale(colorStops() as Double, startPos as Integer, startDate as Integer, endPos as Integer, endWidth as Integer, edgeColor as color)**
CHAPTER 28. CHARTDIRECTOR

Argument Default Description

colorStops (Mandatory) An array of numbers alternating between values and colors. If the number count is even, the array will define a continuous color scale, otherwise it will define a step color scale.

startPos -& h7fffffff The position of the starting point of the color scale. For an angular meter, the position refers to the radius, and the default is the meter scale radius (see AngularMeter.setMeter). For a linear meter, the position refers to the x or y coordinate depending on whether the meter is vertical or horizontal, and the default is the leftX or topY coordinate of the meter scale (see LinearMeter.setMeter).

startWidth -& h7fffffff The width at the starting point of the color scale. A positive value means the width is in the direction of increasing "position", while a negative value means decreasing "position". Please refer to the description of startPos on the meaning of "position" for various types of meters. The default is the length of the major tick (see BaseMeter.setTickLength).

endPos -& h7fffffff The position of the ending point of the color scale. Please refer to the description of startPos above on how the position parameter is interpreted. The default is for the ending position to be equal to the starting position.

endWidth -& h7fffffff The width at the ending point of the color scale. Please refer to the description of startWidth above on how the width parameter is interpreted. The default is for the ending width to be equal to the starting width.

edgeColor -1 The edge color of the color scale. The default is to have no edge.

28.9.4 addColorScale(colorStops() as Double, startPos as Integer, startWidth as Integer, endPos as Integer, endWidth as Integer, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Adds a color scale to the meter.
Notes:

A color scale is similar to a meter scale. Instead of using labels to denote the values, a color scale uses different colors for different values. The colors can vary continuously or in discrete steps. The width of the color scale can also vary based on the value. There can be multiple more than one color scale in a meter.

A color scale is defined with an array of numbers. For a continuous color scale, each pair of numbers represents a value and its associated color. For example, to define a continuous color scale in which 0 is blue (0000FF), 50 is yellow (FFFF00) and 100 is red (FF0000), the numbers should be:

0.0, & h0000ff, 50.0, & hffff00, 100.0, & hff0000

For a step color scale, the number of colors would be one less than the number of values. For example, to define a step color scale in which 0 to 50 is red (FF0000), and 50 to 100 is green (00FF00), the numbers will be:

0.0, & hff0000, 50.0, & h00ff00, 100.0
### 28.9. CLASS CDBASEMETERMBS

- 28.9.3 addColorScale(colorStops() as Double, startPos as Integer = -2147483647, startWidth as Integer = -2147483647, endPos as Integer = -2147483647, endWidth as Integer = -2147483647, edgeColor as Integer = -1)

### 28.9.5 addLabel(v as Double, label as string)

**Function:** Adds a label to a specific position on the meter scale.

**Notes:**

By default, all labels will be associated major ticks on the scale. To associate a label with a minor tick instead, use '-' as the first character of the label. To associate a label with a micro tick instead, use ':' as the first character of the label. To draw the label without any tick at all, use ‘\textasciitilde’ as the first character of the label.

Leading ‘\textasciitilde’, ‘\textasciitilde’ or ‘:\’ characters are tick specification characters and will not appear on the labels. They just specify the the tick style to be associated with the labels. If you want have a label that actually begins these characters, add ‘\textasciitilde’ as the first character as the escape character.
In some cases, it may be desirable to skip some labels. If you want to draw a major, minor or micro tick without any label, use ‘ ’ (a space character), ‘,’ or ‘;’ as the only character in the label text. If you want leave a label position empty without a tick or a label, use an empty string.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos</td>
<td>(Mandatory)</td>
<td>The position to add the label to in meter scale unit.</td>
</tr>
<tr>
<td>label</td>
<td>(Mandatory)</td>
<td>The label to add to the meter scale.</td>
</tr>
</tbody>
</table>

### 28.9.6 addPointer(value as Double, fillColor as color, edgeColor as color) as CDMeterPointerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addPointer method, but uses color instead of integer data type for passing color values.

See also:

- 28.9.7 addPointer(value as Double, fillColor as Integer = & hffff0001, edgeColor as Integer = -1) as CDMeterPointerMBS

### 28.9.7 addPointer(value as Double, fillColor as Integer = & hffff0001, edgeColor as Integer = -1) as CDMeterPointerMBS

**Function:** Adds a pointer to the meter.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(Mandatory)</td>
<td>The value that the pointer will point to.</td>
</tr>
<tr>
<td>fillColor</td>
<td>LineColor</td>
<td>The fill color of the pointer.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>-1</td>
<td>The edge color of the pointer. The default value of -1 means the edge color is the same as the fill color.</td>
</tr>
</tbody>
</table>

See also:

- 28.9.6 addPointer(value as Double, fillColor as color, edgeColor as color) as CDMeterPointerMBS

### 28.9.8 getCoor(v as Double) as Integer

**Function:** Gets the geometric coordinates given the data value.

**Notes:**
For an angular meter, this method returns the angular position of the pointer for the given data value in degrees. The angle is measured in the clockwise direction, with 0 being the upward pointing direction.

For a linear meter, this method returns the linear pixel offset of the pointer for the given data value.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>v</td>
<td>(Mandatory)</td>
<td>The input data value.</td>
</tr>
</tbody>
</table>

Return Value
The geometric representation of the data value, which is an angle in degrees for an angular meter, and a linear pixel offset for a linear meter.

### 28.9.9 getLabel(v as Double) as string

**Function:** Gets the label at the specified position on the meter scale.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>(Mandatory)</td>
<td>The position specified as a value on the meter scale.</td>
</tr>
</tbody>
</table>

Return Value
Returns the label at the specified position, or a null string if there is no label at that position.

### 28.9.10 getTicks as CDArrayMBS

**Function:** Returns the positions of all ticks as values on the meter scale.

**Notes:**

Return Value
All array of numbers representing the positions of the ticks as values on the meter scale.

### 28.9.11 setLabelFormat(mainLabelFormat as string)

**Function:** Sets the format of the labels computed by ChartDirector.

**Example:**
dim c as CDBaseMeterMBS

// you can use label formats like this:

c.setLabelFormat("<block,halign=left><font=timesbi.ttf,size=12,underline=1>{ label }<font><br>US$ { value } K ( { percent } % )")

// we can reduce that to this:

c.setLabelFormat(" { label } { value } { percent } % ")

// and it shows 3 numbers. With | 1 after the variable name, we define the decimals after dot:

c.setLabelFormat(" { label } { value | 1 } { percent | 1 } % ")

// and

c.setLabelFormat(" { label } { value | 1., } { percent | 1., } % ")

// uses dot for thousands and comma for decimal separator.

Notes:

The method is mainly used when BaseMeter.setScale is used, in which case the label values are not directly specified but are computed by ChartDirector. For example, a format string of " { value | 2 } " will format the values with 2 decimal places.

Please refer to Parameter Substitution and Formatting on all available format parameters.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatString</td>
<td>(Mandatory)</td>
<td>The format string.</td>
</tr>
</tbody>
</table>

28.9.12  setLabelPos(labelInside as boolean, labelOffset as Integer = 0)

Function: Sets the positions of the meter scale labels.

Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>labelInside</td>
<td>(Mandatory)</td>
<td>A true value means that the labels are on the 'inward' side of the meter scale. A false value means the labels are on the 'outward' side of the meter scale.</td>
</tr>
</tbody>
</table>

For an angular meter, the default is for the labels on the 'inward' side. For a linear meter, the default is for
the labels on the 'outward' side.

labelOffset 0 The offset, in pixels, of the labels position relative to the standard position. If the major tick is at the same side as the label, the standard starting position of the label is at the end point of the major tick. Otherwise, the standard starting position is on the meter scale.

A positive labelOffset means the labels should move more towards the 'inward' or 'outward' side, depending on the first parameter. A negative labelOffset means moving the labels towards the opposite direction.

28.9.13 setLabelStyle(font as string = "", fontsize as Double = -1, fontcolor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

Function: Sets the font style used to for the meter labels.

Notes:
See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>&quot;bold&quot;</td>
<td>The font used to draw the labels.</td>
</tr>
<tr>
<td>fontSize</td>
<td>-1</td>
<td>The font size used to draw the labels in points. A value of -1 means the font size is not changed. The default font size is 10 points for angular meters, and 8 points for linear meters.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The color used to draw the labels.</td>
</tr>
<tr>
<td>fontAngle</td>
<td>0</td>
<td>The rotation angle of the labels.</td>
</tr>
</tbody>
</table>

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

• 28.9.14 setLabelStyle(font as string, fontsize as Double, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS
CHAPTER 28. CHARTDIRECTOR

28.9.14 setLabelStyle(font as string, fontsize as Double, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setLabelStyle method, but uses color instead of integer data type for passing color values.
See also:
- 28.9.13 setLabelStyle(font as string = "", fontsize as Double = -1, fontcolor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 4577

28.9.15 setLineWidth(axisWidth as Integer, majorTickWidth as Integer = 1, minorTickWidth as Integer = 1, microTickWidth as Integer = 1)

Function: Sets the line widths of the scale line and the ticks on the meter.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>axisWidth</td>
<td>(Mandatory)</td>
<td>The line width for drawing the meter scale line in pixels. For an angular meter, the default is 1 pixel. For a linear meter, the default is 2 pixels.</td>
</tr>
<tr>
<td>majorTickWidth</td>
<td>1</td>
<td>The line width of the major ticks in pixels. For a linear meter, if this method is not called, the initial major tick width is set to 2 pixels.</td>
</tr>
<tr>
<td>minorTickWidth</td>
<td>1</td>
<td>The line width of the minor ticks in pixels.</td>
</tr>
<tr>
<td>microTickWidth</td>
<td>1</td>
<td>The line width of the micro ticks in pixels.</td>
</tr>
</tbody>
</table>

28.9.16 setMeterColors(axisColor as color, labelColor as color, tickColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setMeterColors method, but uses color instead of integer data type for passing color values.
See also:
- 28.9.17 setMeterColors(axisColor as Integer, labelColor as Integer = -1, tickColor as Integer = -1) 4578

28.9.17 setMeterColors(axisColor as Integer, labelColor as Integer = -1, tickColor as Integer = -1)

Function: Sets the colors of the meter scale line, scale label and tick.
Notes:
See also:
28.9. CLASS CDBASEMETERMBS
Argument
axisColor
labelColor

Default
(Mandatory)
-1

tickColor

-1

Description
The color for drawing the meter scale line. The default is LineColor.
The color for drawing the scale labels. Passing -1 in this argument means the
label color is not changed. The default label color is TextColor.
The color for drawing the ticks. Passing -1 in this argument means the tick
color is not changed. The default tick color is LineColor.

• 28.9.16 setMeterColors(axisColor as color, labelColor as color, tickColor as color)

28.9.18

4579

4578

setScale(lowerLimit as Double, upperLimit as Double, labels() as Double, formatstring as string = ””)

Function: Sets the meter to use the given scale with the given numeric labels and tick positions.
Notes:
ChartDirector will distribute the labels evenly on the scale. By default, all labels are associated with major
ticks. If you want certain positions to show a minor or micro ticks only, use MinorTickOnly or MicroTickOnly as the label values for those positions.
Argument
lowerLimit
upperLimit
labels
formatString

Default
(Mandatory)
(Mandatory)
(Mandatory)
””

Description
The lower limit of the meter scale.
The upper limit of the meter scale.
An array of numbers to be used as the labels on the meter scale.
The format string for formatting the numbers. An empty string means the
format will be automatically determined.

See also:
• 28.9.19 setScale(lowerLimit as Double, upperLimit as Double, labels() as string)

4579

• 28.9.20 setScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0, microTickInc as Double = 0)
4580

28.9.19

setScale(lowerLimit as Double, upperLimit as Double, labels() as string)

Function: Sets the meter to use the given scale with the given text labels and tick positions.
Notes:
ChartDirector will distribute the labels evenly on the scale. By default, all labels are associated with major
ticks. These can be modified by using ’-’, ’
textasciitilde ’ or ’:’ as the first character. Please refer to BaseMeter.addLabel for details.


CHAPTER 28. CHARTDIRECTOR

Argument | Default | Description
--- | --- | ---
lowerLimit | (Mandatory) | The lower limit of the meter scale.
upperLimit | (Mandatory) | The upper limit of the meter scale.
labels | (Mandatory) | An array of text strings to be used as the labels on the meter scale.

See also:

- 28.9.18 setScale(lowerLimit as Double, upperLimit as Double, labels() as Double, formatstring as string = "")
- 28.9.20 setScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0, microTickInc as Double = 0)

28.9.20 setScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0, microTickInc as Double = 0)

Function: Sets the meter to use the given scale.
Notes:

Argument | Default | Description
--- | --- | ---
lowerLimit | (Mandatory) | The lower limit of the meter scale.
upperLimit | (Mandatory) | The upper limit of the meter scale.
majorTickInc | 0 | The interval between major ticks. For example, a value of 10 means a major tick every 10 units in the meter scale. Each major tick will have an associated label for the value at the tick. A value of 0 disables major ticks.
minorTickInc | 0 | The interval between minor ticks. For example, a value of 5 means a minor tick every 5 units in the meter scale. A value of 0 disables minor ticks.
microTickInc | 0 | The interval between minor ticks. For example, a value of 1 means a minor tick every 1 units in the meter scale. A value of 0 disables micro ticks.

See also:

- 28.9.18 setScale(lowerLimit as Double, upperLimit as Double, labels() as Double, formatstring as string = "")
- 28.9.19 setScale(lowerLimit as Double, upperLimit as Double, labels() as string)

28.9.21 setTickLength(majorLen as Integer)

Function: Set the lengths of the ticks.
Notes:
28.9. **CLASS CDBASEMETERMBS**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>majorLen</td>
<td>(Mandatory)</td>
<td>The length of the major ticks in pixels. A positive value means the tick is at the 'outward' direction of the meter. A negative value means the tick is at the 'inward' direction.</td>
</tr>
<tr>
<td>minorLen</td>
<td>-7fffffff</td>
<td>The length of the minor ticks in pixels. The default is 60% of the length of the major ticks.</td>
</tr>
<tr>
<td>microLen</td>
<td>-7fffffff</td>
<td>The length of the micro ticks in pixels. The default is 50% of the length of the minor ticks.</td>
</tr>
</tbody>
</table>

For an angular meter, the default is -10 (10 pixels at the inward direction). For a horizontal linear meter, the default is the same height as the meter scale region in the inward direction. For a vertical linear meter, the default is the same width as the meter scale region in the inward direction.

See also:
- 28.9.22 setTickLength(majorLen as Integer, minorLen as Integer) 4581
- 28.9.23 setTickLength(majorLen as Integer, minorLen as Integer, microLen as Integer) 4582

### 28.9.22 setTickLength(majorLen as Integer, minorLen as Integer)

**Function:** Set the lengths of the ticks.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>majorLen</td>
<td>(Mandatory)</td>

- 28.9.23 setTickLength(majorLen as Integer, minorLen as Integer, microLen as Integer) 4582
CHAPTER 28. CHARTDIRECTOR

minorLen -7fffffff The length of the minor ticks in pixels. The default is 60% of the length of the major ticks.

microLen -7fffffff The length of the micro ticks in pixels. The default is 50% of the length of the minor ticks.

28.9.23 setTickLength(majorLen as Integer, minorLen as Integer, microLen as Integer)

Function: Set the lengths of the ticks.

Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>majorLen</td>
<td>(Mandatory)</td>
<td>The length of the major ticks in pixels. A positive value means the tick is at the 'outward' direction of the meter. A negative value means the tick is at the 'inward' direction.</td>
</tr>
<tr>
<td>minorLen</td>
<td>-7fffffff</td>
<td>The length of the minor ticks in pixels. The default is 60% of the length of the major ticks.</td>
</tr>
<tr>
<td>microLen</td>
<td>-7fffffff</td>
<td>The length of the micro ticks in pixels. The default is 50% of the length of the minor ticks.</td>
</tr>
</tbody>
</table>

For an angular meter, the default is -10 (10 pixels at the inward direction). For a horizontal linear meter, the default is the same height as the meter scale region in the inward direction. For a vertical linear meter, the default is the same width as the meter scale region in the inward direction.

- 28.9.22 setTickLength(majorLen as Integer, minorLen as Integer) 4581
28.10. CLASS CDBOXMBS

28.10 class CDBoxMBS

28.10.1 class CDBoxMBS

**Function:** The Box class represents boxes.
**Notes:**
It is used as the base class for more complex classes (such as the TextBox class).
Subclass of the CDDrawObjMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.10.2 Methods

28.10.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The private constructor.

28.10.4 getHeight as Integer

**Function:** Gets the height of the box.
**Notes:**
In some usages, the height of a box may be dynamically determined. An example is the height of an
LegendBox, which cannot be known until all data are available. In these cases, the height is undefined
until the chart or at least the legend box has been laid out (using BaseChart.layout or BaseChart.layout-
Legend), or the chart image has been drawn (eg. using BaseChart.makeChart, BaseChart.makeChart2 or
BaseChart.makeChart3).
**Return Value**
The height of the box in pixels.

28.10.5 getImageCoor(OffsetX as Integer = 0, OffsetY as Integer = 0) as string

**Function:** Gets the image map coordinates of the box as HTML image map attributes.
**Notes:**
The image map coordinates will be in the following format:
shape="rect" cords=" [ x1 ] , [ y1 ] , [ x2 ] , [ y2 ] "

where \((x_1, y_1)\) and \((x_2, y_2)\) are opposite corners of the box. The format is designed so that it can easily be incorporated into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>offsetX</td>
<td>0</td>
<td>An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.</td>
</tr>
<tr>
<td>offsetY</td>
<td>0</td>
<td>An offset to be added to all y coordinates in the image map. See offsetX above for description.</td>
</tr>
</tbody>
</table>

Return Value
A text string representing the coordinates of the box in HTML image map attribute format.

### 28.10.6 getLeftX as Integer

**Function:** Gets the left x pixel coordinate of the box.

**Notes:**

In some cases, the left x coordinate of a box may be dynamically determined. An example is the left x coordinate of an CDLegendBoxMBS with alignment set to Center. To determine the left x coordinate, the size of the box must be known first. For these cases, the left x coordinate is undefined until the legend box or the entire chart has been laid out (using CDBaseChartMBS.layout or CDBaseChartMBS.layoutLegend), or the chart image has been drawn (eg. using CDBaseChartMBS.makeChart).

**Arguments:**
None

**Return Value**
The the left x pixel coordinate of the box.

### 28.10.7 getTopY as Integer

**Function:** Gets the top y pixel coordinate of the box.

**Notes:**
In some cases, the top y coordinate of a box may be dynamically determined. An example is the top y coordinate of an CDLegendBoxMBS with alignment set to Center. To determine the top y coordinate, the size of the box must be known first. For these cases, the top y coordinate is undefined until the legend box or the entire chart has been laid out (using CDBaseChartMBS.layout or CDBaseChartMBS.layoutLegend), or the chart image has been drawn (e.g. using CDBaseChartMBS.makeChart).

Arguments:
None

Return Value
The top y pixel coordinate of the box.

28.10.8 getWidth as Integer

Function: Gets the width of the box.
Notes:
In some usages, the width of a box may be dynamically determined. An example is the width of an LegendBox, which cannot be known until all data are available. In these cases, the width is undefined until the chart or at least the legend box has been laid out (using BaseChart.layout or BaseChart.layoutLegend), or the chart image has been drawn (e.g. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3).
Return Value
The width of the box in pixels.

28.10.9 setBackground(colorvalue as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setBackground method, but uses color instead of integer data type for passing color values.
See also:
• 28.10.10 setBackground(colorvalue as Integer, edgeColor as Integer = -1, raisedEffect as Integer = 0)

28.10.10 setBackground(colorvalue as Integer, edgeColor as Integer = -1, raisedEffect as Integer = 0)

Function: Sets the background color, border color and 3D border effect of the box.
Notes:
Argument Default Description

- color (Mandatory) The background color of the box.
- edgeColor -1 The border color of the box.
- raisedEffect 0 The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support Chart::glassEffect and Chart::softLighting effects.

See also:

- 28.10.9 setBackground(colorvalue as color, edgeColor as color, raisedEffect as Integer = 0)

28.10.11 setPos(x as Integer, y as Integer)

Function: Sets the coordinates of the top-left corner of the box.

Example:

```plaintext
// Create a XYChart object of size 250 x 250 pixels
dim c as new CDXYChartMBS(250, 250)

// Add a bar chart layer using the given data
dim t as CDTextBoxMBS = c.addBarLayer(data)
t.setPos(0, -10) // move 10 up
```

Notes:

- x (Mandatory) The x coordinate of the left of the box.
- y (Mandatory) The y coordinate of the top of the box.

28.10.12 setRoundedCorners(r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1)

Function: Sets the border style to use rounded corners.

Notes:
28.10. CLASS CDBOXMBS

<table>
<thead>
<tr>

</tbody>
</table>
28.11 class CDBoxWhiskerLayerMBS

28.11.1 class CDBoxWhiskerLayerMBS

Function: The BoxWhiskerLayer class represents box-whisker layers.
Notes:
Subclass of the CDBaseBoxLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.11.2 Methods

28.11.3 setBoxColor(item as Integer, boxColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setBoxColor method, but uses color instead of integer data type for passing color values.
See also:
- 28.11.4 setBoxColor(item as Integer, boxColor as Integer) 4588

28.11.4 setBoxColor(item as Integer, boxColor as Integer)

Function: Sets the color for a single box.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>(Mandatory)</td>
<td>The index of the box to change color. The first box is 0, while the Nth box is N - 1.</td>
</tr>
<tr>
<td>boxColor</td>
<td>(Mandatory)</td>
<td>The color to use to fill the box.</td>
</tr>
</tbody>
</table>

See also:
- 28.11.3 setBoxColor(item as Integer, boxColor as color) 4588

28.11.5 setBoxColors(colors() as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setBoxColors method, but uses color instead of integer data type for passing
28.11. **CLASS CDBOXWHISKERLAYERMBS**

color values.

See also:

- 28.11.6 setBoxColors(colors() as color, names() as string) 4589
- 28.11.7 setBoxColors(colors() as Integer) 4589
- 28.11.8 setBoxColors(colors() as Integer, names() as string) 4590

### 28.11.6 setBoxColors(colors() as color, names() as string)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setBoxColors method, but uses color instead of integer data type for passing color values.

See also:

- 28.11.5 setBoxColors(colors() as color) 4588
- 28.11.7 setBoxColors(colors() as Integer) 4589
- 28.11.8 setBoxColors(colors() as Integer, names() as string) 4590

### 28.11.7 setBoxColors(colors() as Integer)

**Function:** Sets the colors for all boxes.

**Notes:**

The method will set the BoxWhiskerLayer into multi-color mode. The colors of each box will be obtained from the given colors array. If there are insufficient colors in the array, the remaining boxes will be auto-colored.

If the names argument is given, the names will appear in the legend box if one is configured for the chart.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colors</td>
<td>(Mandatory)</td>
<td>An array of colors to be used as the color of the boxes.</td>
</tr>
<tr>
<td>names</td>
<td>[ Empty_Array ]</td>
<td>An array of names to be used in the legend box, if one is configured for the chart.</td>
</tr>
</tbody>
</table>

See also:

- 28.11.5 setBoxColors(colors() as color) 4588
- 28.11.6 setBoxColors(colors() as color, names() as string) 4589
- 28.11.8 setBoxColors(colors() as Integer, names() as string) 4590
28.11.8  setBoxColors(colors() as Integer, names() as string)

Function: Sets the colors for all boxes.
Notes:
The method will set the BoxWhiskerLayer into multi-color mode. The colors of each box will be obtained
from the given colors array. If there are insufficient colors in the array, the remaining boxes will be auto-
colored.

If the names argument is given, the names will appear in the legend box if one is configured for the chart.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colors</td>
<td>(Mandatory)</td>
<td>An array of colors to be used as the color of the boxes.</td>
</tr>
<tr>
<td>names</td>
<td>[ Empty_Array ]</td>
<td>An array of names to be used in the legend box, if one is configured for the chart.</td>
</tr>
</tbody>
</table>

See also:

- 28.11.5 setBoxColors(colors() as color) 4588
- 28.11.6 setBoxColors(colors() as color, names() as string) 4589
- 28.11.7 setBoxColors(colors() as Integer) 4589

28.11.9  setWhiskerBrightness(whiskerBrightness as Double)

Function: Sets the whisker colors as darken or brightened fill colors of the boxes for BoxWhiskerLayer in
multi-color mode.
Notes:
In multi-color mode, the boxes of a BoxWhiskerLayer can have different fill colors. Instead of specifying
a single whisker color for all boxes, ChartDirector supports deriving the whisker colors by darkening or
brightening the corresponding fill colors.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| whiskerBrightness | (Mandatory)    | The brightness factor. A value less than 1 means darkening. A value larger
than 1 means brightening. A zero value means black.                        |
28.12. class CDCandleStickLayerMBS

28.12.1 class CDCandleStickLayerMBS

Function: The CandleStickLayer class represents candlestick layers.
Notes:
Subclass of the CDBaseBoxLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.12.2 Methods

28.12.3 setColors(upFillColor as color, upLineColor as color, downFillColor as color, downLineColor as color)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Configures the colors for candlesticks.
Notes:
The standard way to color a candlestick is to color it based on whether it is on an "up" or "down" trading session, in which "up" is defined as the closing price higher than or equal to the opening price, otherwise it is "down".

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>upFillColor</td>
<td>(Mandatory)</td>
<td>The fill color for &quot;up&quot; trading sessions.</td>
</tr>
<tr>
<td>upLineColor</td>
<td>(Mandatory)</td>
<td>The line color for &quot;up&quot; trading sessions.</td>
</tr>
<tr>
<td>downFillColor</td>
<td>(Mandatory)</td>
<td>The fill color for &quot;down&quot; trading sessions.</td>
</tr>
<tr>
<td>downLineColor</td>
<td>(Mandatory)</td>
<td>The line color for &quot;down&quot; trading sessions.</td>
</tr>
</tbody>
</table>

See also:

- 28.12.4 setColors(upFillColor as Integer, upLineColor as Integer, downFillColor as Integer, downLineColor as Integer)

28.12.4 setColors(upFillColor as Integer, upLineColor as Integer, downFillColor as Integer, downLineColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Configures the colors for candlesticks.
Notes:
The standard way to color a candlestick is to color it based on whether it is on an "up" or "down" trading session, in which "up" is defined as the closing price higher than or equal to the opening price, otherwise it is "down".

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>

<td>The fill color for &quot;up&quot; trading sessions.</td>
</tr>
<tr>
<td>upLineColor</td>
<td>(Mandatory)</td>
<td>The line color for &quot;up&quot; trading sessions.</td>
</tr>
<tr>
<td>downFillColor</td>
<td>(Mandatory)</td>
<td>The fill color for &quot;down&quot; trading sessions.</td>
</tr>
<tr>
<td>downLineColor</td>
<td>(Mandatory)</td>
<td>The line color for &quot;down&quot; trading sessions.</td>
</tr>
</tbody>
</table>

See also:

- 28.12.3 setColors(upFillColor as color, upLineColor as color, downFillColor as color, downLineColor as color)

28.12.5 setExtraColors(upDownFillColor as color, upDownLineColor as color, downDownFillColor as color, downDownLineColor as color, leadValue as Double = -1.7E308)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Configures additional colors for candlesticks.

**Notes:**

The standard way to color a candlestick is to color it using the method as mentioned in CandleStickLayer.setColors, in which "up" is defined as the closing price higher than or equal to the opening price.

In some applications, it may be desirable to vary the candlestick colors based on an alternative definition of "up" and "down", in which "up" is defined as the closing price higher than or equal to that of the previous trading session.

With these two definitions of "up" and "down", a candlestick can have 4 states. It can be "up/up" ("up" as according to both the standard and alternative definitions), "up/down" ("up" according to the standard definition, "down" according to the alternative definition), "down/up" or "down/down".

The setExtraColors method can be used to configure the "up/down" and "down/down" colors. If this method is used, the colors configured with CandleStickLayer.setColors will be considered as the "up/up" and "down/up" colors.

See also:

- 28.12.6 setExtraColors(upDownFillColor as Integer, upDownLineColor as Integer, downDownFillColor as Integer, downDownLineColor as Integer, leadValue as Double = -1.7E308)
### 28.12.6 `setExtraColors(upDownFillColor as Integer, upDownLineColor as Integer, downDownFillColor as Integer, downDownLineColor as Integer, leadValue as Double = -1.7E308)`

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Configures additional colors for candlesticks.

**Notes:**

The standard way to color a candlestick is to color it using the method as mentioned in `CandleStickLayer.setColors`, in which "up" is defined as the closing price higher than or equal to the opening price.

In some applications, it may be desirable to vary the candlestick colors based on an alternative definition of "up" and "down", in which "up" is defined as the closing price higher than or equal to that of the previous trading session.

With these two definitions of "up" and "down", a candlestick can have 4 states. It can be "up/up" ("up" according to both the standard and alternative definitions), "up/down" ("up" according to the standard definition, "down" according to the alternative definition), "down/up" or "down/down".

The `setExtraColors` method can be used to configure the "up/down" and "down/down" colors. If this method is used, the colors configured with `CandleStickLayer.setColors` will be considered as the "up/up" and "down/up" colors.

<table>

28.13 class CDColorAxisMBS

28.13.1 class CDColorAxisMBS

**Function:** The ColorAxis class represents color axes.

**Notes:**

It is a subclass of Axis.

A color axis is similar to an x or y axis. However, instead of mapping data values to positions, a color axis maps data values to colors. Color axes are used in CDContourLayerMBS and in CDSurfaceChartMBS objects.

Similar to an x or y axis, a color axis is visually represented as a thin bar that can be horizontal or vertical, and has a scale along its length. The scale can be set explicitly or can be determined by auto-scaling.

If you are using the color axis on a surface chart, please note that by default, the color axis scale is synchronized to the z axis. You need to use CDAxisMBS.syncAxis to cancel the synchronization before you can independently set the color axis scale.

In addition to the scale, a color axis is colored with a continuous color gradient or discrete color steps along its length. This maps the values on the axis with colors.

For an x or y axis, the major and minor ticks correspond to major and minor grid lines on the chart. For a color axis, these ticks correspond to major and minor contour lines on the chart.

Like an x or y axis, you can add marks to the color axis using Axis.addMark. They will become mark contour lines on the chart.

The color axis, if visible, acts as a color legend. The axis stem is a thin rectangle 15 pixels in width, configurable with CDAxisMBS.setWidth. A bounding box can be added to surround the color axis using CDCColorAxisMBS.setBoundingBox.

A color axis works normally (determines color mapping and contour levels) even if it is not displayed.

Subclass of the CDAxisMBS class.

This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.
28.13.2 Methods

28.13.3 getColor as Integer

Function: Gets the color given the data value.

Notes: You must call CDXYChartMBS.layoutAxes, CDBaseChartMBS.layout or CDXYChartMBS.packPlotArea first before calling this method. ChartDirector needs to perform auto-scaling and layout the axis before it can compute the color.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>z</td>
<td>(Mandatory)</td>
<td>The data value.</td>
</tr>
</tbody>
</table>

Return Value

The color that corresponds to the data value.

28.13.6 setAxisBorder(edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other setAxisBorder method, but uses color instead of integer data type for passing color values.

See also:
28.13.7  \texttt{setAxisBorder(edgeColor as Integer, raisedEffect as Integer = 0)}

\textbf{Function:} Sets the position of the color axis.

\textbf{Notes:}

\textbf{Arguments:}

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x-coordinate of the reference point used to position the color axis.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y-coordinate of the reference point used to position the color axis.</td>
</tr>
<tr>
<td>alignment</td>
<td>(Mandatory)</td>
<td>The alignment of the color axis with respect to the reference point. For example, a value of kTopLeft means the reference point is the top-left corner of the color axis. See Alignment Specification for supported alignment types.</td>
</tr>
</tbody>
</table>

See also:

- 28.13.6 \texttt{setAxisBorder(edgeColor as color, raisedEffect as Integer = 0)}

28.13.8  \texttt{setAxisPos(x as Integer, y as Integer, alignment as Integer)}

\textbf{Function:} Sets the position and alignment of the color axis.

28.13.9  \texttt{setBoundingBox(fillColor as color, edgeColor as color, raisedEffect as Integer = 0)}

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

\textbf{Function:} Same as the other \texttt{setBoundingBox} method, but uses color instead of integer data type for passing color values.

See also:

- 28.13.10 \texttt{setBoundingBox(fillColor as Integer, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)}

28.13.10  \texttt{setBoundingBox(fillColor as Integer, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)}

\textbf{Function:} Sets the background color, border color and 3D border effect of the bounding box.
28.13. CLASS CDCOLORAXISMBS

Notes:

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fillColor</td>
<td>(Mandatory)</td>
<td>The background color of the bounding box.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>kTransparent</td>
<td>The border color of the bounding box.</td>
</tr>
<tr>
<td>raisedEffect</td>
<td>0</td>
<td>The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support CDBaseChartMBS.glassEffect, CDBaseChartMBS.softLighting and CDBaseChartMBS.cylinderEffect effects.</td>
</tr>
</tbody>
</table>

See also:

- 28.13.9 setBoundingBox(fillColor as color, edgeColor as color, raisedEffect as Integer = 0)

28.13.11 setBoxMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer)

Function: Sets the margins of the bounding box in pixels.

Notes:
The margins of a bounding box refer to the distances between the borders of the bounding box to the color axis inside.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>leftMargin</td>
<td>(Mandatory)</td>
<td>The left margin in pixels.</td>
</tr>
<tr>

<td>(Mandatory)</td>
<td>The right margin in pixels.</td>
</tr>
<tr>
<td>topMargin</td>
<td>(Mandatory)</td>
<td>The top margin in pixels.</td>
</tr>
<tr>
<td>bottomMargin</td>
<td>(Mandatory)</td>
<td>The bottom margin in pixels.</td>
</tr>
</tbody>
</table>

See also:

- 28.13.12 setBoxMargin(m as Integer)

28.13.12 setBoxMargin(m as Integer)

Function: Sets all margins (left, right, top, and bottom) of the bounding box to the same value.
CHAPTER 28. CHARTDIRECTOR

Notes:
The margins of a bounding box refer to the distances between the borders of the bounding box to the color axis inside.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>m</td>
<td>(Mandatory)</td>
<td>The left, right, top and bottom margins in pixels.</td>
</tr>
</tbody>
</table>

See also:

- 28.13.11 setBoxMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer)

28.13.13 setColorGradient(isContinuous as boolean, Colors() as color, underflowColor as color, overflowColor as color)

Function: Sets the continuous color gradient or discrete color steps for the color axis.

Notes:

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isContinuous</td>
<td>true</td>
<td>True to set to continuous color gradient. False to set to discrete color steps.</td>
</tr>
<tr>
<td>colors</td>
<td>[Empty Array]</td>
<td>An array of colors used to define the continuous color gradient. If an empty array is used, the colors are automatically determined.</td>
</tr>
</tbody>
</table>

ChartDirector will interpolate between the colors to create the continuous gradient. If discrete color steps are used, ChartDirector will take samples along the continuous color gradient. The number of samples is determined by the number of ticks on the axis, and may not equal the number of colors in the colors array.

<table>
<thead>
<tr>
<th>OverflowColor</th>
<th>-1</th>
<th>The color to use if a value exceeds the maximum value of the axis scale. -1 means the overflowColor is the same color at the maximum value.</th>
</tr>
</thead>
<tbody>
<tr>
<td>UnderflowColor</td>
<td>-1</td>
<td>The color to use if a value falls below the minimum value of the axis scale. -1 means the underflowColor is the same color at the minimum value.</td>
</tr>
</tbody>
</table>

- 28.13.16 setColorGradient(isContinuous as boolean=true) 4600

28.13.16 setColorGradient(isContinuous as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the continuous color gradient or discrete color steps for the color axis.

**Notes:**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isContinuous</td>
<td>true</td>
<td>True if set to continuous color gradient. False to set to discrete color steps.</td>
</tr>
<tr>
<td>colors</td>
<td>[Empty Array]</td>
<td>An array of colors used to define the continuous color gradient. If an empty array is used, the colors are automatically determined.</td>
</tr>
</tbody>
</table>

ChartDirector will interpolate between the colors to create the continuous gradient. If discrete color steps are used, ChartDirector will take samples along the continuous color gradient. The number of samples is determined by the number of ticks on the axis, and may not equal the number of colors in the colors array.
28.13. CLASS CDCOLORAXISMBS

overflowColor -1 The color to use if a value exceeds the maximum value of the axis scale. -1 means the overflowColor is the same color at the maximum value.

underflowColor -1 The color to use if a value falls below the minimum value of the axis scale. -1 means the underflowColor is the same color at the minimum value.

See also:

- 59.6.1 setColorGradient(isContinuous as boolean, Colors() as color, underflowColor as color, overflowColor as color) 10567
- 28.13.14 setColorGradient(isContinuous as boolean, Colors() as color, underflowColor as Integer, overflowColor as Integer = -1) 4599
- 28.13.15 setColorGradient(isContinuous as boolean, Colors() as Integer, underflowColor as Integer = -1, overflowColor as Integer = -1) 4599

28.13.17 setColorScale(colorStops() as Double, underflowColor as Integer = -1, overflowColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Sets the axis scale and the associated colors.

Notes:
The axis scale and the associated colors are defined with an array of numbers. For a color scale with continuous color gradient, each pair of numbers represents a value and its associated color. For example, for a continuous color scale in which 0 is blue (0000FF), 50 is yellow (FFFF00) and 100 is red (FF0000), the numbers should be:

0.0, & h0000ff, 50.0, & hffff00, 100.0, & hf0000

For a color scale with discrete color steps, the number of colors would be one less than the number of values. For example, to define a step color scale in which 0 to 50 is red (FF0000), and 50 to 100 is green (00FF00), the numbers will be:

0.0, & hff000, 50.0, & h0ff00, 100.0

28.13.18 setCompactAxis(b as boolean=true)

Function: Sets whether to compact the axis or not.

Notes:
**TABLE 28.13.19 setLevels(maxLevels as Integer)**

**Function:** Sets the maximum number of contour intervals on the axis.  
**Notes:**  
If discrete color steps are used, the number of contour intervals is the number of color steps on the axis.  

For a general color axis, the number of contour intervals is equal to the number of ticks minus 1. For example, an axis with 6 ticks at [ 0, 2, 4, 6, 8, 10 ] has 6 contour lines and 5 contour intervals.  

The main usage of this method is to limit the number of contour lines and/or color steps on the contour layer.  

If this method is never called, the default maximum number of contour intervals is 16.
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxLevels</td>
<td>(Mandatory) An integer representing the maximum number of contour intervals.</td>
</tr>
</tbody>
</table>

### 28.13.20 setRoundedCorners(r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1)

**Function:** Sets the border style of the bounding box to rounded corners.

**Notes:**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>10</td>
<td>The radius of the top-left rounded corner in pixels.</td>
</tr>
<tr>
<td>r2</td>
<td>-1</td>
<td>The radius of the top-right rounded corner in pixels. -1 means it is the same as the radius of the top-left corner.</td>
</tr>
<tr>
<td>r3</td>
<td>-1</td>
<td>The radius of the bottom-right rounded corner in pixels. -1 means it is the same as the radius of the top-left corner.</td>
</tr>
<tr>
<td>r4</td>
<td>-1</td>
<td>The radius of the bottom-left rounded corner in pixels. -1 means it is the same as the radius of the top-left corner.</td>
</tr>
</tbody>
</table>
28.14 class CDContourLayerMBS

28.14.1 class CDContourLayerMBS

**Function:** The ContourLayer class represents contour layers

**Notes:**

CDContourLayerMBS is a subclass of CDLayerMBS.

CDContourLayerMBS objects are created by using CDXYChartMBS.addContourLayer.

The data for the CDContourLayerMBS are the z values at some points in the xy plane. Both gridded and scattered data points are supported.

Using the data, the ContourLayer computes the z values of all pixels in the xy plane. The computation can be based on spline or bilinear/line surface fitting, configurable using CDContourLayerMBS.setSmoothInterpolation.

The ContourLayer then colors the pixels based on the z values, and draws contour lines to join positions with the same z values. The color mapping and contour levels are controlled by the ColorAxis object of the ContourLayer, obtainable using CDContourLayerMBS.colorAxis.

If you need to change colors for the contour layer, please use ColorAxis setColorGradient:

Call myContourLayer.colorAxis().setColorGradient(True, anArrayOfColors)

ChartDirector will then use the array of colors, and interpolate among them, to fill the contour layer. For example, if the array of colors contain 3 colors red, green and blue, ChartDirector will interpolate from red to green for half of the z-levels, and green to blue for the other half.

Subclass of the CDLayerMBS class.

This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.14.2 Methods

28.14.3 colorAxis as CDColorAxisMBS

**Function:** Gets the ColorAxis object representing the color axis (color legend).
28.14.4 setColorAxis(x as Integer, y as Integer, alignment as Integer, length as Integer, orientation as Integer) as CDColorAxisMBS

**Function:** Sets the position, length and orientation of the color axis (color legend).

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x-coordinate of the reference point used to position the color axis.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y-coordinate of the reference point used to position the color axis.</td>
</tr>
<tr>
<td>alignment</td>
<td>(Mandatory)</td>
<td>The alignment of the color axis with respect to the reference point. For example, a value of kTopLeft means the reference point is the top-left corner of the color axis. See Alignment Specification for supported alignment types.</td>
</tr>
<tr>
<td>length</td>
<td>(Mandatory)</td>
<td>The length of the color axis in pixels.</td>
</tr>
<tr>
<td>orientation</td>
<td>(Mandatory)</td>
<td>The orientation of the color axis. A value of kTop/kBottom means the axis is horizontal, and the axis labels are at top/bottom side of the axis. A value of kLeft/kRight means the axis is vertical, and the axis labels are at the left/right side of the axis.</td>
</tr>
</tbody>
</table>

28.14.5 setContourColor(contourColor as color, minorContourColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setContourColor method, but uses color instead of integer data type for passing color values.

See also:

- 28.14.6 setContourColor(contourColor as Integer, minorContourColor as Integer = -1)

28.14.6 setContourColor(contourColor as Integer, minorContourColor as Integer = -1)

**Function:** Sets contour line colors.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contourColor</td>
<td>(Mandatory)</td>
<td>The major contour line color. If this method is never called, the default contour line color is semi-transparent black (&amp; h80000000).</td>
</tr>
<tr>
<td>minorContourColor</td>
<td>-1</td>
<td>The minor contour line color. -1 means the minor contour line color is the same as the major contour line color.</td>
</tr>
</tbody>
</table>

See also:
28.14.7 setContourWidth(contourWidth as Integer, minorContourWidth as Integer = -1)

**Function:** Sets contour line widths.

**Notes:**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contourWidth</td>
<td>(Mandatory)</td>
<td>The major contour line width in pixels. If this method is never called, the default contour line width is 1 pixel.</td>
</tr>
<tr>
<td>minorContourWidth</td>
<td>-1</td>
<td>The minor contour line width. -1 means the minor contour line width is the same as the major contour line width.</td>
</tr>
</tbody>
</table>

28.14.8 setExactContour(contour as boolean = true)

**Function:** Sets whether to use exact contours or boundary contours.

**Notes:**

In exact contour mode, the contour at \( z = N \) refers to all points at \( z = N \). For example, the contour at \( z = 10 \) refers to all points at \( z = 10 \). These points normally constitute lines. However, in case there is an exactly flat region at \( z = 10 \), the entire region will be the contour and will be colored using the contour color. In other words, instead of lines, a contour can become a region.

In boundary contour mode, the contour at \( z = N \) refers to the boundary between \( z < N \) and \( z >= N \), except for the highest contour in which case the contour is the boundary between \( z <= N \) and \( z > N \). With this method, if there is a flat region, the contour will occur at the boundary of the region.

If this method is never called, the default is to use boundary contour mode.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contour</td>
<td>true</td>
<td>A true value specifies exact contour mode for standard contours, otherwise boundary contour mode will be used.</td>
</tr>
<tr>
<td>markContour</td>
<td>[Same_As_Contour]</td>
<td>A true value specifies exact contour mode for mark contours. A false value specifies boundary contour mode for mark contours. A mark contour is an extra contour added using Axis.addMark on the color axis (obtained using ContourLayer.colorAxis). If this parameter is not specified, the default is to use the same contour mode as standard contours.</td>
</tr>
</tbody>
</table>
28.14. CLASS CDCONTOURLAYERMBS

See also:

- 28.14.9 setExactContour(contour as boolean, markContour as boolean)

28.14.9 setExactContour(contour as boolean, markContour as boolean)

**Function:** Sets whether to use exact contours or boundary contours.

**Notes:**

In exact contour mode, the contour at \( z = N \) refers to all points at \( z = N \). For example, the contour at \( z = 10 \) refers to all points at \( z = 10 \). These points normally constitute lines. However, in case there is an exactly flat region at \( z = 10 \), the entire region will be the contour and will be colored using the contour color. In other words, instead of lines, a contour can become a region.

In boundary contour mode, the contour at \( z = N \) refers to the boundary between \( z < N \) and \( z > N \), except for the highest contour in which case the contour is the boundary between \( z <= N \) and \( z > N \). With this method, if there is a flat region, the contour will occur at the boundary of the region.

If this method is never called, the default is to use boundary contour mode.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contour</td>
<td>true</td>
<td>A true value specifies exact contour mode for standard contours, otherwise boundary contour mode will be used.</td>
</tr>
<tr>
<td>markContour</td>
<td>[Same_As_Contour]</td>
<td>A true value specifies exact contour mode for mark contours. A false value specifies boundary contour mode for mark contours. A mark contour is an extra contour added using Axis.addMark on the color axis (obtained using ContourLayer.colorAxis). If this parameter is not specified, the default is to use the same contour mode as standard contours.</td>
</tr>
</tbody>
</table>

See also:

- 28.14.8 setExactContour(contour as boolean = true)

28.14.10 setSmoothInterpolation(b as boolean)

**Function:** Sets whether to use spline or bilinear/linear surface interpolation.

**Notes:**

The data points for the contour layer are samples of the \( z \) values at certain gridded or scattered \((x, y)\) points. However, to draw the contour and to color the layer, it is necessarily to know the \( z \) values at all pixels in the \( xy \) plane. ChartDirector uses surface interpolation to compute the \( z \) values at all pixels from the given data points.
In spline surface interpolation, ChartDirector will compute a smooth surface that passes through all data points. In bilinear/linear surface interpolation, ChartDirector will use the data points to partition the \((x, y)\) plane into rectangular or triangular regions, and will fit bilinear or linear surfaces to the regions.

Spline surface interpolation generally produces smoother contours and is the default.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(b)</td>
<td>(Mandatory)</td>
<td>A true value means to use spline surface interpolation. A false value means to use bilinear/linear surface interpolation.</td>
</tr>
</tbody>
</table>

### 28.14.11 setZBounds(minZ as Double, maxZ as Double)

**Function:** Clips the \(z\) values to the given bounds.

**Notes:**

In spline surface interpolation (see ContourLayer.setSmoothInterpolation), it is possible that the interpolated surface contains regions that are higher than the highest data point, or lower than the lowest data point.

As an example, consider a linear sequence of points with \(z\) values \([10, 20, 30, 40, 40, 30, 20, 10]\). The first 4 points represent an upward slope, while the last 4 points represent a download slope. If these points are to be joined with a smooth spline, the peak will naturally fall somewhere between the middle two points and exceed 40. So there will be a region in the spline higher than the highest data point.

In some applications, it may be desirable to limit the \(z\) values to certain bounds. For example, if the data are about rainfall, it is not desirable if the interpolated surface falls below 0, as there cannot be negative rainfall. The setZBounds method can be used to clip the interpolated surface to the desired bounds.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>minZ</td>
<td>DataBound</td>
<td>The minimum (z) value to clip to. Use NoValue if there is no minimum (z) bound. The special constant DataBound means that the minimum (z) value is the minimum data value.</td>
</tr>
<tr>
<td>maxZ</td>
<td>DataBound</td>
<td>The maximum (z) value to clip to. Use NoValue if there is no maximum (z) bound. The special constant DataBound means that the maximum (z) value is the maximum data value.</td>
</tr>
</tbody>
</table>
28.14.12  \texttt{setZData(zData() \text{ as Double})}

\textbf{Function:} Sets the z data used for the contour chart.

\textbf{Notes:}

Arguments:

\begin{tabular}{lll}
\textbf{Argument} & \textbf{Default} & \textbf{Description} \\
\hline
\texttt{zData} & (Mandatory) & An array of numbers as the z data for the contour chart. \\
\end{tabular}
**Function:** A XY chart showing a contour layer created using ChartDirector with the CDXYChartMBS class.
28.15  class CDDatasetMBS

28.15.1  class CDDatasetMBS

Function: The Dataset class represents data sets.
Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.15.2  Methods

28.15.3  Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

28.15.4  getDataColor as Integer

Function: Gets the main color used to draw the data set.
Notes: Returns the main color used to draw the data set.

28.15.5  getDataName as string

Function: Gets the name of the data set.
Notes: Return the name of the data set.

28.15.6  getLegendIcon as string

Function: Gets the CDML representation of the legend icon for the data set.
Notes:
The CDML representation can be used in any ChartDirector API that supports CDML. Note that the CDML representation is only valid in the BaseChart object that contains the data set. It is not allowed to use the CDML representation obtained from one chart in a different chart.
The legend icon is the same icon that would appear in the LegendBox. If you modify the icon using methods of the LegendBox object (such as using LegendBox.setKeyBorder to set the legend icon border), the modification will also apply to the icon returned by this method.

Returns the CDML representation of the legend icon for the data set.

### 28.15.7 getPosition(i as Integer) as Double

**MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Gets the positional value of a data point.

**Notes:**

The positional value is the value used to position the data point. Usually, the positional value is equal to the data value. However, for chart types in which the data sets are combined using the Stack or Percentage method, the positional value can be different from the data value. For example, for stacked charts, the positional value of a data point is equal to the accumulative value of the corresponding data points from data sets added before the target data set.

**Argument Default Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>(Mandatory)</td>
<td>The data point index of the data point. The first data point is 0; the nth data point is (n - 1).</td>
</tr>
</tbody>
</table>

Returns the positional value of the data point.

### 28.15.8 getUseYAxis as CDAxisMBS

**MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Gets the y-axis to use when drawing the data set.

**Notes:** Returns an Axis object representing the y-axis to use when drawing the data set.

### 28.15.9 getValue(i as Integer) as Double

**MBS ChartDirector Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Gets the value of a data point.

**Notes:**

**Argument Default Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>(Mandatory)</td>
<td>The data point index of the data point. The first data point is 0; the nth data point is (n - 1).</td>
</tr>
</tbody>
</table>
28.15.10 dataSet(data() as Double)

Function: Sets the data for this dataset.

28.15.11 dataSetColor(dataColor as color, edgeColor as color, shadowColor as color, shadowEdgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other dataSetColor method, but uses color instead of integer data type for passing color values.
See also:

- 28.15.12 dataSetColor(dataColor as Integer, edgeColor as Integer = -1, shadowColor as Integer = -1, shadowEdgeColor as Integer = -1)

28.15.12 dataSetColor(dataColor as Integer, edgeColor as Integer = -1, shadowColor as Integer = -1, shadowEdgeColor as Integer = -1)

Function: Sets the colors used to draw the data set.
Notes:
The usage of the colors depend on the layer type. For example, in a bar layer, the dataColor and edgeColor are used as the fill and border color of the bar. In a line layer, the dataColor is used as the color of the line, while the edgeColor is used as the border of the line for 3D lines, and is ignored for 2D lines.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataColor</td>
<td>(Mandatory)</td>
<td>The main color used to draw the data set.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>-1</td>
<td>The color used to draw the edges or borders of the data set, if any. -1 means that the edges are drawn using the default border color of the layer (defined using Layer.setBorderColor).</td>
</tr>
<tr>
<td>shadowColor</td>
<td>-1</td>
<td>The color to use to draw 3D shadows of the data set, if any. -1 means the shadow color will be a &quot;darker&quot; version of the dataColor, created by reducing the RGB intensities of the dataColor in half.</td>
</tr>
<tr>
<td>shadowEdgeColor</td>
<td>-1</td>
<td>The color to use to draw edges of the 3D shadows of the data set, if any. -1 means the shadow color will be a &quot;darker&quot; version of the edgeColor, created by reducing the RGB intensities of the edgeColor in half.</td>
</tr>
</tbody>
</table>

See also:
28.15.13  setDataLabelFormat(formatString as string)

**Function:** Sets the data label format for the data set.

**Notes:**

To set the label format for all data sets in a layer, use Layer.setDataLabelFormat.

For details description of data label format, please refer to Layer.setDataLabelFormat.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatString</td>
<td>(Mandatory)</td>
<td>The format string.</td>
</tr>
</tbody>
</table>

28.15.14  setDataLabelStyle(font as string = "", fontSize as Double = 8, fontColor as Integer = 0, fontAngle as Double = 0) as CDTextBoxMBS

**Function:** Enables data labels and sets their styles.

**Notes:**

To set the data label styles for all data sets in a layer, use Layer.setDataLabelStyle.

For details description of data labels, please refer to :Layer.setDataLabelStyle.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font used to draw the labels.</td>
</tr>
<tr>
<td>fontSize</td>
<td>8</td>
<td>The font size used to draw the labels.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The color used to draw the labels.</td>
</tr>
<tr>
<td>fontAngle</td>
<td>0</td>
<td>The rotation angle of the labels.</td>
</tr>
</tbody>
</table>

**Return Value**

A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See also:

- 28.15.15 setDataLabelStyle(font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS
28.15.15  setDataLabelStyle(font as string, fontsize as Double, fontcolor as color, fontangle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Same as the other setDataLabelStyle method, but uses color instead of integer data type for passing color values.  
See also:

- 28.15.14 setDataLabelStyle(font as string = "", fontsize as Double = 8, fontcolor as Integer = 0, fontangle as Double = 0) as CDTextBoxMBS

28.15.16  setDataName(name as string)

**Function:** Sets the name of the data set.  
**Notes:**
The name will be used in the legend box, if one is available for the chart.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>(Mandatory)</td>
<td>The name of the data set.</td>
</tr>
</tbody>
</table>

28.15.17  setDataSymbol(drawobj as CDDrawAreaMBS)

**Function:** Uses a DrawArea object as the graphics symbol to plot the data points.  
**Notes:**
In the current version of ChartDirector, data symbols are supported only in LineLayer, SplineLayer, StepLineLayer and ScatterLayer. To use data symbols in other layer types, add a ScatterLayer on top of that layer.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>(Mandatory)</td>
<td>A DrawArea object to be used as the symbol.</td>
</tr>
</tbody>
</table>

- 28.15.19 setDataSymbol(ImageFilePath as string)  
- 28.15.20 setDataSymbol(pic as Picture)
28.15.18 **setDataSymbol(file as folderitem)**

**Function:** Load an image from a file and use it as the graphics symbol to plot the data points.

**Notes:**
ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

In the current version of ChartDirector, data symbols are supported only in LineLayer, SplineLayer, StepLineLayer and ScatterLayer. To use data symbols in other layer types, add a ScatterLayer on top of that layer.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>

CHAPTER 28. CHARTDIRECTOR

Argument Default Description

obj (Mandatory) A picture object to be used as the symbol.

- 28.15.17 setDataSymbol(drawobj as CDDrawAreaMBS)
- 28.15.18 setDataSymbol(file as folderitem)
- 28.15.19 setDataSymbol(ImageFilePath as string)
- 28.15.21 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgeColor as Integer = -1)
- 28.15.22 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgeColor as color)
- 28.15.23 setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1)
- 28.15.24 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1)

28.15.21 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgeColor as Integer = -1)

Function: Uses a custom polygon as the graphics symbol to plot the data points.

Notes:
In the current version of ChartDirector, data symbols are supported only in LineLayer, SplineLayer, StepLineLayer and ScatterLayer. To use data symbols in other layer types, add a ScatterLayer on top of that layer.

Argument Default Description

polygon (Mandatory) An array of integers representing the coordinates the polygon vertices. See Shape Specification on how the custom shape is defined.
size 11 The nominal width and height of the symbol in pixels.
fillColor -1 The color used to fill the symbol. -1 means the color of the data set will be used.
edgeColor -1 The edge color used to draw the edge of the symbol. -1 means the edge color of the data set will be used.

See also:

28.15. **CLASS CDDATASETMB**

- 28.15.20 `setDataSymbol(pic as Picture)`

- 28.15.22 `setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgeColor as color)`

- 28.15.23 `setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1)`

- 28.15.24 `setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1)`

### 28.15.22 `setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgeColor as color)`

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other `setDataSymbol` method, but uses color instead of integer data type for passing color values.

See also:

- 28.15.17 `setDataSymbol(drawobj as CDDrawAreaMBS)`

- 28.15.18 `setDataSymbol(file as folderitem)`

- 28.15.19 `setDataSymbol(ImageFilePath as string)`

- 28.15.20 `setDataSymbol(pic as Picture)`

- 28.15.21 `setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgeColor as Integer = -1)`

- 28.15.23 `setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1)`

- 28.15.24 `setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1)`

### 28.15.23 `setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1)`

**Function:** Uses one of the built-in symbols as the graphics symbol to plot the data points.

**Notes:**

In the current version of ChartDirector, data symbols are supported only in LineLayer, SplineLayer, StepLineLayer and ScatterLayer. To use data symbols in other layer types, add a ScatterLayer on top of that layer.

28.15. CLASS CDDATASETMB

28.15.25  setLineWidth(w as Integer)

**Function:** Sets the line width of lines when drawing the data set.
**Notes:**
This method only applies to layers that employ lines to represent data (e.g. line layer).

If this method is not called, the default line width for the layer will be used (set using Layer.setLineWidth).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>w</td>
<td>(Mandatory)</td>
<td>The width of the line in pixels.</td>
</tr>
</tbody>
</table>

28.15.26  setSymbolOffset(offsetX as Integer, offsetY as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Offset the symbols in the x and y directions in pixel unit.
**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xOffset</td>
<td>(Mandatory)</td>
<td>The x offset in pixels. A positive value mean shifting to the right.</td>
</tr>
<tr>
<td>yOffset</td>
<td>(Mandatory)</td>
<td>The y offset in pixels. A positive value mean shifting to the bottom.</td>
</tr>
</tbody>
</table>

28.15.27  setUseYAxis(axis as CDAxisMB)

**Function:** Determine if the primary or secondary y-axis should be used when drawing the data set.
**Notes:**
To set the y-axis to use for all data sets within a layer, use Layer.setUseYAxis2.

Note: DataSet.setUseYAxis is a more general method that can support more than 2 y-axes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>true</td>
<td>A true value means the secondary y-axis will be used. A false value means the primary y-axis will be used.</td>

<td>The y-axis to use when drawing the data set.</td>
</tr>
</tbody>
</table>

See also:

- 28.15.27 `setUseYAxis(axis as CDAxisMBS)`
28.16. class CDDrawAreaMBS

28.16.1. class CDDrawAreaMBS

**Function:** The DrawArea class represents drawing surfaces, with methods for performing graphics primitives (such as drawing lines, shapes and texts) and the surfaces.

**Notes:**

All ChartDirector chart objects contain an internal DrawArea object for drawing the charts. This DrawArea object is accessible via BaseChart.getDrawArea or BaseChart.makeChart. This allows developers to apply custom graphics operations on the charts.

ChartDirector also supports creating standalone DrawArea objects by calling the DrawArea.DrawArea constructor. One common application is to use ChartDirector as a general purpose graphics library (e.g. adding text annotations to existing images, creating GIF buttons on the fly, etc).

28.16.2. Methods

28.16.3. adjustBrightness(c as Integer, brightness as Double) as Integer

**Function:** Creates a color that is a darkened or brightened version of the given color.

**Notes:**

A brightness less than 1 means the color is darkened, while a brightness greater than 1 means the color is brightened. For example, a brightness of 0.5 means the color is half as bright as the original color. If the original color is red, the color will become dark red. Conversely, a brightness of 2 means the color is twice as bright as the original color. If the original color is red, the color will become light red.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>(Mandatory)</td>
<td>The given color.</td>
</tr>
<tr>
<td>brightness</td>
<td>(Mandatory)</td>
<td>A non-negative number represent the factor to darken or brighten the color.</td>
</tr>
</tbody>
</table>

**Return Value**

A 32-bit integer representing the darkened or brightened color.
28.16.4  `affineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as color, filter as Integer = 2, blur as Double = 1.0)`

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other `affineTransform` method, but uses color instead of integer data type for passing color values.
See also:

- 28.16.5 `affineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as Integer = & hFFFFFFF, filter as Integer = 2, blur as Double = 1.0)`

28.16.5  `affineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as Integer = & hFFFFFFF, filter as Integer = 2, blur as Double = 1.0)`

**Function:** Perform affine transformation on the drawing surface.
**Notes:**
An affine transformation is an operation where every pixel is copied to another pixel according to the formula.

\[
\begin{align*}
x_{\text{Dest}} &= a \times x_{\text{Src}} + b \times y_{\text{Src}} + c \\
y_{\text{Dest}} &= d \times x_{\text{Src}} + e \times y_{\text{Src}} + f
\end{align*}
\]

where \((x_{\text{Src}}, y_{\text{Src}})\) is a source pixel, and \((x_{\text{Dest}}, y_{\text{Dest}})\) is where it should go to.

Many graphics operation, such as translation, rotation, and resizing, can be considered as a special case of affine transformation.

See also:

- 28.16.4 `affineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as color, filter as Integer = 2, blur as Double = 1.0)`

28.16.6  `arc(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, c as Integer)`

**Function:** Draws a circular or elliptical arc.
**Notes:**
### Argument Default Description

**a** (Mandatory) The parameter 'a' in the coordinate transformation formula "\( x_{\text{Dest}} = a \times x_{\text{Src}} + b \times y_{\text{Src}} + c \)".

**b** (Mandatory) The parameter 'b' in the coordinate transformation formula "\( x_{\text{Dest}} = a \times x_{\text{Src}} + b \times y_{\text{Src}} + c \)".

**c** (Mandatory) The parameter 'c' in the coordinate transformation formula "\( x_{\text{Dest}} = a \times x_{\text{Src}} + b \times y_{\text{Src}} + c \)".

**d** (Mandatory) The parameter 'd' in the coordinate transformation formula "\( y_{\text{Dest}} = d \times x_{\text{Src}} + e \times y_{\text{Src}} + f \)".

**e** (Mandatory) The parameter 'e' in the coordinate transformation formula "\( y_{\text{Dest}} = d \times x_{\text{Src}} + e \times y_{\text{Src}} + f \)".

**f** (Mandatory) The parameter 'f' in the coordinate transformation formula "\( y_{\text{Dest}} = d \times x_{\text{Src}} + e \times y_{\text{Src}} + f \)".

**bgColor** FFFFFF The background color used to fill destination pixels that are not mapped to any source pixels.

**filter** LinearFilter The filter to use for re-sampling.

**blur** 1 The blur factor to use for re-sampling.

---

### Function: circle(cx as Integer, cy as Integer, rx as Integer, ry as Integer, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other circle method, but uses color instead of integer data type for passing color values.

See also:

- 28.16.8 circle(cx as Integer, cy as Integer, rx as Integer, ry as Integer, edgeColor as Integer, fillColor as color as Integer)
28.16.8  \texttt{circle(cx as Integer, cy as Integer, rx as Integer, ry as Integer, edgeColor as Integer, fillColor as Integer)}

\textbf{Function}: Draws a circle or an ellipse.  
\textbf{Notes}:  

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cx</td>
<td>(Mandatory)</td>
<td>The x coordinate of the center of the circle or ellipse.</td>
</tr>

</tbody>
</table>
28.16. CLASS CDDRAWAREAMBS

28.16.10 Constructor

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a DrawArea object.

28.16.11 cylinder(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, depthX as Integer, depthY as Integer, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other cylinder method, but uses color instead of integer data type for passing color values. **See also:**

- 28.16.12 cylinder(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, depthX as Integer, depthY as Integer, edgeColor as Integer, fillColor as Integer)

28.16.12 cylinder(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, depthX as Integer, depthY as Integer, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Draws a cylinder surface as the area spanned by moving an arc. **Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cx</td>
<td>(Mandatory)</td>
<td>The x coordinate of the center of the circle or ellipse for the arc.</td>
</tr>
<tr>
<td>cy</td>
<td>(Mandatory)</td>
<td>The y coordinate of the center of the circle or ellipse for the arc.</td>
</tr>
<tr>
<td>rx</td>
<td>(Mandatory)</td>
<td>The horizontal radius of the circle or ellipse.</td>
</tr>
<tr>
<td>ry</td>
<td>(Mandatory)</td>
<td>The vertical radius of the circle or ellipse.</td>
</tr>
<tr>
<td>a1</td>
<td>(Mandatory)</td>
<td>The start angle of the arc. The angle is measured clockwise, with 0 degree being the upward pointing direction.</td>
</tr>
<tr>
<td>a2</td>
<td>(Mandatory)</td>
<td>The end angle of the arc. The angle is measured clockwise, with 0 degree being the upward pointing direction.</td>
</tr>
<tr>
<td>depthX</td>
<td>(Mandatory)</td>
<td>The x displacement representing the motion of the arc to span the cylinder.</td>
</tr>
<tr>
<td>depthY</td>
<td>(Mandatory)</td>
<td>The y displacement representing the motion of the arc to span the cylinder.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>(Mandatory)</td>
<td>The border color. To disable border, set the edgeColor the same as the fillColor.</td>
</tr>
<tr>
<td>fillColor</td>
<td>(Mandatory)</td>
<td>The fill color. To disable filling, set the fillColor to Transparent.</td>
</tr>
</tbody>
</table>

**See also:**

- 28.16.11 cylinder(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, depthX as Integer, depthY as Integer, edgeColor as color, fillColor as color)
28.16.13  
dashLineColor(colorvalue as color, patternCode as Integer = & h0505) 
as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other dashLineColor method, but uses color instead of integer data type for passing 
color values.
See also:

- 168.6.4 dashLineColor(colorvalue as Integer, patternCode as Integer = & h0505) as Integer

28.16.14  
dashLineColor(colorvalue as Integer, patternCode as Integer = & h0505) 
as Integer

Function: Creates a dash line color.
Notes:
A dash line color is a dynamic color that switches on and off periodically. When it is used to draw a line, 
the line will appear as a dash line.

The style of the dash line is defined by a pattern code, which is a 4-byte integer. A value of PPQQRSS 
(in hex) means the first PP pixels are turned on, followed by QQ pixels turned off, followed by RR pixels 
turned on, followed by SS pixels turned off, and then restart from PP again.

ChartDirector comes from several predefined constants for common dash line patterns.

Constant Value (in Hex) Dash Line Style

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DashLine</td>
<td>00000505</td>
</tr>
<tr>
<td>DotLine</td>
<td>00000202</td>
</tr>
<tr>
<td>DotDashLine</td>
<td>05050205</td>
</tr>
<tr>
<td>AltDashLine</td>
<td>0A050505</td>
</tr>
</tbody>
</table>

Argument Default Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color to draw the dash line.</td>
</tr>
<tr>
<td>patternCode</td>
<td>DashLine</td>
<td>A 4-byte integer representing the style of the dash line.</td>
</tr>
</tbody>
</table>

Return Value
A 32-bit integer representing the dash line color.
See also:

- 168.5.18 dashLineColor(colorvalue as color, patternCode as Integer = & h0505) as Integer
28.16.15 enableVectorOutput

**Function:** Enables true vector graphics output.

**Notes:**

By default, when creating the output image, ChartDirector draws directly onto an output buffer representing the bitmap of the image. For example, for a chart 800 x 600 pixels in size, the output buffer may represent a 800 x 600 bitmap. The output buffer size is unchanged no matter how many items are drawn onto it. Even if the output contains 1 million elements (e.g. 1 million symbols), the size of the output buffer is still the same.

On the other hand, a true vector output is indefinitely scalable and can be considered as having infinite resolution. To produce a true vector output, it is necessary to remember the graphics operations for every element in the output buffer. The output buffer size is therefore proportional to the number of elements to draw.

This method tells ChartDirector that it needs to remember the graphics operations to prepare for true vector output. If true vector output is needed, this method should be called immediately after creating the DrawArea object.

If this method is not called, and a vector graphics output format is used (such as SVG), instead of a true vector output, ChartDirector will output a raster image using the vector graphics format. (Most vector graphics formats support embedded raster images.)

28.16.16 fill(x as Integer, y as Integer, colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other fill method, but uses color instead of integer data type for passing color values.

See also:

- 28.16.17 fill(x as Integer, y as Integer, colorvalue as color, borderColor as color)
- 28.16.18 fill(x as Integer, y as Integer, colorvalue as Integer)
- 28.16.19 fill(x as Integer, y as Integer, colorvalue as Integer, borderColor as Integer)

28.16.17 fill(x as Integer, y as Integer, colorvalue as color, borderColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other fill method, but uses color instead of integer data type for passing color values.

See also:

- 28.16.16 fill(x as Integer, y as Integer, colorvalue as color)
• 28.16.18 fill(x as Integer, y as Integer, colorvalue as Integer) 4630

• 28.16.19 fill(x as Integer, y as Integer, colorvalue as Integer, borderColor as Integer) 4630

28.16.18  fill(x as Integer, y as Integer, colorvalue as Integer)

**Function:** Flood fill a region using the specified color.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x coordinate one pixel inside the region to be filled.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y coordinate one pixel inside the region to be filled.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color used to fill the region.</td>
</tr>
</tbody>
</table>

See also:

• 28.16.16 fill(x as Integer, y as Integer, colorvalue as color) 4629

• 28.16.19 fill(x as Integer, y as Integer, colorvalue as Integer, borderColor as Integer) 4630

28.16.19  fill(x as Integer, y as Integer, colorvalue as Integer, borderColor as Integer)

**Function:** Fill a region using the specified color, where the region is bounded by a given border color.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x coordinate one pixel inside the region to be filled.</td>

• 28.16.17 fill(x as Integer, y as Integer, colorvalue as color, borderColor as color) 4629

• 28.16.18 fill(x as Integer, y as Integer, colorvalue as Integer) 4630
28.16.20  getARGBColor(c as Integer) as Integer

**Function:** Obtain the ARGB color given a palette color.
**Notes:**
If the given color is already in ARGB format, the same value is returned.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>(Mandatory)</td>
<td>The color to be changed to ARGB format.</td>
</tr>
</tbody>
</table>

**Return Value**
The ARGB color converted from the given color.

28.16.21  getHeight as Integer

**Function:** Gets the height of the drawing surface.

28.16.22  getPixel(x as Integer, y as Integer) as Integer

**Function:** Gets the color of a pixel.
**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x coordinate of the pixel.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y coordinate of the pixel.</td>
</tr>
</tbody>
</table>

**Return Value**
The color of the pixel.

28.16.23  getWidth as Integer

**Function:** Gets the width of the drawing surface.
28.16.24  gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other gradientColor method, but uses color instead of integer data type for passing color values.

See also:

- 28.16.25 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

- 28.16.26 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer

- 28.16.27 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer

28.16.25  gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

**Function:** Creates a multi-point linear gradient color.

**Notes:**

This method is for backward compatibility. Use DrawArea.linearGradientColor2 instead.

<table>
<thead>
<tr>
<th>Argument</th>

</tbody>
</table>

**Return Value**

A 32-bit integer representing the linear gradient color.

See also:

- 28.16.24 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

- 28.16.26 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer
28.16.26 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other gradientColor method, but uses color instead of integer data type for passing color values.

**See also:**
- 28.16.24 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer
- 28.16.25 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer
- 28.16.27 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer

28.16.27 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer

**Function:** Creates a two-point linear gradient color.

**Notes:**
This method is for backward compatibility. Use DrawArea.linearGradientColor instead.

<table>
<thead>
<tr>

28.16.28 halfColor(c as Integer) as Integer

**Function:** Creates a color that is half the intensity of the given color.
**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td></td>
<td>The given color.</td>
</tr>
</tbody>
</table>

**Return Value**
A 32-bit integer representing the half intensity color.

28.16.29 hCylinderTransform(yDiameter as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other hCylinderTransform method, but uses color instead of integer data type for passing color values.
**See also:**
- 28.16.30 hCylinderTransform(yDiameter as Integer, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

28.16.30 hCylinderTransform(yDiameter as Integer, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

**Function:** Wraps the drawing surface onto a horizontal cylinder.
**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>

</table>

**See also:**
- 28.16.29 hCylinderTransform(yDiameter as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0)
28.16.31  hFlip

**Function:** Flip the drawing surface along the central horizontal line.

28.16.32  hline(x1 as Integer, x2 as Integer, y as Integer, c as Integer)

**Function:** Draws a horizontal line.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x1</td>
<td>(Mandatory)</td>
<td>The x coordinate of the first end-point of the line.</td>
</tr>
<tr>
<td>x2</td>
<td>(Mandatory)</td>
<td>The x coordinate of the second end-point of the line.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y coordinate of the line.</td>
</tr>
<tr>
<td>c</td>
<td>(Mandatory)</td>
<td>The color of the line.</td>
</tr>
</tbody>
</table>

28.16.33  hTriangleTransform(tWidth as Integer = -1, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

**Function:** Wraps the drawing surface onto a horizontal triangle pointing leftwards.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tWidth</td>
<td>-1</td>
<td>The width of the triangle in pixels.</td>
</tr>

</tbody>
</table>

See also:

- 28.16.34 hTriangleTransform(tWidth as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

28.16.34  hTriangleTransform(tWidth as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other hTriangleTransform method, but uses color instead of integer data type for passing color values.

See also:
- 28.16.33 hTriangleTransform(tWidth as Integer = -1, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

28.16.35  initDynamicLayer

**Function:** Initializes a dynamic layer for drawing text and shapes.

**Notes:**
This method clears the existing dynamic layer, or creates a new one if there is no existing dynamic layer.
This method returned a DrawArea object that can be used to draw on the dynamic layer. The dynamic layer can later be removed using BaseChart.removeDynamicLayer.

The design of the dynamic layer is for drawing small, rapidly updatable contents for desktop applications.
For example, the dynamic layer can be used to implement a cross-hair mouse cursor, with text showing the location of the mouse cursor. To do this, in the mouse move event handler, BaseChart.initDynamicLayer can be used to create or clear the dynamic layer. The returned DrawArea object can then be used to draw the cross hair cursor (as two straight lines) and the text. When the mouse cursor leaves the chart, BaseChart.removeDynamicLayer can be used in the mouse out event handler to remove the cross-hair cursor and the text.

Note that as long as the dynamic layer is not removed with BaseChart.removeDynamicLayer, only the returned DrawArea object should be used to draw things on the dynamic layer. No other objects should be used to draw on the chart.

Returns a DrawArea object that can be used to add text and shapes to the dynamic layer.

28.16.36  line(x1 as Double, y1 as Double, x2 as Double, y2 as Double, color-Value as color, lineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Draw a straight line.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x1</td>
<td>(Mandatory)</td>
<td>The x coordinate of the first end-point of the line.</td>

28.16.38 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other linearGradientColor method, but uses color instead of integer data type for passing color values.
**See also:**

- 28.16.39 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer
- 28.16.40 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer
- 28.16.41 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer
28.16.39 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer

**Function:** Creates a multi-point linear gradient color.

**Notes:**

In this method, the color points are defined as an array of positions and colors along a reference line segment, in the following format:

position0, color0, position1, color1, ..., positionN, colorN

The positions are specified as a number from 0 - 256 (0 - 100 in hex), in which 0 represents the starting point of the reference line segment, and 256 (100 in hex) represents the ending point of the reference line segment.

For example, the array (in hex):

000000, FF0000, 000080, FFFF00, 000100, 00FF00

means the starting point (000000) is red (FF0000), the mid-point (000080 in hex) is yellow (FFFF00), and the ending point (000100 in hex) is green (00FF00).

One common usage of multi-point gradient colors is to define colors that have metallic look and feel. ChartDirector comes from several predefined gradient color arrays as follows.

**Name** | **Value (in Hex)**
--- | ---
goldGradient | 000000, FFE743, 000060, FFFFE0, 0000B0, FFF0B0, 000100, FFE743
silverGradient | 000000, C8C8C8, 000060, F8F8F8, 0000B0, E0E0E0, 000100, C8C8C8
redMetalGradient | 000000, E09898, 000060, FFF0F0, 0000B0, F0D8D8, 000100, E09898
greenMetalGradient | 000000, 98E098, 000060, F0FFF0, 0000B0, D8F0D8, 000100, 98E098
blueMetalGradient | 000000, 9898E0, 000060, F0F0FF, 0000B0, D8D8F0, 000100, 9898E0

**Return Value**

A 32-bit integer representing the linear gradient color.

See also:

- 28.16.38 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer
- 28.16.40 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer
- 28.16.41 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer

CHAPTER 28. CHARTDIRECTOR

Argument Default Description
startX (Mandatory) The x coordinate of the starting point of the reference gradient line segment.
startY (Mandatory) The y coordinate of the starting point of the reference gradient line segment.
endX (Mandatory) The x coordinate of the ending point of the reference gradient line segment.
endY (Mandatory) The y coordinate of the ending point of the reference gradient line segment.
startColor (Mandatory) The color at the starting point of the reference gradient line segment.
derColor (Mandatory) The color at the ending point of the reference gradient line segment.
periodic false Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie beyond the end points of the gradient line segment will assume the colors of the end points.

- 28.16.40 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer

28.16.42 load(path as string) as boolean

Function: Load an image file into the current DrawArea.
Notes:
This method will overwrite the current DrawArea. The image type is determined based on file extension, which must be png, jpg/jpeg, gif or wbmp/wmp.

Argument Default Description
filename (Mandatory) The filename of the image to be loaded.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.

28.16.43 loadGIF(path as string) as boolean

Function: Load a GIF image into the current DrawArea.
Notes:
This method will overwrite the current DrawArea.

Argument Default Description
filename (Mandatory) The filename of the image to be loaded.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.

### 28.16.44 `loadJPG(path as string) as boolean`

**Function:** Load a JPG image into the current DrawArea.

**Notes:**
This method will overwrite the current DrawArea.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>

### 28.16.50 out(file as folderitem) as boolean

**Function:** Writes the DrawArea to an image file.

**Notes:**

The file format is determined based on file extension, which must be png, jpg/jpeg, gif, wbmp/wmp or bmp.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>(Mandatory)</td>
<td>The filename of the output image file.</td>
</tr>
</tbody>
</table>

**Return Value**

A true value indicates no error. A false value indicates the operation is unsuccessful.

### 28.16.51 outBMP as string

**Function:** Writes the DrawArea as a BMP image to memory.

See also:

- 28.16.52 outBMP(file as folderitem) as boolean

### 28.16.52 outBMP(file as folderitem) as boolean

**Function:** Writes the DrawArea to a BMP image file.

**Notes:**
Argument Default Description
filename (Mandatory) The filename of the output image file.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.
See also:

- 28.16.51 outBMP as string

28.16.53 outGIF as string

Function: Writes the DrawArea as a GIF image to memory.
See also:

- 28.16.54 outGIF(file as folderitem) as boolean

28.16.54 outGIF(file as folderitem) as boolean

Function: Writes the DrawArea to a GIF image file.
Notes:

Argument Default Description
filename (Mandatory) The filename of the output image file.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.
See also:

- 28.16.53 outGIF as string

28.16.55 outJPG(file as folderitem, quality as Integer = 80) as boolean

Function: Writes the DrawArea to a JPEG image file.
Notes:

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.
See also:

- 28.16.56 outJPG(quality as Integer = 80) as string

</thead>
<tbody>
<tr>
<td>filename</td>
<td>(Mandatory)</td>
<td>The filename of the output image file.</td>
</tr>
</tbody>
</table>

**Return Value**

A true value indicates no error. A false value indicates the operation is unsuccessful.

See also:

- 28.16.60 outPNG as string

28.16.62 outSVG(file as folderitem, options as string = "") as boolean

**Function:** Writes the DrawArea to a SVG or SVGZ image file.

**Notes:**

To output true vector graphics in SVG or SVGZ format, please ensure DrawArea.enableVectorOutput is called immediately after creating the DrawArea object. Otherwise the output will be a bitmap image embedded in SVG or SVGZ.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>(Mandatory)</td>
<td>The file of the output image file.</td>
</tr>
<tr>
<td>options</td>
<td>&quot;&quot;</td>
<td>A text string specifying optional parameters for the SVG output. Currently, the only supported text string is &quot;compress&quot;, which means to create a SVGZ (compressed SVG) instead of a regular SVG.</td>

- 28.16.63 outSVG(options as string = "") as string

28.16.63 outSVG(options as string = "") as string

Function: Writes the DrawArea as a SVG or SVGZ image to memory.

Notes:
To output true vector graphics in SVG or SVGZ format, please ensure DrawArea.enableVectorOutput is called immediately after creating the DrawArea object. Otherwise the output will be a bitmap image embedded in SVG or SVGZ.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>&quot;&quot;</td>
<td>A text string specifying optional parameters for the SVG output. Currently, the only supported text string is &quot;compress&quot;, which means to create a SVGZ (compressed SVG) instead of a regular SVG.</td>
</tr>
</tbody>
</table>

Return Value
A memory block containing the SVG or SVGZ image.

See also:
- 28.16.62 outSVG(file as folderitem, options as string = "") as boolean

28.16.64 outWMP as string

Function: Writes the DrawArea to a WAP bitmap image file.

See also:
- 28.16.65 outWMP(file as folderitem) as boolean

28.16.65 outWMP(file as folderitem) as boolean

Function: Writes the DrawArea to a WAP bitmap image file.

Notes:

<table>
<thead>

CHAPTER 28. CHARTDIRECTOR

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.
See also:

- 28.16.64 outWMP as string

28.16.66 patternColor(colors() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other patternColor method, but uses color instead of integer data type for passing color values.
See also:

- 28.16.67 patternColor(colors() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer
- 28.16.68 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer

28.16.67 patternColor(colors() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer

Function: Creates a pattern color using an array of colors as the bitmap pattern.
Notes:
A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colorArray</td>
<td>(Mandatory)</td>
<td>An array of colors representing the colors of the bitmap pixels. The color of the pixel at (x, y) should correspond to index (x + y * width - 1) of the array.</td>
</tr>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the bitmap in pixels. (The width is automatically computed as the size of the color array divided by the height.)</td>
</tr>
<tr>
<td>startX</td>
<td>0</td>
<td>The x coordinate of a reference point to align with the top-left corner the pattern.</td>
</tr>
<tr>
<td>startY</td>
<td>0</td>
<td>The y coordinate of a reference point to align with the top-left corner the pattern.</td>
</tr>
</tbody>
</table>

Return Value
A 32-bit integer representing the pattern color.
See also:

- 28.16.66 patternColor(colors() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer
28.16.68 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer

Function: Creates a pattern color by loading the pattern from an image file.
Notes:
A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to DrawArea.setSearchPath on the directory that ChartDirector will search for the file.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>

28.16.74  **radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer**

**Function:** Creates a multi-point radial gradient color.

**Notes:**

In this method, the color points are defined as an array of radial distances and colors, in the following format:

```
distance0, color0, distance1, color1, ..., distanceN, colorN
```

The distances are specified as a number from 0 - 256 (0 - 100 in hex), in which 0 represents the center of the gradient defining ellipse, and 256 (100 in hex) represents the perimeter of the gradient defining ellipse.

For example, the array (in hex):
means the center (000000) is red (FF0000), the mid-point (000080 in hex) is yellow (FFFF00), and the perimeter (000100 in hex) is green (00FF00).

<table>

<tr>
<td>periodic</td>
<td>false</td>
<td>Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie outside the gradient defining ellipse will assume the color at the perimeter of the gradient defining ellipse.</td>
</tr>
</tbody>
</table>

Return Value

A 32-bit integer representing the radial gradient color.

See also:

- 28.16.74 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer
- 28.16.75 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer

28.16.77 rAffineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other rAffineTransform method, but uses color instead of integer data type for passing color values.

See also:

- 28.16.78 rAffineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

28.16.78 rAffineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as Integer = & hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

Function: Perform reverse affine transformation on the drawing surface.

Notes:

A reverse affine transformation is an operation where every pixel is copied from another pixel according to the formula.
CHAPTER 28. CHARTDIRECTOR

xSrc = a * xDest + b * yDest + cySrc = d * xDest + e * yDest + f
where (xDest, yDest) is a destination pixel, and (xSrc, ySrc) is where it should come from.

Many graphics operation, such as translation, rotation, and resizing, can be considered as a special case of reverse affine transformation.

<table>

<td>The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support CDBaseChartMBS.glassEffect and CDBaseChartMBS.softLighting effects.</td>
</tr>
</tbody>
</table>

See also:

- 28.16.79 rect(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, edgeColor as color, fillColor as color, raisedEffect as Integer = 0)

28.16.81 reduceColors(colorCount as Integer, blackAndWhite as boolean=false) as Integer

Function: Reduces the number of colors in the image.

Notes:

The colors in the image will be reduced to at most the number of colors specified, which should be 16 - 256. You may also set the image to black and white. In this case, the color count means number of grey levels.

The colors will be reduced by computing an optimal palette for the image. The image will then be converted using the palette based on the current dithering settings (see DrawArea.setDitherMethod).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colorCount</td>
<td>(Mandatory)</td>
<td>The maximum number of colors that image should have after after reduction. Must be between 16 - 256.</td>
</tr>
<tr>
<td>blackAndWhite</td>
<td>false</td>
<td>A true value means the image will be converted to black and white (with grey levels). A false value means the image will not be converted to black and white.</td>
</tr>
</tbody>
</table>

Return Value
The actual number of colors the converted image has.

### 28.16.82 `removeDynamicLayer(keepOriginal as boolean = false)`

**Function:** Removes the dynamic layer if any.

### 28.16.83 `resize(newWidth as Integer, newHeight as Integer, filter as Integer = 1, blur as Double = 1.0)`

**Function:** Resizes the drawing surface.
**Notes:**

28.16.86 ringSector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, a1 as Double, a2 as Double, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other ringSector method, but uses color instead of integer data type for passing color values.
See also:

- 28.16.87 ringSector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, a1 as Double, a2 as Double, edgeColor as Integer, fillColor as Integer)

28.16.87 ringSector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, a1 as Double, a2 as Double, edgeColor as Integer, fillColor as Integer)

Function: Draws a ring sector.
See also:

- 28.16.86 ringSector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, a1 as Double, a2 as Double, edgeColor as color, fillColor as color)

28.16.88 rotate(angle as Double, bgColor as color, cx as Double = -1, cy as Double = -1, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other rotate method, but uses color instead of integer data type for passing color values.
See also:

- 28.16.89 rotate(angle as Double, bgColor as Integer = & hFFFFFF, cx as Double = -1, cy as Double = -1, filter as Integer = 2, blur as Double = 1.0)

28.16.89 rotate(angle as Double, bgColor as Integer = & hFFFFFF, cx as Double = -1, cy as Double = -1, filter as Integer = 2, blur as Double = 1.0)

Function: Rotate the drawing surface.
Notes:
See also:
CHAPTER 28. CHARTDIRECTOR

Argument Default Description
angle (Mandatory) The rotation angle measured clockwise in degrees.
bgColor FFFFFF The background color used to fill the space left after rotation.
cx -1 The x coordinate of the center of rotation. -1 means rotating about the center of the drawing surface.
icy -1 The y coordinate of the center of rotation. -1 means rotating about the center of the drawing surface.
filter LinearFilter The filter to use for re-sampling.
blur 1 The blur factor to use for re-sampling.

- 28.16.88 rotate(angle as Double, bgColor as color, cx as Double = -1, cy as Double = -1, filter as Integer = 2, blur as Double = 1.0)

28.16.90 sector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other sector method, but uses color instead of integer data type for passing color values.
See also:

- 28.16.91 sector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, edgeColor as Integer, fillColor as Integer)

28.16.91 sector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, edgeColor as Integer, fillColor as Integer)

Function: Draws a circular or elliptical sector.
Notes:

Argument Default Description
cx (Mandatory) The x coordinate of the center of the circle or ellipse.
cy (Mandatory) The y coordinate of the center of the circle or ellipse.
rx (Mandatory) The horizontal radius of the circle or ellipse.
ry (Mandatory) The vertical radius of the circle or ellipse.
a1 (Mandatory) The start angle of the sector in degrees. The angle is measured clockwise, with 0 degree being the upward pointing direction.
a2 (Mandatory) The end angle of the sector in degrees. The angle is measured clockwise, with 0 degree being the upward pointing direction.
edgeColor (Mandatory) The border color. To disable border, set the edgeColor the same as the fillColor.
fillColor (Mandatory) The fill color. To disable filling, set the fillColor to Transparent.

28.16. CLASS CDDRAWAREAMBS

- 28.16.90 sector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, edgeColor as color, fillColor as color)

28.16.92 setAntiAlias(shapeAntiAlias as boolean=true, textAntiAlias as Integer = 2)

**Function:** Controls whether anti-alias is used when drawing lines, shapes and text.

**Notes:**
For anti-aliasing text, ChartDirector supports the following modes.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NoAntiAlias</td>
<td>0</td>
<td>Disable anti-alias when drawing text</td>
</tr>
<tr>
<td>AntiAlias</td>
<td>1</td>
<td>Always use anti-alias when drawing text</td>
</tr>
<tr>
<td>AutoAntiAlias</td>
<td>2</td>
<td>Automatically determine if anti-alias should be used for the text. This is the default.</td>
</tr>
</tbody>
</table>

Currently, ChartDirector will anti-alias only large or bold fonts. For small fonts, assuming it is of high quality, anti-alias is unnecessary. It is because high quality fonts are normally designed to be sharp and clear at low resolution. Anti-aliasing will blur the fonts and make them look worse.

However, for complicated fonts (e.g. some fonts with oriental characters), or for lower quality fonts (e.g. some freeware fonts), anti-alias may be necessary. In this case, it may be needed to force anti-aliasing of all fonts using AntiAlias mode.

<table>

<td>&quot;&quot;</td>
<td>The default bold-italic font. This is the same as the fourth font in the font table. An empty string means the default is unchanged.</td>
</tr>
</tbody>
</table>

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
28.16.100  setDitherMethod(value as Integer)

**Function:** Sets the dithering method in case dithering is necessary.

**Notes:**

Dithering is a process of reducing the colors of an image. It is required if an image has more colors than can be supported by the image format. For example, a GIF image can only have 256 colors. If the actual image contains more than 256 colors, dithering is needed to reduce the colors to less than 256.

The dithering method must be one of the following predefined constants.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quantize</td>
<td>0</td>
<td>ChartDirector will first compute an optimal 256-color palette based on colors on the actual image. It then replaces the color of each pixel with the nearest color in the palette. This is the default method and produces the best result in most cases.</td>
</tr>
<tr>
<td>OrderedDither</td>
<td>1</td>
<td>Use the ordered dithering algorithm with a 4 x 4 matrix, and with the standard web-safe palette. The web-safe palette is a palette compatible with very old browsers (e.g. Netscape 1.x and 2.x browsers) on 256-color displays.</td>
</tr>
<tr>
<td>ErrorDiffusion</td>
<td>2</td>
<td>Similar to OrderedDither but use the Floyd and Steinberg error diffusion algorithm.</td>
</tr>
</tbody>
</table>

Web-safe palette is not an optimal palette. In most cases, this method is not as good as the Quantize method. Use this method only if you have to use the web-safe palette.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>m</td>
<td>(Mandatory)</td>
<td>The dithering method to use in case dithering is necessary.</td>
</tr>
</tbody>
</table>

28.16.101  setFontTable(index as Integer, font as string)

**Function:** Sets an entry in the font table to the specified font name.

**Notes:**

The first 4 fonts in the font table have special significance. They are the defaults for normal, bold, italic and bold-italic fonts.
28.16. CLASS CDDRAWAREAMBS

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>(Mandatory)</td>
<td>An index to the font table, starting from 0.</td>
</tr>
<tr>
<td>font</td>
<td>(Mandatory)</td>
<td>The font name to be put into the font table.</td>
</tr>
</tbody>
</table>

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

28.16.102 setInterlace(value as boolean)

**Function:** Sets the interlace mode when creating the image.

**Notes:**

Note that in many case an interlaced image is less compressible, and may have a large image size. The default is non-interlace.

Note that this method only applies to image formats that support interlacing (GIF and PNG). It is ignored for image formats that does not support interlacing.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>(Mandatory)</td>
<td>A true value means the image is interlaced. A false value means the image is non-interlaced.</td>
</tr>
</tbody>
</table>
28.16.103 setOutputOptions(options as string)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Sets output format options for the next chart output. Currently, only SVG, SVGZ and PDF output formats support output options.

**Notes:**
An output option can be a flag (such as "compress") or an attribute-value pair (such as "width=800"). Multiple output options can be joined using semicolons as delimiters.

**SVG Options**

<table>
<thead>
<tr>
<th>SVG Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>compress</td>
<td>Flag</td>
<td>Compressed the SVG, that is, output SVGZ.</td>
</tr>
<tr>

<td>Flag</td>
<td>Render the chart as a bitmap and output the bitmap as SVG.</td>
</tr>
<tr>
<td>noxmldecl</td>
<td>Flag</td>
<td>Do not include the xml declaration line &quot;&lt;?xml version=&quot;1.0&quot; .... &gt;&quot; in the SVG.</td>
</tr>
<tr>
<td>nodocdecl</td>
<td>Flag</td>
<td>Do not include the document type declaration line &quot;&lt;!DOCTYPE svg PUBLIC .... &gt;&quot; in the SVG.</td>
</tr>
<tr>
<td>width</td>
<td>Flag / Attribute</td>
<td>Specifies the width attribute of the SVG. By default, ChartDirector will not include the width or height attribute in the SVG output. In this case, the SVG is variable in size and would assume the size of its container. For example, if the SVG is inside a &lt;DIV&gt;block in a web page, it will assume the size of the DIV block. If the &quot;width&quot; option is used as a flag, ChartDirector will include the width attribute in the SVG and set it to the chart width. If the &quot;width&quot; option is used as an attribute (such as &quot;width=800&quot;), ChartDirector will include the width attribute in the SVG and set it to the specified value. The specified value should be some text that is valid as SVG width. Examples are &quot;100&quot; and &quot;75%&quot;.</td>
</tr>
<tr>
<td>height</td>
<td>Flag / Attribute</td>
<td>Specifies the height attribute of the SVG. See the description on &quot;width&quot; above on how to use it.</td>
</tr>
</tbody>
</table>

**PDF Options**

The PDF viewer will convert the pixel unit into physical unit (eg. inches) so that it can be layout on paper or other physical media. The default conversion factor for the chart is 96 pixels per inch. The "dpi" attribute can be used to specify an alternative value. The value must be a number.

28.16.104 setPaletteMode(value as Integer)

**Function:** Sets the palette mode to use when writing the image in PNG format.

**Notes:**
The PNG format supports both palette based images and true color images. Palette based images can only
28.16. CLASS CDDRAWAREAMBS

PDF Option  Type  Description
bitmap  Flag  Render the chart as a bitmap and output the bitmap as PDF.
width  Attribute  The width of the chart in the PDF in pixel unit. By default, ChartDirector will use the pixel width of the chart as the width of the chart in PDF. The "width" attribute can be used to specify an alternative value. The value must be a number.
height  Attribute  The width of the chart in the PDF in pixel unit. See the description on "width" above for how to use it.
pagewidth  Attribute  The page width in pixel unit. By default, ChartDirector will set the page width to the same width as the chart. The "pagewidth" attribute can be used to specify an alternative value. The value must be a number.
pageheight  Attribute  The page height in pixel unit. By default, ChartDirector will set the page height to the same height as the chart. The "pageheight" attribute can be used to specify an alternative value. The value must be a number.
leftx  Attribute  The x coordinate of the left side of the chart within the page in pixel unit. By default, ChartDirector will center the chart in the page. The "leftx" attribute can be used to specify an alternative horizontal position. The coordinate must be a number.
topy  Attribute  The y coordinate of the top side of the chart within the page in pixel unit. By default, ChartDirector will center the chart in the page. The "topy" attribute can be used to specify an alternative vertical position. The coordinate must be a number.
dpi  Attribute  Specify the factor for conversion from pixel to physical unit.

Argument  Default  Description
options  (Mandatory)  A list of options delimited by semicolons.

have 256 colors, but is smaller in size.

The palette mode must be one of the following predefined constants.

Constant  Value  Description
TryPalette  0  Use palette mode if the image contains less than 256 colors, otherwise use true color mode. This is the default.
ForcePalette  1  Use palette mode. If the image contains more than 256 colors, reduce it to 256 colors using dithering (see DrawArea.setDitherMethod).
NoPalette  2  Use true color mode.
CHAPTER 28. CHARTDIRECTOR

66  Argument       Default      Description
  p                        (Mandatory)  The palette mode for PNG images.

28.16.105  setSize(path as string)

Function:  Sets the file system search path for loading image files.
Notes:
Several ChartDirector operations involve loading image files. Examples are wallpapers (BaseChart.setWall-
paper), background images (BaseChart.setBgImage and PlotArea setBackground2), user-defined symbols
(DataSet.setDataSymbol2) or for embedding images in text using ChartDirector Mark Up Language.

• 184.4.9 setSize(width as Integer, height as Integer, bgColor as color)
28.16. CLASS CDDRAWAREAMBS

28.16.108 setTransparentColor(value as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other setTransparentColor method, but uses color instead of integer data type for passing color values.

See also:

• 28.16.109 setTransparentColor(value as Integer)

28.16.109 setTransparentColor(value as Integer)

Function: Specifies a certain color to mean transparent when creating the image output, or to include alpha transparency channel in the output.

Notes:

There are two types of transparency:

Alpha transparency: In addition to red, green and blue levels, there is a transparency level associated with each pixel, which can range from completely transparent to completely opaque. The data associated with the transparency information is called the alpha channel.

Single color transparency: The image itself has no alpha channel, but a certain color is used to mean completely transparent. For internal drawing, ChartDirector always use alpha transparency. However, when outputting the image as an image file, ChartDirector by default will remove the alpha channel to reduce image size. It is because many image displaying software do not support alpha transparency. For example, the IE browser only supports single color transparency but not alpha transparency.

If you want to use single color transparency in the output, you may specify the transparent color as the argument to the setTransparentColor method. Note that only GIF and PNG can support single color transparency. JPEG, BMP and WBMP cannot support transparency at all.

If you do want to keep the alpha channel in final output, you may pass -1 as the argument to setTransparentColor. Note that the only image format that can support alpha transparency is PNG.

One important thing to note is that the IE browser (and possibly many image displaying software) only supports single color transparency for palette based images with up to 256 colors, but not for true color images. For this reason, if single color transparency is used, ChartDirector will automatically reduce the image to 256 colors if it has more than 256 colors. This may result in lost of image quality, especially if the image contains gradient colors.

Therefore, due to the limitations of the current generations of image displaying software, for highest image quality, sometimes it may be beneficial to not using transparency in image output, but to set the image
background color to the same color as the container background.

<table>

28.17.  CLASS CDDRAWOBJMBS

28.17  class CDDrawObjMBS

28.17.1  class CDDrawObjMBS

Function: This is the base class for several drawing related subclasses.
Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.17.2  Methods

28.17.3  Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

28.17.4  paint(d as CDDrawAreaMBS)

Function: Draws the content to this object into a drawarea.

28.17.5  setZOrder(z as Integer)

Function: Sets the z-order.
28.18 **class CDFinanceChartMBS**

28.18.1 **class CDFinanceChartMBS**

**Function:** FinanceChart is a financial charting library built on top of the main ChartDirector library.

**Notes:**

It extends CDMultiChartMBS by implementing many financial indicators, and allowing complex financial charts to be composed easily.

**Key Features:**

- **Arbitrary Financial Chart Composition:** Allows a complex financial chart to be constructed by stacking a main financial chart with arbitrary number of indicator charts in any order.

- **Main Chart Layers:** The main chart can show information in Candlestick or OHLC, and/or various price lines, such as closing price line, weighted close line, typical price line or median price line.

- **Moving Averages:** Chart can include arbitrary number of moving average lines of configurable types and periods. Supports simple, exponential, triangular and weighted moving averages.

- **Parabolic SAR:** A parabolic SAR indicator can be added to the main price chart.

- **Bands and Envelops:** Built-in Bollinger Band layer, Donchian Channel layer, and moving average envelopes. Also supports custom-defined bands.

- **Volume Bars:** Volume Bars can be displayed as part of the main chart, or as a separate indicator chart.

- **Axis Styles:** Axis can be log or linear scale, and can display on left or right side of the chart.

- **Built-In Indicators:** Accumulation/Distribution, Aroon Up/Down, Aroon Oscillator, Average Directional Index, Average True Range (including raw True Range), Bollinger Band Width, Commodity Channel Index, Chaikin Money Flow, Chaikin Oscillator, Chaikin Volatility, Close Location Value, Detrended Price Oscillator, Donchian Channel Width, Ease of Movement, Fast Stochastic, MACD, Mass Index, Money Flow Index, Momentum, Negative Volume Index, On Balance Volume, Performance, Percentage Price Oscillator, Positive Volume Index, Percentage Volume Oscillator, Price Volume Trend, Rate of Change, Relative Strength Index, Slow Stochastic, Standard Deviation, Stochastic RSI, TRIX, Ultimate Oscillator, Volume, William % R.

- **Custom Lines and Indicators:** Extensible design allows developers to implement additional lines and indicator types.

- **Customizable Look and Feel:** Extensible design allows developers to implement additional lines and indicator types.

**Using FinanceChart:**

You create an instance of FinanceChart. Next, you may add data to it using setData. After that, you may add the main chart (addMainChart) and other indicator charts to display the data graphically. These charts
may be added in any order.

For the main chart, you may:

- Display price information using Candlesticks (addCandleStick) or HLOC (addHLOC) symbols
- Add various price lines (addCloseLine, addWeightedClose, addTypicalPrice, addMedianPrice)
- Add moving average lines of different types and periods (addSimpleMovingAvg, addExpMovingAvg, addTriMovingAvg, addWeightedMovingAvg)
- Add Parabolic SAR (addParabolicSAR)
- Add price bands or envelops: (addBollingerBand, addDonchianChannel, addEnvelop)
- Add custom lines or bands (addLineIndicator2, addBand)
- Add volume bars (addVolBars)

For indicator charts, FinanceChart includes a wide variety of indicators. Please refer to the table below for details. You may also add your own custom indicator chart using addLineIndicator and addBarIndicator.

In addition to chart building methods, FinanceChart also has a number of chart formatting methods, such as addPlotAreaTitle to add chart title, setPlotAreaStyle to control background color and grid lines, setDateLabelFormat to control date/time formatting, etc.

Furthermore, as FinanceChart is a subclass of CDMultiChartMBS, and the main and indicator charts are implemented as XYChart objects, they can use the powerful ChartDirector API for formatting (eg. background images, custom logos, custom text boxes, metallic colors, etc).

Subclass of the CDMultiChartMBS class.

### 28.18.2 Methods

#### 28.18.3 addAccDist(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other addAccDist method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.4 addAccDist(height as Integer, ColorValue as Integer) as CDXYChartMBS
28.18.4 addAccDist(height as Integer, ColorValue as Integer) as CDXYChartMBS

Function: Adds an Accumulation/Distribution indicator chart.

Notes:

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
</tbody>
</table>

Return Value
A CDXYChartMBS object representing the chart created.

See also:

- 28.18.3 addAccDist(height as Integer, ColorValue as color) as CDXYChartMBS

28.18.5 addADX(height as Integer, period as Integer, posColor as color, negColor as color, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other addADX method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.6 addADX(height as Integer, period as Integer, posColor as Integer, negColor as Integer, ColorValue as Integer) as CDXYChartMBS

28.18.6 addADX(height as Integer, period as Integer, posColor as Integer, negColor as Integer, ColorValue as Integer) as CDXYChartMBS

Function: Adds an Average Directional Index indicators chart.

Notes:

Arguments:

Return Value
A CDXYChartMBS object representing the chart created.

See also:

- 28.18.5 addADX(height as Integer, period as Integer, posColor as color, negColor as color, ColorValue as color) as CDXYChartMBS
28.18. CLASS CDFINANCECHARTMBS

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>posColor</td>
<td>(Mandatory)</td>
<td>The color of the Positive Directional Index line.</td>
</tr>
<tr>
<td>negColor</td>
<td>(Mandatory)</td>
<td>The color of the Negative Directional Index line.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the Average Directional Index line.</td>
</tr>
</tbody>
</table>

28.18.7 addAroon(height as Integer, period as Integer, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other addAroon method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.8 addAroon(height as Integer, period as Integer, upColor as Integer, downColor as Integer) as CDXYChartMBS

28.18.8 addAroon(height as Integer, period as Integer, upColor as Integer, downColor as Integer) as CDXYChartMBS

Function: Adds an Aroon Up/Down indicators chart.

Notes:

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicators.</td>
</tr>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The color of the Aroon Up indicator line.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The color of the Aroon Down indicator line.</td>
</tr>
</tbody>
</table>

Return Value

A CDXYChartMBS object representing the chart created.

See also:

- 28.18.7 addAroon(height as Integer, period as Integer, upColor as color, downColor as color) as CDXYChartMBS

**CHAPTER 28. CHARTDIRECTOR**

### 28.18.9 addAroonOsc(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addAroonOsc method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.10 addAroonOsc(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

### 28.18.10 addAroonOsc(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

**Function:** Adds an Aroon Oscillator indicator chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDXYChartMBS object representing the chart created.

See also:

- 28.18.9 addAroonOsc(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

### 28.18.11 addATR(height as Integer, period as Integer, color1 as color, color2 as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addATR method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.12 addATR(height as Integer, period as Integer, color1 as Integer, color2 as Integer) as CDXYChartMBS

- 28.18.12 addATR(height as Integer, period as Integer, color1 as Integer, color2 as Integer) as CDXYChartMBS
28.18.12 addATR(height as Integer, period as Integer, color1 as Integer, color2 as Integer) as CDXYChartMBS

**Function:** Adds an Average True Range indicators chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>color1</td>
<td>(Mandatory)</td>
<td>The color of the True Range line.</td>
</tr>
<tr>
<td>color2</td>
<td>(Mandatory)</td>
<td>The color of the Average True Range line.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDXYChartMBS object representing the chart created.

See also:

- 28.18.11 addATR(height as Integer, period as Integer, color1 as color, color2 as color) as CDXYChartMBS

28.18.13 addBand(upperLine() as Double, lowerLine() as Double, LineColor as color, FillColor as color, Name as string) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addBand method, but uses color instead of integer data type for passing color values.

See also:

- 43.11.4 addBand(upperLine() as Double, lowerLine() as Double, LineColor as Integer, FillColor as Integer, Name as string) as CDInterLineLayerMBS

28.18.14 addBand(upperLine() as Double, lowerLine() as Double, LineColor as Integer, FillColor as Integer, Name as string) as CDInterLineLayerMBS

**Function:** Adds a generic band to the main finance chart.

**Notes:**

This method is used internally by other methods to add various bands (eg. Bollinger band, Donchian channels, etc).
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>upperLine</td>
<td>(Mandatory)</td>
<td>The data series for the upper band line.</td>
</tr>
<tr>
<td>lowerLine</td>
<td>(Mandatory)</td>
<td>The data series for the lower band line.</td>
</tr>
<tr>
<td>lineColor</td>
<td>(Mandatory)</td>
<td>The color of the upper and lower band line.</td>
</tr>
<tr>
<td>fillColor</td>
<td>(Mandatory)</td>
<td>The color to fill the region between the upper and lower band lines.</td>
</tr>
<tr>
<td>name</td>
<td>(Mandatory)</td>
<td>The name of the band.</td>
</tr>
</tbody>
</table>

Return Value
An CDInterLineLayerMBS object representing the filled region.

See also:
- 28.18.13 addBand(upperLine() as Double, lowerLine() as Double, LineColor as color, FillColor as color, Name as string) as CDInterLineLayerMBS

28.18.15 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other addBarIndicator method, but uses color instead of integer data type for passing color values.

See also:
- 28.18.16 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDBarLayerMBS
- 28.18.17 addBarIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS
- 28.18.18 addBarIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS

28.18.16 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDBarLayerMBS

**Function:** Adds a bar layer to an existing indicator chart.
**Notes:**

Arguments:

Return Value
A CDBarLayerMBS object representing the bar layer created.

See also:
**28.18.15** addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDBarLayerMBS

**28.18.17** addBarIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS

**28.18.18** addBarIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS

---

**28.18.17** addBarIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other addBarIndicator method, but uses color instead of integer data type for passing color values.

See also:

- **28.18.15** addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDBarLayerMBS
- **28.18.16** addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDBarLayerMBS
- **28.18.18** addBarIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS

**28.18.18** addBarIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a generic bar indicator chart.

**Notes:**

Arguments:

- **Return Value**
  - A CDXYChartMBS object representing the chart created.

CHAPTER 28. CHARTDIRECTOR

28.18.15 `addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string)` as CDBarLayerMBS

- 28.18.16 `addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string)` as CDBarLayerMBS

- 28.18.17 `addBarIndicator(height as Integer, data() as Double, ColorValue as color, name as string)` as CDXYChartMBS

28.18.19 `addBollingerBand(period as Integer, bandWidth as Double, lineColor as color, FillColor as color)` as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addBollingerBand method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.20 `addBollingerBand(period as Integer, bandWidth as Double, lineColor as Integer, FillColor as Integer)` as CDInterLineLayerMBS

28.18.20 `addBollingerBand(period as Integer, bandWidth as Double, lineColor as Integer, FillColor as Integer)` as CDInterLineLayerMBS

**Function:** Adds a Bollinger band to the main chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the band.</td>
</tr>
<tr>
<td>bandWidth</td>
<td>(Mandatory)</td>
<td>The half-width of the band in terms multiples of standard deviation. Typically 2 is used.</td>
</tr>
<tr>
<td>lineColor</td>
<td>(Mandatory)</td>
<td>The color of the lines defining the upper and lower limits.</td>
</tr>
<tr>
<td>fillColor</td>
<td>(Mandatory)</td>
<td>The color to fill the regional within the band.</td>
</tr>
</tbody>
</table>

Return Value
28.18. CLASS CDFINANCECHARTMBS

An CDInterLineLayerMBS object representing the band created.
See also:

- 28.18.19 addBollingerBand(period as Integer, bandWidth as Double, lineColor as color, FillColor as color) as CDInterLineLayerMBS

28.18.21  addBollingerWidth(height as Integer, period as Integer, width as Double, colorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addBollingerWidth method, but uses color instead of integer data type for passing color values.
See also:

- 28.18.22 addBollingerWidth(height as Integer, period as Integer, width as Double, colorValue as Integer) as CDXYChartMBS

28.18.22  addBollingerWidth(height as Integer, period as Integer, width as Double, colorValue as Integer) as CDXYChartMBS

Function: Adds a Bollinger Band Width indicator chart.
Notes:

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The band width to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
</tbody>
</table>

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 28.18.21 addBollingerWidth(height as Integer, period as Integer, width as Double, colorValue as color) as CDXYChartMBS
28.18.23 addCandleStick(upColor as color, downColor as color) as CDCandleStickLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addCandleStick method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.24 addCandleStick(upColor as Integer, downColor as Integer) as CDCandleStickLayerMBS

28.18.24 addCandleStick(upColor as Integer, downColor as Integer) as CDCandleStickLayerMBS

**Function:** Adds a candlestick layer to the main chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The candle color for a up day.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The candle color for a down day.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDCandleStickLayerMBS object representing the candlestick layer created.

See also:

- 28.18.23 addCandleStick(upColor as color, downColor as color) as CDCandleStickLayerMBS

28.18.25 addCCI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addCCI method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.26 addCCI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS
28.18.26 addCCI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

**Function:** Adds a Community Channel Index indicator chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>range</td>
<td>(Mandatory)</td>
<td>The distance between the middle line and the upper and lower threshold lines.</td>
</tr>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator exceeds the upper threshold line.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator falls below the lower threshold line.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDXYChartMBS object representing the chart created.

**See also:**

- 28.18.25 addCCI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

28.18.27 addChaikinMoneyFlow(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addChaikinMoneyFlow method, but uses color instead of integer data type for passing color values.

**See also:**

- 28.18.28 addChaikinMoneyFlow(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

28.18.28 addChaikinMoneyFlow(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

**Function:** Adds a Chaikin Money Flow indicator chart.

**Notes:**
### Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
</tbody>
</table>

#### Return Value

A CDXYChartMBS object representing the chart created.

#### See also:

- 28.18.27 addChaikinMoneyFlow(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS
- 28.18.29 addChaikinOscillator(height as Integer, ColorValue as color) as CDXYChartMBS
- 28.18.30 addChaikinOscillator(height as Integer, ColorValue as Integer) as CDXYChartMBS

### Function:

**addChaikinOscillator**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addChaikinOscillator method, but uses color instead of integer data type for passing color values.

**See also:**

- 28.18.30 addChaikinOscillator(height as Integer, ColorValue as Integer) as CDXYChartMBS

### Notes:

#### Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
</tbody>
</table>

#### Return Value

A CDXYChartMBS object representing the chart created.

#### See also:

- 28.18.29 addChaikinOscillator(height as Integer, ColorValue as color) as CDXYChartMBS
- 28.18.30 addChaikinOscillator(height as Integer, ColorValue as Integer) as CDXYChartMBS
28.18.31  **addChaikinVolatility**(height as Integer, period1 as Integer, period2 as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addChaikinVolatility method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.32 addChaikinVolatility(height as Integer, period1 as Integer, period2 as Integer, ColorValue as Integer) as CDXYChartMBS

28.18.32  **addChaikinVolatility**(height as Integer, period1 as Integer, period2 as Integer, ColorValue as Integer) as CDXYChartMBS

**Function:** Adds a Chaikin Volatility indicator chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period1</td>
<td>(Mandatory)</td>
<td>The period to smooth the range.</td>
</tr>
<tr>
<td>period2</td>
<td>(Mandatory)</td>
<td>The period to compute the rate of change of the smoothed range.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDXYChartMBS object representing the chart created.

See also:

- 28.18.31 addChaikinVolatility(height as Integer, period1 as Integer, period2 as Integer, ColorValue as color) as CDXYChartMBS

28.18.33  **addCloseLine**(ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addCloseLine method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.34 addCloseLine(ColorValue as Integer) as CDLineLayerMBS
28.18.34  **addCloseLine(ColorValue as Integer) as CDLineLayerMBS**

**Function:** Adds a closing price line on the main chart.  
**Notes:**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the line.</td>
</tr>
</tbody>
</table>

**Return Value**
A CDLineLayerMBS object representing the line created.

See also:

- 28.18.33 addCloseLine(ColorValue as color) as CDLineLayerMBS

28.18.35  **addCLV(height as Integer, ColorValue as color) as CDXYChartMBS**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Same as the other addCLV method, but uses color instead of integer data type for passing color values.  
See also:

- 28.18.36 addCLV(height as Integer, ColorValue as Integer) as CDXYChartMBS

28.18.36  **addCLV(height as Integer, ColorValue as Integer) as CDXYChartMBS**

**Function:** Adds a Close Location Value indicator chart.  
**Notes:**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
</tbody>
</table>

**Return Value**
A CDXYChartMBS object representing the chart created.

See also:

- 28.18.35 addCLV(height as Integer, ColorValue as color) as CDXYChartMBS
28.18. addComparison(data() as Double, ColorValue as color, Name as string) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addComparison method, but uses color instead of integer data type for passing color values.
See also:

- 28.18.38 addComparison(data() as Double, ColorValue as Integer, Name as string) as CDLineLayerMBS

28.18.38 addComparison(data() as Double, ColorValue as Integer, Name as string) as CDLineLayerMBS

Function: Adds a data series to the main chart for comparison with the closing price.
Notes:
The data series added will be scaled so that the first visible point in the data series will coincide the first visible point of the main closing price. This facilitate comparing the performance of the closing price with the data series. The data series typically is the closing price of another stock, or the value of a market index.

Arguments:

Argument | Default | Description
---|---|---
data | (Mandatory) | An array of numbers representing the data series.
color | (Mandatory) | The color of the line.
name | (Mandatory) | The name of the data series.

Return Value:
A LineLayer object representing the comparison line created.
See also:

- 28.18.37 addComparison(data() as Double, ColorValue as color, Name as string) as CDLineLayerMBS

28.18.39 addDonchianChannel(period as Integer, lineColor as color, FillColor as color) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addDonchianChannel method, but uses color instead of integer data type for passing color values.
See also:
• 28.18.40 addDonchianChannel(period as Integer, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS

28.18.40 addDonchianChannel(period as Integer, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS

**Function:** Adds a Donchian channel to the main chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the band.</td>
</tr>
<tr>
<td>lineColor</td>
<td>(Mandatory)</td>
<td>The color of the lines defining the upper and lower limits.</td>
</tr>
<tr>
<td>fillColor</td>
<td>(Mandatory)</td>
<td>The color to fill the regional within the band.</td>
</tr>
</tbody>
</table>

**Return Value**

An CDInterLineLayerMBS object representing the band created.

See also:

• 28.18.39 addDonchianChannel(period as Integer, lineColor as color, FillColor as color) as CDInterLineLayerMBS

28.18.41 addDonchianWidth(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addDonchianWidth method, but uses color instead of integer data type for passing color values.

See also:

• 28.18.42 addDonchianWidth(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

28.18.42 addDonchianWidth(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

**Function:** Adds a Donchian Channel Width indicator chart.

**Notes:**
28.18. CLASS CDFINANCECHARTMBS

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
</tbody>
</table>

Arguments:

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 28.18.41 addDonchianWidth(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

28.18.43 addDPO(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addDPO method, but uses color instead of integer data type for passing color values.
See also:

- 28.18.44 addDPO(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

28.18.44 addDPO(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

Function: Adds a Detrended Price Oscillator indicator chart.
Notes:
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
</tbody>
</table>

Return Value
A CDXYChartMBS object representing the chart created.
See also:
28.18.43 addDPO(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

28.18.45 addEaseOfMovement(height as Integer, period as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other addEaseOfMovement method, but uses color instead of integer data type for passing color values.

See also:

28.18.45 addEaseOfMovement(height as Integer, period as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS

28.18.46 addEaseOfMovement(height as Integer, period as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS

Function: Adds a Ease of Movement indicator chart.

Notes:

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to smooth the indicator.</td>
</tr>
<tr>
<td>color1</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>color2</td>
<td>(Mandatory)</td>
<td>The color of the smoothed indicator line.</td>
</tr>
</tbody>
</table>

Return Value
A CDXYChartMBS object representing the chart created.

See also:

28.18.46 addEaseOfMovement(height as Integer, period as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS

28.18.47 addEnvelop(period as Integer, range as Double, lineColor as color, FillColor as color) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other addEnvelop method, but uses color instead of integer data type for passing color values.

See also:
28.18. CLASS CDFINANCECHARTMBS

- 28.18.48 addEnvelop(period as Integer, range as Double, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS

28.18.48  addEnvelop(period as Integer, range as Double, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS

**Function:** Adds a price envelop to the main chart.

**Notes:**
The price envelop is defined as a ratio around a moving average. For example, a ratio of 0.2 means 20% above and below the moving average.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period for the moving average.</td>
</tr>
<tr>
<td>range</td>
<td>(Mandatory)</td>
<td>The ratio above and below the moving average.</td>
</tr>
<tr>
<td>lineColor</td>
<td>(Mandatory)</td>
<td>The color of the lines defining the upper and lower limits.</td>
</tr>
<tr>
<td>fillColor</td>
<td>(Mandatory)</td>
<td>The color to fill the regional within the band.</td>
</tr>
</tbody>
</table>

**Return Value**
An CDInterLineLayerMBS object representing the band created.

See also:
- 28.18.47 addEnvelop(period as Integer, range as Double, lineColor as color, FillColor as color) as CDInterLineLayerMBS

28.18.49  addExpMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addExpMovingAvg method, but uses color instead of integer data type for passing color values.

See also:
- 28.18.50 addExpMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

28.18.50  addExpMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

**Function:** Adds an exponential moving average line on the main chart.
CHAPTER 28. CHARTDIRECTOR

Notes:

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The moving average period</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the line.</td>
</tr>
</tbody>
</table>

Return Value
A CDLineLayerMBS object representing the line created.

See also:

- 28.18.49 addExpMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

28.18.51 addFastStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addFastStochastic method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.52 addFastStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS

28.18.52 addFastStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS

Function: Adds a Fast Stochastic indicator chart.

Notes:

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period1</td>
<td>(Mandatory)</td>
<td>The period to compute the % K line.</td>
</tr>
<tr>
<td>period2</td>
<td>(Mandatory)</td>
<td>The period to compute the % D line.</td>
</tr>
<tr>
<td>color1</td>
<td>(Mandatory)</td>
<td>The color of the % K line.</td>
</tr>
<tr>
<td>color2</td>
<td>(Mandatory)</td>
<td>The color of the % D line.</td>
</tr>
</tbody>
</table>
28.18. **CLASS CDFINANCECHARTMBS**

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 28.18.51 addFastStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS

28.18.53 **addHLOC(upColor as color, downColor as color) as CDHLOCLayerMBS**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addHLOC method, but uses color instead of integer data type for passing color values.
See also:

- 28.18.54 addHLOC(upColor as Integer, downColor as Integer) as CDHLOCLayerMBS

28.18.54 **addHLOC(upColor as Integer, downColor as Integer) as CDHLOCLayerMBS**

Function: Adds a HLOC layer to the main chart.
Notes:
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The candle color for a up day.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The candle color for a down day.</td>
</tr>
</tbody>
</table>

Return Value
A CDHLOCLayerMBS object representing the HLOC layer created.
See also:

- 28.18.53 addHLOC(upColor as color, downColor as color) as CDHLOCLayerMBS

28.18.55 **addIndicator(height as Integer) as CDXYChartMBS**

Function: Adds a blank indicator chart to the finance chart.
Notes:
Used internally to add other indicators. Override to change the default formatting (eg. axis fonts, etc.) of the various indicators.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the chart in pixels.</td>
</tr>
</tbody>
</table>

Return Value
A CDXYChartMBS object representing the chart created.

28.18.56  \texttt{addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS}

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

\textbf{Function:} Same as the other \texttt{addLineIndicator} method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.56 \texttt{addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS} 4702
- 28.18.57 \texttt{addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDLineLayerMBS} 4702
- 28.18.58 \texttt{addLineIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS} 4703
- 28.18.59 \texttt{addLineIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS} 4703

28.18.57  \texttt{addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDLineLayerMBS}

\textbf{Function:} Adds a line to an existing indicator chart.

\textbf{Notes:}

Arguments:

Return Value
A CDLineLayerMBS object representing the line created.

See also:

- 28.18.56 \texttt{addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS} 4702
### 28.18. CLASS CDFINANCECHARTMBS

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>(Mandatory)</td>
<td>The indicator chart to add the line to.</td>
</tr>
<tr>
<td>data</td>
<td>(Mandatory)</td>
<td>The data series of the indicator line.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>name</td>
<td>(Mandatory)</td>
<td>The name of the indicator.</td>
</tr>
</tbody>
</table>

- 28.18.58 `addLineIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS`
- 28.18.59 `addLineIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS`

#### 28.18.58 `addLineIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS`

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other `addLineIndicator` method, but uses color instead of integer data type for passing color values.

See also:
- 28.18.56 `addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS`
- 28.18.57 `addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDLineLayerMBS`
- 28.18.59 `addLineIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS`

#### 28.18.59 `addLineIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS`

**Function:** Adds a generic line indicator chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>data</td>
<td>(Mandatory)</td>
<td>The data series of the indicator line.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>name</td>
<td>(Mandatory)</td>
<td>The name of the indicator.</td>
</tr>
</tbody>
</table>
Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 28.18.56 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS
- 28.18.57 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDLineLayerMBS
- 28.18.58 addLineIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS

28.18.60 addMACD(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addMACD method, but uses color instead of integer data type for passing color values.
See also:

- 28.18.61 addMACD(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS

28.18.61 addMACD(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS

Function: Adds a MACD indicator chart.
Notes:
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period1</td>
<td>(Mandatory)</td>
<td>The first moving average period to compute the indicator.</td>
</tr>
<tr>
<td>period2</td>
<td>(Mandatory)</td>
<td>The second moving average period to compute the indicator.</td>
</tr>
<tr>
<td>period3</td>
<td>(Mandatory)</td>
<td>The moving average period of the signal line.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>signalColor</td>
<td>(Mandatory)</td>
<td>The color of the signal line.</td>
</tr>
<tr>
<td>divColor</td>
<td>(Mandatory)</td>
<td>The color of the divergent bars.</td>
</tr>
</tbody>
</table>
28.18. CLASS CDFINANCECHARTMBS

Return Value
A CDXYChartMBS object representing the chart created.

See also:

- 28.18.60 addMACD(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS

28.18.62 addMainChart(height as Integer) as CDXYChartMBS

Function: Adds the main chart - the chart that shows the data for the prices.

Notes:
The chart added is initially empty. Other methods, such as CDFinanceChartMBS.addCandleStick and CDFinanceChartMBS.addSimpleMovingAvg, may be used to add various layers to the chart.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the main chart in pixels.</td>
</tr>
</tbody>
</table>

Return Value
A CDXYChartMBS object representing the main chart created.

28.18.63 addMassIndex(height as Integer, ColorValue as color, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other addMassIndex method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.64 addMassIndex(height as Integer, ColorValue as Integer, upColor as Integer, downColor as Integer) as CDXYChartMBS

28.18.64 addMassIndex(height as Integer, ColorValue as Integer, upColor as Integer, downColor as Integer) as CDXYChartMBS

Function: Adds a Mass Index indicator chart.

Notes:
CHAPTER 28. CHARTDIRECTOR

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator exceeds the upper threshold line.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator falls below the lower threshold line.</td>
</tr>
</tbody>
</table>

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 28.18.63 addMassIndex(height as Integer, ColorValue as color, upColor as color, downColor as color) as CDXYChartMBS 4705

28.18.65 addMedianPrice(ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other addMedianPrice method, but uses color instead of integer data type for passing color values.
See also:

- 28.18.66 addMedianPrice(ColorValue as Integer) as CDLineLayerMBS 4706

28.18.66 addMedianPrice(ColorValue as Integer) as CDLineLayerMBS

**Function:** Adds a median price line on the main chart.
**Notes:**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the line.</td>
</tr>
</tbody>
</table>

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 28.18.65 addMedianPrice(ColorValue as color) as CDLineLayerMBS 4706
28.18. CLASS CDFINANCECHARTMBS

28.18.67 addMFI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addMFI method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.68 addMFI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

28.18.68 addMFI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

**Function:** Adds a Money Flow Index indicator chart.

**Notes:**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>range</td>
<td>(Mandatory)</td>
<td>The distance between the middle line and the upper and lower threshold lines.</td>
</tr>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator exceeds the upper threshold line.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator falls below the lower threshold line.</td>
</tr>
</tbody>
</table>

Return Value

A CDXYChartMBS object representing the chart created.

See also:

- 28.18.67 addMFI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

28.18.69 addMomentum(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addMomentum method, but uses color instead of integer data type for passing color values.

See also:
• 28.18.70 addMomentum(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

28.18.70 addMomentum(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

**Function:** Adds a Momentum indicator chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDXYChartMBS object representing the chart created.

See also:

• 28.18.69 addMomentum(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

28.18.71 addNVI(height as Integer, period as Integer, ColorValue as color, signalColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addNVI method, but uses color instead of integer data type for passing color values.

See also:

• 28.18.72 addNVI(height as Integer, period as Integer, ColorValue as Integer, signalColor as Integer) as CDXYChartMBS

28.18.72 addNVI(height as Integer, period as Integer, ColorValue as Integer, signalColor as Integer) as CDXYChartMBS

**Function:** Adds a Negative Volume Index indicator chart.

**Notes:**
28.18. CLASS CDFINANCECHARTMBS

Argument Default Description
height (Mandatory) The height of the indicator chart in pixels.
period (Mandatory) The period to compute the signal line.
color (Mandatory) The color of the indicator line.
signalColor (Mandatory) The color of the signal line.

Arguments:

Return Value
A CDXYChartMBS object representing the chart created.
See also:

• 28.18.71 addNVI(height as Integer, period as Integer, ColorValue as color, signalColor as color) as CDXYChartMBS

28.18.73 addOBV(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. 
Function: Same as the other addOBV method, but uses color instead of integer data type for passing color values.
See also:

• 28.18.74 addOBV(height as Integer, ColorValue as Integer) as CDXYChartMBS

28.18.74 addOBV(height as Integer, ColorValue as Integer) as CDXYChartMBS

Function: Adds an On Balance Volume indicator chart.
Notes:

Arguments:

Argument Default Description
height (Mandatory) The height of the indicator chart in pixels.
color (Mandatory) The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

• 28.18.73 addOBV(height as Integer, ColorValue as color) as CDXYChartMBS
28.18.75  addParabolicSAR(accInitial as Double, accIncrement as Double, accMaximum as Double, symbolType as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other addParabolicSAR method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.76 addParabolicSAR(accInitial as Double, accIncrement as Double, accMaximum as Double, symbolType as Integer, symbolSize as Integer, fillColor as Integer, edgeColor as Integer) as CDLineLayerMBS

28.18.76  addParabolicSAR(accInitial as Double, accIncrement as Double, accMaximum as Double, symbolType as Integer, symbolSize as Integer, fillColor as Integer, edgeColor as Integer) as CDLineLayerMBS

Function: Adds a parabolic SAR indicator to the main chart.

Notes:

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accInitial</td>
<td>(Mandatory)</td>
<td>The initial acceleration. A common value to use is 0.02.</td>
</tr>
<tr>
<td>accIncrement</td>
<td>(Mandatory)</td>
<td>The incremental acceleration. A common value to use is 0.02.</td>
</tr>
<tr>
<td>accMaximum</td>
<td>(Mandatory)</td>
<td>The maximum acceleration. A common value to use is 0.2.</td>
</tr>
<tr>
<td>symbolType</td>
<td>(Mandatory)</td>
<td>The symbol used to plot the parabolic SAR. One of the predefined shape constants representing the symbol shape. See Shape Specification for the available built-in shapes.</td>
</tr>
<tr>
<td>symbolSize</td>
<td>(Mandatory)</td>
<td>The width and height of the symbol in pixels</td>
</tr>
<tr>
<td>fillColor</td>
<td>(Mandatory)</td>
<td>The color used to fill the symbol.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>(Mandatory)</td>
<td>The edge color used to draw the edge of the symbol.</td>
</tr>
</tbody>
</table>

Return Value

A CDLineLayerMBS object representing the parabolic SAR created.

See also:

- 28.18.75 addParabolicSAR(accInitial as Double, accIncrement as Double, accMaximum as Double, symbolType as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDLineLayerMBS
28.18. **addPerformance**(height as Integer, ColorValue as color) as CDXY-ChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other addPerformance method, but uses color instead of integer data type for passing color values.
**Notes:**
- See also:
  - 28.18.78 addPerformance(height as Integer, ColorValue as Integer) as CDXYChartMBS

28.18.**addPerformance**(height as Integer, ColorValue as Integer) as CDXY-ChartMBS

**Function:** Adds a Performance indicator chart.
**Notes:**
**Arguments:**
- **height**: (Mandatory) The height of the indicator chart in pixels.
- **color**: (Mandatory) The color of the indicator line.

**Return Value**
A CDXYChartMBS object representing the chart created.
**See also:**
- 28.18.77 addPerformance(height as Integer, ColorValue as color) as CDXYChartMBS

28.18.**addPlotAreaTitle**(alignment as Integer, text as string) as CDTTextBoxMBS

**Function:** Adds a text title above the plot area.
**Notes:**
- You may add multiple title above the plot area by calling this method multiple times.
**Arguments:**

**Return Value**
The CDTTextBoxMBS object representing the text box above the plot area, which may be used to fine-tune the appearance of the text.
### Argument Default Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alignment</td>
<td>(Mandatory)</td>
<td>The alignment with respect to the region that is on top of the plot area. See Alignment Specification for supported alignment types.</td>
</tr>
<tr>
<td>text</td>
<td>(Mandatory)</td>
<td>The text to add.</td>
</tr>
</tbody>
</table>

#### 28.18.80 addPPO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS

**MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Same as the other `addPPO` method, but uses color instead of integer data type for passing color values.

**See also:**

- 28.18.81 addPPO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS

#### 28.18.81 addPPO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS

**MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Adds a Percentage Price Oscillator indicator chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period1</td>
<td>(Mandatory)</td>
<td>The first moving average period to compute the indicator.</td>
</tr>
<tr>
<td>period2</td>
<td>(Mandatory)</td>
<td>The second moving average period to compute the indicator.</td>
</tr>
<tr>
<td>period3</td>
<td>(Mandatory)</td>
<td>The moving average period of the signal line.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>signalColor</td>
<td>(Mandatory)</td>
<td>The color of the signal line.</td>
</tr>
<tr>
<td>divColor</td>
<td>(Mandatory)</td>
<td>The color of the divergent bars.</td>
</tr>
</tbody>
</table>

**Return Value**

A `CDXYChartMBS` object representing the chart created.

**See also:**

- 28.18.80 addPPO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS
28.18.82 addPVI(height as Integer, period as Integer, ColorValue as color, signalColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other addPVI method, but uses color instead of integer data type for passing color values.

See also:
- 28.18.83 addPVI(height as Integer, period as Integer, ColorValue as Integer, signalColor as Integer) as CDXYChartMBS

28.18.83 addPVI(height as Integer, period as Integer, ColorValue as Integer, signalColor as Integer) as CDXYChartMBS

**Function:** Adds a Positive Volume Index indicator chart.

**Notes:**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the signal line.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>signalColor</td>
<td>(Mandatory)</td>
<td>The color of the signal line.</td>
</tr>
</tbody>
</table>

**Return Value**
A CDXYChartMBS object representing the chart created.

See also:
- 28.18.82 addPVI(height as Integer, period as Integer, ColorValue as color, signalColor as color) as CDXYChartMBS

28.18.84 addPVO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other addPVO method, but uses color instead of integer data type for passing color values.

See also:
- 28.18.85 addPVO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS
28.18.85  addPVO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS

**Function:** Adds a Percentage Volume Oscillator indicator chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period1</td>
<td>(Mandatory)</td>
<td>The first moving average period to compute the indicator.</td>
</tr>
<tr>
<td>period2</td>
<td>(Mandatory)</td>
<td>The second moving average period to compute the indicator.</td>
</tr>
<tr>
<td>period3</td>
<td>(Mandatory)</td>
<td>The moving average period of the signal line.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>signalColor</td>
<td>(Mandatory)</td>
<td>The color of the signal line.</td>
</tr>
<tr>
<td>divColor</td>
<td>(Mandatory)</td>
<td>The color of the divergent bars.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDXYChartMBS object representing the chart created.

**See also:**

- 28.18.84 addPVO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS

28.18.86  addPVT(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addPVT method, but uses color instead of integer data type for passing color values.

**See also:**

- 28.18.87 addPVT(height as Integer, ColorValue as Integer) as CDXYChartMBS

28.18.87  addPVT(height as Integer, ColorValue as Integer) as CDXYChartMBS

**Function:** Adds a Price Volume Trend indicator chart.

**Notes:**

**Arguments:**
### 28.18. CLASS CDFINANCECHARTMBS

**Argument Default Description**
- **height** (Mandatory) The height of the indicator chart in pixels.
- **color** (Mandatory) The color of the indicator line.

**Return Value**
A CDXYChartMBS object representing the chart created.

**See also:**
- 28.18.86 addPVT(height as Integer, ColorValue as color) as CDXYChartMBS

#### 28.18.88 addROC(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

**MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Same as the other addROC method, but uses color instead of integer data type for passing color values.

**See also:**
- 28.18.89 addROC(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

#### 28.18.89 addROC(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

**MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Adds a Rate of Change indicator chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
</tbody>
</table>

**Return Value**
A CDXYChartMBS object representing the chart created.

**See also:**
- 28.18.88 addROC(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS
### 28.18.90 addRSI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addRSI method, but uses color instead of integer data type for passing color values.

**See also:**
- 28.18.91 addRSI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

### 28.18.91 addRSI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

**Function:** Adds a Relative Strength Index indicator chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>range</td>
<td>(Mandatory)</td>
<td>The distance between the middle line and the upper and lower threshold lines.</td>
</tr>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator exceeds the upper threshold line.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator falls below the lower threshold line.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDXYChartMBS object representing the chart created.

**See also:**
- 28.18.90 addRSI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

### 28.18.92 addSimpleMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addSimpleMovingAvg method, but uses color instead of integer data type for passing color values.

**See also:**
28.18. CLASS CDFINANCECHARTMBS

- 28.18.93 addSimpleMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

28.18.93 addSimpleMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

**Function:** Adds a simple moving average line on the main chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The moving average period</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the line.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDLineLayerMBS object representing the line created.

See also:

- 28.18.92 addSimpleMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

28.18.94 addSlowStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addSlowStochastic method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.95 addSlowStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS

28.18.95 addSlowStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS

**Function:** Adds a Slow Stochastic indicator chart.

**Notes:**

**Arguments:**
Return Value
A CDXYChartMBS object representing the chart created.

See also:

- 28.18.94 addSlowStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS
- 28.18.96 addStdDev(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS
- 28.18.97 addStdDev(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS
28.18.96 addStdDev(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

28.18.98 addStochRSI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addStochRSI method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.99 addStochRSI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

28.18.99 addStochRSI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

**Function:** Adds a Stochastic RSI indicator chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>range</td>
<td>(Mandatory)</td>
<td>The distance between the middle line and the upper and lower threshold lines.</td>
</tr>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator exceeds the upper threshold line.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator falls below the lower threshold line.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDXYChartMBS object representing the chart created.

See also:

- 28.18.98 addStochRSI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS
28.18.100  addThreshold(chart as CDXYChartMBS, layer as CDLineLayerMBS, topRange as Double, topColor as color, bottomRange as Double, bottomColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Same as the other addThreshold method, but uses color instead of integer data type for passing color values. See also:

- 28.18.101 addThreshold(chart as CDXYChartMBS, layer as CDLineLayerMBS, topRange as Double, topColor as Integer, bottomRange as Double, bottomColor as Integer)

28.18.101  addThreshold(chart as CDXYChartMBS, layer as CDLineLayerMBS, topRange as Double, topColor as Integer, bottomRange as Double, bottomColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Adds an upper/lower threshold range to an existing indicator chart. Notes: Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>(Mandatory)</td>
<td>The indicator chart to add the threshold range to.</td>
</tr>
<tr>
<td>layer</td>
<td>(Mandatory)</td>
<td>The line layer that the threshold range applies to.</td>
</tr>
<tr>
<td>topRange</td>
<td>(Mandatory)</td>
<td>The upper threshold.</td>
</tr>
<tr>
<td>topColor</td>
<td>(Mandatory)</td>
<td>The color to fill the region of the line that is above the upper threshold.</td>
</tr>
<tr>
<td>bottomRange</td>
<td>(Mandatory)</td>
<td>The lower threshold.</td>
</tr>
<tr>
<td>bottomColor</td>
<td>(Mandatory)</td>
<td>The color to fill the region of the line that is below the lower threshold.</td>
</tr>
</tbody>
</table>

See also:

- 28.18.100 addThreshold(chart as CDXYChartMBS, layer as CDLineLayerMBS, topRange as Double, topColor as color, bottomRange as Double, bottomColor as color)

28.18.102  addTriMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Same as the other addTriMovingAvg method, but uses color instead of integer data type for passing color values. See also:

- 28.18.103 addTriMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS
28.18. CLASS CDFINANCECHARTMBS

28.18.103 addTriMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

Function: Adds a triangular moving average line on the main chart.
Notes:

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The moving average period</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the line.</td>
</tr>
</tbody>
</table>

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 28.18.102 addTriMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

28.18.104 addTRIX(height as Integer, Period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addTRIX method, but uses color instead of integer data type for passing color values.
See also:

- 28.18.105 addTRIX(height as Integer, Period as Integer, ColorValue as Integer) as CDXYChartMBS

28.18.105 addTRIX(height as Integer, Period as Integer, ColorValue as Integer) as CDXYChartMBS

Function: Adds a TRIX indicator chart.
Notes:

Arguments:

Return Value
A CDXYChartMBS object representing the chart created.
See also:
**Argument Default Description**
- **height** *(Mandatory)* The height of the indicator chart in pixels.
- **period** *(Mandatory)* The period to compute the indicator.
- **color** *(Mandatory)* The color of the indicator line.

- 28.18.104 addTRIX(height as Integer, Period as Integer, ColorValue as color) as CDXYChartMBS

**28.18.106 addTypicalPrice(ColorValue as color) as CDLineLayerMBS**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other addTypicalPrice method, but uses color instead of integer data type for passing color values.
**See also:**
- 28.18.107 addTypicalPrice(ColorValue as Integer) as CDLineLayerMBS

**28.18.107 addTypicalPrice(ColorValue as Integer) as CDLineLayerMBS**

**Function:** Adds a typical price line on the main chart.
**Notes:**
**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the line.</td>
</tr>
</tbody>
</table>

**Return Value**
A CDLineLayerMBS object representing the line created.
**See also:**
- 28.18.106 addTypicalPrice(ColorValue as color) as CDLineLayerMBS

**28.18.108 addUltimateOscillator(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other addUltimateOscillator method, but uses color instead of integer data type for passing color values.
**See also:**
28.18.109 addUltimateOscillator(\text{height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer}) as CDXYChartMBS

Function: Adds an Ultimate Oscillator indicator chart.

Notes:

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period1</td>
<td>(Mandatory)</td>
<td>The first moving average period to compute the indicator.</td>
</tr>
<tr>
<td>period2</td>
<td>(Mandatory)</td>
<td>The second moving average period to compute the indicator.</td>
</tr>
<tr>
<td>period3</td>
<td>(Mandatory)</td>
<td>The third moving average period to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>range</td>
<td>(Mandatory)</td>
<td>The distance between the middle line and the upper and lower threshold lines.</td>
</tr>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator exceeds the upper threshold line.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator falls below the lower threshold line.</td>
</tr>
</tbody>
</table>

Return Value

A CDXYChartMBS object representing the chart created.

See also:

- 28.18.108 addUltimateOscillator(\text{height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, range as Double, upColor as color, downColor as color}) as CDXYChartMBS

28.18.110 addVolBars(\text{height as Integer, upColor as color, downColor as color, flatColor as color}) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other addVolBars method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.111 addVolBars(\text{height as Integer, upColor as Integer, downColor as Integer, flatColor as Integer}) as CDBarLayerMBS
28.18.111 addVolBars(height as Integer, upColor as Integer, downColor as Integer, flatColor as Integer) as CDBarLayerMBS

**Function:** Adds a volume bar chart layer on the main chart.  
**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the bar chart layer in pixels.</td>
</tr>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The color to used on an ‘up’ day. An ‘up’ day is a day where the closing price is higher than that of the previous day.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The color to used on a ‘down’ day. A ‘down’ day is a day where the closing price is lower than that of the previous day.</td>
</tr>
<tr>
<td>flatColor</td>
<td>(Mandatory)</td>
<td>The color to used on a ‘flat’ day. A ‘flat’ day is a day where the closing price is the same as that of the previous day.</td>
</tr>
</tbody>
</table>

Return Value  
A CDBarLayerMBS object representing the bar layer created.

See also:

- 28.18.110 addVolBars(height as Integer, upColor as color, downColor as color, flatColor as color) as CDBarLayerMBS  
- 28.18.112 addVolIndicator(height as Integer, upColor as color, downColor as color, flatColor as color) as CDXYChartMBS

28.18.112 addVolIndicator(height as Integer, upColor as color, downColor as color, flatColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Same as the other addVolIndicator method, but uses color instead of integer data type for passing color values.  
See also:

- 28.18.113 addVolIndicator(height as Integer, upColor as Integer, downColor as Integer, flatColor as Integer) as CDXYChartMBS

28.18.113 addVolIndicator(height as Integer, upColor as Integer, downColor as Integer, flatColor as Integer) as CDXYChartMBS

**Function:** Adds a Volume indicator chart.  
**Notes:**

**Arguments:**
28.18. **CLASS CDFINANCECHARTMBS**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The color to used on an 'up' day. An 'up' day is a day where the closing price is higher than that of the previous day.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The color to used on a 'down' day. A 'down' day is a day where the closing price is lower than that of the previous day.</td>
</tr>
<tr>
<td>flatColor</td>
<td>(Mandatory)</td>
<td>The color to used on a 'flat' day. A 'flat' day is a day where the closing price is the same as that of the previous day.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDXYChartMBS object representing the chart created.

See also:

- 28.18.112 addVolIndicator(height as Integer, upColor as color, downColor as color, flatColor as color) as CDXYChartMBS

---

**28.18.114 addWeightedClose(ColorValue as color) as CDLineLayerMBS**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addWeightedClose method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.115 addWeightedClose(ColorValue as Integer) as CDLineLayerMBS

---

**28.18.115 addWeightedClose(ColorValue as Integer) as CDLineLayerMBS**

**Function:** Adds a weighted close line on the main chart.

**Notes:**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the line.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDLineLayerMBS object representing the line created.

See also:

- 28.18.114 addWeightedClose(ColorValue as color) as CDLineLayerMBS
28.18.116  addWeightedMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addWeightedMovingAvg method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.117 addWeightedMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS 4726

28.18.117  addWeightedMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

**Function:** Adds a weighted moving average line on the main chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The moving average period</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the line.</td>
</tr>
</tbody>
</table>

**Return Value**

A CDLineLayerMBS object representing the line created.

See also:

- 28.18.116 addWeightedMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS 4726

28.18.118  addWilliamR(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addWilliamR method, but uses color instead of integer data type for passing color values.

See also:

- 28.18.119 addWilliamR(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 4727
28.18.119  addWilliamR(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

Function: Adds a William % R indicator chart.
Notes:
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the indicator chart in pixels.</td>
</tr>
<tr>
<td>period</td>
<td>(Mandatory)</td>
<td>The period to compute the indicator.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the indicator line.</td>
</tr>
<tr>
<td>range</td>
<td>(Mandatory)</td>
<td>The distance between the middle line and the upper and lower threshold lines.</td>
</tr>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator exceeds the upper threshold line.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The fill color when the indicator falls below the lower threshold line.</td>
</tr>
</tbody>
</table>

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 28.18.118 addWilliamR(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

28.18.120  Constructor(width as Integer)

Function: Creates a new FinanceChart object.
Notes:
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The width of the chart in pixels. The height will be automatically determined as the chart is built.</td>
</tr>
</tbody>
</table>

28.18.121  currentChart as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the current chart of this finance chart.
Notes: While you add parts to the finance chart, you can access the last one here.
28.18.122 enableAntiAlias(antiAlias as boolean)

Function: Enables/Disables anti-alias.
Notes:
Enabling anti-alias makes the line smoother. Disabling anti-alias make the chart file size smaller, and so can be downloaded faster through the Internet. The default is to enable anti-alias.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>antiAlias</td>
<td>(Mandatory)</td>
<td>True to enable anti-alias. False to disable anti-alias.</td>
</tr>
</tbody>
</table>

28.18.123 getToolTipDateFormat as string

Function: Gets the date/time format string to use for tool tips.
Notes:
The format string returned will be one of the format strings specified when calling CDFinanceChartMBS.setToolTipDateFormat based on data point spacing, or the equivalent default value. The format string may then be used in other ChartDirector functions such as CDBaseChartMBS.getHTMLImageMap for producing image maps.

Returns the date/time format string to use for tool tips.

28.18.124 mainChart as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Returns the main chart of this finance chart.

28.18.125 setAxisOnRight(b as Boolean)

Function: Sets whether the main y-axis is on right of left side of the plot area.
Notes:
The default is on right.
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>(Mandatory)</td>
<td>A true value means the y-axis is on right. A false value means the y-axis is on left.</td>
</tr>
</tbody>
</table>

28.18.126 `setData(timeStamps() as Double, highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, volData() as Double, extraPoints as Integer)`

Function: Sets the data to be used in the chart.

Notes:
If some of the data are not available, some artificial values should be used. For example, if the high and low values are not available, you may use closeData as highData and lowData.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeStamps</td>
<td>(Mandatory)</td>
<td>An array of dates/times for the time intervals.</td>
</tr>
<tr>
<td>highData</td>
<td>(Mandatory)</td>
<td>The high values in the time intervals.</td>
</tr>
<tr>
<td>lowData</td>
<td>(Mandatory)</td>
<td>The low values in the time intervals.</td>
</tr>
<tr>
<td>openData</td>
<td>(Mandatory)</td>
<td>The open values in the time intervals.</td>
</tr>
<tr>
<td>closeData</td>
<td>(Mandatory)</td>
<td>The close values in the time intervals.</td>
</tr>
<tr>
<td>volData</td>
<td>(Mandatory)</td>
<td>The volume values in the time intervals.</td>
</tr>
<tr>
<td>extraPoints</td>
<td>(Mandatory)</td>
<td>The number of leading time intervals that are not displayed in the chart. These intervals are typically used for computing indicators that require extra leading data, such as moving averages.</td>
</tr>
</tbody>
</table>

28.18.127 `setDateLabelFormat(yearFormat as string, firstMonthFormat as string, otherMonthFormat as string, firstDayFormat as string, otherDayFormat as string, firstHourFormat as string, otherHourFormat as string)`

Function: Sets the date/time formats to use for the x-axis labels under various cases.

Notes:
See Parameter Substitution and Formatting on the syntax of ChartDirector format strings.
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>yearFormat</td>
<td>(Mandatory)</td>
<td>The format for displaying labels on an axis with yearly ticks. The default is &quot;{ value</td>
</tr>
<tr>
<td>firstMonthFormat</td>
<td>(Mandatory)</td>
<td>The format for displaying labels on an axis with monthly ticks. This parameter applies to the first available month of a year (usually January) only, so it can be formatted differently from the other labels. The default is &quot;&lt;font=bold*&gt;{ value</td>
</tr>
<tr>
<td>otherMonthFormat</td>
<td>(Mandatory)</td>
<td>The format for displaying labels on an axis with monthly ticks. This parameter applies to months other than the first available month of a year. The default is &quot; { value</td>
</tr>
<tr>
<td>firstDayFormat</td>
<td>(Mandatory)</td>
<td>The format for displaying labels on an axis with daily ticks. This parameter applies to the first available day of a month only, so it can be formatted differently from the other labels. The default is &quot;&lt;font=bold*&gt;{ value</td>
</tr>
<tr>
<td>otherDayFormat</td>
<td>(Mandatory)</td>
<td>The format for displaying labels on an axis with daily ticks. This parameter applies to days other than the first available day of a month. The default is &quot; { value</td>
</tr>
<tr>
<td>firstHourFormat</td>
<td>(Mandatory)</td>
<td>The format for displaying labels on an axis with hourly resolution. This parameter applies to the first tick of a day only, so it can be formatted differently from the other labels. The default is &quot;&lt;font=bold*&gt;{ value</td>
</tr>
<tr>
<td>otherHourFormat</td>
<td>(Mandatory)</td>
<td>The format for displaying labels on an axis with hourly resolution. This parameter applies to ticks at hourly boundaries, except the first tick of a day. The default is &quot; { value</td>
</tr>
</tbody>
</table>

28.18.128 setDateLabelSpacing(labelSpacing as Integer)

**Function:** Sets the minimum label spacing between two labels on the time axis.

**Notes:**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>labelSpacing</td>
<td>(Mandatory)</td>
<td>The label spacing in pixels. The default is 50 pixels.</td>
</tr>
</tbody>
</table>

28.18.129 setLegendStyle(font as string, fontSize as Double, fontColor as color, bgColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setLegendStyle method, but uses color instead of integer data type for passing color values.

See also:
28.18.130 setLegendStyle(font as string, fontSize as Double, fontColor as Integer, bgColor as Integer)

Function: Sets legend font style and background color.
Notes:
The default is Arial 8 pt black font on a semi-transparent light grey (80CCCCCC) background.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>(Mandatory)</td>
<td>The font of the legend text.</td>
</tr>
<tr>
<td>fontSize</td>
<td>(Mandatory)</td>
<td>The font size of the legend text in points.</td>
</tr>
<tr>
<td>fontColor</td>
<td>(Mandatory)</td>
<td>The color of the legend text.</td>
</tr>
<tr>
<td>bgColor</td>
<td>(Mandatory)</td>
<td>The background color of the legend box.</td>
</tr>
</tbody>
</table>

See also:

- 28.18.129 setLegendStyle(font as string, fontSize as Double, fontColor as color, bgColor as color) 4730

28.18.131 setLogScale(b as Boolean)

Function: Determines if log scale should be used for the main chart.
Notes:
The default is to use linear scale.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>(Mandatory)</td>
<td>A true value means using log scale. A false value means using linear scale.</td>
</tr>
</tbody>
</table>
28.18.132  setMargins(leftMargin as Integer, topMargin as Integer, rightMargin as Integer, bottomMargin as Integer)

Function: Sets the margins around the plot area.
Notes: The default is 40 pixels for the left and right margins, and 30 pixels for the top margin and 35 pixels for the bottom margin.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>leftMargin</td>
<td>(Mandatory)</td>
<td>The distance from the left side of the plot area to the left side of the chart.</td>
</tr>
<tr>
<td>topMargin</td>
<td>(Mandatory)</td>
<td>The distance from the top of the plot area to the top of the chart.</td>
</tr>
<tr>
<td>rightMargin</td>
<td>(Mandatory)</td>
<td>The distance from the right side of the plot area to the right side of the chart.</td>
</tr>
<tr>
<td>bottomMargin</td>
<td>(Mandatory)</td>
<td>The distance from the bottom of the plot area to the bottom of the chart.</td>
</tr>
</tbody>
</table>

28.18.133  setNumberLabelFormat(formatString as string)

Function: Sets the number format to use.
Notes: The default number format in FinanceChart is "P3". See Parameter Substitution and Formatting on the syntax of ChartDirector format strings.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatString</td>
<td>(Mandatory)</td>
<td>The format for displaying numbers.</td>
</tr>
</tbody>
</table>

28.18.134  setPercentageAxis as CDAxisMBS

Function: Label the axis of the main chart in percentage unit.
Notes: By default, the axis of the main chart will be labelled in price unit. If a percentage axis is used, the axis will be labelled in percentage unit, with the first visible point of the closing price being 100%.
28.18.135  setPlotAreaBorder(borderColor as color, borderGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setPlotAreaBorder method, but uses color instead of integer data type for passing color values.

See also:
- 28.18.136 setPlotAreaBorder(borderColor as Integer, borderGap as Integer)

28.18.136  setPlotAreaBorder(borderColor as Integer, borderGap as Integer)

**Function:** Sets the plot area border color and the gap distance between charts.
**Notes:**
The default is a grey (888888) border with two 2 pixels gap between charts.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>borderColor</td>
<td>(Mandatory)</td>
<td>The plot area border color.</td>
</tr>
<tr>
<td>borderGap</td>
<td>(Mandatory)</td>
<td>The distance between charts.</td>
</tr>
</tbody>
</table>

See also:
- 28.18.135 setPlotAreaBorder(borderColor as color, borderGap as Integer)

28.18.137  setPlotAreaStyle(bgColor as color, majorHGridColor as color, majorVGridColor as color, minorHGridColor as color, minorVGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setPlotAreaStyle method, but uses color instead of integer data type for passing color values.

See also:
- 28.18.138 setPlotAreaStyle(bgColor as Integer, majorHGridColor as Integer, majorVGridColor as Integer, minorHGridColor as Integer, minorVGridColor as Integer)
28.18.138  setPlotAreaStyle(bgColor as Integer, majorHGridColor as Integer, majorVGridColor as Integer, minorHGridColor as Integer, minorVGridColor as Integer)

**Function:** Sets the plot area background and grid colors.

**Notes:**

The default is a white background with light grey (DDDDDD) grid lines.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgColor</td>
<td>(Mandatory)</td>
<td>The plot area background color.</td>
</tr>
<tr>
<td>majorHGridColor</td>
<td>(Mandatory)</td>
<td>Major horizontal grid color.</td>
</tr>
<tr>
<td>majorVGridColor</td>
<td>(Mandatory)</td>
<td>Major vertical grid color.</td>
</tr>
<tr>
<td>minorHGridColor</td>
<td>(Mandatory)</td>
<td>Minor horizontal grid color. In current version, minor horizontal grid is not used.</td>
</tr>
<tr>
<td>minorVGridColor</td>
<td>(Mandatory)</td>
<td>Minor vertical grid color.</td>
</tr>
</tbody>
</table>

See also:

- 28.18.137 setPlotAreaStyle(bgColor as color, majorHGridColor as color, majorVGridColor as color, minorHGridColor as color, minorVGridColor as color)

28.18.139  setToolTipDateFormat(monthFormat as string, dayFormat as string, hourFormat as string)

**Function:** Sets the date/time formats to use for the tool tips under various cases.

**Notes:**

See Parameter Substitution and Formatting on the syntax of ChartDirector format strings.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>monthFormat</td>
<td>(Mandatory)</td>
<td>The tool tip format to use if the data point spacing is one or more months (more than 30 days). The default is &quot; [ { xLabel</td>
</tr>
<tr>
<td>dayFormat</td>
<td>(Mandatory)</td>
<td>The tool tip format to use if the data point spacing is 1 day to less than 30 days. The default is &quot; [ { xLabel</td>
</tr>
<tr>
<td>hourFormat</td>
<td>(Mandatory)</td>
<td>The tool tip format to use if the data point spacing is less than 1 day. The default is &quot; [ { xLabel</td>
</tr>
</tbody>
</table>
28.18.140 setXAxisStyle(font as string, fontSize as Double, fontColor as color, fontAngle as Double)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other setXAxisStyle method, but uses color instead of integer data type for passing color values.

See also:
- 28.18.141 setXAxisStyle(font as string, fontSize as Double, fontColor as Integer, fontAngle as Double)

28.18.141 setXAxisStyle(font as string, fontSize as Double, fontColor as Integer, fontAngle as Double)

Function: Sets x-axis label style.

Notes:
The default is Arial 8 pt black color as font with no text rotation.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>(Mandatory)</td>
<td>The font of the axis labels.</td>
</tr>
<tr>
<td>fontSize</td>
<td>(Mandatory)</td>
<td>The font size of the axis labels in points.</td>
</tr>
<tr>
<td>fontColor</td>
<td>(Mandatory)</td>
<td>The color of the axis labels.</td>
</tr>
<tr>
<td>fontAngle</td>
<td>(Mandatory)</td>
<td>The rotation of the axis labels.</td>
</tr>
</tbody>
</table>

See also:
- 28.18.140 setXAxisStyle(font as string, fontSize as Double, fontColor as color, fontAngle as Double)

28.18.142 setYAxisStyle(font as string, fontSize as Double, fontColor as color, bgColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other setYAxisStyle method, but uses color instead of integer data type for passing color values.

See also:
- 28.18.143 setYAxisStyle(font as string, fontSize as Double, fontColor as Integer, bgColor as Integer)
28.18.143 setYAxisStyle(font as string, fontSize as Double, fontColor as Integer, bgColor as Integer)

**Function:** Sets y-axis label style.

**Notes:**

The default is Arial 8 pt black color, with 14 pixels margin.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>(Mandatory)</td>
<td>The font of the axis labels.</td>
</tr>
<tr>
<td>fontSize</td>
<td>(Mandatory)</td>
<td>The font size of the axis labels in points.</td>
</tr>
<tr>
<td>fontColor</td>
<td>(Mandatory)</td>
<td>The color of the axis labels.</td>
</tr>
<tr>
<td>axisMargin</td>
<td>(Mandatory)</td>
<td>The margin at the top of the y-axis in pixels (to leave space for the legend box).</td>
</tr>
</tbody>
</table>

See also:

- 28.18.142 setYAxisStyle(font as string, fontSize as Double, fontColor as color, bgColor as color)
Function: A finance chart created using ChartDirector with the CDFinanceChartMBS class.
**Function:** A finance chart created using ChartDirector with the CDFinanceChartMBS class.
28.19 class CDFinanceSimulatorMBS

**Function:** FinanceSimulator is a utility class to produce tables with random numbers that look like valid financial data series.

**Notes:** It facilitates testing and demonstrating ChartDirector financial charts without needing a real database table.

28.19.2 Methods

28.19.3 Constructor(seed as Integer, startTime as Double, endTime as Double, resolution as Integer)

**Function:** Creates a FinanceSimulator object.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seed</td>
<td>(Mandatory)</td>
<td>The seed to be used in the random number generator.</td>
</tr>
<tr>
<td>startTime</td>
<td>(Mandatory)</td>
<td>The start date/time of the financial date series.</td>
</tr>
<tr>
<td>endTime</td>
<td>(Mandatory)</td>
<td>The end date/time of the financial date series.</td>
</tr>
<tr>
<td>resolution</td>
<td>(Mandatory)</td>
<td>The resolution of the financial data series in seconds. For example, a value of 86400 means daily data (1 day = 86400 seconds). A value of 7 * 86400 means weekly data. A value of 30 * 86400 means monthly data.</td>
</tr>
</tbody>
</table>

See also:

- 28.19.4 Constructor(seed as string, startTime as Double, endTime as Double, resolution as Integer) 4739

28.19.4 Constructor(seed as string, startTime as Double, endTime as Double, resolution as Integer)

**Function:** Creates a FinanceSimulator object.

**Notes:**

See also:

- 28.19.3 Constructor(seed as Integer, startTime as Double, endTime as Double, resolution as Integer) 4739
CHAPTER 28. CHARTDIRECTOR

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seed</td>
<td>(Mandatory)</td>
<td>The seed to be used in the random number generator.</td>
</tr>
<tr>
<td>startTime</td>
<td>(Mandatory)</td>
<td>The start date/time of the financial date series.</td>
</tr>
<tr>
<td>endTime</td>
<td>(Mandatory)</td>
<td>The end date/time of the financial date series.</td>
</tr>
<tr>
<td>resolution</td>
<td>(Mandatory)</td>
<td>The resolution of the financial data series in seconds. For example, a value of 86400 means daily data (1 day = 86400 seconds). A value of 7 * 86400 means weekly data. A value of 30 * 86400 means monthly data.</td>
</tr>
</tbody>
</table>

28.19.5 getCloseData as CDArrayMBS

**Function:** Gets the close data series.

28.19.6 getHighData as CDArrayMBS

**Function:** Gets the high data series.

28.19.7 getLowData as CDArrayMBS

**Function:** Gets the low data series.

28.19.8 getOpenData as CDArrayMBS

**Function:** Gets the open data series.

28.19.9 getTimeStamps as CDArrayMBS

**Function:** Gets the timestamps of the data series.
28.19.10  getVolData as CDArrayMBS

**Function:** Gets the volume data series.
28.20 class CDHLOCLayerMBS

28.20.1 class CDHLOCLayerMBS

Function: The HLOCLayer class represents high-low-open-close layers.
Notes:
Subclass of the CDBaseBoxLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.20.2 Methods

28.20.3 setColorMethod(colorMethod as Integer, riseColor as color, fallColor as color, leadValue as Double = -1.7E308)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setColorMethod method, but uses color instead of integer data type for passing color values.
See also:
- 28.20.4 setColorMethod(colorMethod as Integer, riseColor as Integer, fallColor as Integer = -1, leadValue as Double = -1.7E308)

28.20.4 setColorMethod(colorMethod as Integer, riseColor as Integer, fallColor as Integer = -1, leadValue as Double = -1.7E308)

Function: Sets the coloring method for the HLOC symbols.
Notes:
See XYChart.addHLOCLayer for the supported coloring methods for HLOC symbols.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colorMethod</td>
<td>(Mandatory)</td>
<td>The method to color the HLOC layer. Please refer to XYChart.addHLOCLayer3 for the supported coloring methods.</td>
</tr>
<tr>
<td>riseColor</td>
<td>(Mandatory)</td>
<td>The color to be used on an &quot;up&quot; day.</td>
</tr>
<tr>
<td>fallColor</td>
<td>-1</td>
<td>The color to be used on a &quot;down&quot; day. The default value of -1 means it is the same as the riseColor.</td>
</tr>
<tr>
<td>leadValue</td>
<td>[-Infinity]</td>
<td>The lead value to act as the closing pricing before the first day, so as to determine if the first day is an &quot;up&quot; or &quot;down&quot; day.</td>
</tr>
</tbody>
</table>
28.20. **CLASS CDHLOCLAYERMBS**

See also:

- 28.20.3 `setColorMethod(colorMethod as Integer, riseColor as color, fallColor as color, leadValue as Double = -1.7E308)`
28.21 class CDImageMapHandlerMBS

28.21.1 class CDImageMapHandlerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: ImageMapHandler is a utility class to handle image maps in HTML format (that is, as <AREA> tags). Notes: It determines if a given point is on a hot spot as defined by the image map, and retrieves the hot spot parameters.

The BaseChart.getHTMLImageMap method can be used to automatically generate image maps for charts automatically.

The advantages of using HTML image map format is that it is easy for developers to customize the hot spots. For example, one can create custom buttons in the chart image by drawing custom text boxes, and then create custom image maps to define the text boxes as hot spots. These custom image maps can be appended to the image maps generated by BaseChart.getHTMLImageMap using simple string concatenation.

ImageMapHandler will process the various attributes of the HTML &lt;AREA&gt; tags as follows:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>coords</td>
<td>This attribute defines the position and shape of the hot spot.</td>
</tr>
<tr>
<td>href</td>
<td>The URL specified in this attribute will become the attributes of the hot spot. The path portion of the URL will become the path attribute, while the query parameters will become the attributes of the hot spot as is.</td>
</tr>
<tr>
<td>title</td>
<td>This attribute defines the tool tip text to display when the mouse moves over and stops on the hot spot.</td>
</tr>
</tbody>
</table>

28.21.2 Methods

28.21.3 Constructor(ImageMap as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Constructs an image map handler object for the given image map. Notes:
**28.21.1**  CLASS CDIMAGEMAPHANDLERMBS

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>imageMap</td>
<td>(Mandatory)</td>
<td>A text string representing the image map in HTML format.</td>
</tr>
</tbody>
</table>

### 28.21.4  getHotSpot(xCoordinate as Integer, yCoordinate as Integer) as Integer

**Function:** Gets the hot spot under the given point as the current hot spot.

**Notes:**

This method will retrieve the hot spot under the given point as the "current hot spot". Its attributes can then be retrieved using ImageMapHandler.getKey, ImageMapHandler.getValue and ImageMapHandler.getValue2.

This method returns an integer representing the hot spot, or -1 if the point is not over any hot spot. Each hot spot region is represented by a unique integer, which can be any arbitrary number. The number is mainly used to determine if the cursor has changed from one hot spot to another hot spot.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x coordinate of a point of which the hot spot is to be retrieved.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y coordinate of a point of which the hot spot is to be retrieved.</td>
</tr>
</tbody>
</table>

**Return Value**

An integer representing the hot spot, or -1 if the given point is not over any hot spot.

### 28.21.5  getKey(i as Integer) as string

**Function:** Gets the key of an attribute of the current hot spot.

**Notes:**

Each hot spot is associated with an arbitrary number of attributes, in which each attribute consists of a key and a value. This method returns the key of the (i + 1)th attribute. (The first attribute is 0, while the nth attribute is n - 1.)

If the argument i is equal or larger than the number of attributes, an null string will be returned. This behaviour can be used to enumerate the attributes and to determine how many attributes are associated for the hot spot.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>(Mandatory)</td>
<td>The index of the attribute to retrieve (index of first attribute is 0).</td>
</tr>
</tbody>
</table>
28.21.6  getValue(i as Integer) as string

Function: Gets the value of an attribute of the current hot spot by using its numeric index.

Notes:
Each hot spot is associated with an arbitrary number of attributes, in which each attribute consists of a key and a value. This method returns the value of the \((i + 1)\)th attribute. (The first attribute is 0, while the \(n\)th attribute is \(n - 1\).)

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>(Mandatory)</td>
<td>The index of the attribute to retrieve (index of first attribute is 0).</td>
</tr>
</tbody>
</table>

Return Value
A string representing the value of the attribute, or null if there is no such attribute.

See also:
- 28.21.7 getValue(key as string) as string

28.21.7  getValue(key as string) as string

Function: Gets the value of an attribute of the current hot spot by using its key.

Notes:
Each hot spot is associated with an arbitrary number of attributes, in which each attribute consists of a key and a value. This method returns the value of the attribute given the key.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>(Mandatory)</td>
<td>A text string representing the key of the attribute.</td>
</tr>
</tbody>
</table>

Return Value
A string representing the value of the attribute, or null if there is no such attribute.

See also:
- 28.21.6 getValue(i as Integer) as string
28.22. **CLASS CDINTERLINELAYERMBS**

### 28.22 class CDInterLineLayerMBS

#### 28.22.1 class CDInterLineLayerMBS

**Function:** The InterLineLayer class represents interline layers.

**Notes:**
Interline layers are used to color the region between two lines. The lines can come from a variety of layer types, such as line layers, spline layers, step line layers, trend layers or axis mark lines. Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

### 28.22.2 Methods

#### 28.22.3 setGapColor(gapColor12 as Color, gapColor21 as Color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setGapColor method, but uses color instead of integer data type for passing color values.

**See also:**
- 28.22.4 setGapColor(gapColor12 as Integer, gapColor21 as Integer = -1)

#### 28.22.4 setGapColor(gapColor12 as Integer, gapColor21 as Integer = -1)

**Function:** Sets the color used to fill the area under NoValue data points.

**Notes:**
By default, if there are NoValue data points on the lines, ChartDirector will interpolate across the points. The region will remain continuous.

This method can be used to set up an alternative colors to represent the regions at NoValue data point positions. In particular, if the colors are set to Transparent, the NoValue data points will result in gaps in the fill region.

**See also:**
- 28.22.3 setGapColor(gapColor12 as Color, gapColor21 as Color)
<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gapColor12</td>
<td>(Mandatory)</td>
<td>The color used to fill the region under NoValue positions when value of the first line is greater of the value of the second line.</td>
</tr>
<tr>
<td>gapColor21</td>
<td>-1</td>
<td>The color used to fill the region under NoValue positions when value of the second line is greater of the value of the first line. The default value of -1 means it is the same as gapColor12.</td>
</tr>
</tbody>
</table>
28.23.1  class CDLayerMBS

Function: The Layer class is the base class for all XYChart layer classes.
Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.23.2  Methods

28.23.3  addCustomAggregateLabel(dataItem as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

Function: Adds a custom aggregate label to an aggregated object.
Notes:
Aggregate data labels applies to layer types that contains "aggregated data", such as stacked bar layer and stacked area layer. In these layer types, data labels (see Layer.setDataLabelStyle) represents a single data item, while aggregate labels represents the stacked object.

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataItem</td>
<td>(Mandatory)</td>
<td>The index of the aggregated object. The first aggregated object is 0, while the nth aggregated object is (n - 1).</td>
</tr>
<tr>
<td>label</td>
<td>(Mandatory)</td>
<td>A text string representing the custom aggregate label. Parameter Substitution and Formatting is supported.</td>
</tr>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font used to draw the labels.</td>
</tr>
<tr>
<td>fontSize</td>
<td>8</td>
<td>The font size used to draw the labels.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The color used to draw the labels.</td>
</tr>
<tr>
<td>fontAngle</td>
<td>0</td>
<td>The rotation angle of the labels.</td>
</tr>
</tbody>
</table>

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:
28.23.4 addCustomAggregateLabel(dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addCustomAggregateLabel method, but uses color instead of integer data type for passing color values.

See also:

- 28.23.3 addCustomAggregateLabel(dataItem as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

28.23.5 addCustomDataLabel(dataSet as Integer, dataItem as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

**Function:** Adds a custom data label to a data point.

**Notes:**
Data labels are text used label data points in the layer. Please refer to Layer.setDataLabelStyle for a more detail description.

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataSet</td>
<td>(Mandatory)</td>
<td>The data set number for the data point. The first data set is 0, while the nth data set is (n - 1).</td>
</tr>
<tr>
<td>dataItem</td>
<td>(Mandatory)</td>
<td>The data point number for the data point within the data set. The first data point is 0, while the nth data point is (n - 1).</td>
</tr>
<tr>
<td>label</td>
<td>(Mandatory)</td>
<td>A text string representing the data label. Parameter Substitution and Formatting is supported.</td>
</tr>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font used to draw the label.</td>
</tr>
<tr>
<td>fontSize</td>
<td>8</td>
<td>The font size used to draw the label.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The color used to draw the label.</td>
</tr>
<tr>
<td>fontAngle</td>
<td>0</td>
<td>The rotation angle of the label.</td>
</tr>
</tbody>
</table>

**Return Value**
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.
28.23. **CLASS CDLAYERMBS**

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:

- 28.23.5 `addCustomDataLabel(dataSet as Integer, dataItem as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS` 4750

**28.23.6 addCustomDataLabel(dataSet as Integer, dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addCustomDataLabel method, but uses color instead of integer data type for passing color values.

See also:

- 28.23.5 `addCustomDataLabel(dataSet as Integer, dataItem as Integer, label as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS` 4750

**28.23.7 addCustomGroupLabel(dataGroup as Integer, dataItem as Integer, label as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS**

**Function:** Adds a custom data group label to object representing the group.

**Notes:**

Data group label applies to layer types that may represent data groups. See Layer.addDataGroup on how data groups are created and the layer types that support data groups.

See Font Specification for details on various font attributes.

**Return Value**

A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:

- 28.23.8 `addCustomGroupLabel(dataGroup as Integer, dataItem as Integer, label as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS` 4752
28.23.8  addCustomGroupLabel(dataGroup as Integer, dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other addCustomGroupLabel method, but uses color instead of integer data type for passing color values.

See also:

- 28.23.7 addCustomGroupLabel(dataGroup as Integer, dataItem as Integer, label as string, font as string ="", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

28.23.9  addDataGroup(name as string)

**Function:** Open a new data group.
**Notes:**
Currently, only stacked bar layers support data groups for creating "multi-stacked" bars.

In a normal stacked bar layer, all data sets are stacked on top of one another, creating one stacked bar per x-axis position. If data grouping is used, data sets within the same data group with be stacked up. So there may be multiple stacked bars in each x-axis position. These stacked bars are drawn side by side.

When you add a data set using Layer.addDataSet, the data set will belong to the current data group. The addDataGroup method can be used to open a new data group, so that subsequent data sets will belong to that new group.

You may associate a name with a data group. The name can then be used in data labels or image maps to identify the data group.
### 28.23. CLASS CDLAYERMBS

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>&quot;&quot;</td>
<td>Name of the data group.</td>
</tr>
</tbody>
</table>

#### 28.23.10 addDataSet(data as CDArrayMBS, colorvalue as color, name as string = "") as CDDatasetMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addDataSet method, but uses color instead of integer data type for passing color values.

**See also:**
- 28.23.11 addDataSet(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "") as CDataSetMBS
- 28.23.12 addDataSet(data() as Double, colorvalue as color, name as string = "") as CDDatasetMBS
- 28.23.13 addDataSet(data() as Double, colorvalue as Integer = -1, name as string = "") as CDataSetMBS

#### 28.23.11 addDataSet(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "") as CDDatasetMBS

**Function:** Adds a data set to the chart layer.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the data set.</td>
</tr>
<tr>
<td>color</td>
<td>-1</td>
<td>The color to draw the data item. -1 means that the color is automatically selected from the palette.</td>
</tr>
<tr>
<td>name</td>
<td>&quot;&quot;</td>
<td>The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.</td>
</tr>
</tbody>
</table>

**Return Value**

A Dataset object representing the data set added. You may use the methods of this object to fine-tune how the data set is drawn on the chart.

**See also:**
- 28.23.10 addDataSet(data as CDArrayMBS, colorvalue as color, name as string = "") as CDDatasetMBS
- 28.23.12 addDataSet(data() as Double, colorvalue as color, name as string = "") as CDDatasetMBS
28.23.12  addDataSet(data() as Double, colorvalue as color, name as string = ") as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addDataSet method, but uses color instead of integer data type for passing color values.
See also:

  4754
28.23. CLASS CDLAYERMBS

28.23.14 addExtraField(numbers() as Double)

**Function:** Adds an array of numbers/dates to be used as an extra field in various places.

**Notes:**
This method merely stores the data inside the layer object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>numbers</td>
<td>(Mandatory)</td>
<td>An array of numbers/dates to be stored inside the layer object.</td>
</tr>
</tbody>
</table>

See also:
- 28.23.15 addExtraField(texts() as string)

28.23.15 addExtraField(texts() as string)

**Function:** Adds an array of text to be used as an extra field in various places.

**Notes:**
This method merely stores the data inside the layer object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>texts</td>
<td>(Mandatory)</td>
<td>An array of text to be stored inside the layer object.</td>
</tr>
</tbody>
</table>

See also:
- 28.23.14 addExtraField(numbers() as Double)
28.23.16  alignLayer(layer as CDLayerMBS, dataSet as Integer)

**Function:** Aligns the layer with a data set of another bar chart layer in Side layout.
**Notes:**
The Side layout is a layout method specific to the bar chart layer. In this layout method, multiple bars belonging to the same x-position are laid out side by side. Thus the bars are not centered exactly on the x-position, but are shifted. The shift amount depends on the data set numbers of the bars.

In some cases, it may be necessary to overlay another layer (eg. a line chart layer, or a box-whisker chart layer) on top of the bars. The alignLayer method ensures the data points are shifted by the same amount as a given data set on a given BarLayer.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layer</td>
<td>(Mandatory)</td>
<td>The BarLayer which contains the bars to synchronize with.</td>
</tr>
<tr>
<td>dataSet</td>
<td>(Mandatory)</td>
<td>The data set of the bars to synchronize with.</td>
</tr>
</tbody>
</table>

28.23.17  Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The private constructor.

28.23.18  getDataSet(dataSet as Integer) as CDDatasetMBS

**Function:** Gets the requested DataSet object.
**Notes:**
<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataSet</td>
<td>(Mandatory)</td>
<td>A data set number, starting from 0. The first data set object is 0, and the nth data set is (n-1).</td>
</tr>
</tbody>
</table>

Return Value
The requested DataSet object.

28.23.19  getDataSetByZ(z as Integer) as CDDatasetMBS

**Function:** Gets a DataSet object based on the order in which it is being drawn.
28.23. CLASS CDLAYERMBS

Notes:

In certain layer types, the data sets are drawn in a certain order. For example, in a line layer, the data sets represent lines and they are drawn one by one. In contrast, for a candlestick layer, the high, low, open and close data sets are combined into candlestick symbols, and there is no specific order on which data sets are drawn.

This method can be used to get the data set based on the order it is being drawn. If the data sets are not drawn in any specific order, this method will return the data sets in the reverse order to which it is added to the layer.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>zIndex</td>
<td>(Mandatory)</td>
<td>The z-index of the required data set. The z-index of the first data set drawn is 0. The z-index for the Nth data set drawn is N - 1.</td>
</tr>
</tbody>
</table>

Returns the DataSet object at the specified z-order.

28.23.20 getDataSetCount as Integer

Function: Gets the number of data sets in the layer.
Notes: Returns the number of data sets in the layer.

28.23.21 getHTMLImageMap(url as string, queryFormat as string = "", extraAttr as string = "", offsetX as Integer = 0, offsetY as Integer = 0) as string

Function: Generates an HTML image map for all data points as represented on the layer.
Notes: Please refer to BaseChart.getHTMLImageMap for the detail description of this method.

This method should be called only after creating the chart image (e.g. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default.

Note that an empty string means to use the default query query parameters. To specify no query parameter,
## Argument Default Description

**url** *(Mandatory)*
The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.

**queryFormat** 
A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.

**extraAttr** 
A text string to specify additional attributes to add to the &lt;area&gt; tag. Parameter Substitution and Formatting is supported.

**offsetX**
An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.

**offsetY**
An offset to be added to all y coordinates in the image map. See offsetX above for description.

### Returns

A text string containing the image map generated.

---

### 28.23.22 getImageCoor(dataSet as Integer, dataItem as Integer = & h80000001, offsetX as Integer = 0, offsetY as Integer = 0) as string

**Function:** Gets the image map coordinates of a data point as represented in the layer as HTML image map attributes.

**Notes:**

The image map coordinates will be in the following format:

```
shape="[ shape ]" cords="[ x1 ] , [ y1 ] , [ x2 ] , [ y2 ] ..."
```

This format is specially designed so that it can easily be incorporated into HTML image maps.

This method should be called only after creating the chart image (e.g. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

**Return Value**

A text string representing the coordinates of the data point as represented in the layer in HTML image map attribute format.
getImageCoor2(dataItem as Integer, offsetX as Integer = 0, offsetY as Integer = 0) as string

Function: Gets the image map coordinates of a region containing all data points at the given x-position as HTML image map attributes.

Notes:
For example, in a stacked bar chart, this method will obtain the image map coordinates of the whole stacked bar, which contains multiple data points at the same x-position.

The image map coordinates will be in the following format:

shape="" cords=" [ x1 ] , [ y1 ] , [ x2 ] , [ y2 ] ..."

This format is specially designed so that it can easily be included into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.
28.23.24  **getLegendIcon(dataSetNo as Integer) as string**

**Function:** Gets the textual representation of the legend icon for a data set.  
**Notes:**  
The textual representation can be used in any ChartDirector API that supports the ChartDirector Mark Up Language. A common usage is to insert the icon to a cell in a CDMLTable to label the data series in the table, or to create a custom legend table.

The legend icon is the same legend icon that would be used in the CDLegendBoxMBS. If you modify the icon appearance using the methods of the CDLegendBoxMBS object (such as using CDLegendBoxMBS.setKeyBorder to configure the legend key border), the modification will also apply to the icon returned this method.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataSetNo</td>
<td>(Mandatory)</td>
<td>The data set for which the legend icon represents.</td>
</tr>
</tbody>
</table>

**Return Value**  
The textual representation of the legend icon for the data set.

28.23.25  **getNearestXValue(target as Double) as Double**

**Function:** Gets the x data value that is nearest to the specified x pixel coordinate.  
**Notes:**  
This method will search all x data values in the Layer to look for the x data value that is nearest to the given x coordinate. If there are two x data values equally near to the specified x pixel coordinate, this method will arbitrarily return one of the values.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xCoor</td>
<td>(Mandatory)</td>
<td>The x pixel coordinate to search for.</td>
</tr>
</tbody>
</table>

Returns the x data value that is nearest to the specified x coordinate.
28.23. CLASS CDLAYERMBS

28.23.26  getXCoor(value as Double) as Integer

Function: Gets the x pixel coordinate of a point given the x data value.
Notes:
Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to
perform auto-scaling and determine the axis scale first before it can compute the coordinates.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>v</td>
<td>(Mandatory)</td>
<td>The x data value.</td>
</tr>
</tbody>
</table>

Return Value
The x coordinate of the x data value.

28.23.27  getXIndexOf(xValue as Double, tolerance as Double = 0) as Integer

Function: Gets the data point index at the specified x data value.
Notes:
The index can be used in DataSet.getValue and DataSet.getPosition to obtain the y values and positions of
the data points for all data sets in the layer.

The tolerance argument is to allow this method to consider data points that are not exactly at xValue, but
are within tolerance from it.

If multiple data points at within tolerance, this method will return the index of the data point nearest to
xValue. If multiple data points are equally near to xValue, this method will choose one arbitrarily and return
its data point index. If no data points are found, this method will return -1.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xValue</td>
<td>(Mandatory)</td>
<td>The x data value used to look for the data points in order to get the data point index of the nearest data point.</td>
</tr>
<tr>
<td>tolerance</td>
<td>0</td>
<td>The tolerance allowed for data points that are not exactly at the specified xValue.</td>
</tr>
</tbody>
</table>

Returns the data point index of the data point nearest to the specified x data value up to the specified tolerance, or -1 if no data points are found.
### 28.23.28 `getXPosition(i as Integer) as Double`

**Function:** Gets the x positional value of a data point, as measured on the primary x-axis.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>(Mandatory)</td>
<td>The data point index of the data point. The first data point is 0; the nth data point is ( (n - 1) ).</td>
</tr>
</tbody>
</table>

### 28.23.29 `getYCoor(value as Double, axis as boolean=true) as Integer`

**Function:** Gets the y pixel coordinate of a point given the y data value.

**Notes:**

Note: You must call `BaseChart.layout` first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>v</td>
<td>(Mandatory)</td>
<td>The y data value.</td>
</tr>
<tr>
<td>yAxis</td>
<td>[ Null ]</td>
<td>The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using <code>XYChart.yAxis</code>, <code>XYChart.yAxis2</code> or <code>XYChart.addAxis</code>. The default is to use the primary y-axis.</td>
</tr>
</tbody>
</table>

For backward compatibility, the axis argument can also be a boolean value. A true value means the primary y-axis. A false value means the secondary y-axis.

**Return Value**
The y coordinate of the y data value.

**See also:**

- 28.23.30 `getYCoor(value as Double, axis as CDAxisMBS) as Integer`

### 28.23.30 `getYCoor(value as Double, axis as CDAxisMBS) as Integer`

**Function:** Gets the y pixel coordinate of a point given the y data value.

**Notes:**

Note: You must call `BaseChart.layout` first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.
28.23. CLASS CDLAYERMBS

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>v</td>
<td>(Mandatory)</td>
<td>The y data value.</td>
</tr>
<tr>
<td>yAxis</td>
<td>[ Null ]</td>
<td>The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.</td>
</tr>
</tbody>
</table>

For backward compatibility, the axis argument can also be a boolean value. A true value means the primary y-axis. A false value means the secondary y-axis.

Return Value
The y coordinate of the y data value.

See also:
- 28.23.29 getYCoor(value as Double, axis as boolean=true) as Integer

28.23.31 moveBack(layer as CDLayerMBS=nil)

**Function:** Moves the layer in front of another layer.

**Notes:**
By default, the front to back ordering of the Layer objects are the same as the order in which they are added to the chart. For example, a layer added first will be in front of a layer added last.

This method can be used to move the layer behind another layer.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layer</td>
<td>nil</td>
<td>The Layer for this layer to move behind. A nil object means the layer will be moved behind all current layers.</td>
</tr>
</tbody>
</table>

28.23.32 moveFront(layer as CDLayerMBS=nil)

**Function:** Moves the layer in front of another layer.

**Notes:**
By default, the front to back ordering of the CDLayerMBS objects are the same as the order in which they are added to the chart. For example, a layer added first will be in front of a layer added last.
CHAPTER 28. CHARTDIRECTOR

This method can be used to move the layer in front of another layer.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layer</td>
<td>nil</td>
<td>The Layer for this layer to move in front of. The default value of null means the layer will be moved in front of all current layers.</td>
</tr>
</tbody>
</table>

28.23.33  set3D(d as Integer = -1, zGap as Integer = 0)

Function: Sets the 3D depth of the layer, and the 3D gap between the current layer and the next layer.

Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
<td>-1</td>
<td>The 3D depth of the layer in pixels. -1 means the 3D depth is automatically calculated.</td>
</tr>
<tr>
<td>zGap</td>
<td>0</td>
<td>The 3D gap between the current layer and the next layer in pixels.</td>
</tr>
</tbody>
</table>

28.23.34  setAggregateLabelFormat(formatString as string)

Function: Sets the aggregate label format.

Notes:

By default, the aggregate label format is " { value } ". Please refer to Parameter Substitution and Formatting on available parameters and how to format them.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatString</td>
<td>(Mandatory)</td>
<td>The format string.</td>
</tr>
</tbody>
</table>

28.23.35  setAggregateLabelStyle(font as string = "", fontSize as Double = 8, fontcolor as Integer = & hff0002, fontAngle as Double = 0) as CDTextBoxMBS

Function: Enables aggregate labels and sets their styles.

Notes:
Aggregate data labels applies to layer types that contains "aggregated data", such as stacked bar layer and stacked area layer. In these layer types, data labels (see Layer.setDataLabelStyle) represents a single data item, while aggregate labels represents the stacked object.

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font used to draw the labels.</td>
</tr>
<tr>
<td>fontSize</td>
<td>8</td>
<td>The font size used to draw the labels.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The color used to draw the labels.</td>
</tr>
<tr>
<td>fontAngle</td>
<td>0</td>
<td>The rotation angle of the labels.</td>
</tr>
</tbody>
</table>

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:
- 28.23.36 setAggregateLabelStyle(font as string, fontSize as Double, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS

28.23.36 setAggregateLabelStyle(font as string, fontSize as Double, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setAggregateLabelStyle method, but uses color instead of integer data type for passing color values.

See also:
- 28.23.35 setAggregateLabelStyle(font as string = "", fontSize as Double = 8, fontcolor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

28.23.37 setBaseLine(BaseLine as Double)

**Function:** Sets the baseline for the data representation.

**Notes:**
Certain data representation, such as bars in bar layers and area in area layers, are drawn from a base line. The base line by default is \( y = 0 \).
For example, for a vertical bar layer, the bars start from $y = 0$ and grow upwards for positive data (assuming the y-axis is not reversed), and downwards for negative data.

This method can be used to modify the base line to other values.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseLine</td>
<td>(Mandatory)</td>
<td>The value of the base line.</td>
</tr>
</tbody>
</table>

**28.23.38 setBorderColor(colorvalue as color, lightingEffect as Integer = 0)**

**Function:** Sets the default border color and 3D raised effect when drawing data sets on the layer.

**Notes:**

This method only applies to layers that represents data with elements that have borders (e.g. bar layer).

This method affect all data sets. To set the color of one particular data set, use DataSet.setDataColor.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The border color.</td>
</tr>
<tr>
<td>raisedEffect</td>
<td>0</td>
<td>The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support glassEffect and softLighting effects.</td>
</tr>
</tbody>
</table>

See also:

- 28.23.39 setBorderColor(colorvalue as Integer, lightingEffect as Integer = 0)

**28.23.39 setBorderColor(colorvalue as Integer, lightingEffect as Integer = 0)**

**Function:** Sets the default border color and 3D raised effect when drawing data sets on the layer.

**Notes:**

This method only applies to layers that represents data with elements that have borders (e.g. bar layer).

This method affect all data sets. To set the color of one particular data set, use DataSet.setDataColor.
28.23. CLASS CDLAYERMBS

<table>
<thead>

<td></td>
<td>and softLighting effects.</td>
</tr>
</tbody>
</table>

See also:

- 28.23.38 setBorderColor(colorvalue as color, lightingEffect as Integer = 0)

28.23.40 setDataCombineMethod(m as Integer)

**Function:** Sets the method used to combine multiple data sets in a layer.

**Notes:**

This method is used only for layers that can combine multiple data sets in different ways. Some layers can only support a subset of the data combine methods defined below.

<table>
<thead>
<tr>
<th>Constant Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Side</td>
<td>3 The data sets are combined by plotting the data representation side by side.</td>
</tr>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>m</td>
<td>(Mandatory)</td>
<td>one of the predefined constants representing the data combine method to use.</td>
</tr>
</tbody>
</table>

28.23.41 setDataLabelFormat(formatString as string)

**Function:** Sets the data label format.

**Notes:**
This method affects all data labels in the layer. To set the label format for one particular data set only, use DataSet.setDataLabelFormat.

Data labels are text used label data points in the layer. Please refer to Layer.setDataLabelStyle for a more detail description.

By default, the data label format is "\{ value \}". Please refer to Parameter Substitution and Formatting on available parameters and how to format them.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatString</td>
<td>(Mandatory)</td>
<td>The format string.</td>
</tr>
</tbody>
</table>

28.23.42  

```
setDataSetLabelStyle(font as string = "", fontSize as Double = 8, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS
```

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. 

**Function:** Same as the other setDataLabelStyle method, but uses color instead of integer data type for passing color values.

**See also:**

- 28.23.43 setDataLabelStyle(font as string = "", fontSize as Double = 8, fontcolor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

28.23.43  

```
setDataSetLabelStyle(font as string = "", fontSize as Double = 8, fontcolor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS
```

**Function:** Enables data labels and sets their styles.

**Notes:**

This method affects all data labels in the layer. To set the style for one particular data set only, use DataSet.setDataLabelStyle.

Data labels are text used label data points in the layer. Different layer types put data labels in different positions. For example, in a bar chart, data labels are put at the internal end of the bar. For a line chart, data labels are put above the data points.

For some chart types, the position of the data labels can be manipulated by calling the TextBox.setAlignment method of the TextBox object returned by the setDataLabelStyle method.
28.23. CLASS CDLAYERMBS

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font used to draw the labels.</td>
</tr>
<tr>
<td>fontSize</td>
<td>8</td>
<td>The font size used to draw the labels.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The color used to draw the labels.</td>
</tr>
<tr>
<td>fontAngle</td>
<td>0</td>
<td>The rotation angle of the labels.</td>
</tr>
</tbody>
</table>

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:
- 28.23.42 setDataLabelStyle(font as string = "", fontSize as Double = 8, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS 4768

28.23.44 setHTMLImageMap(url as string, queryFormat as string = "", extraAttr as string = "")

Function: Override the default arguments used when generating HTML image map for the layer.

Notes:
BaseChart.getHTMLImageMap can be used to generate HTML image map for the whole chart. When BaseChart.getHTMLImageMap is used, the image map for all layers will be generated based on the arguments supplied to BaseChart.getHTMLImageMap.

The setHTMLImageMap method can be used to override those arguments for a chart layer, so the image map for that layer can be different.

For a detail description of image maps, please refer to BaseChart.getHTMLImageMap.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(Mandatory)</td>
<td>The URL to be used in the &quot;href&quot; attribute of the image map. Parameter Substitution and Formatting is supported.</td>
</tr>
</tbody>
</table>

The special keyword " { default } " represents the global URL as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global URL.
Note that an empty string also means to use the global URL. To specify no URL, use the special keyword " \{ none \ } ".

To disable the entire image map, use the special keyword " \{ disable \ } ".

\textbf{queryFormat "} A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.

The special keyword " \{ default \ } " represents the global query parameters as specified in \texttt{BaseChart.getHTMLImageMap}. This field is useful for specifying appending to the global query parameters.

Note that an empty string also means to use the global query parameters. To specify no query parameters, use the special keyword " \{ none \ } ".

\textbf{extraAttr "} A text string to specify additional attributes to add to the \texttt{&lt;area&gt;} tag. Parameter Substitution and Formatting is supported.

The special keyword " \{ default \ } " represents the global additional attributes as specified in \texttt{BaseChart.getHTMLImageMap}. This field is useful for specifying appending to the global additional attributes.

Note that an empty string also means to use the global additional attributes. To specify no additional attributes, use the special keyword " \{ none \ } ".

\section*{28.23.45 \texttt{setLegend(m as Integer)}}

\textbf{Function:} Sets the order of the data set names as appeared in the legend box.

\textbf{Notes:}

This method is for backward compatibility. It is equivalent to \texttt{Layer.setLegendOrder(m)}.

\begin{tabular}{lll} 
\textbf{Argument} & \textbf{Default} & \textbf{Description} \\
\texttt{m} & (Mandatory) & One of the predefined constants representing the legend entry ordering method for data sets within the layer. \\
\end{tabular}
28.23. **setLegendOrder** (dataSetOrder as Integer, layerOrder as Integer = -1)

**Function:** Sets the order of the data set names as appeared in the legend box.

**Notes:**

By default, ChartDirector will add named data sets to the legend box. The ordering of the entries follows the order in which the layers are created. For data sets within the same layer, the ordering follows the order in which the data sets are added.

To support flexible ordering of the legend entries, ChartDirector employs a legend entry priority system. Please refer to LegendBox for details of the legend entry priority system.

The base priority of the layer can be specified using the layerOrder argument. The priority of the data sets within a layer can be modified by using the dataSetOrder argument, which must be one of the following predefined constants.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NormalLegend</td>
<td>0</td>
<td>The data set priority is 10 x (data_set_index + 1). Legend entries are ordered in the order with which the data sets are created.</td>
</tr>
<tr>
<td>ReverseLegend</td>
<td>1</td>
<td>The data sets priority is the reverse of the normal data set priority. Legend entries are ordered in the reverse order with which the data sets are created.</td>
</tr>
<tr>
<td>NoLegend</td>
<td>2</td>
<td>The data set names are not added to the legend box at all.</td>
</tr>
</tbody>
</table>

**Argument**    | **Default** | **Description**
------        | -------   | ---------------------------------------------------------------|
dataSetOrder  | (Mandatory) | One of the predefined constants representing the legend entry ordering method for data sets within the layer. |
layerOrder    | -1        | The base legend entry priority of the layer. The default value of -1 means the priority is 10000 x (layer_index + 1). |

28.23.47. **setLineWidth** (w as Integer)

**Function:** Sets the default line width of lines when drawing data sets on the layer.

**Notes:**

This method only applies to layers that employ lines to represent data (e.g. line layer).

This method affect all data sets. To set the line width of one particular data set, use DataSet.setLineWidth.
### 28.23.48 setUseYAxis(axis as CDAxisMBS)

**Function:** Determine the y-axis to use when drawing the data sets.

**Notes:**
This method affects all data sets in the layer. To set the y-axis to use for a particular data set, use DataSet.setUseYAxis.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>(Mandatory)</td>
<td>The y-axis to use when drawing the data sets.</td>
</tr>
</tbody>
</table>

### 28.23.49 setUseYAxis2(b as boolean=true)

**Function:** Determine if the primary or secondary y-axis should be used when drawing the data sets.

**Notes:**
This method affects all data sets in the layer. To set the y-axis to use for a particular data set, use DataSet.setUseYAxis2.

Note: Layer.setUseYAxis is a more general method that can support more than 2 y-axes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>true</td>
<td>A true value means the secondary y-axis will be used. A false value means the primary y-axis will be used.</td>
</tr>
</tbody>
</table>

### 28.23.50 setXData(data as CDArrayMBS)

**Function:** Sets the x values of the data points in the data sets.

**Notes:**
In most ChartDirector XY chart layers, when a data set is added, only the y Values for the data points are needed. For example, in a bar layer, you just need to specify the values of the bars (y values). ChartDirector will automatically layout the bars evenly on the x-axis. You can then specify the labels on the x-axis using
In ChartDirector, this type of x-axis scaling is called "enumerated" scale. Please refer to Axis.setLabels for a more detailed explanation of "enumerated" scale.

However, in some cases, it may be necessary to specify the x values explicitly. For example, if a chart contains data points that are not evenly distributed on the x-axis, it is necessary to specify the x values explicitly. It is because enumerated scale always assumes the data points are distributed evenly on the x-axis. In this case, the setXData method can be used to specify the x values for the data points.

In general, if the data points are evenly distributed on the x-axis, it is recommended that enumerated x-scale be used and no x values are necessary. Even the data points are evenly distributed, except that some data points are missing, it is still possible to use enumerated x-scale by using the NoValue constant to represent missing data points.

On the other hand, if the data points are by its nature not evenly distributed, the x values should be provided explicitly using the setXData method.

Each layer only supports one x values series. All data sets in the layer will use the same x value series. If two data sets have different x values, they should be put in two separate layers.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xData</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the x value series.</td>
</tr>
</tbody>
</table>

28.23.52 setXData(dates() as date)

MBS ChartDirector Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Sets the x values of the data points in the data sets.

Notes:

In most ChartDirector XY chart layers, when a data set is added, only the y Values for the data points are needed. For example, in a bar layer, you just need to specify the values of the bars (y values). ChartDirector will automatically layout the bars evenly on the x-axis. You can then specify the labels on the x-axis using Axis.setLabels.

In ChartDirector, this type of x-axis scaling is called "enumerated" scale. Please refer to Axis.setLabels for a more detail explanation of "enumerated" scale.
However, in some cases, it may be necessary to specify the x values explicitly. For example, if a chart contains data points that are not evenly distributed on the x-axis, it is necessary to specify the x values explicitly. It is because enumerated scale always assume the data points are distributed evenly on the x-axis. In this case, the setXData method can be used to specify the x values for the data points.

In general, if the data points are evenly distributed on the x-axis, it is recommended enumerated x-scale be used and no x values are necessary. Even the data points are evenly distributed, except that some data points are missing, it is still possible to use enumerated x-scale by using the NoValue constant to represent missing data points.

On the other hand, if the data points are by its nature not evenly distributed, the x values should be provided explicitly using the setXData method.

Each layer only supports one x values series. All data sets in the layer will use the same x value series. If two data sets have different x values, they should be put in two separate layers.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xData</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the x value series.</td>
</tr>
</tbody>
</table>

See also:

- 28.23.50 setXData(data as CDArrayMBS) 4772
- 28.23.51 setXData(data() as Double) 4773
- 28.23.53 setXData(minValue as Double, maxValue as Double) 4775

28.23.53 setXData(minValue as Double, maxValue as Double)

**Function:** Sets the x values of the data points in the data sets as evenly distributed in a range. 
**Notes:**

This method is most useful when two layers contain data at different x axis scale. An example is a line layer with one data point per minute, and another line layer with one data point per 5 minutes.

In the above example, in one hour, the first layer will have 60 data points, while the second layer will have 12 data points. If enumerated x-scale is used, the x-axis will contain 60 positions evenly distributed. The 60 data points in the first layer will corresponds to the 60 positions in the x-axis, which is correct. However, the 12 data points in the second layer will corresponds to the first 12 positions on the x-axis, which is not the desired result.

Instead, the 12 data points in the second layer should corresponds to positions 0, 5, 10, 15, .... A little thought will review that the 12 data points in the second layer should be distributed evenly among positions...
0 - 55. The setXData2 method can be used to inform ChartDirector about the scaling used in the second layer.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>minValue</td>
<td>(Mandatory)</td>
<td>The x value of the first point in a data set.</td>
</tr>
<tr>
<td>maxValue</td>
<td>(Mandatory)</td>
<td>The x value of the last point in the data set.</td>
</tr>
</tbody>
</table>

See also:

- 28.23.50 setXData(data as CDArrayMBS) 4772
- 28.23.51 setXData(data() as Double) 4773
- 28.23.52 setXData(dates() as date) 4774

28.23.54  xZoneColor(threshold as Double, belowColor as color, aboveColor as color) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other xZoneColor method, but uses color instead of integer data type for passing color values.

See also:

- 28.23.55 xZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer) as Integer 4776

28.23.55  xZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer) as Integer

**Function:** Creates a x-zone color. A x-zone will change from one color to another depending on a threshold value on the x-axis.

**Notes:**

For example, if a x-zone color is used as the line color in a line layer, the line will switch from one color to another when its passes through a certain value on the x-axis. Similarly, if a x-zone color is used as the fill color in an area layer, the area will switch from one color to another when it passes through a certain value on the x-axis.

The two colors used in a x-zone color can be other dynamic colors. For example, one color could be a solid color, while the other color could be a dash line color (see !BaseChart.dashLineColor). When this x-zone color is as the line color, the line will change from a solid style to a dash line style when the line passes through a certain value on the x-axis.
You may create x-zone colors with more than 2 zones by cascading multiple x-zone colors.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threshold</td>
<td>(Mandatory)</td>
<td>The x value serving as the threshold for switching between two colors.</td>
</tr>
<tr>
<td>belowColor</td>
<td>(Mandatory)</td>
<td>The color to use when the x-axis value of the pixel is smaller than the threshold.</td>
</tr>
<tr>
<td>aboveColor</td>
<td>(Mandatory)</td>
<td>The color to use when the x-axis value of the pixel is greater than the threshold.</td>
</tr>
</tbody>
</table>

Return Value
A 32-bit integer representing the x-zone color.

See also:

- 28.23.54 xZoneColor(threshold as Double, belowColor as color, aboveColor as color) as Integer

28.23.56 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as boolean=true) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other yZoneColor method, but uses color instead of integer data type for passing color values.

See also:

- 28.23.57 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS) as Integer
- 28.23.58 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as boolean=true) as Integer
- 28.23.59 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS) as Integer

28.23.57 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other yZoneColor method, but uses color instead of integer data type for passing color values.

See also:

- 28.23.56 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as boolean=true) as Integer
- 28.23.58 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as boolean=true) as Integer
- 28.23.59 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS) as Integer
28.23.58  yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as boolean=true) as Integer

**Function:** Creates a y-zone color. A y-zone will change from one color to another depending on a threshold value on the y-axis.

**Notes:**

For example, if a y-zone color is used as the fill color in an area layer, the area will switch from one color to another when its value is higher than a certain value on the y-axis.

The two colors used in a y-zone color can be other dynamic colors. You may create y-zone colors with more than 2 zones by cascading multiple y-zone colors.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threshold</td>
<td>(Mandatory)</td>
<td>The y value serving as the threshold for switching between two colors.</td>
</tr>
<tr>
<td>belowColor</td>
<td>(Mandatory)</td>
<td>The color to use when the y-axis value of the pixel is smaller than the threshold.</td>
</tr>
<tr>
<td>aboveColor</td>
<td>(Mandatory)</td>
<td>The color to use when the y-axis value of the pixel is greater than the threshold.</td>
</tr>
<tr>
<td>yAxis</td>
<td>[ Null ]</td>
<td>The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.</td>
</tr>
</tbody>
</table>

For backward compatibility, the axis argument can also be a boolean value. A true value means the primary y-axis. A false value means the secondary y-axis.

**Return Value**
A 32-bit integer representing the y-zone color.

**See also:**

- 28.23.56 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as boolean=true) as Integer 4777
- 28.23.57 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS) as Integer 4777
- 28.23.59 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS) as Integer 4778

28.23.59  yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS) as Integer

**Function:** Creates a y-zone color. A y-zone will change from one color to another depending on a threshold value on the y-axis.

**Notes:**
For example, if a y-zone color is used as the fill color in an area layer, the area will switch from one color to another when its value is higher than a certain value on the y-axis.

The two colors used in a y-zone color can be other dynamic colors. You may create y-zone colors with more than 2 zones by cascading multiple y-zone colors.

Argument | Default | Description
--- | --- | ---
threshold | (Mandatory) | The y value serving as the threshold for switching between two colors.
belowColor | (Mandatory) | The color to use when the y-axis value of the pixel is smaller than the threshold.
aboveColor | (Mandatory) | The color to use when the y-axis value of the pixel is greater than the threshold.
yAxis | [ Null ] | The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

For backward compatibility, the axis argument can also be a boolean value. A true value means the primary y-axis. A false value means the secondary y-axis.

Return Value
A 32-bit integer representing the y-zone color.

See also:

- 28.23.56 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as boolean=true) as Integer 4777

- 28.23.58 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as boolean=true) as Integer 4778
28.24 class CDLegendBoxMBS

28.24.1 class CDLegendBoxMBS

Function: The class LegendBox represents legend boxes.

Notes:
Subclass of the CDTextBoxMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.24.2 Methods

28.24.3 addKey(pos as Integer, text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other addKey method, but uses color instead of integer data type for passing color values.

See also:
• 28.24.4 addKey(pos as Integer, text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 4780
• 28.24.5 addKey(text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 4781
• 28.24.6 addKey(text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 4781

28.24.4 addKey(pos as Integer, text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

Function: Adds a custom entry to the legend box with a given legend entry priority.

Notes:
See LegendBox for more information on legend entry priority system.

See also:
• 28.24.3 addKey(pos as Integer, text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 4780
### 28.24. CLASS CDLEGENDBOXMBS

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos</td>
<td>(Mandatory)</td>
<td>The legend entry priority</td>
</tr>
<tr>
<td>text</td>
<td>(Mandatory)</td>
<td>The text of the legend entry.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The icon color of the legend entry.</td>
</tr>
<tr>
<td>lineWidth</td>
<td>0</td>
<td>The line width for legend entry that represents lines in line charts.</td>
</tr>
<tr>
<td>drawarea</td>
<td>[ Null ]</td>
<td>A DrawArea containing the data symbol represents the legend entry. This is primarily used for legend entries in line charts with data symbols, or in scatter charts.</td>
</tr>
</tbody>
</table>

- 28.24.5 addKey(text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

- 28.24.6 addKey(text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

### 28.24.5 addKey(text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addKey method, but uses color instead of integer data type for passing color values.

See also:

- 28.24.3 addKey(pos as Integer, text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

- 28.24.4 addKey(pos as Integer, text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

- 28.24.6 addKey(text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

### 28.24.6 addKey(text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

**Function:** Adds a custom entry to the legend box.

**Notes:**

This method adds an entry within a legend entry priority of 1 (followed by 2, 3, 4, ... for repeated calls). This has higher priority than entries added automatically by ChartDirector for representing data sets. As a result, by default, the custom entry will appear before the automatic entries.

To control the order of the custom entry relative to the automatic entries, use LegendBox.addKey2.
CHAPTER 28. CHARTDIRECTOR

See LegendBox for more information on legend entry priority system.

- 28.24.5 addKey(text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 4781

28.24.7 getHTMLImageMap(url as string, queryFormat as string = "", extraAttr as string = "", offsetX as Integer = 0, offsetY as Integer = 0) as string

Function: Generates an HTML image map for the legend.

Notes:

By default, ChartDirector will add named data representation to the legend box. For pie charts, named sectors (sectors that have text labels) will be added. For xy charts, named data sets will be added. For polar charts, named layers will be added.

You may add custom entries to the legend box by using LegendBox.addKey.

To control the ordering of the legend entries, ChartDirector employs a legend entry priority system. Each entry is given a priority number, and the entries are ordered according to ascending priority (unless reversed by using LegendBox.setReverse).

For a PieChart, the legend entry priority of a sector is 10000 x (sector_index + 1). The Nth sector has sector_index (N - 1). That means the ordering of the sectors in the legend box is the same as the data array.

For an XYChart, the base legend entry priority for a layer is 10000 x (layer_index + 1). Within a layer, the data set priority is 10 x (data_set_index + 1). For example, the legend entry priority for the 5th dataset in
the 3rd layer will be 30050. That means the ordering of the data sets in the legend box follows the order in which the layers are created. For data sets within the same layer, the ordering follows the order in which the data sets are added. The ordering can be modified by using Layer.setLegendOrder.

For an PolarChart, the legend entry priority of a layer is 10000 x (layer_index + 1). That means the ordering of the layers in the legend box follows the order in which the layers are created.

For custom entries added using LegendBox.addKey2, you may control the legend entry priority. That means you may insert custom entries anywhere relative to the automatic entries added by ChartDirector.

28.24.8  getImageCoor(dataItem as Integer, offsetX as Integer = 0, offsetY as Integer = 0) as string

Function: Gets the image map coordinates of an legend entry as HTML image map attributes.

Notes:

The image map coordinates will be of the following format:

```
shape="rect" cords=" [ x1 ] , [ y1 ] , [ x2 ] , [ y2 ] "
```

where (x1, y1) and (x2, y2) are opposite corners of the box that enclosed the legend entry. The format is specially designed so that it can easily be included into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataItem</td>
<td>(Mandatory)</td>
<td>The legend entry number, starting from 0. The first legend entry is 0. The nth legend entry is (n-1).</td>
</tr>
<tr>
<td>offsetX</td>
<td>0</td>
<td>An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.</td>
</tr>
<tr>
<td>offsetY</td>
<td>0</td>
<td>An offset to be added to all y coordinates in the image map. See offsetX above for description.</td>
</tr>
</tbody>
</table>

Return Value

A text string representing the coordinates of the legend entry in HTML image map attribute format.
28.24.9 setCols(noOfCols as Integer)

Function: Sets the number of columns in the legend box.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>noOfCols</td>
<td>(Mandatory)</td>
<td>The number of columns in the legend box. The special value AutoGrid (= -2) means the number of columns is automatically determined. If this argument is 0, the legend box will use a flow layout (from left to right and then top to bottom, in which the entries may not be vertically aligned).</td>
</tr>
</tbody>
</table>

28.24.10 setKeyBorder(edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setKeyBorder method, but uses color instead of integer data type for passing color values.
See also:
- 28.24.11 setKeyBorder(edgeColor as Integer, raisedEffect as Integer = 0)

28.24.11 setKeyBorder(edgeColor as Integer, raisedEffect as Integer = 0)

Function: Sets the default border color of the legend icon.
Notes:
This method applies only to data sets of which the icons are rectangles showing the colors of the data sets. If the icon is a shape or symbol (such as for a line with data point symbols), the border color of the original shape or symbol is always used.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeColor</td>
<td>(Mandatory)</td>
<td>The border color. The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support Chart::glassEffect and Chart::softLighting effects.</td>
</tr>
<tr>
<td>raisedEffect</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

See also:
- 28.24.10 setKeyBorder(edgeColor as color, raisedEffect as Integer = 0)
28.24. **CLASS CDLEGENDBOXMBS**

### 28.24.12 setKeySize(width as Integer = -1, height as Integer = -1, gap as Integer = -1)

**Function:** Sets the size of the legend icon and its distance from the legend text.

**Notes:**
Each legend entry consists of an icon and a text description. By default, the size of the icon and its distance from the text is determined automatically based on font size. This method can be used to override the default.

**Argument Default Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width (Mandatory)</td>
<td></td>
<td>The width of the legend icon in pixels.</td>
</tr>
<tr>
<td>height</td>
<td>-1</td>
<td>The height of the legend icon in pixels. -1 means the height is automatically determined.</td>
</tr>
<tr>
<td>gap</td>
<td>-1</td>
<td>The distance between the legend icon and the legend text in pixels. -1 means the distance is automatically determined.</td>
</tr>
</tbody>
</table>

### 28.24.13 setKeySpacing(keySpacing as Integer, lineSpacing as Integer = -1)

**Function:** Sets the distance between two legend entries.

**Notes:**
In horizontal legend layout, the legend entries will flow from left to right, top to bottom, with a horizontal gap between two legend entries. In vertical legend layout, the legend entries will flow from top to bottom, with one entry per line.

By default, the horizontal gap and the line spacing is automatically determined based on font size. This method can be used to set the horizontal gap and line spacing in pixels.

**Argument Default Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>keySpacing (Mandatory)</td>
<td></td>
<td>The horizontal gap between two legend entries for horizontal legend layout, expressed in pixels.</td>
</tr>
<tr>
<td>lineSpacing</td>
<td>-1</td>
<td>The line spacing between two lines in the legend box, expressed in pixels. -1 means the line spacing is automatically determined.</td>
</tr>
</tbody>
</table>

### 28.24.14 setLineStyleKey(b as boolean=true)

**Function:** Determines whether to always use "line style legend keys" or not.

**Notes:**
By default, ChartDirector will use a small colored square box as the legend key icon. This allows people to determine the colors for the data representations.

In some cases, colors alone cannot distinguish the data representations. For example, in a line chart with multiple lines, it is possible all lines are of the same color, and are distinguished by line styles (solid, dash, dotted, etc), or the lines may be distinguished by data symbols (small circles, squares, etc) on the lines.

For charts with non-solid lines (eg. dash, dotted, etc) or lines with data symbols, ChartDirector will use "line style legend keys" for the lines. A line style legend key consist a of line with an optional data symbol, which reflects the line style and data symbol representing the data series.

This method can be used to force ChartDirector to always use the "line style legend keys".

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>true</td>
<td>A true value means to always use &quot;line style legend keys&quot;. A false value means to automatically determined if &quot;line style legend keys&quot; should be used.</td>
</tr>
</tbody>
</table>

28.24.15  `setReverse(b as boolean=true)`

Function: Reverses the ordering of the legend entries.

Notes: By default, the legend entries are ordered based on ascending legend entry priority number. This method can be used to change the ordering to following descending legend entry priority number instead.

See LegendBox for more information on legend entry priority system.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>true</td>
<td>A true value means the legend entries are ordered based on descending legend entry priority number. false value means the legend entries are ordered based on ascending legend entry priority number.</td>
</tr>
</tbody>
</table>
28.25.  CLASS CDLINEARMETERMBS

28.25  class CDLinearMeterMBS

28.25.1  class CDLinearMeterMBS

**Function:** The LinearMeter class represents linear meters.
**Notes:** Subclass of the CDBaseMeterMBS class.

28.25.2  Methods

28.25.3  addBar(startValue as Double, endValue as Double, colorvalue as color, effect as Integer = 0, roundedCorner as Integer = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Adds a bar to the meter.
**Notes:**
This method adds an empty TextBox to the meter. It configures the textbox position, size and color so that
it looks like a bar on the meter scale.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startValue</td>
<td>(Mandatory)</td>
<td>The start value of the bar.</td>
</tr>
<tr>
<td>endValue</td>
<td>(Mandatory)</td>
<td>The end value of the bar.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the bar.</td>
</tr>
<tr>
<td>raisedEffect</td>
<td>0</td>
<td>The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument can also be used to specify Chart::glassEffect, Chart::softLighting, Chart::cylinderEffect or Chart::flatBorder effects.</td>
</tr>
<tr>
<td>roundedCorners</td>
<td>0</td>
<td>The radius for the two corners at the end position of the bar.</td>
</tr>
</tbody>
</table>

Returns a CDTextBoxMBS object representing the bar. This may be used to fine-tune the appearance of
the bar.
See also:

- 28.25.4 addBar(startValue as Double, endValue as Double, colorvalue as Integer, effect as Integer = 0, roundedCorner as Integer = 0) as CDTextBoxMBS

28.25.4  addBar(startValue as Double, endValue as Double, colorvalue as Integer, effect as Integer = 0, roundedCorner as Integer = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Adds a bar to the meter.
CHAPTER 28. CHARTDIRECTOR

Notes:

This method adds an empty TextBox to the meter. It configures the textbox position, size and color so that it looks like a bar on the meter scale.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startValue</td>
<td>(Mandatory)</td>
<td>The start value of the bar.</td>
</tr>
<tr>
<td>endValue</td>
<td>(Mandatory)</td>
<td>The end value of the bar.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the bar.</td>
</tr>
<tr>
<td>raisedEffect</td>
<td>0</td>
<td>The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument can also be used to specify Chart::glassEffect, Chart::softLighting, Chart::cylinderEffect or Chart::flatBorder effects.</td>
</tr>
<tr>
<td>roundedCorners</td>
<td>0</td>
<td>The radius for the two corners at the end position of the bar.</td>
</tr>
</tbody>
</table>

Returns a CDTextBoxMBS object representing the bar. This may be used to fine-tune the appearance of the bar.

See also:

• 28.25.3 addBar(startValue as Double, endValue as Double, colorvalue as color, effect as Integer = 0, roundedCorner as Integer = 0) as CDTextBoxMBS

28.25.5 addZone(startValue as Double, endValue as Double, colorvalue as color, label as string = "") as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other addZone method, but uses color instead of integer data type for passing color values.

See also:

• 28.25.6 addZone(startValue as Double, endValue as Double, colorvalue as Integer, label as string = "") as CDTextBoxMBS

28.25.6 addZone(startValue as Double, endValue as Double, colorvalue as Integer, label as string = "") as CDTextBoxMBS

Function: Adds a zone to the meter.

Notes:

Return Value

A TextBox object representing the label. This may be used to fine-tune the appearance of the label.

See also:

• 28.25.5 addZone(startValue as Double, endValue as Double, colorvalue as color, label as string = ") as CDTextBoxMBS
28.25. **CLASS CLINEARMETERMBS**

<table>

### 28.25.7 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other Constructor method, but uses color instead of integer data type for passing color values.

See also:

- 28.25.8 Constructor(width as Integer, height as Integer, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

### 28.25.8 Constructor(width as Integer, height as Integer, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

**Function:** Creates a new LinearMeter object.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The width of the chart in pixels.</td>
</tr>
<tr>

<tr>
<td>bgColor</td>
<td>BackgroundColor</td>
<td>The background color of the chart.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>Transparent</td>
<td>The edge color of the chart.</td>
</tr>
<tr>
<td>raisedEffect</td>
<td>0</td>
<td>The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.</td>
</tr>
</tbody>
</table>

See also:

- 28.25.7 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

### 28.25.9 setMeter(leftX as Integer, topY as Integer, width as Integer, height as Integer, axisPos as Integer = 4, isReversed as boolean=false)

**Function:** Sets the orientation and position of the meter plot area.
Notes:

The plot area is a rectangular region of the linear meter. The meter scale (the labels showing the values) will be on one external side of the plot area (say on the left side). The pointer starts on the opposite side and points towards the meter scale.

This method defines the position and size of the rectangular region, as well as which side the meter scale is on. If the scale is on the left or right side, the meter is assumed to be a horizontal linear meter. If the scale is on the top or bottom side, the meter is assumed to be a vertical linear meter.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>leftX</td>
<td>(Mandatory)</td>
<td>The x-coordinate of the top-left corner of the meter plot area.</td>
</tr>
<tr>
<td>topY</td>
<td>(Mandatory)</td>
<td>The y-coordinate of the top-left corner of the meter plot area.</td>
</tr>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The horizontal width of the meter plot area.</td>
</tr>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The vertical height of the meter plot area.</td>
</tr>
<tr>
<td>axisPos</td>
<td>Left</td>
<td>The position of the meter scale. The scale should be on one of the 4 sides of the plot area border, specified by Left, Top, Right and Bottom.</td>
</tr>
<tr>
<td>isReversed</td>
<td>false</td>
<td>By default, if the meter is horizontal, the meter scale will run from left to right. If the meter is vertical, the meter scale will run from bottom to top. If this argument is set to true, the meter scale will be reversed.</td>
</tr>
</tbody>
</table>

28.25.10 setRail(railColor as color, railWidth as Integer = 2, railOffset as Integer = 6)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other setRail method, but uses color instead of integer data type for passing color values.

See also:

• 28.25.11 setRail(railColor as Integer, railWidth as Integer = 2, railOffset as Integer = 6)

28.25.11 setRail(railColor as Integer, railWidth as Integer = 2, railOffset as Integer = 6)

Function: Sets the position, width and color of the pointer rail.

Notes:

The pointer rail is the locus traced out by the starting point of the meter pointer as the pointer slides on the meter. The pointer rail is on the opposite side of the meter scale.

See also:
<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>railColor</td>
<td>(Mandatory)</td>
<td>The color of the pointer rail.</td>
</tr>
<tr>
<td>railWidth</td>
<td>2</td>
<td>The line width of the pointer rail in pixels.</td>
</tr>
<tr>
<td>railOffset</td>
<td>6</td>
<td>The gap between the pointer rail and the plot area in pixels. A negative value will mean the pointer rail may move within the plot area.</td>
</tr>
</tbody>
</table>

- 28.25.10 setRail(railColor as color, railWidth as Integer = 2, railOffset as Integer = 6)
Function: A meter with three pointers created using ChartDirector with the CDLinearMeterMBS class.
28.26. CLASS CDLINELAYERMBS

28.26. class CDLineLayerMBS

28.26.1. class CDLineLayerMBS

**Function:** The LineLayer class represents line layers.  
**Notes:**  
Subclass of the CDLayerMBS class.  
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.26.3. getLine(dataSet as Integer = 0) as CDLineObjMBS

**Function:** Retrieves an opaque LineObj representing a line in the line layer. The opaque LineObj is to be used in XYChart.addInterLineLayer for adding coloring between lines.  
**Notes:**  
<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataSet</td>
<td>0</td>
<td>The data set number for the line. The first data set is 0. The nth data set is (n - 1).</td>
</tr>
</tbody>
</table>

Return Value  
An opaque LineObj representing the requested line.

28.26.4. setFastLineMode(b as boolean = true)

**Function:** Enables or disables fast line mode.  
**Notes:**  
In a chart, the plot area width is usually a few hundred to around 2000 pixels. For a line chart that "flows" horizontally (eg. from left to right), if there are a lot more data points (eg. 100000 data points than the plot area pixel width, many of the points would be at the same x-pixel coordinates. The line segments joining the data points at the same x-pixel coordinates would just be oscillating up and down, overlapping themselves. What is visible at each x-pixel position is essentially a line joining the minimum point and the maximum point.  

In fast line mode, ChartDirector will automatically detect that there are too many points in the same x-pixel
coordinate, and draws only a line segment joining the extreme points at that coordinate. The resulting line is visually indistinguishable from a line in which the line segments join all data points. The fast line mode can significantly reduce the number of points drawn without affecting the chart appearance.

The fast line mode has no effect if there are not significantly more data points than the pixel width of the plot area. For charts with evenly spaced data points, the fast line mode would only act on x-pixel positions with too many data points. Thus the fast line mode can be enabled on line charts regardless of the number of data points.

The fast line mode should not be used if the data points are not flowing horizontally (or vertically if XY-Chart.swapXY is in effect), but are flowing in random directions.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>true</td>
<td>A true value enables fast line mode. A false value disables fast line mode.</td>
</tr>
</tbody>
</table>

### 28.26.5 setGapColor(lineColor as color, lineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other setGapColor method, but uses color instead of integer data type for passing color values.

See also:

- 28.26.6 setGapColor(lineColor as Integer, lineWidth as Integer = -1)

### 28.26.6 setGapColor(lineColor as Integer, lineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the color and style of the line used for jumping across NoValue data points.

**Notes:**

By default, the color of the line for jumping across NoValue data points is Transparent, which means the line will become discontinuous.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lineColor</td>
<td>(Mandatory)</td>
<td>The line color of the line used for jumping across NoValue data points</td>
</tr>
<tr>
<td>lineWidth</td>
<td>-1</td>
<td>The line width of the line used for jumping across NoValue data points. -1 means the width will be the same as the line width of the line for drawing normal data points.</td>
</tr>
</tbody>
</table>

See also:
28.26. setGapColor(lineColor as color, lineWidth as Integer = -1) - Sets the gap color and line width.

28.26.7 setImageMapWidth(Width as Integer)

**Function:** Sets the effective width of the line used for producing image maps.

**Notes:**
For thin lines, it is hard to click on the lines. So for the purpose of producing image maps for a line chart, ChartDirector can assume the line is very thick. The default is 10 pixels.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The effective width of the line used for producing image maps.</td>
</tr>
</tbody>
</table>

28.26.8 setSymbolScale(zDataX() as Double, scaleTypeX as Integer = 0)

**Function:** Sets the size of the symbol for each data point (for creating bubble charts).

**Notes:**
One common usage for this method is to draw circle symbols of different sizes at each data points, creating a bubble chart. This method supports any valid data symbols. You can create bubble charts with square bubbles, or even custom data symbols. Also, this method supports independent x and y direction sizing, so you can create bubbles elliptical in shape, and use the horizontal and vertical radius to represent different data.

ChartDirector supports specifying sizes as pixels or in axis scale. The unit is specified by using the following predefined constants.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PixelScale</td>
<td>0</td>
<td>The unit is measured in pixels.</td>
</tr>
<tr>
<td>XAxisScale</td>
<td>1</td>
<td>The unit is measured in x-axis scale.</td>
</tr>
<tr>
<td>YAxisScale</td>
<td>2</td>
<td>The unit is measured in y-axis scale.</td>
</tr>
</tbody>
</table>

See also:

- 28.26.9 setSymbolScale(zDataX() as Double, scaleTypeX as Integer, zDataY() as Double, scaleTypeY as Integer = 0)
28.26.9 setSymbolScale(zDataX() as Double, scaleTypeX as Integer, zDataY() as Double, scaleTypeY as Integer = 0)

Function: Sets the size of the symbol for each data point (for creating bubble charts).

Notes:
One common usage for this method is to draw circle symbols of different sizes at each data points, creating a bubble chart.

This method supports any valid data symbols. You can create bubble charts with square bubbles, or even custom data symbols. Also, this method supports independent x and y direction sizing, so you can create bubbles elliptical in shape, and use the horizontal and vertical radius to represent different data.

ChartDirector supports specifying sizes as pixels or in axis scale. The unit is specified by using the following predefined constants.

<table>
<thead>

<td>PixelScale</td>
<td>The unit for zDataY, which must be one of the predefined constants in the table above.</td>
</tr>
</tbody>
</table>
28.27 class CDLineMBS

28.27.1 class CDLineMBS

Function: The Line class represents straight lines.  
Notes:  
Subclass of the CDDrawObjMBS class.  
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.27.2 Methods

28.27.3 setColor(c as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
Function: Same as the other setColor method, but uses color instead of integer data type for passing color values.  
See also:  
• 28.27.4 setColor(c as Integer) 4798

28.27.4 setColor(c as Integer)

Function: Sets the color of the line.  
Notes:  
By default, the color of the line is LineColor. To draw a dash line, you can use a dash line color (created using BaseChart_dashLineColor or DrawArea_dashLineColor).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

28.27. **CLASS CDLINEMBS**

### 28.27.5 `setPos(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer)`

**Function:** Sets the end-points of the line.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x1</td>
<td>(Mandatory)</td>
<td>The x coordinate of the first end-point of the line.</td>
</tr>
<tr>
<td>y1</td>
<td>(Mandatory)</td>
<td>The y coordinate of the first end-point of the line.</td>
</tr>
<tr>
<td>x2</td>
<td>(Mandatory)</td>
<td>The x coordinate of the second end-point of the line.</td>
</tr>
<tr>
<td>y2</td>
<td>(Mandatory)</td>
<td>The y coordinate of the second end-point of the line.</td>
</tr>
</tbody>
</table>

### 28.27.6 `setWidth(w as Integer)`

**Function:** Sets the width of the line in pixels.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>w</td>
<td>(Mandatory)</td>
<td>The width (thickness) of the line in pixels.</td>
</tr>
</tbody>
</table>
28.28 class CDLineObjMBS

28.28.1 class CDLineObjMBS

Function: The line object class.
Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.28.2 Methods

28.28.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.
28.29. **CLASS CDMARKMBS**

28.29 **class CDMarkMBS**

28.29.1 **class CDMarkMBS**

**Function:** The Mark class represents mark lines.

**Notes:**
Subclass of the CDTextBoxMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.29.2 **Methods**

28.29.3 **getLine as CDLineObjMBS**

**Function:** Retrieves an opaque LineObj representing the mark line. The opaque LineObj is to be used in XYChart.addInterLineLayer for adding coloring between lines.

**Notes:**
Return Value
An opaque LineObj representing the mark line.

28.29.4 **setDrawOnTop(b as boolean)**

**Function:** Determine whether the mark line is drawn at the front of the chart layers, or at the back of the plot area (that is, like grid lines).

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>(Mandatory)</td>
<td>A true value means drawing the mark line at the front of the chart layers. A false value means drawing the mark line at the back of the plot area.</td>
</tr>
</tbody>
</table>

28.29.5 **setLineWidth(width as Integer)**

**Function:** Sets the line width of the mark line.

**Notes:**
4802

CHAPTER 28. CHARTDIRECTOR

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>w</td>
<td>(Mandatory)</td>
<td>The mark line width in pixels.</td>
</tr>
</tbody>
</table>

28.29.6  **setMarkColor(lineColor as color, textColor as color, tickColor as color)**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setMarkColor method, but uses color instead of integer data type for passing color values.

**Notes:**

- 28.29.7 setMarkColor(lineColor as Integer, textColor as Integer = -1, tickColor as Integer = -1) 4802

28.29.7  **setMarkColor(lineColor as Integer, textColor as Integer = -1, tickColor as Integer = -1)**

**Function:** Sets the line, text and tick colors of the mark line.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lineColor</td>
<td>(Mandatory)</td>
<td>The color of the mark line.</td>
</tr>
<tr>
<td>textColor</td>
<td>-1</td>
<td>The color of the text label that will be shown on the axis. -1 means the text label color is the same as the line color.</td>
</tr>
<tr>
<td>tickColor</td>
<td>-1</td>
<td>The color of the tick that will be shown on the axis. -1 means the tick color is the same as the line color.</td>
</tr>
</tbody>
</table>

See also:

- 28.29.6 setMarkColor(lineColor as color, textColor as color, tickColor as color) 4802

28.29.8  **setValue(value as Double)**

**Function:** Sets the value of the mark line.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(Mandatory)</td>
<td>The value of the mark.</td>

28.30. CLASS CDMETERPOINTERMBS

28.30 class CDMeterPointerMBS

28.30.1 class CDMeterPointerMBS

**Function:** The MeterPointer class represents meter pointers.  
**Notes:** Subclass of the CDDrawObjMBS class.  
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.30.2 Methods

28.30.3 setColor(fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Same as the other setColor method, but uses color instead of integer data type for passing color values.  
See also:  
• 28.30.4 setColor(fillColor as Integer, edgeColor as Integer = -1)

28.30.4 setColor(fillColor as Integer, edgeColor as Integer = -1)

**Function:** Sets the fill and border colors of the meter pointer.  
**Notes:**  
<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fillColor</td>
<td>(Mandatory)</td>
<td>The fill color of the meter pointer.</td>
</tr>
</tbody>
</table>
| edgeColor      | -1          | The border color of the meter pointer. The default value of -1 means it is the same as the fill color.  
See also:  
• 28.30.3 setColor(fillColor as color, edgeColor as color)

28.30.5 setPos(value as Double)

**Function:** Sets the value the pointer points to on the meter scale.  
**Notes:**
Argument | Default | Description
--- | --- | ---
value | (Mandatory) | The value the pointer points to.

### 28.30.6 setShape(pointerCoor() as Integer)

**Function:** Sets the shape of the meter pointer to a custom polygon.

**Notes:**
The custom polygon is specified as a list of numbers representing the (x, y) coordinates of polygon vertices.

For an angular meter, the polygon should be defined with a nominal dimension of 1000 units. ChartDirector will scale the polygon so that 1000 units will become the radius of the meter.

For a linear meter, the length of the pointer should be defined with a nominal dimension of 1000 units. ChartDirector will scale the polygon so that 1000 units will be the length required for the pointer to reach the meter scale. The width of the pointer will be in 0.1 pixel units (that is, 10 units = 1 pixel).

The coordinate system for defining the polygon is that the x-axis points from left to right, and the y-axis points from bottom to top. The polygon will be defined as a pointer with the pivot at the origin, pointing to the upward direction.

As an example, the coordinates of the standard diamond pointer for an angular meter are:

0, -100, -50, -50, 0, 1000, 50, -50

The coordinates for the standard pencil pointer for a linear meter are:

-30, 0, 30, 0, 30, 768, 0, 1000, -30, 768

After scaling the pointers based on the nominal units, ChartDirector will in addition applies the lengthRatio and widthRatio scaling factor to the pointer. These ratios allow you to change the pointer sizes without changing the polygon definition. For example, if you want the meter pointer to be only 80% of the radius in the angular meter, you can set the lengthRatio to 0.80.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pointerCoor</td>
<td>(Mandatory)</td>
<td>An array of numbers x0, y0, x1, y1, x2, y2, ..., representing the coordinates the polygon vertices.</td>
</tr>
<tr>
<td>lengthRatio</td>
<td>NoValue</td>
<td>The length ratio applies to the pointer. NoValue means the lengthRatio is not modified. The default is 1.0 for angular meters and 0.75 for linear meters.</td>
</tr>
<tr>

- 28.30.8 setShape(pointerCoor() as Integer, lengthRatio as Double, widthRatio as Double) 4806
Argument Default Description
pointerCoor (Mandatory) An array of numbers \(x_0, y_0, x_1, y_1, x_2, y_2, \ldots\), representing the coordinates the polygon vertices.
lenghtRatio NoValue The length ratio applies to the pointer. NoValue means the lengthRatio is not modified. The default is 1.0 for angular meters and 0.75 for linear meters.
widthRatio NoValue The width ratio applies to the pointer. NoValue means the widthRatio is not modified. The default is 1.0.

- 28.30.9 setShape(pointerType as Integer)
- 28.30.10 setShape(pointerType as Integer, lengthRatio as Double)
- 28.30.11 setShape(pointerType as Integer, lengthRatio as Double, widthRatio as Double)

28.30.8 setShape(pointerCoor() as Integer, lengthRatio as Double, widthRatio as Double)

**Function:** Sets the shape of the meter pointer to a custom polygon.

**Notes:**
The custom polygon is specified as a list of numbers representing the \((x, y)\) coordinates of polygon vertices.

For an angular meter, the polygon should be defined with a nominal dimension of 1000 units. ChartDirector will scale the polygon so that 1000 units will become the radius of the meter.

For a linear meter, the length of the pointer should be defined with a nominal dimension of 1000 units. ChartDirector will scale the polygon so that 1000 units will be the length required for the pointer to reach the meter scale. The width of the pointer will be in 0.1 pixel units (that is, 10 units = 1 pixel).

The coordinate system for defining the polygon is that the x-axis points from left to right, and the y-axis points from bottom to top. The polygon will be defined as a pointer with the pivot at the origin, pointing to the upward direction.

As an example, the coordinates of the standard diamond pointer for an angular meter are:

0, -100, -50, -50, 0, 1000, 50, -50

The coordinates for the standard pencil pointer for a linear meter are:

-30, 0, 30, 0, 30, 768, 0, 1000, -30, 768

After scaling the pointers based on the nominal units, ChartDirector will in addition applies the lengthRatio and widthRatio scaling factor to the pointer. These ratios allow you to change the pointer sizes without changing the polygon definition. For example, if you want the meter pointer to be only 80% of the radius in
the angular meter, you can set the lengthRatio to 0.80.

<table>

- 28.30.10 setShape(pointerType as Integer, lengthRatio as Double) 4808
- 28.30.11 setShape(pointerType as Integer, lengthRatio as Double, widthRatio as Double) 4809

28.30.9 setShape(pointerType as Integer)

**Function:** Sets the shape of the meter pointer to one of the built-in shapes.

**Notes:**

The built-in symbols are specified by using the following predefined constants as the pointerType argument.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DiamondPointer</td>
<td>0</td>
<td>The blue pointers in the meters above.</td>
</tr>
<tr>
<td>TriangularPointer</td>
<td>1</td>
<td>The purple pointers in the meters above.</td>
</tr>
<tr>
<td>ArrowPointer</td>
<td>2</td>
<td>The red pointers in the meters above.</td>

CHAPTER 28. CHARTDIRECTOR

Argument Default Description

pointerType (Mandatory) One of the predefined pointer shape constants to specify the pointer shape to use.

lengthRatio NoValue The length ratio applies to the pointer. NoValue means the lengthRatio is not modified. The default is 1.0 for angular meters and 0.75 for linear meters.

widthRatio NoValue The width ratio applies to the pointer. NoValue means the widthRatio is not modified. The default is 1.0.

28.30.9 setShape(pointerType as Integer)
28.30.10 setShape(pointerType as Integer, lengthRatio as Double)
28.30.12 setShapeAndOffset(pointerCoor() as Integer)

28.30.12 setShapeAndOffset(pointerCoor() as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Sets the shape of new style angular meter pointers to a custom polygon.

Notes:

The custom polygon is specified as a list of numbers representing the (x, y) coordinates of the polygon vertices, with the x-axis pointing from left to right and the y-axis pointing from bottom to top. The direction of the pointer should be pointing upwards, with the starting point at y = 0, and the ending point at y = 1000.

As an example, the coordinates of the new style triangular pointer are:

-15, 0, 15, 0, 0, 1000, 1000

The coordinates for the new style line pointer are:

-5, 0, 5, 0, 5, 1000, -5, 1000

In actual usage, ChartDirector will rotate the polygon to point it to the desired value, and adjust the polygon size and position based on the startOffset, endOffset and widthRatio arguments. Please refer to MeterPointer.setShapeAndOffset2 for the meaning of these arguments.

See also:

• 28.30.13 setShapeAndOffset(pointerCoor() as Integer, startOffset as Double)
• 28.30.14 setShapeAndOffset(pointerCoor() as Integer, startOffset as Double, endOffset as Double)
• 28.30.15 setShapeAndOffset(pointerCoor() as Integer, startOffset as Double, endOffset as Double, widthRatio as Double)
• 28.30.16 setShapeAndOffset(pointerType as Integer)
### Argument Default Description

- **pointerCoor** (Mandatory) An array of numbers x0, y0, x1, y1, x2, y2, ..., representing the coordinates the polygon vertices.
- **startOffset** NoValue The position of the starting point as a ratio to the scale radius. NoValue means the position is automatically determined.
- **endOffset** NoValue The position of the ending point as a ratio to the scale radius. NoValue means the position is automatically determined.
- **widthRatio** NoValue The width of the pointer relative to the default width. NoValue means the width is automatically determined.

28.30.15 setShapeAndOffset(pointerCoor() as Integer, startOffset as Double, endOffset as Double, widthRatio as Double)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Sets the shape of new style angular meter pointers to a custom polygon.
Notes:
The custom polygon is specified as a list of numbers representing the (x, y) coordinates of the polygon vertices, with the x-axis pointing from left to right and the y-axis pointing from bottom to top. The direction of the pointer should be pointing upwards, with the starting point at y = 0, and the ending point at y = 1000.

As an example, the coordinates of the new style triangular pointer are:

-15, 0, 15, 0, 0, 1000, 1000

The coordinates for the new style line pointer are:
In actual usage, ChartDirector will rotate the polygon to point it to the desired value, and adjust the polygon size and position based on the startOffset, endOffset and widthRatio arguments. Please refer to MeterPointer.setShapeAndOffset2 for the meaning of these arguments.

### 28.30.16 setShapeAndOffset(pointerType as Integer)

Sets the shape of new style angular meter pointers.

#### Function:
MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Sets the shape of new style angular meter pointers.

#### Notes:

New style pointers are designed to have configurable starting and ending points, as well as configurable width. In this documentation, the ending point refers to the "tip" of the pointer, while the starting point is the "base" of the pointer.

By default, the starting and ending points are at -0.15 and 0.95. It means the distance between the starting point and the center is 15% of the scale radius. The negative sign means that relative to the center, the starting point is at the opposite direction to the value the pointer is supposed to point to. Similarly, the distance between the ending point and the center is 95% of the scale radius, which means the ending point
should be quite close to the outer rim of the meter scale.

28.31. **CLASS CDMLTABLEMBS**

### 28.31 class CDMLTableMBS

#### 28.31.1 class CDMLTableMBS

**Function:** The class for a legend table.  
**Notes:**  
Subclass of the CDDrawObjMBS class.  
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

#### 28.31.2 Methods

#### 28.31.3 appendCol as CDTextBoxMBS

**Function:** Appends a column.

#### 28.31.4 appendRow as CDTextBoxMBS

**Function:** Appends a row.

#### 28.31.5 getCell(col as Integer, row as Integer) as CDTextBoxMBS

**Function:** Returns the textbox object for the cell.  
**Notes:** The index of column and row is zero based.

#### 28.31.6 getColCount as Integer

**Function:** Returns the number of columns.
28.31.7 `getColStyle(col as Integer) as CDTextBoxMBS`

**Function:** Returns the column style.
**Notes:** col is zero based.

28.31.8 `getColWidth(col as Integer) as Integer`

**Function:** Returns the width of a column.
**Notes:** col is zero based.

28.31.9 `getHeight as Integer`

**Function:** Returns the height of the table.

28.31.10 `getRowCount as Integer`

**Function:** Returns the number of row.

28.31.11 `getRowHeight(row as Integer) as Integer`

**Function:** Returns the height of a row.
**Notes:** row is zero based.

28.31.12 `getRowStyle(row as Integer) as CDTextBoxMBS`

**Function:** Returns the row style.
**Notes:** row is zero based.
28.31. **CLASS CDMLTABLEMBS**

### 28.31.13 `getStyle` as `CDTextBoxMBS`

**Function:** Returns the textbox defining the style of the table.

### 28.31.14 `getWidth` as Integer

**Function:** Returns the width of the table.

### 28.31.15 `insertCol(col as Integer)` as `CDTextBoxMBS`

**Function:** Inserts a column at the given column.  
**Notes:** col is zero based.

### 28.31.16 `insertRow(row as Integer)` as `CDTextBoxMBS`

**Function:** Inserts a row on the given position.  
**Notes:** row is zero based.

### 28.31.17 `layout`

**Function:** Layouts the table, so you can get the size.

### 28.31.18 `setCell(col as Integer, row as Integer, width as Integer, height as Integer, text as string)` as `CDTextBoxMBS`

**Function:** Sets the cell to the given text.  
**Notes:** col and row are zero based.
28.31.19 `setPos(x as Integer, y as Integer, alignment as Integer = 7)`

**Function:** Sets the position of the table.
**Notes:** x and y are zero based.

28.31.20 `setText(col as Integer, row as Integer, text as string) as CDTextBoxMBS`

**Function:** Sets the text of a cell.
**Notes:** col and row are zero based.
28.32. **CLASS CDMULTICHARTMBS**

28.32 class CDMultiChartMBS

28.32.1 class CDMultiChartMBS

**Function:** The MultiChart class represents multi-chart.

**Notes:**

A multi-chart is a container to contain multiple charts. You can use a multi-chart to combine multiple BaseChart objects (or its subclass such as PieChart, XYChart, PolarChart, AngularMeter or LinearMeter) into one image.

Subclass of the CDBaseChartMBS class.

28.32.2 Methods

28.32.3 addChart(x as Integer, y as Integer, c as CDBaseChartMBS)

**Function:** Adds a BaseChart object (or its subclass such as PieChart, XYChart, PolarChart, AngularMeter or LinearMeter) into the multi-chart.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>Mandatory</td>
<td>The x coordinate of a point in the multi-chart that is to align with the top-left corner of the added BaseChart.</td>
</tr>
<tr>
<td>y</td>
<td>Mandatory</td>
<td>The y coordinate of a point in the multi-chart that is to align with the top-left corner of the added BaseChart.</td>
</tr>
<tr>
<td>c</td>
<td>Mandatory</td>
<td>The BaseChart object to be added to the multi-chart.</td>
</tr>
</tbody>
</table>

28.32.4 Constructor(width as Integer = 640, height as Integer = 480, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other Constructor method, but uses color instead of integer data type for passing color values.

See also:

- 28.32.5 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)
28.32.5 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

Function: Creates a new MultiChart object.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The width of the chart in pixels.</td>
</tr>
<tr>

<td>The edge color of the chart.</td>
</tr>
<tr>
<td>raisedEffect</td>
<td>0</td>
<td>The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.</td>
</tr>
</tbody>
</table>

See also:

- 28.32.4 Constructor(width as Integer = 640, height as Integer = 480, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

28.32.6 getChart(index as Integer) as CDBaseChartMBS

Function: Gets the specified chart in the MultiChart.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>0</td>
<td>The index of the chart. The index of the first chart set added to the MultiChart is 0. The index of the Nth data set added to the MultiChart is N - 1.</td>
</tr>
</tbody>
</table>

28.32.7 getChartCount as Integer

Function: Gets the number of charts in the MultiChart.
Notes: Returns the number of charts in the MultiChart.

28.32.8 setMainChart(c as CDBaseChartMBS)

Function: Sets the chart that receives view port mouse actions (for zooming and scrolling support).
## Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>(Mandatory)</td>
<td>The chart that is to receive view port mouse actions.</td>
</tr>
</tbody>
</table>
28.33 class CDNotInitializedExceptionMBS

28.33.1 class CDNotInitializedExceptionMBS

Function: Exception raised if method is called on an uninitialized object.
Notes:
Please report this as it may be a bug.
Subclass of the RuntimeException class.
28.34.1 class CDPaneChartMBS

Function: The PieChart class represents pie charts.
Notes: Subclass of the CDBaseChartMBS class.

28.34.2 Methods

28.34.3 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 28.34.4 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as Integer = &hFFFF0000, edgeColor as Integer = &hFF000000, raisedEffect as Integer = 0)

28.34.4 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as Integer = &hFFFF0000, edgeColor as Integer = &hFF000000, raisedEffect as Integer = 0)

Function: Creates a new PieChart object.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The width of the chart in pixels.</td>
</tr>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the chart in pixels.</td>
</tr>
<tr>
<td>bgColor</td>
<td>BackgroundColor</td>
<td>The background color of the chart.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>Transparent</td>
<td>The edge color of the chart.</td>
</tr>
<tr>
<td>raisedEffect</td>
<td>0</td>
<td>The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.</td>
</tr>
</tbody>
</table>

See also:

- 28.34.3 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as color, edgeColor as color, raisedEffect as Integer = 0)
28.34.5 sector(sectorNo as Integer) as CDSectorMBS

**Function:** Retrieves the Sector object representing a single sector in the pie chart.
**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sectorNo</td>
<td>(Mandatory)</td>
<td>The sector number of the sector to retrieve, starting from 0. The first sector is 0. The nth sector is (n-1).</td>
</tr>
</tbody>
</table>

**Return Value**

The requested Sector object.

28.34.6 set3D(depth as Integer = -1, angle as Double = -1, shadowMode as boolean=false)

**Function:** Adds 3D effects to the pie.
**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>depth</td>
<td>-1</td>
<td>The 3D depth of the pie in pixels. -1 means the depth is automatically determined.</td>
</tr>
<tr>
<td>angle</td>
<td>-1</td>
<td>The 3D view angle in degrees. Must be 0 - 90 for standard 3D mode, and 0 - 360 in shadow 3D mode. -1 means the angle is automatically determined.</td>
</tr>
<tr>
<td>shadowMode</td>
<td>false</td>
<td>Flag to indicate whether the pie is in standard 3D or shadow 3D mode. A true value means shadow 3D mode. A false value means standard 3D mode.</td>
</tr>
</tbody>
</table>

See also:

- 28.34.7 set3D(depths() as Double, angle as Double = 45, shadowMode as boolean=false) 4828

28.34.7 set3D(depths() as Double, angle as Double = 45, shadowMode as boolean=false)

**Function:** Adds 3D effects to the pie, where each sector can have a different 3D depth.
**Notes:**

See also:

- 28.34.6 set3D(depth as Integer = -1, angle as Double = -1, shadowMode as boolean=false) 4828
28.34. **CLASS CDPIECHARTMBS**

<table>
<thead>
<tr>

<td>The 3D view angle in degrees. Must be 0 - 90 for standard 3D mode, and 0 - 360 in shadow 3D mode. -1 means the angle is automatically determined.</td>
</tr>
<tr>
<td>shadowMode</td>
<td>false</td>
<td>Flag to indicate whether the pie is in standard 3D or shadow 3D mode. A true value means shadow 3D mode. A false value means standard 3D mode.</td>
</tr>
</tbody>
</table>

### 28.34.8 setData(data() as Double)

**Function:** Sets the data used to draw the pie chart.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the data points.</td>
</tr>
<tr>
<td>labels</td>
<td>[ Empty_Array ]</td>
<td>An array of text strings representing the labels of the sectors. An empty array means no sector label.</td>
</tr>
</tbody>
</table>

See also:

- 28.34.9 setData(data() as Double, label() as string)

### 28.34.9 setData(data() as Double, label() as string)

**Function:** Sets the data used to draw the pie chart.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the data points.</td>

### 28.34.10 setDonutSize(x as Integer, y as Integer, r as Integer, r2 as Integer)

**Function:** Sets the position and size of the donut in the donut chart.

**Notes:**
CHAPTER 28. CHARTDIRECTOR

Argument | Default | Description
---|---|---
x | (Mandatory) | The x coordinate of the donut center.
y | (Mandatory) | The y coordinate of the donut center.
r | (Mandatory) | The inner radius of the donut.
r2 | (Mandatory) | The outer radius of the donut.

28.34.11 setExplode(sectorNo as Integer, distance as Integer = -1)

**Function:** Explode a sector from the pie.
**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sectorNo</td>
<td>(Mandatory)</td>
<td>The sector number of the sector to be exploded from the pie, starting from 0.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The first sector is 0. The nth sector is (n - 1).</td>
</tr>
<tr>
<td>distance</td>
<td>-1</td>
<td>The explosion distance in pixels. -1 means the distance is automatically determined.</td>
</tr>
</tbody>
</table>

28.34.12 setExplodeGroup(startSector as Integer, endSector as Integer, distance as Integer = -1)

**Function:** Explode a group of sectors from the pie.
**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startSector</td>
<td>(Mandatory)</td>
<td>The sector number of the first sector in the sector group to be exploded.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The first sector is 0. The nth sector is (n - 1).</td>
</tr>
<tr>
<td>endSector</td>
<td>(Mandatory)</td>
<td>The sector number of the last sector in the sector group to be exploded.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The first sector is 0. The nth sector is (n - 1).</td>
</tr>
<tr>
<td>distance</td>
<td>-1</td>
<td>The explosion distance in pixels. -1 means the distance is automatically determined.</td>
</tr>
</tbody>
</table>

28.34.13 setJoinLine(joinLineColor as color, joinLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setJoinLine method, but uses color instead of integer data type for passing color values.
See also:

- 28.34.14 setJoinLine(joinLineColor as Integer, joinLineWidth as Integer = -1)
28.34. **CLASS CDPIECHARTMBS**

### 28.34.14 setJoinLine(joinLineColor as Integer, joinLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the color and width of the join lines used to connect the sector labels to the sector perimeter. **Notes:**

This method affects all sectors. To set the color and width of the join line for one particular sector only, use Sector.setJoinLine.

By default, for circular label layout, the join line color is Transparent. For side label layout, the join line color is SameAsMainColor.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>joinLineColor</td>
<td>(Mandatory)</td>
<td>The color of the line that joins the sector perimeter with the sector label.</td>
</tr>
<tr>
<td>joinLineWidth</td>
<td>1</td>
<td>The line width of the join line.</td>
</tr>
</tbody>
</table>

See also:

- 28.34.13 setJoinLine(joinLineColor as color, joinLineWidth as Integer = -1)

### 28.34.15 setLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the format of the all sector labels. **Example:**

```vba
dim c as CDPieChartMBS

// you can use label formats like this:

c.setLabelFormat("<block,halign=left><font=timesbi.ttf,size=12,underline=1>{ label } <*/font*> <*br*> US$ { value } K ( { percent } % )")

// we can reduce that to this:

c.setLabelFormat(" { label } { value } { percent } % ")

// and it shows 3 numbers. With | 1 after the variable name, we define the decimals after dot:

// and

c.setLabelFormat(" { label } { value | 1 } { percent | 1 } % ")
```

// and

```vba
c.setLabelFormat(" { label } { value | 1., } { percent | 1., } % ")
```
// uses dot for thousands and comma for decimal separator.

Notes:
This method affects all sectors. To set the label format for one particular sector only, use Sector.setLabelFormat.

The default sector label format depends on the label layout method used (see PieChart.setLabelLayout).

Label Layout MethodDefault Label Format

Circular Layout  \{ label \} & lt;*br*& gt; \{ percent \} %

(The "& lt;*br*& gt;" above is the CDML syntax for a line break.)

Side Layout  \{ label \} ( \{ percent \} % )

Please refer to Parameter Substitution and Formatting on all available parameters and how to format them.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatString</td>
<td>(Mandatory)</td>
<td>The format string.</td>
</tr>
</tbody>
</table>

28.34.16  setLabelLayout(layoutMethod as Integer, pos as Integer = -1, topBound as Integer = -1, bottomBound as Integer = -1)

**Function:** Sets the layout method and location of the sector labels.
**Notes:**
This method affects all sectors. To set the sector label layout method and location for one particular sector only, use Sector.setLabelLayout.

ChartDirector supports two sector label layout methods - circular layout and side layout. The layout method is determined using the layoutMethod argument, which must be one of the following predefined constants.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>

In the circular layout method, the sector labels are positioned around the perimeter of the pie.

In the side layout method, there is an invisible rectangle containing the pie, where the rectangle can be wider than the diameter of the pie. The sector labels are positioned on the left and right sides outside the rectangle. Because the labels can be quite far away from the sectors, join lines are typically used to connect the labels to the sectors.

The circular layout method usually uses less space and is the default layout method. However, if the pie chart contains a lot of small sectors, the labels may overlap with each other, due to insufficient space on the pie perimeter to position the labels.

The side layout method has the advantages that it can avoid label overlapping. In the side layout method, labels will automatically shift up and down to avoid overlapping.

One common issue in pie charts is the data contain a lot of small sectors. If the data are sorted, the small sectors will be crowded together instead of distributed evenly. Although the side layout method can avoid label overlapping by shifting the labels up and down, some labels may need to be shifted great distances.

Label layout can often be improved if the small sectors are near the horizontal axis. It is because the amount of vertical label space for a sector is greatest at the horizontal axis. This can be achieved by choosing an appropriate start angle (using PieChart.setStartAngle).

If the data is in ascending order (small sectors crowded at the beginning), a start angle of 45 degrees with clockwise sector layout is recommended. With this setting, the first few sectors (the smallest sectors) will be at around 45 - 135 degrees, so is near the horizontal axis (90 degrees). Similarly, if the data is in descending order (small sectors crowded at the end), a start angle of 135 degrees with clockwise sector layout can be used.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layoutMethod</td>
<td>(Mandatory)</td>
<td>Specify the layout method. Must be one of the predefined constants CircleLayout or SideLayout.</td>
</tr>
<tr>
<td>pos</td>
<td>-1</td>
<td>For circular layout, it is the distance between the sector perimeter and the sector label. A negative value (but not -1) means the sector label will be drawn in the interior of the sector. For side layout, it is the distance between the pie perimeter and the left or right edges of the invisible containing rectangle (equal to the width of the rectangle minus the pie diameter and then divided by 2).</td>
</tr>
</tbody>
</table>

In either case, -1 means the distance is automatically determined.
**28.34.17 setLabelPos(pos as Integer, joinLineColor as color)**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setLabelPos method, but uses color instead of integer data type for passing color values.

See also:

- 28.34.18 setLabelPos(pos as Integer, joinLineColor as Integer = -1)

**28.34.18 setLabelPos(pos as Integer, joinLineColor as Integer = -1)**

**Function:** Sets the circular label layout method, and configure the join lines used to connect the sector labels to the sector perimeter.

**Notes:**

This method affects all sectors. To set the sector label position or join line color for one particular sector only, use Sector.setLabelPos.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos (Mandatory)</td>
<td></td>
<td>The distance between the sector perimeter and the sector label. A negative</td>
</tr>
<tr>
<td></td>
<td></td>
<td>value means the sector label will be drawn in the interior of the sector.</td>
</tr>
<tr>
<td>joinLineColor</td>
<td>-1</td>
<td>The color of the line that joins the sector perimeter with the sector label.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The default is Transparent. The join line is ignored if the sector label is</td>
</tr>
<tr>
<td></td>
<td></td>
<td>inside the sector.</td>
</tr>
</tbody>
</table>

- 28.34.17 setLabelPos(pos as Integer, joinLineColor as color)
28.34. **CLASS CDPIECHARTMBS**

**28.34.19 setLabelStyle(font as string = "", fontsize as Double = 8, fontColor as Integer = & hffff0002) as CDTextBoxMBS**

**Function:** Sets the style used to draw all sector labels.

**Notes:**

This method affects all sectors. To set the label style for one particular sector only, use Sector.setLabelStyle.

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font used to draw the sector labels.</td>
</tr>
<tr>
<td>fontSize</td>
<td>8</td>
<td>The font size in points.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The text color for the sector labels.</td>
</tr>
</tbody>
</table>

**Return Value**

A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:

http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:

- 28.34.20 setLabelStyle(font as string, fontsize as Double, fontColor as color) as CDTextBoxMBS 4835

**28.34.20 setLabelStyle(font as string, fontsize as Double, fontColor as color) as CDTextBoxMBS**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setLabelStyle method, but uses color instead of integer data type for passing color values.

See also:

- 28.34.19 setLabelStyle(font as string = "", fontsize as Double = 8, fontColor as Integer = & hffff0002) as CDTextBoxMBS 4835

**28.34.21 setLineColor(edgeColor as color, joinLineColor as color)**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setLineColor method, but uses color instead of integer data type for passing color values.

See also:
28.34.22 setLineColor(edgeColor as Integer, joinLineColor as Integer = -1)

**Function:** Sets the sector edge color and join line color.

**Notes:**
This method affects all sectors. To set the sector label position and join line color for one particular sector, use Sector.setColor.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeColor</td>
<td>(Mandatory)</td>
<td>The colors for the edges of the sectors. By default, the edge color is SameAsMainColor, which means the edge color is the same as the fill color of the sector, and the sector will appear borderless.</td>
</tr>
<tr>
<td>joinLineColor</td>
<td>-1</td>
<td>The color of the line that join the sector perimeter with the sector label. By default, for circular label layout, the join line color is Transparent. For side label layout, the join line color is SameAsMainColor.</td>

<td>(Mandatory)</td>
<td>The y coordinate of the pie center.</td>
</tr>
<tr>
<td>r</td>
<td>(Mandatory)</td>
<td>The radius of the pie.</td>
</tr>
</tbody>
</table>

28.34.24 setSectorStyle(shadingMethod as Integer, edgeColor as color, edgeWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setSectorStyle method, but uses color instead of integer data type for passing color values.

See also:
28.34. `CLASS CDPIECHARTMBS`

- 28.34.25 `setSectorStyle(shadingMethod as Integer, edgeColor as Integer = -1, edgeWidth as Integer = -1)`

### 28.34.25 setSectorStyle(shadingMethod as Integer, edgeColor as Integer = -1, edgeWidth as Integer = -1)

**Function:** Sets the sector shading style, edge color and edge width.

**Notes:**
This method affects all sectors. To set the sector shading style, edge color and edge width for one particular sector, use `CDSectorMBS.setStyle`.

ChartDirector supports various shading effects, which are best illustrated using examples.

The followings are textual descriptions of the shading effects.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DefaultShading</td>
<td>0</td>
<td>This is the default shading method. The top surfaces are shaded with flat colors. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.</td>
</tr>
<tr>
<td>FlatShading</td>
<td>1</td>
<td>All surfaces are shaded with flat colors.</td>
</tr>
<tr>
<td>LocalGradientShading</td>
<td>2</td>
<td>The top surfaces are shaded with linear gradient colors. For each sector, the gradient is from the bottom of the sector bounding box to the top of the sector bounding box, with the bottom side brighter and the top side darker. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.</td>
</tr>
<tr>
<td>GlobalGradientShading</td>
<td>3</td>
<td>The top surfaces are shaded with linear gradient colors. The gradient is from the bottom the pie bounding box to the top of the pie bounding box, with the bottom side brighter and the top side darker. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.</td>
</tr>
<tr>
<td>ConcaveShading</td>
<td>4</td>
<td>The top surfaces are shaded with a special effect so that they look concave, with the pie center appears to be depressed relative to the perimeter. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.</td>
</tr>
<tr>
<td>RoundedEdgeShading</td>
<td>6</td>
<td>The top surfaces are shaded with a special effect so that the pie looks raised with a rounded raised edge at the perimeter.</td>
</tr>
<tr>
<td>RadialShading</td>
<td>7</td>
<td>The top surfaces are shaded with radial gradient colors, with the pie center brighter and the perimeter darker. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.</td>
</tr>
<tr>
<td>RingShading</td>
<td>8</td>
<td>This effect is intended to be used with 2D donut charts only. The top surfaces are shaded with a special effect so that a 2D donut will look like a torus.</td>
</tr>
</tbody>
</table>

**Arguments:**

**See also:**
28.34.24 setSectorStyle(shadingMethod as Integer, edgeColor as color, edgeWidth as Integer = -1)

28.34.26 setStartAngle(startAngle as Double, clockWise as boolean=true)

**Function:** Sets the angle of the first sector in the pie and the layout direction for the sectors.

**Notes:**
By default, the start angle is 0 degree (the upward pointing direction), and subsequent sectors are drawn clockwise.
Function: A pie chart with legend created using ChartDirector with the CDPieChartMBS class.
Function: A pie chart with small sectors created using ChartDirector with the CDPieChartMBS class.
Function: A donut created using ChartDirector with the CDPieChartMBS class.
28.35 class CDPlotAreaMBS

28.35.1 class CDPlotAreaMBS

Function: The PlotArea class represents plot areas in XY charts.
Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.35.2 Methods

28.35.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The private constructor.

28.35.4 getBottomY as Integer

Function: Gets the bottom y pixel coordinate of the plot area.
Notes: Returns the bottom y pixel coordinate of the plot area.

28.35.5 getHeight as Integer

Function: Gets the height of the plot area.

28.35.6 getLeftX as Integer

Function: Gets the left x pixel coordinate of the plot area.

28.35.7 getRightX as Integer

Function: Gets the right x pixel coordinate of the plot area.
Notes: Returns the right x pixel coordinate of the plot area.

### 28.35.8 `getTopY` as Integer

**Function:** Gets the top y pixel coordinate of the plot area.

**Notes:**

In some cases, the top y coordinate of a box may be dynamically determined. An example is the top y coordinate of an LegendBox with alignment set to Center. To determine the top y coordinate, the size of the box must be known first. For these cases, the top y coordinate is undefined until the legend box or the entire chart has been laid out (using `CDBaseChartMBS.layout` or `CDBaseChartMBS.layoutLegend`), or the chart image has been drawn (e.g. using `CDBaseChartMBS.makeChart`).

**Arguments:**

None

**Return Value**

The top y pixel coordinate of the plot area.

### 28.35.9 `getWidth` as Integer

**Function:** Gets the width of the plot area.

### 28.35.10 `moveGridBefore(layer as CDLayerMBS=nil)`

**Function:** Moves the grid lines in front of a Layer.

**Notes:**

By default, the grid lines will be drawn at the back of the plot area, behind all the layers. This method can be used to move the grid lines in front of a given layer.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layer</td>
<td>nil</td>
<td>The Layer for the grid lines to move in front of.</td>
</tr>
</tbody>
</table>
28.35.11  set4QBgColor(Q1Color as color, Q2Color as color, Q3Color as color, Q4Color as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other set4QBgColor method, but uses color instead of integer data type for passing color values.
See also:

- 28.35.12 set4QBgColor(Q1Color as Integer, Q2Color as Integer, Q3Color as Integer, Q4Color as Integer, edgeColor as Integer = -1)

28.35.12  set4QBgColor(Q1Color as Integer, Q2Color as Integer, Q3Color as Integer, Q4Color as Integer, edgeColor as Integer = -1)

**Function:** Sets using 4 background plot area colors for 4 quadrants.
**Notes:**
The first quadrant is the region defined by x > 0 and y > 0. The second quadrant is the region defined by x < 0 and y > 0. The third quadrant is the region defined by x < 0 and y < 0. The fourth quadrant is the region defined by x > 0 and y < 0. These 4 regions can be colored using 4 different background colors.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Q1Color</td>
<td>(Mandatory)</td>
<td>The background color to be used for the first quadrant.</td>
</tr>
<tr>
<td>Q2Color</td>
<td>(Mandatory)</td>
<td>The background color to be used for the second quadrant.</td>
</tr>
<tr>
<td>Q3Color</td>
<td>(Mandatory)</td>
<td>The background color to be used for the third quadrant.</td>
</tr>
<tr>
<td>Q4Color</td>
<td>(Mandatory)</td>
<td>The background color to be used for the fourth quadrant.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>-1</td>
<td>The border color of the plot area. -1 means to use the default, which is Line-Color. However, if the axes are configured in 4 quadrant mode (see XYChart.setAxisAtOrigin), the default will change to Transparent.</td>
</tr>
</tbody>
</table>

See also:

- 28.35.11 set4QBgColor(Q1Color as color, Q2Color as color, Q3Color as color, Q4Color as color, edgeColor as color)

28.35.13  setAltBgColor(horizontal as Boolean, color1 as color, color2 as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setAltBgColor method, but uses color instead of integer data type for passing color values.
See also:
28.35.14 setAltBgColor(horizontal as Boolean, color1 as Integer, color2 as Integer, edgeColor as Integer = -1)

**Function:** Sets alternating plot area background color.

**Notes:**
This method can be used to specify two colors that will be used alternatively to draw horizontal or vertical bands on the plot area background, using major grid lines as boundaries for the bands.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>horizontal</td>
<td>(Mandatory)</td>
<td>true means to use horizontal bands. false means to use vertical bands.</td>
</tr>
<tr>
<td>color1</td>
<td>(Mandatory)</td>
<td>The first color to be used as the alternating background color.</td>
</tr>
<tr>
<td>color2</td>
<td>(Mandatory)</td>
<td>The second color to be used as the alternating background color.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>-1</td>
<td>The border color of the plot area. -1 means to use the default, which is Line-Color. However, if the axes are configured in 4 quadrant mode (see XYChart.setAxisAtOrigin), the default will change to Transparent.</td>
</tr>
</tbody>
</table>

See also:
- 28.35.13 setAltBgColor(horizontal as Boolean, color1 as color, color2 as color, edgeColor as color) 4844

28.35.15 setBackground(colorvalue as color, altBgColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setBackground method, but uses color instead of integer data type for passing color values.

See also:
- 28.35.16 setBackground(colorvalue as Integer, altBgColor as Integer = -1, edgeColor as Integer = -1) 4845
- 28.35.17 setBackground(file as folderitem, align as Integer = 5) 4846

28.35.16 setBackground(colorvalue as Integer, altBgColor as Integer = -1, edgeColor as Integer = -1)

**Function:** Sets the background colors and the border color of the plot area.

**Notes:**
A plot area can have one or two background colors. If it has two background colors, they are drawn alternatively as horizontal bands on the major background grid.

ChartDirector Ver 4.0 introduces two new methods PlotArea.setAltBgColor and PlotArea.set4QBgColor. They are used for vertical alternating bands, and for supporting 4 background colors for 4 quadrants.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The background color.</td>
</tr>
<tr>
<td>altBgColor</td>
<td>-1</td>
<td>The second background color. -1 means there is no second background color.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>-1</td>
<td>The border color of the plot area. -1 means to use the default, which is Line-Color. However, if the axes are configured in 4 quadrant mode (see XYChart.setAxisAtOrigin), the default will change to Transparent.</td>
</tr>
</tbody>
</table>

See also:

- 28.35.15 setBackground(colorvalue as color, altBgColor as color, edgeColor as color) 4845
- 28.35.17 setBackground(file as folderitem, align as Integer = 5) 4846

28.35.17  setBackground(file as folderitem, align as Integer = 5)

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the specified image file as the background image of the plot area. **Notes:** ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>img</td>
<td>(Mandatory)</td>
<td>The image file that is used as the background image of the plot area.</td>
</tr>
<tr>
<td>align</td>
<td>Center</td>
<td>The alignment of the background image relative to the plot area. See Alignment Specification for supported alignment types.</td>
</tr>
</tbody>
</table>

See also:

- 28.35.15 setBackground(colorvalue as color, altBgColor as color, edgeColor as color) 4845
- 28.35.16 setBackground(colorvalue as Integer, altBgColor as Integer = -1, edgeColor as Integer = -1) 4845
28.35.18  setGridAxis(xGridAxis as CDAxisMBS, yGridAxis as CDAxisMBS)

**Function:** Sets the axis used for drawing grid lines.

**Notes:**

By default, the grid lines will be based on the ticks on the primary x-axis (CDXYChartMBS.xAxis) and primary y-axis (CDXYChartMBS.yAxis). This method may be used to specify alternative x-axis and y-axis to base the grid lines on.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xGridAxis</td>
<td>(Mandatory)</td>
<td>The x-axis used for drawing grid lines.</td>
</tr>
<tr>
<td>yGridAxis</td>
<td>(Mandatory)</td>
<td>The y-axis used for drawing grid lines.</td>
</tr>
</tbody>
</table>

28.35.19  setGridColor(hGridColor as color, vGridColor as color, minorHGridColor as color, minorVGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setGridColor method, but uses color instead of integer data type for passing color values.

**Notes:**

**Argument Default Description**

| hGridColor (Mandatory) | The color for the horizontal grid lines associated with major ticks. |
| vGridColor Transparent | The color for the vertical grid lines associated with major ticks.    |
| minorHGridColor -1     | The color for the horizontal grid lines associated with minor ticks. -1 means the color is the same as hGridColor. |
| minorVGridColor -1     | The color for the vertical grid lines associated with minor ticks. -1 means the color is the same as vGridColor. |

See also:

- 28.35.20 setGridColor(hGridColor as Integer, vGridColor as Integer = & hff000000, minorHGridColor as Integer = -1, minorVGridColor as Integer = -1) 4847

28.35.20  setGridColor(hGridColor as Integer, vGridColor as Integer = & hff000000, minorHGridColor as Integer = -1, minorVGridColor as Integer = -1)

**Function:** Sets the horizontal and vertical grid colors of the plot area.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hGridColor</td>
<td>(Mandatory)</td>
<td>The color for the horizontal grid lines associated with major ticks.</td>
</tr>
<tr>
<td>vGridColor</td>
<td>Transparent</td>
<td>The color for the vertical grid lines associated with major ticks.</td>

28.36  class CDPolarAreaLayerMBS

28.36.1  class CDPolarAreaLayerMBS

**Function:** The PolarAreaLayer class represents polar area layers.

**Notes:**

Subclass of the CDPolarLayerMBS class.

This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.
28.37 class CDPolarChartMBS

28.37.1 class CDPolarChartMBS

Function: The PolarChart class represents polar charts (including radar charts).
Notes: Subclass of the CDBaseChartMBS class.

28.37.2 Methods

28.37.3 addAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addAreaLayer method, but uses color instead of integer data type for passing color values.
See also:
- 28.37.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = ") as CDPolarAreaLayerMBS
- 28.37.5 addAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS
- 28.37.6 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = ") as CDPolarAreaLayerMBS

28.37.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = ") as CDPolarAreaLayerMBS

Function: Adds a polar area layer to the polar chart.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the data points in the layer.</td>
</tr>
<tr>
<td>color</td>
<td>-1</td>
<td>The color to draw the area. -1 means that the color is automatically selected from the palette.</td>
</tr>
<tr>
<td>name</td>
<td>&quot;&quot;</td>
<td>The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.</td>
</tr>
</tbody>
</table>

Return Value
A PolarAreaLayer object representing the chart layer created.
See also:
addAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other addAreaLayer method, but uses color instead of integer data type for passing color values.

See also:

</tbody>
</table>

Return Value
A PolarSplineLineLayer object representing the chart layer created.
See also:

- 28.37.15 addSplineLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS
- 28.37.16 addSplineLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS
- 28.37.17 addSplineLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS
28.37.19 addVectorLayer(rdata() as Double, adata() as Double, lengths() as Double, directions() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CD PolarVectorLayerMBS

**Function:** Adds a vector layer to the chart.

**Notes:**

The vectors are specified as 4 data series, representing the radial and angular coordinates of the reference points to put the vectors, and the lengths and directions of the vectors.

By default, the vector starts from the reference point and points away from it. You may use PolarVectorLayer.setArrowAlignment to specify other options, such as for the vectors to point into the reference point, or to have the reference as a pivot at the mid-point of the vector.

ChartDirector supports specifying vectors lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

**Constant** | **Value** | **Description**
--- | --- | ---
PixelScale | 0 | The unit is measured in pixels.
RadialAxisScale | 2 | The unit is measured in the radial axis scale.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rData</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the radial coordinates for the reference points of the vectors.</td>
</tr>
<tr>
<td>aData</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the angular coordinates for the reference points of the vectors.</td>
</tr>
<tr>
<td>lengths</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.</td>
</tr>
<tr>
<td>directions</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.</td>
</tr>
<tr>
<td>lengthScale</td>
<td>PixelScale</td>
<td>The unit for the lengths, which must be one of the predefined constants in the table above.</td>
</tr>
<tr>
<td>color</td>
<td>-1</td>
<td>The color to draw the data points. -1 means that the color is automatically selected from the palette.</td>
</tr>
<tr>
<td>name</td>
<td>&quot;&quot;</td>
<td>The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.</td>
</tr>
</tbody>
</table>

**Return Value**

A PolarVectorLayer object representing the vector layer created.

**See also:**

- 28.37.20 addVectorLayer(rdata() as Double, adata() as Double, lengths() as Double, directions() as

### 28.37.23 `getXCoor(r as Double, a as Double) as Integer`

**Function:** Gets the x pixel coordinate of a point given its radial and angular coordinates.

**Notes:**

The radial and angular coordinates are measured using the scale of the radial and angular axes. In particular, the scale of the angular axis may not be in degrees or radians. See AngularAxis.setLabels and AngularAxis.setLinearScale on how the angular axis scale is defined.

Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>(Mandatory)</td>
<td>The radial coordinate of the point.</td>
</tr>
<tr>
<td>a</td>
<td>(Mandatory)</td>
<td>The angular coordinate of the point.</td>
</tr>
</tbody>
</table>

**Return Value**

The x pixel coordinate of the point.

### 28.37.24 `getYCoor(r as Double, a as Double) as Integer`

**Function:** Gets the y pixel coordinate of a point given its radial and angular coordinates.

**Notes:**

The radial and angular coordinates are measured using the scale of the radial and angular axes. In particular, the scale of the angular axis may not be in degrees or radians. See AngularAxis.setLabels and AngularAxis.setLinearScale on how the angular axis scale is defined.

Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

**Return Value**

The y pixel coordinate of the point.
Argument | Default | Description
--- | --- | ---
r | (Mandatory) | The radial coordinate of the point.
a | (Mandatory) | The angular coordinate of the point.

**28.37.25 setGridColor(rGridColor as color, rGridWidth as Integer, aGridColor as color, aGridWidth as Integer = 1)**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setGridColor method, but uses color instead of integer data type for passing color values.

**Notes:**

- **28.37.26 setGridColor(rGridColor as Integer = &h80000000, rGridWidth as Integer = 1, aGridColor as Integer = &h80000000, aGridWidth as Integer = 1)**

**28.37.26 setGridColor(rGridColor as Integer = &h80000000, rGridWidth as Integer = 1, aGridColor as Integer = &h80000000, aGridWidth as Integer = 1)**

**Function:** Sets the grid colors and widths of the polar plot area.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rGridColor</td>
<td>80000000</td>
<td>The color of grid lines in the radial direction (from the center outwards).</td>
</tr>
<tr>
<td>rGridWidth</td>
<td>1</td>
<td>The line width for grid lines in the radial direction (from the center outwards).</td>
</tr>
<tr>
<td>aGridColor</td>
<td>80000000</td>
<td>The color of grid lines in the angular direction (concentric circles around the center).</td>
</tr>
<tr>
<td>aGridWidth</td>
<td>1</td>
<td>The line width of grid lines in the angular direction (concentric circles around the center). The line width is only used if the polar plot area is using a polygon grid (see PolarChart.setGridStyle). If circular grid is used, the line width is always 1.</td>
</tr>
</tbody>
</table>

See also:

- **28.37.25 setGridColor(rGridColor as color, rGridWidth as Integer, aGridColor as color, aGridWidth as Integer = 1)**

**28.37.27 setGridStyle(polygonGrid as boolean, gridOnTop as boolean=true)**

**Function:** Configure whether to use circular grids or polygon grids, and whether the grid lines are on top.
of the polar plot area or are at the back.

Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>polygonGrid</td>
<td>(Mandatory)</td>
<td>A true value means polygonal grid will be used. A false value means circular grid will be used.</td>

<td>gridOnTop</td>
<td>true</td>
<td>A true value means the grid lines will be on top of the polar plot area. A false value means the grid lines will be at the bottom of the polar plot area.</td>
</tr>
</tbody>
</table>

28.37.28 setPlotArea(x as Integer, y as Integer, r as Integer, bgColor as color, edgeColor as color, edgeWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other setPlotArea method, but uses color instead of integer data type for passing color values.

See also:

- 28.37.29 setPlotArea(x as Integer, y as Integer, r as Integer, bgColor as Integer = & hff000000, edgeColor as Integer = & hff000000, edgeWidth as Integer = 1) 4862

28.37.29 setPlotArea(x as Integer, y as Integer, r as Integer, bgColor as Integer = & hff000000, edgeColor as Integer = & hff000000, edgeWidth as Integer = 1)

Function: Sets the position, background colors, border color and border width of the polar plot area.

Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x coordinate of the center of the polar plot area.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y coordinate of the center of the polar plot area.</td>
</tr>
<tr>
<td>r</td>
<td>(Mandatory)</td>
<td>The radius of the polar plot area in pixels.</td>
</tr>
<tr>
<td>bgColor</td>
<td>Transparent</td>
<td>The background color of the polar plot area.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>Transparent</td>
<td>The border color of the polar plot area.</td>
</tr>
<tr>
<td>edgeWidth</td>
<td>1</td>
<td>The border width of the polar plot area. The border width is only used if the polar plot area is using a polygon grid (see PolarChart.setGridStyle). If circular grid is used, the border width is always 1.</td>
</tr>
</tbody>
</table>

See also:

- 28.37.28 setPlotArea(x as Integer, y as Integer, r as Integer, bgColor as color, edgeColor as color, edgeWidth as Integer = 1) 4862
28.37. CLASS CDPOLARCHARTMBS

28.37.30 setPlotAreaBg(bgColor1 as color, bgColor2 as color, altRings as boolean = true)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setPlotAreaBg method, but uses color instead of integer data type for passing color values.
See also:

- 28.37.31 setPlotAreaBg(bgColor1 as Integer, bgColor2 as Integer, altRings as boolean = true)

28.37.31 setPlotAreaBg(bgColor1 as Integer, bgColor2 as Integer, altRings as boolean = true)

Function: Sets alternating background colors for the polar plot area.
Notes: ChartDirector supports using two alternating background colors for the polar plot area. The colors can change on the radial direction, resulting in concentric circles, on and the angular direction, resulting in alternating sectors.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgColor1</td>
<td>(Mandatory)</td>
<td>The first background color.</td>
</tr>
<tr>
<td>bgColor2</td>
<td>-1</td>
<td>The second background color. The default value of -1 means it is the same as the first background color.</td>
</tr>
<tr>
<td>altRings</td>
<td>true</td>
<td>A true value means the background colors alternate in the radial direction, resulting in concentric circles. A false value means the background colors alternates in the angular direction, resulting in alternating sectors.</td>
</tr>
</tbody>
</table>

See also:

- 28.37.30 setPlotAreaBg(bgColor1 as color, bgColor2 as color, altRings as boolean = true)

28.37.32 setStartAngle(startAngle as Double, clockwise as boolean=true)

Function: Sets the angle of the radial axis, and the layout direction of radial grid lines.
Notes: The default radial axis angle is 0 degree, which means the radial axis is upward pointing.
<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startAngle</td>
<td>(Mandatory)</td>
<td>The angle of the radial axis in degrees. The upward pointing direction is 0 degree, with angle measured in the clockwise direction.</td>
</tr>
<tr>
<td>clockwise</td>
<td>true</td>
<td>A true value means the radial grid line will be laid out in the clockwise direction. A false value means the radial grid lines will be laid out in the counter-clockwise direction.</td>
</tr>
</tbody>
</table>

### 28.37.33 Properties

**28.37.34 angularAxis as CDAngularAxisMBS**

**Function:** Gets the AngularAxis object representing the angular axis of the polar chart.  
**Notes:** (Read only property)

**28.37.35 radialAxis as CDRadialAxisMBS**

**Function:** Gets the RadialAxis object representing the radial axis of the polar chart.  
**Notes:** (Read only property)
**Function:** A polar chart created using ChartDirector with the CDPolarChartMBS class.
28.37.38 polarzones.jpg

**Chemical Concentration**

- **Under-Absorp**
- **Normal**
- **Over-Absorp**

**Function:** A polar chart created using ChartDirector with the CDPolarChartMBS class.
CHAPTER 28. CHARTDIRECTOR

28.38 class CDPolarLayerMBS

28.38.1 class CDPolarLayerMBS

Function: The PolarLayer class is the base class for all PolarChart layer classes.

Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.38.2 Methods

28.38.3 addCustomDataLabel(i as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

Function: Adds a custom data label to a data point.

Notes:

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>(Mandatory)</td>
<td>The data point number for the data point. The first data point is 0, while the nth data point is (n - 1).</td>
</tr>
<tr>
<td>label</td>
<td>(Mandatory)</td>
<td>A text string representing the data label. Parameter Substitution and Formatting is supported.</td>
</tr>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font used to draw the label.</td>
</tr>
<tr>
<td>fontSize</td>
<td>8</td>
<td>The font size used to draw the label.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The color used to draw the label.</td>
</tr>
<tr>
<td>fontAngle</td>
<td>0</td>
<td>The rotation angle of the label.</td>
</tr>
</tbody>
</table>

Return Value

A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:

- 28.38.4 addCustomDataLabel(i as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS
28.38.4 addCustomDataLabel(i as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addCustomDataLabel method, but uses color instead of integer data type for passing color values.

See also:

- 28.38.3 addCustomDataLabel(i as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = & hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

28.38.5 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** The private constructor.

28.38.6 getHTMLImageMap(url as string, queryFormat as string = "", extraAttr as string = "", offsetX as Integer = 0, offsetY as Integer = 0) as string

**Function:** Generates an HTML image map for all data points on the layer.

**Notes:**

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(Mandatory)</td>
<td>The URL to be used in the &quot;href&quot; attribute of the image map. Parameter</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Substitution and Formatting is supported. Use an empty string if no href</td>
</tr>
<tr>
<td></td>
<td></td>
<td>attribute is needed.</td>
</tr>
<tr>
<td>queryFormat</td>
<td>&quot;&quot;</td>
<td>A text string representing the template of the query parameters to be</td>
</tr>
<tr>
<td></td>
<td></td>
<td>appended to the URL. Parameter Substitution and Formatting is supported.</td>
</tr>
</tbody>
</table>

The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default.

Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.
extraAttr  ""  A text string to specify additional attributes to add to the &lt;area&gt; tag. Parameter Substitution and Formatting is supported.

offsetX  0  An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.

offsetY  0  An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string containing the image map generated.

28.38.7  getImageCoor(dataItem as Integer, offsetX as Integer = 0, offsetY as Integer = 0) as string

Function:  Gets the image map coordinates of a data point.
Notes:
The image map coordinates will be in the following format:

\[
\text{shape=\"rect\" cords=\"[ x1 ] , [ y1 ] , [ x2 ] , [ y2 ] \"}
\]
This format is specially designed so that it can easily be included into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataItem</td>
<td>(Mandatory)</td>
<td>The data point number for the data point. The first data point is 0, while the nth data point is (n - 1).</td>
</tr>
<tr>
<td>offsetX</td>
<td>0</td>
<td>An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.</td>
</tr>
<tr>
<td>offsetY</td>
<td>0</td>
<td>An offset to be added to all y coordinates in the image map. See offsetX above for description.</td>
</tr>
</tbody>
</table>

Return Value
A text string representing the image map coordinates of the data points as HTML image map attributes.
28.38.8 setAngles(data() as Double)

**Function:** Sets the angular coordinates of the data points.

**Notes:**

Note that the angular coordinates are measured using the scale of the angular axis, which may not be in degrees or radians. See AngularAxis.setLabels and AngularAxis.setLinearScale on how the angular axis scale is defined.

If this method is not called, the first data point is assumed to have an angular coordinate of 0, and the nth data point is assumed to have an angular coordinate of (n - 1). This is common for radar charts, in which enumerated scale is used for the angular axis (see AngularAxis.setLabels).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>angles</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the angular coordinates of the data points.</td>
</tr>
</tbody>
</table>

28.38.9 setBorderColor(edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setBorderColor method, but uses color instead of integer data type for passing color values.

See also:

- 28.38.10 setBorderColor(edgeColor as Integer)

28.38.10 setBorderColor(edgeColor as Integer)

**Function:** Sets the border color for drawing the data on the layer.

**Notes:**

This method only applies to layers that represents data with elements that have borders (e.g. polar area layer and polar spline area layer).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeColor</td>
<td>(Mandatory)</td>
<td>The border color.</td>
</tr>
</tbody>
</table>

See also:

- 28.38.9 setBorderColor(edgeColor as color)
CHAPTER 28. CHARTDIRECTOR

28.38.11  setData(data() as Double, colorvalue as color, name as string = "")

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setData method, but uses color instead of integer data type for passing color values.
See also:

- 28.38.12 setData(data() as Double, colorvalue as Integer = -1, name as string = "")

28.38.12  setData(data() as Double, colorvalue as Integer = -1, name as string = ")

Function: Sets the values of the data points.
See also:

- 28.38.11 setData(data() as Double, colorvalue as color, name as string = "")

28.38.13  setDataLabelFormat(formatString as string)

Function: Sets the data label format.
Notes:
By default, the data label format is " { value } ". Please refer to Parameter Substitution and Formatting on available parameters and how to format them.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatString</td>
<td>(Mandatory)</td>
<td>The format string.</td>
</tr>
</tbody>
</table>

28.38.14  setDataLabelStyle(font as string = ", fontsize as Double = 8, font-
color as Integer = 0, fontangle as Double = 0) as CDTextBoxMBS

Function: Enables data labels and sets their styles.
Notes:
Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.
See also:
28.38. **CLASS CDPOLARLAYERMBS**

### Argument Default Description
- **font** `""` The font used to draw the labels.
- **fontSize** `8` The font size used to draw the labels.
- **fontColor** `TextColor` The color used to draw the labels.
- **fontAngle** `0` The rotation angle of the labels.

- **28.38.15 setDataLabelStyle(font as string, fontsize as Double, fontcolor as color, fontangle as Double = 0) as CDTextBoxMBS**

---

### 28.38.15 setDataLabelStyle(font as string, fontsize as Double, fontcolor as color, fontangle as Double = 0) as CDTextBoxMBS

**MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Same as the other setDataLabelStyle method, but uses color instead of integer data type for passing color values.

**See also:**
- **28.38.14 setDataLabelStyle(font as string = "", fontsize as Double = 8, fontcolor as Integer = 0, fontangle as Double = 0) as CDTextBoxMBS**

---

### 28.38.16 setDataSymbol(area as CDDrawAreaMBS)

**MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Uses a DrawArea object as the graphics symbol to plot the data points.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>(Mandatory)</td>
<td>A DrawArea object to be used as the symbol.</td>
</tr>
</tbody>
</table>

**See also:**
- **28.38.17 setDataSymbol(image as folderitem)**
- **28.38.18 setDataSymbol(pic as Picture)**
- **28.38.19 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1)**
- **28.38.20 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1)**
- **28.38.21 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1)**
- **28.38.22 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1)**
28.38.17  **setDataSetSymbol(image as folderitem)**

**Function:** Load an image from a file and use it as the graphics symbol to plot the data points.

**Notes:**

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>image</td>
<td>(Mandatory)</td>
<td>The filename of the image file. The image type is determined based on file</td>
</tr>
<tr>
<td></td>
<td></td>
<td>extension, which must be png, jpg/jpeg, gif or wbmp/wmp.</td>
</tr>
</tbody>
</table>

- 28.38.18 setDataSetSymbol(pic as Picture)
- 28.38.19 setDataSetSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1)
- 28.38.20 setDataSetSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1)
- 28.38.21 setDataSetSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1)
- 28.38.22 setDataSetSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1)

28.38.18  **setDataSetSymbol(pic as Picture)**

MBS ChartDirector Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Uses a picture object as the graphics symbol to plot the data points.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>(Mandatory)</td>
<td>A picture object to be used as the symbol.</td>

28.38. CLASS CDPOLARLAYERMBS

- 28.38.19 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1) 4875
- 28.38.20 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1) 4876
- 28.38.22 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 4877

28.38.22 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other setDataSymbol method, but uses color instead of integer data type for passing color values.

See also:

- 28.38.16 setDataSymbol(area as CDDrawAreaMBS) 4873
- 28.38.17 setDataSymbol(image as folderitem) 4874
- 28.38.18 setDataSymbol(pic as Picture) 4874
- 28.38.19 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1) 4875
- 28.38.20 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1) 4876
- 28.38.21 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 4876

28.38.23 setHTMLImageMap(url as string, queryFormat as string = "", extraAttr as string = "")

Function: Override the default arguments used when generating HTML image map for the layer.

Notes:

BaseChart.getHTMLImageMap can be used to generate HTML image map for the whole chart. When BaseChart.getHTMLImageMap is used, the image map for all layers will be generated based on the arguments supplied to BaseChart.getHTMLImageMap.

The setHTMLImageMap method can be used to override those arguments for a chart layer, so the image map for that layer can be different.
CHAPTER 28. CHARTDIRECTOR

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(Mandatory)</td>
<td>The URL to be used in the &quot;href&quot; attribute of the image map. Parameter Substitution and Formatting is supported.</td>
</tr>
</tbody>
</table>

For a detail description of image maps, please refer to BaseChart.getHTMLImageMap.

The special keyword " { default } " represents the global URL as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global URL.

Note that an empty string also means to use the global URL. To specify no URL, use the special keyword " { none } ".

To disable the entire image map, use the special keyword " { disable } ".

queryFormat    "" A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the global query parameters as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global query parameters.

Note that an empty string also means to use the global query parameters. To specify no query parameters, use the special keyword " { none } ".

extraAttr    "" A text string to specify additional attributes to add to the &lt;area&gt; tag. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the global additional attributes as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global additional attributes.

Note that an empty string also means to use the global additional attributes. To specify no additional attributes, use the special keyword " { none } ".

28.38.24 setImageMapWidth(width as Integer)

Function: Sets the effective size of a data point for producing image maps.
Notes:
For the purpose of producing image maps for the data points, the sizes of the data points are assumed to be the size of the data symbols. If no data symbol is used, an effective size is assumed. The default is 10 pixels in width and height.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The effective width and height of the data point for the purpose of producing image maps.</td>
</tr>
</tbody>
</table>

**28.38.25 setLineWidth(w as Integer)**

**Function:** Sets the line width of lines when drawing the data on the layer.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>w</td>
<td>(Mandatory)</td>
<td>The width of the line in pixels.</td>
</tr>
</tbody>
</table>

**28.38.26 setSymbolOffset(offsetX as Integer, offsetY as Integer)**

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Offset the symbols in the x and y directions in pixel unit.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xOffset</td>
<td>(Mandatory)</td>
<td>The x offset in pixels. A positive value mean shifting to the right.</td>
</tr>
<tr>
<td>yOffset</td>
<td>(Mandatory)</td>
<td>The y offset in pixels. A positive value mean shifting to the bottom.</td>
</tr>
</tbody>
</table>

**28.38.27 setSymbolScale(data() as Double, scaleType as Integer = 0)**

**Function:** Sets the size of the symbol for each data point (for creating bubble charts).

**Notes:**

One common usage for this method is to draw circle symbols of different sizes at each data points, creating a bubble chart.

This method supports any valid data symbols. You can create bubble charts with square bubbles, or even custom data symbols.
ChartDirector supports specifying sizes as pixels or in axis scale. The unit is specified by using the following predefined constants.

Constant | Value | Description
---|---|---
PixelScale | 0 | The unit is measured in pixels.
RadialAxisScale | 2 | The unit is measured in the radial axis scale.

**Argument | Default | Description**
---|---|---
zData | (Mandatory) | The sizes of the symbols, expressed using the unit defined by the scaleType argument.
scaleType | PixelScale | The unit for zData, which must be one of the predefined constants in the table above.
28.39.1 class CDPolarLineLayerMBS

Function: The PolarLineLayer class represents polar area layers.
Notes:
Subclass of the CDPolarLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.39.2 Methods

28.39.3 setCloseLoop(b as boolean)

Function: Specifies whether the polar line should form a close loop (joining the last point to the first point) or not.
Notes:
<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>(Mandatory)</td>
<td>A true value means the polar line should form a close loop. A false value means the polar line should not form a close loop.</td>
</tr>
</tbody>
</table>

28.39.4 setGapColor(lineColor as color, lineWidth as Integer)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setGapColor method, but uses color instead of integer data type for passing color values.
See also:
- 28.39.5 setGapColor(lineColor as Integer, lineWidth as Integer)

28.39.5 setGapColor(lineColor as Integer, lineWidth as Integer)

Function: Sets the color and style of the line used for jumping across NoValue data points.
Notes:
By default, the color of the line for jumping across NoValue data points is Transparent, which means the line will become discontinuous.
Argument | Default | Description
---|---|---
lineColor | (Mandatory) | The line color of the line used for jumping across NoValue data points.
lineWidth | -1 | The line width of the line used for jumping across NoValue data points. -1 means the width will be the same as the line width of the line for drawing normal data points.

See also:

- 28.39.4 `setGapColor(lineColor as color, lineWidth as Integer)`
28.40  class CDPaneSplineAreaLayerMBS

28.40.1  class CDPaneSplineAreaLayerMBS

**Function:** The PolarSplineAreaLayer class represents polar spline area layers.

**Notes:**
Subclass of the CDPaneAreaLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.40.2  Methods

28.40.3  setTension(tension as Double)

**Function:** Sets the tension to use when computing the spline curve.

**Notes:**
The tension parameter should be between -1 and 1. A positive tension will make the spline tighter. The spline curve will become straight line segments when tension is 1. A negative tension will make the spline looser.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tension</td>
<td>(Mandatory)</td>
<td>The tension of the spline, which should be between -1 and 1.</td>
</tr>
</tbody>
</table>
28.41 class CDPolarSplineLineLayerMBS

28.41.1 class CDPolarSplineLineLayerMBS

Function: The PolarSplineLineLayer class represents polar spline line layers.

Notes:

Subclass of the CDPolarLineLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.41.2 Methods

28.41.3 setTension(tension as Double)

Function: Sets the tension to use when computing the spline curve.

Notes:

The tension parameter should be between -1 and 1. A positive tension will make the spline tighter. The spline curve will become straight line segments when tension is 1. A negative tension will make the spline looser.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tension</td>
<td>(Mandatory)</td>
<td>The tension of the spline, which should be between -1 and 1.</td>
</tr>
</tbody>
</table>
28.42.  CLASS CDPOLARVECTORLAYERMBS

28.42  class CDPolarVectorLayerMBS

28.42.1  class CDPolarVectorLayerMBS

Function: The PolarVectorLayer class represents polar vector layers.

Notes:
Subclass of the CDPolarLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.42.2  Methods

28.42.3  setArrowAlignment(alignment as Integer)

Function: Sets the alignment of the vector relative to the data point.

Notes:
<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alignment</td>
<td>(Mandatory)</td>
<td>A BottomCenter value means the vector will point away from the data point (the default). A TopCenter value means the vector will point into the data point. A Center value means the center of the vector will be at the data point.</td>
</tr>
</tbody>
</table>

28.42.4  setArrowHead(polygon() as Integer)

Function: Sets a custom shape to be used as the arrow head.

Notes:
The custom shape is specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 10 x 10 units, in which the x-axis is from left to right, and the y-axis from bottom to top. The origin is assumed to be the bottom center of the arrow (the point where the arrow head joins the arrow stem). The shape is assumed to represent an arrow pointing upwards.

As an example, the followings are the integer array that represents the standard ChartDirector vector arrow head:
ChartDirector will automatically scale the shape to the actual width and height as specified in PolarVectorLayer.setArrowHead.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>polygon</td>
<td>(Mandatory)</td>
<td>An array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates the polygon vertices on a 10 x 10 units grid.</td>
</tr>
</tbody>
</table>

See also:

- 28.42.5 setArrowHead(width as Integer, height as Integer)

### 28.42.5 setArrowHead(width as Integer, height as Integer)

**Function:** Sets the size of the arrow head.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The width of the arrow head in pixels. The default width is 8 pixels.</td>
</tr>
<tr>
<td>height</td>
<td>0</td>
<td>The height of the arrow head in pixels. The default value of 0 means the height is the same as the width.</td>
</tr>
</tbody>
</table>

See also:

- 28.42.4 setArrowHead(polygon() as Integer)

### 28.42.6 setArrowStem(polygon() as Integer)

**Function:** Sets a custom shape to be used as the arrow stem.

**Notes:**

By default, the arrow stem is just a straight line, with the line width controlled using PolarLayer.setLineWidth. The setArrowStem method can specify a custom shape for the arrow stem.

The custom shape is specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 10 x 100 units, in which the x-axis is from left to right, and the y-axis from bottom to top. The origin is assumed to be the starting point of the arrow stem.
and the shape is assumed to represent an arrow stem pointing upwards.

ChartDirector will automatically scale the shape so that the total arrow length (head + stem) is the required length of the arrow as according to actual data, and the stem width is as specified in PolarLayer.setLineWidth.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>polygon</td>
<td>(Mandatory)</td>
<td>An array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates the polygon vertices on a 10 x 100 units grid.</td>
</tr>
</tbody>
</table>

### 28.42.7 setIconSize(height as Integer, width as Integer = 0)

**Function:** Sets the size of the icon to be used in legend box.

**Notes:**

By default, if a legend box is available on the chart, ChartDirector will insert an legend entry if the PolarVectorLayer is named. The size of the icon will be the size of the vectors used on the chart, using a short vector length to fit the legend box.

This method can be used to override the legend box settings to specify a custom width/height for the icons of the current PolarVectorLayer.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the icon in pixels.</td>
</tr>
<tr>
<td>width</td>
<td>0</td>
<td>The width of the icon in pixels. The default value of 0 means the width is automatically determined.</td>
</tr>
</tbody>
</table>

### 28.42.8 setVector(lengths() as Double, directions() as Double, lengthScale as Integer = 0)

**Function:** Sets the lengths and directions for the vectors.

**Notes:**

ChartDirector supports specifying lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

```
Constant    Value    Description
```

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lengths</td>
<td></td>
<td></td>
</tr>
<tr>
<td>directions</td>
<td></td>
<td></td>
</tr>
<tr>
<td>lengthScale</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>
PixelScale 0 The unit is measured in pixels.
RadialAxisScale 2 The unit is measured in the radial axis scale.

Argument Default Description
lengths (Mandatory) An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.
directions (Mandatory) An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.
lengthScale PixelScale The unit for the lengths, which must be one of the predefined constants in the table above.

28.42.9 setVectorMargin(startMargin as Double)

Function: Sets the vector margin.
See also:

• 28.42.10 setVectorMargin(startMargin as Double, endMargin as Double)

28.42.10 setVectorMargin(startMargin as Double, endMargin as Double)

Function: Sets the vector margin.
See also:

• 28.42.9 setVectorMargin(startMargin as Double)
28.43. **CLASS CDPYRAMIDCHARTMBS**

28.43  **class CDPyramidChartMBS**

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The PyramidChart class represents pyramid charts (including cone charts and funnel charts). **Notes:**

The PyramidChart class is a subclass of BaseChart. Subclass of the CDBaseChartMBS class.

28.43.2  **Methods**

28.43.3  **Constructor**(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new PyramidChart object. **Notes:**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The width of the chart in pixels.</td>
</tr>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the chart in pixels.</td>
</tr>
<tr>
<td>bgColor</td>
<td>kBackgroundColor</td>
<td>The background color of the chart.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>kTransparent</td>
<td>The edge color of the chart.</td>
</tr>
<tr>
<td>raisedEffect</td>
<td>0</td>
<td>The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.</td>
</tr>
</tbody>
</table>

See also:

- 28.43.4 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

28.43.4  **Constructor**(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other Constructor method, but uses color instead of integer data type for passing
color values.
See also:

- 28.43.3 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000,
  edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

28.43.5 getLayer(layerNo as Integer) as CDPyramidLayerMBS

Function: Retrieves the PyramidLayer object representing a single pyramid layer in the pyramid chart.
Notes:
You must call CDPyramidChartMBS.setData to create the layers first before calling this method.
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layerNo</td>
<td>(Mandatory)</td>
<td>The layer number of the pyramid layer to retrieve, starting from 0. The first</td>
</tr>
<tr>
<td></td>
<td></td>
<td>pyramid layer is 0. The nth pyramid layer is (n-1).</td>
</tr>
</tbody>
</table>

Return Value
The requested CDPyramidLayerMBS object.

28.43.6 setCenterLabel(labelTemplate as string = "", font as string = "", font-
  Size as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

Function: Adds labels to the center of the pyramid layers.
Notes:
This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use
CDPyramidLayerMBS.setCenterLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Return Value
A CDTextBoxMBS object representing the prototype of the labels. This may be used to fine-tune the ap-
pearance of the labels.
### 28.43. **CLASS CDPYRAMIDCHARTMBS**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>labelTemplate</td>
<td>&quot; { skip } &quot;</td>
<td>The label template. &quot; { skip } &quot; means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>font</td>
<td>&quot; { skip } &quot;</td>
<td>The font style. &quot; { skip } &quot; means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>fontSize</td>
<td>-1</td>
<td>The font size in points. -1 means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>fontColor</td>
<td>-1</td>
<td>The font color. -1 means to keep the existing value unchanged.</td>
</tr>
</tbody>
</table>

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontsizepecification.shtml

See also:

- 28.43.7 **setCenterLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color)** as CDTextBoxMBS

### 28.43.7 **setCenterLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color)** as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setCenterLabel method, but uses color instead of integer data type for passing color values.

See also:

- 28.43.6 **setCenterLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1)** as CDTextBoxMBS

### 28.43.8 **setConeSize(cx as Integer, cy as Integer, radius as Integer, height as Integer)**

**Function:** Sets the position and size of the cone in a cone chart.

**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cx</td>
<td>(Mandatory)</td>
<td>The x-coordinate of the center of the cone. The center of the cone is the midpoint of the vertical axis of the cone.</td>
</tr>
<tr>
<td>cy</td>
<td>(Mandatory)</td>
<td>The y-coordinate of the center of the cone. The center of the cone is the midpoint of the vertical axis of the cone.</td>
</tr>
<tr>
<td>radius</td>
<td>(Mandatory)</td>
<td>The radius of the base of the cone.</td>
</tr>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the cone.</td>
</tr>
</tbody>
</table>
CHAPTER 28. CHARTDIRECTOR

28.43.9 setData(data() as Double)

Function: Sets the data used to draw the pyramid chart.
Notes:
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the data values.</td>
</tr>
<tr>
<td>labels</td>
<td>[ Empty_Array ]</td>
<td>An array of text strings representing the labels of the layers. An empty array means no layer label.</td>
</tr>
</tbody>
</table>

See also:
- 28.43.10 setData(data() as Double, labels() as string)

28.43.10 setData(data() as Double, labels() as string)

Function: Sets the data used to draw the pyramid chart.
Notes:
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the data values.</td>
</tr>
<tr>
<td>labels</td>
<td>[ Empty_Array ]</td>
<td>An array of text strings representing the labels of the layers. An empty array means no layer label.</td>
</tr>
</tbody>
</table>

See also:
- 28.43.9 setData(data() as Double)

28.43.11 setFunnelSize(cx as Integer, cy as Integer, radius as Integer, height as Integer, tubeRadius as Double = 0.2, tubeHeight as Double = 0.3)

Function: Sets the position and size of the funnel in a funnel chart.
Notes:
A funnel is similar to an inverted cone, except that the vertex of the cone is replaced by a tube.
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cx</td>
<td>(Mandatory)</td>
<td>The x-coordinate of the center of the funnel. The center of the funnel is the midpoint of the vertical axis of the funnel.</td>
</tr>
<tr>
<td>cy</td>
<td>(Mandatory)</td>
<td>The y-coordinate of the center of the funnel. The center of the funnel is the midpoint of the vertical axis of the funnel.</td>
</tr>
<tr>
<td>radius</td>
<td>(Mandatory)</td>
<td>The radius of the mouth of the funnel.</td>
</tr>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the funnel, inclusive of the tube.</td>
</tr>
<tr>
<td>tubeRadius</td>
<td>0.2</td>
<td>The radius of the tube, as a ratio to the radius of the mouth of the funnel.</td>
</tr>
<tr>
<td>tubeHeight</td>
<td>0.3</td>
<td>The height (length) of the tube, as a ratio to the total height of the funnel. It must be between 0 to 1.</td>
</tr>
</tbody>
</table>

28.43.12 setGradientShading(startBrightness as Double, endBrightness as Double)

**Function:** Sets gradient shading mode.

**Notes:**

Gradient shading only applies to 2D and 3D pyramids, and 2D cones and funnels. 3D cones and funnels always use Phong lighting (see CDPyramidChartMBS.setLighting).

The gradient is specified with two brightness values at the gradient end points. A brightness less than 1 means the color is darkened, while a brightness greater than 1 means the color is brightened. For example, a brightness of 0.5 means the color is half as bright as the original color. If the original color is red, the color will become dark red. Conversely, a brightness of 2 means the color is twice as bright as the original color. If the original color is red, the color will become light red.

For a pyramid or cone layer, the gradient is from left edge to the right edge. For a funnel chart, the gradient is from the right edge to the left edge.

For a pyramid chart, this is the default coloring method. If this method is never called, the default brightness is from 0.75 to 2.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startBrightness</td>
<td>(Mandatory)</td>
<td>The brightness at the starting point.</td>
</tr>
<tr>
<td>endBrightness</td>
<td>(Mandatory)</td>
<td>The brightness at the ending point.</td>
</tr>
</tbody>
</table>
28.43.13  setJoinLine(ColorValue as color, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setJoinLine method, but uses color instead of integer data type for passing color values.
See also:

- 28.43.14 setJoinLine(ColorValue as Integer, width as Integer = -1)

28.43.14  setJoinLine(ColorValue as Integer, width as Integer = -1)

**Function:** Sets the color and line width of the join lines that join the pyramid layers with the left and right labels.
**Notes:**
This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use PyramidLayer.setJoinLine.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the join line. -1 means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>width</td>
<td>-1</td>
<td>The width of the line join. -1 means to keep the existing value unchanged.</td>
</tr>
</tbody>
</table>

See also:

- 28.43.13 setJoinLine(ColorValue as color, width as Integer = -1)

28.43.15  setJoinLineGap(pyramidGap as Integer)

**Function:** Sets the gaps of the join lines that join the pyramid layers with the left and right labels.
**Notes:**
This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.
This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pyramidGap</td>
<td>(Mandatory)</td>
<td>The gap in pixels between the starting point of the join line and the pyramid layer edge.</td>
</tr>
<tr>
<td>pyramidMargin</td>
<td>10</td>
<td>The distance in pixels between the ending point of the join line and the pyramid bounding box.</td>
</tr>
<tr>
<td>textGap</td>
<td>3</td>
<td>The gap in pixels between the label text box and the ending point of the join line.</td>
</tr>
</tbody>
</table>

See also:

- 28.43.16 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer)
- 28.43.17 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer)

**28.43.16 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer)**

**Function:** Sets the gaps of the join lines that join the pyramid layers with the left and right labels.  
**Notes:**  
This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

<table>
<thead>
<tr>

<td>3</td>
<td>The gap in pixels between the label text box and the ending point of the join line.</td>
</tr>
</tbody>
</table>
28.43.17 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer)

Function: Sets the gaps of the join lines that join the pyramid layers with the left and right labels.

Notes:
This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pyramidGap</td>
<td>(Mandatory)</td>
<td>The gap in pixels between the starting point of the join line and the pyramid layer edge.</td>

28.43.18 setLayerBorder(ColorValue as color, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other setLayerBorder method, but uses color instead of integer data type for passing color values.

See also:
28.43. **CLASS CDPYRAMIDCHARTMBS**

- 28.43.19 `setLayerBorder(ColorValue as Integer, width as Integer = -1)`

28.43.19 **setLayerBorder(ColorValue as Integer, width as Integer = -1)**

**Function:** Sets the color and line width of the layer border.

**Notes:**
This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use `CDPyramidLayerMBS.setLayerBorder`.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the layer border. -1 means to keep the existing value unchanged.</td>

<tr>
<td>width</td>
<td>-1</td>
<td>The width of the layer border. -1 means to keep the existing value unchanged.</td>
</tr>
</tbody>
</table>

See also:

- 28.43.18 `setLayerBorder(ColorValue as color, width as Integer = -1)`

28.43.20 **setLayerGap(layerGap as Double)**

**Function:** Sets the gaps between pyramid layers.

**Notes:**
This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use `CDPyramidLayerMBS.setLayerGap`.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layerGap</td>
<td>(Mandatory)</td>
<td>The gap between layers as a ratio to the height of the pyramid. The gap must be greater than or equals 0. The sum of all gaps must be less than 1.</td>
</tr>
</tbody>
</table>

28.43.21 **setLeftLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS**

**Function:** Adds labels to the left of the pyramid layers.
Notes:

This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setLeftLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>&quot; { skip } &quot;</td>
<td>The label template. &quot; { skip } &quot; means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>font</td>
<td>&quot; { skip } &quot;</td>
<td>The font style. &quot; { skip } &quot; means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>fontSize</td>
<td>-1</td>
<td>The font size in points. -1 means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>fontColor</td>
<td>-1</td>
<td>The font color. -1 means to keep the existing value unchanged.</td>
</tr>
</tbody>
</table>

Return Value

A CDTTextBoxMBS object representing the prototype of the labels. This may be used to fine-tune the appearance of the labels.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:

- 28.43.22 setLeftLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTTextBoxMBS

28.43.22 setLeftLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other setLeftLabel method, but uses color instead of integer data type for passing color values.

See also:

- 28.43.21 setLeftLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTTextBoxMBS
**28.43.23**  
```
setLighting(ambientIntensity as Double = 0.5, diffuseIntensity as Double = 0.5, specularIntensity as Double = 1, shininess as Double = 8)
```

**Function:** Sets Phong lighting mode.  
**Notes:**  
This method adjusts the brightness of the surfaces as according to the Phong lighting model, in which the light source is from the viewer direction and is far away.  

For a cone or funnel chart, this is the default coloring method.  

For a pyramid chart, only ambient and diffuse reflections are used.  

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ambientIntensity</td>
<td>0.5</td>
<td>The ambient reflection coefficient of the Phong lighting model.</td>
</tr>
<tr>
<td>diffuseIntensity</td>
<td>0.5</td>
<td>The diffuse reflection coefficient of the Phong lighting model.</td>
</tr>
<tr>
<td>specularIntensity</td>
<td>1</td>
<td>The specular reflection coefficient of the Phong lighting model.</td>
</tr>
<tr>
<td>shininess</td>
<td>8</td>
<td>The shininess coefficient of the Phong lighting model.</td>
</tr>
</tbody>
</table>

**28.43.24**  
```
setPyramidSides(noOfSides as Integer)
```

**Function:** Sets the number of sides of the base polygon in a pyramid chart.  
**Notes:**  
By default, the base of a pyramid is a square. This method can be used to change it to other regular polygon.  

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>noOfSides</td>
<td>(Mandatory)</td>
<td>The number of sides of the base polygon in a pyramid chart.</td>
</tr>
</tbody>
</table>

**28.43.25**  
```
setPyramidSize(cx as Integer, cy as Integer, radius as Integer, height as Integer)
```

**Function:** Sets the position and size of the pyramid in a pyramid chart.
CHAPTER 28. CHARTDIRECTOR

Notes:
Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cx</td>
<td>(Mandatory)</td>
<td>The x-coordinate of the center of the pyramid. The center of the pyramid is the midpoint of the vertical axis of the pyramid.</td>
</tr>
<tr>
<td>cy</td>
<td>(Mandatory)</td>
<td>The y-coordinate of the center of the pyramid. The center of the pyramid is the midpoint of the vertical axis of the pyramid.</td>
</tr>
<tr>
<td>radius</td>
<td>(Mandatory)</td>
<td>For a square pyramid, it is the length of the square. For a pyramid with other regular polygonal base, it is the radius of the circumcircle of the base.</td>
</tr>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the pyramid.</td>
</tr>
</tbody>
</table>

28.43.26  setRightLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

Function: Adds labels to the right of the pyramid layers.

Notes:
This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setRightLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>&quot; { skip } &quot;</td>
<td>The label template. &quot; { skip } &quot; means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>font</td>
<td>&quot; { skip } &quot;</td>
<td>The font style. &quot; { skip } &quot; means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>fontSize</td>
<td>-1</td>
<td>The font size in points. -1 means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>fontColor</td>
<td>-1</td>
<td>The font color. -1 means to keep the existing value unchanged.</td>
</tr>
</tbody>
</table>

Return Value:
A TextBox object representing the prototype of the labels. This may be used to fine-tune the appearance of the labels.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:
28.43. setRightLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setRightLabel method, but uses color instead of integer data type for passing color values.

See also:

- 28.43.26 setRightLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

28.43.28 setViewAngle(elevation as Double, rotation as Double = 0, twist as Double = 0)

**Function:** Sets the 3D view angles.

**Notes:**

ChartDirector uses elevation, rotation and twist angles to specify the 3D view angles.

To explain the meaning of the angles, imagine the object being viewed is put at the center of a hollow sphere, and a camera (the view point) is put at the surface of the sphere, directed inwards to the center to look at the object.

The elevation angle refers to the "latitude" of the camera. An elevation angle of 0 degrees means the camera is at the "equator" pointing to the object from the side. An elevation angle of 90 degrees means the camera is at the "north pole" pointing down to the object. An angle elevation of -90 degrees means the camera is at the "south pole", pointing up to the object.

The rotation angle refers to the "longitude" of the camera. If the elevation is 0 degrees, and the rotation angle varies from 0 to 360 degrees, the camera will move around the "equator" in the easterly direction (counter-clockwise when viewed from the north pole).

The twist angle is for rotating the camera itself while still pointing to the object. For example, a twist angle of 90 degrees means you are holder the camera "vertically" instead of "horizontally". The rotation is clockwise from the view point of the person holding the camera.

Note that from the view point of the camera, the object will appear to be rotating in the opposite direction. For example, as the rotation angle rotates the camera counter-clockwise along the "equator", the object will
appear to be rotating clockwise on the screen.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elevation</td>
<td>(Mandatory)</td>
<td>The elevation angle in degrees.</td>
</tr>
<tr>
<td>rotation</td>
<td>0</td>
<td>The rotation angle in degrees.</td>
</tr>
<tr>
<td>twist</td>
<td>0</td>
<td>The twist angle in degrees.</td>
</tr>
</tbody>
</table>
Function: A pyramid chart showing a cone created using ChartDirector with the CDPyramidChartMBS class.
A pyramid chart created using ChartDirector with the CDPyramidChartMBS class.
28.44. CLASS CDPYRAMIDLAYERMBS

28.44  class CDPyramidLayerMBS

28.44.1  class CDPyramidLayerMBS

**Function:** The PyramidLayer class represents pyramid layers (including cone and funnel layers).

**Notes:**

The PyramidLayer object is obtained using PyramidChart.getLayer.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.44.2  Methods

28.44.3  Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The private constructor.

28.44.4  setCenterLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

**Function:** Adds a label to the center of the pyramid layer.

**Notes:**

To apply this method to all pyramid layers, use CDPyramidChartMBS.setCenterLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>&quot; { skip } &quot;</td>
<td>The label template. &quot; { skip } &quot; means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>font</td>
<td>&quot; { skip } &quot;</td>
<td>The font style. &quot; { skip } &quot; means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>fontSize</td>
<td>-1</td>
<td>The font size in points. -1 means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>fontColor</td>
<td>-1</td>
<td>The font color. -1 means to keep the existing value unchanged.</td>
</tr>
</tbody>
</table>

Return Value
A CDTextBoxMBS object representing the prototype of the label. This may be used to fine-tune the appearance of the label.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 28.44.5 setCenterLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

28.44.5 setCenterLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other setCenterLabel method, but uses color instead of integer data type for passing color values.
See also:

- 28.44.4 setCenterLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

28.44.6 setColor(ColorValue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other setColor method, but uses color instead of integer data type for passing color values.
See also:

- 28.44.7 setColor(ColorValue as Integer)

28.44.7 setColor(ColorValue as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the color of the pyramid layer.
See also:

- 28.44.6 setColor(ColorValue as color)

28.44.8 setJoinLine(ColorValue as color, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other setJoinLine method, but uses color instead of integer data type for passing
color values.

See also:

- 28.44.9 setJoinLine(ColorValue as Integer, width as Integer = -1)

**28.44.9 setJoinLine(ColorValue as Integer, width as Integer = -1)**

**Function:** Sets the color and line width of the join line that joins the pyramid layer with the left and right labels.

**Notes:**

To apply this method to all pyramid layers, use CDPyramidChartMBS.setJoinLine.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the join line. -1 means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>width</td>
<td>-1</td>
<td>The width of the line join. -1 means to keep the existing value unchanged.</td>
</tr>
</tbody>
</table>

See also:

- 28.44.8 setJoinLine(ColorValue as color, width as Integer = -1)

**28.44.10 setJoinLineGap(pyramidGap as Integer)**

**Function:** Sets the gaps of the join line that joins the pyramid layer with the left and right labels.

**Notes:**

To apply this method to all pyramid layers, use CDPyramidChartMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

**Arguments:**

See also:
CHAPTER 28. CHARTDIRECTOR

28.44.11 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer)

28.44.12 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer)

**28.44.11 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer)**

**Function:** Sets the gaps of the join line that joins the pyramid layer with the left and right labels.

**Notes:**
To apply this method to all pyramid layers, use CDPyramidChartMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pyramidGap</td>
<td>(Mandatory)</td>
<td>The gap in pixels between the starting point of the join line and the pyramid layer edge.</td>
</tr>
<tr>
<td>pyramidMargin</td>
<td>10</td>
<td>The distance in pixels between the ending point of the join line and the pyramid bounding box.</td>
</tr>
<tr>
<td>textGap</td>
<td>3</td>
<td>The gap in pixels between the label text box and the ending point of the join line.</td>
</tr>
</tbody>
</table>

See also:

- 28.44.10 setJoinLineGap(pyramidGap as Integer)
- 28.44.12 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer)
28.44.12 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer)

**Function:** Sets the gaps of the join line that joins the pyramid layer with the left and right labels.
**Notes:**
To apply this method to all pyramid layers, use CDPyramidChartMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pyramidGap</td>
<td>(Mandatory)</td>
<td>The gap in pixels between the starting point of the join line and the pyramid layer edge.</td>
</tr>
<tr>
<td>pyramidMargin</td>
<td>10</td>
<td>The distance in pixels between the ending point of the join line and the pyramid bounding box.</td>
</tr>
<tr>
<td>textGap</td>
<td>3</td>
<td>The gap in pixels between the label text box and the ending point of the join line.</td>
</tr>
</tbody>
</table>

See also:

- 28.44.10 setJoinLineGap(pyramidGap as Integer)
- 28.44.11 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer)

28.44.13 setLayerBorder(ColorValue as color, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setLayerBorder method, but uses color instead of integer data type for passing color values.

See also:

- 28.44.14 setLayerBorder(ColorValue as Integer, width as Integer = -1)

28.44.14 setLayerBorder(ColorValue as Integer, width as Integer = -1)

**Function:** Sets the color and line width of the layer border.
Notes:

To apply this method to all pyramid layers, use CDPyramidChartMBS.setLayerBorder.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the layer border. -1 means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>width</td>
<td>-1</td>
<td>The width of the layer border. -1 means to keep the existing value unchanged.</td>
</tr>
</tbody>
</table>

See also:

- 28.44.13 setLayerBorder(ColorValue as color, width as Integer = -1)

28.44.15 setLayerGap(layerGap as Double)

**Function:** Sets the gap between this pyramid layer and the next pyramid layer.

**Notes:**

To apply this method to all pyramid layers, use CDPyramidChartMBS.setLayerGap.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layerGap</td>
<td>(Mandatory)</td>
<td>The gap between layers as a ratio to the height of the pyramid. The gap must be greater than or equals 0. The sum of all gaps must be less than 1.</td>
</tr>
</tbody>
</table>

28.44.16 setLeftLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

**Function:** Adds a label to the left of the pyramid layer.

**Notes:**

To apply this method to all pyramid layers, use CDPyramidChartMBS.setLeftLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.
28.44. **CLASS CDPYRAMIDLAYERMBS**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>&quot; { skip } &quot;</td>
<td>The label template. &quot; { skip } &quot; means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>font</td>
<td>&quot; { skip } &quot;</td>
<td>The font style. &quot; { skip } &quot; means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>fontSize</td>
<td>-1</td>
<td>The font size in points. -1 means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>fontColor</td>
<td>-1</td>
<td>The font color. -1 means to keep the existing value unchanged.</td>
</tr>
</tbody>
</table>

Return Value

A CDTextBoxMBS object representing the prototype of the label. This may be used to fine-tune the appearance of the label.

See font specification here:

http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:

- 28.44.17 setLeftLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

---

### 28.44.17 setLeftLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setLeftLabel method, but uses color instead of integer data type for passing color values.

See also:

- 28.44.16 setLeftLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

---

### 28.44.18 setRightLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

**Function:** Adds a label to the right of the pyramid layer.

**Notes:**

To apply this method to all pyramid layers, use CDPyramidChartMBS.setRightLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.
CHAPTER 28. CHARTDIRECTOR

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>&quot; { skip } &quot;</td>
<td>The label template. &quot; { skip } &quot; means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>font</td>
<td>&quot; { skip } &quot;</td>
<td>The font style. &quot; { skip } &quot; means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>fontSize</td>
<td>-1</td>
<td>The font size in points. -1 means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>fontColor</td>
<td>-1</td>
<td>The font color. -1 means to keep the existing value unchanged.</td>
</tr>
</tbody>
</table>

Return Value

A CDTextBoxMBS object representing the prototype of the label. This may be used to fine-tune the appearance of the label.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

See also:

- 28.44.19 setRightLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

28.44.19 setRightLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other setRightLabel method, but uses color instead of integer data type for passing color values.

See also:

- 28.44.18 setRightLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS
28.45. class CDRadialAxisMBS

Function: The RadialAxis class represents radial axes in polar charts.

Notes:

In the current version of ChartDirector, RadialAxis is implemented as a special configuration of Axis.
Subclass of the CDAxisMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.
28.46  class CDRanSeriesMBS

28.46.1  class CDRanSeriesMBS

Function:  RanSeries is a utility class to produce random series.
Notes:  It facilitates testing and demonstrating ChartDirector programs without needing a real data source.

28.46.2  Methods

28.46.3  Constructor(seed as Integer)

Function:  Creates a RanSeries object.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seed</td>
<td>(Mandatory)</td>
<td>The seed to be used in the random number generator.</td>
</tr>
</tbody>
</table>

28.46.4  create(seed as Integer) as CDRanSeriesMBS

Function:  Creates a RanSeries object.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seed</td>
<td>(Mandatory)</td>
<td>The seed to be used in the random number generator.</td>
</tr>
</tbody>
</table>

28.46.5  get2DSeries(xLen as Integer, yLen as Integer, minValue as Double, maxValue as Double) as Double()

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function:  Gets an array of random numbers representing points on a 2D grid in which the difference between neighbouring points is random.
Notes:

Returns an array of random numbers representing points on a 2D grid in which the difference between neighbouring points is random. The array will contain (xLen * yLen) elements. The element at index (y * xLen + x) represents the point at (x, y), in which x and y are integers such that 0 <= x < xLen and 0 <= y < yLen.
### 28.46.6 `getDateSeries(len as Integer, startTime as Double, tickInc as Double, weekDayOnly as boolean = false) as Double()`

**Function:** Gets an array of date/time values.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>len</td>
<td>(Mandatory)</td>
<td>The number of random values to get.</td>
</tr>
<tr>
<td>startTime</td>
<td>(Mandatory)</td>
<td>The date/time of the first record in the column.</td>
</tr>
<tr>
<td>tickInc</td>
<td>(Mandatory)</td>
<td>The change in date/time for subsequent records in seconds. The value 30 * 86400 is assumed to mean 1 month (which is not a constant interval), and its multiplies are assumed to mean multiple months. In particular, the value 360 * 86400 is assumed to mean 12 months, or 1 year.</td>
</tr>
<tr>
<td>weekDayOnly</td>
<td>false</td>
<td>A true value means skipping dates that are not weekdays (Saturday and Sunday). A % F value means no skipping.</td>
</tr>
</tbody>
</table>

Returns an array of date/time values.

### 28.46.7 `getSeries(len as Integer, minValue as Double, maxValue as Double) as Double()`

**Function:** Gets an array of numbers that fluctuate randomly.

**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>len</td>
<td>(Mandatory)</td>
<td>The number of random values to get.</td>
</tr>
<tr>
<td>startValue</td>
<td>(Mandatory)</td>
<td>The first value in the sequence.</td>
</tr>
<tr>
<td>minDelta</td>
<td>(Mandatory)</td>
<td>The minimum change between two consecutive numbers.</td>
</tr>
<tr>
<td>maxDelta</td>
<td>(Mandatory)</td>
<td>The maximum change between two consecutive numbers.</td>
</tr>
<tr>
<td>lowerLimit</td>
<td>[-Infinity ]</td>
<td>The minimum allowed value of the numbers.</td>
</tr>
<tr>
<td>upperLimit</td>
<td>[+Infinity ]</td>
<td>The maximum allowed value of the numbers.</td>
</tr>
</tbody>
</table>

Returns an array of numbers that fluctuate randomly.

See also:
28.46.8 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double) as Double()

Function: Gets an array of numbers that fluctuate randomly.
Notes:
<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>len</td>
<td>(Mandatory)</td>
<td>The number of random values to get.</td>
</tr>
<tr>
<td>startValue</td>
<td>(Mandatory)</td>
<td>The first value in the sequence.</td>
</tr>
<tr>
<td>minDelta</td>
<td>(Mandatory)</td>
<td>The minimum change between two consecutive numbers.</td>
</tr>
<tr>
<td>maxDelta</td>
<td>(Mandatory)</td>
<td>The maximum change between two consecutive numbers.</td>
</tr>
<tr>
<td>lowerLimit</td>
<td>[-Infinity]</td>
<td>The minimum allowed value of the numbers.</td>
</tr>
<tr>
<td>upperLimit</td>
<td>[+Infinity]</td>
<td>The maximum allowed value of the numbers.</td>
</tr>
</tbody>
</table>

Returns an array of numbers that fluctuate randomly.
See also:
- 28.46.7 getSeries(len as Integer, minValue as Double, maxValue as Double) as Double()
- 28.46.9 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) as Double() 4916
- 28.46.10 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) as Double() 4917

28.46.9 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) as Double()

Function: Gets an array of numbers that fluctuate randomly.
Notes:
Returns an array of numbers that fluctuate randomly.
See also:
- 28.46.7 getSeries(len as Integer, minValue as Double, maxValue as Double) as Double() 4915
28.46. CLASS CDRANSERIESMBS

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>

CHAPTER 28. CHARTDIRECTOR

28.47  class CDRanTableMBS

28.47.1  class CDRanTableMBS

Function: RanTable is a utility class to produce tables with random numbers.
Notes: It facilitates testing and demonstrating ChartDirector programs without needing a real database table.

28.47.2  Methods

28.47.3  Constructor(seed as Integer, noOfCols as Integer, noOfRows as Integer)

Function: Creates a RanTable object.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seed</td>
<td>(Mandatory)</td>
<td>The seed to be used in the random number generator.</td>
</tr>
<tr>
<td>noOfCols</td>
<td>(Mandatory)</td>
<td>The number of columns in the random number table.</td>
</tr>
<tr>
<td>noOfRows</td>
<td>(Mandatory)</td>
<td>The number of rows in the random number table.</td>
</tr>
</tbody>
</table>

28.47.4  getCol(colNo as Integer) as CDArrayMBS

Function: Gets the request column as an array of numbers.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>(Mandatory)</td>
<td>The column to get. The first column is 0. The nth column is (n - 1).</td>
</tr>
</tbody>
</table>

Return Value
An array containing numbers from the requested column.

28.47.5  selectDate(colNo as Integer, minDate as Double, maxDate as Double) as Integer

Function: Selects the rows within a certain date range.
Notes:
After executing this method, the RanTable will be reduced to only contain rows that are within minDate and maxDate (inclusive of both dates).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colNo</td>
<td>(Mandatory)</td>
<td>The date column to be used as selection criteria.</td>
</tr>
<tr>
<td>minDate</td>
<td>(Mandatory)</td>
<td>The minimum date (earliest date).</td>
</tr>
<tr>
<td>maxDate</td>
<td>(Mandatory)</td>
<td>The maximum date (latest date).</td>
</tr>
</tbody>
</table>

### 28.47.6 setCol(colNo as Integer, minValue as Double, maxValue as Double)

**Function:** Fill the given column in the RanTable with random numbers in the given range.

**Notes:**

- The column to fill. The first column is 0. The nth column is (n - 1).
- The minimum value of the random number.
- The maximum value of the random number.

See also:

- 28.47.7 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double) 4919
- 28.47.8 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) 4920
- 28.47.9 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) 4920

### 28.47.7 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double)

**Function:** Fill the given column in the RanTable with random numbers that fluctuates within a given speed.

**Notes:**

See also:

- 28.47.6 setCol(colNo as Integer, minValue as Double, maxValue as Double) 4919
- 28.47.7 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double) 4919
- 28.47.8 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) 4920
- 28.47.9 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) 4920
CHAPTER 28. CHARTDIRECTOR

Argument Default Description

colNo (Mandatory) The column to fill. The first column is 0. The nth column is (n - 1).

startValue (Mandatory) The value of the first record in the column.

minDelta (Mandatory) The minimum change allowed for between the current random number and the previous random number. This parameter is usually negative.

maxDelta (Mandatory) The maximum change allowed for between the current random number and the previous random number.

lowerLimit [ -Infinity ] The minimum value of the random number.

upperLimit [ +Infinity ] The maximum value of the random number.

28.47.8 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double)

Function: Fill the given column in the RanTable with random numbers that fluctuates within a given speed.

Notes:

See also:

- 28.47.6 setCol(colNo as Integer, minValue as Double, maxValue as Double) 4919
- 28.47.7 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double) 4919
- 28.47.9 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) 4920

28.47.9 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double)

Function: Fill the given column in the RanTable with random numbers that fluctuates within a given speed.

Notes:

</tr>
</tbody>
</table>

**28.47.11 setHLOCCols(i as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double = 0.0)**

**Function:** Fill 4 columns in the RanTable with random high, low, open and close records.

**Notes:**

The 4 columns will meet the constraints that for each record, the high value will be greater than or equal to the low value, and both the open and close values will be in between the high and low values.
### Argument Default Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>i</code></td>
<td>(Mandatory)</td>
<td>The column number of the &quot;high&quot; column. The next column will be assumed to be &quot;low&quot;, followed by &quot;open&quot; and &quot;close&quot;. The column number starts at 0. The first column is 0. The nth column is (n - 1).</td>
</tr>
<tr>
<td><code>startValue</code></td>
<td>(Mandatory)</td>
<td>The initial &quot;open&quot; value.</td>
</tr>
<tr>
<td><code>minDelta</code></td>
<td>(Mandatory)</td>

See also:

- 28.47.12 setHLOCCols(i as Integer, `startValue` as Double, `minDelta` as Double, `maxDelta` as Double, `lowerLimit` as Double, `upperLimit` as Double)

### 28.47.12 setHLOCCols(i as Integer, `startValue` as Double, `minDelta` as Double, `maxDelta` as Double, `lowerLimit` as Double, `upperLimit` as Double)

**MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:** Fill 4 columns in the RanTable with random high, low, open and close records.

**Notes:**

The 4 columns will meet the constraints that for each record, the high value will be greater than or equal to the low value, and both the open and close values will be in between the high and low values.
• 28.47.11 setHLOCCols(i as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double = 0.0)
28.48 class CDScatterLayerMBS

28.48.1 class CDScatterLayerMBS

**Function:** The ScatterLayer class represents scatter layers.

**Notes:**
Subclass of the CDLineLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.
28.49. CLASS CDSECTORMBS

28.49 class CDSectorMBS

28.49.1 class CDSectorMBS

**Function:** The Sector class represents sectors.

**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.49.2 Methods

28.49.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** The private constructor.

28.49.4 getImageCoor(offsetX as Integer = 0, offsetY as Integer = 0) as string

**Function:** Gets the image map coordinates of the sector as HTML image map attributes.

**Notes:**

The image map coordinates will be in the following format:

```
shape="poly" cords=" [ x1 ] , [ y1 ] , [ x2 ] , [ y2 ] ...
```

where (x1, y1), (x2, y2) ... are vertices of a polygon that approximate the sector. The format is specially designed so that it can easily be incorporated into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>offsetX</td>
<td>0</td>
<td>An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.</td>
</tr>
<tr>
<td>offsetY</td>
<td>0</td>
<td>An offset to be added to all y coordinates in the image map. See offsetX above for description.</td>
</tr>
</tbody>
</table>

**Return Value**

A text string representing the coordinates of the sector in HTML image map attribute format.
28.49.5  getLabelCoor(offsetX as Integer = 0, offsetY as Integer = 0) as string

**Function:** Gets the image map coordinates of the sector label as HTML image map attributes.

**Notes:**
The image map coordinates will be in the following format:

```
shape="rect" cords="[ x1 ], [ y1 ], [ x2 ], [ y2 ]"
```

where \((x1, y1)\) and \((x2, y2)\) are opposite corners of the box that encloses the sector label. The format is specially designed so that it can easily be incorporated into HTML image maps.

This method should be called only after creating the chart image (eg. using `BaseChart.makeChart`, `BaseChart.makeChart2` or `BaseChart.makeChart3`). The image map cannot be determined without creating the chart image first.

**Argument** | **Default** | **Description**
--- | --- | ---
offsetX | 0 | An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY | 0 | An offset to be added to all y coordinates in the image map. See offsetX above for description.

**Return Value**
A text string representing the coordinates of the sector label in HTML image map attribute format.

28.49.6  setColor(colorvalue as color, edgeColor as color, joinLineColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setColor method, but uses color instead of integer data type for passing color values.

See also:
- 28.49.7 setColor(colorvalue as Integer, edgeColor as Integer = -1, joinLineColor as Integer = -1) 4926

28.49.7  setColor(colorvalue as Integer, edgeColor as Integer = -1, joinLineColor as Integer = -1)

**Function:** Sets the fill color, edge color and join line color of the sector.
Notes:

By default, the edge color is SameAsMainColor. For the join line color, if the circular label layout method is used, the default is Transparent, otherwise the default is SameAsMainColor.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the sector.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>-1</td>
<td>The edge color of the sector. -1 means the color is unchanged.</td>
</tr>
<tr>
<td>joinLineColor</td>
<td>-1</td>
<td>The color of the line that join the sector perimeter with the sector label. -1 means the color is unchanged.</td>
</tr>
</tbody>
</table>

See also:

- 28.49.6 setColor(colorvalue as color, edgeColor as color, joinLineColor as color)

28.49.8 setExplode(distance as Integer = -1)

Function: Explode the sector.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>distance</td>
<td>-1</td>
<td>The explosion distance in pixels. -1 means the distance is automatically determined.</td>
</tr>
</tbody>
</table>

28.49.9 setJoinLine(joinLineColor as color, joinLineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setJoinLine method, but uses color instead of integer data type for passing color values.
See also:

- 28.49.10 setJoinLine(joinLineColor as Integer, joinLineWidth as Integer = 1)

28.49.10 setJoinLine(joinLineColor as Integer, joinLineWidth as Integer = 1)

Function: Sets the color and width of the join line used to connect the sector label to the sector perimeter.
Notes:

By default, for circular label layout, the join line color is Transparent. For side label layout, the join line color is SameAsMainColor.
CHAPTER 28. CHARTDIRECTOR

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>joinLineColor</td>
<td>(Mandatory)</td>
<td>The color of the line that joins the sector perimeter with the sector label.</td>
</tr>
<tr>
<td>joinLineWidth</td>
<td>1</td>
<td>The line width of the join line.</td>
</tr>
</tbody>
</table>

See also:

- 28.49.9 setJoinLine(joinLineColor as color, joinLineWidth as Integer = 1)

28.49.11 setLabelFormat(formatString as string = "")

**Function:** Sets the format of the sector label.

**Example:**

```plaintext
dim c as CDSectorMBS

// you can use label formats like this:

c.setLabelFormat("\{"block,halign=left\} \{"font=timesbi.ttf,size=12,underline=1\}\{ label \} \{"/font\}\{br\}\US\{ value \} K ( \{ percent \} % ")")

// we can reduce that to this:

c.setLabelFormat("\{ label \} \{ value \} \{ percent \} %")

// and it shows 3 numbers. With | 1 after the variable name, we define the decimals after dot:

c.setLabelFormat("\{ label \} \{ value | 1 \} \{ percent | 1 \} %")

// and

c.setLabelFormat("\{ label \} \{ value | 1. \} \{ percent | 1. \} %")

// uses dot for thousands and comma for decimal separator.
```

**Notes:**

To set the label format for all sectors, use PieChart.setLabelFormat.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formatString</td>
<td>(Mandatory)</td>
<td>The format string. See PieChart.setLabelFormat for details.</td>
</tr>
</tbody>
</table>
28.49. **CLASS CDSECTORMBS**

28.49.12 **setLabelLayout(layoutMethod as Integer, pos as Integer = -1)**

**Function:** Sets the layout method and location of the sector label.

**Notes:**

To set the sector label layout method and location for all sectors, use PieChart.setLabelLayout.

ChartDirector supports two sector label layout methods - circular layout and side layout. For detail descriptions, please refer to PieChart.setLabelLayout.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default (Mandatory)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layoutMethod</td>
<td></td>
<td>Specify the layout method. Must be one of the predefined constants CircleLayout or SideLayout.</td>
</tr>
<tr>
<td>pos</td>
<td>-1</td>
<td>For circular layout, it is the distance between the sector perimeter and the sector label. A negative value (but not -1) means the sector label will be drawn in the interior of the sector. For side layout, it is the distance between the pie perimeter and the left or right edges of the invisible containing rectangle (equal to the width of the rectangle minus the pie diameter and then divided by 2). In either case, -1 means the distance is automatically determined.</td>
</tr>
</tbody>
</table>

28.49.13 **setLabelPos(pos as Integer, joinLineColor as color)**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setLabelPos method, but uses color instead of integer data type for passing color values.

See also:

- 28.49.14 setLabelPos(pos as Integer, joinLineColor as Integer = -1)

28.49.14 **setLabelPos(pos as Integer, joinLineColor as Integer = -1)**

**Function:** Sets the circular label layout method, and configure the join lines used to connect the sector label to the sector perimeter.

**Notes:**

To set the sector label position or join line color for all sectors, use PieChart.setLabelPos.

See also:
CHAPTER 28. CHARTDIRECTOR

Argument Default Description
pos (Mandatory) The distance between the sector perimeter and the sector label. A negative value means the sector label will be drawn in the interior of the sector.
joinLineColor -1 The color of the line that joins the sector perimeter with the sector label. The default is Transparent. The join line is ignored if the sector label is inside the sector.

- 28.49.13 setLabelPos(pos as Integer, joinLineColor as color)

28.49.15 setLabelStyle(font as string = "", fontSize as Double = 8, fontColor as Integer = & hfff0002) as CDTextBoxMBS

Function: Sets the style used to draw the sector label.
Notes:
To set the label style for all sector labels, use PieChart.setLabelStyle.

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>&quot;&quot;</td>
<td>The font used to draw the sector label.</td>
</tr>
<tr>
<td>fontSize</td>
<td>8</td>
<td>The font size in points.</td>
</tr>
<tr>
<td>fontColor</td>
<td>TextColor</td>
<td>The text color for the sector label.</td>
</tr>
</tbody>
</table>

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:
- 28.49.16 setLabelStyle(font as string, fontSize as Double, fontcolor as color) as CDTextBoxMBS

28.49.16 setLabelStyle(font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other setLabelStyle method, but uses color instead of integer data type for passing color values.
See also:
28.49. CLASS CDSECTORMBS

- 28.49.15 setLabelStyle(font as string = "", fontsize as Double = 8, fontcolor as Integer = & hffff0002) as CDTextBoxMBS

28.49.17 setStyle(shadingMethod as Integer, edgeColor as color, edgeWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setStyle method, but uses color instead of integer data type for passing color values.
See also:
- 28.49.18 setStyle(shadingMethod as Integer, edgeColor as Integer = -1, edgeWidth as Integer = -1)

28.49.18 setStyle(shadingMethod as Integer, edgeColor as Integer = -1, edgeWidth as Integer = -1)

**Function:** Sets the sector shading style, edge color and edge width.
**Notes:**
This method is the same as CDPieChartMBS.setSectorStyle, except it only affects one sector. Please refer to CDPieChartMBS.setSectorStyle for the detail explanation of this method.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shadingMethod</td>
<td>(Mandatory)</td>
<td>The sector shading style to use. -1 means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>-1</td>
<td>The edge color of the sector. -1 means to keep the existing value unchanged.</td>
</tr>
<tr>
<td>edgeWidth</td>
<td>-1</td>
<td>The edge width of the sector. -1 means to keep the existing value unchanged.</td>
</tr>
</tbody>
</table>

See also:
- 28.49.17 setStyle(shadingMethod as Integer, edgeColor as color, edgeWidth as Integer = -1)
28.50  class CDSplineLayerMBS

28.50.1  class CDSplineLayerMBS

Function: The SplineLayer class represents spline layers.
Notes:
In the current version of ChartDirector, SplineLayer is implemented as a special configuration of LineLayer. Subclass of the CDLineLayerMBS class. This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.50.2  Methods

28.50.3  setMonotonicity(m as Integer)

Function: Sets the monotonicity constraint when computing the spline curve.
Notes:
Monotonicity means a sequence is increasing or decreasing in one direction. For example, the sequence 1, 2, 3, 4 is monotonically increasing, while the sequence 1, 3, 2, 5, 4 is not monotonic.

A standard spline curve can overshoot or undershoot if the underlying points have "sharp corners". That means without any constrain, even if the data points are monotonic, the spline curve joining the points is not necessarily monotonic. It can overshoot and then "fall back".

In many charts, it may be desirable to constraint the spline curve to flow in a certain direction. For example, in a time based chart, it may be desirable to constraint the curve always flow from left to right.

ChartDirector supports the following monotonic modes.

Arguments:

28.50.4  setTension(tension as Double)

Function: Sets the tension to use when computing the spline curve.
Notes:
The tension parameter should be between -1 and 1. A positive tension will make the spline tighter. The
<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MonotonicNone</td>
<td>0</td>
<td>The spline curve is not constraint to flow in any direction. This results in the smoothest spline curve.</td>
</tr>
<tr>
<td>MonotonicX</td>
<td>1</td>
<td>The spline curve is constraint to not overshooting or undershooting in the x-axis direction. This means if the data points are monotonic in the x-axis direction, the spline curve will also be monotonic in the x-axis direction.</td>
</tr>
<tr>
<td>MonotonicY</td>
<td>2</td>
<td>The spline curve is constraint to not overshooting or undershooting in the y-axis direction. This means if the data points are monotonic in the y-axis direction, the spline curve will also be monotonic in the y-axis direction.</td>
</tr>
<tr>
<td>MonotonicXY</td>
<td>3</td>
<td>The spline curve is constraint to not overshooting or undershooting in both the x-axis and the y-axis directions. This means if the data points are monotonic in the x-axis direction, the spline curve will also be monotonic in the x-axis direction. If the data points are monotonic in the y-axis direction, the spline curve will also be monotonic in the y-axis direction.</td>
</tr>
<tr>
<td>MonotonicAuto</td>
<td>4</td>
<td>Automatically choose between MonotonicX, MonotonicY or MonotonicXY, depending on whether the data points are monotonic in the x-axis direction, or y-axis direction, or both.</td>
</tr>
</tbody>
</table>

spline curve will become straight line segments when tension is 1. A negative tension will make the spline looser.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>monotonicMode</td>
<td>(Mandatory)</td>
<td>The monotonic constraint of the spline curve. Must be one of the constants in the above table. If this method is never called for a spline layer, the default is MonotonicAuto.</td>
</tr>
<tr>
<td>tension</td>
<td>(Mandatory)</td>
<td>The tension of the spline, which should be between -1 and 1.</td>
</tr>
</tbody>
</table>
28.51 class CDStepLineLayerMBS

28.51.1 class CDStepLineLayerMBS

Function: The StepLineLayer class represents step line layers.

Notes:
Subclass of the CDLineLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.51.2 Methods

28.51.3 setAlignment(a as Integer)

Function: Sets the alignment of the steps relative to the data points.

Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>(Mandatory)</td>
<td>The alignment of the steps relative to the data points. Must be one of the predefined constants Left, Center or Right.</td>
</tr>
</tbody>
</table>
28.52. **CLASS CDSURFACECHARTMBS**

### 28.52.1 class CDSurfaceChartMBS

**Function:** The SurfaceChart class represents surface charts.
**Notes:** Subclass of the CDThreeDChartMBS class.

### 28.52.2 Methods

#### 28.52.3 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = & hffff0000, edgeColor as Integer = & hff000000, raisedEffect as Integer = 0)

**Function:** Creates a new SurfaceChart object.
**Notes:**

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The width of the chart in pixels.</td>
</tr>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the chart in pixels.</td>
</tr>
<tr>
<td>bgColor</td>
<td>kBackgroundColor</td>
<td>The background color of the chart.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>kTransparent</td>
<td>The edge color of the chart.</td>
</tr>
<tr>
<td>raisedEffect</td>
<td>0</td>
<td>The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.</td>
</tr>
</tbody>
</table>

See also:

- 28.52.4 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

#### 28.52.4 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other Constructor method, but uses color instead of integer data type for passing color values.
**See also:**
28.52.5 setBackSideBrightness(brightness as Double)

**Function:** Sets the back side brightness as a ratio of the front side brightness.
**Notes:**
The surface of a surface chart has two sides. The side that is facing the positive z direction of the plot region is the front side. The side that is facing the negative z direction of the plot region is the back side.

By default, the back side brightness is half the front side brightness. This method can be used to adjust the ratio.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>brightness</td>
<td>(Mandatory)</td>
<td>The ratio of the back side brightness to the front side brightness.</td>
</tr>
</tbody>
</table>

28.52.6 setBackSideColor(ColorValue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setBackSideColor method, but uses color instead of integer data type for passing color values.
**See also:**

- 28.52.7 setBackSideColor(ColorValue as Integer)

28.52.7 setBackSideColor(ColorValue as Integer)

**Function:** Sets the color of the back side of the surface.
**Notes:**
The surface of a surface chart has two sides. The side that is facing the positive z direction of the plot region is the front side. The side that is facing the negative z direction of the plot region is the back side.

By default, the back side is colored similar to the front side, but with different brightness of lighting parameters. This method can be used to color the back side with a fixed color instead.
28.52. **CLASS CDSURFACECHARTMBS**

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color used for the back side.</td>
</tr>
</tbody>
</table>

See also:

- 28.52.6 `setBackSideColor(ColorValue as color)`

### 28.52.8 `setBackSideLighting(ambientLight as Double, diffuseLight as Double, specularLight as Double, shininess as Double)`

**Function:** Sets the Phong lighting parameters for the back side of the surface.

**Notes:**

The surface of a surface chart has two sides. The side that is facing the positive z direction of the plot region is the front side. The side that is facing the negative z direction of the plot region is the back side.

ChartDirector uses the Phong lighting model to adjust the brightness of the surface to make it look realistic. The default lighting parameters for the back side is half the brightness of those for the front side. This method may be used to set alternative lighting parameters for the back side.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ambientIntensity</td>
<td>(Mandatory)</td>
<td>The ambient reflection coefficient of the Phong lighting model.</td>
</tr>
<tr>
<td>diffuseIntensity</td>
<td>(Mandatory)</td>
<td>The diffuse reflection coefficient of the Phong lighting model.</td>
</tr>
<tr>
<td>specularIntensity</td>
<td>(Mandatory)</td>
<td>The specular reflection coefficient of the Phong lighting model.</td>
</tr>
<tr>
<td>shininess</td>
<td>(Mandatory)</td>
<td>The shininess coefficient of the Phong lighting model.</td>
</tr>
</tbody>
</table>

### 28.52.9 `setContourColor(contourColor as color, minorContourColor as color)`

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other `setContourColor` method, but uses color instead of integer data type for passing color values.

See also:

- 28.52.10 `setContourColor(contourColor as Integer, minorContourColor as Integer = -1)`
**28.52.10 setContourColor(contourColor as Integer, minorContourColor as Integer = -1)**

**Function:** Sets the colors of the contour lines on the surface.  
**Notes:**  
The contour lines are lines that join regions of the same z value on the surface. The contour levels are determined by the ticks on the z-axis. Major ticks associate with major contour lines. Minor ticks associate with minor contour lines.  
**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contourColor</td>
<td>(Mandatory)</td>
<td>The color of the major contour lines.</td>
</tr>
<tr>
<td>minorContourColor</td>
<td>-1</td>
<td>The color of the minor contour lines. -1 means it is the same as the contourColor.</td>
</tr>
</tbody>
</table>

See also:  
- 28.52.9 setContourColor(contourColor as color, minorContourColor as color)

**28.52.11 setData(xData() as Double, yData() as Double, zData() as Double)**

**Function:** Sets the data for the surface chart.  
**Notes:**  
ChartDirector supports both gridded and scattered data. If the data points are on a rectangular grid with no missing points, they will be handled as gridded data. Otherwise, they will be handled as scattered data.  
For gridded data, you may provide the x and y values of the grid, and the z values of the data points. For a 10 x 15 grid, that means the x data series should have 10 values, the y data series should have 15 values, and the z data series should have 150 values. The x and y data series should be strictly monotonic (either strictly increasing or strictly decreasing).  
For both gridded and scattered data, you may also provide the (x, y, z) values of the data points. For example, for 150 data points, the x, y and z data series should each have 150 values. ChartDirector will automatically detect if the data points are gridded or scattered.  
**Arguments:**
28.52.12 setInterpolation(xSamples as Integer, ySamples as Integer = -1, isSmooth as boolean=true)

Function: Enables and sets the degree and method of interpolation of the data points.

Notes:

A surface chart consists of planar patches, drawn using the data points as the vertices. To create visually smooth surfaces, we may use a large number of small planar patches. However, this requires a large number of data points.

For example, consider a plot region of which the x and y dimensions are both 400 pixels in length. To create a smooth surface, if gridded data are used, the distance between grid lines should be no more than a few pixels. Suppose a grid spacing of 8 pixels is used. The grid size will be 51 x 51, and 2601 data points will be needed.

If the number of available data points are too small to create a smooth surface, this method can be used to generate a denser grid of data points from the original data points using interpolation.

Two types of interpolation are supported. In spline surface interpolation, ChartDirector will compute a smooth surface that passes through the original data points, and sample the spline surface for the new data points. In bilinear/linear interpolation, ChartDirector will apply bilinear/linear interpolation to its vertices of the original patches to compute the new data points.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xSamples</td>
<td>(Mandatory)</td>
<td>The number of samples on the x-dimension to interpolate to.</td>
</tr>
<tr>
<td>ySamples</td>
<td>-1</td>
<td>The number of samples on the y-dimension to interpolate to. -1 means it is the same as xSamples.</td>
</tr>
<tr>
<td>isSmooth</td>
<td>true</td>
<td>A true value means to use spline surface interpolation. A false value means to use bilinear/linear interpolation.</td>
</tr>
</tbody>
</table>
28.52.13  setLighting(ambientIntensity as Double, diffuseIntensity as Double, specularIntensity as Double, shininess as Double)

Function: Sets the Phong lighting parameters for the front side of the surface.

Notes:
The surface of a surface chart has two sides. The side that is facing the positive z direction of the plot region is the front side. The side that is facing the negative z direction of the plot region is the back side.

ChartDirector uses the Phong lighting model to adjust the brightness of the surface to make it look realistic. The light source is assumed to be from the direction of the viewer and is far away. The default lighting parameters for the front side are 0.5 for both ambient and diffuse reflections, 1 for specular reflection and 8 for shininess.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ambientIntensity</td>
<td>(Mandatory)</td>
<td>The ambient reflection coefficient of the Phong lighting model.</td>
</tr>
<tr>
<td>diffuseIntensity</td>
<td>(Mandatory)</td>
<td>The diffuse reflection coefficient of the Phong lighting model.</td>
</tr>
<tr>
<td>specularIntensity</td>
<td>(Mandatory)</td>
<td>The specular reflection coefficient of the Phong lighting model.</td>
</tr>
<tr>
<td>shininess</td>
<td>(Mandatory)</td>
<td>The shininess coefficient of the Phong lighting model.</td>
</tr>
</tbody>
</table>

28.52.14  setShadingMode(shadingMode as Integer, wireWidth as Integer = 1)

Function: Sets the shading mode for the surface.

Notes:
ChartDirector supports the following methods for shading the surface.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kSmoothShading</td>
<td>0</td>
<td>The brightness of the surface varies smoothly.</td>
</tr>
<tr>
<td>kTriangularShading</td>
<td>0</td>
<td>The surface is divided into triangular patches.</td>
</tr>
<tr>
<td>kRectangularShading</td>
<td>0</td>
<td>The surface is divided into rectangular patches.</td>
</tr>
<tr>
<td>kTriangularFrame</td>
<td>0</td>
<td>The surface is divided into triangular patches.</td>
</tr>
<tr>
<td>kRectangularFrame</td>
<td>0</td>
<td>The surface is divided into rectangular patches.</td>
</tr>
</tbody>
</table>

Arguments:
28.52.15 **setSurfaceAxisGrid(majorXGridColor as color, majorYGridColor as color, minorXGridColor as color, minorYGridColor as color)**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other setSurfaceAxisGrid method, but uses color instead of integer data type for passing color values.

See also:

- 28.52.16 setSurfaceAxisGrid(majorXGridColor as Integer, majorYGridColor as Integer = -1, minorXGridColor as Integer = -1, minorYGridColor as Integer = -1)

28.52.16 **setSurfaceAxisGrid(majorXGridColor as Integer, majorYGridColor as Integer = -1, minorXGridColor as Integer = -1, minorYGridColor as Integer = -1)**

**Function:** Sets the colors of the axis grid lines on the surface.

**Notes:**

Axis grid lines are grid lines associated with the ticks on the x and y axes. Major grid lines associate with major ticks. Minor grid lines associate with minor ticks. They can be drawn on the surface of the surface chart, and on the plot region walls. This method is for the surface of the surface chart. For the plot region walls, see CDSurfaceChartMBS.setWallGrid.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>majorXGridColor</td>
<td>(Mandatory)</td>
<td>The color of the major x-axis grid lines on the surface.</td>
</tr>
<tr>
<td>majorYGridColor</td>
<td>-1</td>
<td>The color of the major y-axis grid lines on the surface. -1 means it is the same as the majorXGridColor.</td>
</tr>
<tr>
<td>minorXGridColor</td>
<td>-1</td>
<td>The color of the minor x-axis grid lines on the surface. -1 means it is the same as the majorXGridColor.</td>
</tr>
<tr>
<td>minorYGridColor</td>
<td>-1</td>
<td>The color of the minor y-axis grid lines on the surface. -1 means it is the same as the majorYGridColor.</td>
</tr>
</tbody>
</table>

See also:

- 28.52.15 setSurfaceAxisGrid(majorXGridColor as color, majorYGridColor as color, minorXGridColor as color, minorYGridColor as color)
28.52.17  setSurfaceDataGrid(xGridColor as color, yGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setSurfaceDataGrid method, but uses color instead of integer data type for passing color values.
See also:

- 28.52.18 setSurfaceDataGrid(xGridColor as Integer, yGridColor as Integer = -1)

28.52.18  setSurfaceDataGrid(xGridColor as Integer, yGridColor as Integer = -1)

**Function:** Sets the colors of the data grid lines on the surface.
**Notes:**
Data grid lines are grid lines that define the positions of the data points. They can be drawn on the surface of the surface chart.

**Arguments:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xGridColor</td>
<td>(Mandatory)</td>
<td>The color of the x data grid lines.</td>
</tr>
<tr>
<td>yGridColor</td>
<td>-1</td>
<td>The color of the y data grid lines. -1 means it is the same as the yGridColor.</td>
</tr>
</tbody>
</table>

See also:

- 28.52.17 setSurfaceDataGrid(xGridColor as color, yGridColor as color)
Function: A surface chart created using ChartDirector with the CDSurfaceChartMBS class.
Function: A surface chart created using ChartDirector with the CDSurfaceChartMBS class.
**Function:** A surface chart created using ChartDirector with the CDSurfaceChartMBS class.
Function: A surface chart created using ChartDirector with the CDSurfaceChartMBS class.
Function: A surface chart created using ChartDirector with the CDSurfaceChartMBS class.
28.53  class CDTextBoxMBS

28.53.1  class CDTextBoxMBS

Function: The TextBox class represents text boxes.
Notes:
Subclass of the CDBoxMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.53.2  Methods

28.53.3  setAlignment(a as Integer)

Function: Sets the alignment of the text relative to the container box.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>(Mandatory)</td>
<td>The alignment specification. See Alignment Specification for supported alignment types.</td>
</tr>
</tbody>
</table>

28.53.4  setFontAngle(angle as Double, vertical as boolean=false)

Function: Sets the rotation angle and layout direction of the text.
Notes:

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>angle</td>
<td>(Mandatory)</td>
<td>The text rotation angle. Rotation is measured in counter-clockwise direction in degrees.</td>
</tr>
<tr>
<td>vertical</td>
<td>false</td>
<td>Determine if the font is layout horizontally (from left to right) or vertically (from top to down). Vertical layout is common for Oriental languages such as Chinese, Japanese and Korean. A true value means vertical layout. A false value means horizontal layout.</td>
</tr>
</tbody>
</table>

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
28.53.5 setFontColor(colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other setFontColor method, but uses color instead of integer data type for passing color values.
See also:
- 28.53.6 setFontColor(colorvalue as Integer)

28.53.6 setFontColor(colorvalue as Integer)

**Function:** Sets the color of the text.
**Notes:**
If this method is not called, TextColor will be used to draw the text.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The font color.</td>
</tr>
</tbody>
</table>

See also:
- 28.53.5 setFontColor(colorvalue as color)

28.53.7 setFontSize(fontHeight as Double, fontWidth as Double = 0)

**Function:** Sets the font height and width in points.
**Notes:**
See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fontHeight</td>
<td>(Mandatory)</td>
<td>The font height in points.</td>
</tr>
<tr>
<td>fontWidth</td>
<td>0</td>
<td>The font width in points. If the font width is zero, it is assumed to be the same as the font height.</td>
</tr>
</tbody>
</table>

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
28.53.8 setFontStyle(font as string, fontIndex as Integer = 0)

Function: Sets the font of the text by specifying the file that contains the font.
Notes:

See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>(Mandatory)</td>
<td>The font name.</td>
</tr>
<tr>
<td>fontIndex</td>
<td>0</td>
<td>The font index in case the font name refers to a font collection. An index of 0 means the first font.</td>
</tr>
</tbody>
</table>

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

28.53.9 setHeight(height as Integer)

Function: Sets the height of the text box.
Notes:

By default, the height of the text box is automatically determined to be just enough to hold the text. The setHeight method can be used to specified a fix height.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the text box in pixels.</td>
</tr>
</tbody>
</table>

28.53.10 setMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer)

Function: Sets the margins of the text box in pixels.
Notes:

The margins of a text box are the distances between the borders of the text box to the text inside. By default, the left and right margins are approximately half the font width, and the top and bottom margins are approximately 1/4 of the font height.

See also:

- 28.53.11 setMargin(m as Integer)
28.53. **CLASS CDTEXTBOXMBS**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>leftMargin</td>
<td>(Mandatory)</td>
<td>The left margin in pixels.</td>
</tr>
<tr>
<td>rightMargin</td>
<td>(Mandatory)</td>
<td>The right margin in pixels.</td>
</tr>
<tr>
<td>topMargin</td>
<td>(Mandatory)</td>
<td>The top margin in pixels.</td>
</tr>
<tr>
<td>bottomMargin</td>
<td>(Mandatory)</td>
<td>The bottom margin in pixels.</td>
</tr>
</tbody>
</table>

### 28.53.11 setMargin(m as Integer)

**Function:** Sets all margins (left, right, top, and bottom) of the text box to the same value.

**Notes:**

The margins of a text box are the distances between the borders of the text box to the text inside. By default, the left and right margins are approximately half the font width, and the top and bottom margins are approximately 1/4 of the font height.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>m</td>
<td>(Mandatory)</td>
<td>The left, right, top and bottom margins in pixels.</td>
</tr>
</tbody>
</table>

See also:

- 28.53.10 setMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer)

### 28.53.12 setMaxWidth(width as Integer)

**Function:** Sets the maximum width of the text box and wraps text if necessary.

**Notes:**

By default, the width of the text box is automatically determined to be the length of the text. This method can be used to limit the width of the text box. If the text requires a longer width for display, it will be wrapped into multiple lines.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxWidth</td>
<td>(Mandatory)</td>
<td>The maximum width of the text box in pixels.</td>
</tr>
</tbody>
</table>

### 28.53.13 setText(text as string)

**Function:** Sets the text to be shown in the text box.

**Notes:**

See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>(Mandatory)</td>
<td>The text to be displayed in the text box.</td>
</tr>
</tbody>
</table>

### 28.53.14 setTruncate(maxWidth as Integer, maxLines as Integer = 1)

**Function:** Sets the maximum number of lines in the text box, and truncate the text if it exceeds the line count.

**Notes:**

The maxWidth parameter of this method specifies the maximum width of the text box. If the text requires a longer width for display, it will be wrapped into multiple lines. However, if the number of lines exceed maxLines, the text will be truncated, with the last visible characters replaced with "...".

If maxLines is 1 (the default), the text will never be wrapped and will be truncated directly if it needs more than maxWidth for display.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxWidth</td>
<td>(Mandatory)</td>
<td>The maximum width of the text box in pixels.</td>
</tr>
<tr>
<td>maxLines</td>
<td>1</td>
<td>The maximum number of lines that the text box can have. The text will be truncated if it exceeds the maximum number of lines.</td>
</tr>
</tbody>
</table>

### 28.53.15 setWidth(width as Integer)

**Function:** Sets the width of the text box and wraps text if necessary.

**Notes:**

By default, the width of the text box is automatically determined to be the length of the text. The setWidth method can be used to specified a fix width. If the text requires a longer width for display, the text will be wrapped into multiple lines.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The width of the text box in pixels.</td>
</tr>
</tbody>
</table>
28.54  class CDThreeDChartMBS

28.54.1  class CDThreeDChartMBS

**Function:** The ThreeDChart class is an abstract class containing methods that are common to all true 3D chart types.
**Notes:**
ThreeDChart is a subclass of BaseChart.
Subclass of the CDBaseChartMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.54.2  Methods

28.54.3  colorAxis as CDCColorAxisMBS

**Function:** Gets the ColorAxis object representing the color axis (color legend).
**Notes:** Returns the ColorAxis object representing the color axis.

28.54.4  Constructor

**Function:** The private constructor.
**Notes:**
The ThreeDChart class is an abstract class containing methods that are common to all true 3D chart types.
ThreeDChart is a subclass of BaseChart.
This constructor is private to make sure you don’t create an object from this class by error. Please use designated functions to create objects.

28.54.5  getXCoor(xValue as Double, yValue as Double, zValue as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Gets the x pixel coordinate of a point given its x, y and z data values.
**Notes:**
Note: You must call BaseChart.layout first before calling this method. ChartDirector needs to perform auto-scaling and layout the axis before it can compute pixel coordinates from data values.
CHAPTER 28. CHARTDIRECTOR

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x data value of the point.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y data value of the point.</td>
</tr>
<tr>
<td>z</td>
<td>(Mandatory)</td>
<td>The z data value of the point.</td>
</tr>
</tbody>
</table>

Returns the x pixel coordinate of the point.

**28.54.6 getYCoor(xValue as Double, yValue as Double, zValue as Double) as Integer**

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Gets the y pixel coordinate of a point given its x, y and z data values.  
**Notes:**  
You must call BaseChart.layout first before calling this method. ChartDirector needs to perform auto-scaling and layout the axis before it can compute pixel coordinates from data values.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x data value of the point.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y data value of the point.</td>
</tr>
<tr>
<td>z</td>
<td>(Mandatory)</td>
<td>The z data value of the point.</td>
</tr>
</tbody>
</table>

Returns the y pixel coordinate of the point.

**28.54.7 setColorAxis(x as Integer, y as Integer, alignment as Integer, length as Integer, orientation as Integer) as CDColorAxisMBS**

**Function:** Sets the position, length and orientation of the color axis (color legend).  
**Notes:**

**28.54.8 setPerspective(perspective as Double)**

**Function:** Sets the strength of the perspective effect.  
**Notes:**  
When taking the photograph of a scene, things closer to the camera are larger in the photograph, while things farther from the camera are smaller. For example, two trees of exactly the same height but at different distances from the camera will have different heights as measured in the photograph. This is known as
### 28.54. CLASS CDTHREEDCHARTMBS

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x-coordinate of the reference point used to position the color axis.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y-coordinate of the reference point used to position the color axis.</td>
</tr>
<tr>
<td>alignment</td>
<td>(Mandatory)</td>
<td>The alignment of the color axis with respect to the reference point. For example, a value of TopLeft means the reference point is the top-left corner of the color axis. See Alignment Specification for supported alignment types.</td>
</tr>
<tr>
<td>length</td>
<td>(Mandatory)</td>
<td>The length of the color axis in pixels.</td>
</tr>
<tr>
<td>orientation</td>
<td>(Mandatory)</td>
<td>The orientation of the color axis. A value of Top/Bottom means the axis is horizontal, and the axis labels are at top/bottom side of the axis. A value of Left/Right means the axis is vertical, and the axis labels are at the left/right side of the axis.</td>
</tr>
</tbody>
</table>

This method configures the strength of the perspective effect for a ThreeDChart object. The nearer part of the plot region will be magnified, while the farther part will be reduced. The average size of the plot region will be approximately unchanged.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>perspective</td>
<td>(Mandatory)</td>
<td>The strength of the perspective effect. It approximately represents the maximum percentage magnification of the plot region, which is the same as the maximum percentage reduction. A value of 0 means no perspective effect. This value is usually between 0 to 100. If this method is never called, the default is 12.</td>
</tr>
</tbody>
</table>

### 28.54.9 setPlotRegion(cx as Integer, cy as Integer, xWidth as Integer, yDepth as Integer, zHeight as Integer)

**Function:** Sets the position of the plot region.

**Notes:**

The plot region is a 3D box, with x, y, and z axes along its border, using a right-hand cartesian coordinate system.

To create the chart image, you may imagine a camera taking a photograph of the box. The photograph can be taken at different angles, configurable with ThreeDChart.setViewAngle. The position of the plot region in the photograph is such that the center of the plot region is at a given point (cx, cy) on the image.
## 28.54.10 setViewAngle(elevation as Double, rotation as Double = 0, twist as Double = 0)

**Function:** Sets the 3D view angles.

**Notes:**

ChartDirector uses elevation, rotation and twist angles to specify the 3D view angles.

To explain the meaning of the angles, imagine the object being viewed is put at the center of a hollow sphere, and a camera (the view point) is put at the surface of the sphere, directed inwards to the center to look at the object.

The elevation angle refers to the "latitude" of the camera. An elevation angle of 0 degrees means the camera is at the "equator" pointing to the object from the side. An elevation angle of 90 degrees means the camera is at the "north pole" pointing down to the object. An angle elevation of -90 degrees means the camera is at the "south pole", pointing up to the object.

The rotation angle refers to the "longitude" of the camera. If the elevation is 0 degrees, and the rotation angle varies from 0 to 360 degrees, the camera will move around the "equator" in the easterly direction (counter-clockwise when viewed from the north pole).

The twist angle is for rotating the camera itself while still pointing to the object. For example, a twist angle of 90 degrees means you are holder the camera "vertically" instead of "horizontally". The rotation is clockwise from the view point of the person holding the camera.

Note that from the view point of the camera, the object will appear to be rotating in the opposite direction. For example, as the rotation angle rotates the camera counter-clockwise along the "equator", the object will appear to be rotating clockwise on the screen.

Note: The twist angle is not supported in the current version of ChartDirector. It should always be 0, and should be considered as a reserved argument for future use.
28.54.4 CLASS CDTHREECHARTMBS

### Argument Default Description
- **elevation** *(Mandatory)* The elevation angle in degrees.
- **rotation** 0 The rotation angle in degrees.
- **twist** 0 The twist angle in degrees.

---

### 28.54.11 setWallColor(xyColor as color, yzColor as color, zxColor as color, borderColor as color)

**Function:** Sets the color of the plot region walls.

**Notes:**
By default, the plot region walls are light grey (eeeeee) in color, with a grey (888888) border. This method can be used to modify the colors.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>

28.54.13 `setWallGrid(majorXGridColor as color, majorYGridColor as color, majorZGridColor as color, minorXGridColor as color, minorYGridColor as color, minorZGridColor as color)`

**Function:** Sets the grid line colors on plot region walls.

**Notes:**

The grid lines on the walls are associated with the ticks on the x, y and z axes. Major ticks associate with major grid lines. Minor ticks associate with minor grid lines. By default, the major grid lines are light grey (cccccc), and the minor grid lines are lighter grey (dddddd). This method can be used to modify the grid line colors.

<td>yzVisible</td>
<td>(Mandatory)</td>
<td>A true value means the yz wall is visible. A false value means the yz wall is hidden.</td>
</tr>
<tr>
<td>zxVisible</td>
<td>(Mandatory)</td>
<td>A true value means the zx wall is visible. A false value means the zx wall is hidden.</td>
</tr>
</tbody>
</table>

28.54.17  setZAxisPos(pos as Integer)

**Function:** Sets the position of the z-axis.

**Notes:**
In a ThreeDChart object, the z-axis can be drawn either on the left side or the right side. By default, ChartDirector will draw the z-axis on the side that is nearer to the viewer.

This method can be used to specify which side the z-axis should be drawn.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>

<tbody>
<tr>
<td>pos</td>
<td>(Mandatory)</td>
<td>The position of the z-axis, which must be either Left or Right.</td>
</tr>
</tbody>
</table>

28.54.18  Properties

28.54.19  xAxis as CDAxisMBS

**Function:** Retrieves the x-axis of the ThreeDChart object.

**Notes:**
Returns the Axis object representing the x-axis of the ThreeDChart object.
(Read only property)

28.54.20  yAxis as CDAxisMBS

**Function:** Retrieves the y-axis of the ThreeDChart object.

**Notes:**
Returns the Axis object representing the y-axis of the ThreeDChart object.
(Read only property)
28.54.21  zAxis as CDAxisMBS

**Function:** Retrieves the z-axis of the ThreeDChart object.

**Notes:**

Returns the Axis object representing the z-axis of the ThreeDChart object.
(Read only property)
28.55 class CDThreeDScatterChartMBS

28.55.1 class CDThreeDScatterChartMBS

**Function:** The ThreeDScatterChart class represents 3D scatter charts.

**Notes:**
ThreeDScatterChart is a subclass of ThreeDChart. Subclass of the CDThreeDChartMBS class.

28.55.2 Methods

28.55.3 `addScatterGroup(xData() as Double, yData() as Double, zData() as Double, name as string = "", symbol as Integer = 7, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDThreeDScatterGroupMBS`

**Function:** Adds a group of scatter symbols to the ThreeDScatterChart.

**Notes:**
A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>

**Notes:**
CHAPTER 28. CHARTDIRECTOR

Argument | Default | Description
--- | --- | ---
symbol | (Mandatory) | One of the predefined shape constants representing the symbol shape. See Shape Specification for the available built-in shapes.
size | 5 | The width and height of the symbol in pixels.
fillColor | -1 | The color used to fill the symbol. -1 means that the color is automatically selected from the palette. kSameAsMainColor means the color is based on the z value of the symbol as according to the ColorAxis (accessible via ThreeDChart.colorAxis).
edgeColor | -1 | The edge color used to draw the edge of the symbol. -1 means using LineColor as the edge color.
lineWidth | 1 | The line width used for drawing the symbols.

See also:

- 28.56.16 setLegendIcon(width as Integer, height as Integer = -1, color as Integer = -1) 4973

28.56.18 setSymbolOffset(offsetX as Integer, offsetY as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Offset the symbols in the x and y directions in pixel unit.
Notes:

Argument | Default | Description
--- | --- | ---
xOffset | (Mandatory) | The x offset in pixels. A positive value mean shifting to the right.
yOffset | (Mandatory) | The y offset in pixels. A positive value mean shifting to the bottom.
28.57. class CDtrendLayerMBS

28.57.1 class CDtrendLayerMBS

Function: The TrendLayer class represents trend layers.

Notes:
The trend layer performs linear regression analysis on the data points, and represents the result as a best fit straight line with optional confidence and prediction bands.

In linear regression analysis, the data points are assumed to be related by:

\[ y = m \times x + c + \text{err} \]

where \( m \) and \( c \) are constants, and \( \text{err} \) is a random variable.

Linear regression analysis estimates \( m \), \( c \) and \( \text{err} \) based on available data using the least square method. Using estimated values of \( m \) and \( c \), the line \( y = m \times x + c \) are plotted as the best fit straight line based on available data.

However, as \( m \) and \( c \) are estimations based on available data, it may not be exactly equal to the "real" \( m \) and \( c \). In ChartDirector, the uncertainties are represented visually as a confidence band around the regression line. For example, the 95% confidence band means there are 95% probability that the "real" line is in that band.

To predict a data point (infer \( y \) given \( x \)), we can use the formula:

\[ y = m \times x + c + \text{err} \]

based on estimated values of \( m \), \( c \) and \( \text{err} \).

The uncertainties of the data point is contributed by the uncertainties in \( m \) and \( c \), as well as \( \text{err} \). In ChartDirector, the uncertainties of the data points are represented visually as a prediction band around the regression line. For example, a 95% prediction band means there are 95% probability that a data point will be in that band.

The prediction band is always wider than the confidence band. It is because the uncertainties of the regression line is contributed by \( m \) and \( c \), while the uncertainties of the data points are contributed by \( m \), \( c \) and \( \text{err} \). The \( \text{err} \) term makes the data points less certain that the regression line.

Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.
28.57.2 Methods

28.57.3 addConfidenceBand(confidence as Double, upperFillColor as color, upperEdgeColor as color, upperLineWidth as Integer, lowerFillColor as color, lowerEdgeColor as color, lowerLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other addConfidenceBand method, but uses color instead of integer data type for passing color values.

See also:

- 28.57.4 addConfidenceBand(confidence as Double, upperFillColor as Integer, upperEdgeColor as Integer = & hFF000000, upperLineWidth as Integer = -1, lowerFillColor as Integer = -1, lowerEdgeColor as Integer = -1, lowerLineWidth as Integer = -1) 4976

28.57.4 addConfidenceBand(confidence as Double, upperFillColor as Integer, upperEdgeColor as Integer = & hFF000000, upperLineWidth as Integer = -1, lowerFillColor as Integer = -1, lowerEdgeColor as Integer = -1, lowerLineWidth as Integer = -1)

Function: Adds a confidence band to the trend layer.

Notes:

Please refer to the description of TrendLayer on what is a confidence band.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>

\hline
\end{tabular}

See also:

\begin{itemize}
  \item 28.57.5 addPredictionBand(\text{confidence as Double, upperFillColor as color, upperEdgeColor as color, upperLineWidth as Integer, lowerFillColor as color, lowerEdgeColor as color, lowerLineWidth as Integer = -1})
\end{itemize}
28.57.7  getCoefficient(index as Integer) as Double

**Function:** Gets the coefficients of the regression function.
**Notes:** The coefficients depend on the regression type. They are indexed as a0, a1, a2, ... in the regression type table published on TrendLayer.

28.57.8  getCorrelation as Double

**Function:** Gets the correlation coefficient of the trend line.

28.57.9  getIntercept as Double

**Function:** Gets the y-axis intercept of the trend line.

28.57.10  getLine as CDLineObjMBS

**Function:** Retrieves an opaque LineObj representing the trend line. The opaque LineObj is to be used in XYChart.addInterLineLayer for adding coloring between lines.

28.57.11  getSlope as Double

**Function:** Gets the slope of the trend line.

28.57.12  getStdError as Double

**Function:** Gets the standard error of the trend line.
28.57.13 setImageMapWidth(w as Integer)

**Function:** Sets the effective width of the line used for producing image maps.
**Notes:**
For thin lines, it is hard to click on the lines. So for the purpose of producing image maps for a line chart, ChartDirector can assume the line is very thick. The default is 10 pixels.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The effective width of the line used for producing image maps.</td>
</tr>
</tbody>
</table>

28.57.14 setRegressionType(regressionType as Integer)

**Function:** Sets the regression type to be used.
**Notes:**
RegressionType:
Must be one of the constants kLinearRegression, kConstrainedLinearRegression, kExponentialRegression and kLogarithmicRegression, or the return value of BaseChartMBS.PolynomialRegression. They represent linear regression, constrained linear regression, exponential regression, logarithmic regression, and polynomial regression of configurable degree.
28.58  class CDTTFTextMBS

28.58.1  class CDTTFTextMBS

**Function:** The TTFText class represents text blocks.  
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.58.2  Methods

28.58.3  Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** The private constructor.

28.58.4  destroy

**Function:** Destroys the text object.  
**Notes:** Normally you don’t need to call this.

28.58.5  draw(x as Integer, y as Integer, colorvalue as color, alignment as Integer = 7)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Same as the other draw method, but uses color instead of integer data type for passing color values.  
See also:  
- 28.58.6 draw(x as Integer, y as Integer, colorvalue as Integer, alignment as Integer = 7)  

28.58.6  draw(x as Integer, y as Integer, colorvalue as Integer, alignment as Integer = 7)

**Function:** Draws the text block.  
**Notes:**  
See also:
28.58. **CLASS CDTTTEXTMBS**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x coordinate of a reference point to align the text.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y coordinate of a reference point to align the text.</td>
</tr>
<tr>
<td>color</td>
<td>(Mandatory)</td>
<td>The color of the text.</td>
</tr>
<tr>
<td>alignment</td>
<td>TopLeft</td>
<td>The location of the text relative to the reference point. See Alignment Specification for supported alignment types.</td>
</tr>
</tbody>
</table>

- **28.58.5 draw(x as Integer, y as Integer, colorvalue as color, alignment as Integer = 7)**

**28.58.7 getHeight as Integer**

**Function:** Gets the height of the text block.

**28.58.8 getLineDistance as Integer**

**Function:** Gets the distance between two lines in the text block.  
**Notes:**

Return Value  
The distance between two lines in the text block in pixels.

**28.58.9 getLineHeight as Integer**

**Function:** Gets the height of a typical line in the text block.

**28.58.10 getWidth as Integer**

**Function:** Gets the width of the text block.
28.59  class CDVectorLayerMBS

28.59.1  class CDVectorLayerMBS

Function: The VectorLayer class represents vector layers.
Notes:
Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

28.59.2  Methods

28.59.3  setArrowAlignment(alignment as Integer)

Function: Sets the alignment of the vector relative to the data point.
Notes:
<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alignment</td>
<td>(Mandatory)</td>
<td>A BottomCenter value means the vector will point away from the data point (the default). A TopCenter value means the vector will point into the data point. A Center value means the center of the vector will be at the data point.</td>
</tr>
</tbody>
</table>

28.59.4  setArrowHead(polygon() as Integer)

Function: Sets a custom shape to be used as the arrow head.
Notes:
The custom shape is specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 10 x 10 units, in which the x-axis is from left to right, and the y-axis from bottom to top. The origin is assumed to be the bottom center of the arrow (the point where the arrow head joins the arrow stem). The shape is assumed to represent an arrow pointing upwards.

As an example, the followings are the integer array that represents the standard ChartDirector vector arrow head:
ChartDirector will automatically scale the shape to the actual width and height as specified in VectorLayer.setArrowHead.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>polygon</td>
<td>(Mandatory)</td>
<td>An array of integers (x_0, y_0, x_1, y_1, x_2, y_2) ... representing the coordinates the polygon vertices on a (10 \times 10) units grid.</td>
</tr>
</tbody>
</table>

See also:

- 28.59.5 `setArrowHead(width as Integer, height as Integer = 0)`

### 28.59.5 `setArrowHead(width as Integer, height as Integer = 0)`

**Function:** Sets the size of the arrow head.  
**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The width of the arrow head in pixels. The default width is 8 pixels.</td>
</tr>
<tr>
<td>height</td>
<td>0</td>
<td>The height of the arrow head in pixels. The default value of 0 means the height is the same as the width.</td>
</tr>
</tbody>
</table>

See also:

- 28.59.4 `setArrowHead(polygon() as Integer)`

### 28.59.6 `setArrowStem(polygon() as Integer)`

**Function:** Sets a custom shape to be used as the arrow stem.  
**Notes:**

By default, the arrow stem is just a straight line, with the line width controlled using Layer.setLineWidth. The `setArrowStem` method can specify a custom shape for the arrow stem.

The custom shape is specified as an array of integers \(x_0, y_0, x_1, y_1, x_2, y_2\) ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of \(10 \times 100\) units, in which the x-axis is from left to right, and the y-axis from bottom to top. The origin is assumed to be the starting point of the arrow stem,
and the shape is assumed to represent an arrow stem pointing upwards.

ChartDirector will automatically scale the shape so that the total arrow length (head + stem) is the required length of the arrow as according to actual data, and the stem width is as specified in Layer.setLineWidth.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>polygon</td>
<td>(Mandatory)</td>
<td>An array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates the polygon vertices on a 10 x 100 units grid.</td>
</tr>
</tbody>
</table>

28.59.7 setIconSize(height as Integer, width as Integer = 0)

**Function:** Sets the size of the icon to be used in legend box.  
**Notes:**  
By default, if a legend box is available on the chart, ChartDirector will insert an legend entry if the VectorLayer is named. The size of the icon will be the size of the vectors used on the chart, using a short vector length to fit the legend box.  
This method can be used to override the legend box settings to specify a custom width/height for the icons of the current VectorLayer.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The height of the icon in pixels.</td>
</tr>
<tr>
<td>width</td>
<td>0</td>
<td>The width of the icon in pixels. The default value of 0 means the width is automatically determined.</td>
</tr>
</tbody>
</table>

28.59.8 setVector(lengths() as Double, directions() as Double, lengthScale as Integer = 0)

**Function:** Sets the lengths and directions for the vectors.  
**Notes:**  
ChartDirector supports specifying lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.
28.59. CLASS CDVECTORLAYERMBS

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PixelScale</td>
<td>0</td>
<td>The unit is measured in pixels.</td>
</tr>
<tr>
<td>XAxisScale</td>
<td>1</td>
<td>The unit is measured in x-axis scale.</td>
</tr>
<tr>
<td>YAxisScale</td>
<td>2</td>
<td>The unit is measured in y-axis scale.</td>
</tr>
</tbody>
</table>

Argument  Default Description
lengths    (Mandatory) An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.
directions (Mandatory) An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.
lengthScale PixelScale The unit for the lengths, which must be one of the predefined constants in the table above.

28.59.9 setVectorMargin(startMargin as Double)

Function: Sets the margins to shorten the vectors.

Notes:
By default, vectors will be drawn from the given start points to the given end points.

In some cases, it may be desirable to shorten the vectors so that they do not start exactly at the start points and/or end exactly at the end points. For example, the vectors may be used to point to some circular symbols created by a ScatterLayer. The vectors may need to point to the perimeter of the circles, rather than their centers. This can be achieved by shortening the vectors by the radius of the circles.

Arguments:

Argument  Default Description
startMargin (Mandatory) The length to shorten at the start of the vector in pixels.
endMargin   NoValue The length to shorten at the end of the vector in pixels. NoValue means the length is the same as startMargin.

See also:
- 28.59.10 setVectorMargin(startMargin as Double, endMargin as Double)

28.59.10 setVectorMargin(startMargin as Double, endMargin as Double)

Function: Sets the margins to shorten the vectors.

Notes:
By default, vectors will be drawn from the given start points to the given end points.

In some cases, it may be desirable to shorten the vectors so that they do not start exactly at the start points and/or end exactly at the end points. For example, the vectors may be used to point to some circular symbols created by a ScatterLayer. The vectors may need to point to the perimeter of the circles, rather than their centers. This can be achieved by shortening the vectors by the radius of the circles.

<tr>
<td>endMargin</td>
<td>NoValue</td>
<td>The length to shorten at the end of the vector in pixels. NoValue means the length is the same as startMargin.</td>
</tr>
</tbody>
</table>

See also:

- 28.59.9 setVectorMargin(startMargin as Double)
28.60. class CDViewPortManagerMBS

Function: A view port can be imagined as a rectangular window of an underlying rectangular surface.

Notes:
For example, a chart that has 10 years of data can be imagined as a very long chart. If one only displays one of the year, we can say the view port covers only 10% of the underlying chart.

With the view port concept, scrolling can be handled as moving the view port, while zooming in and out can be handled as changing the view port size.

ViewPortManager is a utility class for handling view ports. It manages mapping of the mouse and display pixel coordinates to view port coordinates, and supports various user interface constraints that limits how the view port may be changed.

View port coordinates are represented as fractions of the width or height of the underlying surface. For example, the width of a view port is represented as a fraction of the width of the underlying surface, so it must be between 0 to 1. A value of 0.1 means the view port width is 10% of the underlying surface width.

If you are using MFC, there is no need to create a ViewPortManager object directly. You may simply use the MFC CChartViewer control, which is a derived class of ViewPortManager and contains all its functions.

If you are using other GUI framework, and would like to perform zooming and scrolling functions by mouse drag, the ViewPortManager may be useful to you. The section Using ChartDirector with Other GUI Frameworks contains outlines on how the ViewPortManager may be used in general GUI frameworks.

28.60.2 Methods

28.60.3 canZoomIn(zoomDirection as Integer) as boolean

Function: Checks if it is possible to zoom in further at a certain direction without violating zoom in limits.

Notes:
See ViewPortManager.setZoomInWidthLimit and ViewPortManager.setZoomInHeightLimit on how to configure zoom in limits.

Return Value
True if can zoom in further, otherwise false.
### 28.60.4 canZoomOut(zoomDirection as Integer) as boolean

**Function:** Checks if it is possible to zoom out further at a certain direction without violating zoom out limits.

**Notes:**
See ViewPortManager.setZoomOutWidthLimit and ViewPortManager.setZoomOutHeightLimit on how to configure zoom out limits.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>zoomDirection</td>
<td>(Mandatory)</td>
<td>The zoom direction to check. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional zooming.</td>
</tr>
</tbody>
</table>

**Return Value**
True if can zoom out further, otherwise false.

### 28.60.5 clearAllRanges

**Function:** A convenience method to clear all the ranges configured using setFullRange.

### 28.60.6 commitPendingSyncAxis(baseChart as CDBaseChartMBS)

**Function:** The commitPendingSyncAxis is a method to actually perform the function in syncLinearAxisWithViewPort, syncLogAxisWithViewPort and syncDateAxisWithViewPort.

**28.60.7 Constructor**

**Function:** Creates a new viewport.

---

**28.60.8 dragTo(scrollDirection as Integer, x as Integer, y as Integer) as boolean**

**Function:** Scrolls the view port to reflect dragging of the underlying rectangular surface.

**Notes:**

The amount of drag is measured as changed in mouse cursor coordinates since the call to ViewPortManager.startDrag. A positive change means the dragging is to the right or bottom. A negative change means the dragging is to the left or top.

The drag is considered as applying to the underlying surface. The view port moves in the opposite direction to the drag. For example, dragging the underlying surface to the right is equivalent to moving the view port to the left.

The view port may not change at all if it has reached the borders of the underlying surface.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scrollDirection</td>
<td>(Mandatory)</td>
<td>The allowed scroll direction. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional scrolling.</td>
</tr>
<tr>
<td>deltaX</td>
<td>(Mandatory)</td>
<td>The change in mouse x-coordinates. A positive change means the drag is to the right. A negative change means the drag is to the right.</td>
</tr>
<tr>
<td>deltaY</td>
<td>(Mandatory)</td>
<td>The change in mouse y-coordinates. A positive change means the drag is to the bottom. A negative change means the drag is to the top.</td>
</tr>
</tbody>
</table>

---

**28.60.9 getPlotAreaHeight as Integer**

**Function:** Gets the height of the plot area in pixels.

**Notes:**

Return Value
The height of the plot area in pixels.
28.60.10  getPlotAreaLeft as Integer

Function: Gets the x-coordinate of the left side of the plot area in pixels.
Notes:
Return Value
The x-coordinate of the left side of the plot area in pixels.

28.60.11  getPlotAreaTop as Integer

Function: Gets the y-coordinate of the top side of the plot area in pixels.

28.60.12  getPlotAreaWidth as Integer

Function: Gets the width of the plot area in pixels.

28.60.13  getValueAtViewPort(id as string, ratio as Double, isLogScale as boolean = false) as Double

Function: Converts a view port coordinate to a value of the specified data scale.
Notes:
Please refer to ViewPortManager.setFullRange on how to define a data scale.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>(Mandatory)</td>
<td>The name of the data scale.</td>
</tr>
<tr>
<td>vpCoor</td>
<td>(Mandatory)</td>
<td>The view port coordinate.</td>
</tr>
<tr>
<td>isLogScale</td>
<td>false</td>
<td>true if the conversion is based on a logarithmic scale. false if the conversion is based on a non-logarithmic scale.</td>
</tr>
</tbody>
</table>

Returns the value of the specified data scale at the view port coordinate.
28.60.14 `getViewPortAtValue(id as string, ratio as Double, isLogScale as boolean = false) as Double`

**Function:** Converts a value of the specified data scale to a view port coordinate.  
**Notes:**  
Please refer to ViewPortManager.setFullRange on how to define a data scale.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>(Mandatory)</td>
<td>The name of the data scale.</td>
</tr>
<tr>
<td>value</td>
<td>(Mandatory)</td>
<td>The value to be converted.</td>
</tr>
<tr>
<td>isLogScale</td>
<td>false</td>
<td>true if the conversion is based on a logarithmic scale. false if the conversion is based on a non-logarithmic scale.</td>
</tr>
</tbody>
</table>

Returns the view port coordinate at the value of the specified data scale.

28.60.15 `getViewPortHeight as Double`

**Function:** Gets the height of the view port.  
**Notes:** The view port height is expressed as a fraction of the height of the underlying surface. It should be between 0 and 1.

28.60.16 `getViewPortLeft as Double`

**Function:** Gets the position of the left side of the view port.  
**Notes:** The position of the view port left side is its distance from the left side of the underlying surface, as a fraction of the width of the underlying surface. It should be between 0 and 1.

28.60.17 `getViewPortTop as Double`

**Function:** Gets the position of the top side of the view port.  
**Notes:** The position of the view port top side is its distance from the top side of the underlying surface, as a fraction of the height of the underlying surface. It should be between 0 and 1.
28.60.18 getViewPortWidth as Double

Function: Gets the width of the view port.
Notes: The view port width is expressed as a fraction of the width of the underlying surface. It should be between 0 and 1.

28.60.19 getZoomInHeightLimit as Double

Function: Gets the view port height at maximum zoom in for mouse zoom in actions.

28.60.20 getZoomInWidthLimit as Double

Function: Gets the view port width at maximum zoom in for mouse zoom in actions.

28.60.21 getZoomOutHeightLimit as Double

Function: Gets the view port height at maximum zoom out for mouse zoom out actions.

28.60.22 getZoomOutWidthLimit as Double

Function: Gets the view port width at maximum zoom out for mouse zoom out actions.

28.60.23 inExtendedPlotArea(x as Integer, y as Integer) as boolean

Function: Determines if a given (x, y) coordinate is within the extended plot area (the plot area plus the extra margin sets up using setPlotAreaMouseMargin).
28.60. **CLASS CDVIEWPORTMANAGERMBS**

28.60.24 **inPlotArea**(x as Integer, y as Integer) as boolean

**Function:** Determines if a given point is within the plot area.
**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x coordinate of the point in pixel unit.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y coordinate of the point in pixel unit.</td>
</tr>
</tbody>
</table>

Return Value
True if the point is within the plot area, otherwise false.

28.60.25 **setChartMetrics**(metrics as string)

**Function:** Sets the chart metrics to the ViewPortManager so it knows the positions of the necessary chart objects for supporting view ports.
**Notes:**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metrics</td>
<td>(Mandatory)</td>
<td>A text string obtained from BaseChart.getChartMetrics that represents the metrics of the chart.</td>
</tr>
</tbody>
</table>

28.60.26 **setFullRange**(ID as string, minValue as Double, maxValue as Double)

**Function:** Defines the full range of a view port data scale.
**Notes:**

In the ChartDirector zooming and scrolling framework, the view port coordinates are expressed as the visible fractions of the "full data scale". For example, if the "full data scale" is 10 years horizontally, a view port width of 0.1 means that 1 year of data are visible.

The setFullRange method defines the full range of a data scale and gives it a name. As ChartDirector supports multiple x-axes and y-axes, so there can be multiple data scales with different names. The name can be used in other ChartDirector APIs to convert between the view port coordinates and data scale (see ViewPortManager.getValueAtViewPort, ViewPortManager.getViewPortAtValue), and to configure an Axis to reflect the visible data scale (see ViewPortManager.syncLinearAxisWithViewPort, ViewPortManager.syncLogAxisWithViewPort and ViewPortManager.syncDateAxisWithViewPort).
Argument Default Description
id (Mandatory) The name of the data scale.
minValue (Mandatory) The minimum value of the data scale.
maxValue (Mandatory) The maximum value of the data scale.

28.60.27 setPlotAreaMouseMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer)

**Function:** Configures area for mouse tracking.
**Notes:** SetPlotAreaMouseMargin configures some margins outside the plot area, so that a mouse cursor in that region (and therefore just outside the plot area) will still be considered to be exactly at the boundary of the plot area for the purpose of triggering plot area mouse events. Without this mechanism, it would be difficult to put the mouse exactly at the edge of the plot area (as it is too easy to "overshoot” the edge). Putting the mouse exactly at the edge is very useful for "track cursors” as this tracks the first or last data point.

28.60.28 setViewPortHeight(value as Double)

**Function:** Sets the height of the view port.
**Notes:**
The view port height is expressed as a fraction of the height of the underlying surface. It should be between 0 and 1.

Argument Default Description
height (Mandatory) The height of the view port.

28.60.29 setViewPortLeft(value as Double)

**Function:** Sets the position of the left side of the view port.
**Notes:**
The position of the view port left side is its distance from the left side of the underlying surface, as a fraction of the width of the underlying surface. It should be between 0 and 1.
28.60. **CLASS CDVIEWPORTMANAGERMBS**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>left</td>
<td>(Mandatory)</td>
<td>The position of the left side of the view port.</td>
</tr>
</tbody>
</table>

28.60.30 **setViewPortTop(value as Double)**

**Function:** Sets the position of the top side of the view port.

**Notes:**
The position of the view port top side is its distance from the top side of the underlying surface, as a fraction of the height of the underlying surface. It should be between 0 and 1.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>top</td>
<td>(Mandatory)</td>
<td>The position of the top side of the view port.</td>
</tr>
</tbody>
</table>

28.60.31 **setViewPortWidth(value as Double)**

**Function:** Sets the width of the view port.

**Notes:**
The view port width is expressed as a fraction of the width of the underlying surface. It should be between 0 and 1.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>(Mandatory)</td>
<td>The width of the view port.</td>
</tr>
</tbody>
</table>

28.60.32 **setZoomInHeightLimit(value as Double)**

**Function:** Sets the view port height at maximum zoom in.

**Notes:**
In many applications, it is desirable to set a maximum zoom in level, instead of allowing the user to zoom in indefinitely.

This method determines the minimum allowed view port height. It should be between 0 and 1. The default is 0.01, which means a maximum zoom in of 100x (the view port see only 1% of the underlying surface).
28.60.33 setZoomInWidthLimit(value as Double)

**Function:** Sets the view port width at maximum zoom in.

**Notes:**
In many applications, it is desirable to set a maximum zoom in level, instead of allowing the user to zoom in indefinitely.

This method determines the minimum allowed view port width. It should be between 0 and 1. The default is 0.01, which means a maximum zoom in of 100x (the view port see only 1% of the underlying surface).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The minimum allowed view port height.</td>
</tr>
</tbody>
</table>

28.60.34 setZoomOutHeightLimit(value as Double)

**Function:** Sets the view port height at maximum zoom in.

**Notes:**
In many applications, it is desirable to set a maximum zoom in level, instead of allowing the user to zoom in indefinitely.

This method determines the minimum allowed view port height. It should be between 0 and 1. The default is 0.01, which means a maximum zoom in of 100x (the view port see only 1% of the underlying surface).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>

</tr>
</thead>
<tbody>
<tr>
<td>height</td>
<td>(Mandatory)</td>
<td>The minimum allowed view port height.</td>
</tr>
</tbody>
</table>

28.60.35 setZoomOutWidthLimit(value as Double)

**Function:** Gets the view port width at maximum zoom out for mouse zoom out actions.
28.60. **CLASS CDVIEWPORTMANAGERMBS**

### 28.60.36 startDrag

**Function:** Takes a snapshot of the view port to prepare for dragging.
**Notes:** This method must be called before calling ViewPortManager.dragTo.

### 28.60.37 syncDateAxisWithViewPort(id as string, axis as CDAxisMBS)

**Function:** Synchronizes a date/time Axis with the part of the data scale in view port.
**Notes:**
- If the data scale has already been defined (see ViewPortManager.setFullRange on how to define a data scale), this method will compute the visible data scale based on the view port coordinates using date/time interpolation, and then sets the axis to that date/time scale.
- If the data scale has not been defined, this method will define the data scale based on the axis scale and the view port coordinates using date/time extrapolation. Because the axis scale may not be known at the time of calling this method (the axis could be auto-scaled by ChartDirector, which may not occur until the chart is rendered), the definition of the data scale will not occur immediately, but will be pending until the chart is to be displayed.

  If your charting code calls this method but never defines the full data scale or the view port coordinates (in which case the view port defaults to showing the complete data scale), then the first time the code is executed, the data scale will be defined to be equal to the axis scale. Subsequently, when the user zooms into the chart (which means the view port coordinates are changed), the same charting code will set up the axis scale to the range that the user has zoomed to.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>(Mandatory)</td>
<td>The name of the data scale.</td>
</tr>
<tr>
<td>axis</td>
<td>(Mandatory)</td>
<td>The Axis object to synchronize with.</td>
</tr>
</tbody>
</table>

### 28.60.38 syncLinearAxisWithViewPort(id as string, axis as CDAxisMBS)

**Function:** Synchronizes a linear Axis with the part of the data scale in view port.
**Notes:**
- If the data scale has already been defined (see ViewPortManager.setFullRange on how to define a data scale), this method will compute the visible data scale based on the view port coordinates using linear interpolation, and then sets the axis to that linear scale.
CHAPTER 28. CHARTDIRECTOR

If the data scale has not been defined, this method will define the data scale based on the axis scale and the view port coordinates using linear extrapolation. Because the axis scale may not be known at the time of calling this method (the axis could be auto-scaled by ChartDirector, which may not occur until the chart is rendered), the definition of the data scale will not occur immediately, but will be pending until the chart is to be displayed.

If your charting code calls this method but never defines the full data scale or the view port coordinates (in which case the view port defaults to showing the complete data scale), then the first time the code is executed, the data scale will be defined to be equal to the axis scale. Subsequently, when the user zooms into the chart (which means the view port coordinates are changed), the same charting code will set up the axis scale to the range that the user has zoomed to.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>(Mandatory)</td>
<td>The name of the data scale.</td>
</tr>
<tr>
<td>axis</td>
<td>(Mandatory)</td>
<td>The Axis object to synchronize with.</td>
</tr>
</tbody>
</table>

28.60.39 syncLogAxisWithViewPort(id as string, axis as CDAxisMBS)

Function: Synchronizes a logarithmic Axis with the part of the data scale in view port.

Notes:

If the data scale has already been defined (see ViewPortManager.setFullRange on how to define a data scale), this method will compute the visible data scale based on the view port coordinates using logarithmic interpolation, and then sets the axis to that logarithmic scale.

If the data scale has not been defined, this method will define the data scale based on the axis scale and the view port coordinates using logarithmic extrapolation. Because the axis scale may not be known at the time of calling this method (the axis could be auto-scaled by ChartDirector, which may not occur until the chart is rendered), the definition of the data scale will not occur immediately, but will be pending until the chart is to be displayed.

If your charting code calls this method but never defines the full data scale or the view port coordinates (in which case the view port defaults to showing the complete data scale), then the first time the code is executed, the data scale will be defined to be equal to the axis scale. Subsequently, when the user zooms into the chart (which means the view port coordinates are changed), the same charting code will set up the axis scale to the range that the user has zoomed to.

</tbody>
</table>
28.60.40  updateFullRangeH(id as string, minValue as Double, maxValue as Double, updateType as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Updates the full range of a horizontal viewport data scale.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>(Mandatory)</td>
<td>The name of the horizontal data scale.</td>
</tr>
<tr>
<td>minValue</td>
<td>(Mandatory)</td>
<td>The new minimum value of the data scale.</td>
</tr>
<tr>
<td>maxValue</td>
<td>(Mandatory)</td>
<td>The new maximum value of the data scale.</td>
</tr>
<tr>
<td>updateType</td>
<td>(Mandatory)</td>
<td>The method to update the viewport. Must be one of ViewPortNoUpdate, KeepVisibleRange, ScrollWithMax or ScrollWithMin.</td>
</tr>
</tbody>
</table>

28.60.41  updateFullRangeV(id as string, minValue as Double, maxValue as Double, updateType as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Updates the full range of a vertical viewport data scale.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>(Mandatory)</td>
<td>The name of the vertical data scale.</td>
</tr>
<tr>
<td>minValue</td>
<td>(Mandatory)</td>
<td>The new minimum value of the data scale.</td>
</tr>
<tr>
<td>maxValue</td>
<td>(Mandatory)</td>
<td>The new maximum value of the data scale.</td>
</tr>
<tr>
<td>updateType</td>
<td>(Mandatory)</td>
<td>The method to update the viewport. Must be one of ViewPortNoUpdate, KeepVisibleRange, ScrollWithMax or ScrollWithMin.</td>
</tr>
</tbody>
</table>

28.60.42  validateViewPort

Function: Ensures the view port left, top, width and height are within valid ranges and adjusts them if necessary.
Notes: The valid ranges of the view port width and height should be 0 to 1. The view port left should be in between 0 and (1 - view port width). The view port top should be in between 0 and (1 - view port height).

28.60.43  zoomAround(x as Integer, y as Integer, xZoomRatio as Double, yZoomRatio as Double) as boolean

MBS ChartDirector Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Zoom at a given point using the zoom ratio.
28.60.44 `zoomAt(zoomDirection as Integer, x as Integer, y as Integer, zoomRatio as Double) as boolean`

**Function:**Zooms in/out around a certain point.

**Notes:**
This method adjusts the view port position and size to reflect zooming in/out around the given point. If possible, the given point will be at the center of the view port after zooming in/out.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>zoomDirection</td>
<td>(Mandatory)</td>
<td>The allowed zoom direction. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional zooming.</td>
</tr>
<tr>
<td>x</td>
<td>(Mandatory)</td>
<td>The x-coordinate of the point to zoom around.</td>
</tr>
<tr>
<td>y</td>
<td>(Mandatory)</td>
<td>The y-coordinate of the point to zoom around.</td>
</tr>
<tr>
<td>zoomRatio</td>
<td>(Mandatory)</td>
<td>The zoom magnification factor. For example, a value of 2 means zooming in by 2x. A value of 0.5 means zooming out by 2x.</td>
</tr>
</tbody>
</table>

**Return Value**
True if view port is changed, otherwise false. It is possible for no zooming to occur if zoom limits are reached. See ViewPortManager.setZoomInWidthLimit, ViewPortManager.setZoomOutWidthLimit, ViewPortManager.setZoomInHeightLimit and ViewPortManager.setZoomOutHeightLimit for the meaning of zoom limits.

28.60.45 `zoomTo(zoomDirection as Integer, x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer) as boolean`

**Function:**Zooms to the selected rectangular region.

**Notes:**
This method updates the view port position and size to reflect a rectangular region on the chart. (x1, y1) and (x2, y2) are opposite vertices of the rectangular region in pixel coordinates.

The final view port position may not exactly reflect the rectangular region because of zoom limits. See ViewPortManager.setZoomInWidthLimit, ViewPortManager.setZoomOutWidthLimit, ViewPortManager.setZoomInHeightLimit and ViewPortManager.setZoomOutHeightLimit for the meaning of zoom limits.

**Return Value**
True if view port is changed, otherwise false.
<table>
<thead>
<tr>

</tbody>
</table>
28.61 class CDXYChartMBS

28.61.1 class CDXYChartMBS

**Function:** The XYChart class represents XY charts. 
**Notes:** Subclass of the CDBaseChartMBS class.

28.61.2 Methods

28.61.3 addAreaLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. 
**Function:** Same as the other addAreaLayer method, but uses color instead of integer data type for passing color values. 
**See also:**

- 28.61.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDAreaLayerMBS
- 28.61.5 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS
- 28.61.6 addAreaLayer(dates() as date, colorvalue as color, name as string = "", depth as Integer = 0) as CDAreaLayerMBS
- 28.61.7 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDAreaLayerMBS

28.61.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDAreaLayerMBS

**Function:** Adds an area chart layer to the XYChart, and specify the data set to use for drawing the area. 
**Notes:** 
**Return Value**
An AreaLayer object representing the area layer created. 
**See also:**

- 28.61.3 addAreaLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDAreaLayerMBS
- 28.61.5 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS
28.61. CLASS CXYCHARTMBS

Parameter | Default | Description
--- | --- | ---
data | (Mandatory) | An array of numbers representing the data set.
color | -1 | The color to draw the area. -1 means that the color is automatically selected from the color palette.
name | "" | The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth | 0 | The 3D depth of the area layer.

- 28.61.6 addAreaLayer(dates() as date, colorvalue as color, name as string = "", depth as Integer = 0) as CDAreaLayerMBS
- 28.61.7 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDAreaLayerMBS

28.61.5 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS

**Function:** Adds an empty area chart layer to the XYChart.

**Notes:**
This method is typically used to add multiple data sets to a single bar layer. First an empty area chart layer is created, then the data sets can be added using Layer.addDataSet.

The dataCombineMethod parameter specifies how to combine the data sets together in the area layer. The followings methods are supported:

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stack</td>
<td>1</td>
<td>The data sets are combined by stacking up the areas.</td>
</tr>
<tr>
<td>Percentage</td>
<td>4</td>
<td>The data sets are combined similar to stacked area, except that the data are scaled so that the area always stacked up to 100. An area strip within the stacked area therefore represents the percentage of the data item relative to sum of all the data items in the stacked area.</td>
</tr>
</tbody>
</table>

- Parameter | Default | Description
- dataCombineMethod | Stack | The method to combine the data sets together in the area layer.
- depth | 0 | The 3D depth of the area layer.

**Return Value**
An AreaLayer object representing the area layer created.

<td>0</td>
<td>The 3D depth of the area layer.</td>
</tr>
</tbody>
</table>
Return Value
An AreaLayer object representing the area layer created.
See also:

- 28.61.3 addAreaLayer(data() as Double, colorvalue as color, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS
- 28.61.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS
- 28.61.5 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS
- 28.61.6 addAreaLayer(dates() as date, colorvalue as color, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS

28.61.8 addAxis(align as Integer, offset as Integer) as CDAxisMBS

Function: Adds an additional axis to the chart.
Notes:
By default, ChartDirector XY charts have 2 x-axes and 2 y-axes at the 4 borders of the plot area. The addAxis method can be used to create additional axis.

The new axis will be put at one of the 4 borders of the plot area. To avoid overlapping with existing axis, the new axis will not be put exactly as the plot area border, but at an offset from it.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>align</td>
<td>(Mandatory)</td>
<td>Specifies which side of the plot area is the primary side of the axis. Must be one of the constants Left, Right, Top and Bottom for the 4 sides of the plot area.</td>
</tr>
<tr>
<td>offset</td>
<td>(Mandatory)</td>
<td>An offset in pixels to move the axis away from the plot area. If a negative value is used, it will mean to move the axis into the plot area.</td>
</tr>
</tbody>
</table>

28.61.9 addBarLayer(data() as Double, colors() as color, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other addBarLayer method, but uses color instead of integer data type for passing color values.
See also:

- 28.61.10 addBarLayer(data() as Double, colors() as color, names() as string, depth as Integer = 0) as CDBarLayerMBS
28.61.10 addBarLayer(data() as Double, colors() as color, names() as string, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Same as the other addBarLayer method, but uses color instead of integer data type for passing color values.

See also:

- 28.61.11 addBarLayer(data() as Double, colors() as Integer, depth as Integer = 0) as CDBarLayerMBS 5006
- 28.61.12 addBarLayer(data() as Double, colors() as Integer, names() as string, depth as Integer = 0) as CDBarLayerMBS 5008
- 28.61.13 addBarLayer(data() as Double, colorvalue as color, name as string = ””, depth as Integer = 0) as CDBarLayerMBS 5009
- 28.61.14 addBarLayer(data() as Double, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDBarLayerMBS 5009
- 28.61.15 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS 5010

28.61.11 addBarLayer(data() as Double, colors() as Integer, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds an empty bar layer to the XYChart.

**Example:**
// Create a XYChart object of size 250 x 250 pixels
dim c as new CDXYChartMBS(250, 250)

// Add a bar chart layer using the given data
dim t as CDTextBoxMBS = c.addBarLayer(data)
t.setPosition(0, -10) // move 10 up

Notes:
This method is typically used to add multiple data sets to a single bar layer. First an empty bar layer is created, then the data sets can be added using Layer.addDataSet.

The dataCombineMethod parameter specifies how to combine the data sets together in the bar layer. The followings methods are supported:

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Side</td>
<td>3</td>
<td>The data sets are combined by plotting the bars side by side.</td>
</tr>
<tr>
<td>Stack</td>
<td>1</td>
<td>The data sets are combined by stacking up the bar segments.</td>
</tr>
<tr>
<td>Overlay</td>
<td>0</td>
<td>The data sets are combined similar to stacked bars. However, in Overlay, one data set is assumed to already include the other data set. For example, if the data sets are &quot;average&quot; and &quot;peak&quot;, the &quot;peak&quot; cannot be stacked on top of &quot;average&quot;, because the &quot;peak&quot; already contains &quot;average&quot;. In the Overlay style, only &quot;peak - average&quot; is stacked on top of &quot;average&quot;, and so the total bar length will be &quot;peak&quot;.</td>
</tr>
<tr>
<td>Percentage</td>
<td>4</td>
<td>The data sets are combined similar to stacked bars, except that the data in a bar are scaled so that they summed to 100. In other words, all stacked bars will be of the same length. A bar segment within a bar represents the percentage of the data item relative to sum of all the data items in the stacked bar.</td>
</tr>
</tbody>
</table>

Parameter | Default | Description |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>dataCombineMethod</td>
<td>Side</td>
<td>The method to combine the data sets together in the bar layer.</td>
</tr>
<tr>
<td>depth</td>
<td>0</td>
<td>The 3D depth of the bar layer.</td>
</tr>
</tbody>
</table>

Return Value
A BarLayer object representing the bar layer created.

To set some more options like transparent border of the bar, please use the methods in CDBarLayerMBS class. e.g. setBorderColor(CDXYChartMBS.kTransparent) will make them transparent.

See also:
- 28.61.9 addBarLayer(data() as Double, colors() as color, depth as Integer = 0) as CDBarLayerMBS 5005
28.61.12 addBarLayer(data() as Double, colors() as Integer, names() as string, depth as Integer = 0) as CDBarLayerMBS

**Function:** Adds a multi-color bar layer to the XYChart, and specify the data set to use for drawing the bars.

**Notes:**
A multi-color bar layer is a bar layer in which each bar has a different color. In a normal bar layer, each data set has a different color, but the bars in the same data set have the same color.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the data set.</td>
</tr>
<tr>
<td>colors</td>
<td>(Mandatory)</td>
<td>An array of colors to draw the bars. An empty array means the colors are automatically selected from the palette.</td>
</tr>
<tr>

- 28.61.15 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS

28.61.15 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS

**Function:** Adds an empty bar layer to the XYChart.

**Notes:**

This method is typically used to add multiple data sets to a single bar layer. First an empty bar layer is created, then the data sets can be added using Layer.addDataSet.

The dataCombineMethod parameter specifies how to combine the data sets together in the bar layer. The followings methods are supported:

**Return Value**
A BarLayer object representing the bar layer created.
### 28.61. CLASS CDXYCHARTMBS

#### Constant Value Description

- **Side**: The data sets are combined by plotting the bars side by side.
- **Stack**: The data sets are combined by stacking up the bar segments.
- **Overlay**: The data sets are combined similar to stacked bars. However, in Overlay, one data set is assumed to already include the other data set. For example, if the data sets are "average" and "peak", the "peak" cannot be stacked on top of "average", because the "peak" already contains "average". In the Overlay style, only "peak - average" is stacked on top of "average", and so the total bar length will be "peak".
- **Percentage**: The data sets are combined similar to stacked bars, except that the data in a bar are scaled so that they summed to 100. In other words, all stacked bars will be of the same length. A bar segment within a bar represents the percentage of the data item relative to sum of all the data items in the stacked bar.

#### Parameter Default Description

- **dataCombineMethod Side**: The method to combine the data sets together in the bar layer.
- **depth 0**: The 3D depth of the bar layer.

To set some more options like transparent border of the bar, please use the methods in CDBarLayerMBS class. e.g. `setBorderColor(CDXYChartMBS.kTransparent)` will make them transparent.

See also:

- **28.61.9 addBarLayer(data() as Double, colors() as color, depth as Integer = 0) as CDBarLayerMBS 5005**
- **28.61.10 addBarLayer(data() as Double, colors() as color, names() as string, depth as Integer = 0) as CDBarLayerMBS 5006**
- **28.61.11 addBarLayer(data() as Double, colors() as Integer, depth as Integer = 0) as CDBarLayerMBS 5006**
- **28.61.12 addBarLayer(data() as Double, colors() as Integer, names() as string, depth as Integer = 0) as CDBarLayerMBS 5008**
- **28.61.13 addBarLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDBarLayerMBS 5009**
- **28.61.14 addBarLayer(data() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDBarLayerMBS 5009**

**28.61.16 addBoxLayer(boxTop() as Double, boxBottom() as Double, colorvalue as color, name as string = "") as CDBoxWhiskerLayerMBS**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function**: Same as the other addBoxLayer method, but uses color instead of integer data type for passing
color values.
See also:

- 28.61.17 addBoxLayer(boxTop() as Double, boxBottom() as Double, colorvalue as Integer = -1, name as string = "") as CDBoxWhiskerLayerMBS

**28.61.17 addBoxLayer(boxTop() as Double, boxBottom() as Double, colorvalue as Integer = -1, name as string = "") as CDBoxWhiskerLayerMBS**

**Function:** Adds a floating box layer to the XYChart, and specify the data sets to use for drawing the layer.

**Notes:**
This method is a simplification of XYChart.addBoxWhiskerLayer. Instead of adding a full box-whisker layer, only the box part is used, resulting in a chart layer displaying floating boxes.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boxTop</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the top edge of the box.</td>
</tr>
<tr>
<td>boxBottom</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the bottom edge of the box.</td>
</tr>
<tr>
<td>color</td>
<td>-1</td>
<td>The color to draw the area. -1 means that the color is automatically selected from the color palette.</td>
</tr>
<tr>
<td>name</td>
<td>&quot;&quot;</td>
<td>The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.</td>
</tr>
</tbody>
</table>

**Return Value**
A BoxWhiskerLayer object representing the box-whisker layer created.
See also:

- 28.61.16 addBoxLayer(boxTop() as Double, boxBottom() as Double, colorvalue as color, name as string = "") as CDBoxWhiskerLayerMBS

**28.61.18 addBoxWhiskerLayer(boxTop() as Double, boxBottom() as Double) as CDBoxWhiskerLayerMBS**

**Function:** Adds a box-whisker layer to the XYChart, and specify the data sets to use for drawing the layer.

**Notes:**
Traditionally, each box-whisker symbol represents 5 values, which are the as maximum, 3rd quartile, median, 1st quartile and minimum of some data samples.

A vertical box-whisker symbol (on a non-swapped XY chart) consists of a vertical line joining the maximum and minimum points, a box extending from the 1st quartile point to the 3rd quartile point, and 3 horizontal
mark lines at the maximum, median and minimum points.

In practice, the box-whisker symbol is not limited to representing the maximum, 3rd quartile, median, 1st quartile and minimum values. It can be used to represent any ordered values.

The boxTop and boxBottom data sets specifies the top and bottom edges of the box. The maxData, minData and midData specifies the top, bottom and middle mark lines.

You can use empty arrays to disable showing some parts of the box-whisker symbol.

For example, if you just want to show a floating box, you can use only boxTop and boxBottom and set the maxData, minData and midData to empty arrays.

Similarly, if the boxTop, boxBottom and midData are set to empty arrays, only the top and bottom mark lines and the joining center line are visible. This style is most often used as "error bands" together with line charts.

In addition to maxData, minData and midData, you can add additional mark lines to the box-whisker element by adding more data sets using Layer.addDataSet.

By default, the box-whisker symbol will be drawn using the colors specified in the fillColor, whiskerColor and edgeColor argument. The fillColor and edgeColor are used as the fill and border colors of the box, while the whiskerColor is used as the color of the center line and the mark lines.

Internally, ChartDirector maps the colors of different parts of the box-whisker symbol to data set colors as shown in the following table. You may control the colors of the box-whisker symbol in more details by setting the data set colors directly. The data set objects can be obtained using Layer.getDataSet, and the colors can be changed using DataSet.setDataColor.

<table>
<thead>
<tr>
<th>Box-Whisker Symbol Color</th>
<th>Data Set Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fill color of the box</td>
<td>Data Color for the first data set (index = 0)</td>
</tr>
<tr>
<td>Border color of the box</td>
<td>Edge Color for the first data set (index = 0)</td>
</tr>
<tr>
<td>Center line color</td>
<td>Data Color for the second data set (index = 1)</td>
</tr>
<tr>
<td>Maximum value mark line color</td>
<td>Data Color for the third data set (index = 2)</td>
</tr>
<tr>
<td>Minimum value mark line color</td>
<td>Data Color for the fourth data set (index = 3)</td>
</tr>
<tr>
<td>Middle value mark line color</td>
<td>Data Color for the fifth data set (index = 4)</td>
</tr>
<tr>
<td>Mark line color for additional mark lines</td>
<td>Data Color for the data set representing the additional mark line</td>
</tr>
</tbody>
</table>

Return Value
A BoxWhiskerLayer object representing the box-whisker layer created.
See also:

- 28.61.19 addBoxWhiskerLayer(boxTop() as Double, boxBottom() as Double, maxData() as Double) as
Parameter | Default | Description
--- | --- | ---
boxTop | (Mandatory) | An array of numbers representing the top edge of the box.
boxBottom | (Mandatory) | An array of numbers representing the bottom edge of the box.
maxData | [ Empty Array ] | An array of numbers representing the maximum value mark lines.
minData | [ Empty Array ] | An array of numbers representing the minimum value mark lines.
midData | [ Empty Array ] | An array of numbers representing the middle value mark lines.
fillColor | -1 | The color used to fill the box. -1 means that the color is automatically selected from the palette.
whiskerColor |LineColor | The color used to draw the central line and mark lines.
edgeColor |LineColor | The color used to draw the border of the box.

**Function:** Adds a box-whisker layer to the XYChart, and specify the data sets to use for drawing the layer.

**Notes:**
Traditionally, each box-whisker symbol represents 5 values, which are the as maximum, 3rd quartile, median, 1st quartile and minimum of some data samples.

A vertical box-whisker symbol (on a non-swapped XY chart) consists of a vertical line joining the maximum and minimum points, a box extending from the 1st quartile point to the 3rd quartile point, and 3 horizontal mark lines at the maximum, median and minimum points.

In practice, the box-whisker symbol is not limited to representing the maximum, 3rd quartile, median, 1st quartile and minimum values. It can be used to represent any ordered values.

The boxTop and boxBottom data sets specifies the top and bottom edges of the box. The maxData, minData and midData specifies the top, bottom and middle mark lines.
You can use empty arrays to disable showing some parts of the box-whisker symbol.

For example, if you just want to show a floating box, you can use only `boxTop` and `boxBottom` and set the `maxData`, `minData` and `midData` to empty arrays.

Similarly, if the `boxTop`, `boxBottom` and `midData` are set to empty arrays, only the top and bottom mark lines and the joining center line are visible. This style is most often used as "error bands" together with line charts.

In addition to `maxData`, `minData` and `midData`, you can add additional mark lines to the box-whisker element by adding more data sets using `Layer.addDataSet`.

By default, the box-whisker symbol will be drawn using the colors specified in the `fillColor`, `whiskerColor` and `edgeColor` argument. The `fillColor` and `edgeColor` are used as the fill and border colors of the box, while the `whiskerColor` is used as the color of the center line and the mark lines.

Internally, ChartDirector maps the colors of different parts of the box-whisker symbol to data set colors as shown in the following table. You may control the colors of the box-whisker symbol in more details by setting the data set colors directly. The data set objects can be obtained using `Layer.getDataSet`, and the colors can be changed using `DataSet.setDataColor`.

Return Value
A `BoxWhiskerLayer` object representing the box-whisker layer created.

See also:
28.61.20 addBoxWhiskerLayer(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double) as CDBoxWhiskerLayerMBS

28.61.21 addBoxWhiskerLayer(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColor as color, whiskerColor as color, edgeColor as color) as CDBoxWhiskerLayerMBS

28.61.22 addBoxWhiskerLayer(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColor as Integer = -1, whiskerColor as Integer = &hffffff0001, edgeColor as Integer = -1) as CDBoxWhiskerLayerMBS

28.61.20 addBoxWhiskerLayer(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double) as CDBoxWhiskerLayerMBS

**Function:** Adds a box-whisker layer to the XYChart, and specify the data sets to use for drawing the layer.

**Notes:**
Traditionally, each box-whisker symbol represents 5 values, which are the as maximum, 3rd quartile, median, 1st quartile and minimum of some data samples.

A vertical box-whisker symbol (on a non-swapped XY chart) consists of a vertical line joining the maximum and minimum points, a box extending from the 1st quartile point to the 3rd quartile point, and 3 horizontal mark lines at the maximum, median and minimum points.

In practice, the box-whisker symbol is not limited to representing the maximum, 3rd quartile, median, 1st quartile and minimum values. It can be used to represent any ordered values.

The boxTop and boxBottom data sets specifies the top and bottom edges of the box. The maxData, minData and midData specifies the top, bottom and middle mark lines.

You can use empty arrays to disable showing some parts of the box-whisker symbol.

For example, if you just want to show a floating box, you can use only boxTop and boxBottom and set the maxData, minData and midData to empty arrays.

Similarly, if the boxTop, boxBottom and midData are set to empty arrays, only the top and bottom mark lines and the joining center line are visible. This style is most often used as "error bands" together with line charts.
In addition to maxData, minData and midData, you can add additional mark lines to the box-whisker element by adding more data sets using Layer.addDataSet.

By default, the box-whisker symbol will be drawn using the colors specified in the fillColor, whiskerColor and edgeColor argument. The fillColor and edgeColor are used as the fill and border colors of the box, while the whiskerColor is used as the color of the center line and the mark lines.

Internally, ChartDirector maps the colors of different parts of the box-whisker symbol to data set colors as shown in the following table. You may control the colors of the box-whisker symbol in more details by setting the data set colors directly. The data set objects can be obtained using Layer.getDataSet, and the colors can be changed using DataSet.setDataColor.

28.61.23 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double) as CDBoxWhiskerLayerMBS

Function: Adds a multi-color box-whisker layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes:
This method is similar to XYChart.addBoxWhiskerLayer, except that the layer will be added in multi-color mode. Please refer to XYChart.addBoxWhiskerLayer on basic information of what is a box-whisker layer.

In multi-color mode, the boxes of a BoxWhiskerLayer can have different fill colors. For the whisker, instead of specifying a single whisker color for all boxes, ChartDirector computes the whisker colors by darkening or brightening the corresponding fill colors using a configurable brightness factor.

- 28.61.30 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double, names() as string) as CDBoxWhiskerLayerMBS
CHAPTER 28. CHARTDIRECTOR

28.61.28 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as color, whiskerBrightness as Double, names() as string) as CDBoxWhiskerLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. 
**Function:** Same as the other addBoxWhiskerLayer2 method, but uses color instead of integer data type for passing color values.

See also:

- 28.61.23 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double) as CDBoxWhiskerLayerMBS 5020

- 28.61.26 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double) as CDBoxWhiskerLayerMBS 5023
- 28.61.27 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as color, whiskerBrightness as Double = 0.5) as CDBoxWhiskerLayerMBS 5024
- 28.61.28 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, names() as string) as CDBoxWhiskerLayerMBS 5025
- 28.61.29 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double = 0.5) as CDBoxWhiskerLayerMBS 5026
- 28.61.30 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double, names() as string) as CDBoxWhiskerLayerMBS 5028

28.61.29 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double = 0.5) as CDBoxWhiskerLayerMBS

**Function:** Adds a multi-color box-whisker layer to the XYChart, and specify the data sets to use for drawing the layer.

**Notes:**

This method is similar to XYChart.addBoxWhiskerLayer, except that the layer will be added in multi-color mode. Please refer to XYChart.addBoxWhiskerLayer on basic information of what is a box-whisker layer.
In multi-color mode, the boxes of a BoxWhiskerLayer can have different fill colors. For the whisker, instead of specifying a single whisker color for all boxes, ChartDirector computes the whisker colors by darkening or brightening the corresponding fill colors using a configurable brightness factor.

<table>
<thead>

  minData() as Double, midData() as Double, fillColors() as color, whiskerBrightness as Double = 0.5)
as CDBoxWhiskerLayerMBS 5025
• 28.61.28 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double,
  minData() as Double, midData() as Double, fillColors() as color, whiskerBrightness as Double,
  names() as string) as CDBoxWhiskerLayerMBS 5026
• 28.61.29 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double,
  minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double =
  0.5) as CDBoxWhiskerLayerMBS

28.61.31  addCandleStickLayer(highData() as Double, lowData() as Double, openData() as Double,
  closeData() as Double, riseColor as color, fallColor as color, edgeColor as color) as CDCandleStickLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Same as the other addCandleStickLayer method, but uses color instead of integer data type for
passing color values.

See also:

• 28.61.32 addCandleStickLayer(highData() as Double, lowData() as Double, openData() as Double,
  closeData() as Double, riseColor as Integer = -1, fallColor as Integer = 0, edgeColor as Integer = &
  hffff0001) as CDCandleStickLayerMBS 5029

28.61.32  addCandleStickLayer(highData() as Double, lowData() as Double, openData() as Double,
  closeData() as Double, riseColor as Integer = -1, fallColor as Integer = 0, edgeColor as Integer = &
  hffff0001) as CDCandleStickLayerMBS

**Function:** Adds a candlestick layer to the XYChart, and specify the data sets to use for drawing the layer.

**Notes:**

By default, the candlestick symbol will be drawn using the colors specified in the riseColor, fallColor and
edgeColor argument. The riseColor and fallColor are used to fill the candle depending on whether the opening
value or closing value is larger. The edgeColor is used to the center line and the border of the candle.

Internally, ChartDirector maps the colors of different parts of the candlestick symbol to data set colors as
shown in the following table. You may control the colors of the candlestick symbol in more details by setting
the data set colors directly. The data set objects can be obtained using Layer.getDataSet, and the colors
can be changed using DataSet.setDataColor.

**Return Value**

A CandleStickLayer object representing the candlestick layer created.
Candlestick Symbol Color | Data Set Color
--- | ---
Fill color for "up" candlesticks | Data Color for the first data set (index = 0).
Fill color for "down" candlesticks | Data Color for the second data set (index = 1).
Border color | Edge Color for the first data set (index = 0).
Center line color | Edge Color for the second data set (index = 1).

28.61.33 addContourLayer(xData() as Double, yData() as Double, zData() as Double) as CDContourLayerMBS

**Function:** Adds a contour layer to the XYChart, and specify the data sets to use for drawing the layer.

**Notes:**

ChartDirector supports both gridded and scattered data. If the data points are on a rectangular grid with no missing points, they will be handled as gridded data. Otherwise, they will be handled as scattered data. For gridded data, you may provide the x and y values of the grid, and the z values of the data points. For a 10 x 15 grid, that means the x data series should have 10 values, the y data series should have 15 values, and the z data series should have 150 values. The x and y data series should be strictly monotonic (either strictly increasing or strictly decreasing).

For both gridded and scattered data, you may also provide the (x, y, z) values of the data points. For example, for 150 data points, the x, y and z data series should each have 150 values. ChartDirector will automatically detect if the data points are gridded or scattered.

**Arguments:**

**Return Value:**
A ContourLayer object representing the contour layer created.
### 28.61.34 addHLOCLayer as CDHLOCLayerMBS

**Function:** Adds an empty high-low-open-close (HLOC) layer to the XYChart.

**Notes:**

- **Return Value**
  - A HLOCLayer object representing the HLOC layer created.

CHAPTER 28. CHARTDIRECTOR

28.61.35 addHLOCLayer(highData() as Double, lowData() as Double) as CDHLOCLayerMBS

Function: Adds a high-low-open-close (HLOC) layer to the XYChart, and specify the data sets to use for drawing the layer.

Notes:

In this method, all HLOC symbols will be drawn using the color specified in the color argument. Use XYChart.addHLOCLayer for multi-color HLOC layers.

Internally, ChartDirector maps the colors of different parts of the HLOC symbol to data set colors as shown in the following table. You may control the colors of the HLOC symbol in more details by setting the data set colors directly. The data set objects can be obtained using Layer.getDataSet, and the colors can be changed using DataSet.setDataColor.

<table>
<thead>
<tr>
<th>HLOC Symbol Color</th>
<th>Data Set Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Central Line</td>
<td>Data Color for the first data set (index = 0)</td>
</tr>
<tr>
<td>Open Mark Line</td>
<td>Data Color for the third data set (index = 2)</td>
</tr>
<tr>
<td>Close Mark Line</td>
<td>Data Color for the fourth data set (index = 3)</td>
</tr>
</tbody>
</table>

Parameter | Default | Description
-----------|---------|-------------------
highData   | (Mandatory) | An array of numbers representing the high values. An empty array means there is no high value data available.
lowData    | (Mandatory) | An array of numbers representing the low values. An empty array means there is no low value data available.
openData   | [ Empty_Array ] | An array of numbers representing the opening values. An empty array means there is no opening value data available.
closeData  | [ Empty_Array ] | An array of numbers representing the closing values. An empty array means there is no closing value data available.
color      | -1       | The color to draw the HLOC symbol. -1 means that the color is automatically selected from the palette.

Return Value

A HLOCLayer object representing the HLOC layer created.

28.61.41  

```
addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer = -1) as CDHLOCLayerMBS
```

28.61.42  

```
addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS
```

**Function:** Adds a multi-color high-low-open-close (HLOC) layer to the XYChart, and specify the data sets to use for drawing the layer.

**Notes:**

ChartDirector supports drawing the HLOC symbol using different colors depending on whether the data represents an "up" day or "down" day. ChartDirector supports different definitions of what is an "up" day and "down" day, denoted using the following constants.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HLOCDefault</td>
<td>0</td>
<td>Do not distinguish between &quot;up&quot; and &quot;down&quot; days and use the same color for all HLOC symbols.</td>
</tr>
<tr>
<td>HLOCOpenClose</td>
<td>1</td>
<td>An up day is a day of which the closing value is on or above the opening value. This is the same definition commonly used in candlestick charts.</td>
</tr>
<tr>
<td>HLOCUpDown</td>
<td>2</td>
<td>An up day is a day of which the closing value is on or above the closing value of the previous day.</td>
</tr>
</tbody>
</table>

**Return Value**

A HLOCLayer object representing the HLOC layer created.

**See also:**

MBS ChartDirector Plugin, Plugin Version: 8.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a multi-color high-low-open-close (HLOC) layer to the XYChart, and specify the data sets to use for drawing the layer. **Notes:** ChartDirector supports drawing the HLOC symbol using different colors depending on whether the data represents an "up" day or "down" day. ChartDirector supports different definitions of what is an "up" day and "down" day, denoted using the following constants. **Return Value** A HLOCLayer object representing the HLOC layer created.
### Constant Value Description

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HLOCDefault</td>
<td>0</td>
<td>Do not distinguish between &quot;up&quot; and &quot;down&quot; days and use the same color for all HLOC symbols.</td>
</tr>
<tr>
<td>HLOCOpenClose</td>
<td>1</td>
<td>An up day is a day of which the closing value is on or above the opening value. This is the same definition commonly used in candlestick charts.</td>
</tr>
<tr>
<td>HLOCUpDown</td>
<td>2</td>
<td>An up day is a day of which the closing value is on or above the closing value of the previous day.</td>
</tr>
</tbody>
</table>

### Parameter Default Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>highData</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the high values. An empty array means there is no high value data available.</td>
</tr>
<tr>
<td>lowData</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the low values. An empty array means there is no low value data available.</td>
</tr>
<tr>
<td>openData</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the opening values. An empty array means there is no opening value data available.</td>
</tr>
<tr>
<td>closeData</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the closing values. An empty array means there is no closing value data available.</td>
</tr>
<tr>
<td>upColor</td>
<td>(Mandatory)</td>
<td>The color to be used on an &quot;up&quot; day.</td>
</tr>
<tr>
<td>downColor</td>
<td>(Mandatory)</td>
<td>The color to be used on a &quot;down&quot; day.</td>
</tr>
<tr>
<td>colorMode</td>
<td>-1</td>
<td>The method used to determine if a day is an &quot;up&quot; or &quot;down&quot;. Must be one of the constants in the above table. The default value of -1 means the colorMode is automatically determine to be either HLOCDefault or HLOCUpDown, depending on whether upColor and downColor are the same or different.</td>
</tr>
<tr>
<td>leadValue</td>
<td>[-Infinity]</td>
<td>The lead value to act as the closing pricing before the first day, so as to determine if the first day is an &quot;up&quot; or &quot;down&quot; day.</td>
</tr>
</tbody>
</table>

- 28.61.39 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as color, downColor as color, colorMode as Integer = -1) as CDHLOCLayerMBS 5036
- 28.61.40 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as color, downColor as color, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS 5037
28.61.43  **addInterLineLayer(line1 as CDLineObjMBS, line2 as CDLineObjMBS, color12 as color, color21 as color) as CDInterLineLayerMBS**

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Same as the other addInterLineLayer method, but uses color instead of integer data type for passing color values.  
See also:

- 28.61.44 addInterLineLayer(line1 as CDLineObjMBS, line2 as CDLineObjMBS, color12 as Integer, color21 as Integer = -1) as CDInterLineLayerMBS

28.61.44  **addInterLineLayer(line1 as CDLineObjMBS, line2 as CDLineObjMBS, color12 as Integer, color21 as Integer = -1) as CDInterLineLayerMBS**

**Function:** Adds an inter-line layer the XYChart. An inter-line layer is used to fill the region between any two lines (straight lines, spline curves, step lines, etc).  
**Notes:**  
This method expects two "line" objects representing the two lines. The line objects can be obtained using LineLayer.getLine (inherited by SplineLayer and StepLineLayer), TrendLayer.getLine, and Mark.getLine.  

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line1</td>
<td>(Mandatory)</td>
<td>An opaque line object representing the first line.</td>
</tr>
<tr>
<td>line2</td>
<td>(Mandatory)</td>
<td>An opaque line object representing the second line.</td>
</tr>
<tr>
<td>color12</td>
<td>(Mandatory)</td>
<td>The color used to fill the region of the lines when line1 &gt; line2.</td>
</tr>
<tr>
<td>color21</td>
<td>-1</td>
<td>The color used to fill the region of the lines when line2 &gt; line1. -1 means this color is the same as color12.</td>
</tr>
</tbody>
</table>

**Return Value**  
An InterLineLayer object representing the inter-line layer created.  
See also:

- 28.61.43 addInterLineLayer(line1 as CDLineObjMBS, line2 as CDLineObjMBS, color12 as color, color21 as color) as CDInterLineLayerMBS
28.61.45  addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other addLineLayer method, but uses color instead of integer data type for passing color values.

See also:

- 28.61.49 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS 5044

28.61.46  addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDLineLayerMBS

**Function:** Adds a line layer to the XYChart, and specify the data set to use for drawing the line.

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the data set.</td>
</tr>
<tr>
<td>color</td>
<td>-1</td>
<td>The color to draw the line. -1 means that the color is automatically selected from the palette.</td>
</tr>
<tr>
<td>name</td>
<td>&quot;&quot;</td>
<td>The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.</td>
</tr>
<tr>
<td>depth</td>
<td>0</td>
<td>The 3D depth of the line layer.</td>
</tr>
</tbody>
</table>

**Return Value**

A LineLayer object representing the line layer created.

See also:

- 28.61.45 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS 5042

- 28.61.49 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS

28.61.48 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDLineLayerMBS

**Function:** Adds a line layer to the XYChart, and specify the data set to use for drawing the line.

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the data set.</td>
</tr>
<tr>
<td>color</td>
<td>-1</td>
<td>The color to draw the line. -1 means that the color is automatically selected from the palette.</td>
</tr>
<tr>
<td>name</td>
<td>&quot;&quot;</td>
<td>The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.</td>
</tr>
<tr>

<td>0</td>
<td>The 3D depth of the line layer.</td>
</tr>
</tbody>
</table>

**Return Value**

A LineLayer object representing the line layer created.

See also:

- 28.61.45 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS
28.61.46 addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDLineLayerMBS
5042

28.61.47 addLineLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS
5043

28.61.49 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS
5044

28.61.49 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS

**Function:** Adds an empty line layer to the XYChart.

**Notes:**
This method is typically used to add multiple data sets to a single line layer. First an empty line layer is created, then the data sets can be added using Layer.addDataSet.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataCombineMethod</td>
<td>Overlay</td>
<td>In this version of ChartDirector, this parameter is ignored.</td>
</tr>
<tr>
<td>depth</td>
<td>0</td>
<td>The 3D depth of the line layer.</td>
</tr>
</tbody>
</table>

**Return Value**
A LineLayer object representing the line layer created.

See also:

- 28.61.45 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS
- 28.61.46 addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDLineLayerMBS
- 28.61.47 addLineLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS
- 28.61.48 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDLineLayerMBS

28.61.50 addScatterLayer(xData() as Double, yData() as Double, name as string = "", symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDSctrLayerMBS

**Function:** Adds a scatter chart layer to the XYChart.

**Notes:**
A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xData</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the x values of the data points. If no explicit x coordinates are used in the chart (e.g. using an enumerated x-axis), an empty array may be used for this argument.</td>
</tr>
<tr>
<td>yData</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the y values of the data points.</td>
</tr>
<tr>
<td>name</td>
<td>&quot;&quot;</td>
<td>The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.</td>
</tr>
<tr>
<td>symbol</td>
<td>SquareShape</td>
<td>One of the predefined symbol constants to specify the symbol to use. (See Shape Specification for available built-in shapes.)</td>
</tr>
<tr>
<td>symbolSize</td>
<td>5</td>
<td>The width and height of the symbol in pixels.</td>
</tr>
<tr>
<td>fillColor</td>
<td>-1</td>
<td>The color used to fill the symbol. -1 means that the color is automatically selected from the palette.</td>
</tr>
<tr>
<td>edgeColor</td>
<td>-1</td>
<td>The edge color used to draw the edge of the symbol. The default value of -1 means using LineColor as the edge color.</td>
</tr>
</tbody>
</table>

Return Value
A ScatterLayer object representing the scatter layer created.

- 28.61.56 addScatterLayer(xDate() as Double, yDate() as date, name as string = "", symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS
- 28.61.57 addScatterLayer(xDate() as Double, yDate() as Date, name as string, symbol as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDScatterLayerMBS

28.61.52  addScatterLayer(xDate() as Date, yDate() as Date, name as string = "", symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function:  Adds a scatter chart layer to the XYChart.

Notes:

A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

Return Value
A ScatterLayer object representing the scatter layer created.

28.61.56 addScatterLayer(xDate() as Date, yDate() as Date, name as string = "", symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS

28.61.57 addScatterLayer(xDate() as Date, yDate() as Date, name as string, symbol as Integer, symbolSize as Integer, fillColor as Integer, edgeColor as Integer) as CDScatterLayerMBS

28.61.54 addScatterLayer(xDate() as Date, yDate() as Double, name as string = "", symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS

MBS ChartDirector Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Adds a scatter chart layer to the XYChart.

Notes:
A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

Return Value
A ScatterLayer object representing the scatter layer created.

• 28.61.50 addScatterLayer(xData() as Double, yData() as Double, name as string = "", symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS
• 28.61.51 addScatterLayer(xData() as Double, yData() as Double, name as string, symbol as Integer, symbolSize as Integer, fillColor as Integer, edgeColor as Integer) as CDScatterLayerMBS
### Parameter | Default | Description
--- | --- | ---
xData | (Mandatory) | An array of numbers representing the x values of the data points. If no explicit x coordinates are used in the chart (e.g., using an enumerated x-axis), an empty array may be used for this argument.
yData | (Mandatory) | An array of numbers representing the y values of the data points.
name | "" | The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
symbol | SquareShape | One of the predefined symbol constants to specify the symbol to use. (See Shape Specification for available built-in shapes.)
symbolSize | 5 | The width and height of the symbol in pixels.
fillColor | -1 | The color used to fill the symbol. -1 means that the color is automatically selected from the palette.
edgeColor | -1 | The edge color used to draw the edge of the symbol. The default value of -1 means using LineColor as the edge color.

CHAPTER 28. CHARTDIRECTOR

28.61.57 addScatterLayer(xDate() as Double, yDate() as date, name as string, symbol as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDScatterLayerMBS

MBS ChartDirector Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Adds a scatter chart layer to the XYChart.

**Notes:**

A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

</tr>
<tr>
<td>edgeColor</td>
<td>-1</td>
<td>The edge color used to draw the edge of the symbol. The default value of -1 means using LineColor as the edge color.</td>
</tr>
</tbody>
</table>

**Return Value**

A ScatterLayer object representing the scatter layer created.

See also:

- 28.61.50 addScatterLayer(xData() as Double, yData() as Double, name as string = "", symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS
- 28.61.51 addScatterLayer(xData() as Double, yData() as Double, name as string, symbol as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDScatterLayerMBS
- 28.61.52 addScatterLayer(xDate() as date, yDate() as date, name as string = "", symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS
- 28.61.53 addScatterLayer(xDate() as date, yDate() as date, name as string, symbol as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDScatterLayerMBS
- 28.61.54 addScatterLayer(xDate() as date, yDate() as Double, name as string = "", symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS
28.61.58  addSplineLayer as CDSplineLayerMBS

**Function:** Adds a spline layer to the XYChart.

**Notes:**

In a spline layer, the data points are connected together using cardinal spline curves (as opposed to straight lines). The "tension" of the curve can be configured using SplineLayer.setTension.

<table>

- 28.61.69 `addTrendLayer(dates() as date, yData() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDTrendLayerMBS` 5060
- 28.61.70 `addTrendLayer(xData() as Double, yData() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDTrendLayerMBS` 5061
- 28.61.71 `addTrendLayer(xData() as Double, yData() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDTrendLayerMBS` 5062

### 28.61.66 `addTrendLayer(dates() as date, colorvalue as color, name as string = "", depth as Integer = 0) as CDTrendLayerMBS`

**Function:** Adds a trend chart layer to the XYChart, and specify the data set to use for drawing the trend line.

**Notes:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the data set.</td>
</tr>
<tr>
<td>color</td>
<td>-1</td>
<td>The color to draw the line. -1 means that the color is automatically selected from the palette.</td>
</tr>
<tr>
<td>name</td>
<td>&quot;&quot;</td>
<td>The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.</td>
</tr>
<tr>
<td>depth</td>
<td>0</td>
<td>The 3D depth of the line layer.</td>
</tr>
</tbody>
</table>

**Return Value**

A TrendLayer object representing the trend layer created.

**See also:**

- 28.61.66 `addTrendLayer(dates() as date, colorvalue as color, name as string = ", depth as Integer = 0) as CDTrendLayerMBS`  
- 28.61.67 `addTrendLayer(dates() as date, colorvalue as Integer = -1, name as string = ", depth as Integer = 0) as CDTrendLayerMBS`  
- 28.61.68 `addTrendLayer(dates() as date, yData() as Double, colorvalue as color, name as string = ", depth as Integer = 0) as CDTrendLayerMBS`  
- 28.61.69 `addTrendLayer(dates() as date, yData() as Double, colorvalue as Integer = -1, name as string = ", depth as Integer = 0) as CDTrendLayerMBS`
28.61.70  addTrendLayer(xData() as Double, yData() as Double, colorValue as color, name as string = "", depth as Integer = 0) as CDTrendLayerMBS

28.61.72  addVectorLayer(dates() as date, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer = 0, colorValue as Integer = -1, name as string = "") as CDVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Adds a vector layer to the chart.
**Notes:**
The vectors are specified as 4 data series, representing the x and y coordinates of the reference points to put the vectors, and the lengths and directions of the vectors.

By default, the vector starts from the reference point and points away from it. You may use VectorLayer.setArrowAlignment to specify other options, such as for the vectors to point into the reference point, or to have the reference as a pivot at the mid-point of the vector.

ChartDirector supports specifying vectors lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PixelScale</td>
<td>0</td>
<td>The unit is measured in pixels.</td>
</tr>
<tr>
<td>XAxisScale</td>
<td>1</td>
<td>The unit is measured in x-axis scale.</td>
</tr>
<tr>
<td>YAxisScale</td>
<td>2</td>
<td>The unit is measured in y-axis scale.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xData</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the x coordinates for the reference points of the vectors.</td>
</tr>
<tr>
<td>yData</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the y coordinates for the reference points of the vectors.</td>
</tr>
<tr>
<td>lengths</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.</td>
</tr>
<tr>
<td>directions</td>
<td>(Mandatory)</td>
<td>An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.</td>
</tr>
<tr>
<td>lengthScale</td>
<td>PixelScale</td>
<td>The unit for the lengths, which must be one of the predefined constants in the table above.</td>
</tr>
<tr>
<td>color</td>
<td>-1</td>
<td>The color to draw the data points. -1 means that the color is automatically selected from the palette.</td>
</tr>
<tr>
<td>name</td>
<td>&quot;&quot;</td>
<td>The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.</td>
</tr>
</tbody>
</table>

Return Value
A VectorLayer object representing the vector layer created.
See also:

- 28.61.77 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)
CHAPTER 28. CHARTDIRECTOR

28.61.77 Constructor(width as Integer, height as Integer, bgcolor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:
- 28.61.76 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as Integer = & hFFFF0000, edgeColor as Integer = & hFF000000, raisedEffect as Integer = 0)

28.61.78 getLayer(i as Integer) as CDLayerMBS

Function: Gets a Layer object based on the order in which it is being added to the chart.
Notes:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>(Mandatory)</td>
<td>The index of the data layer. The index of the first layer added to the chart is 0. The index of the Nth layer added to the chart is N - 1.</td>
</tr>
</tbody>
</table>

28.61.79 getLayerByZ(i as Integer) as CDLayerMBS

Function: Gets a Layer object based on the order in which it is being drawn.
Notes:

In ChartDirector, by default, the first layer added will stay on the top of the chart. The second layer will be added under the first layer, and so on. It means The layers will be drawn in the reverse order that they are added to the chart. The ordering can be configured with Layer.moveFront or Layer.moveBack.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>zIndex</td>
<td>(Mandatory)</td>
<td>The z-index of the required layer. The z-index of the first layer drawn is 0. The z-index for the Nth layer drawn is N - 1.</td>
</tr>
</tbody>
</table>

28.61.80 getLayerCount as Integer

Function: Gets the number of layers in the chart.
28.61. CLASS CDXYCHARTMBS

28.61.81 getNearestXValue(xCoor as Double) as Double

**Function:** Gets the x data value that is nearest to the specified x pixel coordinate.

**Notes:**
This method will search all x data values in the XYChart to look for the x data value that is nearest to the given x coordinate. If there are two x data values equally near to the specified x pixel coordinate, this method will arbitrarily return one of the values.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xCoor</td>
<td>(Mandatory)</td>
<td>The x pixel coordinate to search for.</td>
</tr>
</tbody>
</table>

Returns the x data value that is nearest to the specified x coordinate.

28.61.82 getPlotArea as CDPlotAreaMBS

**Function:** Gets the PlotArea object representing the plot area.

28.61.83 getXCoor(value as Double) as Integer

**Function:** Gets the x pixel coordinate of a point given the x data value.

**Notes:**
Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

For a 3D chart, this method will get the pixel coordinate of the data value on the top surface of the chart. Use Layer.getXCoor to obtain the pixel coordinate of the data value on a particular chart layer.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>v</td>
<td>(Mandatory)</td>
<td>The x data value.</td>
</tr>
</tbody>
</table>

Return Value
The x coordinate of the x data value.
CHAPTER 28. CHARTDIRECTOR

28.61.84  **getXValue(xCoor as Integer) as Double**

**Function:**
Gets the x data value given the x pixel coordinate.

**Notes:**
Note: This method should be used only after ChartDirector has output the chart image, or after XYChart.layoutAxes, BaseChart.layout or XYChart.packPlotArea has been called. ChartDirector needs to perform auto-scaling and layout the axis before it can convert between pixel coordinates and data values.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xCoor</td>
<td>(Mandatory)</td>
<td>The x pixel coordinate.</td>
</tr>
</tbody>
</table>

Returns the x data value at the x pixel coordinate.

28.61.85  **getYCoor(value as Double, yAxis as CDAxisMBS=nil) as Integer**

**Function:**
Gets the y pixel coordinate of a point given the y data value.

**Notes:**
Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

For a 3D chart, this method will get the pixel coordinate of the data value on the top surface of the chart. Use Layer.getYCoor to obtain the pixel coordinate of the data value on a particular chart layer.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>v</td>
<td>(Mandatory)</td>
<td>The y data value.</td>
</tr>
<tr>
<td>yAxis</td>
<td>[ Null ]</td>
<td>The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.</td>
</tr>
</tbody>
</table>

Return Value
The y coordinate of the y data value.

28.61.86  **getYValue(yCoor as Integer, axis as CDAxisMBS = nil) as Double**

**Function:**
Gets the y data value given the y pixel coordinate.

**Notes:**
Note: This method should be used only after ChartDirector has output the chart image, or after XYChart.layoutAxes, BaseChart.layout or XYChart.packPlotArea has been called. ChartDirector needs to perform auto-scaling and layout the axis before it can convert between pixel coordinates and data values.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>

</tr>
</thead>
<tbody>
<tr>
<td>yCoor</td>
<td>(Mandatory)</td>
<td>The y pixel coordinate.</td>
</tr>
<tr>
<td>yAxis</td>
<td>[ Null ]</td>
<td>The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.</td>
</tr>
</tbody>
</table>

Returns the y data value at the y pixel coordinate.

### 28.61.87 layoutAxes

**Function:** Performs axis auto-scaling and sets the axis positions and lengths.

**Notes:**
ChartDirector automatically calls this method when creating the chart output (e.g. using BaseChart.makeChart). There is usually no need to call this method explicitly.

However, if you would like to draw custom objects whose positions or contents depend on the axis scales, you may call this method to auto-scaling the axes before creating the chart output.

The axes will auto-scale based on the data at the time of calling this method. New data added afterwards will not affect the axis scale.

You should not modify the axis scale (e.g. using Axis.setLinearScale, Axis.setLabels, etc) after calling this method.

### 28.61.88 packPlotArea(leftX as Integer, topY as Integer, rightX as Integer, bottomY as Integer, minWidth as Integer = 0, minHeight as Integer = 0)

**Function:** Adjusts the plot area size and position to fit the plot area and the axis labels in a bounding box.

**Notes:**
In some charts, the axis labels may vary widely and can be very short or very long. It may be difficult to determine to plot area position and size so as to reserve reasonable and sufficient space for the axis labels. This method adjusts the size and position of the plot area, so that the plot area, together with the axis
labels can fit within a given bounding box.
Note that this method only adjusts for the thickness of the primary and secondary axes, and assumes they
are at the border of the plot area. For other axes, you may use Axis.getThickness to get their thickness and
adjust the plot area size and position accordingly.
For this method to determine the thickness of the axes, it needs to auto-scale the axes to determine the axis
labels. That means all the data should be entered to the chart before calling this method.
Furthermore, the labels generated by auto-scaling depend on the number of labels that can fit on the axis,
which in turn depends on the plot area size. So even the final plot area size is determined by this method,
the XYChart.setPlotArea must still be used to set a reasonable initial plot area size.
To adjust only the plot area width and horizontal position, and leave the height and vertical position un-
changed, simply use a bounding box with zero height (eg. set both topY and bottomY to 0). Similarly, to
adjust only the height and vertical position, use a bounding box with zero width.
In some extreme cases, the axis labels may be so long that the plot area needs to adjust to an unreasonably
small size, or even zero in size. For example, the axis labels may be names entered by the user, and the
user may enter a name thousands of characters long. These extreme cases should be avoided by checking
and limiting the length of the labels before passing the labels to ChartDirector. This method also has a
safeguard for these unreasonable labels by ensuring the plot area will not shrink below a given minimum size.

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>leftX</td>
<td>(Mandatory)</td>
<td>The left x coordinate of the bounding box.</td>
</tr>
<tr>
<td>topY</td>
<td>(Mandatory)</td>
<td>The top y coordinate of the bounding box.</td>
</tr>
<tr>
<td>rightX</td>
<td>(Mandatory)</td>
<td>The right x coordinate of the bounding box.</td>
</tr>
<tr>
<td>bottomY</td>
<td>(Mandatory)</td>
<td>The bottom y coordinate of the bounding box.</td>
</tr>
<tr>
<td>minWidth</td>
<td>0</td>
<td>The minimum width the plot area can adjust to.</td>
</tr>
<tr>
<td>minHeight</td>
<td>0</td>
<td>The minimum height the plot area can adjust to.</td>
</tr>
</tbody>
</table>

28.61.89  setAxisAtOrigin(originMode as Integer = 3, symmetryMode as Integer = 0)

Function: Sets the chart into 4 quadrant mode. The axes may intersect at origin inside the plot area (as
opposed to at the border of the plot area).
Notes:
By default, ChartDirector puts the axes at the border of the plot area. This ensures the axes and the axes
labels will not block the contents of the plot area.

However, in some cases, it may be desirable for the axes to intersect at the origin. The axes may need to
move inside the plot area.

ChartDirector allows you to move the primary x-axis and/or y-axis to so that they intersect with the zero
point of the other axis. The following constants represent different possibilities:

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XAxisAtOrigin</td>
<td>1</td>
<td>Move the x-axis so that it will intersect with the zero point of the y-axis, if that point exists.</td>
</tr>
<tr>
<td>YAxisAtOrigin</td>
<td>2</td>
<td>Move the y-axis so that it will intersect with the zero point of the x-axis, if that point exists.</td>
</tr>
<tr>
<td>XYAxisAtOrigin</td>
<td>3</td>
<td>Move the x-axis so that it will intersect with the zero point of the y-axis, if that point exists. Move the y-axis so that it will intersect with the zero point of the x-axis, if that point exists.</td>
</tr>
</tbody>
</table>

In addition to ensure the axes intersects at the origin, ChartDirector allows you to control if the axes are symmetrical about the origin with the following flags. Multiple flags can be specified by "or" them together.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XAxisSymmetric</td>
<td>1</td>
<td>Adjust the x-axis so that it becomes symmetrical about the zero point, that is, the positive and negative part of the x-axis will be of the same length.</td>
</tr>
<tr>
<td>XAxisSymmetricIfNeeded</td>
<td>2</td>
<td>Adjust the x-axis will be symmetrical about the zero point if the axis scale needs both positive and negative values.</td>
</tr>
<tr>
<td>YAxisSymmetric</td>
<td>4</td>
<td>Adjust the y-axis so that it becomes symmetrical about the zero point, that is, the positive and negative part of the y-axis will be of the same length.</td>
</tr>
<tr>
<td>YAxisSymmetricIfNeeded</td>
<td>8</td>
<td>Adjust the y-axis will be symmetrical about the zero point if the axis scale needs both positive and negative values.</td>
</tr>
<tr>
<td>XYAxisSymmetric</td>
<td>16</td>
<td>Adjust the x-axes and y-axes so that they become symmetrical about the zero point. The positive and negative parts of the x-axes and the y-axes will all be of the same length.</td>
</tr>
<tr>
<td>XYAxisSymmetricIfNeeded</td>
<td>32</td>
<td>Adjust the x-axes and y-axes so that they become symmetrical about the zero point. However, if an axis does not need both positive and negative values, it will not be adjusted.</td>
</tr>
</tbody>
</table>

Parameter Default Description
originMode XYAxisAtOrigin predefined constants to determine which axis needs to move to intersect with the zero point of the other axis.
symmetryMode 0 Flags to determine if the axes need to be symmetrical about the origin.

28.61.90  setClipping(margin as Integer = 0)

Notes:
In normal usage, ChartDirector will auto-scale the axis to ensure all the data points will be within the plot area.
However, if manual scaling is used (e.g. using Axis.setLinearScale), it is possible to choose an axis scale such that some data points will be outside the plot area. So some of the data representation (bars, lines, etc) will be outside the plot area.

This method can be used to clip the plot area, so that any data representation that is outside the plot area will not be drawn.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>margin</td>
<td>0</td>
<td>Additional margin, measured in pixels, to be added to the 4 sides of the plot area for the purpose of clipping. A positive value means the clipping region will be larger than the plot area. A negative value means the clipping region will be smaller than the plot area. The default value of 0 means the clipping region is equal to the plot area.</td>
</tr>
</tbody>
</table>

28.61.91 setPlotArea(x as Integer, y as Integer, width as Integer, height as Integer, bgColor as color, altBgColor as color, edgeColor as color, hGridColor as color, vGridColor as color) as CDPlotAreaMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Same as the other setPlotArea method, but uses color instead of integer data type for passing color values.

See also:

- 28.61.92 setPlotArea(x as Integer, y as Integer, width as Integer, height as Integer, bgColor as Integer = & hff000000, altBgColor as Integer = -1, edgeColor as Integer = -1, hGridColor as Integer = & hc0c0c0, vGridColor as Integer = & hff000000) as CDPlotAreaMBS

28.61.92 setPlotArea(x as Integer, y as Integer, width as Integer, height as Integer, bgColor as Integer = & hff000000, altBgColor as Integer = -1, edgeColor as Integer = -1, hGridColor as Integer = & hc0c0c0, vGridColor as Integer = & hff000000) as CDPlotAreaMBS

Function: Sets the position, size, background colors, edge color and grid colors of the plot area.

Notes:

Return Value
A PlotArea object representing the plot area.

See also:

- 28.61.91 setPlotArea(x as Integer, y as Integer, width as Integer, height as Integer, bgColor as color, altBgColor as color, edgeColor as color, hGridColor as color, vGridColor as color) as CDPlotAreaMBS

<td>The vertical grid color.</td>
</tr>
</tbody>
</table>

**28.61.93 setTrimData(startPos as Integer, len as Integer = & h7fffffff)**

**Function:** Uses only a subset of the data series to draw charts.  
**Notes:**

In finance charts, "lead data" are commonly needed to plot technical indicators. For example, to show a 20-days moving average line for 30 days, one needs 50 days of data. It is because computing 20-days moving average requires 20 days of "lead data". The setTrimData method is a convenience method for trimming off these "lead data" so they will not appear on the chart.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startPos</td>
<td>(Mandatory)</td>
<td>The index for the first data position to use for plotting charts.</td>
</tr>
<tr>
<td>len</td>
<td>7FFFFFFF</td>
<td>The length of the data points used for plotting charts.</td>
</tr>
</tbody>
</table>

**28.61.94 setXAxisOnTop(value as boolean=true)**

**Function:** Interchange the position of the primary x-axis and the secondary x-axis.  
**Notes:**

By default, the primary x-axis is the x-axis on the bottom side of the plot area (left side if XYChart.swapXY is in effect), and the secondary x-axis is on the top side of the plot area (right side if XYChart.swapXY is in effect). This method can be used to interchange their positions.
### Parameter, Default, Description

**b**  
Default: **true**  
Description: A true value means to interchange the positions of the primary and secondary x-axes. A false value means using the default positions for the primary and secondary x-axes.

#### 28.61.95  setYAxisOnRight(value as boolean=true)

**Function:** Interchange the position of the primary y-axis and the secondary y-axis.  
**Notes:**  
By default, the primary y-axis is the y-axis on the left side of the plot area (bottom side if XYChart.swapXY is in effect), and the secondary y-axis is on the right side of the plot area (top side if XYChart.swapXY is in effect). This method can be used to interchange their positions.

**Parameter, Default, Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>true</td>
<td>A true value means to interchange the positions of the primary and secondary y-axes. A false value means using the default positions for the primary and secondary y-axes.</td>
</tr>
</tbody>
</table>

#### 28.61.96  swapXY(value as boolean=true)

**Function:** Swap the position of the x and y axes, so the x-axes will become vertical, and the y-axes will become horizontal.  
**Notes:**  
After swapping the x and y axes, the charts will appear rotated. For example, the bars in a bar chart will become horizontal instead of vertical, and the area in a stacked area chart will grow from left to right (instead of bottom to top).

**Parameter, Default, Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>true</td>
<td>A true value means the x and y axes will be swapped. A false value means the x and y axes not be swapped.</td>
</tr>
</tbody>
</table>

#### 28.61.97  syncYAxis(slope as Double = 1, intercept as Double = 0)

**Function:** Sets a linear formula to synchronize the secondary y-axis scale to the primary y-axis scale.  
**Notes:**
The formula is in the format:

\[ y_2 = y_1 \times \text{slope} + \text{intercept} \]

This method is usually used if the two y-axes represent the same measurement using different units. Examples including temperature in Celsius and in Fahrenheit, and length in meters and feet.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>slope</td>
<td>1</td>
<td>The slope parameter for the formula linking the secondary y-axis to the primary y-axis.</td>
</tr>
<tr>
<td>intercept</td>
<td>0</td>
<td>The intercept parameter for the formula linking the secondary y-axis to the primary y-axis.</td>
</tr>
</tbody>
</table>

**28.61.98** \texttt{xZoneColor(threshold as Double, belowColor as color, aboveColor as color) as Integer}

MBS ChartDirector Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same as the other \texttt{xZoneColor} method, but uses color instead of integer data type for passing color values.

See also:

- 28.61.99 \texttt{xZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer) as Integer}

**28.61.99** \texttt{xZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer) as Integer}

**Function:** Creates a x-zone color. A x-zone will change from one color to another depending on a threshold value on the x-axis.

**Notes:**

For example, if a x-zone color is used as the line color in a line layer, the line will switch from one color to another when its passes through a certain value on the x-axis. Similarly, if a x-zone color is used as the fill color in an area layer, the area will switch from one color to another when it passes through a certain value on the x-axis.

The two colors used in a x-zone color can be other dynamic colors. For example, one color could be a solid color, while the other color could be a dash line color (see \texttt{!BaseChart.dashLineColor}). When this x-zone color is as the line color, the line will change from a solid style to a dash line style when the line passes through a certain value on the x-axis.
You may create x-zone colors with more than 2 zones by cascading multiple x-zone colors.

For a 3D chart, this method will get the zone color at the top surface of the chart. Use Layer.xZoneColor to obtain the zone color for a particular chart layer.

- **threshold** (Mandatory) The x value serving as the threshold for switching between two colors.
- **belowColor** (Mandatory) The color to use when the x-axis value of the pixel is smaller than the threshold.
- **aboveColor** (Mandatory) The color to use when the x-axis value of the pixel is greater than the threshold.

Return Value
A 32-bit integer representing the x-zone color.

See also:
- [28.61.98 xZoneColor(threshold as Double, belowColor as color, aboveColor as color) as Integer](#)
- [28.61.100 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS=nil) as Integer](#)

</tbody>
</table>

Return Value
A 32-bit integer representing the x-zone color.

See also:

- 28.61.100 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS=nil) as Integer

28.61.102 Properties

28.61.103 xAxis as CDAxisMBS

**Function:** Retrieves the Axis object representing primary x-axis of the XYChart.

**Notes:**
By default, the primary x-axis is the x-axis on the bottom side of the plot area (left side if XYChart.swapXY is in effect), and the secondary x-axis is on the top side of the plot area (right side if XYChart.swapXY is in effect). You may interchange their positions using XYChart.setXAxisOnTop.

Return Value
The Axis object representing the primary x-axis of the XYChart.
(Read only property)
28.61.104  xAxis2 as CDAxisMBS

**Function:** Retrieves the Axis object representing secondary x-axis of the XYChart.
**Notes:**
By default, the primary x-axis is the x-axis on the bottom side of the plot area (left side if XYChart.swapXY is in effect), and the secondary x-axis is on the top side of the plot area (right side if XYChart.swapXY is in effect). You may interchange their positions using XYChart.setXAxisOnTop.

Return Value
The Axis object representing the secondary x-axis of the XYChart.
(Read only property)

28.61.105  yAxis as CDAxisMBS

**Function:** Retrieves the Axis object representing primary y-axis of the XYChart.
**Notes:**
Return Value
The Axis object representing the primary y-axis of the XYChart.
(Read only property)

28.61.106  yAxis2 as CDAxisMBS

**Function:** Retrieves the Axis object representing secondary y-axis of the XYChart.
**Notes:**
By default, the primary y-axis is the y-axis on the left side of the plot area (bottom side if XYChart.swapXY is in effect), and the secondary y-axis is on the right side of the plot area (top side if XYChart.swapXY is in effect). You may interchange their positions using XYChart.setYAxisOnRight.

Return Value
The Axis object representing the secondary y-axis of the XYChart.
(Read only property)
**Function:** A line chart created using ChartDirector with the CDXYChartMBS class.
Function: A bar chart created using ChartDirector with the CDXYChartMBS class.
Chapter 29

Clipboard

29.1 class ClipboardMBS

29.1.1 class ClipboardMBS

Function: A clipboard class for Mac OS.

Notes:

For all datatypes, the available function is faster than the size function. And the both functions are faster than the getter function.

This is older Carbon API. You may want to prefer NSPasteboardMBS class with new projects. Only available in Mac 32 bit applications. Will not be ported to 64 bit.

29.1.2 Methods

29.1.3 AddData(FlavorType as string, data as string)

29.1.4 AddText(Text as string)

29.1.5 AddUnicodeText(Text as string)

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Adds unicode text to the clipboard.  
**Notes:** UTF16 encoded strings only.

29.1.6 clear

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Clears the clipboard.  
**Notes:** You must clear before you add something.

29.1.7 close

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.  
**Notes:**  
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.  
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

29.1.8 DataAvailable(FlavorType as string) as boolean

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether data is available.

29.1.9 DataSize(FlavorType as string) as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the byte size of the selected data.

29.1.10 GetData(FlavorType as string) as string

MBS MacClassic Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the data of a given type.  
**Example:**
29.1. CLASS CLIPBOARDMBS

// Take PICT data from clipboard

dim c as ClipboardMBS
dim s as string

c=new ClipboardMBS

if c.DataAvailable("PICT") then
s=c.GetData("PICT")

if s<>"" then
Backdrop=BuildPictureWithPicHandleDataMBS(s)
end if
end if

29.1.11 GetText as string

29.1.12 GetUnicodeText as string

Notes: UTF16 encoded strings only.

29.1.13 PictAvailable as boolean

29.1.14 ScrapFlavorCount as Integer

Example:
dim clip as ClipboardMBS
dim i,c,c1,c2 as Integer
dim s as string

clip=new ClipboardMBS

c=clip.ScrapFlavorCount

s=str(c)+" types: ", "    
c1=c-1

c2=c-2

for i=0 to c2
    s=S+clip.ScrapFlavorType(i)+", ", "
next

if c>0 then
    s=S+clip.ScrapFlavorType(c1)
end if

MsgBox s

Notes: Calling this function recreates the internal flavor list in the Realbasic clipboard object.

29.1.15 ScrapFlavorFlags(index as Integer) as Integer

Function: Returns the flags of the given flavor.
Notes:
Index goes from 0 to count-1.
Returns 0 on any error.

Flags are a combination of type values:
1 - private data (Sender only)
2 - translated data

29.1.16 ScrapFlavorType(index as Integer) as string

Function: Returns the type of the given flavor.
29.1. CLASS CLIPBOARDMBS

Notes:
Index goes from 0 to count-1.
Returns "" on any error.

29.1.17 TextAvailable as boolean

29.1.18 TextSize as Integer

29.1.19 UnicodeTextAvailable as boolean

Notes: UTF16 encoded strings only.

29.1.20 UnicodeTextSize as Integer

Notes: UTF16 encoded strings only.

29.1.21 Properties

29.1.22 Handle as Integer

Notes:
Carbon only.
(Read only property)
29.2 class NSPasteboardItemDataProviderMBS

29.2.1 class NSPasteboardItemDataProviderMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This protocol is implemented by the data provider of a pasteboard item to provide the data for a particular UTI type. **Notes:** You can specify an object as a pasteboard data provider for a pasteboard item using NSPasteboard-ItemMBS's setDataProviderForTypes method. The data provider must implement this protocol to provide data upon request.

29.2.2 Methods

29.2.3 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

29.2.4 Destructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

29.2.5 Properties

29.2.6 Handle as Integer

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

29.2.7 Events

29.2.8 Finished(Pasteboard as NSPasteboardMBS)

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Informs the receiver that the pasteboard no longer needs the data provider for any of its pasteboard items. **Notes:**
One data provider can provide data for more than one pasteboard item. This method is called when the pasteboard no longer needs the data provider for any of its pasteboard items. This can be either because the data provider has fulfilled all promises, or because ownership of the pasteboard has changed.

Available in OS X v10.6 and later.

29.2.9 `provideDataForType(Pasteboard as NSPasteboardMBS, item as NSPasteboardItemMBS, type as string)`

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Asks the receiver to provide data for a specified type to a given pasteboard. (required)
**Notes:**
pasteboard: A pasteboard to which the receiver has promised to provide data.
item: A pasteboard item for which the receiver has promised to provide data
type: A UTI type string.

The receiver was previously set as the provider using `setDataProviderForTypes`. Available in OS X v10.6 and later.
29.3 class NSPasteboardItemMBS

29.3.1 class NSPasteboardItemMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSPasteboardItem is a generic class to represent an item on a pasteboard.

**Example:**

```
dim n as new NSPasteboardItemMBS

dim type as string = NSPasteboardmbs.NSPasteboardTypeString
n.stringForType(type) = "Hello World"
MsgBox n.stringForType(type)
```

**Notes:**

There are three main uses for an NSPasteboardItem object:

- Providing data on the pasteboard.
  You can create one or more pasteboard items, set data or data providers for types, and write to them pasteboard.

- Customizing data already on the pasteboard.
  As a delegate or subclass, you can retrieve the pasteboard items currently on the pasteboard, read the existing types and data and set new data and data providers for types as needed.

- Retrieving data from the pasteboard.
  You can retrieve pasteboard items from the pasteboard then read the data for types you’re interested in.

A pasteboard item can be associated with a single pasteboard. When you create an item, it can be written to any pasteboard. When you pass an item to a pasteboard in writeObjects, that item becomes bound to the pasteboard it was written to. When you retrieve items from a pasteboard using pasteboardItems, the returned items are associated with the messaged pasteboard. Passing an item that is already associated with a pasteboard into writeObjects: causes an exception to be raised.

Pasteboard items are intended to be used during a single pasteboard interaction, not held onto and used repeatedly. A pasteboard item is only valid until the owner of the pasteboard changes.

**Important:** If a pasteboard item is stale because the pasteboard owner has changed, it returns nil or false values from its methods.
29.3. CLASS NSPASTEBOARDITEMMBS

29.3.2 Methods

29.3.3 availableTypeFromArray(types() as string) as string

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns from a given array of types the the first type contained in the pasteboard item, according to the ordering of types.

**Notes:**

types: An array of strings representing UTIs, arranged in order of preference (most preferred as the 0th element in the array).

Returns the first (according to the sender’s ordering of types) type in types contained in the pasteboard item, or nil if the receiver does not contain any types given in types.

The method checks for UTI conformance of the requested types, preferring an exact match to conformance. Available in OS X v10.6 and later.

29.3.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

29.3.5 Destructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

29.3.6 setDataProviderForType(dataProvider as NSPasteboardItemDataProviderMBS, types() as string) as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the data provider for the specified types.

**Notes:**

dataProvider: A pasteboard data provider.
types: An array of strings indicating the UTIs for the data representations dataProvider may provide.

Returns true if the data provider was set successfully, otherwise false.
This method registers the data provider to be messaged to provide the data for any of the specified types when requested.
Available in OS X v10.6 and later.

29.3.7 types as string()

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns an array of UTI strings of the data types supported by the receiver.
Notes: Available in OS X v10.6 and later.

29.3.8 Properties

29.3.9 dataProvider as NSPasteboardItemDataProviderMBS

Notes:
You should keep your dataprovider alive, so the object is not destroyed while pasteboarditem is used.
In this property we keep a reference to the data provider for you.
(Read and Write property)

29.3.10 Handle as Integer

Notes: (Read and Write property)

29.3.11 dataForType(type as string) as memoryblock

Example:

dim n as new NSPasteboardItemMBS

dim data as MemoryBlock = ”Hello World”
dim type as string = NSPasteboardmbs.NSPasteboardTypeString
n.dataForType(type) = data
29.3. **CLASS NSPASTEBOARDITEMMBS**

```vba
dim d as MemoryBlock = n.dataForType(type)
MsgBox DefineEncoding(d, encodings.UTF8)
```

**Notes:** (Read and Write computed property)

### 29.3.12 `propertyListForType(type as string) as Variant`

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for a specified type as a property list.  
**Notes:**  
Stores a property list object (array, dictionary, string, numbers, memoryblocks)  
Available in OS X v10.6 and later.  
(Read and Write computed property)

### 29.3.13 `stringForType(type as string) as string`

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for the specified type as a string.  
**Example:**

```vba
dim n as new NSPasteboardItemMBS

dim type as string = NSPasteboardmbs.NSPasteboardTypeString
n.stringForType(type) = "Hello World"
MsgBox n.stringForType(type)
```

**Notes:**

- type: A UTI type string.  
Available in OS X v10.6 and later.  
(Read and Write computed property)
29.4 class NSPasteboardMBS

29.4.1 class NSPasteboardMBS

Example:

dim p as new NSPasteboardMBS

MsgBox join(p.types,EndOfLine)

Notes:

NSPasteboard objects transfer data to and from the pasteboard server. The server is shared by all running applications. It contains data that the user has cut or copied, as well as other data that one application wants to transfer to another. NSPasteboard objects are an application's sole interface to the server and to all pasteboard operations.

An NSPasteboard object is also used to transfer data between applications and service providers listed in each application’s Services menu. The drag pasteboard (NSDragPboard) is used to transfer data that is being dragged by the user.

The plugin class NSPasteboardMBS does not implement all features of the NSPasteboard. If you miss something, please email us.

29.4.2 Methods

29.4.3 addType(type as string) as Integer

Notes:

types: An array of strings, each of which specifies a type of data that can be provided to the pasteboard.

Returns the new change count, or 0 if there was an error adding the types.

This method adds promises for the specified types to the first pasteboard item.

You use this methods to declare additional types of data for the first pasteboard item in the receiver. You
can also use it to replace existing types added by a previous declareTypes or addTypes call.

The types parameter specifies the types of data you are promising to the pasteboard. The types should be ordered according to the preference of the source application, with the most preferred type coming first (typically, the richest representation). New types are added to the end of the list containing any existing types, if any.

If you specify a type that has already been declared, this method replaces the owner of that type with the value in newOwner. In addition, any data already written to the pasteboard for that type is removed.

29.4.4 addTypes(types() as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds promises for the specified types to the first pasteboard item.

**Notes:**

- types: An array of strings, each of which specifies a type of data that can be provided to the pasteboard.

Returns the new change count, or 0 if there was an error adding the types.

This method adds promises for the specified types to the first pasteboard item.

You use this method to declare additional types of data for the first pasteboard item in the receiver. You can also use it to replace existing types added by a previous declareTypes or addTypes call.

The types parameter specifies the types of data you are promising to the pasteboard. The types should be ordered according to the preference of the source application, with the most preferred type coming first (typically, the richest representation). New types are added to the end of the list containing any existing types, if any.

If you specify a type that has already been declared, this method replaces the owner of that type with the value in newOwner. In addition, any data already written to the pasteboard for that type is removed.

29.4.5 changeCount as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s change count.

**Example:**
dim p as new NSPasteboardMBS(NSPasteboardMBS.NSGeneralPboard)

MsgBox str(p.changeCount)

**Notes:**
The change count starts at zero when a client creates the receiver and becomes the first owner. The change count subsequently increments each time the pasteboard ownership changes.

The change count is also returned from clearContents and declareTypes. You can therefore record the change count at the time that you take ownership of the pasteboard and later compare it with the value returned from changeCount to determine whether you still have ownership.

### 29.4.6 clearContents as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the existing contents of the pasteboard. **Example:**

dim p as new NSPasteboardMBS(NSPasteboardMBS.NSGeneralPboard)

MsgBox str(p.clearContents)

**Notes:**
Clears the existing contents of the pasteboard, preparing it for new contents. This is the first step in providing data on the pasteboard.

Available in Mac OS X v10.6 and later.

### 29.4.7 Constructor

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSPasteboardMBS object linked to the general NSPasteboard object. **Example:**

dim p as new NSPasteboardMBS

MsgBox join(p.types,EndOfLine)
29.4. CLASS NSPASTEBOARDMBS

Notes: On success the handle property is not 0.
See also:

- 29.4.8 Constructor(name as string)

29.4.8 Constructor(name as string)

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates a new NSPasteboardMBS object linked to the pasteboard with the specified name.

Example:

```pascal
dim p as new NSPasteboardMBS(NSPasteboardMBS.NSFindPboard)

// shows last find string
MsgBox p.stringForType(p.NSPasteboardTypeString)
```

Notes: On success the handle property is not 0.
See also:

- 29.4.7 Constructor

29.4.9 declareType(type as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Prepares the receiver for a change in its contents by declaring the new types of data it will contain.

Notes:

type: An strings that specify the type of data that may be added to the new pasteboard. The types should be ordered according to the preference of the source application, with the most preferred type coming first (typically, the richest representation).

Returns the receiver’s new change count.

This method is the equivalent of invoking clearContents, implicitly writing the first pasteboard item, and then calling addTypes to promise types for the first pasteboard item.

In Mac OS X v10.5 and earlier, this method is the first step in writing data to the pasteboard and must precede the messages that actually write the data. A declareTypes message essentially changes the contents of the receiver: It invalidates the current contents of the receiver and increments its change count.
29.4.10  declareTypes(types() as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Prepares the receiver for a change in its contents by declaring the new types of data it will contain. **Notes:**

type: An array of Strings that specify the types of data that may be added to the new pasteboard. The types should be ordered according to the preference of the source application, with the most preferred type coming first (typically, the richest representation).

Returns the receiver’s new change count.

This method is the equivalent of invoking clearContents, implicitly writing the first pasteboard item, and then calling addTypes to promise types for the first pasteboard item.

In Mac OS X v10.5 and earlier, this method is the first step in writing data to the pasteboard and must precede the messages that actually write the data. A declareTypes message essentially changes the contents of the receiver: It invalidates the current contents of the receiver and increments its change count.

29.4.11  generalPasteboard as NSPasteboardMBS

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the general NSPasteboard object. **Example:**

dim p as NSPasteboardMBS = NSPasteboardMBS.generalPasteboard
MsgBox join(p.types, EndOfLine)

29.4.12  name as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s name. **Example:**

dim p as new NSPasteboardMBS

MsgBox p.name
29.4.13 NSColorPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.

**Notes:**

NSColor data.
On Mac OS X v10.6 and later, use NSPasteboardTypeColor (and you read and write colors directly to and from the pasteboard).

29.4.14 NSDragPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for pasteboards.

**Example:**

```dim p as new NSPasteboardMBS(NSPasteboardMBS.NSDragPboard)
MsgBox p.name```

**Notes:**

The pasteboard that stores data to be moved as the result of a drag operation.
For additional information on working with the drag pasteboard, see Drag and Drop Programming Topics for Cocoa.

29.4.15 NSFilenamesPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.

**Notes:**

An array of strings designating one or more filenames.
On Mac OS X v10.6 and later, use writeObjects to write file URLs to the pasteboard.

29.4.16 NSFilesPromisePboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.

**Notes:**

Promised files.
On Mac OS X v10.6 and later, use kPasteboardTypeFileURLPromise instead.
For information on promised files, see Dragging Files in Drag and Drop Programming Topics for Cocoa.

### 29.4.17 NSFindPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for pasteboards.

**Example:**

```vbnet
dim p as new NSPasteboardMBS(NSPasteboardMBS.NSFindPboard)
MsgBox p.name
```

**Notes:**
The pasteboard that holds information about the current state of the active application’s find panel. This information permits users to enter a search string into the find panel, then switch to another application to conduct another search.

### 29.4.18 NSFontPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for pasteboards.

**Example:**

```vbnet
dim p as new NSPasteboardMBS(NSPasteboardMBS.NSFontPboard)
MsgBox p.name
```

**Notes:** The pasteboard that holds font and character information and supports Copy Font and Paste Font commands that may be implemented in a text editor.

### 29.4.19 NSFontPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.

**Notes:**
Font and character information.
On Mac OS X v10.6 and later, use NSPasteboardTypeFont instead.
29.4. **CLASS NSPASTEBOARDMBS**

29.4.20 **NSGeneralPboard as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for pasteboards. **Example:**

```vba
Dim p As New NSPasteboardMBS(NSPasteboardMBS.NSGeneralPboard)
MsgBox p.name
```

**Notes:**
The pasteboard that’s used for ordinary cut, copy, and paste operations. This pasteboard holds the contents of the last selection that’s been cut or copied.

29.4.21 **NSHTMLPboardType as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types. **Notes:**

HTML (which an NSTextView object can read from, but not write to). On Mac OS X v10.6 and later, use NSPasteboardTypeHTML instead.

29.4.22 **NSInkTextPboardType as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types. **Notes:**

Ink text data. On Mac OS X v10.6 and later, use kUTTypeInkText instead. For information on ink text objects, see Using Ink Services in Your Application.

29.4.23 **NSMultipleTextSelectionPboardType as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types. **Notes:**

Multiple text selection. On Mac OS X v10.6 and later, use NSPasteboardTypeMultipleTextSelection instead.
Available in Mac OS X v10.5 and later.

### 29.4.24 NSPasteboardTypeColor as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.  
**Notes:**  
Color data (an NSColor object).  
Available in Mac OS X v10.6 and later.

### 29.4.25 NSPasteboardTypeFindPanelSearchOptions as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.  
**Notes:**  
Type for the Find panel metadata property list.  
Available in Mac OS X v10.6 and later.

### 29.4.26 NSPasteboardTypeFont as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.  
**Notes:**  
Font and character information.  
Available in Mac OS X v10.6 and later.

### 29.4.27 NSPasteboardTypeHTML as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.  
**Notes:**  
HTML data.  
Available in Mac OS X v10.6 and later.
29.4.28  **NSPasteboardTypeMultipleTextSelection as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types. **Notes:**

Multiple text selection.
Available in Mac OS X v10.6 and later.

29.4.29  **NSPasteboardTypePDF as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types. **Notes:**

PDF data.
Available in Mac OS X v10.6 and later.

29.4.30  **NSPasteboardTypePNG as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types. **Notes:**

PNG image data.
Available in Mac OS X v10.6 and later.

29.4.31  **NSPasteboardTypeRTF as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types. **Notes:**

Rich Text Format (RTF) data.
Available in Mac OS X v10.6 and later.

29.4.32  **NSPasteboardTypeRTFD as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types. **Notes:**
CHAPTER 29. CLIPBOARD

RTFD formatted file contents.
Available in Mac OS X v10.6 and later.

29.4.33 NSPasteboardTypeRuler as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
**Notes:**
Paragraph formatting information.
Available in Mac OS X v10.6 and later.

29.4.34 NSPasteboardTypeSound as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
**Notes:**
Sound data (an NSSound object).
Available in Mac OS X v10.6 and later.

29.4.35 NSPasteboardTypeString as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
**Notes:**
String data.
Available in Mac OS X v10.6 and later.

29.4.36 NSPasteboardTypeTabularText as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.
**Notes:**
A string containing tab-separated fields of text.
Available in Mac OS X v10.6 and later.
29.4. CLASS NSPASTEBOARDMBS

29.4.37 NSPasteboardTypeTIFF as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for defining UTIs for common pasteboard data types.  
**Notes:**  
Tag Image File Format (TIFF) data.  
Available in Mac OS X v10.6 and later.

29.4.38 NSPDFPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.  
**Notes:**  
PDF data.  
On Mac OS X v10.6 and later, use NSPasteboardTypePDF instead.

29.4.39 NSPICTPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.  
**Notes:**  
QuickDraw picture data.  
The PICT format was formally deprecated in Mac OS X v10.4 along with QuickDraw. You should not be explicitly providing or looking for PICT data on the pasteboard.  
To aid in this deprecation, if PICT is the only image type on the pasteboard, as is sometimes the case when copying images from 32-bit Carbon applications, a translated image type will be automatically reported and provided by NSPasteboard. The translated type is added to the types array ahead of PICT so that the deprecated PICT format is not the preferred format. In addition, when an application provides image data to NSPasteboard, the Carbon Pasteboard Manager will automatically make a PICT translation available to 32-bit Carbon applications.  
Although NSPICTPboardType, and its UTI equivalent kUTTypePICT, will appear in a pasteboard’s type array retrieved from the existing NSPasteboard API, it may cease to be reported in future releases.

29.4.40 NSPostScriptPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.  
**Notes:**  
Encapsulated PostScript (EPS) code.
CHAPTER 29. CLIPBOARD

On Mac OS X v10.6 and later, use "com.adobe.encapsulated-postscript" instead.

29.4.41 NSRTFDBoardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types. **Notes:**

RTFD formatted file contents.
On Mac OS X v10.6 and later, use NSPasteboardTypeRTFD instead.

29.4.42 NSRTFBoardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types. **Notes:**

Rich Text Format (RTF) data.
On Mac OS X v10.6 and later, use NSPasteboardTypeRTF instead.

29.4.43 NSRulerBoard as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for pasteboards. **Example:**

```dim p as new NSPasteboardMBS(NSPasteboardMBS.NSRulerBoard)
MsgBox p.name```

**Notes:** The pasteboard that holds information about paragraph formats in support of the Copy Ruler and Paste Ruler commands that may be implemented in a text editor.

29.4.44 NSRulerBoardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types. **Notes:**

Paragraph formatting information.
On Mac OS X v10.6 and later, use NSPasteboardTypeRuler instead.
29.4.45 **NSStringPboardType as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.  
**Notes:**  
String data.  
On Mac OS X v10.6 and later, use NSPasteboardTypeString instead.

29.4.46 **NSTabularTextPboardType as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.  
**Notes:**  
A string containing tab-separated fields of text.  
On Mac OS X v10.6 and later, use NSPasteboardTypeTabularText instead.

29.4.47 **NSTIFFPboardType as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.  
**Notes:**  
Tag Image File Format (TIFF) data.  
On Mac OS X v10.6 and later, use NSPasteboardTypeTIFF instead.

29.4.48 **NSURLPboardType as string**

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the common pasteboard data types.  
**Notes:**  
NSURL data for one file or resource.  
On Mac OS X v10.6 and later, use writeObjects: to write URLs directly to the pasteboard instead.  
On Mac OS X v10.5 and earlier: to write an URL to a pasteboard you use writeToPasteboard: (NSURL); to get an URL from a pasteboard you use URLFromPasteboard: (NSURL).
29.4.49  NSVCardPboardType as string

Notes: VCard data.
On Mac OS X v10.6 and later, use kUTTypeVCard instead.

29.4.50  pasteboardItems as NSPasteboardItemMBS()

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns all the items held by the receiver.
Notes: Returns all the items held by the receiver, or nil if there is an error retrieving pasteboard items.
Available in OS X v10.6 and later.

29.4.51  pasteboardWithName(name as string) as NSPasteboardMBS

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the pasteboard with the specified name.
Example:
```dim p as NSPasteboardMBS = NSPasteboardMBS.pasteboardWithName(NSPasteboardMBS.NSFindPboard)
// shows last find string
MsgBox p.stringForType(p.NSPasteboardTypeString)```

29.4.52  pasteboardWithUniqueName as NSPasteboardMBS

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and returns a new pasteboard with a name that is guaranteed to be unique with respect to other pasteboards on the computer.
Notes: This method is useful for applications that implement their own interprocess communication using pasteboards.
29.4.53 releaseGlobally

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Releases the receiver’s resources in the pasteboard server.

**Notes:**
After this method is invoked, no other application can use the receiver.

A temporary, privately named pasteboard can be released this way when it is no longer needed, but a standard pasteboard should never be released globally.

29.4.54 SetPasteboardItems(items() as NSPasteboardItemMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes pasteboard items to the pasteboard.

**Notes:** Returns true if the array was successfully added, otherwise false.

29.4.55 types as string()

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of the receiver’s supported data types.

**Example:**
```vbscript
dim p as new NSPasteboardMBS
MsgBox join(p.types,EndOfLine)
```

**Notes:**
An array of Strings containing the union of the types of data declared for all the pasteboard items on the receiver. The returned types are listed in the order they were declared.

You must send a types or availableTypeFromArray message before reading any data from an NSPasteboard object.

29.4.56 URLFromPasteboard as string

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads the URL string off of pasteboard.
Notes: Returns "" if pasteboard does not contain data of type NSURLPboardType.

29.4.57  writeURLToPasteboard(URL as string)

Notes: You must declare an NSURLPboardType data type for pasteboard before invoking this method; otherwise it returns without doing anything.

29.4.58  Properties

29.4.59  Handle as Integer

Example:
   dim p as new NSPasteboardMBS
   MsgBox hex(p.Handle)

Notes: (Read and Write property)

29.4.60  dataForType(type as string) as Memoryblock

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Get the data for the specified type from the first item in the receiver that contains the type or sets the given data as the representation for the specified type for the first item on the receiver.
Example:
   dim p as new NSPasteboardMBS
   // may have chr(0) on the end!
   MsgBox p.dataForType(p.NSPasteboardTypeString)

Notes:
Returns a data object containing the data for the specified type from the first item in the receiver that contains the type, or "" if the contents of the pasteboard changed since they were last checked.
This method may also return nil if the pasteboard server cannot supply the data in time for example, if the pasteboard's owner is slow in responding to a pasteboard:provideDataForType: message and the interprocess communication times out.

Errors other than a timeout raise a NSPasteboardCommunicationException (a NSExceptionMBS in Real Studio).

If "" is returned, the application should put up a panel informing the user that it was unable to carry out the paste operation.

For standard text data types such as string, RTF, and RTFD, the text data from each item is returned as one combined result separated by newlines.

(Read and Write computed property)

29.4.61 propertyListForType(type as string) as Variant

MBS MacBase Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The property list for the specified type from the first item in the receiver that contains the type.
Notes:
dataType: The pasteboard data type containing the property-list data.

The property list for the specified type from the first item in the receiver that contains the type. This object consists of NSArray, NSData, NSDictionary, or NSString objects or any combination thereof.

This method invokes the dataForType method.
You must send types or availableTypeFromArray before invoking propertyListForType.
(Read and Write computed property)

29.4.62 stringForType(type as string) as string

MBS MacBase Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Get/Set the given string as the representation for the specified type for the first item on the receiver.
Example:

dim p as new NSPasteboardMBS

MsgBox p.stringForType(p.NSPasteboardTypeString)

Notes:
A concatenation of the strings for the specified type from all the items in the receiver that contain the type, or nil if none of the items contain strings of the specified type.

This method invokes `dataForType` to obtain the string. If the string cannot be obtained, `stringForType` returns "". See `dataForType` for a description of what will cause "" to be returned.

In Mac OS X v10.6 and later, if the receiver contains multiple items that can provide string, RTF, or RTFD data, the text data from each item is returned as a combined result separated by newlines. (Read and Write computed property)
Chapter 30

Clipper

30.1  class ClipperEngineMBS

30.1.1  class ClipperEngineMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Clipper class encapsulates boolean operations on polygons (intersection, union, difference and XOR), which is also called polygon clipping. **Notes:** Input polygons, both subject and clip sets, are passed to a Clipper object by its AddPath and AddPaths methods, and the clipping operation is performed by calling its Execute method. Multiple boolean operations can be performed on the same input polygon sets by repeat calls to Execute.

30.1.2  Methods

30.1.3  AddPath(path as ClipperPathMBS, PolyType as ClipperMBS.PolyType, Closed as Boolean) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Any number of subject and clip paths can be added to a clipping task, either individually via the AddPath() method, or as groups via the AddPaths() method, or even using both methods. **Notes:** 'Subject' paths may be either open (lines) or closed (polygons) or even a mixture of both, but 'clipping' paths must always be closed. Clipper allows polygons to clip both lines and other polygons, but doesn’t allow lines to clip either lines or polygons.

With closed paths, orientation should conform with the filling rule that will be passed via Clippper’s Execute method.
Path Coordinate range:
Path coordinates must be between & h3FFFFFFFFFFFFFFF (4.6e+18), otherwise a range error will be thrown when attempting to add the path to the Clipper object. If coordinates can be kept between 0x3FFFFFFF (1.0e+9), a modest increase in performance (approx. 15-20%) over the larger range can be achieved by avoiding large integer math.

Return Value:
The function will return false if the path is invalid for clipping. A path is invalid for clipping when:

- it has less than 2 vertices
- it has 2 vertices but is not an open path
- the vertices are all co-linear and it is not an open path

Returns true on success.
See also:
- 30.1.4 AddPath(path as ClipperPathMBS, PolyType as Integer, Closed as Boolean) as Boolean

30.1.4 AddPath(path as ClipperPathMBS, PolyType as Integer, Closed as Boolean) as Boolean

MBS Tools Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Any number of subject and clip paths can be added to a clipping task, either individually via the AddPath() method, or as groups via the AddPaths() method, or even using both methods.
See also:
- 30.1.3 AddPath(path as ClipperPathMBS, PolyType as ClipperMBS.PolyType, Closed as Boolean) as Boolean

30.1.5 AddPaths(paths as ClipperPathsMBS, PolyType as ClipperMBS.PolyType, Closed as Boolean) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Any number of subject and clip paths can be added to a clipping task, either individually via the AddPath() method, or as groups via the AddPaths() method, or even using both methods.
Notes:
'subject' paths may be either open (lines) or closed (polygons) or even a mixture of both, but 'clipping' paths must always be closed. Clipper allows polygons to clip both lines and other polygons, but doesn't allow lines to clip either lines or polygons.
With closed paths, orientation should conform with the filling rule that will be passed via Clipper’s Execute method.

Path Coordinate range:
Path coordinates must be between \&h3FFFFFFFFFFFFF (4.6e+18), otherwise a range error will be thrown when attempting to add the path to the Clipper object. If coordinates can be kept between 0x3FFFFFFF (1.0e+9), a modest increase in performance (approx. 15-20%) over the larger range can be achieved by avoiding large integer math.

Return Value:
The function will return false if the path is invalid for clipping. A path is invalid for clipping when:

- it has less than 2 vertices
- it has 2 vertices but is not an open path
- the vertices are all co-linear and it is not an open path

Returns true on success.

- 30.1.6 AddPaths(paths as ClipperPathsMBS, PolyType as Integer, Closed as Boolean) as Boolean 5113

### 30.1.6 AddPaths(paths as ClipperPathsMBS, PolyType as Integer, Closed as Boolean) as Boolean

MBS Tools Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Any number of subject and clip paths can be added to a clipping task, either individually via the AddPath() method, or as groups via the AddPaths() method, or even using both methods.

See also:

- 30.1.5 AddPaths(paths as ClipperPathsMBS, PolyType as ClipperMBS.PolyType, Closed as Boolean) as Boolean 5112

### 30.1.7 Clear

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Clear method removes any existing subject and clip polygons allowing the Clipper object to be reused for clipping operations on different polygon sets.
CHAPTER 30. CLIPPER

30.1.8 Constructor(initOptions as integer = 0)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Clipper constructor creates an instance of the Clipper class.

**Notes:**
One or more InitOptions may be passed as a parameter to set the corresponding properties. (These properties can still be set or reset after construction.)

**Options:**
- ReverseSolution 1
- StrictlySimple 2
- PreserveCollinear 4

30.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper engine.

See also:
- 30.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean
- 30.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean
- 30.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean
- 30.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean
- 30.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean
- 30.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean
- 30.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean
30.1. CLASS CLIPPERENGINE

30.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper engine.

See also:

- 30.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5114
- 30.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5115
- 30.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5116
- 30.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5116
- 30.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5118
- 30.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5118
- 30.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5119

30.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper engine.

See also:

- 30.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5114
- 30.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5115
- 30.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5116
- 30.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5116
- 30.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5118
30.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean

See also:

• 30.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean

• 30.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean

• 30.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean

• 30.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean

• 30.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean

• 30.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean

• 30.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean

30.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean

Notes:

Once subject and clip paths have been assigned (via AddPath and/or AddPaths), Execute can then perform the clipping operation (intersection, union, difference or XOR) specified by the clipType parameter.

The solution parameter can be either a Paths or PolyTree. The Paths is simpler than the PolyTree. Because of this it is quicker to populate and hence clipping performance is a little better (it’s roughly 10% faster).
However, the PolyTree class provides more information about the returned paths which may be important to users. Firstly, the PolyTree class preserves nested parent-child polygon relationships (ie outer polygons owning/containing holes and holes owning/containing other outer polygons etc). Also, only the PolyTree class can differentiate between open and closed paths since each PolyNode has an IsOpen property. (The Path structure has no member indicating whether it’s open or closed.) For this reason, when open paths are passed to a Clipper object, the user must use a PolyTree object as the solution parameter, otherwise an exception will be raised.

When a PolyTree object is used in a clipping operation on open paths, two ancilliary functions have been provided to quickly separate out open and closed paths from the solution - ClipperMBS.OpenPathsFromPolyTree and ClipperMBS.ClosedPathsFromPolyTree. PolyTreeToPaths is also available to convert path data to a Paths structure (irrespective of whether they’re open or closed).

There are several things to note about the solution paths returned:

- they aren’t in any specific order
- they should never overlap or be self-intersecting (but see notes on rounding)
- holes will be oriented opposite outer polygons
- the solution fill type can be considered either EvenOdd or NonZero since it will comply with either filling rule
- polygons may rarely share a common edge (though this is now very rare as of version 6)

The subjFillType and clipFillType parameters define the polygon fill rule to be applied to the polygons (ie closed paths) in the subject and clip paths respectively. (It’s usual though obviously not essential that both sets of polygons use the same fill rule.)

Execute can be called multiple times without reassigning subject and clip polygons (ie when different clipping operations are required on the same polygon sets).

- **30.1.16** Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5119

**30.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Executes the clipper engine.

See also:

- **30.1.9** Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5114
- **30.1.10** Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5115
- **30.1.11** Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5115
- **30.1.12** Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5115
- **30.1.13** Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5116
- **30.1.14** Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5118
- **30.1.15** Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5118

**30.1.17 GetBounds(byref left as integer, byref top as integer, byref right as integer, byref bottom as integer)**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This method returns the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.

**Notes:** This call is more efficient than querying all bounds properties.
30.1.18  Properties

30.1.19  BoundsBottom as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Bottom of bounds.
**Notes:**
This method returns the bottom value of the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
(Read only property)

30.1.20  BoundsLeft as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Left of bounds.
**Notes:**
This method returns the left value of the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
(Read only property)

30.1.21  BoundsRight as Integer

**Notes:**
This method returns the right value of the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
(Read only property)

30.1.22  BoundsTop as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Top of bounds.
**Notes:**
This method returns the top value of the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
(Read only property)
30.1.23 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference. **Notes:** (Read and Write property)

30.1.24 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object. **Notes:** To avoid Xojo freeing the parent too quick, we keep a reference here. (Read only property)

30.1.25 PreserveCollinear as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to preserve collinear in input polygons. **Notes:** By default, when three or more vertices are collinear in input polygons (subject or clip), the Clipper object removes the ‘inner’ vertices before clipping. When enabled the PreserveCollinear property prevents this default behavior to allow these inner vertices to appear in the solution. (Read and Write property)

30.1.26 ReverseSolution as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** When this property is set to true, polygons returned in the solution parameter of the Execute() method will have orientations opposite to their normal orientations. **Notes:** (Read and Write property)

30.1.27 StrictlySimple as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to do strictly simple polygon. **Notes:** Terminology:
• A simple polygon is one that does not self-intersect.

• A weakly simple polygon is a simple polygon that contains ‘touching’ vertices, or ‘touching’ edges.

• A strictly simple polygon is a simple polygon that does not contain ‘touching’ vertices, or ‘touching’ edges.

Vertices ‘touch’ if they share the same coordinates (and are not adjacent). An edge touches another if one of its end vertices touches another edge excluding its adjacent edges, or if they are co-linear and overlapping (including adjacent edges).

Polygons returned by clipping operations (see Clipper.Execute()) should always be simple polygons. When the StrictlySimply property is enabled, polygons returned will be strictly simple, otherwise they may be weakly simple. It’s computationally expensive ensuring polygons are strictly simple and so this property is disabled by default.

Note: There’s currently no guarantee that polygons will be strictly simple since ‘simplifying’ is still a work in progress.
(Read and Write property)

30.1.28 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The tag value.
**Notes:**
You can store here whatever value you like.
(Read and Write property)
30.2. CLASS CLIPPEREXCEPTIONMBS

30.2 class ClipperExceptionMBS

30.2.1 class ClipperExceptionMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The exception class for clipper.

**Notes:** Subclass of the RuntimeException class.
30.3  module ClipperMBS

30.3.1  module ClipperMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The central module for Clipper library methods.

30.3.2  Methods

30.3.3  Area(path as ClipperPathMBS) as double

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This function returns the area of the supplied polygon.
**Notes:** It’s assumed that the path is closed and does not self-intersect. Depending on orientation, this value may be positive or negative. If Orientation is true, then the area will be positive and conversely, if Orientation is false, then the area will be negative.

30.3.4  CleanPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, distance as double = 1.415)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a clean polygon.
**Notes:**
Removes vertices:
- that join co-linear edges, or join edges that are almost co-linear (such that if the vertex was moved no more than the specified distance the edges would be co-linear)
- that are within the specified distance of an adjacent vertex
- that are within the specified distance of a semi-adjacent vertex together with their out-lying vertices
Vertices are semi-adjacent when they are separated by a single (out-lying) vertex.

The distance parameter’s default value is approximately 2 so that a vertex will be removed when adjacent or semi-adjacent vertices having their corresponding X and Y coordinates differing by no more than 1 unit. (If the edges are semi-adjacent the out-lying vertex will be removed too.)

This function is overloaded. In the first definition, the InPoly and OutPolys parameters can reference the same Path object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.
**See also:**
- 30.3.5  CleanPolygon(Poly as ClipperPathMBS, distance as double = 1.415)
30.3. **MODULE CLIPPERMBS**

30.3.5 **CleanPolygon(Poly as ClipperPathMBS, distance as double = 1.415)**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a clean polygon.

**Notes:**

Removes vertices:

30.3.7 CleanPolygons(Poly as ClipperPathsMBS, distance as double = 1.415)

Notes:
Removes vertices:
- that join co-linear edges, or join edges that are almost co-linear (such that if the vertex was moved no more than the specified distance the edges would be co-linear)
- that are within the specified distance of an adjacent vertex
- that are within the specified distance of a semi-adjacent vertex together with their out-lying vertices

Vertices are semi-adjacent when they are separated by a single (out-lying) vertex.

The distance parameter’s default value is approximately 2 so that a vertex will be removed when adjacent or semi-adjacent vertices having their corresponding X and Y coordinates differing by no more than 1 unit. (If the edges are semi-adjacent the out-lying vertex will be removed too.)

This function is overloaded. In the first definition, the InPoly and OutPoly parameters can reference the same Paths object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.

See also:
- 30.3.6 CleanPolygons(InPoly as ClipperPathsMBS, byref OutPolys as ClipperPathsMBS, distance as double = 1.415)

30.3.8 ClosedPathsFromPolyTree(polytree as ClipperPolyTreeMBS, byref paths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: This function filters out open paths from the PolyTree structure and returns only closed paths in a Paths structure.

30.3.9 EllipsePoints(Left as Double, Top as Double, Right as Double, Bottom as Double) as ClipperPathMBS

Example:
30.3. **MODULE CLIPPERMBS**

```vbnet
dim p as ClipperPathMBS = ClipperMBS.EllipsePoints(100,100,300,300)
```

30.3.10 **MinkowskiDiff(poly1 as ClipperPathMBS, poly2 as ClipperPathMBS, byref solution as ClipperPathsMBS)**

**Notes:**

Minkowski Difference is performed by subtracting each point in a polygon from the set of points in an open or closed path. A key feature of Minkowski Difference is that when it’s applied to two polygons, the resulting polygon will contain the coordinate space origin whenever the two polygons touch or overlap. (This function is often used to determine when polygons collide.)

In the image on the left the blue polygon is the 'minkowski difference' of the two red boxes. The black dot represents the coordinate space origin.

30.3.11 **MinkowskiSum(pattern as ClipperPathMBS, path as ClipperPathMBS, byref solution as ClipperPathsMBS, pathIsClosed as boolean)**

**Notes:** Minkowski Addition is performed by adding each point in a polygon 'pattern' to the set of points in an open or closed path. The resulting polygon (or polygons) defines the region that the 'pattern' would pass over in moving from the beginning to the end of the 'path'.

See also:

- 30.3.12 **MinkowskiSum(pattern as ClipperPathMBS, paths as ClipperPathsMBS, byref solution as ClipperPathsMBS, pathIsClosed as boolean)**

30.3.12 **MinkowskiSum(pattern as ClipperPathMBS, paths as ClipperPathsMBS, byref solution as ClipperPathsMBS, pathIsClosed as boolean)**

**Notes:** Minkowski Addition is performed by adding each point in a polygon 'pattern' to the set of points in an open or closed path. The resulting polygon (or polygons) defines the region that the 'pattern' would pass over in moving from the beginning to the end of the 'path'.

See also:
30.3.11 MinkowskiSum(pattern as ClipperPathMBS, path as ClipperPathMBS, byref solution as ClipperPathsMBS, pathIsClosed as boolean)

30.3.13 OpenPathsFromPolyTree(polytree as ClipperPolyTreeMBS, byref paths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
This function filters out closed paths from the PolyTree structure and returns only open paths in a Paths structure.

30.3.14 Orientation(path as ClipperPathMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Queries orientation of path.
Notes:
Orientation is only important to closed paths. Given that vertices are declared in a specific order, orientation refers to the direction (clockwise or counter-clockwise) that these vertices progress around a closed path.

Orientation is also dependent on axis direction:

- On Y-axis positive upward displays, Orientation will return true if the polygon’s orientation is counter-clockwise.
- On Y-axis positive downward displays, Orientation will return true if the polygon’s orientation is clockwise.

Notes:

- Self-intersecting polygons have indeterminate orientations in which case this function won’t return a meaningful value.
- The majority of 2D graphic display libraries (eg GDI, GDI+, XLib, Cairo, AGG, Graphics32) and even the SVG file format have their coordinate origins at the top-left corner of their respective viewports with their Y axes increasing downward. However, some display libraries (eg Quartz, OpenGL) have their coordinate origins undefined or in the classic bottom-left position with their Y axes increasing upward.
- For Non-Zero filled polygons, the orientation of holes must be opposite that of outer polygons.
- For closed paths (polygons) in the solution returned by Clipper’s Execute method, their orientations will always be true for outer polygons and false for hole polygons (unless the ReverseSolution property has been enabled).
30.3.15  **PointInPolygon(path as ClipperPathMBS, pt as ClipperPointMBS) as Integer**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns 0 when false, -1 when pt is on poly and +1 when pt is in poly.  
**Notes:** It’s assumed that ‘poly’ is closed and does not self-intersect.

30.3.16  **PolyTreeToPaths(polytree as ClipperPolyTreeMBS, byref paths as ClipperPathsMBS)**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This function converts a PolyTree structure into a Paths structure.

30.3.17  **ReversePath(path as ClipperPathMBS)**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reverses the vertex order (and hence orientation) in the specified path.

30.3.18  **ReversePaths(paths as ClipperPathsMBS)**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reverses the vertex order (and hence orientation) in each contained path.

30.3.19  **SimplifyPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS,fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd)**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes self-intersections from the supplied polygon (by performing a boolean union operation using the nominated PolyFillType).  
**Notes:** Polygons with non-contiguous duplicate vertices (ie ‘touching’) will be split into two polygons.  
**Note:** There’s currently no guarantee that polygons will be strictly simple since ‘simplifying’ is still a work in progress.  
**See also:**
30.3.20  **SimplifyPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, fillType as Integer)**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes self-intersections from the supplied polygon (by performing a boolean union operation using the nominated PolyFillType).

**Notes:**

Polygons with non-contiguous duplicate vertices (ie 'touching’) will be split into two polygons.

Note: There’s currently no guarantee that polygons will be strictly simple since ‘simplifying’ is still a work in progress.

See also:

- 30.3.19  **SimplifyPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd)**

30.3.21  **SimplifyPolygons(InPolys as ClipperPathsMBS, byref OutPolys as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd)**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes self-intersections from the supplied polygons (by performing a boolean union operation using the nominated PolyFillType).

**Notes:**

Polygons with non-contiguous duplicate vertices (ie 'vertices are touching’) will be split into two polygons.

This function is overloaded. In the first definition, the InPolys and OutPolys parameters can reference the same Paths object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.

Note: There’s currently no guarantee that polygons will be strictly simple since ‘simplifying’ is still a work in progress.

See also:

30.3.25 TranslatePath(path as ClipperPathMBS, delta as ClipperPointMBS) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Offsets each point in path by x and y.

**Notes:** Returns a new path.
See also:

- 30.3.26 TranslatePath(path as ClipperPathMBS, x as Int64, y as Int64) as ClipperPathMBS 5133
30.3.26 TranslatePath(path as ClipperPathMBS, x as Int64, y as Int64) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Offsets each point in path by x and y.  
**Notes:** Returns a new path.  
See also:

- 30.3.25 TranslatePath(path as ClipperPathMBS, delta as ClipperPointMBS) as ClipperPathMBS

30.3.27 Version as string

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries the version of the Clipper library used.

30.3.28 Constants

30.3.29 hiRange = & h3FFFFFFFFFFFFFFFF

MBS Tools Plugin, Plugin Version: 18.0. **Function:** The higher range.

30.3.30 loRange = & h3FFFFFFF

MBS Tools Plugin, Plugin Version: 18.0. **Function:** The lower range.
30.4 class ClipperOffsetMBS

30.4.1 class ClipperOffsetMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The ClipperOffset class encapsulates the process of offsetting (inflating/deflating) both open and closed paths using a number of different join types and end types. **Notes:** Preconditions for offsetting: 1. The orientations of closed paths must be consistent such that outer polygons share the same orientation, and any holes have the opposite orientation (ie non-zero filling). Open paths must be oriented with closed outer polygons. 2. Polygons must not self-intersect. Limitations: When offsetting, small artefacts may appear where polygons overlap. To avoid these artefacts, offset overlapping polygons separately.

30.4.2 Methods

30.4.3 AddPath(path as ClipperPathMBS, joinType as ClipperMBS.JoinType, endType as ClipperMBS.EndType)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a Path to a ClipperOffset object in preparation for offsetting. **Notes:** Any number of paths can be added, and each has its own JoinType and EndType. All 'outer' Paths must have the same orientation, and any 'hole' paths must have reverse orientation. Closed paths must have at least 3 vertices. Open paths may have as few as one vertex. Open paths can only be offset with positive deltas. See also: * 30.4.4 AddPath(path as ClipperPathMBS, joinType as Integer, endType as Integer)

30.4.4 AddPath(path as ClipperPathMBS, joinType as Integer, endType as Integer)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a Path to a ClipperOffset object in preparation for offsetting. **Notes:** Any number of paths can be added, and each has its own JoinType and EndType. All 'outer' Paths must have the same orientation, and any 'hole' paths must have reverse orientation. Closed paths must have at least 3 vertices. Open paths may have as few as one vertex. Open paths can only be offset with positive
deltas.

See also:

- 30.4.3 AddPath(path as ClipperPathMBS, joinType as ClipperMBS.JoinType, endType as ClipperMBS.EndType)

30.4.5 AddPaths(paths as ClipperPathsMBS, joinType as ClipperMBS.JoinType, endType as ClipperMBS.EndType)

**Function:** Adds Paths to a ClipperOffset object in preparation for offsetting.

**Notes:** Any number of paths can be added, and each path has its own JoinType and EndType. All 'outer' Paths must have the same orientation, and any 'hole' paths must have reverse orientation. Closed paths must have at least 3 vertices. Open paths may have as few as one vertex. Open paths can only be offset with positive deltas.

See also:

- 30.4.6 AddPaths(paths as ClipperPathsMBS, joinType as Integer, endType as Integer)

30.4.6 AddPaths(paths as ClipperPathsMBS, joinType as Integer, endType as Integer)

**Function:** Adds Paths to a ClipperOffset object in preparation for offsetting.

**Notes:** Any number of paths can be added, and each path has its own JoinType and EndType. All 'outer' Paths must have the same orientation, and any 'hole' paths must have reverse orientation. Closed paths must have at least 3 vertices. Open paths may have as few as one vertex. Open paths can only be offset with positive deltas.

See also:

- 30.4.5 AddPaths(paths as ClipperPathsMBS, joinType as ClipperMBS.JoinType, endType as ClipperMBS.EndType)

30.4.7 Clear

**Function:** This method clears all paths from the ClipperOffset object, allowing new paths to be assigned.

30.4.8 Constructor(miterLimit as double = 2.0, roundPrecision as double = 0.25)

**Function:** Initializes the clipper offset.
Notes: The ClipperOffset constructor takes 2 optional parameters: MiterLimit and ArcTolerance. These two parameters correspond to properties of the same name. MiterLimit is only relevant when JoinType is jtMiter, and ArcTolerance is only relevant when JoinType is jtRound or when EndType is etOpenRound.

30.4.9 Execute(byref Paths as ClipperPathsMBS, delta as double)

Notes: This method takes two parameters. The first is the structure that receives the result of the offset operation (either a PolyTree or a Paths structure). The second parameter is the amount to which the supplied paths will be offset. Negative delta values shrink polygons and positive delta expand them.

This method can be called multiple times, offsetting the same paths by different amounts (ie using different deltas).
See also:
- 30.4.10 Execute(byref PolyTree as ClipperPolyTreeMBS, delta as double)

30.4.10 Execute(byref PolyTree as ClipperPolyTreeMBS, delta as double)

Notes: This method takes two parameters. The first is the structure that receives the result of the offset operation (either a PolyTree or a Paths structure). The second parameter is the amount to which the supplied paths will be offset. Negative delta values shrink polygons and positive delta expand them.

This method can be called multiple times, offsetting the same paths by different amounts (ie using different deltas).
See also:
- 30.4.9 Execute(byref Paths as ClipperPathsMBS, delta as double)

30.4.11 Properties

30.4.12 ArcTolerance as Double

Notes:
Firstly, this field/property is only relevant when JoinType = jtRound and/or EndType = etRound.

Since flattened paths can never perfectly represent arcs, this field/property specifies a maximum acceptable imprecision ('tolerance') when arcs are approximated in an offsetting operation. Smaller values will increase 'smoothness' up to a point though at a cost of performance and in creating more vertices to construct the arc.

The default ArcTolerance is 0.25 units. This means that the maximum distance the flattened path will deviate from the 'true' arc will be no more than 0.25 units (before rounding).

Reducing tolerances below 0.25 will not improve smoothness since vertex coordinates will still be rounded to integer values. The only way to achieve sub-integer precision is through coordinate scaling before and after offsetting (see example below).

It’s important to make ArcTolerance a sensible fraction of the offset delta (arc radius). Large tolerances relative to the offset delta will produce poor arc approximations but, just as importantly, very small tolerances will substantially slow offsetting performance while providing unnecessary degrees of precision. This is most likely to be an issue when offsetting polygons whose coordinates have been scaled to preserve floating point precision.

Example:
Imagine a set of polygons (defined in floating point coordinates) that is to be offset by 10 units using round joins, and the solution is to retain floating point precision up to at least 6 decimal places.
To preserve this degree of floating point precision, and given that Clipper and ClipperOffset both operate on integer coordinates, the polygon coordinates will be scaled up by 108 (and rounded to integers) prior to offsetting. Both offset delta and ArcTolerance will also need to be scaled by this same factor. If ArcTolerance was left unscaled at the default 0.25 units, every arc in the solution would contain a fraction of 44 THOUSAND vertices while the final arc imprecision would be 0.25 10-8 units (ie once scaling was reversed). However, if 0.1 units was an acceptable imprecision in the final unscaled solution, then ArcTolerance should be set to 0.1 scaling_factor (0.1 108 ). Now if scaling is applied equally to both ArcTolerance and to Delta Offset, then in this example the number of vertices (steps) defining each arc would be a fraction of 23.

The formula for the number of steps in a full circular arc is ... Pi / acos(1 - arc_tolerance / abs(delta))
(Read and Write property)

30.4.13 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
The internal object reference.
Notes: (Read and Write property)
30.4.14 MiterLimit as Double

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The miter limit.
**Notes:**
This property sets the maximum distance in multiples of delta that vertices can be offset from their original positions before squaring is applied. (Squaring truncates a miter by 'cutting it off' at 1 delta distance from the original vertex.)

The default value for MiterLimit is 2 (ie twice delta). This is also the smallest MiterLimit that’s allowed. If mitering was unrestricted (ie without any squaring), then offsets at very acute angles would generate unacceptably long 'spikes'.
(Read and Write property)

30.4.15 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The parent object.
**Notes:**
To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

30.4.16 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The tag value.
**Notes:**
You can store here whatever value you like.
(Read and Write property)
30.5. CLASS CLIPPERPATHMBS

30.5 class ClipperPathMBS

30.5.1 class ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This class contains a sequence of IntPoint vertices defining a single contour (see also terminology).

**Notes:**
Paths may be open and represent a series of line segments bounded by 2 or more vertices, or they may be closed and represent polygons. Whether or not a path is open depends on context. Closed paths may be 'outer' contours or 'hole' contours. Which they are depends on orientation.

Multiple paths can be grouped into a Paths class: ClipperPathsMBS.

30.5.2 Methods

30.5.3 Append(item as ClipperPointMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Appends a new point to the path.

See also:

- 30.5.4 Append(X as Int64, Y as Int64)

30.5.4 Append(X as Int64, Y as Int64)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Appends a new path.

**Notes:** Without creating intermediate Xojo ClipperPointMBS object.

See also:

- 30.5.3 Append(item as ClipperPointMBS)

30.5.5 Area as double

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This function returns the area of the supplied polygon.

**Example:**

```vbs
dim points() as ClipperPointMBS
points.Append new ClipperPointMBS(1,2)
points.Append new ClipperPointMBS(4,2)
```
points.Append new ClipperPointMBS(4,6)
points.Append new ClipperPointMBS(1,6)

`dim path as new ClipperPathMBS(points)`
`dim area as Double = path.Area`

**Notes:** It’s assumed that the path is closed and does not self-intersect. Depending on orientation, this value may be positive or negative. If Orientation is true, then the area will be positive and conversely, if Orientation is false, then the area will be negative.

### 30.5.6 Clear

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Cleans the path.

### 30.5.7 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new empty path.
See also:
- 30.5.8 Constructor(otherPath as ClipperPathMBS)
- 30.5.9 Constructor(points() as ClipperPointMBS)

### 30.5.8 Constructor(otherPath as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new path with the copy of old path.
See also:
- 30.5.7 Constructor
- 30.5.9 Constructor(points() as ClipperPointMBS)

### 30.5.9 Constructor(points() as ClipperPointMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new path with given points.
See also:
30.5. **CLASS CLIPPERPATHMBS**

- 30.5.7 Constructor
- 30.5.8 Constructor(otherPath as ClipperPathMBS)

30.5.10 **Equal(otherPath as ClipperPathMBS) as boolean**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks if two paths are equal. **Notes:** Returns true if both are equal.

30.5.11 **Insert(Index as Integer, item as ClipperPointMBS)**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Inserts a point into the path at given index. **Notes:** Index = 0 adds as first path.

30.5.12 **Orientation as boolean**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries orientation of path. **Example:**

```vba
dim points() as ClipperPointMBS
points.Append new ClipperPointMBS(1,2)
points.Append new ClipperPointMBS(4,2)
points.Append new ClipperPointMBS(4,6)
points.Append new ClipperPointMBS(1,6)
dim path as new ClipperPathMBS(points)
dim Orientation as boolean = path.Orientation
```

**Notes:**

Orientation is only important to closed paths. Given that vertices are declared in a specific order, orientation refers to the direction (clockwise or counter-clockwise) that these vertices progress around a closed path.

Orientation is also dependent on axis direction:

- On Y-axis positive upward displays, Orientation will return true if the polygon’s orientation is counter-clockwise.
CHAPTER 30. CLIPPER

- On Y-axis positive downward displays, Orientation will return true if the polygon’s orientation is clockwise.

Notes:

- Self-intersecting polygons have indeterminate orientations in which case this function won’t return a meaningful value.

- The majority of 2D graphic display libraries (eg GDI, GDI+, XLib, Cairo, AGG, Graphics32) and even the SVG file format have their coordinate origins at the top-left corner of their respective viewports with their Y axes increasing downward. However, some display libraries (eg Quartz, OpenGL) have their coordinate origins undefined or in the classic bottom-left position with their Y axes increasing upward.

- For Non-Zero filled polygons, the orientation of holes must be opposite that of outer polygons.

- For closed paths (polygons) in the solution returned by Clipper’s Execute method, their orientations will always be true for outer polygons and false for hole polygons (unless the ReverseSolution property has been enabled).

30.5.13 PointInPolygon(pt as ClipperPointMBS) as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Returns 0 when false, -1 when pt is on poly and +1 when pt is in poly.

Example:

dim points() as ClipperPointMBS

points.Append new ClipperPointMBS(1,2)
points.Append new ClipperPointMBS(4,2)
points.Append new ClipperPointMBS(4,6)
points.Append new ClipperPointMBS(1,6)

dim path as new ClipperPathMBS(points)

dim b1 as Integer = path.PointInPolygon(new ClipperPointMBS(2,2)) // -1 on line
dim b2 as Integer = path.PointInPolygon(new ClipperPointMBS(22,2)) // 0 outside
dim b3 as Integer = path.PointInPolygon(new ClipperPointMBS(2,3)) // 1 = inside

Notes: It’s assumed that ‘poly’ is closed and does not self-intersect.
30.5. **CLASS CLIPPERPATHMBS**

### 30.5.14 Remove(index as integer)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes a point.

### 30.5.15 ReversePath

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reverses the vertex order (and hence orientation) in the specified path.

### 30.5.16 TranslatePath(delta as ClipperPointMBS) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Offsets each point in path by x and y.  
**Notes:** Returns a new path.  
See also:

- 30.5.17 TranslatePath(x as Int64, y as Int64) as ClipperPathMBS

### 30.5.17 TranslatePath(x as Int64, y as Int64) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Offsets each point in path by x and y.  
**Notes:** Returns a new path.  
See also:

- 30.5.16 TranslatePath(delta as ClipperPointMBS) as ClipperPathMBS

### 30.5.18 Values as ClipperPointMBS()

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates copy of path as Xojo array or ClipperPointMBS.

### 30.5.19 ValuesToArray(dest() as ClipperPointMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds ClipperPointMBS objects for the points in the path to the Xojo array.  
**Notes:** Mainly for older Realbasic versions where the plugin can’t create an array for you.
30.5.20 Properties

30.5.21 Count as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns number of points in path. 
**Notes:** (Read only property)

30.5.22 Empty as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if path is empty. 
**Notes:** (Read only property)

30.5.23 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference. 
**Notes:** (Read and Write property)

30.5.24 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object. 
**Notes:** To avoid Xojo freeing the parent too quick, we keep a reference here. 
(Read only property)

30.5.25 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value. 
**Notes:** You can store here whatever value you like. 
(Read and Write property)
30.5.26 Value(Index as Integer) as ClipperPointMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries or sets a value in the path.

**Notes:**

Raises exception if out of bounds.

(Read and Write computed property)
30.6  class ClipperPathsMBS

30.6.1  class ClipperPathsMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a list of paths.

**Notes:**
This class is fundamental to the Clipper Library. It’s a list or array of one or more Path structures. (The Path structure contains an ordered list of vertices that make a single contour.)

Paths may open (a series of line segments), or they may closed (polygons). Whether or not a path is open depends on context. Closed paths may be 'outer’ contours or 'hole’ contours. Which they are depends on orientation.

30.6.2  Methods

30.6.3  Append(item as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Appends a new path to the paths.

30.6.4  Clear

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Clears the path.

30.6.5  Constructor

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new empty path.

See also:

- 30.6.6 Constructor(otherPaths as ClipperPathsMBS)

30.6.6  Constructor(otherPaths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new paths list with the copy of old paths list.

See also:
30.6. CLASS CLIPPERPATHSMBS

• 30.6.5 Constructor

30.6.7 Equal(otherPaths as ClipperPathsMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks if two path lists are equal.  
**Notes:** Returns true if both are equal.

30.6.8 Insert(Index as Integer, item as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Inserts a path into the path list at given index.  
**Notes:** Index = 0 adds as first point.

30.6.9 Remove(index as integer)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes a path.

30.6.10 Reverse

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reverses the vertex order (and hence orientation) in the specified paths.

30.6.11 Values as ClipperPathMBS()

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates copy of path list as Xojo array or ClipperPathMBS.

30.6.12 ValuesToArray(dest() as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds ClipperPathMBS objects for the paths in the path list to the Xojo array.  
**Notes:** Mainly for older Realbasic versions where the plugin can’t create an array for you.
30.6.13 Properties

30.6.14 Count as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns number of paths in paths.  
**Notes:** (Read only property)

30.6.15 Empty as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if path list is empty.  
**Notes:** (Read only property)

30.6.16 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

30.6.17 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object.  
**Notes:**  
To avoid Xojo freeing the parent too quick, we keep a reference here.  
(Read only property)

30.6.18 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value.  
**Notes:**  
You can store here whatever value you like.  
(Read and Write property)
30.6.19  Value(Index as Integer) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries or sets a value in the path.

**Notes:**

Raises exception if out of bounds.
(Read and Write computed property)
30.7 class ClipperPointMBS

30.7.1 class ClipperPointMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a point.
**Notes:** All functions accept nil as a point with values 0/0.

30.7.2 Methods

30.7.3 Constructor(x as Int64 = 0, y as Int64 = 0)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new point with given values.

30.7.4 Equal(other as ClipperPointMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Compares two points.
**Notes:**
Returns true if both have same value.
All functions accept nil as a point with values 0/0.

30.7.5 Point(x as Int64 = 0, y as Int64 = 0) as ClipperPointMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new point with given values.

30.7.6 Properties

30.7.7 X as Int64

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The x coordinate.
**Notes:** (Read and Write property)
30.7.8  Y as Int64

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The y coordinate.
**Notes:** (Read and Write property)
30.8 class ClipperPolyNodeMBS

30.8.1 class ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a poly node.

**Notes:**
PolyNodes are encapsulated within a PolyTree container, and together provide a data structure representing the parent-child relationships of polygon contours returned by Clipper’s Execute method.

A PolyNode object represents a single polygon. Its IsHole property indicates whether it’s an outer or a hole. PolyNodes may own any number of PolyNode children (Childs), where children of outer polygons are holes, and children of holes are (nested) outer polygons.

30.8.2 Methods

30.8.3 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor for a new object.

30.8.4 Properties

30.8.5 ChildCount as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of PolyNode Childs directly owned by the PolyNode object.

**Notes:** (Read only property)

30.8.6 Childs as ClipperPolyNodesMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The children.

**Notes:**
A read-only list of PolyNode.
Outer PolyNode childs contain hole PolyNodes, and hole PolyNode childs contain nested outer PolyNodes. (Read only property)
30.8. **CLASS CLIPPERPOLYNODEMBS**

**30.8.7 Contour as ClipperPathMBS**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a path list which contains any number of vertices.  
**Notes:** (Read and Write property)

**30.8.8 Handle as Integer**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

**30.8.9 IsHole as Boolean**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true when the PolyNode's polygon (Contour) is a hole.  
**Notes:** Children of outer polygons are always holes, and children of holes are always (nested) outer polygons. The IsHole property of a PolyTree object is undefined but its children are always top-level outer polygons. (Read only property)

**30.8.10 IsOpen as Boolean**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true when the PolyNode's Contour results from a clipping operation on an open contour (path).  
**Notes:** Only top-level PolyNodes can contain open contours. (Read only property)

**30.8.11 NextNode as ClipperPolyNodeMBS**

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The returned Polynode will be the first child if any, otherwise the next sibling, otherwise the next sibling of the Parent etc.  
**Notes:** A PolyTree can be traversed very easily by calling First() followed by NextNode in a loop until the returned object is a nil reference ...
30.8.12 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object.

**Notes:**
To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

30.8.13 ParentNode as ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the parent PolyNode.

**Notes:**
The PolyTree object (which is also a PolyNode) does not have a parent and will return a null pointer.
(Read only property)

30.8.14 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value.

**Notes:**
You can store here whatever value you like.
(Read and Write property)
30.9.  CLASS CLIPPERPOLYNODESMBS

30.9  class ClipperPolyNodesMBS

30.9.1  class ClipperPolyNodesMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for the node list.

30.9.2  Methods

30.9.3  Append(item as ClipperPolyNodeMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Appends a new node to the node list.

30.9.4  Clear

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Clears the node list.

30.9.5  Constructor

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new empty node list.

See also:

- 30.9.6 Constructor(otherPolyNodes as ClipperPolyNodesMBS)

30.9.6  Constructor(otherPolyNodes as ClipperPolyNodesMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new poly node list with the copy of old poly node list.

See also:

- 30.9.5 Constructor

30.9.7  Equal(otherPolyNodes as ClipperPolyNodesMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Checks if two node lists are equal.
Notes: Returns true if both are equal.

### 30.9.8 Insert/Index as Integer, item as ClipperPolyNodeMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Inserts a poly node into the node list at given index. **Notes:** Index = 0 adds as first node.

### 30.9.9 Remove/index as integer)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes a node.

### 30.9.10 Values as ClipperPolyNodeMBS()

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates copy of node list as Xojo array or ClipperPolyNodeMBS.

### 30.9.11 Properties

#### 30.9.12 Count as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns number of nodes. **Notes:** (Read only property)

#### 30.9.13 Empty as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if list is empty. **Notes:** (Read only property)

#### 30.9.14 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.
30.9. **CLASS CLIPPERPOLYNODESMBS**

**Notes:** (Read and Write property)

### 30.9.15 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent object.

**Notes:**
To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

### 30.9.16 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value.

**Notes:**
You can store here whatever value you like.
(Read and Write property)

### 30.9.17 Value(Index as Integer) as ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries or sets a value in the node list.

**Notes:**
Raises exception if out of bounds.
(Read and Write computed property)
30.10 class ClipperPolyTreeMBS

30.10.1 class ClipperPolyTreeMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** PolyTree is intended as a read-only data structure that should only be used to receive solutions from clipping and offsetting operations.

**Notes:**

PolyTree’s two major advantages over the Paths structure are: it properly represents the parent-child relationships of the returned polygons; it differentiates between open and closed paths. However, since PolyTree is a more complex structure than the Paths structure, and since it’s more computationally expensive to process (the Execute method being roughly 5-10% slower), it should used only be when parent-child polygon relationships are needed, or when open paths are being ‘clipped’.

An empty PolyTree object can be passed as the solution parameter in ClipperEngineMBS.Execute and in ClipperOffsetMBS.Execute. Once the clipping or offsetting operation is completed, the method returns with the PolyTree structure filled with data representing the solution.

A PolyTree object is a container for any number of PolyNode children, with each contained PolyNode representing a single polygon contour (either an outer or hole polygon). PolyTree itself is a specialized PolyNode whose immediate children represent the top-level outer polygons of the solution. (Its own Contour property is always empty.) The contained top-level PolyNodes may contain their own PolyNode children representing hole polygons that may also contain children representing nested outer polygons etc. Children of outers will always be holes, and children of holes will always be outers.

PolyTrees can also contain open paths. Open paths will always be represented by top level PolyNodes. Two functions are provided to quickly separate out open and closed paths from a polytree - OpenPathsFromPolyTree and ClosedPathsFromPolyTree.

Subclass of the ClipperPolyNodeMBS class.

30.10.2 Methods

30.10.3 Clear

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This method clears any PolyNode children contained by PolyTree the object.

**Notes:** Clear does not need to be called explicitly. The Clipper.Execute method that accepts a PolyTree parameter will automatically clear the PolyTree object before propagating it with new PolyNodes. Likewise, PolyTree’s destructor will also automatically clear any contained PolyNodes.
30.10. **CLASS CLIPPERPOLYTREEMBS**

### 30.10.4 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Creates a new empty polytree.

See also:

- 30.10.5 Constructor(otherPolyNodes as ClipperPolyTreeMBS)

### 30.10.5 Constructor(otherPolyNodes as ClipperPolyTreeMBS)

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Creates a copy of an existing poly tree.

See also:

- 30.10.4 Constructor

### 30.10.6 Properties

### 30.10.7 First as ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

The first node.

**Notes:**

This method returns the first outer polygon contour if any, otherwise a null pointer.

This function is almost equivalent to calling Childs [ 0 ] except that when a PolyTree object is empty (has no children), calling Childs [ 0 ] would raise an out of range exception.

(Read only property)

### 30.10.8 Total as Integer

MBS Tools Plugin, Plugin Version: 18.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Returns the total number of PolyNodes (polygons) contained within the PolyTree.

**Notes:**

This value is not to be confused with ChildCount which returns the number of immediate children only (Childs) contained by PolyTree.

(Read only property)
Chapter 31

CloudKit

31.1 class CKAcceptSharesOperationMBS

31.1.1 class CKAcceptSharesOperationMBS

31.1.2 Methods

31.1.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes and returns an operation object configured to process share metadata. Notes: You can use the returned CKAcceptSharesOperation only once. When executed, this query object processes the share metadata. See also:

- 31.1.4 Constructor(shareMetadatas() as CKShareMetadataMBS) 5161

31.1.4 Constructor(shareMetadatas() as CKShareMetadataMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes and returns an operation object configured to process the specified share objects. Notes: shareMetadatas: An array of CKShareMetadataMBS objects. This parameter is used to initialize the value in the shareMetadatas property. If you specify nil, you must assign an appropriate value to the
shareMetadatas property before executing the operation.
See also:

• 31.1.3 Constructor

### 31.1.5 setShareMetadatas(shareMetadatas() as CKShareMetadataMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the metadata of the shares that you want to process. **Notes:** Use this property to view or change the metadata of the share objects you want to process. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

### 31.1.6 shareMetadatas as CKShareMetadataMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The metadata of the shares that you want to process. **Notes:** Use this property to view or change the metadata of the share objects you want to process. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

### 31.1.7 Events

### 31.1.8 acceptSharesCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called when the operation completes. **Notes:**

The Completed event of the underlying NSOperation is also called if both are set. If the error is CKErrorPartialFailure, the errors userInfo dictionary contains a dictionary of shareURL objects to errors keyed off of CKPartialErrorsByItemIDKey. This call happens as soon as the server has seen all record changes and may be invoked while the server is processing the side effects of those changes.

The event is executed serially with respect to the other progress blocks of the operation. If you intend to use this event to process results, update the value of this property before executing the operation or submitting the operation object to a queue.
MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute for each share metadata that the server has processed.

**Notes:**

If the error is nil the share was successfully accepted. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.
31.2 class CKAssetMBS

31.2.1 class CKAssetMBS

31.2.2 Methods

31.2.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether this class is available. Notes: Should be true for OS X 10.10 and newer in 64-bit application.

31.2.4 Constructor(file as FolderItem)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initialize an asset to be saved with the content at the given file. See also:

- 31.2.5 Constructor(URL as String)

31.2.5 Constructor(URL as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initialize an asset to be saved with the content at the given file URL. See also:

- 31.2.4 Constructor(file as FolderItem)

31.2.6 Properties

31.2.7 fileURL as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The URL to the file. Notes:
31.2. CLASS CKASSETMBS

Local file URL where fetched records are cached and saved records originate from.
(Read only property)

31.2.8 Handle as Integer

Notes: (Read and Write property)
31.3 class CKContainerMBS

31.3.1 class CKContainerMBS

Function: An encapsulation of content associated with an app, including content that is accessible to all users and content that is available only to a specific user.

Notes:
A container object manages all explicit and implicit attempts to access the contents of the container.

Every app has a default container object that manages its own native content. If you develop a suite of apps, you can also access any container objects for which you have the appropriate entitlements. Each new container distinguishes between publicly available data and data that is private to the current user. Private data is always stored in the appropriate container directory in the users iCloud account.

see

31.3.2 Methods

31.3.3 accountStatus(tag as Variant = nil)

Function: Reports whether the current users iCloud account can be accessed.

Notes: This method determines the status of the current users iCloud account asynchronously, reporting the results to the block in the completionHandler parameter. Call this method before accessing the private database to determine whether that database is available. While your app is running, use the NSUbiquityIdentityDidChangeNotification notification to detect account changes and call this method again to retrieve the status for the new account.

31.3.4 addOperation(operation as CKOperationMBS)

Function: Queues an operation for execution in the current container.

Notes:
operation: The CKOperationMBS to enqueue. Make sure the operation object you provide is fully configured and ready to be enqueued. Do not change the settings of this object after calling this method.

This method adds the operation object to an operation queue managed by the container itself. Operation objects in the containers queue execute concurrently with default priorities in background threads.
This method changes the operation objects container (if any) to the current container.

### 31.3.5 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.  
**Notes:** Should be true for OS X 10.10 and newer in 64-bit application.

### 31.3.6 CKAccountChangedNotification as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The account changed notification name.

### 31.3.7 CKCurrentUserDefaultName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default name for the current user.

### 31.3.8 CKErrorDomain as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The error domain name for CloudKit.

### 31.3.9 CKErrorRetryAfterKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the user dictionary keys for error dictionaries.  
**Notes:** On CKErrorServiceUnavailable or CKErrorRequestRateLimited errors the userInfo dictionary may contain a number that specifies the period of time in seconds after which the client may retry the request.

### 31.3.10 CKOwnerDefaultName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The user ID representing the current user. Use this value when creating zone IDs.
31.3.11 **CKPartialErrorsByItemIDKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** When a CKErrorPartialFailure happens this key will be set in the error’s userInfo dictionary. **Notes:** The value of this key will be a dictionary, and the values will be errors for individual items with the keys being the item IDs that failed.

31.3.12 **CKRecordChangedErrorAncestorRecordKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the error details keys. **Notes:** If the server rejects a record save because it has been modified since the last time it was read, a CKErrorServerRecordChanged error will be returned and it will contain versions of the record in its userInfo dictionary. Apply your custom conflict resolution logic to the server record (CKServerRecordKey) and attempt a save of that record.

31.3.13 **CKRecordChangedErrorClientRecordKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the error details keys. **Notes:** If the server rejects a record save because it has been modified since the last time it was read, a CKErrorServerRecordChanged error will be returned and it will contain versions of the record in its userInfo dictionary. Apply your custom conflict resolution logic to the server record (CKServerRecordKey) and attempt a save of that record.

31.3.14 **CKRecordChangedErrorServerRecordKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the error details keys. **Notes:** If the server rejects a record save because it has been modified since the last time it was read, a CKErrorServerRecordChanged error will be returned and it will contain versions of the record in its userInfo dictionary. Apply your custom conflict resolution logic to the server record (CKServerRecordKey) and attempt a save of that record.
31.3. CLASS CKCONTAINERMBS

31.3.15 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

31.3.16 containerWithIdentifier(name as string) as CKContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the container object associated with the specified identifier.  
**Notes:**

containerIdentifier: The bundle identifier of the app whose container you want to access. The bundle identifier must be in the apps com.apple.developer.icloud-container-identifiers entitlement. This parameter must not be nil.

Returns the container object for the designated apps content, or nil if the container cannot be found.

The specified identifier must correspond to one of the ubiquity containers listed in the iCloud capabilities section of your Xcode project. Including the identifier with your apps capabilities adds the corresponding entitlements to your app. To access your apps default container, use the defaultContainer method instead.

31.3.17 defaultContainer as CKContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default container object for managing the current apps content.  
**Notes:**

Returns the container object associated with the current apps content. This method always returns a valid container object.

Use this method to retrieve the container for your apps native content. This container is the one your app typically uses to store its data. If you want the container for a different app, create and initialize that container using the containerWithIdentifier method.

During development, the returned container object points to a development version of your apps container. When you ship your app, the returned object points to the live production environment.
31.3.18 discoverAllContactUserInfos(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieves information about all discoverable users that are known to the current user. **Notes:**

Use this method to retrieve information about other users of the app. This method returns information about those users who meet the following criteria:

- There is contact information for the user in the current users address book.
- The user has run the app.
- The user has granted the CKApplicationPermissionUserDiscoverability permission to your app for this container.

This method searches for the users asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverAllContactsOperationMBS object and configure the desired priority.

31.3.19 discoverAllIdentities(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fetches all user records that match an entry in the users address book. **Notes:**

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverAllContactsOperation object and configure the desired priority.

31.3.20 discoverUserIdentityWithEmailAddress(emailAddress as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the user record ID associated in the users contacts with the email address. **Notes:**

email: The email address used to locate the user.

Use this method to retrieve the ID of a user that is known to the current user. The user you are searching for must meet the following criteria:

- The user must be in the current users address book.
31.3. CLASS CKCONTAINERMBS

- The user must have run the app.
- The user must have granted the userDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

31.3.21 discoverUserIdentityWithPhoneNumber(phoneNumber as string, tag as Variant = nil)

Function: Returns the user record ID associated in the users contacts with the phone number.

Notes:
phoneNumber: The phone number used to locate the user.

Use this method to retrieve the ID of a user that is known to the current user. The user you are searching for must meet the following criteria:

- The user must be in the current users address book.
- The user must have run the app.
- The user must have granted the userDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

31.3.22 discoverUserIdentityWithUserRecordID(userRecordID as CKRecordIDMBS, tag as Variant = nil)

Function: Retrieves information about a single user based on the ID of the corresponding user record.

Notes:
userRecordID: The ID of the user record.

Use this method to retrieve information about a user for which you already have a user record ID. The user you are searching for must meet the following criteria:

- The user must have run the app.
• The user must have granted the userDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

31.3.23 discoverUserInfoWithEmailAddress(emailAddress as string, tag as Variant = nil)

Function: Retrieves information about a single user based on that users email address. 
Notes: 
email: The iCloud email address of the user you want to locate. 

Use this method to retrieve the ID of a user that is known to the current user. The user you are searching for must meet the following criteria:

• The user must be in the current users address book. 
• The user must have run the app. 
• The user must have granted the CKApplicationPermissionUserDiscoverability permission for this container. 

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

31.3.24 discoverUserInfoWithUserRecordID(userRecordID as CKRecordIDMBS, tag as Variant = nil)

Function: Retrieves information about a single user based on the ID of the corresponding user record. 
Notes: 
userRecordID: The ID of the user record. 

Use this method to retrieve information about a user for which you already have a user record ID. The user you are searching for must meet the following criteria:

• The user must have run the app.
31.3. **CLASS CKCONTAINERMBS**

- The user must have granted the CKApplicationPermissionUserDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

### 31.3.25 fetchAllLongLivedOperationIDs(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the identifiers of the running or recently completed long-lived operations. **Notes:** A long-lived operation is an operation that continues to run after the app exits, described in CKOperationMBS. To get the operation object for an identifier, use the fetchLongLivedOperationWithID method.

### 31.3.26 fetchLongLivedOperationWithID(operationID as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the running or recently completed long-lived operation specified by the operation identifier. **Notes:**

- operationID: The identifier of the long-lived operation you want to fetch.

A long-lived operation is an operation that continues to run after the app exits, described in CKOperationMBS. To receive the callbacks for a long-lived operations, set its completion block and add it to an operation queue.

### 31.3.27 fetchShareParticipantWithEmailAddress(emailAddress as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieves information about a single share participant (a person who accepted a shared record) based on that participants email address. **Notes:**

- emailAddress: The iCloud email address of the share participant you want to locate.

This method searches for the share participant asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKFetchShareParticipantsOperationMBS object and configure the desired priority.
### 31.3.28 fetchShareParticipantWithPhoneNumber

**Function:** Retrieves information about a single share participant (a person who accepted a shared record) based on that participant's phone number.

**Notes:**

- `phoneNumber`: The phone number used to locate the share participant.

This method searches for the share participant asynchronously and with a low priority. If you want the task to execute with a higher priority, create a `CKFetchShareParticipantsOperationMBS` object and configure the desired priority.

### 31.3.29 fetchShareParticipantWithUserRecordID

**Function:** Retrieves information about a single share participant based on the ID of the corresponding user record.

**Notes:**

- `userRecordID`: The ID of the user record.

This method searches for the share participant asynchronously and with a low priority. If you want the task to execute with a higher priority, create a ` CKFetchShareParticipantsOperationMBS` object and configure the desired priority.

### 31.3.30 fetchUserRecordID

**Function:** Returns the user record ID associated with the current user.

**Notes:**

- At startup time, fetching the user record ID may take longer while CloudKit makes the initial iCloud account request. After the initial fetch, accessing the user record ID should take less time. If no iCloud account is associated with the device, or if access to the user's iCloud account is restricted, this method returns an error of type `CKErrorNotAuthenticated`. 

31.3. CLASS CKCONTAINERMBS

31.3.31 requestApplicationPermission(applicationPermission as Integer, tag as Variant = nil)

Function: Requests the specified permission from the user to make the user's identity discoverable.
Notes:
applicationPermission: The requested permission. This requested permission applies to the current container only and will not impact permissions granted for other containers. For a list of possible values, see CKApplicationPermissions.

To implement social features in your app, it is possible to correlate a user record with the user's actual name, but your app must get permission from the user to do so. Making a user record discoverable to the friends (contacts) of that user involves calling the requestApplicationPermission method and asking for the CKApplicationPermissionUserDiscoverability permission. When you call that method, CloudKit asks the user on your behalf whether the user record should be made discoverable. If the user grants the request, that user's contacts can discover that user's true identity when running the app. To discover the contacts of the current user, you use the discoverAllContactUserInfos method or one of several other methods to get the related user information.

The first time you request a permission on any of the user's devices, the user is prompted to grant or deny the request. Once the user grants or denies a permission, subsequent requests for the same permission (on the same or separate devices), do not prompt the user again.

This method runs asynchronously and delivers the results to the block you provide.

31.3.32 statusForApplicationPermission(applicationPermission as Integer, tag as Variant = nil)

Function: Checks the status of the specified permission asynchronously.
Notes:
applicationPermission: The permission whose status you want to check. For a list of possible values, see CKApplicationPermissions.

Use this method to determine the extra capabilities granted to your app by the user. If your app has not yet requested a specific permission, calling this method may yield the value CKApplicationPermissionStatusInitialState for the permission. When that value is returned, call the requestApplicationPermission method to request the permission from the user.
31.3.33 Properties

31.3.34 containerIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The string that identifies the app's container. **Notes:** Use the value in this property to distinguish between different container objects in your app. (Read only property)

31.3.35 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

31.3.36 privateCloudDatabase as CKDatabaseMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The database containing the users private data. **Notes:** The database in this property is available only if the device has an active iCloud account. Access to the database is limited to the user of that iCloud account by default. The current user owns all content in the private database and is allowed to read and write that content. Data in the private database is not visible in the developer portal or to any other users. Data stored in the private database counts against the storage quota of the current users iCloud account. If there is no active iCloud account on the users device, this property still returns a valid database object, but attempts to use that object will return errors. To determine if there is an active iCloud account on the device, use the accountStatus method. (Read only property)

31.3.37 publicCloudDatabase as CKDatabaseMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The database containing the data shared by all users. **Notes:**
The database in this property is available regardless of whether the users device has an active iCloud account. The contents of the public database are readable by all users of the app, and users have write access to the records (and other data objects) they create. Data in the public database is also visible in the developer portal, where you can assign roles to users and restrict access as needed.

Data stored in the public database counts against your apps iCloud storage quota and not against the quota of any single user.

(Read only property)

**31.3.38 sharedCloudDatabase as CKDatabaseMBS**

**Function:** The database containing shared user data.  
**Notes:**

The database in this property is available only if the device has an active iCloud account. Permissions on the database are limited to the user based on the permissions of the enclosing CKShareMBS object (representing the record that has been shared). The current user does not own the content in the shared database and is allowed to read and write that content only if that permission has been granted in the CKShareMBS. Data in the shared database is not visible in the developer portal or to any user who has not been granted access.

Data stored in the shared database does not count against the storage quota of the current users iCloud account.

If there is no active iCloud account on the users device, this property still returns a valid database object, but attempts to use the object will return errors. To determine whether the device has an active iCloud account use the accountStatus method.

(Read only property)

**31.3.39 Events**

**31.3.40 accountStatusCompleted(accountStatus as Integer, error as NSErrorMBS, tag as Variant)**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to be called when accountStatus is returned.  
**Notes:**

accountStatus: The status of the current users iCloud account.  
error: An error object, or nil if the status is determined successfully. Use the information in the error object to determine whether the problem has a workaround.
### discoverAllContactUserInfosCompleted

**Function:** The event to execute with the results for discoverAllContactUserInfos method.

**Notes:**
Your block must be capable of executing on any thread of the app. This block returns no value and takes the following parameters:

- **userInfos:** An array of CKDiscoveredUserInfoMBS objects. Each object in the array contains information about the user, including the ID of the corresponding user record. If no users are discovered, the provided array is empty.
- **error:** An error object if a problem occurs, or nil if the IDs are retrieved successfully.

### discoverAllIdentitiesWithCompleted

**Function:** The event to execute with the results for discoverAllIdentities method.

**Notes:**
This event returns no value and takes the following parameters:

- **userIdentities:** An array of CKUserIdentityMBS objects that match entries in the users contacts.
- **error:** An error object if a problem occurs or nil if the fetch completed successfully.

### discoverUserIdentityWithEmailAddressCompleted

**Function:** The event to execute with the results for discoverUserIdentityWithEmailAddress method.

**Notes:**
This event returns no value and takes the following parameters:

- **userInfo:** The user (CKUserIdentityMBS object) associated with the email address, or nil if an identity could not be located.
- **error:** An error object if a problem occurs or nil if the CKUserIdentityMBS is retrieved successfully.
31.3.44 discoverUserIdentityWithPhoneNumberCompleted(phoneNumber as String, userInfo as CKUserIdentityMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event to execute with the results for discoverUserIdentityWithPhoneNumber method.

Notes:
This event returns no value and takes the following parameters:

userInfo: The user (CKUserIdentityMBS object) associated with the phone number, or nil if an identity could not be located.
error: An error object if a problem occurs, or nil if the CKUserIdentityMBS is retrieved successfully.

31.3.45 discoverUserIdentityWithUserRecordIDCompleted(userRecordID as CKRecordIDMBS, userInfo as CKUserIdentityMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event to execute with the results for discoverUserIdentityWithUserRecordID.

Notes:
This event returns no value and takes the following parameters:

userInfo
An object containing information about the user, or nil if the user is not found.

error
An error object if a problem occurs, or nil if the ID is retrieved successfully.

31.3.46 discoverUserInfoWithEmailAddressCompleted(emailAddress as String, userInfo as CKDiscoveredUserInfoMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event to execute with the results for discoverUserInfoWithEmailAddress method.

Notes:
This event returns no value and takes the following parameters:

userInfo: An object containing information about the user or nil if the user is not found.
error: An error object if a problem occurs or nil if the ID is retrieved successfully.
31.3.47 discoverUserInfoWithUserRecordIDCompleted(userRecordID as CKRecordIDMBS, userInfo as CKDiscoveredUserInfoMBS, error as NSErrorMBS, tag as Variant)

Notes: This event returns no value and takes the following parameters:

userInfo: An object containing information about the user or nil if the user is not found.
error: An error object if a problem occurs or nil if the ID is retrieved successfully.

31.3.48 fetchAllLongLivedOperationIDsCompleted(outstandingOperationIDs() as String, error as NSErrorMBS, tag as Variant)

Notes: outstandingOperationsByIDs: An array containing the identifiers for all the active long-lived operations. If a long-lived operation is canceled or completed, it is no longer an active operation, and its identifier will not be included in this array. An operation is complete if the app successfully receives the completion callback.
error: An error object, or nil if the fetch is successful.

31.3.49 fetchLongLivedOperationWithIDCompleted(operationID as String, outstandingOperation as CKOperationMBS, error as NSErrorMBS, tag as Variant)

Notes: outstandingOperation: The proxy object for the corresponding long-lived operation. If a long-lived operation was canceled or completed, this is nil.
error: An error object, or nil if the fetch is successful.
31.3.50 fetchShareParticipantWithEmailAddressCompleted(emailAddress as String, shareParticipant as CKShareParticipantMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchShareParticipantWithEmailAddress method.

**Notes:**
This event returns no value and takes the following parameters:

- shareParticipant: An object containing information about the share participant, or nil if the participant is not found.
- error: An error object if a problem occurs, or nil if the participant is retrieved successfully.

31.3.51 fetchShareParticipantWithPhoneNumberCompleted(phoneNumber as String, shareParticipant as CKShareParticipantMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchShareParticipantWithPhoneNumber method.

**Notes:**
- shareParticipant: An object containing information about the share participant, or nil if the participant is not found.
- error: An error object if a problem occurs, or nil if the participant is retrieved successfully.

31.3.52 fetchShareParticipantWithUserRecordIDCompleted(userRecordID as CKRecordIDMBS, shareParticipant as CKShareParticipantMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called for fetchShareParticipantWithUserRecordID.

**Notes:**
This event returns no value and takes the following parameters:

- shareParticipant: An object containing information about the share participant, or nil if the participant is not found.
- error: An error object if a problem occurs, or nil if the participant is retrieved successfully.
31.3.53 fetchUserRecordIDCompleted(userRecordID as CKRecordIDMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchUserRecordID method.

**Notes:**
- recordID: The ID of the user record for the current user, or nil if the current device is not configured with an iCloud account.
- error: An error object if a problem occurs, or nil if the record ID is retrieved successfully.

31.3.54 requestApplicationPermissionCompleted(applicationPermissionStatus as Integer, accountStatus as Integer, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for requestApplicationPermission method.

31.3.55 statusForApplicationPermissionCompleted(applicationPermissionStatus as Integer, accountStatus as Integer, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for statusForApplicationPermission method.

31.3.56 Constants

31.3.57 CKAccountStatusAvailable = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the availability of the users iCloud account.

**Notes:** The users iCloud account is available and may be used by this app.

31.3.58 CKAccountStatusCouldNotDetermine = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the availability of the users iCloud account.

**Notes:** An error occurred during an attempt to retrieve the account status. Consult the provided NSError
31.3.59  CKAccountStatusNoAccount = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the availability of the users iCloud account.
**Notes:** The users iCloud account is not available because no account information has been provided for this device.

31.3.60  CKAccountStatusRestricted = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the availability of the users iCloud account.
**Notes:** The users iCloud account is not available. Access was denied due to Parental Controls or Mobile Device Management restrictions.

31.3.61  CKApplicationPermissionStatusCouldNotComplete = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating whether the app has been granted a specific permission.
**Notes:** An error occurred during the getting or setting of the app permission. Consult the provided NSErrorMBS object for more information.

31.3.62  CKApplicationPermissionStatusDenied = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating whether the app has been granted a specific permission.
**Notes:** The user denied access to the permission.

31.3.63  CKApplicationPermissionStatusGranted = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating whether the app has been granted a specific permission.
**Notes:** The user granted access to the permission.
31.3.64  **CKApplicationPermissionStatusInitialState = 0**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating whether the app has been granted a specific permission.  
**Notes:** The user has not yet decided whether to grant this permission. Use the requestApplicationPermission method to ask the user to grant the permission.

31.3.65  **CKApplicationPermissionUserDiscoverability = 1**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** The current user is discoverable (through the users email address) to other users of the app.

31.3.66  **ErrorAlreadyShared = 30**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** A record/share cannot be saved, doing so would cause a hierarchy of records to exist in multiple shares.

31.3.67  **ErrorAssetFileModified = 17**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** Asset file content was modified while being saved.

31.3.68  **ErrorAssetFileNotFound = 16**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** Asset file was not found.

31.3.69  **ErrorBadContainer = 5**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** Un-provisioned or unauthorized container. Try provisioning the container before retrying the operation.
31.3.70  **ErrorBadDatabase = 24**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** Operation could not be completed on the given database. Likely caused by attempting to modify zones in the public database.

31.3.71  **ErrorBatchRequestFailed = 22**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** One of the items in this batch operation failed in a zone with atomic updates, so the entire batch was rejected.

31.3.72  **ErrorChangeTokenExpired = 21**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** The previousServerChangeToken value is too old and the client must re-sync from scratch.

31.3.73  **ErrorConstraintViolation = 19**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** The server rejected the request because there was a conflict with a unique field.

31.3.74  **ErrorIncompatibleVersion = 18**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** App version is less than the minimum allowed version.

31.3.75  **ErrorInternalError = 1**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** CloudKit.framework encountered an error. This is a non-recoverable error.

31.3.76  **ErrorInvalidArguments = 12**

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** Bad client request (bad record graph, malformed predicate)
31.3.77 ErrorLimitExceeded = 27

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the error constants.
Notes: The request to the server was too large. Retry this request as a smaller batch.

31.3.78 ErrorManagedAccountRestricted = 32

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the error constants.
Notes: Request was rejected due to a managed account restriction.

31.3.79 ErrorMissingEntitlement = 8

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the error constants.
Notes: Missing entitlement

31.3.80 ErrorNetworkFailure = 4

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the error constants.
Notes: Network error (available but CFNetwork gave us an error)

31.3.81 ErrorNetworkUnavailable = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the error constants.
Notes: Network not available

31.3.82 ErrorNotAuthenticated = 9

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the error constants.
Notes: Not authenticated (writing without being logged in, no user record)
31.3. CLASS CKCONTAINERMBS

31.3.83 ErrorOperationCancelled = 20

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the error constants. Notes: A CKOperation was explicitly cancelled.

31.3.84 ErrorPartialFailure = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the error constants. Notes: Some items failed, but the operation succeeded overall. Check CKPartialErrorsByItemIDKey in the userInfo dictionary for more details.

31.3.85 ErrorParticipantMayNeedVerification = 33

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the error constants. Notes: Share Metadata cannot be determined, because the user is not a member of the share. There are invited participants on the share with email addresses or phone numbers not associated with any iCloud account. The user may be able to join the share if they can associate one of those email addresses or phone numbers with their iCloud account via the system Share Accept UI. Call UIApplication’s openURL on this share URL to have the user attempt to verify their information.

31.3.86 ErrorPermissionFailure = 10

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the error constants. Notes: Access failure (save, fetch, or shareAccept)

31.3.87 ErrorQuotaExceeded = 25

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the error constants. Notes: Saving a record would exceed quota

31.3.88 ErrorReferenceViolation = 31

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the error constants. Notes: The target of a record’s parent or share reference was not found.
31.3.89  ErrorRequestRateLimited = 7
MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** Client is being rate limited

31.3.90  ErrorResultsTruncated = 13
MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** Results Truncated. Deprecated and will not be returned. 

31.3.91  ErrorServerRecordChanged = 14
MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** The record was rejected because the version on the server was different. 

31.3.92  ErrorServerRejectedRequest = 15
MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** The server rejected this request. This is a non-recoverable error. 

31.3.93  ErrorServiceUnavailable = 6
MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** Service unavailable 

31.3.94  ErrorTooManyParticipants = 29
MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** A share cannot be saved because there are too many participants attached to the share. 

31.3.95  ErrorUnknownItem = 11
MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** Record does not exist
31.3. CLASS CKCONTAINERMBS

31.3.96 ErrorUserDeletedZone = 28

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
**Notes:** The user deleted this zone through the settings UI. Your client should either remove its local data or prompt the user before attempting to re-upload any data to this zone.

31.3.97 ErrorZoneBusy = 23

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
**Notes:** The server is too busy to handle this zone operation. Try the operation again in a few seconds.

31.3.98 ErrorZoneNotFound = 26

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the error constants.
**Notes:** The specified zone does not exist on the server.
31.4 class CKDatabaseMBS

31.4.1 class CKDatabaseMBS

**Function:** A conduit for accessing and for performing operations on the public and private data of an app container.

**Notes:**
An app container has a public database whose data is accessible to all users and a private database whose data is accessible only to the current user. A database object takes requests for data and applies them to the appropriate part of the container.

You do not create database objects yourself, nor should you subclass CKDatabaseMBS. Your apps CKContainerMBS objects provide the CKDatabaseMBS objects you use to access the associated data. Use database objects as-is to perform operations on data.

The public database is always available, regardless of whether the device has an active iCloud account. When no iCloud account is available, your app may fetch records and perform queries on the public database, but it may not save changes. (Saving records to the public database requires an active iCloud account to identify the owner of those records.) Access to the private database always requires an active iCloud account on the device.

see

31.4.2 Methods

31.4.3 addOperation(operation as CKDatabaseOperationMBS)

**Function:** Executes the specified operation asynchronously against the current database.

**Notes:**
operation: The operation object to execute. You must configure the operation object with any dependencies and completion handlers before calling this method. If this parameter is nil, the method does nothing.

Do not change the properties of the operation object after calling this method. Prior to executing the operation, this method sets the operation objects database property to the current database, replacing any previously assigned database.

This method executes the operation object with the priority you assigned to the object through its queuePriority property.
31.4. CLASS CKDATABASEMBS

31.4.4 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available. **Notes:** Should be true for OS X 10.10 and newer in 64-bit application.

31.4.5 Constructor(Container as CKContainerMBS, databaseScope as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieves the database with the appropriate scope. **Notes:**

databaseScope: The scope of the database you want returned.

Returns an initialized CKDatabase object with the appropriate scope. This convenience method returns the database associated with the specified container that is of the scope requested.

31.4.6 deleteRecordWithID(recordID as CKRecordIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Deletes the specified record asynchronously, with a low priority, from the current database. **Notes:**

recordID: The ID of the record you want to delete. This method throws an exception if this parameter is nil.

Deleting a record may trigger additional deletions if the record was referenced by other records. This method reports only the ID of the record you asked to delete. CloudKit does not report deletions triggered by owning relationships between records.

This method deletes the record with a low priority, which may cause the task to execute after higher-priority tasks. To delete records more urgently, create a CKModifyRecordsOperationMBS object with the desired priority. You can also use that operation object to delete multiple records simultaneously.
31.4.7 deleteRecordWithIDSync(recordID as CKRecordIDMBS, byref error as NSErrorMBS)

Function: Deletes the specified record synchronously, with a low priority, from the current database.

Notes:

recordID: The ID of the record you want to delete. This method throws an exception if this parameter is nil.

Deleting a record may trigger additional deletions if the record was referenced by other records. This method reports only the ID of the record you asked to delete. CloudKit does not report deletions triggered by owning relationships between records.

This method deletes the record with a low priority, which may cause the task to execute after higher-priority tasks. To delete records more urgently, create a CKModifyRecordsOperationMBS object with the desired priority. You can also use that operation object to delete multiple records simultaneously.

31.4.8 deleteRecordZone(zoneID as CKRecordZoneIDMBS, tag as Variant = nil)

Function: Deletes one record zone (and its contents) asynchronously, with a low priority, from the current database.

Notes:

zoneID: The ID of the zone you want to delete. This method throws an exception if this parameter is nil.

Deleting a zone permanently deletes the zone and all records in that zone. After deleting the zone, you can use the same ID to create a new empty zone.

This method deletes the record zone with a low priority, which may cause the task to execute after higher-priority tasks. To delete the record zone more urgently, create a CKModifyRecordZonesOperationMBS object with the desired priority. You can also use that operation object to delete multiple record zones simultaneously.

31.4.9 deleteSubscriptionWithID(subscriptionID as String, tag as Variant = nil)

Function: Deletes one subscription object asynchronously, with a low priority, from the current database.

Notes:
subscriptionID: The ID of the subscription object to delete. This method throws an exception if this parameter is nil.

Deleting a subscription stops the subscription from watching its changed records and sending alerts.

This method deletes the subscription object with a low priority, which may cause the task to execute after higher-priority tasks. To delete the subscription more urgently, create a CKModifySubscriptionsOperationMBS object with the desired priority. You can also use that operation object to delete multiple subscription objects simultaneously.

31.4.10 fetchAllRecordZones(tag as Variant = nil)

Function: Fetches all record zones asynchronously, with a low priority, from the current database.
Notes:
Use this method to locate the record zones in this database. Record zones represent groups of records with a common purpose.

This method fetches record zones with a low priority, which may cause the task to execute after higher-priority tasks. To fetch record zones more urgently, create a CKFetchRecordZonesOperationMBS object with the desired priority.

31.4.11 fetchAllSubscriptions(tag as Variant = nil)

Function: Fetches all subscription objects asynchronously, with a low priority, from the current database.
Notes:
Use this method to locate the subscriptions in the current database. Subscriptions represent persistent queries on the server. A subscription can be used to alert the app when records change.

This method fetches the subscription objects with a low priority, which may cause the task to execute after higher-priority tasks. To fetch subscriptions more urgently, create a CKFetchSubscriptionsOperationMBS object with the desired priority.
31.4.12 fetchRecordWithID(recordID as CKRecordIDMBS, tag as Variant = nil)

Function: Fetches one record asynchronously, with a low priority, from the current database.
Notes:
recordID: The ID of the record you want to fetch. This method throws an exception if this parameter is nil.

Use this method to fetch records that are not urgent to your app's execution. This method fetches the record with a low priority, which may cause the fetch to execute after higher-priority tasks. To fetch records more urgently, create a CKFetchRecordsOperation object with the desired priority. You can also use that operation object to fetch multiple records simultaneously.

31.4.13 fetchRecordWithIDSync(recordID as CKRecordIDMBS, byref record as CKRecordMBS, byref error as NSErrorMBS)

Function: Fetches one record synchronously, with a low priority, from the current database.
Notes:
recordID: The ID of the record you want to fetch. This method throws an exception if this parameter is nil.
record: The requested record object. If no such record is found, this parameter is nil.
error: An error object, or nil if the record was fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

Use this method to fetch records that are not urgent to your app's execution. This method fetches the record with a low priority, which may cause the fetch to execute after higher-priority tasks. To fetch records more urgently, create a CKFetchRecordsOperation object with the desired priority. You can also use that operation object to fetch multiple records simultaneously.

31.4.14 fetchRecordZoneWithID(zoneID as CKRecordZoneIDMBS, tag as Variant = nil)

Function: Fetches one record zone asynchronously, with a low priority, from the current database.
Notes:
zoneID: The ID of the record zone. This method throws an exception if this parameter is nil.

Use this method to retrieve a record zone whose ID you already know. You might retrieve a record zone object so that you can assess its capabilities.
31.4. CLASS CKDATABASEMBS

This method fetches the record zone with a low priority, which may cause the task to execute after higher-priority tasks. To fetch the record zone more urgently, create a CKFetchRecordZonesOperationMBS object with the desired priority. You can also use that operation object to fetch multiple record zones simultaneously.

31.4.15 fetchSubscriptionWithID(subscriptionID as String, tag as Variant = nil)

Function: Fetches one subscription object asynchronously, with a low priority, from the current database.  
Notes:  
subscriptionID: The ID of the subscription object. This method throws an exception if this parameter is nil.

Use this method to retrieve a subscription object whose ID you already know. You might retrieve a subscription object so that you can assess its attributes or update the notification information used to generate alerts.

This method fetches the subscription object with a low priority, which may cause the task to execute after higher-priority tasks. To fetch the subscription more urgently, create a CKFetchSubscriptionsOperationMBS object with the desired priority. You can also use that operation object to fetch multiple subscription objects simultaneously.

31.4.16 performQuery(query as CKQueryMBS, zoneID as CKRecordZoneIDMBS, tag as Variant = nil)

Function: Searches the specified zone asynchronously for records that match the query parameters.  
Notes:  
query: The query object containing the parameters for the search. This method throws an exception if this parameter is nil. For information about how to construct queries, see CKQueryMBS.  
zoneID: The ID of the zone to search. Search results are limited to records in the specified zone. Specify nil to search the default zone of the database.

Use this method to execute searches against the current database. Do not use this method when the number of returned records is potentially more than a few hundred records; when more records are needed, create an execute a CKQueryOperationMBS instead of calling performQuery:inZoneWithID on the CKDatabaseMBS. For efficiency, all queries automatically limit the number of returned records based on current conditions. If your query hits the maximum value, this method returns only the first portion of the overall results. The number of returned records should be sufficient in most cases, but to get the entire set of records you must create and execute a CKQueryOperationMBS object instead. Query operations also return a maximum number of results, but when they do, they provide a cursor object that you can use to fetch the next batch of results.
You can search any content that is represented by a CKRecord object, including user records. You cannot use this method to search for CKSubscriptionMBS or CKRecordZoneMBS objects.

### 31.4.17 saveRecord(record as CKRecordMBS, tag as Variant = nil)

**Function:** Saves one record asynchronously, with a low priority, to the current database, if the record has never been saved or if it is newer than the version on the server.

**Notes:**
- record: The record to save. This method throws an exception if this parameter is nil.
- This method saves the record only if it has never been saved before or if it is newer than the version on the server. You cannot use this method to overwrite newer versions of a record on the server.
- This method saves the record with a low priority, which may cause the task to execute after higher-priority tasks. To save records more urgently, create a CKModifyRecordsOperationMBS object with the desired priority. You can also use that operation object to save multiple records simultaneously.

### 31.4.18 saveRecordSync(record as CKRecordMBS, byref error as NSErrorMBS)

**Function:** Saves one record synchronously, with a low priority, to the current database, if the record has never been saved or if it is newer than the version on the server.

**Notes:**
- record: The record to save. This method throws an exception if this parameter is nil.
- This method saves the record only if it has never been saved before or if it is newer than the version on the server. You cannot use this method to overwrite newer versions of a record on the server.
- This method saves the record with a low priority, which may cause the task to execute after higher-priority tasks. To save records more urgently, create a CKModifyRecordsOperationMBS object with the desired priority. You can also use that operation object to save multiple records simultaneously.

### 31.4.19 saveRecordZone(zone as CKRecordZoneMBS, tag as Variant = nil)

**Function:** Saves one record zone asynchronously, with a low priority, to the current database.
31.4. CLASS CKDATABASEMBS

Notes:

zone: The zone you want to save to the database. This method throws an exception if this parameter is nil.

Use this method to save a record zone to the database so that you can subsequently store records in it. Record zones must be saved before you attempt to save any records that reside in that zone. Because this method executes asynchronously, use the completion handler to verify that the zone was saved successfully before attempting to save any records.

This method saves the record zone with a low priority, which may cause the task to execute after higher-priority tasks. To save the record zone more urgently, create a CKModifyRecordZonesOperationMBS object with the priority you want. You can also use that operation object to save multiple record zones all at once.

31.4.20 saveSubscription(subscription as CKSubscriptionMBS, tag as Variant = nil)

Function: Saves one subscription object asynchronously, with a low priority, to the current database.

Notes:

subscription: The subscription object you want to save to the database. This method throws an exception if this parameter is nil.

Use this method to save a subscription to the database so that the subscription can begin watching for changes.

This method saves the subscription object with a low priority, which may cause the task to execute after higher-priority tasks. To save the subscription more urgently, create a CKModifySubscriptionsOperationMBS object with the desired priority. You can also use that operation object to save multiple subscription objects simultaneously.

31.4.21 Properties

31.4.22 databaseScope as Integer

Function: The type of database (public, private, or shared).

Notes: (Read only property)
31.4.23 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

31.4.24 Events

31.4.25 `deleteRecordWithIDCompleted(recordID as CKRecordIDMBS, error as NSErrorMBS, tag as Variant)`

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute with the results for deleteRecordWithID method. **Notes:**

recordID: The ID of the record you attempted to delete.
error: An error object, or nil if the record zone was deleted successfully. Use the information in the error object to determine whether a problem has a workaround.

31.4.26 `deleteRecordZoneWithIDCompleted(zoneID as CKRecordZoneIDMBS, error as NSErrorMBS, tag as Variant)`

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute with the results for deleteRecordZone method. **Notes:**

zoneID: The ID of the zone that you tried to delete.
error: An error object, or nil if the record zone was deleted successfully. Use the information in the error object to determine whether a problem has a workaround.

31.4.27 `deleteSubscriptionWithIDCompleted(subscriptionID as String, error as NSErrorMBS, tag as Variant)`

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for deleteSubscriptionWithID method. **Notes:**

subscriptionID: The ID of the subscription object you attempted to delete.
error: An error object, or nil if the subscription was deleted successfully. Use the information in the error object to determine whether a problem has a workaround.
31.4. CLASS CKDATABASEMBS

31.4.28 fetchAllRecordZonesCompleted(zones() as CKRecordZoneMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchAllRecordZones method. **Notes:**

zones: An array of CKRecordZoneMBS objects. The returned array always contains at least one record zone corresponding to the default zone.
error: An error object, or nil if the record zones were fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

31.4.29 fetchAllSubscriptionsCompleted(subscriptions() as CKSubscriptionMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchAllSubscriptions. **Notes:**

subscriptions: An array of CKSubscription objects. If the subscription objects cannot be retrieved, the array is empty.
error: An error object, or nil if the subscriptions were fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

31.4.30 fetchRecordWithIDCompleted(recordID as CKRecordIDMBS, record as CKRecordMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results. **Notes:**

record: The requested record object. If no such record is found, this parameter is nil.
error: An error object, or nil if the record was fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

31.4.31 fetchRecordZoneWithIDCompleted(zoneID as CKRecordZoneIDMBS, zone as CKRecordZoneMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for fetchRecordZoneWithID method. **Notes:**
zone: The requested CKRecordZone object or nil if the object is not found or cannot be retrieved.
error: An error object, or nil if the record zone was fetched successfully. Use the information in the error
object to determine whether a problem has a workaround.

31.4.32 fetchSubscriptionWithIDCompleted(subscriptionID as String, subscription as CKSubscriptionMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event to execute with the results for fetchSubscriptionWithID.
Notes:
subscription: The requested subscription object or nil if the object is not found or cannot be retrieved.
error: An error object, or nil if the subscription was fetched successfully. Use the information in the error
object to determine whether a problem has a workaround.

31.4.33 performQueryCompleted(query as CKQueryMBS, zoneID as CKRecordZoneIDMBS, results() as CKRecordMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event to execute with the search results.
Notes:
The event to execute with the search results for performQuery method.
results: An array containing zero or more CKRecord objects. The returned records correspond to the records in the specified zone that match the parameters of the query.
error: An error object, or nil if the query was completed successfully. Use the information in the error object to determine whether a problem has a workaround.

31.4.34 saveRecordCompleted(record as CKRecordMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event to execute with the results for saveRecord.
Notes:
record: The record object you attempted to save.
error: An error object, or nil if the record was saved successfully. Use the information in the error object to
determine whether a problem has a workaround.

31.4.35  saveRecordZoneCompleted(zone as CKRecordZoneMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the results for saveRecordZone method.  
**Notes:**  
zone: The CKRecordZone object you attempted to save.  
error: An error object, or nil if the record zone was saved successfully. Use the information in the error object to determine whether a problem has a workaround.

31.4.36  saveSubscriptionCompleted(subscription as CKSubscriptionMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute with the results for saveSubscription method.  
**Notes:**  
subscription: The subscription object you attempted to save.  
error: An error object, or nil if the subscription was saved successfully. Use the information in the error object to determine whether a problem has a workaround.

31.4.37  Constants

31.4.38  ScopePrivate = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the database scopes.  
**Notes:** The private database.

31.4.39  ScopePublic = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the database scopes.  
**Notes:** The public database.
31.4.40 ScopeShared = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the database scopes. **Notes:** The shared database.
31.5 class CKDatabaseNotificationMBS

31.5.1 class CKDatabaseNotificationMBS

Function: A notification object about a database.
Notes:
Subclass of the CKNotificationMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

31.5.2 Methods

31.5.3 Constructor

31.5.4 Properties

31.5.5 databaseScope as Integer

Notes: (Read only property)
31.6 class CKDatabaseOperationMBS

31.6.1 class CKDatabaseOperationMBS

**Function:** The CKDatabaseOperation class is an abstract parent class for operations that act on the public or private databases in a container. 
**Notes:**
Database operations typically involve fetching and saving records and other database objects, as well as queries on the contents of the database. You use the property of this class to tell the operation object which database to use when executing its task. Do not subclass this class or create instances of it. Instead, create instances of one of its concrete subclasses.

Available on macOS 10.12 or newer. 
Subclass of the CKOperationMBS class.

31.6.2 Methods

31.6.3 Constructor

**Function:** The private constructor.

31.6.4 Properties

31.6.5 database as CKDatabaseMBS

**Function:** The database that is the target of the operation. 
**Notes:**
For operations you plan to execute from your own custom queue, use this property to specify the target database. Setting the database also sets the corresponding container, inherited from the CKOperationMBS parent class. If the value of this property is nil, the operation targets the private database of the apps default container.

The default value of this property is nil. 
(Read and Write property)
31.7.  CLASS CKDATABASESUBSCRIPTIONMBS

31.7  class CKDatabaseSubscriptionMBS

31.7.1  class CKDatabaseSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A subscription for database changes.  
**Notes:** Subclass of the CKSubscriptionMBS class.

31.7.2  Methods

31.7.3  Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.  
**Notes:** Should be true for OS X 10.12 and newer in 64-bit application.

31.7.4  Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.  
See also:

- 31.7.5 Constructor(subscriptionID as string)

31.7.5  Constructor(subscriptionID as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.  
See also:

- 31.7.4 Constructor

31.7.6  copy as CKDatabaseSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.
31.7.7 Properties

31.7.8 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The record type.
**Notes:** (Read and Write property)
31.8. class CKDiscoverAllContactsOperationMBS

31.8.1 class CKDiscoverAllContactsOperationMBS

Function: A CKDiscoverAllContactsOperation object retrieves the IDs of all discoverable users that are also in the users address book.

Notes:

The search of the users address book does not return any personal data about the users contacts. The search returns only the IDs of the corresponding user records, which contain only data that your app puts there. CloudKit uses the address book information to identify users of the app that the current user knows. Because the system accesses the address book instead of your app, the system does not display a prompt to the user when that access occurs.

Users of an app must opt in to discoverability before their user records can be accessed. To opt in for a user, your app must call the requestApplicationPermission:completion: method of your container object and request the userDiscoverability permission. Calling that method prompts the user to grant or deny the permission.

If you assign a completion block to the completionBlock property of the operation object, the completion block is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

No Address Book access dialog will be displayed.
Available in OS X 10.10 and newer. Deprecated in 10.12 in favor of CKDiscoverAllUserIdentitiesOperationMBS classes.
Subclass of the CKOperationMBS class.

31.8.2 Methods

31.8.3 Constructor

Function: The constructor.
31.8.4 Events

31.8.5 `discoverAllContactsCompleted(userInfos() as CKDiscoveredUserInfoMBS, 
operationError as NSErrorMBS)`

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to use to process the search results.
**Notes:**
The event has no return value and takes the following parameters:

- `userRecordIDs`: An array of CKDiscoveredUserInfoMBS objects. Each ID corresponds to a user of the app who opts in to discovery by other known users. Use this ID to retrieve the corresponding user record.
- `operationError`: An error object containing information about a problem, or nil if the user record IDs are retrieved successfully.

This event is executed only once, at the conclusion of the operation. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.
31.9. **CLASS CKDISCOVERALLUSERIDENTITIESOPERATIONMBS** 5209

31.9  class CKDiscoverAllUserIdentitiesOperationMBS

31.9.1  class CKDiscoverAllUserIdentitiesOperationMBS

**Function:** An operation that finds all discoverable users in the devices contacts.
**Notes:**
The operation will not generate a dialog indicating that the contacts are being accessed.

Available in OS X 10.12 and newer.
Subclass of the CKOperationMBS class.

31.9.2  Methods

31.9.3  Constructor

**Function:** Initializes and returns an operation object configured to search the devices contacts.
**Notes:** You can use the returned CKDiscoverAllUserIdentitiesOperationMBS only once. When executed, this query object performs a new search and returns a batch of results.
See also:

- 31.9.4 Constructor(accessToken as CKUserIdentityLookupInfoMBS) 5209

31.9.4  Constructor(accessToken as CKUserIdentityLookupInfoMBS)

**Function:** The constructor.
See also:

- 31.9.3 Constructor 5209

31.9.5  Events

31.9.6  discoverAllUserIdentitiesCompleted(operationError as NSErrorMBS)

**Function:** The event to execute with the results.
**Notes:**
operationError: An error object that contains the information about a problem or nil if the results are
retrieved successfully.

This event is executed only once and represents your last chance to process the operation results. It is
executed after all of the individual progress blocks but before the operations completed event. The block is
executed serially with respect to the other progress blocks of the operation. If you intend to use this block to
process results, update the value of this property before executing the operation or submitting the operation
object to a queue.

31.9.7  userIdentityDiscovered(identity as CKUserIdentityMBS)

Notes:

identity: A CKUserIdentityMBS object that was discovered in the devices contacts.

This event is executed once for each identity that is discovered. Each time the block is executed, it is exe-
cuted serially with respect to the other progress blocks of the operation.

If you intend to use this block to process results, set it before executing the operation or submitting the
operation object to a queue.
31.10. **CLASS CKDISCOVEREDUSERINFOMBS**

### 31.10.1 class CKDiscoveredUserInfoMBS

**Function:** A CKDiscoveredUserInfo object contains information about a discoverable user in a database.

**Notes:**
You do not create instances of this class yourself. Instead, use a CKDiscoverAllContactsOperation object or other means to retrieve these objects.

Available in OS X 10.10 and newer.  
Deprecated in OS X 10.12 in favor of CKUserIdentityMBS class.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

### 31.10.2 Methods

### 31.10.3 Available as Boolean

**Function:** Whether this class is available.

**Notes:** Should be true for OS X 10.10 and newer in 64-bit application.

### 31.10.4 Constructor

**Function:** The private constructor.

### 31.10.5 Properties

### 31.10.6 displayContact as Variant

**Function:** Contains the given and family name of the user who is not associated with the local Address Book.

**Notes:**
DisplayContact is not associated with the local Address Book. It is a wrapper around information known to the CloudKit server, including first and last names.

Value is a CNContactMBS object.
31.10.7 first_name as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The first name of the user. Notes: (Read only property)

31.10.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The internal object reference. Notes: (Read and Write property)

31.10.9 last_name as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The last name of the user. Notes: (Read only property)

31.10.10 user_record_id as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The ID of the user record. Notes: Use this value to retrieve the user record associated with the specified user. The user record does not contain any personal information about the user by default. Your app can add data to the user record but should not add any sensitive user data to it. (Read only property)
31.11. CLASS CKDISCOVERUSERIDENTITIESOPERATIONMBS

31.11 class CKDiscoverUserIdentitiesOperationMBS

31.11.1 class CKDiscoverUserIdentitiesOperationMBS

Notes: Subclass of the CKOperationMBS class.

31.11.2 Methods

31.11.3 Constructor

Function: Initializes and returns an operation object configured to discover user identities.
Notes: You can use the returned CKDiscoverUserIdentitiesOperation only once. When executed, this query object processes the share metadata.
See also:

- 31.11.4 Constructor(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS)

31.11.4 Constructor(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS)

Function: Initializes and returns an operation object configured to discover all user identities associated with the specified lookup info.
Notes:

userIdentityLookupInfos: An array of CKUserIdentityLookupInfoMBS objects. This parameter is used to initialize the value in the userIdentityLookupInfos property. If you specify nil, you must assign an appropriate value to the userIdentityLookupInfos property before executing the operation.

Returns an initialized operation object.
See also:

- 31.11.3 Constructor

31.11.5 setUserIdentityLookupInfos(IDs() as CKUserIdentityLookupInfoMBS)

Function: Sets the lookup info (email address, phone number, or record ID) used to discover user identities.
Notes: Use this property to view or change the lookup info used to discover user identities. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation.
object to a queue.

31.11.6 userIdentityLookupInfos as CKUserIdentityLookupInfoMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The lookup info (email address, phone number, or record ID) used to discover user identities. **Notes:** Use this property to view or change the lookup info used to discover user identities. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

31.11.7 Events

31.11.8 discoverUserIdentitiesCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute when the operation has completed. **Notes:** This block is called when the operation completes. The completionBlock of the underlying NSOperationMBS is also called if both are set. This block is executed serially with respect to the other progress blocks of the operation. If you intend to use this block to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

31.11.9 userIdentityDiscovered(identity as CKUserIdentityMBS, lookupInfo as CKUserIdentityLookupInfoMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute for each user identity that has been discovered. **Notes:**

Each time the event is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.
31.12. CLASS CKDISCOVERUSERINFOSOPERATIONMBS

31.12 class CKDiscoverUserInfosOperationMBS

31.12.1 class CKDiscoverUserInfosOperationMBS

**Function:** A CKDiscoverUserInfosOperation object retrieves the IDs for discoverable users whose email addresses or user record IDs you already know.

**Notes:**
This operation returns information about the corresponding users.

Users of an app must opt in to discoverability before their user records can be accessed. To opt in for a user, your app must call the requestApplicationPermission:completion: method of your container object and request the userDiscoverability permission. Calling that method prompts the user to grant or deny the permission.

If you assign a completed event of the operation object, the completed event is called after the operation executes and returns its results to you. You can use a completed event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completed event you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Subclass of the CKOperationMBS class.

31.12.2 Methods

31.12.3 Constructor(emailAddresses() as String, userRecordIDs() as CKRecordIDMBS)

**Function:** Initializes the operation object with the specified email addresses.

**Notes:**
emailAddresses: An array of strings, each of which contains a single email address to look for. The value you specify is used to initialize the value of the emailAddresses property. If you specify nil for this parameter, assign at least one email address to the emailAddresses property before executing the operation object.

userRecordIDs: An array of CKRecordIDMBS objects, each of which contains the ID of a user record to look for. The value you specify is used to initialize the value of the userRecordIDs property. If you specify nil for this parameter, assign at least one email address to the userRecordIDs property before executing the operation object.

The email addresses you specify need not belong to users in the current users address book. The users associated with those email addresses must be discoverable for their user record ID to be returned.
31.12.4 emailAddresses as String()

Function: The email addresses of the users whose information you want to retrieve.

Notes: This property contains an array of strings, each of which corresponds to a single email address. Use this property to add or remove email addresses to the operation. If you intend to change the property value, do so before executing the operation or submitting the operation object to a queue.

The default value of this property is set to the email addresses you specify in the Constructor.

31.12.5 setEmailAddresses(emails() as String)

Function: Sets the email addresses of the users whose information you want to retrieve.

Notes: This property contains an array of strings, each of which corresponds to a single email address. Use this property to add or remove email addresses to the operation. If you intend to change the property value, do so before executing the operation or submitting the operation object to a queue.

The default value of this property is set to the email addresses you specify in the Constructor.

31.12.6 setUserRecordIDs(IDs() as CKRecordIDMBS)

Function: Sets the IDs of the users whose information you want to retrieve.

Notes: This property contains an array of CKRecordIDMBS objects, each of which corresponds to the ID of a user record. Use this property to add or remove record IDs to the operation. If you intend to change the value of this property, you must do so before executing the operation or submitting the operation object to a queue.

The default value of this property is set to the record IDs you specify in the Constructor.

31.12.7 userRecordIDs as CKRecordIDMBS()

Function: The IDs of the users whose information you want to retrieve.

Notes:
This property contains an array of CKRecordIDMBS objects, each of which corresponds to the ID of a user record. Use this property to add or remove record IDs to the operation. If you intend to change the value of this property, you must do so before executing the operation or submitting the operation object to a queue.

The default value of this property is set to the record IDs you specify in the Constructor.

### 31.12.8 Events

#### 31.12.9 discoverUserInfosCompleted(emailsToUserInfos as Dictionary, userRecordIDsToUserInfos as Dictionary, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to use to process the search results.

**Notes:**

The event has no return value and takes the following parameters:

- **emailsToUserInfos:** A dictionary whose keys are events with the email addresses you provided in the emailAddresses property. The value of each key is a CKDiscoveredUserInfo object that identifies the user associated with the email address. Use that object to get the users name and fetch the corresponding user record.
- **userRecordIDsToUserInfos:** A dictionary whose keys are the CKRecordIDMBS objects you provided. The value of each key is a CKDiscoveredUserInfo object that identifies the user associated with the user record. You can use that object to get the users name.
- **operationError:** An error object containing information about a problem, or nil if the results are retrieved successfully.

This event is executed only once, at the conclusion of the operation. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.
31.13 class CKFetchDatabaseChangesOperationMBS

31.13.1 class CKFetchDatabaseChangesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An operation that fetches changes to the database. **Notes:** Subclass of the CKDatabaseOperationMBS class.

31.13.2 Methods

31.13.3 Constructor

**Constructor**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured with the previous change token. **Notes:**

previousServerChangeToken: The previous change token.

Returns an initialized operation object.

After initializing the operation, assign a block to the fetchDatabaseChangesCompletionBlock property to process the results.

If a change anchor from a previous CKFetchDatabaseChangesOperation is passed in, only the zones that have changed since that anchor will be returned.

This per-database CKServerChangeToken is not to be confused with the per-recordZone CKServerChangeToken from CKFetchRecordZoneChangesOperationMBS.

If this is your first fetch or if you wish to re-fetch all zones, pass nil for the change token. Change tokens are opaque and clients should not infer any behavior based on their content.

31.13.4 Properties

31.13.5 fetchAllChanges as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Configuration setting to control whether this operation makes repeated calls to the server. **Notes:**
When this property is set to true, the operation sends repeated requests to the server until all record zone changes have been fetched. When this property is set to false, it is the responsibility of the caller to issue subsequent fetch-change operations when moreComing is true in a fetchDatabaseChangesCompleted invocation.

fetchAllChanges is true by default.
(Read and Write property)

### 31.13.6 previousServerChangeToken as CKServerChangeTokenMBS

**Function:** The change token from a previous fetch operation.
**Notes:**
Assign the token you received previously from the fetchDatabaseChangesCompleted event to this property. Doing so yields only the changes that have occurred since your last fetch operation. If you specify nil for this parameter, the operation starts fetching changes at the beginning.
(Read and Write property)

### 31.13.7 resultsLimit as Integer

**Function:** The maximum number of results to fetch with this operation.
**Notes:**
Use this property to limit the number of changes processed in one operation. When the results limit is reached, the operation object updates the original token you provided and returns it to you to let you know that more results are available.
(Read and Write property)

### 31.13.8 Events

### 31.13.9 changeTokenUpdated(serverChangeToken as CKServerChangeTokenMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the change token has changed.
**Notes:** This event will be executed periodically, giving you an updated change token so that already-fetched record zone changes do not need to be re-fetched on a subsequent operation.
31.13.10 fetchDatabaseChangesCompleted(serverChangeToken as CKServerChangeTokenMBS, moreComing as Boolean, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the operation completes.

**Notes:**

serverChangeToken: The current server change token to be stored and used in subsequent CKFetchDatabaseChangesOperation instances.
moreComing: Indicates if this is the last record zone change. If fetchAllChanges is false, it is the responsibility of the client to create additional CKFetchDatabaseChangesOperation instances for the additional changes.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The client is responsible for saving the change token at the end of the operation and passing it into the next call to CKFetchDatabaseChangesOperationMBS. If the server returns a CKErrorChangeTokenExpired error, the previousServerChangeToken value was too old and the client should toss its local cache and re-fetch the changes in this record zone starting with a nil previousServerChangeToken.

31.13.11 recordZoneWithIDChanged(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block that processes a single record zone change.

**Notes:**

The event returns no value and takes the following parameter:

zoneID: The CKRecordZoneID corresponding to the record zone that changed.

31.13.12 recordZoneWithIDWasDeleted(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event that processes a single record zone deletion.

**Notes:**

The event returns no value and takes the following parameter:

zoneID: The CKRecordZoneID corresponding to the record zone that was deleted.
31.14  class CKFetchNotificationChangesOperationMBS

31.14.1  class CKFetchNotificationChangesOperationMBS

**Function:** A CKFetchNotificationChangesOperationMBS object retrieves unread CKNotification objects from a container.

**Notes:**

Notification objects contain the data associated with push notifications that have already been sent to an app. Fetch notification objects to identify changes that your app might have missed or to retrieve the complete push notification payload, which might have been truncated when it was delivered to the device.

After fetching the current notifications, you can mark some or all of them as read using a CKMarkNotificationsReadOperation object. Marking a notification as read prevents it from being returned by subsequent fetch operations.

The events to process the fetched notifications are executed serially on an internal queue that is managed by the operation object. Your events must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

The completion event is called after the operation executes and returns its results to you. You can use a completed event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion event you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Subclass of the CKOperationMBS class.

31.14.2  Methods

31.14.3  Constructor(previousServerChangeToken as CKServerChangeTokenMBS)

**Function:** Initializes and returns an operation object set to fetch notification changes.

**Notes:**

previousServerChangeToken: The change token from a previous fetch operation, or nil to fetch all changes. When you specify a change token, the operation object fetches only the changes that occurred since the change token was generated.

Returns an initialized operation object.

The first time you fetch notifications, specify nil for the previousServerChangeToken to get information about all push notifications that have been sent. When that operation finishes executing, it passes a change
token to your completion block. Save that change token and use it to initialize new operation objects that fetch only the newly generated notification objects.

If you mark one or more notifications as read using a CKMarkNotificationsReadOperationMBS object, those notifications are not returned, even if you specify nil for previousServerChangeToken.

### 31.14.4 Properties

#### 31.14.5 moreComing as Boolean

**MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** A Boolean value indicating that more notifications are waiting to be delivered.

**Notes:**

Access this property only from your fetchNotificationChangesCompletionBlock block. When the value is true, your completed event should create another CKFetchNotificationChangesOperation object and use it to fetch the next batch of results. Use the change token passed to your completion block to configure the new operation object. Specifying the change token prevents the new operation object from returning older notifications.

(Read only property)

#### 31.14.6 previousServerChangeToken as CKServerChangeTokenMBS

**MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The change token from a previous fetch operation.

**Notes:**

Assign the token you received previously from the fetchNotificationChangesCompleted event to this property. Doing so yields only the notifications that have arrived since your last fetch operation. If you specify nil for this parameter, the operation starts fetching notifications at the beginning of the list and returns all but those that have already been marked as read.

(Read and Write property)

#### 31.14.7 resultsLimit as Integer

**MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The maximum number of results to fetch with this operation.

**Notes:**

Use this property to limit the number of push notifications processed in one operation. When the results limit is reached, the operation object updates the original token you provided and returns it to you to let you know that more results are available.
31.14.8 Events

31.14.9 fetchNotificationChangesCompleted(serverChangeToken as CKServerChangeTokenMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event that is executed after all requested notifications are fetched.

Notes:

The event returns no value and takes the following parameters:

- serverChangeToken: An opaque object that you can use during subsequent fetch operations to retrieve the next batch of notifications.
- operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this event only once, which represents your last chance to process the operation results. This event is executed after all individual progress events but before the operations completion event. The event is executed serially with respect to the other progress events of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

In your event, check the value of the moreComing property to determine if there are more results waiting on the server. If the value of that property is true, use the value in the serverChangeToken parameter to configure a new CKFetchNotificationChangesOperationMBS object to fetch the next batch of results.

31.14.10 notificationChanged(notification as CKNotificationMBS)

Notes:

The event returns no value and takes the following parameter:

- notification: The CKNotification object corresponding to a push notification. The actual object passed to this method is a concrete subclass of CKNotification that contains specific details about the source of the change.
The operation object executes this event once for each push notification that is found. Each time the event is executed, it is executed serially with respect to the other progress events of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.
31.15. **CLASS CKFETCHRECORDCHANGESOPERATIONMBS**

31.15  *class* CKFetchRecordChangesOperationMBS

31.15.1  *class* CKFetchRecordChangesOperationMBS

**Function:** A CKFetchRecordChangesOperation object reports on the changed and deleted records in the specified record zone.

**Notes:**

Use this type of operation object to optimize fetch operations for locally managed sets of records. Specifically, use it when you maintain a local cache of your record data and need to synchronize that cache periodically with the server.

To get the most benefit out of a CKFetchRecordChangesOperation object, you must maintain a local cache of the records from the specified zone. Each time you fetch changes from that zone, the server provides a token that identifies your request. With each subsequent fetch request, you initialize the operation object with the token from the previous request, and the server returns only the records that changed since that request.

The blocks you assign to process the fetched records are executed serially on an internal queue managed by the operation. Your blocks must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

The completed event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Available in 10.10 and newer and deprecated with 10.12.
Subclass of the CKDatabaseOperationMBS class.

31.15.2  **Methods**

31.15.3  **Constructor(recordZoneID as CKRecordZoneIDMBS, previousServerChangeToken as CKServerChangeTokenMBS)**

**Function:** Initializes and returns an operation object configured to fetch changes in the specified record zone.

**Notes:**

recordZoneID: The zone containing the records you want to fetch. The zone can be a custom zone. Syncing the default zone is not supported.
previousServerChangeToken: The change token from a previous fetch operation. This is the token passed to your fetchRecordChangesCompleted event during a previous fetch operation. Use this token to limit the returned data to only those changes that have occurred since you last made the same fetch request. If you specify nil for this parameter, the operation object fetches all records and their contents.

Returns an initialized operation object.

When initializing the operation object, use the token from a previous fetch request if you have one. You can archive tokens and write them to disk for later use if needed.

The returned operation object is configured to retrieve all changed fields of the record, including any assets stored in those fields. If you want to minimize the amount of data returned even further, configure the desiredKeys property with the subset of keys whose values you want to fetch.

After initializing the operation, associate at least one progress block with the operation object (excluding the completion block) to process the results.

### 31.15.4 desiredKeys as String()

**Function:** The fields to fetch for the requested records.  
**Notes:**  
Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and include at least one field name from each record type.

If you intend to specify the desired set of keys, set the value of this property before executing the operation or submitting it to a queue.

### 31.15.5 setDesiredKeys(desiredKeys() as String)

**Function:** Sets the fields to fetch for the requested records.  
**Notes:**  
Use this property to limit the amount of data retrieved for each record during the fetch operation. This
property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and include at least one field name from each record type.

If you intend to specify the desired set of keys, set the value of this property before executing the operation or submitting it to a queue.

### 31.15.6 Properties

#### 31.15.7 moreComing as Boolean

**Function:** A Boolean value indicating that more results are available.  
**Notes:**  
If the server is unable to deliver all of the changed results with this operation object, it sets this property to true before executing the fetchRecordChangesCompleted event. To fetch the remaining changes, create a new CKFetchRecordChangesOperationMBS object using the change token returned by the server.  
(Read only property)

#### 31.15.8 previousServerChangeToken as CKServerChangeTokenMBS

**Function:** The token that identifies the starting point for retrieving changes.  
**Notes:**  
Each fetch request returns a unique token in addition to any changes. The token is passed as a parameter to your fetchRecordChangesCompleted event. During a subsequent fetch request, providing the previous token causes the server to return only the changes that have occurred since the last fetch request. Tokens are opaque data objects that you can write to disk safely and reuse later.

Typically, you set the value of this property when you initialize the operation object. If you intend to change the record zone, update the value of the property before executing the operation or submitting it to a queue.  
(Read and Write property)
31.15.9 recordZoneID as CKRecordZoneIDMBS

**Function:** The ID of the record zone whose records you want to fetch.  
**Notes:**  
Typically, you set the value of this property when you initialize the operation object. If you intend to change  
the record zone, update the value before executing the operation or submitting it to a queue.  
(Read and Write property)

31.15.10 resultsLimit as Integer

**Function:** The maximum number of changed records to report with this operation object.  
**Notes:**  
Use this property to limit the number of results in situations where you expect the number of changed  
records might be large. The default value is 0, which causes the server to choose an appropriate number of  
results to return based on dynamic conditions.  
When the number of returned results exceeds the results limit, the operation object sets the moreComing  
property to true before executing the fetchRecordChangesCompleted event. In your event, check the value  
of that property, and if it is true, create a new CKFetchRecordChangesOperationMBS object to fetch more  
results.  
(Read and Write property)

31.15.11 Events

31.15.12 fetchRecordChangesCompleted(serverChangeToken as CKServerChange-
TokenMBS, clientChangeTokenData as MemoryBlock, operationError  
as NSErrorMBS)

**Function:** The event to execute when all changes have been reported.  
**Notes:**  
The block returns no value and takes the following parameters:  
serverChangeToken: The new change token from the server. You can store this token locally and use it  
during subsequent fetch operations to limit the results to records that changed since this operation executed.
clientChangeToken: The last client change token received from this device. If this change token is not the last change token you provided, the server may not have received the associated changes.

operationError: An error object containing information about a problem, or nil if the changes are retrieved successfully.

Your implementation of this block should check the moreComing property of the operation object to ensure that the server was able to deliver all results. If that property is set to true, you must create another operation object (using the value in the serverChangeToken parameter) to fetch any remaining changes.

The operation object executes this block only once, at the conclusion of the operation. It is executed after all individual change blocks but before the operations completed event. The block is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

31.15.13 recordChanged(record as CKRecordMBS)

Notes:

The event returns no value and takes the following parameters:

record: The record that changed. If you specified a value for the desiredKeys property, the record only contains the fields specified in the desiredKeys property.

The operation object executes this event once for each record in the zone that changed since the previous fetch request. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation. If no records changed, the block is not executed.

If you intend to use this event to process results, set it before executing the operation or submitting it to a queue.

31.15.14 recordWithIDWasDeleted(recordID as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The block to execute with the ID of a record that was deleted.

Notes:

The block returns no value and takes the following parameters:
recordID: The ID of the record that was deleted.

The operation object executes this block once for each record in the zone that was deleted since the previous fetch request. Each time the event is executed, it is executed serially with respect to the other progress blocks of the operation. If no records were deleted, this event is not executed.

If you intend to use this event to process results, set it before executing the operation or submitting it to a queue.
31.16. CLASS CKFETCHRECORDSOPERATIONMBS

31.16 class CKFetchRecordsOperationMBS

31.16.1 class CKFetchRecordsOperationMBS

**Function:** A CKFetchRecordsOperation object retrieves CKRecord objects (whose IDs you already know) from iCloud.

**Notes:**
Use this operation to retrieve the entire contents of each record or only a subset of its contained values. As records become available, the operation object reports progress about the state of the operation to several different blocks, which you can use to process the results.

Fetching records is a common use of CloudKit, even if your app does not cache record IDs locally. For example, when you fetch a record related to the current record through a CKReference object, you use the ID in the reference to perform the fetch.

The blocks you assign to process the fetched records are executed serially on an internal queue managed by the fetch records operation. Your blocks must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

In addition to data records, a fetch records operation can fetch the current user record. The fetchCurrentUserRecordOperation() method returns a specially configured operation object that retrieves the current user record. That record is a standard CKRecord object whose contents are empty initially. You can add data to the user record and save it as needed. Because a discoverable user record can be accessed by other users of the app, never store sensitive personal information such as passwords in the user record. If you must store sensitive information about a user, do so in a separate record that is accessible only to that user.

The completed event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Subclass of the CKDatabaseOperationMBS class.

31.16.2 Methods

31.16.3 Constructor

**Function:** The constructor.

See also:

- 31.16.4 Constructor(recordIDs() as CKRecordIDMBS)
31.16.4 Constructor(recordIDs() as CKRecordIDMBS)

Function: Initializes and returns an operation object configured to fetch the records with the specified IDs.

Notes:

recordIDs: An array of CKRecordIDMBS objects representing the records you want to retrieve. This parameter is used to initialize the value in the recordIDs property. If specify nil, you must assign an appropriate value to the recordIDs property before executing the operation.

If any of the objects in the array are not CKRecordIDMBS objects, this method raises an exception.

Returns an initialized operation object.

The returned operation object is configured to retrieve all fields of the record, including any assets stored in those fields. If you want to minimize the amount of data returned initially, configure the desiredKeys property with the subset of keys whose values you want to retrieve.

See also:

• 31.16.3 Constructor

31.16.5 desiredKeys as String()

Function: The fields to fetch for the requested records.

Notes:

Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value of this property is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and should include at least one field name from each record type.

If you intend to specify a value other than nil, do so before executing the operation or submitting the operation object to a queue.

31.16.6 fetchCurrentUserRecordOperation as CKFetchRecordsOperationMBS

Function: Returns an operation object that can be used to fetch the current user record.
Notes: The returned operation object searches for the single record corresponding to the current user record. You must associate at least one progress block with the operation object (excluding the completed event) to process the results.

31.16.7 recordIDs as CKRecordIDMBS()

Function: The array of IDs corresponding to the records to fetch.

Notes: Use this property to view or change the IDs of the records you want to retrieve. Each item in the array must be a CKRecordIDMBS object. If you used the fetchCurrentUserRecordOperation method to create the operation object, the contents of this property are ignored and the value is set to nil.

If you intend to specify a value other than nil, do so before executing the operation or submitting the operation object to a queue. The records you fetch do not need to be in the same record zone. The record ID for each record provides the zone information needed by the server to fetch the corresponding record.

31.16.8 setDesiredKeys(desiredKeys() as String)

Function: Set the fields to fetch for the requested records.

Notes: Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value of this property is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and should include at least one field name from each record type.

If you intend to specify a value other than nil, do so before executing the operation or submitting the operation object to a queue.

31.16.9 setRecordIDs(IDs() as CKRecordIDMBS)

Function: Sets the array of IDs corresponding to the records to fetch.

Notes:
Use this property to view or change the IDs of the records you want to retrieve. Each item in the array must be a CKRecordIDMBS object. If you used the fetchCurrentUserRecordOperation method to create the operation object, the contents of this property are ignored and the value is set to nil.

If you intend to specify a value other than nil, do so before executing the operation or submitting the operation object to a queue. The records you fetch do not need to be in the same record zone. The record ID for each record provides the zone information needed by the server to fetch the corresponding record.

31.16.10 Events

31.16.11 fetchRecordsCompleted(recordsByRecordID as Dictionary, operationError as NSErrorMBS)

Function: The event to execute after all records are fetched or have received appropriate errors.

Notes:
The event returns no value and takes the following parameters:

recordsByRecordID: A dictionary containing the records that are retrieved successfully. Each key in the dictionary is a CKRecordID object corresponding to a record you requested. The value of each key is the corresponding CKRecord object that was retrieved from the database.

operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this event only once and is your last chance to process the operation results. The event is executed after all of the individual progress events but before the operations completed event. The event is executed serially with respect to the other progress events of the operation.

This event reports an error of type CKErrorPartialFailure when it retrieves only some of the records successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is an NSDictionary object. The keys of that dictionary are the IDs of the records that were not retrieved, and the corresponding values are error objects containing information about what happened.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.
31.16.12 RecordCompleted(record as CKRecordMBS, recordID as CKRecordIDMBS, error as NSErrorMBS)

**Function:** The event to execute when the results of a single record are available.

**Notes:**
The event returns no value and takes the following parameters:
- **record:** The retrieved record, or nil if the specified record cannot be retrieved.
- **recordID:** The ID of the record. This value corresponds to one of the IDs you specified in the recordIDs property.
- **error:** An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this block once for each record ID in the recordIDs property. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

31.16.13 RecordProgress(recordID as CKRecordIDMBS, progress as Double)

**Function:** The event to execute with progress information for individual records.

**Notes:**
The event returns no value and takes the following parameters:
- **recordID:** The ID of the record that is being retrieved.
- **progress:** The amount of the record that has been downloaded, represented as a percentage of the total. The range of this value is 0.0 to 1.0, where 0.0 means nothing has been downloaded, and 1.0 means the download is complete.

The operation object executes this block zero or more times for each record ID in the recordIDs property. Each time the block is executed, it is executed serially with respect to the other progress events of the operation. You can use this event to track the ongoing progress of the download operation and possibly to provide feedback to the user.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.
31.17 class CKFetchRecordZoneChangesOperationMBS

31.17.1 class CKFetchRecordZoneChangesOperationMBS

31.17.2 Methods

31.17.3 Constructor(recordZoneIDs() as CKRecordZoneIDMBS, optionsByRecordZoneID as Dictionary = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes and returns an operation object configured to fetch record zone changes. Notes: The returned operation object is configured to retrieve all record zones passed in. If you want to minimize the amount of data returned even further, configure the CKFetchRecordZoneChangesOptionsMBS property for each record zone.

After initializing the operation, associate at least one progress block with the operation object (excluding the completion block) to process the results.

optionsByRecordZoneID: The options per zone. recordZoneIDs: The record zones that should be fetched.

31.17.4 recordZoneIDs as CKRecordZoneIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The IDs of the record zones whose records you want to fetch. Notes: Typically, you set the value of this property when you initialize the operation object. If you intend to change the record zones, update the value before executing the operation or submitting it to a queue.

31.17.5 setRecordZoneIDs(IDs() as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Sets the IDs of the record zones whose records you want to fetch. Notes: Typically, you set the value of this property when you initialize the operation object. If you in-
tend to change the record zones, update the value before executing the operation or submitting it to a queue.

### 31.17.6 Properties

#### 31.17.7 fetchAllChanges as Boolean

**Function:** A Boolean value indicating whether repeated requests should be sent to the server.

**Notes:**

If true, this operation sends repeated requests to the server until CKFetchRecordZoneChangesOperationMBS is false. The server calls recordZoneFetchCompletionBlock with an incremental change token after every request. The default value is true.

(Read and Write property)

#### 31.17.8 optionsByRecordZoneID as Dictionary

**Function:** Options for each zone that is retrieved from the server.

**Notes:**

Each CKRecordZoneIDMBS can have its own CKFetchRecordZoneChangesOptionsMBS object that allows you to configure what is fetched for that zone. See CKFetchRecordZoneChangesOptionsMBS for details on what options can be set.

(Read and Write property)

### 31.17.9 Events

#### 31.17.10 fetchRecordZoneChangesCompleted(operationError as NSErrorMBS)

**Function:** The event to use to process the record zone changes.

**Notes:**

The event has no return value and takes the following parameter:

- **operationError:** An error object containing information about a problem, or nil if the record zone changes were retrieved successfully.
31.17.11 recordChanged(record as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The block to execute with the contents of a changed record. **Notes:**

The block returns no value and takes the following parameter:

record: The record that changed. If you specified a value for the desiredKeys property, the record only contains the fields specified in the desiredKeys property.

The operation object executes this block once for each record in the zone that changed since the previous fetch request. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation. If no records changed, the block is not executed.

If you intend to use this block to process results, set it before executing the operation or submitting it to a queue.

31.17.12 recordWithIDWasDeleted(recordID as CKRecordIDMBS, recordType as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the ID of a record that was deleted. **Notes:**

The event returns no value and takes the following parameter:

recordID: The ID of the record that was deleted.

The operation object executes this block once for each record that was deleted since the previous fetch request. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation. If no records were deleted, this block is not executed.

If you intend to use this block to process results, set it before executing the operation or submitting it to a queue.
31.17.13 recordZoneChangeTokensUpdated(recordZoneID as CKRecordZoneIDMBS, serverChangeToken as CKServerChangeTokenMBS, clientChangeTokenData as MemoryBlock)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the change token has been updated.

**Notes:**

The event returns no value and takes the following parameters:

- `recordZoneID`: The ID of the zone with the updated token.
- `serverChangeToken`: The new change token from the server. You can store this token locally and use it during subsequent fetch operations to limit the results to records that changed since this operation executed.
- `clientChangeTokenData`: The last client change token received from this device. If this change token is not the last change token you provided, the server may not have received the associated changes.

The operation object executes this block once for each record zone. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this block to process results, set it before executing the operation or submitting it to a queue.

31.17.14 recordZoneFetchCompleted(recordZoneID as CKRecordZoneIDMBS, serverChangeToken as CKServerChangeTokenMBS, clientChangeTokenData as MemoryBlock, moreComing as boolean, recordZoneError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when the fetch for a zone has completed.

**Notes:**

The block returns no value and takes the following parameters:

- `recordZoneID`: The ID of the zone with the updated token.
- `serverChangeToken`: The current server change token to be stored and used in subsequent CKFetchRecordZoneChangesOperation instances.
- `clientChangeTokenData`: The last client change token received from this device. If this change token is not the last change token you provided, the server may not have received the associated changes.
- `moreComing`: Indicates if this is the last record zone change. If fetchAllChanges is false, it is the responsibility of the client to create additional CKFetchRecordZoneChangesOperationMBS instances for the additional changes.
- `recordZoneError`: An error object containing information about a problem, or nil if the results are retrieved successfully.
The client is responsible for saving the change token at the end of the operation and passing it into the next call to CKFetchRecordZoneChangesOperationMBS. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting it to a queue.
31.18. CLASS CKFETCHRECORDZONECHANGESOPTIONSMBS

31.18. class CKFetchRecordZoneChangesOptionsMBS

31.18.1. class CKFetchRecordZoneChangesOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Options when fetching record zone changes.

31.18.2. Methods

31.18.3. Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

31.18.4. desiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The fields to fetch for the requested records.

**Notes:**

Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and include at least one field name from each record type.

If you intend to specify the desired set of keys, set the value of this property before executing the operation or submitting it to a queue.

31.18.5. setDesiredKeys(desiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the fields to fetch for the requested records.

**Notes:**

Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included.
in the returned record. The default value is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and include at least one field name from each record type.

If you intend to specify the desired set of keys, set the value of this property before executing the operation or submitting it to a queue.

### 31.18.6 Properties

### 31.18.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.

**Notes:** (Read and Write property)

### 31.18.8 previousServerChangeToken as CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The token that identifies the starting point for retrieving changes.

**Notes:**

Each fetch request returns a unique token in addition to any changes. The token is passed as a parameter to your fetchRecordChangesCompleted event. During a subsequent fetch request, providing the previous token causes the server to return only the changes that have occurred since the last fetch request. Tokens are opaque data objects that you can write to disk safely and reuse later.

Typically, you set the value of this property when you initialize the operation object. If you intend to change the record zone, update the value of the property before executing the operation or submitting it to a queue. (Read and Write property)

### 31.18.9 resultsLimit as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum number of changed records to report with this operation object.

**Notes:**

Use this property to limit the number of results in situations where you expect the number of changed records might be large. The default value is 0, which causes the server to choose an appropriate number of results to return based on dynamic conditions.
When the number of returned results exceeds the results limit, the operation object sets the moreComing property to true before executing the fetchRecordChangesCompleted event. In your block, check the value of that property, and if it is true, create a new CKFetchRecordChangesOperationMBS object to fetch more results.
(Read and Write property)
31.19 class CKFetchRecordZonesOperationMBS

31.19.1 class CKFetchRecordZonesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKFetchRecordZonesOperation object retrieves CKRecordZone objects (whose IDs you already know) from iCloud.

**Notes:**
Use this operation object to fetch record zones so that you can ascertain their capabilities.

The completed event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Subclass of the CKDatabaseOperationMBS class.

31.19.2 Methods

31.19.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

See also:

- 31.19.4 Constructor(recordZoneIDs() as CKRecordZoneIDMBS)

31.19.4 Constructor(recordZoneIDs() as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to fetch the specified record zones.

**Notes:**
zoneIDs: An array of CKRecordZoneID objects representing the zones you want to retrieve. This parameter is used to initialize the value in the recordZoneIDs property. If you specify nil, you must assign a value to the recordZoneIDs property before executing the operation.

Returns an initialized operation object.

See also:

- 31.19.3 Constructor
31.19. **CLASS CKFETCHRECORDZONESOPERATIONMBS**

31.19.5  **fetchAllRecordZonesOperation as CKFetchRecordZonesOperationMBS**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an operation object that can be used to fetch all record zones in the current database.

31.19.6  **recordZoneIDs as CKRecordZoneIDMBS()**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The IDs of the record zones you want to retrieve.

**Notes:**
Use this property to view or change the IDs of the record zones you want to retrieve. Each item in the array must be a CKRecordZoneID object. If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

If you used the fetchAllRecordZonesOperationMBS method to create the operation object, the contents of this property are ignored and the default value is set to nil.

31.19.7  **setRecordZoneIDs(IDs() as CKRecordZoneIDMBS)**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the IDs of the record zones you want to retrieve.

**Notes:**
Use this property to view or change the IDs of the record zones you want to retrieve. Each item in the array must be a CKRecordZoneID object. If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

If you used the fetchAllRecordZonesOperationMBS method to create the operation object, the contents of this property are ignored and the default value is set to nil.

31.19.8  **Events**

31.19.9  **fetchRecordZonesCompleted(recordZonesByZoneID as Dictionary, operationError as NSErrorMBS)**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the fetch results.

**Notes:**
The event returns no value and takes the following parameters:
recordZonesByZoneID: A dictionary that maps the requested IDs to the retrieved objects. The keys in the
dictionary are the CKRecordZoneID objects you requested, and the values are the corresponding CKRecord-
Zone objects.

operationError: An error object containing information about a problem, or nil if the results are retrieved
successfully.

The operation object executes this block only once and it is your only chance to process the operation results.
The block is executed before the operations completion block. Your block must be capable of executing on
a background thread, so any tasks that require access to the main thread must be redirected accordingly.

If you intend to use this block to process results, set it before executing the operation or submitting the
operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it retrieves only some of the record zones
successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value
is a dictionary. The keys of that dictionary are the IDs of the record zones that were not retrieved, and the
corresponding values are error objects containing information about what happened.
31.20. **CLASS CKFETCHSHAREMETADATAPROPERTIESMBS**

31.20  class CKFetchShareMetadataOperationMBS

31.20.1  class CKFetchShareMetadataOperationMBS

**Function:** An operation that fetches shared record metadata for one or more shares.

**Notes:**

This operation may be run in any container that the client has access to.

Subclass of the CKOperationMBS class.

31.20.2  Methods

31.20.3  Available as Boolean

**Function:** Whether this class is available.

**Notes:** Should be true for OS X 10.12 and newer in 64-bit application.

31.20.4  Constructor(URLs() as String)

**Function:** Initializes and returns an operation object configured to fetch the metadata for the specified shares.

**Notes:**

shareURLs: An array of URLs. This parameter is used to initialize the value in the shareURLs property. If you specify nil, you must assign an appropriate value to the shareURLs property before executing the operation.

Returns an initialized operation object.

31.20.5  rootRecordDesiredKeys as String()

**Function:** Keys to be fetched if the root record is to be fetched.

**Notes:**

This property declares which user-defined keys should be fetched and added to the resulting root record. This property is only consulted if shouldFetchRootRecord is set to true.
If this property is set to nil, the entire root record is downloaded.
If this property is set to an empty array, no user fields are downloaded.

This property defaults to nil.

31.20.6  setRootRecordDesiredKeys(rootRecordDesiredKeys() as String)

**Function:** Sets the keys to be fetched if the root record is to be fetched.
**Notes:**
This property declares which user-defined keys should be fetched and added to the resulting root record.
This property is only consulted if shouldFetchRootRecord is set to true.

If this property is set to nil, the entire root record is downloaded.
If this property is set to an empty array, no user fields are downloaded.

This property defaults to nil.

31.20.7  setShareURLs(URLs() as String)

**Function:** Sets the URLs of the shares that you want to process.
**Notes:** Use this property to view or change the URLs of the share objects that you want to fetch. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

31.20.8  shareURLs as String()

**Function:** The URLs of the shares that you want to process.
**Notes:** Use this property to view or change the URLs of the share objects that you want to fetch. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.
31.20.  CLASS CKFETCHSHAREMETADATAMBSOPERATIONMBS

31.20.9  Properties

31.20.10 shouldFetchRootRecord as Boolean

Function: A flag to indicate whether the root record should be retrieved.
Notes:
If this property is set to true, the resulting CKShareMetadataMBS has a rootRecord object filled out. The resulting CKShareMetadata has a rootRecordID property regardless of the value of this property. This property defaults to false.
(Read and Write property)

31.20.11 Events

31.20.12 fetchShareMetadataCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event to execute when the operation has completed.
Notes:
This block is called when the operation completes. The Complete of the underlying NSOperation is also called if both are implemented.
The event is executed serially with respect to the other progress events of the operation. If you intend to use this event to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

31.20.13 ShareMetadataFetched(shareURL as String, shareMetadata as CKShareMetadataMBS, error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event to execute for each share metadata that has been fetched from the server.
Notes:
If error is nil then the share was successfully accepted. Each time the event is executed, it is executed serially with respect to the other progress blocks of the operation.
If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.
31.21 class CKFetchShareParticipantsOperationMBS

31.21.1 class CKFetchShareParticipantsOperationMBS

31.21.2 Methods

31.21.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes and returns an operation object configured to fetch share participants. Notes: You can use the returned CKFetchShareParticipantsOperation only once. When executed, this query object fetches the share participants.

Note
If userIdentityLookupInfos is not set prior to executing the operation, it returns immediately with no results.

See also:
- 31.21.4 Constructor(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS)

31.21.4 Constructor(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes and returns an operation object configured to fetch the specified share participants. Notes: userIdentityLookupInfos: An array of CKUserIdentityLookupInfoMBS objects. This parameter is used to initialize the value in the userIdentityLookupInfos property. If you specify nil, you must assign an appropriate value to the userIdentityLookupInfos property before executing this operation.

Returns an initialized operation object.
See also:
- 31.21.3 Constructor
31.21.5  setUserIdentityLookupInfos(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS)

**Function:** Sets the user identities that are used to fetch the share participants.  
**Notes:**  
Use this property to view or change the user identities you want to fetch against. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.  

Note  
If userIdentityLookupInfos is not set prior to executing the operation, it returns immediately with no results.

31.21.6  userIdentityLookupInfos as CKUserIdentityLookupInfoMBS()  

**Function:** The user identities that are used to fetch the share participants.  
**Notes:**  
Use this property to view or change the user identities you want to fetch against. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.  

Note  
If userIdentityLookupInfos is not set prior to executing the operation, it returns immediately with no results.

31.21.7  Events  

31.21.8  fetchShareParticipantsCompleted(operationError as NSErrorMBS)

**Function:** The event to execute when the operation has completed.  
**Notes:**  
This event is called when the operation complete. The Completed of the underlying NSOperation is also called if both are set.  

The event is executed serially with respect to the other progress blocks of the operation. If you intend to use this event to process results, update the value of this property before executing the operation or submitting the operation object to the queue.
31.21.9  shareParticipantFetched(participant as CKShareParticipantMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute for each share participant that has been fetched from the server.

**Notes:**

Each time the event is executed, it is executed serially with respect to the other progress events of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.
31.22. CLASS CKFETCHSUBSCRIPTIONSOPERATIONMBS

31.22 class CKFetchSubscriptionsOperationMBS

31.22.1 class CKFetchSubscriptionsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKFetchSubscriptionsOperation object retrieves CKSubscription objects (whose IDs you already know) from iCloud and can fetch all subscriptions associated with the current user.

**Notes:**

You might fetch subscription objects so you can examine or modify their parameters; for example, to adjust the delivery options for push notifications generated by the subscription.

The completion event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Subclass of the CKDatabaseOperationMBS class.

31.22.2 Methods

31.22.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

See also:

- 31.22.4 Constructor(subscriptionIDs() as String)

31.22.4 Constructor(subscriptionIDs() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to fetch the specified subscriptions.

**Notes:**

subscriptionIDs: An array of strings, each of which contains the ID of a subscription object you want to retrieve. This parameter is used to initialize the value in the subscriptionIDs property. If you specify nil, you must assign an appropriate value to the subscriptionIDs property before executing the operation.

Returns an initialized operation object.

See also:

- 31.22.3 Constructor
31.22.5 fetchAllSubscriptionsOperation as CKFetchSubscriptionsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an operation object that retrieves all of the users subscription objects in the current database. **Notes:** Returns a newly allocated operation object that fetches the active subscription objects operating on behalf of the current user.

31.22.6 setSubscriptionIDs(emails() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the IDs of the subscription objects you want to retrieve. **Notes:** Use this property to view or change the IDs of the subscription objects you want to retrieve. Each item in the array must be a string whose value is the ID of the subscription object you want to retrieve. If you intend to specify or change the value for this property, do so before executing the operation or submitting the operation object to a queue.

If you used the fetchAllSubscriptionsOperation method to create the operation object, the contents of this property are ignored and its value is set to nil.

31.22.7 subscriptionIDs as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The IDs of the subscription objects you want to retrieve. **Notes:** Use this property to view or change the IDs of the subscription objects you want to retrieve. Each item in the array must be a string whose value is the ID of the subscription object you want to retrieve. If you intend to specify or change the value for this property, do so before executing the operation or submitting the operation object to a queue.

If you used the fetchAllSubscriptionsOperation method to create the operation object, the contents of this property are ignored and its value is set to nil.
31.22.8 Events

31.22.9 fetchSubscriptionCompleted(subscriptionsBySubscriptionID as Dictionary, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with the fetch results.

**Notes:**

The event returns no value and takes the following parameters:

- `subscriptionsBySubscriptionID`: A dictionary that maps the requested IDs to the retrieved objects. The keys in the dictionary are the NSString objects with the IDs of the subscription objects you requested and the values are the corresponding CKSubscription objects.
- `operationError`: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this block only once and it is your only chance to process the operation results. The block is executed before the operations completion block. Your block must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it retrieves only some of the subscriptions successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the subscriptions that were not retrieved and the corresponding values are error objects containing information about what happened.
31.23 class CKFetchWebAuthTokenOperationMBS

31.23.1 class CKFetchWebAuthTokenOperationMBS

**Function:** The CKFetchWebAuthTokenOperation object fetches a web authentication token given an API token that you obtain from CloudKit Dashboard.

**Notes:**
Use the add method in the CKDatabase class to add this operation to the operation queue of the public database.
Subclass of the CKDatabaseOperationMBS class.

31.23.2 Methods

31.23.3 Constructor(APIToken as string)

**Function:** Initializes and returns a CKFetchWebAuthTokenOperationMBS object with the specified API token.
**Notes:** APItoken: An API token that allows access to an apps container.

31.23.4 Properties

31.23.5 APIToken as String

**Function:** An API token that allows access to an apps container.
**Notes:** (Read and Write property)

31.23.6 Events

31.23.7 fetchWebAuthTokenCompleted(webAuthToken as string, operationError as NSErrorMBS)

**Function:** The event to execute when this CKFetchWebAuthTokenOperation object fetches the web authentication token.
**Notes:**
The event returns no value and takes the following parameters:
webAuthToken: If the operation is successful, the web authentication token; otherwise, nil.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this block only once and it is your only chance to process the operation results. Your block must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.
31.24 class CKLocationSortDescriptorMBS

31.24.1 class CKLocationSortDescriptorMBS

**Function:** A CKLocationSortDescriptor object sorts records containing location data based on their distance from a location that you specify.
**Notes:**
You can add a location sort descriptor to your queries when searching for records. At creation time, you must provide the sort descriptor with a key whose value is a CLLocation object. The sort descriptor uses the value of that key to perform the sort.

Distances are computed by drawing a direct line between the two locations that follows the curvature of the Earth. Distances do not take into account altitude changes between the two locations.
Subclass of the NSSortDescriptorMBS class.

31.24.2 Methods

31.24.3 Available as Boolean

**Function:** Whether this class is available.
**Notes:** Should be true for OS X 10.10 and newer in 64-bit application.

31.24.4 Constructor

**Function:** Private constructor.
See also:
- 31.24.5 Constructor(key as string, relativeLocation as Variant)

31.24.5 Constructor(key as string, relativeLocation as Variant)

**Function:** Initializes and returns a location sort descriptor object.
**Notes:**
key: The name of the key whose value is a CLLocationMBS object. The key must belong to the records being sorted. The sort descriptor uses this key to retrieve the corresponding value from the record.
relativeLocation: The reference location to use when sorting. Records are sorted based on their distance to
31.24. CLASS CKLOCATIONSORTDESCRIPTORMBS

this location.

Returns an initialized location sort descriptor object, or nil if the object cannot be initialized.

During sorting, the sort descriptor computes the distance between the value in the relativeLocation parameter and the location value found in the specified key of each record. It then sorts the records in ascending order using the distance between the two points. You cannot change the sort order.

relativeLocation must be a CLLocationMBS object.

See also:

- 31.24.4 Constructor

31.24.6 Properties

31.24.7 relativeLocation as Variant

Function: The reference location against which records are sorted.

Notes:

Value is a CLLocationMBS.
(Read only property)
31.25 class CKMarkNotificationsReadOperationMBS

31.25.1 class CKMarkNotificationsReadOperationMBS

Function: A CKMarkNotificationsReadOperation object marks push notifications as read by your app so that they do not show up in future fetch results.
Notes:
If your app uses push notifications to track changes to records, you can use this operation object to note which push notifications do not need to be processed again.

The completion event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKOperationMBS class.

31.25.2 Methods

31.25.3 Constructor

Function: The private constructor.
See also:
- 31.25.4 Constructor(IDs() as CKNotificationIDMBS)

31.25.4 Constructor(IDs() as CKNotificationIDMBS)

Function: Initializes and returns an operation object configured to mark the specified notifications as read.
Notes:
notificationIDs: An array of CKNotificationIDMBS objects representing the notifications you want to mark as read. Use this parameter to initialize the value in the notificationIDs property. If you specify nil, assign an appropriate value to the notificationIDs property before executing the operation.

If any objects in the array are not CKNotificationIDMBS objects, this method raises an exception.

Returns an initialized operation object.
See also:
31.25.5 **notificationIDs as CKNotificationIDMBS()**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The array of notifications to mark as read. **Notes:** Use this property to view or change the IDs of the notifications you want to mark as read. Each item in the array must be a CKNotificationIDMBS object. If you intend to specify a value for this property, do so before executing the operation or submitting the operation object to a queue.

31.25.6 **setNotificationIDs(IDs() as CKNotificationIDMBS)**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the array of notifications to mark as read. **Notes:** Use this property to view or change the IDs of the notifications you want to mark as read. Each item in the array must be a CKNotificationIDMBS object. If you intend to specify a value for this property, do so before executing the operation or submitting the operation object to a queue.

31.25.7 **Events**

31.25.8 **markNotificationsReadCompleted(notificationIDsMarkedRead() as CKNotificationIDMBS, operationError as NSErrorMBS)**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute when all results of the operation are known. **Notes:**

The event returns no value and takes the following parameters:

- notificationIDsMarkedRead: An array of CKNotificationID objects corresponding to the notifications that were successfully marked as read.
- operationError: An error object containing information about a problem, or nil if all notifications are updated successfully.

The operation object executes this block only once and it is your only chance to process the operation results. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it is able to update only some of the notifications successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the notifications that were not updated, and
the corresponding values are error objects containing information about what happened.
31.26 class CKModifyBadgeOperationMBS

31.26.1 class CKModifyBadgeOperationMBS

Function: A CKModifyBadgeOperation object updates the badge value applied to the app's icon.

Notes:
This operation object can update the badge for the current device or for all of the users' devices.

The completion event is called after the operation executes and returns its results to you. You can use a completion event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion event you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Subclass of the CKOperationMBS class.

31.26.2 Methods

31.26.3 Constructor

Function: The private constructor.

See also:
- 31.26.4 Constructor(badgeValue as Integer)

31.26.4 Constructor(badgeValue as Integer)

Function: Initializes and returns an operation object for setting the badge of the app.

Notes: badgeValue: The numerical value of the app's badge. Specify 0 to remove the badge.

See also:
- 31.26.3 Constructor

31.26.5 Properties

31.26.6 badgeValue as Integer

Function: The numerical value to apply to the app's badge.

Notes:
The initial value of this property is set to the value you specified using the Constructor. If you intend to change the value, do so before executing the operation or submitting it to a queue.
(Read and Write property)

31.26.7 Events

31.26.8 modifyBadgeCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event to execute with the results of the operation.
Notes:
The event returns no value and takes the following parameters:

operationError: An error object containing information about a problem, or nil if the badge is applied successfully.

This event is executed only once and represents your only chance to process the operation results. If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.
31.27 class CKModifyRecordsOperationMBS

31.27.1 class CKModifyRecordsOperationMBS

Function: A CKModifyRecordsOperationMBS object saves changes to one or more CKRecordMBS objects.
Notes:
After modifying the fields of a record, use this type of operation object to save those changes to a database. You also use instances of this class to delete records permanently from a database.

see https://developer.apple.com/reference/cloudkit/ckmodifyrecordsoperation
Subclass of the CKDatabaseOperationMBS class.

31.27.2 Methods

31.27.3 Constructor

Function: The private constructor.
See also:
- 31.27.4 Constructor(recordsToSave() as CKRecordMBS, recordIDsToDelete() as CKRecordIDMBS)

31.27.4 Constructor(recordsToSave() as CKRecordMBS, recordIDsToDelete() as CKRecordIDMBS)

Function: Initializes and returns an operation object configured to save and delete the specified records.
Notes:
recordsToSave: An array of CKRecordMBS objects representing the records to save, if any. You may specify nil for this parameter.
recordIDsToDelete: An array of CKRecordIDMBS objects representing the records you want to delete, if any. You may specify nil for this parameter.

Returns an initialized operation object.

The records you intend to save or delete must all reside in the same database, which you can specify when you configure the operation object. Saving a record that is not in the current database creates it in the
database. Trying to delete a record that does not exist in the current database returns an error for that record.

See also:

• 31.27.3 Constructor

31.27.5 recordIDsToDelete as CKRecordIDMBS()

Function: The IDs of the records to delete permanently from the database.
Notes:
This property contains the array of CKRecordID objects that identify the records to delete. The initial contents of the array are set to the records you specified in the Constructor.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

When deleting records, the operation object reports progress only on the records you specify in this property. Deleting records can trigger the deletion of related records if there is an owner-owned relationship between the records involving a CKReference object. When additional deletions occur, they are not reported to the progress blocks of this object. For that reason, it is important to understand the implications of the ownership model you use when you relate records to each other through a CKReference object. For more information about owner-owned relationships, see CKReference.

31.27.6 recordsToSave as CKRecordMBS()

Function: The records to save to the database.
Notes:
This property contains the array of CKRecordMBS objects that you want to save. The initial contents of the array are set to the records you specified in the constructor. You can modify this array as needed before executing the operation. The records must all target the same database but may belong to different zones in the database.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.
31.27.7 setrecordIDsToDelete(IDs() as CKRecordIDMBS)

Function: Sets the IDs of the records to delete permanently from the database.
Notes:
This property contains the array of CKRecordID objects that identify the records to delete. The initial contents of the array are set to the records you specified in the Constructor.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

When deleting records, the operation object reports progress only on the records you specify in this property. Deleting records can trigger the deletion of related records if there is an owner-owned relationship between the records involving a CKReference object. When additional deletions occur, they are not reported to the progress blocks of this object. For that reason, it is important to understand the implications of the ownership model you use when you relate records to each other through a CKReference object. For more information about owner-owned relationships, see CKReference.

31.27.8 setRecordsToSave(IDs() as CKRecordMBS)

Function: Sets the records to save to the database.
Notes:
This property contains the array of CKRecordMBS objects that you want to save. The initial contents of the array are set to the records you specified in the constructor. You can modify this array as needed before executing the operation. The records must all target the same database but may belong to different zones in the database.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

31.27.9 Properties

31.27.10 atomic as Boolean

Function: A Boolean value indicating whether the entire operation fails when one or more records in the same zone cannot be written.
Notes:
Modifying records atomically prevents you from updating your data in a way that would leave it in an
inconsistent state. You use atomic updates when you want to write multiple records to the same record zone. If there is a failure to modify any of the records in a particular zone, no changes are made to the other records in that same zone. The zone itself must have the CKRecordZoneCapabilityAtomic capability for this behavior to apply. If a record zone does not support the atomic capability, setting this property has no effect.

The default value of this property is true, which causes all modifications within a single record zone to be made atomically. If your operation object contains records in multiple record zones, a failure in one zone does not prevent modifications to records in a different zone. Changing the value of this property to false causes the records to be modified individually, regardless of whether the record zone supports atomic modifications. (Read and Write property)

### 31.27.11 clientChangeTokenData as MemoryBlock

**Function:** A data token used to track client-side changes to records.

**Notes:**

When you modify records from a fetch operation, specify a client-generated data token using this property to indicate which version of the record you last modified. Compare the data token you supplied to the data token in the next record fetch to confirm the server has successfully received the devices last modify request.

The default value is nil.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

(Read and Write property)

### 31.27.12 savePolicy as Integer

**Function:** The policy to apply when the server contains a newer version of a specific record.

**Notes:**

Each record has a change tag that allows the server to track when that record was saved. When you save a record, CloudKit compares the change tag in your local copy of the record with the one on the server. If the two tags do not match meaning that there is a potential conflict the server uses the value in this property to determine how to proceed.

The default value of this property is CKRecordSaveIfServerRecordUnchanged. If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

(Read and Write property)
31.27.13 Events

31.27.14 modifyRecordsCompleted(savedRecords() as CKRecordMBS, deletedRecordIDs() as CKRecordIDMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event to execute after the status of all changes is known.
Notes:
The event returns no value and takes the following parameters:

- savedRecords: The array of CKRecordMBS objects you tried to save.
- deletedRecordIDs: The array of CKRecordIDMBS objects corresponding to the records you tried to delete.
- operationError: An error object containing information about a problem, or nil if the results are saved successfully.

This event is executed only once and represents your last chance to process the operation results. It is executed after all individual progress blocks have completed but before the operations completion block. The block is executed serially with respect to the other progress blocks of the operation.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it saves or deletes only some of the records successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the records that were not saved or deleted, and the corresponding values are error objects containing information about what happened.

31.27.15 RecordCompleted(record as CKRecordMBS, error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event to execute when the save results of a single record are known.
Notes:
The event returns no value and takes the following parameters:

- record: A CKRecordMBS object that you attempted to save.
- error: An error object containing information about a problem, or nil if the record was saved successfully.

This block is executed once for each record in the recordsToSave property. Each time the block is executed, it is executed serially with respect to the other progress events of the operation.
If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue. Use this block to take any actions after the status of saving the record is known.

### 31.27.16 RecordProgress(record as CKRecordMBS, progress as Double)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute with progress information for an individual record. **Notes:**

The block returns no value and takes the following parameters:

- record: The CKRecordMBS object that is in the process of being saved.
- progress: The amount of progress toward saving the record, expressed as a percentage of its total size. This value is a number between 0.0 and 1.0, where 0.0 means none of the record is saved and 1.0 means the entire record has been saved.

The operation object executes this block zero or more times for each record in the recordsToSave property. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue. Use this block to track the ongoing progress of the upload operation and possibly to provide feedback to the user.

### 31.27.17 Constants

#### 31.27.18 SaveAllKeys = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the policy to apply when saving records. **Notes:** A policy that saves all keys of the record (including those that have not changed) to the server, overwriting any values currently on the server. Keys present only on the server remain unchanged.

#### 31.27.19 SaveChangedKeys = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the policy to apply when saving records. **Notes:** A policy that saves only those fields of the record that actually changed, overwriting any values currently on the server. Unmodified fields are left untouched.
31.27.20  SaveIfServerRecordUnchanged = 0

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the policy to apply when saving records.

**Notes:** A policy that saves the record only if the local copy of the record is based on the record still on the server. The server maintains a change tag for each record automatically. When you fetch a record, that change tag is included with the rest of the records data. If the change tag in your local record matches the change tag of the record on the server, the save operation proceeds normally. If the server record contains a newer change tag, the record is not saved and an error of type CKErrorServerRecordChanged is reported.
31.28 class CKModifyRecordZonesOperationMBS

31.28.1 class CKModifyRecordZonesOperationMBS

Function: A CKModifyRecordZonesOperationMBS object saves or deletes record zones.

Notes:

After creating one or more record zones, use this operation object to save those zones to the database. You can also use it to delete existing zones and the records they contain.

The completion event is called after the operation executes and returns its results to you. You can use a completion event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Subclass of the CKDatabaseOperationMBS class.

31.28.2 Methods

31.28.3 Constructor

Function: The private constructor.

See also:

- 31.28.4 Constructor(recordZonesToSave() as CKRecordZoneMBS, recordZoneIDsToDelete() as CKRecordZoneIDMBS)

31.28.4 Constructor(recordZonesToSave() as CKRecordZoneMBS, recordZoneIDsToDelete() as CKRecordZoneIDMBS)

Function: Initializes and returns an operation object configured to save and delete the specified record zones.

Notes:

recordZonesToSave: An array of CKRecordZoneMBS objects representing the record zones to save. You may specify nil for this parameter.

recordZoneIDsToDelete: An array of CKRecordZoneIDMBS objects representing the record zones you want to delete, if any. You may specify nil for this parameter.

Returns an initialized operation object.
The record zones you intend to save or delete must all reside in the same database, which you specify when configuring the operation object. Deleting a record zone also deletes any records it contains. Trying to delete a record zone that does not exist in the current database returns an error.

See also:

- 31.28.3 Constructor

31.28.5 recordZoneIDsToDelete as CKRecordZoneIDMBS()

Function: The IDs of the record zones to delete permanently from the database.

Notes:

This property contains an array of CKRecordZoneIDMBS objects identifying the zones you want to delete. You set the initial contents of this property with the Constructor. You can assign a new array as needed before executing the operation. The record zones must all be located in the same database. You may specify nil or an empty array for this property.

If you intend to change the value of this property, do so before executing the operation or submitting it to a queue.

31.28.6 recordZonesToSave as CKRecordZoneMBS()

Function: The record zones to save to the database.

Notes:

This property contains an array of CKRecordZoneMBS objects representing the zones you want to save. You set the initial contents of this property with the Constructor. You can assign a new array as needed before executing the operation. The record zones must all target the same database. You may specify nil or an empty array for this property.

If you intend to change the value of this property, do so before executing the operation or submitting it to a queue.

31.28.7 setRecordZoneIDsToDelete(IDs() as CKRecordZoneIDMBS)

Function: Set the IDs of the record zones to delete permanently from the database.
31.28.8  setRecordZonesToSave(IDs() as CKRecordZoneMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the record zones to save to the database.

31.28.9  Events

31.28.10  modifyRecordZonesCompleted(savedRecordZones() as CKRecordZoneMBS, deletedRecordZoneIDs() as CKRecordZoneIDMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute after the status of all changes is known.

**Notes:**
The event returns no value and takes the following parameters:

- `savedRecordZones`: An array of `CKRecordZone` objects you tried to save.
- `deletedRecordZoneIDs`: An array of `CKRecordZoneID` objects corresponding to the record zones you tried to delete.
- `operationError`: An error object containing information about a problem, or `nil` if the results are saved successfully.

This block is executed only once and represents your only chance to process the operation results. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This event reports an error of type `CKErrorPartialFailure` when it saves or deletes only some of the record zones successfully. The `userInfo` dictionary of the error contains a `CKPartialErrorsByItemIDKey` key whose value is a dictionary. The keys of that dictionary are the IDs of the record zones that were not saved or deleted, and the corresponding values are error objects containing information about what happened.
31.29. **CLASS CKMODIFYSUBSCRIPTIONSOPERATIONMBS**

### 31.29 class CKModifySubscriptionsOperationMBS

**MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** A CKModifySubscriptionsOperation object saves changes to one or more CKSubscription objects.

**Notes:**

After creating or changing the configuration of a subscription object, use this type of operation object to save those changes to an iCloud container. You also use instances of this class to delete subscriptions permanently from a database.

The complete event is called after the operation executes and returns its results to you. You can use a completion event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion event you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Available in macOS 10.10 and newer in 64-bit applications.
Subclass of the CKDatabaseOperationMBS class.

### 31.29.2 Methods

#### 31.29.3 Constructor(subscriptionsToSave() as CKSubscriptionMBS, subscriptionIDsToDelete() as String = nil)

**MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Initializes and returns an operation object configured to save and delete the specified subscriptions.

**Notes:**

subscriptionsToSave: An array of CKSubscription objects representing the subscriptions to save or update. You may specify nil for this parameter.
subscriptionIDsToDelete: An array of strings representing the IDs of the subscriptions you want to delete, if any. You may specify nil for this parameter.

The subscriptions you intend to save or delete must all reside in the same container, which you must specify when configuring the operation object. Saving a subscription that is not in the current database creates it in the database. Trying to delete a subscription that does not exist in the current database returns an error for that subscription.
31.29.4 setSubscriptionIDsToDelete(SubscriptionIDsToDelete() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the IDs of the subscriptions you want to delete permanently from the database.

31.29.5 setSubscriptionsToSave(IDs() as CKSubscriptionMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the subscriptions to save to the database.

31.29.6 subscriptionIDsToDelete as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The IDs of the subscriptions you want to delete permanently from the database. **Notes:**

This property contains the array of strings that identify the subscriptions to delete. The initial contents of the array are set to the records you specified with the Constructor.

If you intend to change the set of subscriptions to be deleted, update the value of this property before executing the operation or submitting the operation object to a queue.

31.29.7 subscriptionsToSave as CKSubscriptionMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The subscriptions to save to the database. **Notes:**

This property contains the array of CKSubscriptionMBS objects that you want to save. The initial contents of the array are set to the subscriptions you specified with the Constructor. You can modify this array as needed before executing the operation. After saving the subscription objects, the server begins applying the criteria from those objects to the contents of the database, generating push notifications as appropriate.

If you intend to change the set of subscriptions to be saved, update the value of this property before executing the operation or submitting the operation object to a queue.
31.29.8 Events

31.29.9 modifySubscriptionsCompleted(savedSubscriptions() as CKSubscription-MBS, deletedSubscriptionIDs() as String, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute after the status of all changes is known.

**Notes:**
The event returns no value and takes the following parameters:

- **savedSubscriptions:** The array of CKSubscription objects you tried to save.
- **deletedSubscriptionIDs:** An array of NSString objects corresponding to the subscriptions you tried to delete.
- **operationError:** An error object containing information about a problem, or nil if the results are saved successfully.

The operation object executes this block only once and represents your last chance to process the operation results. The block is executed on a background thread of your app. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it saves or delete only some of the subscriptions successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the subscriptions that were not saved or deleted, and the corresponding values are error objects containing information about what happened.
31.30 class CKNotificationIDMBS

31.30.1 class CKNotificationIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A CKNotificationID object uniquely identifies a push notification sent from a container. Notes: You do not create notification IDs directly. The server creates them when it creates the CKNotification objects that correspond to the push notifications sent to your app. You can compare two IDs using the isEqual method to determine if two notification objects are the same. This class defines no methods or properties. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

31.30.2 Methods

31.30.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether this class is available. Notes: Should be true for OS X 10.10 and newer in 64-bit application.

31.30.4 Constructor

31.30.5 IsEqual(Other as CKNotificationIDMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Checks if two objects are equal.

31.30.6 Properties

31.30.7 Handle as Integer

31.30.  CLASS CKNOTIFICATIONIDMBS

Notes: (Read and Write property)
31.31 class CKNotificationInfoMBS

31.31.1 class CKNotificationInfoMBS

Function: A CKNotificationInfo object specifies the push notification data that the server sends to your app when a subscription finds a match.

Notes: When configuring a CKSubscriptionMBS object, create one of these objects and use it to specify the type of push notifications you want generated when the subscriptions trigger condition is met. You can provide a message for an alert panel, information about the sounds to play, and information about whether the app should be badged. You can also ask the server to provide information about the record that triggered the notification.

see https://developer.apple.com/reference/cloudkit/cknotificationinfo

31.31.2 Methods

31.31.3 alertLocalizationArgs as String()

Function: The array of fields to use when building an alert message.

Notes: Use of this property is optional. This property contains an array of strings, each of which corresponds to a field of the record that triggered the push notification. Those names are used to retrieve the corresponding values from the record. The values themselves must be string, integer, double, or dates. Do not specify keys with other values. String values that are greater than 100 characters in length may be truncated when added to the push notification.

If you use % @ for your substitution variables, those variables are replaced by walking the array in order. If you use variables of the form % n$ @, where n is an integer, n represents the index (starting at 1) of the item in the array to use. Thus, the first item in the array replaces the variable % 1$ @, the second item replaces the variable % 2$ @, and so on. You can use indexed substitution variables to change the order of items in the resulting string, which might be necessary when you localize your apps messages.

31.31.4 Available as Boolean

Function: Whether this class is available.
31.31. **CLASS CKNOTIFICATIONINFOMBS**

**Notes:** Should be true for OS X 10.10 and newer in 64-bit application.

### 31.31.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

### 31.31.6 copy as CKNotificationInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

### 31.31.7 desiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The names of fields to include in the push notification payload. **Notes:**

This property contains an array of strings, each of which corresponds to the name of a field in the record that triggered the notification. When a push notification is delivered, the keys and their corresponding values are included in the payload of the push notification. You can include a maximum of three keys in the array.

For the keys you specify, the allowable values are string, integer, double, CLLocationMBS, date, and CKReferenceMBS. You cannot specify keys whose values contain other data types. String values that are greater than 100 characters in length may be truncated when added to the push notification.

### 31.31.8 setAlertLocalizationArgs(args() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the array of fields to use when building an alert message. **Notes:**

Use of this property is optional. This property contains an array of strings, each of which corresponds to a field of the record that triggered the push notification. Those names are used to retrieve the corresponding values from the record. The values themselves must be string, integer, double, or dates. Do not specify keys with other values. String values that are greater than 100 characters in length may be truncated when added to the push notification.

If you use % @ for your substitution variables, those variables are replaced by walking the array in order.
If you use variables of the form \( \% n$ @ \), where \( n \) is an integer, \( n \) represents the index (starting at 1) of the item in the array to use. Thus, the first item in the array replaces the variable \( \% 1$ @ \), the second item replaces the variable \( \% 2$ @ \), and so on. You can use indexed substitution variables to change the order of items in the resulting string, which might be necessary when you localize your apps messages.

### 31.31.9 setDesiredKeys(desiredKeys() as String)

**Function:** Sets the names of fields to include in the push notification payload.

**Notes:**

This property contains an array of strings, each of which corresponds to the name of a field in the record that triggered the notification. When a push notification is delivered, the keys and their corresponding values are included in the payload of the push notification. You can include a maximum of three keys in the array.

For the keys you specify, the allowable values are string, integer, double, CLLocationCoordinateMBS, date, and CKReferenceMBS. You cannot specify keys whose values contain other data types. String values that are greater than 100 characters in length may be truncated when added to the push notification.

### 31.31.10 Properties

#### 31.31.11 alertActionLocalizationKey as String

**Function:** The key that identifies the text to use for the action button in the alert panel.

**Notes:**

This property identifies the text to use for the button to open your app. Specifically, it contains the name of a key to look up in the apps Localizable.strings file, the value of which is used for the button title.

Specifying a value for this property is optional. When its value is nil, the alert panel triggered by the push notification contains only an OK button to dismiss the alert. When its value is not nil, the alert panel contains one button to dismiss the alert and a second button to open your app.

(Read and Write property)

#### 31.31.12 alertBody as String

**Function:** The text to use for the alert message.

**Notes:**
Use of this property is optional. If you set its value, the corresponding push notification causes the device to display an alert with the specified message. If you want to use a localized string for the alert message, specify a value for the alertLocalizationKey property instead.

(Read and Write property)

### 31.31.13 alertLaunchImage as String

**Function:** The filename of an image to use as a launch image.

**Notes:**

Use of this property is optional. If you specify a value, the string is used to locate an image file in the app bundle. That image is displayed as a launch image when the user launches the app after receiving a push notification.

(Read and Write property)

### 31.31.14 alertLocalizationKey as String

**Function:** The key that identifies the localized string to use for the alert message.

**Notes:**

Use of this property is optional. If you set its value, the corresponding push notification causes the device to display an alert on the users device. The push notification obtains the text for the alert by looking up the specified key in your apps Localizable.strings file. If you specify a value for this property, the value in the alertBody property is ignored.

For information about localizing string resources, see Internationalization and Localization Guide.

(Read and Write property)

### 31.31.15 category as String

**Function:** Name of the action group corresponding to this notification.

**Notes:**

Categories allow you to present custom actions to the user on your push notifications. For more information, read UIMutableUserNotificationCategory.

(Read and Write property)
31.31.16 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.
**Notes:** (Read and Write property)

31.31.17 shouldBadge as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean setting that controls whether a badge value should be incremented.
**Notes:**
The default value of this property is false. Setting it to true causes the system to increment the current badge count for the app whenever the corresponding push notification is delivered.
(Read and Write property)

31.31.18 shouldSendContentAvailable as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the push notification should include the content-available flag.
**Notes:**
When this property is true, the server includes the content-available flag in the push notifications payload. That flag causes the system to wake or launch an app that is not currently running. The app is then given background execution time to download any data related to the push notification, such as the set of records that changed. If the app is already running in the foreground, the inclusion of this flag has no additional effect and the notification is delivered to the app delegate for processing as usual.

The default value of this property is false.
(Read and Write property)

31.31.19 soundName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the sound file to play when a notification arrives.
**Notes:**
Use of this property is optional. If you specify a value, the string is used to locate a sound file in the app bundle. That sound file is played as an alert when a push notification arrives on the users device. If the specified sound file does not exist, or if you specify the string default for this property, the system plays the default alert sound.
31.31. CLASS CKNOTIFICATIONINFOMBS

(Read and Write property)
31.32 class CKNotificationMBS

31.32.1 class CKNotificationMBS

Function: A CKNotificationMBS object represents a push notification that was sent to your app.

Notes:

Notification objects wrap the data associated with a push notification. Use notification objects to wrap recently received push notification data or to fetch notification objects representing already delivered push notifications from a container. In both cases, the information in the notification object tells you what changed.

The CKNotificationMBS class itself is an abstract class. When you create a new notification object from a payload dictionary, the constructor instantiates a subclass of the appropriate type. Similarly, when you fetch notifications from a container, what you receive are instances of a concrete subclass. The base CKNotificationMBS class provides information about the push notification and how it was delivered. Specific subclasses contain specific data indicating what change actually occurred.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

31.32.2 Methods

31.32.3 alertLocalizationArgs as String()

Function: The array of fields used to build the alert message

Notes:

This property contains an array of NSString objects, each of which corresponds to a field of the record that triggered the push notification. Use the field values to replace any substitution variables in the alert strings specified by the notificationFromRemoteNotificationDictionary or Identifying the Notification Object properties. The field values must be string, integer, double, or dates. String values that are greater than 100 characters in length may be truncated when added to the push notification.

If you used `% @` for your substitution variables, those variables are replaced by walking the array in order. If you use variables of the form `% n$ @`, where n is an integer, n represents the index (starting at 1) of the item in the array to use. Thus, the first item in the array replaces the variable `% 1$ @`, the second item replaces the variable `% 2$ @`, and so on. You can use indexed substitution variables to change the order of items in the resulting string, which might be necessary when you localize your apps messages.
31.32.4 Constructor

31.32.5 notificationFromRemoteNotificationDictionary(notificationDictionary as Dictionary) as CKNotificationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and returns a new notification object using the specified payload data. Notes: notificationDictionary: The payload data for the push notification. This dictionary is the same one passed to your app delegatesdidReceiveRemoteNotification method. This parameter must not be nil. Returns a new notification object initialized with the payload data. Use this method to initialize a notification object from a push notification received by your app.

31.32.6 Properties

31.32.7 alertActionLocalizationKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The key that identifies the text to use for the action button in the alert panel. Notes: When this property is nil, the alert panel triggered by the push notification contains only an OK button to dismiss the alert. When this property is not nil, the alert panel contains one button to dismiss the alert and a second button to open your app. This property identifies the text to use for the button to open your app. Specifically, it contains the name of a key to look up in the apps Localizable.strings file, the value of which is used for the button title. (Read only property)

31.32.8 alertBody as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The text of the alert message. Notes: This property contains the nonlocalized version of the message string displayed by the alert.
31.32.9  alertLaunchImage as String

**Function:** The filename of the launch image displayed when your app is launched from the push notification alert.

**Notes:**

The string in this property is used to locate an image file in the app bundle.

(Read only property)

31.32.10  alertLocalizationKey as String

**Function:** The key that identifies the localized string to use for the alert message.

**Notes:**

When delivered to your app, the push notification gets the text for the alert by looking up the specified key in your apps Localizable.strings file. When this property is set, the value in the notificationFromRemoteNotificationDictionary property is ignored.

(Read only property)

31.32.11  badge as Integer

**Function:** The current badge value.

**Notes:**

The value of this property is the integer value displayed in the apps badge at the time the push notification was sent.

(Read only property)

31.32.12  category as String

**Function:** Name of the action group corresponding to this notification.

**Notes:**

Categories allow you to present custom actions to the user on your push notifications. For more information, read UIMutableUserNotificationCategory.
31.32. **CLASS CKNOTIFICATIONMBS**

(Read only property)

### 31.32.13 containerIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the container whose content triggered the notification. **Notes:** (Read only property)

### 31.32.14 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

### 31.32.15 isPruned as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether some push notification content was removed prior to delivery. **Notes:**

(Read only property)

### 31.32.16 notificationID as CKNotificationIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the notification. **Notes:** (Read only property)

### 31.32.17 notificationType as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of event that generated the notification. **Notes:**

Different notification types correspond to different subclasses of CKNotificationMBS, so you can use the value in this property to determine how to handle the notification data.
31.32.18  soundName as String

Function: The name of the sound file to play when a notification arrives.

Notes:
This property contains the string used to locate a sound file in your apps bundle. That sound file is played
as an alert when a push notification arrives on the users device. If the specified sound file does not exist, or
if you specify the string default for this property, the system plays the default alert sound.
(Read only property)

31.32.19  subscriptionID as String

Function: The identifier of the subscription that caused this notification to fire.

Notes: (Read only property)

31.32.20  Constants

31.32.21  TypeDatabase = 4

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the notification type constants.

Notes: A notification generated when the contents of a database changed.

31.32.22  TypeQuery = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the notification type constants.

Notes: A notification generated based on the conditions set forth in a subscription object.

31.32.23  TypeReadNotification = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. Function: One of the notification type constants.

Notes: A notification that your app previously marked as read using a CKMarkNotificationsReadOperationMBS object.
31.32. CLASS CKNOTIFICATIONMBS

31.32.24 TypeRecordZone = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the notification type constants. **Notes:** A notification generated when the contents of a record zone changed.
31.33 class CKOperationMBS

31.33.1 class CKOperationMBS

**Function:** The abstract base class for all operations that can be executed against a CloudKit database.

**Notes:**

see

31.33.2 Methods

31.33.3 cancel

**Function:** Advises the operation object that it should stop executing its task.

**Notes:**

This method does not force your operation code to stop. The code for your operation must invoke the
isCancelled method periodically to determine whether the operation should be stopped. Once cancelled, an
operation cannot be restarted.

If the operation is already finished executing, this method has no effect. Canceling an operation that is
currently in an operation queue, but not yet executing, causes it to be removed from the queue (although
not necessarily right away).

31.33.4 Constructor

**Function:** The constructor.

31.33.5 isCancelled as boolean

**Function:** Returns a Boolean value indicating whether the operation has been cancelled.

**Notes:**

True if the operation was explicitly cancelled by an invocation of the operation’s cancel method; otherwise,
false. This method may return true even if the operation is currently executing.
Discussion
Canceling an operation does not actively stop the operation’s code from executing. An operation object is responsible for calling this method periodically and stopping itself if the method returns true.

31.33.6  isExecuting as boolean

Function: Returns a Boolean value indicating whether the operation is currently executing.  
Notes: True if the operation is executing; otherwise, false if the operation has not been started or is already finished.

31.33.7  isFinished as boolean

Function: A Boolean value indicating whether the operation is done executing.  
Notes: True if the operation is no longer executing; otherwise, false.

31.33.8  start

Function: Begins the execution of the operation.  
Notes: The default implementation of this method configures the execution environment for a non-concurrent operation and invokes the operation’s main method. As part of the default configuration, this method performs several checks to ensure that the non-concurrent operation can actually run and generates appropriate KVO notifications for each change in the operation’s state. If the operation’s operation has already been performed, was cancelled, or is not yet ready to run, this method throws an NSInvalidArgumentException exception. If the operation is to be performed on a separate thread, this method may return before the operation itself completes on the other thread.

31.33.9  Properties

31.33.10  allowsCellularAccess as Boolean

Function: A Boolean value indicating whether the operation object may send data over the cell network.  
Notes: When you send or receive many records, or when you send records with large assets, you might set this property to false to avoid consuming too much of the users cellular data bandwidth. For operations involving
only a few records, it is fine to leave this property set to true, which is the default.

When this property is set to false, the operation executes normally but fails if Wi-Fi is not available.
(Read and Write property)

### 31.33.11 container as CKContainerMBS

**Function:** The container to use for the operation. 
**Notes:**
The container sets the context for where the operation should perform its work. The addOperation method of both the CKContainerMBS and CKDatabaseMBS classes implicitly sets the value of this property to their container.

If you execute the operation yourself, either directly or using a custom operation queue, it is recommended that you set the value of this property explicitly. If the value is nil when you execute an operation, the operation object implicitly executes against your apps default container.
(Read and Write property)

### 31.33.12 Handle as Integer

**Function:** The handle to the internal used NSOperation reference. 
**Notes:** (Read and Write property)

### 31.33.13 longLived as Boolean

**Function:** A Boolean value indicating whether the operation is long-lived. 
**Notes:**
To create a long-lived operation, set to true. The default value is false. If the operation is running or is a long-lived operation fetched from a CKContainer object, changing this property value has no effect.

For more information on long-lived operations, read Long-Lived Operations. 
(Read and Write property)
31.33. CLASS CKOPERATIONMBS

31.33.14 operationID as String

**Function:** A unique identifier for a long-lived operation.

**Notes:**
Use this property to fetch a long-lived operation using the fetchLongLivedOperationWithID method in the CKContainer class. For more information on long-lived operations, read Long-Lived Operations.
(Read only property)

31.33.15 timeoutIntervalForRequest as Double

**Function:** The timeout interval to use when waiting for additional data.

**Notes:**
This property determines the request timeout interval for the operation. The request timeout interval controls how long (in seconds) the operation should wait for additional data to arrive before giving up. The timer associated with this value is reset whenever new data arrives. When the request timer reaches the specified interval without receiving any new data, it triggers a timeout.

The default value is 60 seconds.
(Read and Write property)

31.33.16 timeoutIntervalForResource as Double

**Function:** The maximum amount of time that a resource request should be allowed to take.

**Notes:**
This property determines the resource timeout interval for this operation. The resource timeout interval controls how long (in seconds) to wait for the entire operation to complete before giving up. The resource timer starts when the operation is initiated and counts until either the operation completes or this timeout interval is reached, whichever comes first.

The default value is 7 days.
(Read and Write property)
31.33.17 Events

31.33.18 Completed

31.33.19 LongLivedOperationWasPersisted

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The event to execute when the server starts storing callbacks for this long-lived operation.

Notes:

If your app exits before this event is called, the long-lived operation identifier is not included in the results of the fetchAllLongLivedOperationIDs method.

For more information on long-lived operations, read Long-Lived Operations.
31.34. CLASS CKQUERYCURSORMBS

31.34 class CKQueryCursorMBS

31.34.1 class CKQueryCursorMBS

**Function:** A CKQueryCursor object is an opaque data object that marks the stopping point for a query and the starting point for retrieving the remaining results.
**Notes:**
You do not create instances of this class yourself. When fetching records using a CKQueryOperation object, if the number of results exceeds the results limit value set for the query, the server provides you with a query cursor object. Use that cursor object to initialize a new CKQueryOperationMBS and retrieve the next batch of results for the same query.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

31.34.2 Methods

31.34.3 Available as Boolean

**Function:** Whether this class is available.
**Notes:** Should be true for OS X 10.10 and newer in 64-bit application.

31.34.4 Constructor

**Function:** The private constructor.

31.34.5 copy as CKQueryCursorMBS

**Function:** Creates a copy of this object.

31.34.6 Properties

31.34.7 Handle as Integer

**Function:** The internal object reference.
Notes: (Read and Write property)
31.35. CLASS CKQUERYMBS

31.35 class CKQueryMBS

31.35.1 class CKQueryMBS

Function: A CKQuery object manages the criteria to apply when searching for records in a database.

Notes:

You create a query object as the first step in the search process. The query object stores the search parameters, including the type of records to search, the match criteria (predicate) to apply, and the sort parameters to apply to the results. The second step is to use the query object to initialize a CKQueryOperation object, which you then execute to generate the results.

see https://developer.apple.com/reference/cloudkit/ckquery

31.35.2 Methods

31.35.3 Available as Boolean

Function: Whether this class is available.

Notes: Should be true for OS X 10.10 and newer in 64-bit application.

31.35.4 Constructor

Function: The private constructor.

See also:

- 31.35.5 Constructor(RecordType as String, predicate as NSPredicateMBS) 5299

31.35.5 Constructor(RecordType as String, predicate as NSPredicateMBS)

Function: Initializes and returns a query object with the specified parameters.

Notes:

recordType: The type of record to search. Specify the name of one of your apps supported record types. This method throws an exception if this parameter is nil or contains an empty string.
predicate: The search predicate to apply to the prospective records. Only records matching the predicate criteria are returned in the search results. For guidelines on how to construct predicates for your queries,
see Predicate Rules for Query Objects. This parameter must not be nil.

Returns an initialized query object.

Discussion
You cannot change the record type and predicate of a query object after you create it. If you want to search for a different set of records using a different set of search criteria, create a new query object. You can add sort descriptors to the query and change them later as needed.

You cannot query for user records and executing a query where the record type is set to CKRecordType-UserRecordMBS results in an error. You must fetch user records directly using their ID.

See also:
- 31.35.4 Constructor

31.35.6 setSortDescriptors(sortDescriptors() as NSSortDescriptorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Sets the sort descriptors to use when organizing the query results.

31.35.7 sortDescriptors as NSSortDescriptorMBS()

Notes:
This property contains an array of NSSortDescriptor objects. You can add sort descriptors to a query object and change them later as needed. Each sort descriptor contains a field name of the intended record type and information about whether to sort values in that field in ascending or descending order. The default value of this property is nil, which means that records are returned in an indeterminate order.

The order of the items in the array matches the order in which the sort descriptors are applied to the results. In other words, the first sort descriptor in the array is applied first, followed by the second sort descriptor if needed, and the third, and so on.

31.35.8 Properties

31.35.9 Handle as Integer

### 31.35.10 predicate as NSPredicateMBS

**Function:** The search criteria to use when matching records.

**Notes:**

A predicate contains one or more expressions that evaluate to true or false. Expressions are often value-based comparisons, but predicates support other types of operators, including string comparisons and aggregate operations. For guidelines on how to construct predicates for your queries, see Predicate Rules for Query Objects.

This property is set at initialization time and cannot be changed later.

(Read only property)

### 31.35.11 recordType as String

**Function:** The record type to search.

**Notes:**

Searches return only records of the specified type. This property is set at initialization time and cannot be changed later.

The record type is an app-specific string that you use to distinguish among the records of your app. The records of a given type all represent different instances of the same information. For example, an employee record type might store the employees name, phone number, and a reference to the employees manager.

(Read only property)
31.36 class CKQueryNotificationMBS

31.36.1 class CKQueryNotificationMBS

**Function:** A CKQueryNotification object represents a push notification that was generated by a subscription object.

**Notes:** Subscription objects represent persistent queries on the server. When the server detects a change related to a subscription, it sends a push notification to the client that created the subscription and logs the push notification in the container. You use instances of this class to get information about the record involved in the push notification.

see https://developer.apple.com/reference/cloudkit/ckquerynotification

Subclass of the CKNotificationMBS class.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

31.36.2 Methods

31.36.3 Constructor

**Function:** The private constructor.

31.36.4 Properties

31.36.5 databaseScope as Integer

**Function:** The database scope.

**Notes:** (Read only property)

31.36.6 isPublicDatabase as Boolean

**Function:** A Boolean value indicating whether the record is in the public database.

**Notes:**
The value of this property is true if the record is in the public database, or false if it is in the current users private database.
(Read only property)

### 31.36.7 queryNotificationReason as Integer

Function: The event that triggered the delivery of the push notification.

Notes:
Subscription-initiated notifications are triggered by the creation, deletion, or updating of a single record. The record in question must match the predicate specified by the subscription object for an event to be triggered.
(Read only property)

### 31.36.8 recordFields as Dictionary

Function: A dictionary of the fields that changed.

Notes:
For updated and newly created records, this property contains the desired keys requested by the subscription object. When you configure the CKNotificationInfoMBS object of a subscription object, you can specify the names of one or more fields in the desiredKeys property of that notification information object. When a push notification is triggered, the values for each of those keys is retrieved from the record and included in the push notifications payload, space permitting.

For query notification objects fetched from a container, all keys and values are present. For query notification objects generated from an incoming push notification, one or more keys and values may be missing. Push notification payloads are limited in size, and record fields are one of the first pieces of data to be excluded when that size limit is exceeded. For information about the order in which fields are removed, see the overview of this class.
(Read only property)

### 31.36.9 recordID as CKRecordIDMBS

Function: The identifier of the record that was created, deleted, or updated.

Notes:
Use this identifier to fetch the record from the container. Check the value of the isPublicDatabase property to determine which database to fetch it from.
31.36.10 Constants

31.36.11 ReasonRecordCreated = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the event that triggered the notification. 
**Notes:** A record matching the subscriptions predicate was created.

31.36.12 ReasonRecordDeleted = 3

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the event that triggered the notification. 
**Notes:** A record matching the subscriptions predicate was deleted.

31.36.13 ReasonRecordUpdated = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the event that triggered the notification. 
**Notes:** A record matching the subscriptions predicate was updated.
31.37. **CLASS CKQUERYOPERATIONMBS**

31.37 **class CKQueryOperationMBS**

31.37.1 **class CKQueryOperationMBS**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CKQueryOperation object is a concrete operation that you can use to execute queries against a database. **Notes:** A query operation takes the query parameters you provide and applies those parameters to the specified database and zone, delivering any matching records asynchronously to the blocks that you provide.

see https://developer.apple.com/reference/cloudkit/ckqueryoperation
Subclass of the CKDatabaseOperationMBS class.

31.37.2 **Methods**

31.37.3 **CKQueryOperationMaximumResults as Integer**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A placeholder value representing the maximum number of results to retrieve. **Notes:** The value of this constant does not correspond to the actual number of records. The actual maximum value is determined dynamically by the server based on various conditions.

31.37.4 **Constructor**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor. See also:

- 31.37.5 Constructor(query as CKQueryMBS) 5305
- 31.37.6 Constructor(queryCursor as CKQueryCursorMBS) 5306

31.37.5 **Constructor(query as CKQueryMBS)**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an operation object configured to search for records in the specified zone. **Notes:** query: The query to use during the search. This parameter must not be nil.
Returns an initialized operation object.

You can use the returned CKQueryOperationMBS object only once to perform a search, but the object you specify in the query parameter can be reused as needed. When executed, this query object performs a new search and returns the first batch of results. If there are more results available, you must create a separate query object using the provided cursor object.

See also:

- 31.37.4 Constructor
- 31.37.6 Constructor(queryCursor as CKQueryCursorMBS)

31.37.6 Constructor(queryCursor as CKQueryCursorMBS)

Function: Initializes and returns an operation object that returns more results from a previous search.
Notes:

cursor: The cursor object identifying the previous search. This value is passed to the completion block of the previous search.

Returns an initialized operation object ready to continue the search.

Use this method to initialize a query operation that retrieves the next batch of results from a previous search. When executing searches based on a cursor, do not cache cursor objects for a long time before using them. A cursor is not a snapshot of the previous search results; it stores a relative offset into the results list. An operation object created using a cursor performs a new search, sorts the new set of results, and uses the previous offset value to determine where the next batch of results starts.

See also:

- 31.37.4 Constructor
- 31.37.5 Constructor(query as CKQueryMBS)

31.37.7 desiredKeys as String()

Function: The fields to retrieve for the requested records.
Notes:

Use this property to limit the amount of data retrieved for each record during the search operation. The value is an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the specified keys are included in the returned record. If you specify nil, the operation retrieves all keys for the record. The default value of this property is nil.
If you intend to specify a value, you must do so before executing the operation or submitting the operation object to a queue.

### 31.37.8 setDesiredKeys(desiredKeys() as String)

**Function:** Sets the fields to retrieve for the requested records.

**Notes:**
Use this property to limit the amount of data retrieved for each record during the search operation. The value is an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the specified keys are included in the returned record. If you specify nil, the operation retrieves all keys for the record. The default value of this property is nil.

If you intend to specify a value, you must do so before executing the operation or submitting the operation object to a queue.

### 31.37.9 Properties

#### 31.37.10 cursor as CKQueryCursorMBS

**Function:** The data cursor to use for continuing the search.

**Notes:**
You set the initial value of this property with the Constructor. When you use a cursor, the contents of the query property are ignored. The data cursor stored in this property is an opaque object that is provided to you by the server.

If you intend to specify or change the value in this property, do so before executing the operation or submitting the operation object to a queue.

(Read and Write property)

#### 31.37.11 query as CKQueryMBS

**Function:** The query to use for the search.

**Notes:**
You set the initial value of this property with the Constructor method. When the value in the cursor property is nil, the query operation uses the CKQueryMBS object in this property to execute a new search and
return the results to your completion handler. If the cursor value is not nil, the cursor is used instead.

If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

(Read and Write property)

### 31.37.12 resultsLimit as Integer

**Function:** The maximum number of records to return at one time.

**Notes:**

For most queries, leave the value of this property set to the default value, which is represented by the CK-QueryOperationMaximumResults constant. When using that value, the server chooses a limit that aims to provide an optimal number of results that returns as many records as possible while minimizing delays in receiving those records. However, if you know that you want to process a fixed number of results, change the value of this property accordingly.

(Read and Write property)

### 31.37.13 zoneID as CKRecordZoneIDMBS

**Function:** The ID of the zone containing the records to search.

**Notes:**

When set, the value of this property limits the scope of the search to the records in the specified zone. If no zone is specified, the search takes place on all zones.

When you initialize the operation object using the Constructor method, the value of this property is set to nil and any changes you make to the property are ignored. When the operation object is executed, the cursor object provides the zone information from the initial search that generated the cursor.

(Read and Write property)

### 31.37.14 Events

### 31.37.15 queryCompleted(cursor as CKQueryCursorMBS, operationError as NSErrorMBS)
The block returns no value and takes the following parameters:

cursor: A CKQueryCursorMBS object that indicates there are more results to fetch or nil if the results parameter contains all of the remaining search results. Use the provided object to initialize a new query operation object when you are ready to retrieve the next batch of results.

operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

This block is executed only once and represents your last chance to process the operation results. It is executed after all of the individual progress blocks but before the operations completion block. The block is executed serially with respect to the other progress blocks of the operation. If you intend to use this block to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

When the results of a query operation are known, the operation object uses this block to deliver the available set of records to your app. If the number of records exceeds the value in resultsLimit, the operation object provides an opaque data object in the cursor parameter of your block that you can use to retrieve the next batch of results. You must create a separate operation object using that cursor to get the next batch of results.

31.37.16 recordFetched(record as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event to execute for each record returned by the query.

**Notes:**

record: A CKRecordMBS object matching the search criteria.

After identifying and sorting the records, the operation object executes this block once for each record in the sorted results. The block is executed serially with respect to all progress blocks of the operation object, so you can expect only one block at a time to be executing for this operation object.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

**Warning**

Query indexes are updated asynchronously so they are not guaranteed to be current. If you query for records that you recently changed and not allow enough time for those changes to be processed, the query results may be incorrect. The results may not contain the correct records and the records may be out of order.
31.38 class CKQuerySubscriptionMBS

31.38.1 class CKQuerySubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Subscription that fires whenever a change matches the specified predicate.  
**Notes:** Subclass of the CKSubscriptionMBS class.

31.38.2 Methods

31.38.3 Constructor(RecordType as String, predicate as NSPredicateMBS, querySubscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a query-based subscription that monitors records with the specified options.  
**Notes:**  
recordType: The string that identifies the type of records to track. You are responsible for naming your apps record types. This parameter must not be nil or an empty string.  
predicate: The matching criteria to apply to the records. This parameter must not be nil. For information about the operators that are supported in search predicates, see the discussion in CKQuery.  
querySubscriptionOptions: A bitmask of the configuration options for the subscription. Specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion. 

Returns a subscription object initialized to track record-related changes.

The object returned by this method is configured as a query-based subscription searching records in the target database. The subscription monitors the specified type of records in all of the users record zones and generates push notifications when the search criteria are met.  
See also:

- 31.38.4 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer)
31.38. CLASS CKQUERYSUBSCRIPTIONMBS

apps record types. This parameter must not be nil or an empty string.
predicate: The matching criteria to apply to the records. This parameter must not be nil. For information
about the operators that are supported in search predicates, see the discussion in CKQuery.
subscriptionID: The unique name of the subscription. This string must be unique in the specified database
and must not be nil.
querySubscriptionOptions: A bitmask of the configuration options for the subscription. Specify at least one
of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOn-
RecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.

Returns a subscription object initialized to track record-related changes.

The object returned by this method is configured as a query-based subscription searching records in the
target database. The subscription monitors the specified type of records in all of the users record zones and
generates push notifications when the search criteria are met.
See also:

• 31.38.3 Constructor(RecordType as String, predicate as NSPredicateMBS, querySubscriptionOptions
  as Integer)

31.38.5 copy as CKQuerySubscriptionMBS

31.38.6 Properties

31.38.7 predicate as NSPredicateMBS

Notes:

A query-based subscription uses its search predicate to identify potential matches for records. It combines
the predicate information with the value in the querySubscriptionOptions property to determine the conditions under which to send a push notification to the app.

The search predicate defines the records that the subscription object monitors for changes. The value in this
property is used only if the subscriptionType property is set to CKSubscriptionTypeQueryMBS; otherwise,
it is ignored. (Read only property)
31.38.8  querySubscriptionOptions as Integer

Function:  Option flags describing the firing behavior of the subscription

Notes:  Set the value of this property at initialization time. When configuring a query-based subscription, one of
the following values must be specified:

CKQuerySubscriptionOptionsFiresOnRecordCreation
CKQuerySubscriptionOptionsFiresOnRecordUpdate
CKQuerySubscriptionOptionsFiresOnRecordDeletion

If an option flag is not set, an NSInvalidArgumentException is thrown.
(Read only property)

31.38.9  recordType as String

Function:  The record type being monitored in a query-based subscription. (read-only)

Notes:  The value of this property applies only to query-based subscriptions and is set automatically by the Con-
structor. For all other types of subscription objects, the value of this property is ignored and set to nil.
(Read only property)

31.38.10  zoneID as CKRecordZoneIDMBS

Function:  Zone that this query subscription is scoped to.

Notes:  The value of this property applies both to query-based subscriptions and zone-based subscriptions. Specifying
a record zone limits the search scope to the records in that zone. In the case of a zone-based subscription,
the search encompasses all records in the zone. For a query-based subscription, the search encompasses only
records of a specific type in that zone.

For zone-based subscriptions, the value of this property is set automatically by the Constructor. For all
other subscription types, the default value is nil. To apply a zone to a query-based subscriptions, you must
assign a value explicitly.
(Read only property)
31.38.11 Constants

31.38.12 OptionsFiresOnce = 8
MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the option values for notifications. **Notes:** Fire only once.

31.38.13 OptionsFiresOnRecordCreation = 1
MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the option values for notifications. **Notes:** Fire at record creation.

31.38.14 OptionsFiresOnRecordDeletion = 4
MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the option values for notifications. **Notes:** Fire on record deletion.

31.38.15 OptionsFiresOnRecordUpdate = 2
MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the option values for notifications. **Notes:** Fire on record update.
31.39 class CKRecordIDMBS

31.39.1 class CKRecordIDMBS

Function: A CKRecordID object uniquely identifies a record in a database.

Notes:
Record ID objects are normally created automatically when you create a new record, but you might also create IDs in several specific situations. For example, you must create record ID objects when you want to save a record in a zone other than the default zone. You can also create record ID objects when you want to retrieve records whose IDs you know from a database.

see https://developer.apple.com/reference/cloudkit/ckrecordid

31.39.2 Methods

31.39.3 Available as Boolean

Function: Whether this class is available.

Notes: Should be true for OS X 10.10 and newer in 64-bit application.

31.39.4 Constructor

Function: The private constructor.
See also:

- 31.39.5 Constructor(recordName as string) 5314
- 31.39.6 Constructor(recordName as string, zoneID as CKRecordZoneIDMBS) 5315

31.39.5 Constructor(recordName as string)

Function: Initializes and returns a new record ID with the specified name in the default zone.

Notes:
recordName: The name to use to identify the record. The string must contain only ASCII characters and must not exceed 255 characters. If you specify nil or an empty string for this parameter, this method throws
an exception.

Returns an initialized record ID object or nil if the object cannot be created.

Use this method when you are creating or searching for records in the default zone.

See also:

- 31.39.4 Constructor
- 31.39.6 Constructor(recordName as string, zoneID as CKRecordZoneIDMBS)

31.39.6 Constructor(recordName as string, zoneID as CKRecordZoneIDMBS)

**Function:** Initializes and returns a new record ID with the specified name and zone information.  
**Notes:**

- recordName: The name to use to identify the record. The string must contain only ASCII characters and must not exceed 255 characters. If you specify nil or an empty string for this parameter, this method throws an exception.
- zoneID: The ID of the zone in which to place the record. This parameter must not be nil.

Returns an initialized record ID object or nil if the object cannot be created.

Use this method when you create or search for records in a zone other than the default zone. The value in the zoneID parameter must represent a zone that already exists in the database. If the record zone does not exist yet, save the corresponding CKRecordZoneMBS object to the database before attempting to save any CKRecordMBS objects in that zone.

See also:

- 31.39.4 Constructor
- 31.39.5 Constructor(recordName as string)

31.39.7 copy as CKRecordIDMBS

**Function:** Creates a copy of this object.

31.39.8 IsEqual(Other as CKRecordIDMBS) as boolean

**Function:** Checks if two objects are equal.
31.39.9 Properties

31.39.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

31.39.11 recordName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The unique name of the record.  
**Notes:** (Read only property)

31.39.12 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the zone containing the record.  
**Notes:** (Read only property)
31.40. CLASS CKRECORDMBS

31.40.1 class CKRecordMBS

Function: A dictionary of key-value pairs that you use to fetch and save the data of your app.
Notes:
Records are the fundamental objects you use to manage data in CloudKit. You may define any number of record types for your app, with each record type corresponding to a different type of information you need. Within a given record type, you then define one or more fields, each of which has a name and a data value. Records can contain simple data types such as strings and numbers or more complex types such as geographic locations or pointers to other records.

An important step in using CloudKit is defining the record types your app supports. Each new record object contains no keys or values initially. During development, you can add new keys and values at any time. The first time you set a value for a key and save the record, the server associates that type with the key for all records of the same type. (The CKRecordMBS class does not enforce these type constraints or do any local validation of a records contents; those constraints are enforced by the server when you save records.)

Note

The ability to add new keys is only possible during development. When you deploy to a production environment, the server returns an error when you try to specify an unknown record type or try to save a record containing unknown keys.
Although records act like dictionaries, there are still limitations to the types of values you can assign to keys. The following are the object types that the CKRecord class supports. Attempting to specify objects of any other type is a programmer error and will fail. Fields of all types are searchable unless otherwise noted.

see also

31.40.2 Methods

31.40.3 allKeys as String()

Function: Returns an array of strings corresponding to all keys currently in the record.
Notes:
Returns an array of strings. The returned array contains only the keys that have corresponding values in the record. If no keys are set for the record, this method returns an empty array.
This method may not return all possible keys in the record. Specifically, the method does not return keys whose values are nil.

### 31.40.4 allTokens as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings that you can use for full-text searches of the fields string-based values.  
**Notes:** Returns an array of strings containing data from the records string-based fields.

When performing your own full-text searches, you can use this method to get a list of strings for your search. The method acts only on keys whose values are NSString objects. It breaks each value string apart at whitespace boundaries, creates new strings for each word, adds the new strings to an array, and returns the array. This tokenized version of the records string values makes it easier to do string-based comparisons of individual words.

### 31.40.5 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.  
**Notes:** Should be true for OS X 10.10 and newer in 64-bit application.

### 31.40.6 changedKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings representing the keys that have changed recently.  
**Notes:** An array of strings, each of which represents a key whose value has changed since the record was downloaded or saved. If no keys have changed, this method returns an empty array.

### 31.40.7 CKRecordTypeUserRecord as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The record type for an user record.
31.40. CLASS CKRECORDMBS

31.40.8 Constructor

Function: The private constructor.

See also:

- 31.40.9 Constructor(RecordType as String)
- 31.40.10 Constructor(RecordType as String, recordID as CKRecordIDMBS)
- 31.40.11 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS)

31.40.9 Constructor(RecordType as String)

Function: Initializes and returns a new record of the specified type.

Example:

```plaintext
// Create a new record of type "employee".

dim myRecord as new CKRecordMBS("employee")
```

Notes:

recordType: A string reflecting the type of record that you want to create. This string becomes the type of record thereafter and cannot be changed. You define the record types that your app supports and use them to distinguish between records with different types of data. This parameter must not be nil or contain an empty string.

Record type names must consist of one or more alphanumeric characters and must start with a letter. Type names may include underscore characters as long as they do not start with that character. Spaces are not allowed in the names.

Returns an initialized record object or nil if the record cannot be created.

Use this method to initialize a new record object in the default zone of the database. The newly created record contains no data in any of its fields and is assigned a unique ID.

New records exist only in memory until you explicitly save them to iCloud. In addition, new records are sparse by default and have no values assigned to the fields you defined. (In fact, until you set the value of a key explicitly, getting the value of a key in a new record returns nil.) Even though a record has an associated type, that type information is ignored until you save the record.

Save the record using a CKModifyRecordsOperationMBS object or using the saveRecord method of CKDatabaseMBS to transfer the records contents to the server.
Constructors

**31.40.10 Constructor(RecordType as String, recordID as CKRecordIDMBS)**

**Function:** Initializes and returns a record using an ID that you provide.

**Notes:**

- `recordType`: A string reflecting the type of record that you want to create. Define the record types that your app supports, and use them to distinguish between records with different types of data. This parameter must not be nil or contain an empty string. Record type names consist of one or more alphanumeric characters and start with a letter. Type names may include underscore characters if they do not start with that character. Spaces are not allowed in record type names.
- `recordID`: The ID to assign to the record itself. When creating the ID, you can specify the zone in which to place the record. The ID cannot currently be in use by any other record and must not be nil.

Returns an initialized record object or nil if the record cannot be created.

**Discussion**

Use this method to initialize a new record object with the specified ID. The newly created record contains no data.

Upon creation, record objects exist only in memory on the local device. Save the record using a CKModifyRecordsOperationMBS object or using the saveRecord method of CKDatabaseMBS to transfer the records contents to the server.

**31.40.11 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS)**

**Function:** Initializes and returns a record in the specified zone.

**Notes:**
recordType: A string reflecting the type of record that you want to create. Define the record types that your app supports, and use them to distinguish between records with different types of data. This parameter must not be nil or contain an empty string. Record type names consist of one or more alphanumeric characters and start with a letter. Type names may include underscore characters if they do not start with that character. Spaces are not allowed in record type names.

zoneID: The ID of the record zone in which to place the record.

Returns an initialized record object, or nil if the record cannot be created.

Use this method to initialize a new record object in the specified record zone.

Upon creation, the new record contains no data and exists only in memory on the local device. Save the record using a CKModifyRecordsOperationMBS object or using the saveRecord:completion: method of CKDatabase to transfer the records contents to the server.

See also:

- 31.40.8 Constructor
- 31.40.9 Constructor(RecordType as String)
- 31.40.10 Constructor(RecordType as String, recordID as CKRecordIDMBS)

31.40.12 copy as CKRecordMBS

31.40.13 setParentReferenceFromRecord(parentRecord as CKRecordMBS)

Notes:

parentRecord: A record that you want to set as the parent to this record.

This method creates and sets a CKReferenceMBS object for the CKRecordMBS passed in. The resulting CKReferenceMBS will have its action set to none.

31.40.14 setParentReferenceFromRecordID(parentRecordID as CKRecordIDMBS)

31.40.15 Properties

31.40.16 creationDate as Date

**Function:** The time when the record was first saved to the server.

**Notes:**

The creation date reflects the time at which a record with the current records ID was created on the server. For new instances of this class, the value of this property is initially set to nil. When you save the record to the server, the value is updated with the appropriate creation date for the record. (Read only property)

31.40.17 creatorUserRecordID as CKRecordIDMBS

**Function:** The ID of the user who created the record.

**Notes:**

Use the value in this property to retrieve the user record of the user who created this record. Every user of the app has a unique user record that is empty by default. Apps can add data to the user record on behalf of the user but should not store sensitive data in it. (Read only property)

31.40.18 Handle as Integer

**Function:** The internal object reference.

**Notes:** (Read and Write property)

31.40.19 lastModifiedUserRecordID as CKRecordIDMBS

**Function:** The ID of the user who last modified the record.

**Notes:**

Use the value in this property to retrieve the user record of the user who last modified this record. Every user of the app has a unique user record that is empty by default. Apps can add data to the user record on behalf of the user but should not store sensitive data in it.
31.40. CLASS CKRECORDMBS

(Read only property)

31.40.20 modificationDate as Date

Function: The time when the record was last saved to the server.
Notes:
The modification date reflects the time at which a record with the current records ID was last saved to the server. For new instances of this class, the value of this property is initially set to nil. When you save the record to the server, the value is updated with the appropriate modification date for the record.
(Read only property)

31.40.21 parent as CKReferenceMBS

Function: A reference to the parent record to this record.
Notes:
A parent reference is used to teach CloudKit about the hierarchy of your records. This hierarchy of records will be shared if the share reference is set on a record.

A parent record reference must have a none set.

The target of a parent reference must exist at save time either already on the server, or part of the same CKModifyRecordsOperationMBS batch.

You are encouraged to set up the parent relationships as part of normal record saves, even if you are not planning on sharing records at this time. This allows you to share and unshare a hierarchy of records at a later date by only modifying the top level record, setting or clear its share reference.
(Read and Write property)

31.40.22 recordChangeTag as String

Function: A string containing the server change token for the record.
Notes:
When you fetch a record from the server, you get the current version of that record as it exists on the server. However, at any time after you fetch a record, other users might save a newer version of the record to the server. Every time a record is saved, the server updates the records change token to a new value. When you
save your instance of the record to the server, the server compares the token in your record with the token on the server. If the two tokens match, the server knows that you modified the latest version of the record and that your changes can be applied right away. If the two tokens do not match, the server applies the save policy your app specified to determine how to proceed.

In your own code, you can use change tokens to distinguish between two different versions of the same record. (Read only property)

### 31.40.23 recordID as CKRecordIDMBS

**Function:** The unique ID of the record.
**Notes:**
The ID of a new record is always set at initialization time. If you use the Constructor method to initialize the record, the ID is derived from the CKRecordIDMBS object you provide. In all other cases, the record generates a UUID and bases its ID on that value. The ID of a record never changes over the lifetime of that record.

When you save a new record object to the server, the server validates the uniqueness of the record but reports an error only if the save policy calls for it. Specifically, it reports an error when the save policy is set to ifServerRecordUnchanged, which is the default. For other save policies, the server overwrites the contents of the existing record accordingly. (Read only property)

### 31.40.24 recordType as String

**Function:** The app-defined string that identifies the type of the record.
**Notes:**
Use this string to differentiate between different record types in your app. The string is primarily for your benefit, so choose type names that reflect the data in the corresponding records. (Read only property)

### 31.40.25 share as CKReferenceMBS

**Function:** A reference to the share associated with the sharing of this record.
**Notes:**
The share property (CKReferenceMBS) on a record will be removed when the corresponding CKShare object is deleted from the server. Send this record in the same batch as the share that is being deleted, and this
31.40. **CLASS CKRECORDMBS**

records share property will be updated.

Sharing is only supported in zones with the CKRecordZoneCapabilitySharing capability. The default zone does not support sharing.

If any records have a parent reference to this record, they are implicitly shared alongside this record.

Note

Records in a hierarchy must only exist within one share. If a child record in a hierarchy already has a share reference set, you will get a CKErrorAlreadyShared error if you try to share any of that records parents. (Read only property)

**31.40.26 dataForKey(key as string) as MemoryBlock**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for the given key stored in the record as data. **Notes:** (Read and Write computed property)

**31.40.27 objectForKey(key as string) as Variant**

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for the given key stored in the record. **Notes:**

key: The string that identifies a field in the record. Key names consist of one or more alphanumeric characters and start with a letter. You may also include underscore characters if you do not use an underscore as the first character in the name. Spaces are not allowed in key names.

Returns the object associated with the specified key or nil if no such key exists in the record.

New records do not contain any keys or values initially. Values are always one of the object types listed in Supported Data Types.

You access the fields of a CKRecord object the same way you access key-value pairs in an NS MUTABLE DICTIONARY. The CKRecord class defines the objectForKey: and setObject:forKey: methods for getting and setting values. It also supports dictionary index notation. (Read and Write computed property)
31.40.28 **stringForKey(key as string) as string**

**Function:** The value for the given key stored in the record as string.

**Notes:**
- If field contains a number, we convert it to string for you.
- (Read and Write computed property)

31.40.29 **textForKey(key as string) as text**

**Function:** The value for the given key stored in the record as text.

**Notes:**
- If field contains a number, we convert it to text for you.
- (Read and Write computed property)
31.41. class CKRecordZoneIDMBS

Overview
A record zone ID distinguishes one zone from another by a name string and the ID of the user that created the zone. Both strings must be ASCII strings that do not exceed 255 characters. For automatically created record zones, the ID name string is based on a UUID and is therefore guaranteed to be unique. When creating your own record zone ID objects, you are free to use names that have more meaning to your app or to the user, providing each zone name is unique within the specified database. The owner name must be either the current user name (obtained from the fetchUserRecordID method) or the name of another user.

When creating new record zones, make the name string in the record zone ID unique in the target database. Public databases do not support custom zones, and zones in a private database can only be created by the user that owns the database.

This class is not intended to be subclassed.

Interacting with Record Zone IDs
After you create a CKRecordZoneIDMBS object, interactions with that object typically include:

- Creating a CKRecordIDMBS object so that you can fetch or create records in that zone.
- Retrieving an existing CKRecordZoneMBS object from the database.

You do not need to create a CKRecordZoneIDMBS object in order to create a CKRecordZoneMBS object. The CKRecordZoneMBS class has initialization methods that create a record zone ID using the name string you provide.

Creating Record Zone IDs to Use with Records
To create a new record in a custom zone, first create a CKRecordZoneIDMBS object that specifies the zone name. Use the record zone ID to create a CKRecordID and then use the record ID to create the record itself.

Fetching a Record Zone Object from the Database
To fetch a CKRecordZoneMBS object from a database, use a CKFetchRecordZonesOperationMBS object.
or the fetchRecordZoneWithID method of the CKDatabaseMBS class. Both techniques take a CKRecordZoneIDMBS object that you provide and retrieve the corresponding record zone object asynchronously. If you use the operation object, you can retrieve multiple record zones at the same time.

### 31.41.2 Methods

### 31.41.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.  
**Notes:** Should be true for OS X 10.10 and newer in 64-bit application.

### 31.41.4 Constructor(zoneName as string, ownerName as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a record zone ID with the specified name and owner.  
**Notes:**  
zoneName: The name that identifies the record zone. The string must contain only ASCII characters and must not exceed 255 characters. To specify the default zone of the current database, pass the CKRecordZoneDefaultName constant for this parameter. This parameter must not be nil or the empty string.  
ownerName: The user who created the record zone. To specify the current user, use the CKOwnerDefaultName constant. If you specify nil or an empty string for this parameter, this method throws an exception.  

Returns an initialized record zone ID object or nil if the object cannot be created.

Use this method to create a record zone ID for use in creating or fetching a record zone.

### 31.41.5 copy as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.

### 31.41.6 IsEqual(Other as CKRecordZoneIDMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Checks if two objects are equal.
31.41.7 Properties

31.41.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

31.41.9 ownerName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the user who owns the record zone. **Notes:** (Read only property)

31.41.10 zoneName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The unique name of the record zone. **Notes:** (Read only property)
31.42 class CKRecordZoneMBS

31.42.1 class CKRecordZoneMBS

Function: A definition of a custom area for organizing related records in a database.

Notes:

Zones are an important part of how you organize your data. The public and private databases have a single default zone. In the private database you can use CKRecordZoneMBS objects to create additional custom zones as needed. Use custom zones to arrange and encapsulate groups of related records in the private database. Custom zones support other capabilities too, such as the ability to write multiple records as a single atomic transaction.

Treat each custom zone as a single unit of data that is separate from every other zone in the database. Inside the zone, you add records as you would anywhere else. You can also create links between the records inside a zone by using the CKReferenceMBS class. However, the CKReferenceMBS class does not support cross-zone linking, so each reference object must point to a record in the same zone as the current record.

Use the CKRecordZoneMBS class as-is and do not subclass.

Creating a Custom Record Zone

For the most part, you use instances of this class to create and manage custom zones. Although you can use this class to retrieve a databases default zone, most operations act on records in the default zone by default, so you rarely need to specify it explicitly.

To create a custom zone, use CKRecordZoneMBS to create the zone object, and then save that zone to the users private database using a CKModifyRecordZonesOperationMBS object. You cannot save any records in the zone until you save it to the database. When creating records, explicitly specify the zone ID if you want the records to reside in a specific zone; otherwise, they will be saved to the default zone. You cannot create custom zones in a public database.

After creating a CKRecordZoneMBS object and saving it to the database, you do not interact with the object much. Instead, most interactions occur with its associated CKRecordZoneIDMBS object, which you use to refer to the zone when creating records.

31.42.2 Methods

31.42.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether this class is available.
31.42. CLASS CKRECORDZONEMBS

Notes: Should be true for OS X 10.10 and newer in 64-bit application.

31.42.4 CKRecordZoneDefaultName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The name of the default zone. Notes: Use this constant when you need to refer to the default zone by name, perhaps when creating a zone ID. The default zone has no special capabilities.

31.42.5 Constructor(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes and returns a record zone object using the specified ID. Notes: zoneID: The ID for the new zone. This parameter must not be nil.

Returns the new custom zone, or nil if the zone cannot be created.

Use this method when you want to create a new record zone based on the information in a zone ID. After creating the zone, save it to the server using a CKModifyRecordZonesOperationMBS object or the save method of the CKDatabaseMBS class.

Do not use this method to create a CKRecordZoneMBS object corresponding to a zone that already exists in the database. If the zone exists, fetch it using a CKFetchRecordZonesOperationMBS object or the fetch method of the CKDatabaseMBS class. See also:

• 31.42.6 Constructor(zoneName as string)

31.42.6 Constructor(zoneName as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes and returns a record zone object with the specified name. Notes: zoneName: The name of the new zone. Zone names inside a user’s private database are unique, consist of ASCII characters, are no longer than 255 characters, and do not start with an underscore (_) character. One way to ensure the uniqueness of zone names is to create a string based on a UUID, but you can also use other techniques.
If this parameter is nil or is an empty string, the method throws an exception.

Returns the new custom zone, or nil if the zone cannot be created.

Use this method to create a new record zone. The new zone has the name you provide and the zones owner is set to the current user. After creating the zone, save it to the server using a CKModifyRecordZonesOperationMBS object or the saveRecordZone method of the CKDatabase class. You must save the zone to the server before attempting to save any records to that zone.

Do not use this method to create a CKRecordZone object corresponding to a zone that already exists in the database. If the zone exists, fetch it using a CKFetchRecordZonesOperationMBS object or the fetchRecordZoneWithID method of the CKDatabase class.

See also:
- 31.42.5 Constructor(zoneID as CKRecordZoneIDMBS)

31.42.7 copy as CKRecordZoneMBS

31.42.8 defaultRecordZone as CKRecordZoneMBS

Notes:
The default record zone for a database.

Always use this method to retrieve the default zone for a database. The returned object can be used to specify the default zone for either the public or private database of a container. You do not need to save the returned zone object before using it. The owner of the zone is set to CKOwnerDefaultName, which corresponds to the current user.

The default zone of a database is a convenient place to store and access records. Whenever you do not explicitly assign a zone to a record, CloudKit puts the record in the default zone.

The disadvantage of using the default zone for storing records is that it does not have any special capabilities. You cannot save a group of records to iCloud atomically in the default zone. Similarly, you cannot use a CKFetchRecordChangesOperationMBS object on records in the default zone.
31.42. **CLASS CKRECORDZONEMBS**

### 31.42.9 Properties

#### 31.42.10 capabilities as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The capabilities supported by the zone. **Notes:**

The server determines the capabilities of the zone and sets the value of this property when you save the record zone. Always check this property before performing tasks that require a specific capability.

Typically, default zones do not support any special capabilities. Custom zones in a private database normally support all options.

For more information about what you can do with specific capabilities, see Capabilities* constants. *(Read only property)*

#### 31.42.11 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** *(Read and Write property)*

#### 31.42.12 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The unique ID of the zone. **Notes:**

The zone ID contains the name of the zone and the name of the user who owns the zone. Use this property to access both of those values. *(Read only property)*

#### 31.42.13 Constants

#### 31.42.14 CapabilityAtomic = 2

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the special capabilities supported by a zone. **Notes:**
A capability that allows changes to multiple records to be made atomically.

When you use a CKModifyRecordsOperationMBS object to save records, if the server is unable to save the changes for one record, it does not save the changes for any of the records. When combined with the CK-RecordSaveIfServerRecordUnchanged policy of the operation object, this behavior prevents your app from overwriting changes to a group of records if one of the records was modified elsewhere.

### 31.42.15 CapabilityFetchChanges = 1

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the special capabilities supported by a zone.

**Notes:**

A capability that allows you to fetch only the changed values in records.

This capability makes the creation of offline caches more efficient. Instead of fetching the entire record every time, use a CKFetchRecordChangesOperationMBS object to fetch only the values that changed, and use the returned data to update your caches. Doing so minimizes the amount of data you receive from the server. You can still fetch the entire record using a CKFetchRecordsOperationMBS object if you want.

### 31.42.16 CapabilitySharing = 4

MBS Mac64bit Plugin, Plugin Version: 16.5. **Function:** One of the constants indicating the special capabilities supported by a zone.

**Notes:** Sharing
31.43. CLASS CKRECORDZONENOTIFICATIONMBS

31.43 class CKRecordZoneNotificationMBS

31.43.1 class CKRecordZoneNotificationMBS

Function: A notification that is caused by changes to the contents of a record zone.

Notes:
Zone-related changes occur when existing records in the zone are modified, when new records are added, and when existing records are deleted. Use instances of this class to determine which zone triggered the notification.

You do not create instances of this class directly. When your app receives a push notification, call the notificationFromRemoteNotificationDictionary method of CKNotificationMBS to generate a notification object of the appropriate type. You can also fetch previously delivered notifications from a container using a CKFetchNotificationChangesOperationMBS object. If the notification was triggered due to a record zone change, the operation object delivers an instance of CKRecordZoneNotificationMBS with its notificationType property set to CKNotificationTypeRecordZoneMBS. Use the record zone notification object to get the record zone information and other push-related data.

If a push notifications payload is too large, pieces of data may be dropped until the payload meets the allowed size limit. The data that alerts the user is the most important and is dropped last. Data values in this class are among the first to be dropped, with values being dropped in the following order:

1. containerIdentifier defined in the CKNotification class.
2. recordZoneID
3. Other properties of the CKNotification class.

Subclass of the CKNotificationMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

31.43.2 Methods

31.43.3 Constructor

31.43.4 Properties

31.43.5 databaseScope as Integer

Function: The type of database (public, private, or shared) associated with the zone.
Notes:
For more details on the values returned, see CKDatabaseMBS.Scope* constants.
(Read only property)

31.43.6 recordZoneID as CKRecordZoneIDMBS

Function: The ID of the zone that changed.
Notes:
Use the value of this property to fetch the corresponding zone from the database.
(Read only property)
31.44. class CKRecordZoneSubscriptionMBS

31.44.1 class CKRecordZoneSubscriptionMBS
