dim b as Boolean=result.SetValue("test",TheAB.kABGroupNameProperty,error)
if not b then
    MsgBox("Failed to name group test." +error.description)
else
    MessageBox "OK"
end if
```

**Notes:** This property is used for groups only.

9.2.56  kABHomeLabel as string

**Function:** A generic label.  
**Notes:** All kABXXXXHomeLabel are equivalent to this label.

9.2.57  kABHomePageLabel as string

**Function:** Homepage URL label for the kABURLsProperty.

9.2.58  kABHomePageProperty as string

**Function:** Home Web page - kABStringProperty  
**Notes:**  
This property is used for persons only.  
Deprecated in Mac OS 10.4. You should use kABURLsProperty.
9.2. CLASS ABAADDRESSBOOKMBS

9.2.59  kABICQHomeLabel as string

9.2.60  kABICQInstantProperty as string

Notes: Deprecated in Mac OS 10.7. You should use kABInstantMessageProperty. This property is used for persons only.

9.2.61  kABICQWorkLabel as string

9.2.62  kABInsertedRecords as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the keys contained by the user-info dictionary of the notifications posted by the Address Book framework. Notes: Records that have been inserted.

9.2.63  kABInstantMessageProperty as string

9.2.64  kABInstantMessageServiceAIM as string

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.
AIM

9.2.65  kABInstantMessageServiceFacebook as string

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.
Facebook

9.2.66  kABInstantMessageServiceGaduGadu as string

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.
Gadu-Gadu

9.2.67  kABInstantMessageServiceGoogleTalk as string

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.
Google Talk

9.2.68  kABInstantMessageServiceICQ as string

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes:
9.2. CLASS ABADDRESSBOOKMBS

Available on Mac OS X 10.7 or later.

ICQ

9.2.69  kABInstantMessageServiceJabber as string

**Function:** One of the values for the kABInstantMessageUsernameKey key.
**Notes:**
Available on Mac OS X 10.7 or later.
Jabber

9.2.70  kABInstantMessageServiceKey as string

**Function:** One of the keys for the dictionary for an instant message.
**Notes:**
Available on Mac OS X 10.7 or later.
Dictionary key for the service type, not guaranteed to be present; possible values follow.

9.2.71  kABInstantMessageServiceMSN as string

**Function:** One of the values for the kABInstantMessageUsernameKey key.
**Notes:**
Available on Mac OS X 10.7 or later.
MSN

9.2.72  kABInstantMessageServiceQQ as string

**Function:** One of the values for the kABInstantMessageUsernameKey key.
**Notes:**
Available on Mac OS X 10.7 or later.
QQ
9.2.73  kABInstantMessageServiceSkype as string

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes:  
Available on Mac OS X 10.7 or later.
Skype

9.2.74  kABInstantMessageServiceYahoo as string

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes:  
Available on Mac OS X 10.7 or later.
Yahoo!

9.2.75  kABInstantMessageUsernameKey as string

Function: One of the keys for the dictionary for an instant message.
Notes:  
Available on Mac OS X 10.7 or later.
Dictionary key for the instant messaging handle/username

9.2.76  kABJabberHomeLabel as string

Function: A label for the home jabber Instant Messaging account.

9.2.77  kABJabberInstantProperty as string

Function: Jabber Instant Messaging - kABMultiStringProperty  
Notes:  
Deprecated in Mac OS 10.7. You should use kABInstantMessageProperty. This property is used for persons only.
9.2. CLASS ABADDRESSBOOKMBS

9.2.78 kABJabberWorkLabel as string

9.2.79 kABJobTitleProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Job Title - kABStringProperty
**Notes:** This property is used for persons only.

9.2.80 kABLastNamePhoneticProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Last name Phonetic - kABStringProperty
**Notes:** This property is used for persons only.

9.2.81 kABLastNameProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Last name - kABStringProperty
**Example:**
```vbscript
dim a as new ABAddressBookMBS
dim p as new ABPersonMBS
if not p.setValue("Miller",a.kABLastNameProperty) then
    MsgBox "Failed to set field " +a.LocalizedPropertyOrLabel(a.kABLastNameProperty)
end if
```
**Notes:** This property is used for persons only.

9.2.82 kABMaidenNameProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maiden name of the person - kABStringProperty
**Example:**
dim a as new ABAddressBookMBS
dim p as ABPersonMBS = a.owner // get my card
MsgBox p.valueForProperty(a.kABMaidenNameProperty) // show my maiden name

Notes: This property is used for persons only.

9.2.83  kABManagerLabel as string

9.2.84  kABMiddleNamePhoneticProperty as string

Notes: This property is used for persons only.

9.2.85  kABMiddleNameProperty as string

Notes: This property is used for persons only.

9.2.86  kABMobileMeLabel as string

Notes:
Available on Mac OS X 10.7 or later.
MobileMe - for AIM or email values

9.2.87  kABModificationDateProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Last saved date - kABDateProperty
9.2.88  **kABMotherLabel as string**

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the labels for the related names.

9.2.89  **kABMSNHomeLabel as string**

9.2.90  **kABMSNInstantProperty as string**

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** MSN Instant Messaging - kABMultiStringProperty

**Notes:**
This property is used for persons only.
Deprecated in Mac OS 10.7. You should use kABInstantMessageProperty.

9.2.91  **kABMSNWorkLabel as string**

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A label for the work MSN Instant Messaging account.

9.2.92  **kABNicknameProperty as string**

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The nick name of the person - kABStringProperty

**Notes:** This property is used for persons only.

9.2.93  **kABNoteProperty as string**

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Note - kABStringProperty
Example:

```vba
   dim a as new ABAddressBookMBS
    dim p as ABPersonMBS = a.owner

    // read
    MsgBox p.valueForProperty(a.kABNoteProperty).StringValue

    // write
    if p.setValue("Hello World", a.kABNoteProperty) then
        if a.save then
            MsgBox "Changed."
        end if
    end if
```

**Notes:** This property is used for persons only.

### 9.2.94 kABOrganizationProperty as string

**Function:** Company name - kABStringProperty

**Example:**

```vba
    dim a as new ABAddressBookMBS
    dim p as new ABPersonMBS

    if not p.setValue("My Company", a.kABOrganizationProperty) then
        MsgBox "Failed to set field " + a.LocalizedPropertyOrLabel(a.kABOrganizationProperty)
    end if
```

**Notes:** This property is used for persons only.

### 9.2.95 kABOtherDateComponentsProperty as string

**Function:** One of the properties for a addressbook records.

**Notes:**

Available on Mac OS X 10.7 or later.
Dates associated with this person - kABMultiDateComponentsProperty - (Person)
9.2. CLASS ABADDRESSBOOKMBS

9.2.96  kABOtherDatesProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Dates associated with this person - kABMultiDateProperty - (Person) Notes: This property is used for persons only.

9.2.97  kABOtherLabel as string

9.2.98  kABParentLabel as string

9.2.99  kABPartnerLabel as string

9.2.100  kABPersonFlags as string

```vbnet
dim a as new ABAddressBookMBS
dim p as new ABPersonMBS
if not p.setValue("Miller",a.kABLastNameProperty) then
    MsgBox "Failed to set field " + a.LocalizedPropertyOrLabel(a.kABLastNameProperty)
end if

if not p.setValue("Ben",a.kABFirstNameProperty) then
    MsgBox "Failed to set field " + a.LocalizedPropertyOrLabel(a.kABFirstNameProperty)
end if

if not p.setValue("My Company",a.kABOrganizationProperty) then
```

CHAPTER 9. ADDRESSBOOK

MsgBox "Failed to set field " + a.LocalizedPropertyOrLabel(a.kABOrganizationProperty) end if

if not p.setValue(a.kABShowAsCompany, a.kABPersonFlags) then
  MsgBox "Failed to set field " + a.LocalizedPropertyOrLabel(a.kABPersonFlags)
end if

if a.addRecord(p) then
  MsgBox "Record added"
else
  MsgBox "Failed to add record"
end if

if a.save then
  MsgBox "Changes saved"
else
  MsgBox "Failed to save changes"
end if

Notes: This property is used for persons only.

9.2.101 kABPhoneHomeFAXLabel as string

9.2.102 kABPhoneHomeLabel as string

9.2.103  kABPhoneiPhoneLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The label for the mobile phone number (for iPhone).

9.2.104  kABPhoneMainLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The label for the main phone number.

9.2.105  kABPhoneMobileLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The label for the mobile phone number.

9.2.106  kABPhonePagerLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The label for the pager number.

9.2.107  kABPhoneProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Generic phone number - kABMultiStringProperty

**Notes:** This property is used for persons only.

9.2.108  kABPhoneWorkFAXLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The label for the work fax number.

9.2.109  kABPhoneWorkLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The label for the work phone number.
9.2. CLASS ABADDRESSBOOKMBS

9.2.110 kABRelatedNamesProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** names related to this person - kABMultiStringProperty
**Notes:** This property is used for persons only.

9.2.111 kABSisterLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the labels for the related names.

9.2.112 kABSocialProfileProperty as string

**Notes:** Available on Mac OS X 10.7 or later.
The multi dictionary contains dictionaries. Each has keys like kABSocialProfileURLKey, kABSocialProfileUsernameKey, kABSocialProfileUserIdentifierKey and kABSocialProfileServiceKey.

kABSocialProfileServiceKey has values like kABSocialProfileServiceTwitter, kABSocialProfileServiceFacebook, kABSocialProfileServiceLinkedIn, kABSocialProfileServiceFlickr and kABSocialProfileServiceMySpace.

9.2.113 kABSocialProfileServiceFacebook as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the social profile dictionary’s kABSocialProfileServiceKey key.
**Notes:** Available on Mac OS X 10.7 or later.
Facebook

9.2.114 kABSocialProfileServiceFlickr as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values for the social profile dictionary’s kABSocialProfileServiceKey key.
**Notes:** Available on Mac OS X 10.7 or later.
9.2.115 kABSocialProfileServiceKey as string

Function: One of the keys for addressbook record values.
Notes:
Available on Mac OS X 10.7 or later.
The service for this social profile. Can be kABSocialProfileServiceTwitter, kABSocialProfileServiceFacebook, kABSocialProfileServiceLinkedIn, kABSocialProfileServiceFlickr or kABSocialProfileServiceMySpace.

9.2.116 kABSocialProfileServiceLinkedIn as string

Function: One of the values for the social profile dictionary’s kABSocialProfileServiceKey key.
Notes:
Available on Mac OS X 10.7 or later.
LinkedIn

9.2.117 kABSocialProfileServiceMySpace as string

Function: One of the values for the social profile dictionary’s kABSocialProfileServiceKey key.
Notes:
MySpace
Available on Mac OS X 10.7 or later.

9.2.118 kABSocialProfileServiceSinaWeibo as string

Function: One of the values for the social profile dictionary’s kABSocialProfileServiceKey key.
Notes:
SinaWeibo
Available in Mac OS X 10.8 and newer.
9.2.119  kABSocialProfileServiceTencentWeibo as string

Function: One of the values for the social profile dictionary’s kABSocialProfileServiceKey key.
Notes:
Available on Mac OS X 10.9 or later.
Tencent Weibo

9.2.120  kABSocialProfileServiceTwitter as string

Function: One of the values for the social profile dictionary’s kABSocialProfileServiceKey key.
Notes:
Available on Mac OS X 10.7 or later.
Twitter

9.2.121  kABSocialProfileServiceYelp as string

Function: One of the values for the social profile dictionary’s kABSocialProfileServiceKey key.
Notes:
Available on Mac OS X 10.7 or later.
Yelp

9.2.122  kABSocialProfileURLKey as string

Function: One of the keys for addressbook record values.
Notes:
Available on Mac OS X 10.7 or later.
Service name. Possible values follow.

9.2.123  kABSocialProfileUserIdentifierKey as string

Function: One of the keys for addressbook record values.
Notes:
CHAPTER 9. ADDRESSBOOK

Available on Mac OS X 10.7 or later.
Service-specific identifier.

9.2.124 kABSocialProfileUsernameKey as string

**Function:** One of the keys for addressbook record values. 
**Notes:**
Available on Mac OS X 10.7 or later.  
User-visible profile name.

9.2.125 kABSpouseLabel as string

**Function:** One of the labels for the related names.

9.2.126 kABSuffixProperty as string

**Function:** The name suffix - kABStringProperty
**Notes:**
e.g. "Sr." "Jr." "III"
This property is used for persons only.

9.2.127 kABTitleProperty as string

**Function:** the title of the person - kABStringProperty
**Notes:**
e.g. "Sir" "Duke" "General" "Lord"
This property is used for persons only.

9.2.128 kABUIDProperty as string

**Function:** The UID property - kABStringProperty
9.2. CLASS ABADDRESSBOOKMBS

Notes: A property for all records.

9.2.129 kABUpdatedRecords as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the keys contained by the user-info dictionary of the notifications posted by the Address Book framework. Notes: Records that have been updated.

9.2.130 kABURLsProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: URLs - kABMultiStringProperty Example:

```vba
// shows all websites with labels
dim a as new ABAddressBookMBS
dim p as ABPersonMBS = a.owner
dim m as ABMultiValueMBS = p.valueForProperty(a.kABURLsProperty)

dim u as Integer = m.count-1
for i as Integer = 0 to u
    dim label as string = m.labelAtIndex(i)
    dim value as string = m.valueAtIndex(i)
    MsgBox label+” -“+value
next
```

Notes: This property is used for persons only.

9.2.131 kABWorkLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A generic label. Notes: All kABXXXXWorkLabel are equivalent to this label
9.2.132  kABYahooHomeLabel as string

9.2.133  kABYahooInstantProperty as string

**Notes**: This property is used for persons only. Deprecated in Mac OS 10.7. You should use kABInstantMessageProperty.

9.2.134  kABYahooWorkLabel as string

9.2.135  LocalizedPropertyOrLabel(propertyOrLabel as string) as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Returns the localized version of built in properties, labels or keys
**Notes**: Returns propertyOrLabel if not found (e.g. if not built in).

9.2.136  NewPersonWithVCardRepresentation(data as memoryblock) as ABPersonMBS

**Notes**: Returns nil on failure. Convenience function which can be used instead of the ABPersonMBS constructor.
9.2. CLASS ABADDRESSBOOKMBS

9.2.137 people as ABPersonMBS()

**Function:** Returns an array of all the people in the AddressBook database

**Example:**

```vba
dim a as new ABAddressBookMBS

// get all people
dim p(-1) as ABPersonMBS = a.people

// walk over people list
for each m as ABPersonMBS in p
try
  // ask for image
  dim j as NSImageMBS = m.image

  // do something with image
  if j<>nil then
    Backdrop=j.CopyPictureWithMask
  end if

  catch x as NSExceptionMBS
    // raises exception if there is no image
  end try
end next
```

**Notes:**

Returns an empty array in case the DB doesn’t contain any body.

Returns nil on any error.

---

9.2.138 peopleForAccount(account as ABAccountMBS) as ABPersonMBS()

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Returns an array of all the people for this account.

**Example:**

```vba
dim a as new ABAddressBookMBS
dim c as ABAccountMBS = a.defaultAccount
dim people() as ABPersonMBS = a.peopleForAccount(c)

Break // look in debugger
```
Notes: Returns an empty array in case the DB doesn’t contain any body.

9.2.139  peopleForEmail(email as string) as ABPersonMBS()

Function: Searches a contact for the given email.
Example:

dim a as new ABAddressBookMBS
dim persons() as ABPersonMBS = a.peopleForEmail("support@monkeybreadsoftware.de")

if UBound(persons) >= 0 then
  MsgBox persons(0).DisplayName
else
  MsgBox "nothing found."
end if

9.2.140  persistentAccounts as ABAccountMBS()

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Queries list of all persistent accounts.
Example:

dim a as new ABAddressBookMBS
dim accounts() as ABAccountMBS = a.persistentAccounts
Break // look in debugger

9.2.141  personForUniqueId(uniqueid as string) as ABPersonMBS

Function: Returns a ABPersonMBS matching a given unique ID.
Example:

dim a as new ABAddressBookMBS

// you have some uid
dim uid as string = a.owner.valueForProperty(a.kABUIDProperty)

// later you want to find the person
9.2. CLASS ABADDRESSBOOKMBS

```
dim p as ABPersonMBS = a.personForUniqueId(uid)

// shows the name
MsgBox p.valueForProperty(a.kABFirstNameProperty)
```

**Notes:**

Returns nil if the record could not be found or matches to a group.
Available in Mac OS X 10.3 or newer.
see also recordForUniqueId.
See also:

- 9.2.142 personForUniqueId(uniqueid as string, account as ABAccountMBS) as ABPersonMBS 2517

9.2.142 personForUniqueId(uniqueid as string, account as ABAccountMBS) as ABPersonMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Finds a person for given unique ID for given account.
See also:

- 9.2.141 personForUniqueId(uniqueid as string) as ABPersonMBS 2516

9.2.143 recordClassFromUniqueId(uniqueid as string) as string

**Function:** Given a record uniqueId returns the record class name.
**Notes:** Return "ABPersonMBS" or "ABGroup" or "" for a given uniqueid.

9.2.144 recordForUniqueId(uniqueid as string) as ABRecordMBS

**Function:** Returns a record (ABPersonMBS or ABGroup) matching a given unique ID.
**Example:**

```
dim a as new ABAddressBookMBS

// you have some uid
dim uid as string = a.owner.valueForProperty(a.kABUIDProperty)

// later you want to find the person
dim r as ABRecordMBS = a.recordForUniqueId(uid)
```
if r is ABPersonMBS then
    dim p as ABPersonMBS = ABPersonMBS(r)

    // shows the name
    MsgBox p.valueForProperty(a.kABFirstNameProperty)
end if

Notes:

Returns nil if the record could not be found.
Available in Mac OS X 10.3 or newer.
See also:

- 9.2.145 recordForUniqueId(uniqueid as string, account as ABAccountMBS) as ABRecordMBS

9.2.145 recordForUniqueId(uniqueid as string, account as ABAccountMBS) as ABRecordMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Finds a record for given unique ID for given account.
See also:

- 9.2.144 recordForUniqueId(uniqueid as string) as ABRecordMBS

9.2.146 recordsMatchingSearchElement(search as ABSearchElementMBS) as ABRecordMBS()

Function: Returns an array of records matching the given search element
Example:

dim ab as new ABAAddressBookMBS

    // search for people with birthday, by searching for dates starting 1901.
    dim searchDate as new date( 1901, 1, 1 )
    dim search as ABSearchElementMBS = ab.SearchElementForPersonProperty( ab.kABBirthdayProperty, ",", ",", searchDate, ab.kABGreaterThan )

    // do the search
    dim people() as ABRecordMBS = ab.RecordsMatchingSearchElement( search )

    for each person as ABRecordMBS in people
        dim p as ABPersonMBS = ABPersonMBS( person )
9.2. CLASS ABADDRESSBOOKMBS 2519

// now work on them
next

Notes: Returns an empty array if no matches or an error.

9.2.147 removeRecord(record as ABRecordMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Removes a record (ABPersonMBS or ABGroup) from the AddressBook Database
Notes: Returns true if the removal was successful.
See also:
  • 9.2.148 removeRecord(record as ABRecordMBS, byref error as NSErrorMBS) as boolean 2519

9.2.148 removeRecord(record as ABRecordMBS, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Removes a record (ABPersonMBS or ABGroup) from the AddressBook Database.
Notes: Returns true if the removal was successful.
On Mac OS X 10.7 the error parameter is set to describe the error.
See also:
  • 9.2.147 removeRecord(record as ABRecordMBS) as boolean 2519

9.2.149 save as boolean

Notes: Return true if successful (or there was no change).
See also:
  • 9.2.150 save(byref error as NSErrorMBS) as boolean 2519

9.2.150 save(byref error as NSErrorMBS) as boolean

Notes:
Return true if successful (or there was no change).
On Mac OS X 10.5 the error object is returned. On Mac OS X 10.4 this error property is nil and you only
can use the result.
See also:

- 9.2.149 save as boolean

9.2.151 searchElementForConjunction(conjunction as Integer, children() as ABSearchElementMBS) as ABSearchElementMBS

Notes: Convenience function which can be used instead of ABSearchElementMBS.searchElementForConjunction.

9.2.152 searchElementForGroupProperty(PropertyName as string, Label as string, Key as string, value as Variant, comparison as Integer) as ABSearchElementMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a search element that will search groups.
Notes: Convenience function to be used instead of the searchElementForProperty method in the ABGroupMBS class.

9.2.153 searchElementForPersonProperty(PropertyName as string, Label as string, Key as string, value as Variant, comparison as Integer) as ABSearchElementMBS

Example:

// search person by record’s unique ID
// this is same as calling recordForUniqueId function directly
dim a as new ABAAddressBookMBS
dim e as ABSearchElementMBS

dim PropertyName as string = a.kABUIDProperty
const Label = ""
const Key = ""
const value = "637FA922-7A2B-4F9A-BFA3-023253D4A3D5:ABPerson" // some person ID
const comparison = a.kABEqual
9.2. CLASS ABADDRESSBOOKMBS

\[
e = \text{ABPersonMBS.searchElementForProperty(PropertyName, label, key, value, comparison)}
\]

\[
\text{dim records() as ABRecordMBS = a.recordsMatchingSearchElement(e)}
\]

\[
\text{for each r as ABRecordMBS in records}
\]
\[
\text{dim p as ABPersonMBS = ABPersonMBS(r)}
\]

\[
\text{MsgBox p.DisplayName}
\]

\text{next}

\text{Notes:} Convenience function to be used instead of the searchElementForProperty method in the ABPersonMBS class.

9.2.154 \text{ setMe(moi as ABPersonMBS)}

\text{Notes:} Pass nil to clear “Me”.

9.2.155 \text{ sharedAddressbook as ABAddressBookMBS}

\text{Example:}

// quickly find the addressbook, locate me and display my name:
\text{MsgBox ABAddressBookMBS.sharedAddressbook.owner.DisplayName}

\text{Notes:}

If you call this method several times, the object is cached, so it’s only created the first time (singleton). Returns nil on Windows or Linux or low memory or missing permissions.

9.2.156 \text{ sharedAddressbookMT as ABAddressBookMBS}

\text{Notes:}
On Mac OS X 10.8, the user will be asked to allow access to the addressbook for your application. As the call to sharedAddressbook blocks in this case, this method can be called on a thread to avoid the blocking of your app.

If you call this method several times, the object is cached, so it’s only created the first time (singleton). Returns nil on Windows or Linux or low memory or missing permissions.

### 9.2.157 Properties

#### 9.2.158 defaultAccount as ABAccountMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries default account. **Example:**

```vba
dim a as new ABAddressBookMBS
MsgBox a.defaultAccount.Name
```

**Notes:** (Read only property)

#### 9.2.159 defaultCountryCode as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default country code for records without specified codes. **Notes:**

Available in Mac OS X 10.3 or newer. (Read only property)

#### 9.2.160 defaultNameOrdering as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default name ordering defined by the user in the Address Book preferences. **Notes:**

Possible values: kABFirstNameFirst or kABLastNameFirst Available in Mac OS X 10.3 or newer. (Read only property)
9.2. CLASS ABADDRESSBOOKMBS

9.2.161 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The handle to the used ABAddressbook object. Notes: (Read and Write property)

9.2.162 hasUnsavedChanges as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns true if they are unsaved changes. Notes: The unsaved changes flag is automatically set when changes are made. (Read only property)

9.2.163 owner as ABPersonMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the person that represents the user. Notes: Returns nil if "me" was never set. (function is not named me as me is a reserved word in RealBasic) (Read only property)

9.2.164 Events

9.2.165 DatabaseChanged(Externally as boolean, InsertedRecords() as string, UpdatedRecords() as string, DeletedRecords() as string)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The database has changed. Notes: Externally: true if changes were made by another application.
InsertedRecords: Record UIDs of records changed. (can be empty)
UpdatedRecords: Record UIDs of records updated. (can be empty)
DeletedRecords: Record UIDs of records deleted. (can be empty)
9.2.166 Constants

9.2.167 ABAddRecordsError = 1001
MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the error constants.

9.2.168 ABPropertyReadOnlyError = 1014
MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the error constants.

9.2.169 ABPropertyUnsupportedBySourceError = 1013
MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the error constants.

9.2.170 ABPropertyValueValidationError = 1012
MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the error constants.

9.2.171 ABRemoveRecordsError = 1002
MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the error constants.

9.2.172 kABArrayProperty = 5

9.2.173 kABBitsInBitFieldMatch = 11
MBS MacCocoa Plugin, Plugin Version: 7.1. Function: One of the search comparison modes. Notes: Supported in Mac OS X 10.3 and newer versions.
9.2.174  kABContainsSubString = 7
MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the search comparison modes.

9.2.175  kABContainsSubStringCaseInsensitive = 8
MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the search comparison modes.

9.2.176  kABDataProperty = 7
MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the property type constants.  
**Notes:** Data object.

9.2.177  kABDateComponentsProperty = 8
MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the property type constants.  
**Notes:**  
Available on Mac OS X 10.7 or later.  
Date component.

9.2.178  kABDateProperty = 4
MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the property type constants.  
**Notes:** Date.

9.2.179  kABDefaultNameOrdering = 0
MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the flags constants for the integer value stored in the property kABPersonFlags.

9.2.180  kABDictionaryProperty = 6
MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the property type constants.  
**Notes:** Dictionary.
9.2.181 kABDoesNotContainSubString = 12

Notes: Supported in Mac OS X 10.4 and newer versions.

9.2.182 kABDoesNotContainSubStringCaseInsensitive = 13

Notes: Supported in Mac OS X 10.4 and newer versions.

9.2.183 kABEqual = 0

9.2.184 kABEqualCaseInsensitive = 6

9.2.185 kABErrorInProperty = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the property type constants.
Notes: Invalid property.

9.2.186 kABFirstNameFirst = & h40

MBS MacCocoa Plugin, Plugin Version: 7.1. Function: One of the flags constants for the integer value stored in the property kABPersonFlags.

9.2.187 kABGreaterThan = 4

9.2.188 kABGreaterThanOrEqual = 5

MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the search comparison modes.

9.2.189 kABIntegerProperty = 2

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the property type constants. **Notes:** Integer.

9.2.190 kABLastNameFirst = & h20

MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the flags constants for the integer value stored in the property kABPersonFlags.

9.2.191 kABLessThan = 2

MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the search comparison modes.

9.2.192 kABLessThanOrEqual = 3

MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the search comparison modes.

9.2.193 kABMultiArrayProperty = 261

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the property type constants. **Notes:** Multiple arrays.

9.2.194 kABMultiDataProperty = 263

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the property type constants. **Notes:** Multiple data values.
9.2.195  kABMultiDateComponentsProperty = 264

MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the property type constants. Notes: Available on Mac OS X 10.7 or later. Date components.

9.2.196  kABMultiDateProperty = 260

MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the property type constants. Notes: Multiple date values.

9.2.197  kABMultiDictionaryProperty = 262

MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the property type constants.

9.2.198  kABMultiIntegerProperty = 258

MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the property type constants. Notes: Multiple integer values.

9.2.199  kABMultiRealProperty = 259

MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the property type constants. Notes: Multiple floating point values.

9.2.200  kABMultiStringProperty = 257

MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the property type constants. Notes: Multiple strings.

9.2.201  kABMultiValueMask = & h100

MBS MacCocoa Plugin, Plugin Version: 11.2. Function: One of the property type constants. Notes: This value is combined with other values to define multi value defined.
9.2.202  kABNameOrderingMask = & h70

MBS MacCocoa Plugin, Plugin Version: 7.1. Function: One of the flags constants for the integer value stored in the property kABPersonFlags.

9.2.203  kABNotEqual = 1

9.2.204  kABNotEqualCaseInsensitive = 14

MBS MacCocoa Plugin, Plugin Version: 7.1. Function: One of the search comparison modes. Notes: Supported in Mac OS X 10.4 and newer versions.

9.2.205  kABNotWithinIntervalAroundToday = 19

MBS MacCocoa Plugin, Plugin Version: 7.1. Function: One of the search comparison modes. Notes: Supported in Mac OS X 10.4 and newer versions.

9.2.206  kABNotWithinIntervalAroundTodayYearless = 20

MBS MacCocoa Plugin, Plugin Version: 7.1. Function: One of the search comparison modes. Notes: Supported in Mac OS X 10.4 and newer versions.

9.2.207  kABNotWithinIntervalFromToday = 23

MBS MacCocoa Plugin, Plugin Version: 7.1. Function: One of the search comparison modes. Notes: Supported in Mac OS X 10.4 and newer versions.

9.2.208  kABNotWithinIntervalFromTodayYearless = 24

MBS MacCocoa Plugin, Plugin Version: 7.1. Function: One of the search comparison modes. Notes: Supported in Mac OS X 10.4 and newer versions.
9.2.209  kABPrefixMatch = 9

MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the search comparison modes.

9.2.210  kABPrefixMatchCaseInsensitive = 10

MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the search comparison modes.

9.2.211  kABRealProperty = 3

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the property type constants.  
**Notes:** a floating point number

9.2.212  kABSearchAnd = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** A search conjunction.

9.2.213  kABSearchOr = 1

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** A search conjunction.

9.2.214  kABShowAsCompany = 1

MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the flags constants for the integer value stored in the property kABPersonFlags.

9.2.215  kABShowAsMask = 7

MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the flags constants for the integer value stored in the property kABPersonFlags.
9.2. CLASS ABADDRESSBOOKMBS

9.2.216 kABShowAsPerson = 0

MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the flags constants for the integer value stored in the property kABPersonFlags.

9.2.217 kABShowAsResource = 2

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the flags constants for the integer value stored in the property kABPersonFlags.  
**Notes:** for Mac OS X 10.6.

9.2.218 kABShowAsRoom = 3

MBS MacCocoa Plugin, Plugin Version: 9.6. **Function:** One of the flags constants for the integer value stored in the property kABPersonFlags.  
**Notes:** for Mac OS X 10.6.

9.2.219 kABStringProperty = 1

MBS MacCocoa Plugin, Plugin Version: 11.2. **Function:** One of the property type constants.  
**Notes:** String

9.2.220 kABSuffixMatch = 15

MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the search comparison modes.  
**Notes:** Supported in Mac OS X 10.4 and newer versions.

9.2.221 kABSuffixMatchCaseInsensitive = 16

MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the search comparison modes.  
**Notes:** Supported in Mac OS X 10.4 and newer versions.

9.2.222 kABWithinIntervalAroundToday = 17

MBS MacCocoa Plugin, Plugin Version: 7.1. **Function:** One of the search comparison modes.  
**Notes:** Supported in Mac OS X 10.4 and newer versions.
9.2.223  \texttt{kABWithinIntervalAroundTodayYearless} = 18

MBS MacCocoa Plugin, Plugin Version: 7.1. \textbf{Function}: One of the search comparison modes. \textbf{Notes}: Supported in Mac OS X 10.4 and newer versions.

9.2.224  \texttt{kABWithinIntervalFromToday} = 21

MBS MacCocoa Plugin, Plugin Version: 7.1. \textbf{Function}: One of the search comparison modes. \textbf{Notes}: Supported in Mac OS X 10.4 and newer versions.

9.2.225  \texttt{kABWithinIntervalFromTodayYearless} = 22

MBS MacCocoa Plugin, Plugin Version: 7.1. \textbf{Function}: One of the search comparison modes. \textbf{Notes}: Supported in Mac OS X 10.4 and newer versions.
9.3. CLASS ABGROUPMBS

9.3 class ABGroupMBS

9.3.1 class ABGroupMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** ABGroup is a subclass of ABRecord. **Example:**

```vbs
    dim a as new ABAddressBookMBS
    dim g() as ABGroupMBS = a.groups
    dim names() as string
    for each gg as ABGroupMBS in g
        names.append gg.DisplayName
    next
    MsgBox Join(names,EndOfLine)
```

**Notes:**
It represents a group of people or other groups. No recursions allowed.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

Subclass of the ABRecordMBS class.

9.3.2 Methods

9.3.3 addMember(group as ABPersonMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds person to this group. **Example:**

```vbs
    dim wbook As new ABAddressBookMBS
    dim Group as new ABGroupMBS
    if not Group.setValue("Test Group", wbook.kABGroupNameProperty) then
        MsgBox "Failed to set group name."
    Return
    end if
    if not wbook.addRecord(Group) then
        MsgBox "Failed to add group to database."
    return
```
end if

dim Person as new ABPersonMBS

if not person.setValue("John", wbook.kABFirstNameProperty) then
    MsgBox "Failed to set first name."
    Return
end if

if not person.setValue("Miller", wbook.kABLastNameProperty) then
    MsgBox "Failed to set last name."
    Return
end if

if not wbook.addRecord(person) then
    MsgBox "Failed to add person to database."
    return
end if

if not group.addMember(person) then
    MsgBox "Failed to add person to group."
    Return
end if

if not wbook.save then
    MsgBox "Failed to save addressbook."
    return
end if

MsgBox "Created test group with a person."

Notes:

Does nothing if person is already part of this group (returns false)
Returns true if successful.

9.3.4 addProperty(propertyName as string, type as Integer) as Integer

Example:
call ABGroupMBS.addProperty "GroupWeight",1
9.3. CLASS ABGROUPMBS

Notes:
Property name must be unique.
For types see typeOfProperty.
Returns the number of properties successfully added.

9.3.5 addSubgroup(group as ABGroupMBS) as boolean

Notes:
Does nothing if group is already part of this group (returns false)
Recursions are not allowed (returns false)
Returns true if successful

9.3.6 Constructor

Notes: Available in Mac OS X 10.5 or newer.
See also:
- 9.3.7 Constructor(addressBook as ABAAddressBookMBS)

9.3.7 Constructor(addressBook as ABAAddressBookMBS)

See also:
- 9.3.6 Constructor

9.3.8 members as ABPersonMBS()

Notes:
Returns an empty array if this group doesn’t contain any people.
Returns an empty array on any error.
9.3.9 parentGroups as ABGroupMBS()

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of ABGroup this group belongs to.
**Notes:**
Returns an empty array if this group doesn’t belong to any groups.
Returns an empty array on any error.

9.3.10 properties as string()

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of property names.
**Notes:** Returns nil on any error.

9.3.11 removeMember(group as ABPersonMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes group from this group.
**Notes:**
Does nothing if group is not part of this group (returns false)
Returns true if successful.

9.3.12 removeProperties(properties() as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes properties from all groups.
**Notes:** Returns the number of properties successfully removed.

9.3.13 removeProperty(propertyName as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes property from all groups
**Notes:** Returns the number of properties successfully removed.
9.3. CLASS ABGROUPMBS

9.3.14 removeSubgroup(group as ABGroupMBS) as boolean

Notes:

Does nothing if group is not part of this group (returns false).
Returns true if successful.

9.3.15 searchElementForProperty(PropertyName as string, Label as string, Key as string, value as Variant, comparison as Integer) as ABSearchElementMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a search element object that searches for records of this type.

Notes:

property: The name of the property to search on. It cannot be "."
label: The label name for a multivalue list. If property does not have multiple values, pass ".". If property does have multiple values, pass "." to search all the values. By default, ABGroup records don’t contain any multivalue list properties.
key: The key name for a dictionary. Pass "" if property is not a dictionary. If property is a dictionary, pass "" to search all keys. By default, ABGroup records don’t contain any properties that are dictionaries.
value: What you’re searching for. If "", the only supported value for comparison is kABEqual or kABNotEqual.
comparison: The type of comparison to perform and is an ABSearchComparison, such as kABEqual or kABPrefixMatchCaseInsensitive.

9.3.16 subgroups as ABGroupMBS()

Notes:

Returns an empty array if this group doesn’t contain any other groups.
Returns an empty array on any error.

9.3.17 typeOfProperty(propertyName as string) as Integer

Notes:
Possible values:

const kABMultiValueMask = & h100
const kABErrorInProperty = & h0
const kABStringProperty = & h1
const kABIntegerProperty = & h2
const kABRealProperty = & h3
const kABDateProperty = & h4
const kABArrayProperty = & h5
const kABDictionaryProperty = & h6
const kABDataProperty = & h7
const kABMultiStringProperty = kABMultiValueMask + kABStringProperty
const kABMultiIntegerProperty = kABMultiValueMask + kABIntegerProperty
const kABMultiRealProperty = kABMultiValueMask + kABRealProperty
const kABMultiDateProperty = kABMultiValueMask + kABDateProperty
const kABMultiArrayProperty = kABMultiValueMask + kABArrayProperty
const kABMultiDictionaryProperty = kABMultiValueMask + kABDictionaryProperty
const kABMultiDataProperty = kABMultiValueMask + kABDataProperty

9.3.18 Properties

9.3.19 distributionIdentifierForProperty(propertyName as string, person as ABPersonMBS) as String

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the distribution identifier for a given property and person. Notes:

If not set then returns the property primary identifier.
Returns the distribution identifier or "" if not successful.
(Read and Write computed property)
9.4. CLASS ABMULTIVALUEMBS

9.4 class ABMultiValueMBS

9.4.1 class ABMultiValueMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Represents values of type ABMultiXXXXXProperty.

**Example:**

```vbnet
// shows all websites with labels

dim a as new ABAaddressBookMBS

dim p as ABPersonMBS = a.owner

dim m as ABMultiValueMBS = p.valueForProperty(a.kABURLsProperty)

dim u as Integer = m.count-1
for i as Integer = 0 to u

dim label as string = m.labelAtIndex(i)

dim value as string = m.valueAtIndex(i)

MsgBox label+" ->"+value
next
```

**Notes:**

All values in an ABMultiValue must be of the same type (kABMultiStringProperty: all values must be strings,...)

In case your application needs to store away a reference to a specific value/label pair, use the identifier. Index won’t work in this case because any client can add/remove/reorder a multivalue making your index point to the wrong pair. Identifiers are unique Ids.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

9.4.2 Methods

9.4.3 Constructor

9.4.4 copy as ABMultiValueMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an immutable copy of the data. **Notes:** Returns nil on any error.

9.4.5 edit as ABMutableMultiValueMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a mutable copy of the data. **Notes:** Returns nil on any error.

9.4.6 identifierAtIndex(index as UInt32) as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an identifier at a given index **Notes:** Returns "" on any error. Index is zero based.

9.4.7 identifiers as string()

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns list of identifiers.

9.4.8 indexForIdentifier(identifier as string) as UInt32

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of a given identifier **Notes:** Returns NotFound (& h7fffffff) on any error.

9.4.9 indexForLabel(label as string) as UInt32

MBS MacCocoa Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the index of a given label **Notes:** Returns NotFound (& h7fffffff) on any error.
9.4. CLASS ABMULTIVALUEMBS

9.4.10 labelAtIndex(index as UInt32) as string

Example:

// get an entry
dim a as new ABAddressBookMBS
dim p as ABPersonMBS = a.owner

// query all emails
dim e as ABMultiValueMBS = p.valueForProperty(a.kABEmailProperty)

// walk over all
dim u as Integer = e.count-1
for i as Integer = 0 to u
    dim label as string = e.labelAtIndex(i)
    dim value as string = e.valueAtIndex(i)

    // show label and value for this entry
    MsgBox str(i)+": " + label +", " + value

    // is it home?
    if label = a.kABEmailHomeLabel then
        MsgBox "Home: " + value
    end if
next

Notes:
Returns "" on any error.
Index is zero based.

9.4.11 labelForIdentifier(identifier as string) as string

Example:

// same as the following code, but with index bound checking:

dim s as string
dim identifier as string = "fill the identifier here"
dim a as ABMultiValueMBS
// get multivalue somehow
s=a.labelAtIndex(a.indexForIdentifier(identifier))

Notes:
Returns "" if identifier is not found.
A convenience method.

9.4.12 labels as string()

9.4.13 valueAtIndex(index as UInt32) as Variant

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a value at a given index
Example:
// shows all websites with labels

dim a as new ABAddressBookMBS
dim p as ABPersonMBS = a.owner
dim m as ABMultiValueMBS = p.valueForProperty(a.kABURLsProperty)

dim u as Integer = m.count-1
for i as Integer = 0 to u
    dim label as string = m.labelAtIndex(i)
    dim value as string = m.valueAtIndex(i)
    MsgBox label+" - >"+value
next

Notes:
Returns nil on any error.
Index is zero based.
9.4. CLASS ABMULTIVALUEMBS

9.4.14 valueForIdentifier(identifier as string) as Variant

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value with the given identifier. **Notes:**

Returns nil if identifier is not found.
A convenience method.

9.4.15 valueForLabel(label as string) as Variant

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value for the value with the given label. **Example:**

```vbnet
dim a as new ABAddressBookMBS
dim p as ABPersonMBS
dim m as ABMultiValueMBS

a=new ABAddressBookMBS
p=a.owner
m=p.valueForProperty(a.kABPhoneProperty)
MsgBox "Work phone: " + m.valueForLabel(a.kABPhoneWorkLabel)
MsgBox "Mobile phone: " + m.valueForLabel(a.kABPhoneMobileLabel)
```

**Notes:**

Returns nil if not value exists for the label.
A convenience method.

9.4.16 values as Variant()

MBS MacCocoa Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns list of all values. **Notes:**

Returns nil on any error.
Useful to get all email addresses as array.
9.4.17 Properties

9.4.18 Addressbook as ABAddressBookMBS

Function: Reference to parent addressbook.
Notes:
Plugin sets this for most objects to keep reference to addressbook and avoid this addressbook from being closed too early.
(Read and Write property)

9.4.19 Content as Dictionary

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns content of multi value as dictionary.
Notes:
This is more for inspection in debugger.
The plugin will add key and value for all values.
Values will be twice in the dictionary, once with label and once with identifier as key.
So if two items have same label, one will overwrite other in dictionary.
(Read only property)

9.4.20 count as Integer

Function: Returns the number of value/label pairs.
Notes:
Returns 0 on any error.
(Read only property)

9.4.21 Description as string

Function: The description for this multi value.
Example:
```vbnet
dim a as new ABAddressBookMBS
dim m as new ABMutableMultiValueMBS
call m.insertValue("Hello World", "Owner", 0)
MsgBox m.Description
```
9.4. CLASS ABMULTIVALUEMBS  

Notes: (Read only property)

9.4.22 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The handle of the used ABMultiValue object. Notes: (Read and Write property)

9.4.23 primaryIdentifier as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Identifier for the primary value. Notes: Returns "" on any error. (Read only property)

9.4.24 propertyType as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Type of this multivalue (kABMultixxxxProperty) Notes: Returns kABErrorInProperty if this multi-value is empty or not all values have the same type.

Possible values:

const kABMultiValueMask = & h100  
const kABErrorInProperty = & h0  
const kABStringProperty = & h1  
const kABIntegerProperty = & h2  
const kABRealProperty = & h3  
const kABDateProperty = & h4  
const kABArrayProperty = & h5  
const kABDictionaryProperty = & h6  
const kABDataProperty = & h7  
const kABMultiStringProperty = kABMultiValueMask + kABStringProperty  
const kABMultiIntegerProperty = kABMultiValueMask + kABIntegerProperty  
const kABMultiRealProperty = kABMultiValueMask + kABRealProperty
const kABMultiDateProperty = kABMultiValueMask + kABDateProperty
const kABMultiArrayProperty = kABMultiValueMask + kABArrayProperty
const kABMultiDictionaryProperty = kABMultiValueMask + kABDictionaryProperty
const kABMultiDataProperty = kABMultiValueMask + kABDataProperty
(Read only property)
9.5. CLASS ABMUTABLEMULTIVALUEMBS

9.5 class ABMutableMultiValueMBS

9.5.1 class ABMutableMultiValueMBS

Notes:

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

Subclass of the ABMultiValueMBS class.

9.5.2 Methods

9.5.3 addValue(value as Variant, label as string) as string

Notes:

Returns the identifier if successful, "" otherwise.

Note: No type checking is made when adding a value. But trying to set a multivalue property with a multivalue that doesn't have all its values of the same type will return an error.

Supported types: Date, Integer, String, Dictionary.

9.5.4 Constructor

9.5.5 insertValue(value as Variant, label as string, index as UInt32) as string

Notes:

Returns the identifier if successful, "" otherwise
Note: No type checking is made when adding a value. But trying to set a multivalue property with a multivalue that doesn’t have all its values of the same type will return an error.

Index is zero based.

9.5.6 `removeValueAndLabelAtIndex(index as UInt32) as boolean`

Notes:
Returns true if successful.

Index is zero based.

9.5.7 `replaceLabelAtIndex(index as UInt32, label as string) as boolean`

Notes:
Index is zero based.
Returns true on success.

9.5.8 `replaceValueAtIndex(index as UInt32, value as Variant) as boolean`

Notes:
Index is zero based.
Returns true on success.

9.5.9 `setPrimaryIdentifier(identifier as string) as boolean`

Notes: Returns true if successful.
9.6. CONTROL ABPEOPLEPICKERVIEWCONTROLMBS

9.6 control ABPeoplePickerViewControlMBS

9.6.1 control ABPeoplePickerViewControlMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control to host a people picker view.
Notes: Shows people and groups from Addressbook and allows picking them.

9.6.2 Properties

9.6.3 View as ABPeoplePickerViewMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used.
Notes: Access properties of the view hosted in the control via this variable.
(Read only property)

9.6.4 Events

9.6.5 BoundsChanged

Function: The event called when the bounds, but not the frame, changed.

9.6.6 DisplayedPropertyChanged

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when the displayed property in the record list is changed.

9.6.7 EnableMenuItems

Function: The event where you can enable menu items.
9.6.8 FrameChanged

Function: The event called when the frame changed.

9.6.9 GotFocus

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

9.6.10 GroupDoubleClick

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event to be invoked when a group is double-clicked.

9.6.11 GroupSelectionDidChange

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when the selection in the group list is changed.

9.6.12 LostFocus

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

9.6.13 MenuAction(HitItem as MenuItem) As Boolean

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.
9.6.14 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

**Function:** The mouse button was pressed inside the controls region at the location passed in to x, y.

**Notes:**

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.

Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

9.6.15 MouseDrag(x as Integer, y as Integer)

**Function:** This event fires continuously after the mouse button was pressed inside the Control.

**Notes:**

Mouse location is local to the control passed in to x, y.

As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

9.6.16 MouseUp(x as Integer, y as Integer)

**Function:** The mouse button was released.

**Notes:** Use the x and y parameters to determine if the mouse button was released within the control’s boundaries.

9.6.17 NameDoubleClick

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** The event to be invoked when a name is double-clicked.
9.6.18 NameSelectionDidChange

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when the selection in the name list is changed.

9.6.19 ScaleFactorChanged(NewFactor as Double)

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

9.6.20 ValueSelectionDidChange

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when the selection in a multivalue property is changed.
9.7. CLASS ABPEOPLEPICKERVIEWMBS

9.7  class ABPeoplePickerViewMBS

9.7.1  class ABPeoplePickerViewMBS

**Function:** This is a view for Mac applications to select people from the addressbook.

**Notes:**

The ABPeoplePickerView class allows you to customize the behavior of people-picker views in an application’s user interface.

Use CocoaControlMBS control to put this view on a window.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

9.7.2  Methods

9.7.3  ABPeoplePickerDisplayedPropertyDidChangeNotification as string

**Function:** One of the notification names.

**Notes:**

Use this string with NSNotificationObserverMBS class. Or use the DisplayedPropertyDidChange event. Posted when the displayed property in the record list is changed.

9.7.4  ABPeoplePickerGroupSelectionDidChangeNotification as string

**Function:** One of the notification names.

**Notes:**

Use this string with NSNotificationObserverMBS class. Or use the GroupSelectionDidChange event. Posted when the selection in the group list is changed.

9.7.5  ABPeoplePickerNameSelectionDidChangeNotification as string

**Function:** One of the notification names.

**Notes:**
Use this string with NSNotificationObserverMBS class. Or use the NameSelectionDidChange event.
Posted when the selection in the name list is changed.

9.7.6 ABPeoplePickerValueSelectionDidChangeNotification as string

Function: One of the notification names.
Notes: Use this string with NSNotificationObserverMBS class. Or use the ValueSelectionDidChange event.
Posted when the selection in a multivalue property is changed.

9.7.7 addProperty(PropertyName as string)

Function: Adds a property to the group of properties whose values are shown in the record list.

9.7.8 clearSearchField

Function: Clears the search field and resets the list of displayed records.

9.7.9 Constructor

Function: The constructor for a new people picker view object.
See also:

- 9.7.10 Constructor(Handle as Integer) 2554
- 9.7.11 Constructor(left as Double, top as Double, width as Double, height as Double) 2555

9.7.10 Constructor(Handle as Integer)

Function: The constructor for a new people picker view object.
Notes: Pass a handle to a Cocoa ABPeoplePickerView object.
See also:
9.7. CLASS ABPEOPLEPICKERVIEWMBS

- 9.7.9 Constructor
- 9.7.11 Constructor(left as Double, top as Double, width as Double, height as Double)

9.7.11 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: The constructor for a new people picker view object.

Notes: Pass rectangle for new control.

See also:
- 9.7.9 Constructor
- 9.7.10 Constructor(Handle as Integer)

9.7.12 deselectAll

Function: Deselects all selected groups, records, and values in multivalue properties.

9.7.13 deselectGroup(group as ABGroupMBS)

Function: Deselects a group selected in the group list.

9.7.14 deselectIdentifier(identifier as string, person as ABPersonMBS)

Function: Deselects a value selected in a multivalue property.

Notes:
- identifier: The identifier of the value that will be deselected.
- person: The person whose value will be deselected.

9.7.15 deselectRecord(record as ABRecordMBS)

Function: Deselects a record selected in the record list.

Notes: record: The record to deselect.
9.7.16  editInAddressBook

**Function:** Launches Address Book to edit the item selected in the people picker.

9.7.17  properties as string()

**Function:** Returns an array of the properties whose values are shown in the record list.

9.7.18  removeProperty(PropertyName as string)

**Function:** Removes a property from the group of properties whose values are shown in the record list.

9.7.19  selectedGroups as ABGroupMBS()

**Function:** The groups selected in the group list.  
**Notes:**  
The selected groups are returned as an array of ABGroupMBS objects.  
Available in Mac OS X v10.6 and later.

9.7.20  selectedIdentifiersForPerson(person as ABPersonMBS) as string()

**Function:** Returns the identifiers of the selected values in a multivalue property.  
**Notes:**  
person: The person whose identifiers for selected values will be returned.  
Returns nil if the property displayed is a single-value property.

9.7.21  selectedRecords as ABRecordMBS()

**Function:** The selection in the records list.
Notes:
The selection is returned as an array of ABGroupMBS or ABPersonMBS objects. Available in Mac OS X v10.6 and later.

9.7.22 selectedValues as Variant()

**Function:** Returns an array of all the values selected in the displayed multivalue property.

9.7.23 selectGroup(group as ABGroupMBS, byExtendingSelection as boolean)

**Function:** Selects a group or a set of groups in the group list.
**Notes:**
- group: The group to be selected, or to be added to the current selection.
- byExtendingSelection: True to extend the current selection; otherwise, false.

9.7.24 selectIdentifier(identifier as string, person as ABPersonMBS, byExtendingSelection as boolean)

**Function:** Selects a value or a set of values in a multivalue property.
**Notes:**
- identifier: The identifier to be selected, or to be added to the current selection.
- person: The person that the value to be selected is associated with.
- byExtendingSelection: True to extend the current selection; otherwise, false.

9.7.25 selectInAddressBook

**Function:** Launches Address Book and selects the item selected in the people picker.

9.7.26 selectRecord(group as ABRecordMBS, byExtendingSelection as boolean)

**Function:** Selects a record or a set of records in the record list.
Notes:

record: The record to be selected, or to be added to the current selection.
byExtendingSelection: True to extend the current selection; otherwise, false.

9.7.27 Properties

9.7.28 accessoryView as NSViewMBS

Function: The view that is placed to the left of the search field.
Notes:
Available in Mac OS X v10.6 and later.
If accessory is nil, the accessory view is removed.
(Read and Write property)

9.7.29 allowsGroupSelection as boolean

Function: A Boolean value that specifies whether the user can select entire groups in the group column.
Notes:
If true, the user can to select entire groups. If false, the user is required to select at least one person in the group.
Available in Mac OS X v10.6 and later.
(Read and Write property)

9.7.30 allowsMultipleSelection as boolean

Function: A Boolean value that specifies whether multiple groups, records, or values of multivalue properties can be selected at a time.
Notes:
Available in Mac OS X v10.6 and later.
(Read and Write property)
9.7.31 autosaveName as string

Function: The name under which the column positions and the filter selection are saved.
Notes:
Available in Mac OS X v10.6 and later.
(Read and Write property)

9.7.32 displayedProperty as string

Function: The property currently displayed in the record list.
Notes:
Available in Mac OS X v10.6 and later.
(Read and Write property)

9.7.33 valueSelectionBehavior as Integer

Function: The current selection behavior.
Notes:
The default behavior is ABSingleValueSelection.
Available in Mac OS X v10.6 and later.
(Read and Write property)

9.7.34 columnTitleForProperty(propertyName as string) as string

Function: The title of a custom property.
Notes: (Read and Write computed property)

9.7.35 Events

9.7.36 DisplayedPropertyDidChange

Function: Called when the displayed property in the record list is changed.
9.7.37  GroupDoubleClick

**Function:** The event to be invoked when a group is double-clicked.

9.7.38  GroupSelectionDidChange

**Function:** Called when the selection in the group list is changed.

9.7.39  NameDoubleClick

**Function:** The event to be invoked when a name is double-clicked.

9.7.40  NameSelectionDidChange

**Function:** Called when the selection in the name list is changed.

9.7.41  ValueSelectionDidChange

**Function:** Called when the selection in a multivalue property is changed.

9.7.42  Constants

9.7.43  ABMultipleValueSelection = 2

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the constants for the Selection Behavior type.
**Notes:** The user can select multiple values.
9.7.44 ABNoValueSelection = 0

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the constants for the Selection Behavior type.
**Notes:** The user cannot select individual values.

9.7.45 ABSingleValueSelection = 1

MBS MacControls Plugin, Plugin Version: 11.2. **Function:** One of the constants for the Selection Behavior type.
**Notes:** The user can select a single value.
9.8 class ABPersonMBS

9.8.1 class ABPersonMBS

**Function:** ABPersonMBS is a subclass of ABRecord and represents a person.

**Example:**

```lisp
dim a as new ABAddressBookMBS // get addressbook
dim p as ABPersonMBS = a.owner // and find me

// read note
MsgBox p.valueForProperty(a.kABNoteProperty).StringValue

// write note
if p.setValue("Hello World", a.kABNoteProperty) then 
  if a.save then 
    MsgBox "Changed."
  end if
end if
```

**Notes:**

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

Subclass of the ABRecordMBS class.

9.8.2 Methods

9.8.3 addProperty(propertyName as string, type as Integer) as Integer

**Function:** Adds property to all people records.

**Example:**

```lisp
dim p as ABPersonMBS
// get a person

call p.addProperty "Distance",1
```

**Notes:**
9.8. CLASS ABPERSONMBS

Property name must be unique.
For types see typeOfProperty.
Returns the number of properties successfully added.

9.8.4 Constructor

See also:

- 9.8.5 Constructor(addressBook as ABAddressBookMBS)
- 9.8.6 Constructor(vCardData as Memoryblock)

9.8.5 Constructor(addressBook as ABAddressBookMBS)

**Notes**: Available in Mac OS X 10.5 or newer.
See also:

- 9.8.4 Constructor
- 9.8.6 Constructor(vCardData as Memoryblock)

9.8.6 Constructor(vCardData as Memoryblock)

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Create a person from a vCard
**Notes**:
Handle is 0 on failure after constructor finished.
(e.g. because of invalid vCard data)

This gives a temporary ABPersonMBS object which is only useful in the same method.
At least we observed problems and crashes when this person is stored in a property of a window and used later.
See also:

- 9.8.4 Constructor
- 9.8.5 Constructor(addressBook as ABAddressBookMBS)
CHAPTER 9. ADDRESSBOOK

9.8.7 EditInAddressbook as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens addressbook entry in the addressbook for editing. **Notes:** Returns true on success and false on failure.

9.8.8 linkedPeople as ABPersonMBS()

MBS MacCocoa Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of all linked people, including this person. **Notes:**

Returns an array of only this person if this person is not linked. Available in Mac OS X 10.8 and newer.

9.8.9 parentGroups as ABGroupMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of ABGroup this group belongs to. **Notes:**

Returns an empty array if this person doesn’t belong to any groups. Returns an empty array on any error.

9.8.10 properties as string()

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of property names. **Notes:** Returns an empty array on any error.

9.8.11 removeProperties(properties() as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes properties from all people **Notes:** Returns the number of properties successfully removed.
9.8.12 removeProperty(propertyName as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Removes property from all people
Notes: Returns the number of properties successfully removed.

9.8.13 searchElementForProperty(PropertyName as string, Label as string, Key as string, value as Variant, comparison as Integer) as ABSearchElementMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a search element object that specifies a query for records of this type.
Notes:
property: The name of the property to search on, such as kABAddressProperty or kABLastNameProperty. This name cannot be "".
label: The label name for a multivalue list, such as kABAddressHomeLabel, kABPhoneWorkLabel, or a user-specified label, such as Summer Home. If the specified property does not have multiple values, pass "". If the specified property does have multiple values, pass "" to search all the values.
key: The key name for a dictionary, such as kABAddressCityKey or kABAddressStreetKey. If the specified property is not a dictionary, pass "". If the specified property is a dictionary, pass nil to search all keys.
value: What you're searching for. If nil, then the only supported value for comparison is kABEqual or kABNotEqual.
comparison: The type of comparison to perform, such as kABEqual or kABPrefixMatchCaseInsensitive.

9.8.14 setImageData(data as Memoryblock) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Set the image of a person to data. data should be in an NSImage/QuickTime compatible format.
Notes: Pass "" to clear the image.

9.8.15 ShowInAddressbook as boolean

Example:

// open addressbook
dim a as new ABAddressBookMBS

// pick a person, in this case me
dim p as ABPersonMBS = a.owner
// show in AddressBook
call p.ShowInAddressbook

Notes: Returns true on success and false on failure.

9.8.16  

**typeOfProperty**(propertyName as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the type of a given property.  
**Notes:**
Possible values:

```
cost kABMultiValueMask = & h100
const kABErrorInProperty = & h0
const kABStringProperty = & h1
const kABIntegerProperty = & h2
const kABRealProperty = & h3
const kABDateProperty = & h4
const kABArrayProperty = & h5
const kABDictionaryProperty = & h6
const kABDataProperty = & h7
const kABMultiStringProperty = kABMultiValueMask + kABStringProperty
const kABMultiIntegerProperty = kABMultiValueMask + kABIntegerProperty
const kABMultiRealProperty = kABMultiValueMask + kABRealProperty
const kABMultiDateProperty = kABMultiValueMask + kABDateProperty
const kABMultiArrayProperty = kABMultiValueMask + kABArrayProperty
const kABMultiDictionaryProperty = kABMultiValueMask + kABDictionaryProperty
const kABMultiDataProperty = kABMultiValueMask + kABDataProperty
```

9.8.17  

**vCardRepresentation** as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the vCard representation of a person  
**Notes:** Returns nil on any error.
9.8.18 Properties

9.8.19 image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Synchronously returns data containing an image for this person.  
**Example:**

```vbscript
dim a as new ABAddressBookMBS  
dim p as ABPersonMBS = a.owner

Backdrop=p.image.CopyPictureWithMask
```

**Notes:**

Only does local file system searches.
Raises an exception if no image exists.

Convenience function which calls imageData and converts data to and from NSImage.  
(Read and Write computed property)

9.8.20 imageData as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Synchronously returns data containing an image for this person.  
**Example:**

```vbscript
dim a as new ABAddressBookMBS

dim owner as ABPersonMBS = a.owner

dim s as string = owner.imageData

dim p as Picture

p=JPEGStringToPictureMBS(s)  // try jpeg
if p<>Nil then
    Title="jpeg"
    Backdrop=p
    Return
end if

p=TIFFStringToPictureMBS(s)  // try tiff
if p<>Nil then
    Title="tiff"
    Backdrop=p
    Return
```
end if

Notes:

Only does local file system searches. Data will be in an NSImage/QuickTime compatible format.
Raises an exception if no image exists.
(Read and Write computed property)
9.9. CONTROL ABPERSONVIEWCONTROLMBS

9.9 control ABPersonViewControlMBS

9.9.1 control ABPersonViewControlMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control to host a Person view.
Notes: Shows people from Addressbook and allows editing.

9.9.2 Methods

9.9.3 retainObject

Function: Retains the viewer object.
Notes:
This method is to workaround a bug which your app may see in OS X 10.11.
So to avoid crashes with releasing an view, you can retain it an extra time.

9.9.4 Properties

9.9.5 View as ABPersonViewMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used.
Notes:
Access properties of the view hosted in the control via this variable.
(Read only property)

9.9.6 Events

9.9.7 BoundsChanged

Function: The event called when the bounds, but not the frame, changed.
9.9.8  EnableMenuItems

**Function:** The event where you can enable menu items.

9.9.9  FrameChanged

**Function:** The event called when the frame changed.

9.9.10  GotFocus

**Function:** The control itself got focus.
**Notes:** This only fires if the control itself got focus and not a sub control.

9.9.11  LostFocus

**Function:** The control lost focus.
**Notes:** This only fires if the control itself lost focus and not a sub control.

9.9.12  MenuAction(HitItem as MenuItem) As Boolean

**Function:** Called when a menuitem is choosen.
**Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

9.9.13  MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

**Function:** The mouse button was pressed inside the controls region at the location passed in to x, y.
**Notes:**
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

### 9.9.14 MouseDrag(x as Integer, y as Integer)

**Function:** This event fires continuously after the mouse button was pressed inside the Control.

**Notes:**
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

### 9.9.15 MouseUp(x as Integer, y as Integer)

**Function:** The mouse button was released.

**Notes:** Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

### 9.9.16 ScaleFactorChanged(NewFactor as Double)

**Function:** The backing store scale factor has changed.

**Notes:** Please invalidate any cached bitmaps or other relevant state.
9.10 class ABPersonViewMBS

9.10.1 class ABPersonViewMBS

**Function:** ABPersonViewMBS provides a view for displaying and editing ABPersonMBS objects in your user interface.
**Notes:**
Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the ABPersonView class.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard. Subclass of the NSViewMBS class.

9.10.2 Methods

9.10.3 available as Boolean

**Function:** Whether this class is available.
**Example:**
```plaintext```
msgbox "ABPersonView available: " + str(ABPersonViewMBS.available)
```

**Notes:** Returns true on Mac OS X 10.7 or later.

9.10.4 Constructor

**Function:** The constructor for a new people picker view object.
See also:

- 9.10.5 Constructor(Handle as Integer) 2572
- 9.10.6 Constructor(left as Double, top as Double, width as Double, height as Double) 2573

9.10.5 Constructor(Handle as Integer)

**Function:** The constructor for a new people picker view object.
9.10. CLASS ABPERSONVIEWMBS

Notes: Pass a handle to a Cocoa ABPersonView object.
See also:

- 9.10.4 Constructor
- 9.10.6 Constructor(left as Double, top as Double, width as Double, height as Double)

9.10.6 Constructor(left as Double, top as Double, width as Double, height as Double)

Function: The constructor for a new people picker view object.
Notes: Pass rectangle for new control.
See also:

- 9.10.4 Constructor
- 9.10.5 Constructor(Handle as Integer)

9.10.7 Properties

9.10.8 editing as Boolean

Function: A Boolean value that determines whether the receiver is in editing mode.
Notes:
When true, ABPersonView includes additional controls to manipulate person properties.
(Read and Write property)

9.10.9 person as ABPersonMBS

Function: An ABPersonMBS record for display.
Notes:
Raises if person originates from ABAddressBook’s sharedAddressBook. Use ABAddressBookMBS constructor.
Person must be exist in an ABAddressBook created and manipulated on the main thread only.
When person is nil, displays an empty selection state.
(Read and Write property)
9.10.10 shouldShowLinkedPeople as Boolean

Function: Indicates whether the view should include information for linked contacts in addition to the set contact.

Notes:
If true, information is included from linked contacts. If false, only the information on this person is shown.
Available in Mac OS X 10.8 and newer.
(Read and Write property)
9.11  class ABPickerMBS

9.11.1  class ABPickerMBS

Example:

dim p as ABPickerMBS // a global property

p = new ABPickerMBS
p.Create
p.visible = True

Notes:
Requires Mac OS X 10.3 or newer.

This class is for Carbon as event handling does not work on Cocoa.
For Cocoa better use ABPeoplePickerViewMBS.

9.11.2 Methods

9.11.3 AddProperty(propertyname as String)

Notes: Requires Mac OS X 10.3 or newer.

9.11.4 ClearSearchField

Notes: Requires Mac OS X 10.3 or newer.

9.11.5 Create

Example:

```
dim p as ABPickerMBS // a global property

p = new ABPickerMBS
p.Create

p.visible = True
```

Notes:
The window is created invisible.
Requires Mac OS X 10.3 or newer.
The handle property is not 0 if this call was successful.

9.11.6 DeselectAll

**Function**: Remove selection.

9.11.7 DeselectGroup(group as ABGroupMBS)

**Function**: Removes selection.
**Notes**: Requires Mac OS X 10.3 or newer.

9.11.8 DeselectIdentifier(person as ABPersonMBS, Identifier as String)

**Function**: Removes selection.
**Notes**: Requires Mac OS X 10.3 or newer.

9.11.9 DeselectPerson(person as ABPersonMBS)

**Function**: Removes selection.
**Notes**: Requires Mac OS X 10.3 or newer.
9.11.10 EditInAddressBook

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Launch AddressBook and edit the current selection  
**Notes:** Requires Mac OS X 10.3 or newer.

9.11.11 InstallEvents(targetwindow as window)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Installs the event handler.  
**Notes:** Requires Mac OS X 10.3 or newer.  
The target window is only used as an anchor to send and receive events. You can use any window for that.

9.11.12 Properties as string()

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A list of all the properties shown in the value columns.  
**Notes:** Requires Mac OS X 10.3 or newer.

9.11.13 RemoveEvents

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Removes the event handler.  
**Notes:** Requires Mac OS X 10.3 or newer.

9.11.14 RemoveProperty(propertyname as String)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Removes a property from the value column.  
**Notes:** Requires Mac OS X 10.3 or newer.

9.11.15 SelectedDictionaries as Dictionary()

MBS MacCocoa Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array containing dictionaries for each item selected in the values column.  
**Notes:**
Use this method if you select single addresses.
Requires Mac OS X 10.3 or newer.

9.11.16  SelectedGroups as ABGroupMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns group column selection as an array of ABGroup object handles. **Notes:** Requires Mac OS X 10.3 or newer.

9.11.17  SelectedIdentifiers(person as ABPersonMBS) as string()

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This method returns an array of selected multi-value identifiers. **Notes:** Requires Mac OS X 10.3 or newer. Returns empty array if the displayed property is a single value type.

9.11.18  SelectedRecords as ABRecordMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns names column selection as an array of ABGroup or ABPersonMBS objects. **Notes:** Requires Mac OS X 10.3 or newer. You need to cast the objects from the array to ABGroupMBS or ABPersonMBS to use them better. And IsA can tell you whether an object is from the group or the person class.

9.11.19  SelectedStrings as String()

MBS MacCocoa Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array containing strings for each item selected in the values column. **Notes:** Use this method if you select single strings like a phone number. Requires Mac OS X 10.3 or newer.
9.11. CLASS ABPICKERMBS

9.11.20 SelectedValues as Variant()

**Function:** Returns an array containing variants for each item selected in the values column. 
**Notes:**  
Use this method if you select single strings like a phone number.  
Requires Mac OS X 10.3 or newer.  
Changed from string to variant in plugin version 13.2, so you don’t need to use SelectedDictionaries.

9.11.21 SelectGroup(group as ABGroupMBS, ExtendSelection as boolean)

**Function:** Select group programatically. 
**Notes:** Requires Mac OS X 10.3 or newer.

9.11.22 SelectIdentifier(person as ABPersonMBS, Identifier as String, ExtendSelection as boolean)

**Function:** Individual values contained within an multi-value property can be selected with this method. 
**Notes:** Requires Mac OS X 10.3 or newer.

9.11.23 SelectInAddressBook

**Function:** Launch AddressBook and select the current selection 
**Notes:** Requires Mac OS X 10.3 or newer.

9.11.24 SelectPerson(person as ABPersonMBS, ExtendSelection as boolean)

**Function:** Select person programatically. 
**Notes:** Requires Mac OS X 10.3 or newer.
9.11.25 Properties

9.11.26 AllowGroupSelection as Boolean

**Function:** Allow the user to select entire groups in the group column.
**Notes:**
Requires Mac OS X 10.3 or newer.
If false, at least one person in the group will be selected. Defaults to false.
(Read and Write property)

9.11.27 AllowMultipleSelection as Boolean

**Function:** Allow the user to select more than one group/record at a time.
**Notes:**
Default is true.
Requires Mac OS X 10.3 or newer.
(Read and Write property)

9.11.28 AllowMultipleValueSelection as Boolean

**Function:** Allow user to choose multiple values for a person.
**Notes:**
Requires Mac OS X 10.3 or newer.
Choose the selection behavior for the value column. If multiple behaviors are selected, the most restrictive behavior will be used. Defaults to SingleValueSelection set.
(Read and Write property)

9.11.29 AllowSingleValueSelection as Boolean

**Function:** Allow user to choose a single value for a person.
**Notes:**
Requires Mac OS X 10.3 or newer.
Choose the selection behavior for the value column. If multiple behaviors are selected, the most restrictive behavior will be used. Defaults to SingleValueSelection set.
9.11. CLASS ABPICKERMBS

(Read and Write property)

9.11.30 Available as Boolean

Notes:
Returns true on Mac OS X 10.3 or newer.
(Read only property)

9.11.31 DisplayedProperty as String

Notes:
Returns nil on any error.
(Read and Write property)

9.11.32 Handle as Integer

Notes: (Read and Write property)

9.11.33 Height as Single

Notes:
Requires Mac OS X 10.3 or newer.
(Read and Write property)

9.11.34 Left as Single

CHAPTER 9. ADDRESSBOOK

Notes:
Requires Mac OS X 10.3 or newer.
(Read and Write property)

9.11.35  Top as Single

Notes:
Requires Mac OS X 10.3 or newer.

top=0 is on the bottom of the screen as this is the Cocoa coordinate system.
(Read and Write property)

9.11.36  Visible as Boolean

Notes:
The window is created invisible, so you must make it visible to show it to the user.
Requires Mac OS X 10.3 or newer.
(Read and Write property)

9.11.37  Width as Single

Notes:
Requires Mac OS X 10.3 or newer.
(Read and Write property)

9.11.38  ColumnTitle(columntitle as String) as String

Notes:
9.11. CLASS ABPICKERMBS

Requires Mac OS X 10.3 or newer.
(Read and Write computed property)

9.11.39 Events

9.11.40 DisplayedPropertyChanged

9.11.41 GroupDoubleClicked

9.11.42 GroupSelectionChanged

9.11.43 NameDoubleClicked

9.11.44 NameSelectionChanged

9.11.45 ValueSelectionChanged

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** One of the events of a People Picker. 
**Notes:** Requires Mac OS X 10.3 or newer.
9.12.  CLASS ABRECORDMBS

9.12  class ABRecordMBS

9.12.1  class ABRecordMBS

Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

9.12.2  Methods

9.12.3  Constructor

9.12.4  removeValueForProperty(propertyName as string) as boolean

Notes:
Subsequent calls to valueForProperty on the same property will return nil.
Returns true if the value was removed successfully and false on any error.

9.12.5  setValue(value as Variant, propertyName as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function: Set the value of a given property. The type of the value must match the property type.
Example:

dim a as ABAddressBookMBS
dim p as ABPersonMBS
// get a somehow
// get p somehow

if not p.setValue("My Company", a.kABOrganizationProperty) then
MsgBox "Failed to set field " + a.LocalizedPropertyOrLabel(a.kABOrganizationProperty)
end if

Notes:
Value can be Date, Integer, Double, Dictionary, MultiValueMBS/MutableMultiValueMBS or String.
Returns true if the value was set successfully
See also:

- 9.12.6 setValue(value as Variant, propertyName as string, byref error as NSErrorMBS) as boolean

9.12.6  setValue(value as Variant, propertyName as string, byref error as NSErrorMBS) as boolean

Function: Set the value of a given property. The type of the value must match the property type.
Notes:
Value can be Date, Integer, Double, Dictionary, MultiValueMBS/MutableMultiValueMBS or String.
Returns true if the value was set successfully

On Mac OS X 10.7 or later, we set the error property on any error.
See also:

- 9.12.5 setValue(value as Variant, propertyName as string) as boolean

9.12.7  valueForProperty(PropertyName as string) as Variant

Function: Returns the value of a given property.
Example:

dim a as new ABAddressBookMBS // get addressbook
dim p as ABPersonMBS = a.owner // and find me

// read note
MsgBox p.valueForProperty(a.kABNoteProperty).StringValue

Notes:
The type of the value depends on the property type.
Returns nil on any error.
Tip: Put the result in a variant, so you can see the type in the debugger. Emails for example can be a ABMultiValueMBS object while name is normally a string.

### 9.12.8 Properties

#### 9.12.9 account as ABAccountMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries account for this record. **Notes:** (Read only property)

#### 9.12.10 Addressbook as ABAddressBookMBS

MBS MacCocoa Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reference to parent addressbook. **Notes:** Plugin sets this for most objects to keep reference to addressbook and avoid this addressbook from being closed too early. (Read and Write property)

#### 9.12.11 Description as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The description for this record. **Example:**

```vbnet
dim a as new ABAddressBookMBS
dim m as ABPersonMBS = a.owner
MsgBox m.Description
```

**Notes:** (Read only property)

#### 9.12.12 DisplayName as string

MBS MacCocoa Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The display name. **Example:**
// quickly find the addressbook, locate me and display my name:
MsgBox ABAddressBookMBS.sharedAddressbook.owner.DisplayName

Notes:
For a group, the group name, for an organization the organization name and for a normal person the first
name, last name, prefix/suffix and middle name. Name order depends on the settings for person or address-
book.
(Read only property)

9.12.13  Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The handle of the ABGroup or ABPersonMBS object being used.
Notes: (Read and Write property)

9.12.14  isReadOnly as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns whether or not the record is read only.
Notes:
Available on Mac OS X 10.4.
Returns false on older systems or other errors.
(Read only property)

9.12.15  uniqueId as string

Example:

dim a as new ABAddressBookMBS
dim o as ABPersonMBS = a.owner

// the unique ID for this record including the type
dim u as string = o.uniqueId

// the raw ID as Apple stores it
dim i as string = o.valueForProperty("com.apple.uuid")
9.12. CLASS ABRECORDMBS

// show it
MsgBox u+EndOfLine+i

Notes:

Equivalent to valueForProperty(kABUIDProperty).
(Read only property)
9.13 class ABSearchElementMBS

9.13.1 class ABSearchElementMBS

Example:

// search and display all entries with a given name in a 2 column listbox with address

// Save reference to caller.
dim addr as new ABAAddressBookMBS // Initialise the Address Book plugin
dim searchName as string = "Schmitz" // search on.

// Do the search
dim srch as ABSearchElementMBS = addr.searchElementForPersonProperty(addr.kABLastNameProperty,
"", ",", searchName, addr.kABContainsSubStringCaseInsensitive)
dim srchRes() as ABRecordMBS = addr.recordsMatchingSearchElement(srch) // Get the results into an array

for each rc as ABRRecordMBS in srchRes
if rc isa ABPersonMBS then // Is it a person record?
dim pers as ABPersonMBS = ABPersonMBS(rc) // Get it into a personnel record

// Now get the names and addresses.
listbox1.AddRow(pers.valueForProperty(addr.kABFirstNameProperty) + " " + pers.valueForProperty(addr.kABLastNameProperty))
listbox1.RowTag(listbox1.LastIndex) = pers.valueForProperty(addr.kABUIDProperty)

// Need to find the home address.
dim mlv as ABMultiValueMBS = pers.valueForProperty(addr.kABAddressProperty)
if mlv <> nil Then
    // get home address
    dim d as Dictionary = mlv.valueForLabel(addr.kABHomeLabel)
    if d = nil then
        // get primary
        d = mlv.valueForIdentifier(mlv.primaryIdentifier)
    end if

    if d <> Nil then
        // show address with street and city
        listbox1.Cell(listbox1.LastIndex,1) = d.Lookup(addr.kABAddressStreetKey,"") + "+" + d.Lookup(addr.kABAddressCityKey,"")
    end if
end if
next
Notes:
Use.searchElementForProperty.in.ABPersonMBS.and.ABGroupMBS.classes.to.create.objects.

All.methods.in.this.class.will.catch.exceptions.from.Cocoa.and.raise.a.NSExceptionMBS.instead.Using.the
message,.name.and.reason.properties.you.can.see.what.was.the.reason.for.this.exception..Please.report.if
you.find.a.method.that.does.not.handle.exceptions.correct.
This.is.an.abstract.class. You.can’t.create.an.instance,.but.you.can.get.one.from.various.plugin.functions.

9.13.2 Methods

9.13.3 Constructor

9.13.4 matchesRecord(record as ABRecordMBS) as boolean

Notes: Returns false if handle=0 or record=nil or record does not match. Else yes.

9.13.5 searchElementForConjunction(conjunction as Integer, children() as ABSearchElementMBS) as ABSearchElementMBS

Notes:
conjunction can be kABSearchAnd or kABSearchOr.
Returns nil on any error.

Pass kABSearchOr or kABSearchAnd for conjunction.

This is a class method. No need to have a valid handle.
CHAPTER 9. ADDRESSBOOK

9.13.6 Properties

9.13.7 Addressbook as ABAddressBookMBS

Function: Reference to parent addressbook.
Notes: 
Plugin sets this for most objects to keep reference to addressbook and avoid this addressbook from being closed too early.
(Read and Write property)

9.13.8 Description as string

Function: The description for this search element.
Example:
```vbs
dim a as new ABAddressBookMBS
dim m as ABSearchElementMBS = a.searchElementForPersonProperty(a.kABFirstNameProperty, "", "", "John", a.kABContainsSubStringCaseInsensitive)
MsgBox m.Description
```

Notes: (Read only property)

9.13.9 Handle as Integer

Function: The handle to the Cocoa object being used.
Notes: (Read and Write property)

9.13.10 Constants

9.13.11 kABSearchAnd = 0

9.13.12 kABSearchOr = 1

Chapter 10

Alias

10.1  class AliasInfoMBS

10.1.1  class AliasInfoMBS

Function: A class for information about an alias.
Example:

// select an alias file. use TrueChild so it’s not resolved
dim f as FolderItem = SpecialFolder.Desktop.TrueChild("Development")

// get alias info
dim a as AliasInfoMBS = f.AliasInfoMBS

// show info
MsgBox "alias points to " + a.TargetName + " in path " + a.PathString + " of volume " + a.VolumeName

Notes:
Only for Mac OS X.
This is for resource fork based alias files.
Newer OS X version use the newer bookmark format, so please use CFBookmarkMBS module there.
10.1.2 Methods

10.1.3 Constructor

**Function:** A dummy constructor used only for automatic plugin testing.
See also:

- 10.1.4 Constructor(AliasHandle as Integer)

10.1.4 Constructor(AliasHandle as Integer)

**Function:** The constructor: Loads object properties with information about the alias inside the Alias Handle.
**Notes:** Check Lasterror code to see whether it was successful.
See also:

- 10.1.3 Constructor

10.1.5 InfoForAliasData(data as string) as AliasInfoMBS

**Function:** Query information for alias data.
**Example:**

```vba
dim folder as FolderItem = SpecialFolder.Desktop
dim m as new MacAliasMBS
dim error as Integer = m.Create(nil, folder)
if error = 0 then
dim data as string = m.GetRecord
dim info as AliasInfoMBS = AliasInfoMBS_INFO AliasData(data)
MsgBox info.PathString
else
MsgBox "Failed to create the alias. Error " + str(error)
end if
```

**Notes:** Returns nil on any error.
10.1.6  InfoForSaveInfo(data as string) as AliasInfoMBS

**Function**: Query information about alias in SaveInfo.
**Example**:

```vbscript
dim folder as FolderItem = SpecialFolder.Desktop
dim SaveInfo as string = folder.GetSaveInfo(nil, FolderItem.SaveInfoDefaultMode)
dim info as AliasInfoMBS = AliasInfoMBS.InfoForSaveInfo(SaveInfo)
MsgBox info.PathString
```

**Notes:**
This is for saveinfo data returns by GetSaveInfo function in folderitem class.
Returns nil on any error.

10.1.7  Properties

10.1.8  FileCreator as String

**Function**: The file creator code.
**Example**:

```vbscript
// select an alias file. use TrueChild so it’s not resolved
dim f as FolderItem = SpecialFolder.Desktop(TrueChild("IMG_0793.jpg"))

// get alias info
dim a as AliasInfoMBS = f.AliasInfoMBS

// show info
MsgBox "FileCreator: " + a.FileCreator // shows Mac OS creator code like GKON
```

**Notes**: (Read only property)

10.1.9  FilesystemID as Integer

**Function**: The file system ID of the target file system.
**Notes**: (Read only property)
10.1.10  **FileType as String**

**Function:** The file type code.

**Example:**

```vba
// select an alias file. use TrueChild so it’s not resolved
Dim f As FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")
// get alias info
Dim a As AliasInfoMBS = f.AliasInfoMBS
// show info
MsgBox "FileType: " + a.FileType // shows Mac OS creator code like JPEG
```

**Notes:** (Read only property)

10.1.11  **Flags as Integer**

**Function:** Which properties do have valid content.

**Notes:**

Some constants:

- `AliasInfoNone = &h00000000` no valid info
- `AliasInfoVolumeCreateDate = &h00000001` volume creation date is valid
- `AliasInfoTargetCreateDate = &h00000002` target creation date is valid
- `AliasInfoFinderInfo = &h00000004` file type and creator are valid
- `AliasInfoIsDirectory = &h00000008` isDirectory boolean is valid
- `AliasInfoIDs = &h00000010` parentDirID and nodeID are valid
- `AliasInfoFSInfo = &h00000020` filesystemID and signature are valid
- `AliasInfoVolumeFlags = &h00000040` volumeIsBootVolume, volumeIsAutomounted, volumeIsEjectable and volumeHasPersistentFileIDs are valid

(Read only property)

10.1.12  **IsDirectory as Boolean**

**Function:** Whether the target item is a directory or not.

**Example:**
10.1. CLASS ALIASINFOMBS

// select an alias file. use TrueChild so it's not resolved
dim f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
dim a as AliasInfoMBS = f.AliasInfoMBS

// show info
MsgBox "IsDirectory: " + str(a.IsDirectory)

Notes: (Read only property)

10.1.13 LastError as Integer

Notes: (Read only property)

10.1.14 NodeID as Integer

Notes: (Read only property)

10.1.15 ParentDirID as Integer

Notes: (Read only property)

10.1.16 PathString as String

Example:

// select an alias file. use TrueChild so it's not resolved
dim f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")
// get alias info
Dim a As AliasInfoMBS = f.AliasInfoMBS

// show info
MsgBox "TargetName: " + a.PathString // shows target file path

Notes: (Read only property)

10.1.17 Signature as Integer

MBS MacClassic Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The signature of the target file system.
**Notes:** (Read only property)

10.1.18 TargetCreateDate as Double

MBS MacClassic Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Target file creation date.
**Notes:** Value should be in absolute seconds.
(Read only property)

10.1.19 TargetName as String

MBS MacClassic Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the target item.
**Example:**
// select an alias file. use TrueChild so it’s not resolved
Dim f As FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
Dim a As AliasInfoMBS = f.AliasInfoMBS

// show info
MsgBox "TargetName: " + a.TargetName // shows target file name

Notes: (Read only property)
10.1.20  **VolumeCreateDate as Double**

MBS MacClassic Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The creation date of the target volume.  
**Notes:** (Read only property)

10.1.21  **VolumeHasPersistentFileIDs as Boolean**

MBS MacClassic Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The target volume has persistent file IDs, so the NodeID and parentDirID are usable.  
**Example:**
```
// select an alias file. use TrueChild so it’s not resolved
dim f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
dim a as AliasInfoMBS = f.AliasInfoMBS

// show info
MsgBox "VolumeHasPersistentFileIDs: "+str(a.VolumeHasPersistentFileIDs)
```

**Notes:** (Read only property)

10.1.22  **VolumeIsAutomounted as Boolean**

MBS MacClassic Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the volume is automounted.  
**Notes:**
```
// select an alias file. use TrueChild so it’s not resolved
dim f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
dim a as AliasInfoMBS = f.AliasInfoMBS

// show info
MsgBox "VolumeIsAutomounted: "+str(a.VolumeIsAutomounted)
```

(Read only property)
10.1.23 VolumeIsBootVolume as Boolean

Function: Whether the target volume is bootable.
Example:

// select an alias file. use TrueChild so it’s not resolved
dim f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
dim a as AliasInfoMBS = f.AliasInfoMBS

// show info
MsgBox "VolumeIsBootVolume: " + str(a.VolumeIsBootVolume)

Notes: (Read only property)

10.1.24 VolumeIsEjectable as Boolean

Function: Whether the target file is on an ejectable volume.
Example:

// select an alias file. use TrueChild so it’s not resolved
dim f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
dim a as AliasInfoMBS = f.AliasInfoMBS

// show info
MsgBox "VolumeIsEjectable: " + str(a.VolumeIsEjectable)

Notes: (Read only property)

10.1.25 VolumeName as String

Function: The name of the volume the target resides on.
Example:

// select an alias file. use TrueChild so it’s not resolved
dim f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")
// get alias info
Dim a As AliasInfoMBS = f.AliasInfoMBS

// show info
MsgBox "VolumeName: " + a.VolumeName // shows target volume name

Notes: (Read only property)

10.1.26 Constants

10.1.27 kAliasInfoFinderInfo = 4

MBS MacClassic Plugin, Plugin Version: 13.4. Function: One of the flag constants. Notes: File type and creator are valid.

10.1.28 kAliasInfoFSInfo = 32

10.1.29 kAliasInfoIDs = 16

MBS MacClassic Plugin, Plugin Version: 13.4. Function: One of the flag constants. Notes: ParentDirID and nodeID are valid.

10.1.30 kAliasInfoIsDirectory = 8

10.1.31 kAliasInfoNone = 0

10.1.32  kAliasInfoTargetCreateDate = 2

MBS MacClassic Plugin, Plugin Version: 13.4. **Function:** One of the flag constants.  
**Notes:** Target creation date is valid.

10.1.33  kAliasInfoVolumeCreateDate = 1

MBS MacClassic Plugin, Plugin Version: 13.4. **Function:** One of the flag constants.  
**Notes:** Volume creation date is valid.

10.1.34  kAliasInfoVolumeFlags = 64

MBS MacClassic Plugin, Plugin Version: 13.4. **Function:** One of the flag constants.  
**Notes:** VolumeIsBootVolume, volumeIsAutomounted, volumeIsEjectable and volumeHasPersistentFileIDs are valid.
10.2. MODULE CFBOOKMARKMBS

10.2.1 module CFBookmarkMBS

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The module for Mac OS X bookmark/alias functions.

**Notes:**
Bookmark data strings have no text encoding. If you use ConvertEncoding on them, you destroy them.
Available with Mac OS X 10.6 or newer.
For older systems, please use MacAliasMBS class.

10.2.2 Methods

10.2.3 Available as boolean

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether bookmark functions are available.

**Notes:** Returns true on Mac OS X 10.6 or newer.

10.2.4 CreateBookmarkData(file as folderitem, options as UInt32 = 1024, relativeToURL as folderitem = nil) as string

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create a string containing an externalizable representation from a folderitem, modified with the given options, including (at the minimum) any properties in the propertiesToInclude array which are retrievable from the given url.

**Example:**
```plaintext
dim file as FolderItem = SpecialFolder.Desktop.Child(“test.rtf”)
dim Bookmark as string = CFBookmarkMBS.CreateBookmarkData(file, CFBookmarkMBS.kCreationSuitableForBookmarkFile)
MsgBox str(lenb(Bookmark))+” bytes”
```

**Notes:**
file: the folderitem to create a bookmark data from.
options: a set of options which control creation of the bookmark data
resourcePropertiesToInclude: Optional, If non-empty, an array of additional properties copied from the url to include in the created bookmark data.
relativeToURL: If non-nil, the created bookmark will be relative to the given url
Lasterror is set.

Returns a string containing an data, which can be later be passed to ResolveBookmarkData.

**10.2.5 CreateBookmarkData**

(file as folderitem, options as UInt32, resourcePropertiesToInclude() as string, relativeToURL as folderitem = nil) as string

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Create a string containing an externalizable representation from a folderitem, modified with the given options, including ( at the minimum ) any properties in the propertiesToInclude array which are retrievable from the given url.

**Notes:**

- file: the folderitem to create a bookmark data from.
- options: a set of options which control creation of the bookmark data
- resourcePropertiesToInclude: Optional, If non-empty, an array of additional properties copied from the url to include in the created bookmark data.
- relativeToURL: If non-nil, the created bookmark will be relative to the given url

Lasterror is set.

Returns a string containing an data, which can be later be passed to ResolveBookmarkData.

See also:

- 10.2.4 CreateBookmarkData(file as folderitem, options as UInt32 = 1024, relativeToURL as folderitem = nil) as string
10.2.6 CreateBookmarkData(URL as CFURLMBS, options as UInt32 = 1024, relativeToURL as CFURLMBS = nil) as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Create a string containing an externalizable representation from a URL, modified with the given options,
including (at the minimum) any properties in the propertiesToInclude array which are retrievable from the
given url.

Notes:
URL: the URL to create a bookmark data from.
options: a set of options which control creation of the bookmark data
resourcePropertiesToInclude: Optional, If non-empty, an array of additional properties copied from the url
to include in the created bookmark data.
relativeToURL: If non-nil, the created bookmark will be relative to the given url

LastError is set.
Returns a string containing an data, which can be later be passed to ResolveBookmarkData.
See also:

- 10.2.11 CreateBookmarkData(URL as string, options as UInt32, resourcePropertiesToInclude() as string, relativeToURL as string = ””) as string 2611

10.2.11 CreateBookmarkData(URL as string, options as UInt32, resourcePropertiesToInclude() as string, relativeToURL as string = ””) as string

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Create a string containing an externalizable representation from a URL, modified with the given options,
including (at the minimum) any properties in the propertiesToInclude array which are retrievable from the
given url.

**Notes:**

URL: the URL to create a bookmark data from.
options: a set of options which control creation of the bookmark data
resourcePropertiesToInclude: Optional, If non-empty, an array of additional properties copied from the url
to include in the created bookmark data.
relativeToURL: If non-nil, the created bookmark will be relative to the given url

Lasterror is set.
Returns a string containing an data, which can be later be passed to ResolveBookmarkData.
See also:

- 10.2.4 CreateBookmarkData(file as folderitem, options as UInt32 = 1024, relativeToURL as folderitem = nil) as string 2605
- 10.2.5 CreateBookmarkData(file as folderitem, options as UInt32, resourcePropertiesToInclude() as string, relativeToURL as folderitem = nil) as string 2606
10.2.12 \textbf{CreateBookmarkDataFromAliasRecord(AliasRecordData as string) as string}

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Create a string containing bookmarkdata by converting the alias data in aliasRecordData which should be the contents of an AliasRecord copied into a string. 
\textbf{Notes:}

The created bookmarkdata can be passed into ResolveBookmarkData to resolve the item into a folderitem or URL, or a small set of information can be returned from ResourcePropertiesForKeysFromBookmarkData / ResourcePropertyForKeyFromBookmarkData.

AliasRecordData: the contents of an AliasRecord to create bookmark data for.

Returns a string containing bookmark data.

10.2.13 \textbf{LastError as CFErrorMBS}

\textbf{Notes:} This ia CFErrorMBS object.

10.2.14 \textbf{ReadBookmarkDataFromFile(file as folderitem) as string}

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Given a file which is a Finder "alias" file, return a string with the bookmark data from the file. 
\textbf{Notes:}

If file points to an alias file created before SnowLeopard which contains Alias Manager information and no bookmark data, then a bookmark data string will be synthesized which contains a approximation of the alias
10.2. MODULE CFBOOKMARKMBS

information in a format which can be used to resolve the bookmark. If an error prevents reading the data or if it is corrupt, nil will be returned and lasterror will be filled in if error object.

File: a folderitem to to the alias file to create the bookmark data from.

Returns a string containing bookmark data, or nil if there was an error creating bookmark data from the file, such as if the file is not an alias file.

10.2.15 ResolveBookmarkData(bookmark as string, options as UInt32, relativeToURL as folderitem, byref isStale as boolean) as folderitem

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Given a bookmark data string, returns a folderitem of the item it was a bookmark to.

Example:

```vba
dim AliasFile as FolderItem = SpecialFolder.Desktop.trueChild("test.alias")
dim Bookmark as string = CFBookmarkMBS.ReadBookmarkDataFromFile(AliasFile)
dim isStale as Boolean

dim options as UInt32 = CFBookmarkMBS.kResolutionWithoutUMask + CFBookmarkMBS.kResolution-
WithoutMountingMask

dim file as FolderItem = CFBookmarkMBS.ResolveBookmarkData(Bookmark, options, nil, isStale)

if file<>Nil then
    MsgBox file.AbsolutePath
else
    dim e as CFEErrorMBS = CFBookmarkMBS.LastError
    if e = nil then
        MsgBox "Failed to resolve."
    else
        MsgBox e.Description
    end if
end if
```

Notes:

If in the process of resolving the bookmark into the folderitem it points to this determines that some properties in the bookmark are out of date or not correct for the item it resolves to, set isStale to true, which the client may want to use to decide to make a new bookmark from the returned item and replace the saved bookmark it has. If the bookmarked item cannot be found, return nil. If an error (other than "original item can not be found") occurs during the process, return nil and fill in lasterror property.

bookmark: a string containing a bookmark data, created with CreateBookmarkData
options: options which affect the resolution
relativeToURL: If non-nil, and if the bookmark was created relative to another file/folder, then resolve it relative to this file/folder.

resourcePropertiesToInclude: Optional, if non-empty, an array containing those properties which the caller would like to already be cached on the given url.

isStale: On exit will be set to true if during resolution any of the properties in the bookmark no longer seemed to match the corresponding properties on the returned file. Clients, upon seeing a stale representation, may want to replace whatever stored bookmark data they have saved and create a new one.

LastError is set.

Returns a folderitem of a file which is the closest match to the file the bookmark data.

- 10.2.17 ResolveBookmarkData(bookmark as string, options as UInt32, relativeToURL as string, byref isStale as boolean) as string
10.2.19 ResolveBookmarkDataToCFURLMBS(bookmark as string, options as UInt32, relativeToURL as CFURLMBS, byref isStale as boolean) as CFURLMBS

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Given a bookmark data string, returns a CFURL of the item it was a bookmark to.
Notes:

If in the process of resolving the bookmark into the folderitem it points to this determines that some properties in the bookmark are out of date or not correct for the item it resolves to, set isStale to true, which the client may want to use to decide to make a new bookmark from the returned item and replace the saved bookmark it has. If the bookmarked item cannot be found, return nil. If an error (other than "original item can not be found") occurs during the process, return nil and fill in lasterror property.

Returns a CFURLMBS of a file which is the closest match to the file the bookmark data.

10.2.20 ResolveBookmarkDataToCFURLMBS(bookmark as string, options as UInt32, relativeToURL as CFURLMBS, resourcePropertiesToInclude() as string, byref isStale as boolean) as CFURLMBS

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Given a bookmark data string, returns a CFURL of the item it was a bookmark to.
Notes:
If in the process of resolving the bookmark into the folder item it points to, this determines that some properties in the bookmark are out of date or not correct for the item it resolves to, set isStale to true, which the client may want to use to decide to make a new bookmark from the returned item and replace the saved bookmark it has. If the bookmarked item cannot be found, return nil. If an error (other than "original item can not be found") occurs during the process, return nil and fill in lasterror property.

bookmark: a string containing a bookmark data, created with CreateBookmarkData
options: options which affect the resolution
relativeToURL: If non-nil, and if the bookmark was created relative to another file/folder, then resolve it relative to this file/folder.
resourcePropertiesToInclude: Optional, if non-empty, an array containing those properties which the caller would like to already be cached on the given url.
isStale: On exit will be set to true if during resolution any of the properties in the bookmark no longer seemed to match the corresponding properties on the returned file. Clients, upon seeing a stale representation, may want to replace whatever stored bookmark data they have saved and create a new one.

Lasterror is set.

Returns a CFURLMBS of a file which is the closest match to the file the bookmark data.

10.2.23 ResourcePropertiesForKeysFromBookmarkData(BookmarkData as string) as dictionary

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Given a bookmark, return a dictionary of all properties.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.TrueChild("Webseiten")

dim data as string = CFBookmarkMBS.ReadBookmarkDataFromFile(f)

if data.lenb > 0 then
    dim dic as Dictionary = CFBookmarkMBS.ResourcePropertiesForKeysFromBookmarkData(data)

    Break ' // see in debugger
end if
```

Notes:
This returns only the properties stored within the bookmark and will not attempt to resolve the bookmark or do i/o.

BookmarkData: a string containing a bookmark data, created with CreateBookmarkData

Returns a dictionary containing the values for all properties passed in obtained from the bookmark data (not by attempting to resolve it or do i/o in any way)
Version 17.1 of our plugin knows a list of keys, so it tries all keys and returns the dictionary with matching ones.

See also:

- 10.2.24 ResourcePropertiesForKeysFromBookmarkData(BookmarkData as string, resourcePropertiesToReturn() as string) as dictionary

10.2.24 ResourcePropertiesForKeysFromBookmarkData(BookmarkData as string, resourcePropertiesToReturn() as string) as dictionary

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Given a bookmark, return a dictionary of properties.

**Notes:**
This returns only the properties stored within the bookmark and will not attempt to resolve the bookmark or do i/o.

BookmarkData: a string containing a bookmark data, created with CreateBookmarkData
resourcePropertiesToReturn: Optional an array of string of the properties of the bookmark data which the client would like returned.

Returns a dictionary containing the values for the properties passed in obtained from the bookmark data (not by attempting to resolve it or do i/o in any way)

See also:

- 10.2.23 ResourcePropertiesForKeysFromBookmarkData(BookmarkData as string) as dictionary

10.2.25 ResourcePropertyForKeyFromBookmarkData(BookmarkData as string, resourcePropertyKey as string) as Variant

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Given a bookmark, return the value for a given property from the bookmark data.

**Notes:**
This returns only the properties stored within the bookmark and will not attempt to resolve the bookmark or do i/o.

BookmarkData: a string containing a bookmark data, created with CreateBookmarkData
resourcePropertyKey: the property key to return.

Returns a variant value for the property passed in obtained from the bookmark data (not by attempting to resolve it or do i/o in any way)
10.2.26 StartAccessingSecurityScopedResource(URL as CFURLMBS) as boolean

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Given a file URL created by resolving a bookmark data created with security scope, make the resource referenced by the url accessible to the process. **Notes:** When access to this resource is no longer needed the client should call StopAccessingSecurityScopedResource(). Each call to StartAccessingSecurityScopedResource() must be balanced with a call to StopAccessingSecurityScopedResource(). URL: the file URL for the resource returned by CreateByResolvingBookmarkData() using kResolutionWithSecurityScope. Returns true if access was granted and false if the url does not reference a security scoped resource, or if some error occurred which didn’t allow access to be granted. Available on Mac OS X 10.7 or newer.

10.2.27 StopAccessingSecurityScopedResource(URL as CFURLMBS)

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Revokes the access granted to the url by a prior successful call to StartAccessingSecurityScopedResource(). **Notes:** Available on Mac OS X 10.7 or newer.

10.2.28 WriteBookmarkDataToFile(BookmarkData as string, file as folderitem, options as UInt32) as boolean

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Given a created bookmarkData object, create a new Finder "alias" file at file which contains the bookmark data. **Example:**

```plaintext
dim file as FolderItem = SpecialFolder.Desktop.TrueChild(“test.rtf”)  
dim Bookmark as string = CFBookmarkMBS.CreateBookmarkData(file, CFBookmarkMBS.kCreationSuitableForBookmarkFile)  

dim AliasFile as FolderItem = SpecialFolder.Desktop.TrueChild(“test.alias”)  
if CFBookmarkMBS.WriteBookmarkDataToFile(Bookmark, AliasFile, 0) then  
    MsgBox “OK”  
else  
    dim e as CFErrorMBS = CFBookmarkMBS.lasterror  
    MsgBox “Failed: ” + e.Description  
end if
```
Notes:
If file points to a directory, an alias file will be created with the same name as the bookmarked item and a ".alias" extension. If file points to a file and it exists it will be overwritten. If a .alias extension is not present it will be added. In addition to the bookmark data, sufficient pre-SnowLeopard alias data will added to the file to allow systems running something before SnowLeopard to resolve this file using Alias Manager routines and get back the same file as the bookmark routines.

The bookmark data must have been created with the kCFURLBookmarkCreationSuitableForBookmarkFile option and an error will be returned if not.

bookmark: A string containing a bookmark data, created with CreateBookmarkData
file: The file/folder to write the alias to.
options: options flags

LastError is set.

10.2.29 Constants

10.2.30 kCreationMinimalBookmarkMask = 512

MBS MacCF Plugin, Plugin Version: 11.3. Function: One of the creation option constants.
Notes: Creates a bookmark with "less" information, which may be smaller but still be able to resolve in certain ways.

10.2.31 kCreationPreferFileIDResolutionMask = 256

MBS MacCF Plugin, Plugin Version: 11.3. Function: One of the creation option constants.
Notes: At resolution time, this alias will prefer resolving by the embedded fileID to the path.

10.2.32 kCreationSecurityScopeAllowOnlyReadAccess = 4096

MBS MacCF Plugin, Plugin Version: 12.4. Function: One of the creation option constants.
Notes: Mac OS X 10.7.3 and later, if used with kCFURLBookmarkCreationWithSecurityScope, at resolution time only read access to the resource will be granted.
10.2.33  \texttt{kCreationSuitableForBookmarkFile} = 1024

MBS MacCF Plugin, Plugin Version: 11.3. \textbf{Function:} One of the creation option constants. 
\textbf{Notes:} Includes in the created bookmark those properties which are needed for a bookmark/alias file.

10.2.34  \texttt{kCreationWithSecurityScope} = 2048

MBS MacCF Plugin, Plugin Version: 12.4. \textbf{Function:} One of the creation option constants. 
\textbf{Notes:} Mac OS X 10.7.3 and later, include information in the bookmark data which allows the same sandboxed process to access the resource after being relaunched.

10.2.35  \texttt{kResolutionWithoutMountingMask} = 512

MBS MacCF Plugin, Plugin Version: 11.3. \textbf{Function:} One of the resolving option constants. 
\textbf{Notes:} Don’t mount a volume during bookmark resolution.

10.2.36  \texttt{kResolutionWithoutUIMask} = 256

MBS MacCF Plugin, Plugin Version: 11.3. \textbf{Function:} One of the resolving option constants. 
\textbf{Notes:} Don’t perform any UI during bookmark resolution.

10.2.37  \texttt{kResolutionWithSecurityScope} = 1024

MBS MacCF Plugin, Plugin Version: 12.4. \textbf{Function:} One of the resolving option constants. 
\textbf{Notes:} Mac OS X 10.7.3 and later, extract the security scope included at creation time to provide the ability to access the resource.
10.3. CLASS MACALIASMBS

10.3 class MacAliasMBS

10.3.1 class MacAliasMBS

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gives access to Aliases on Mac.

**Example:**

// Store the reference to a FolderItem in a Binary File

Dim alias as MacAliasMBS
Dim t,f as FolderItem
Dim bf as BinaryStream, s as String
Dim t as SpecialFolder.Desktop.Child("test")
bf = t.CreateBinaryFile("") // open your binary file here
f = SpecialFolder.Desktop // the FolderItem you want to save
alias = new MacAliasMBS
if alias.Create(nil, f) = 0 then
    s = alias.GetRecord
    bf.WriteLong LenB(s) // this saves the length of the record
    bf.Write s // this saves the record itself
end
bf.Close

// Retrieve the reference to a FolderItem from a Binary File

dim l as Integer

Dim t as SpecialFolder.Desktop.Child("test")
bf = t.OpenAsBinaryFile(false) // open your binary file here
alias = new MacAliasMBS
l = bf.ReadLong
alias.SetRecord bf.Read(l)
f = alias.Resolve(nil, alias.attemptMount)
if alias.needsUpdate then
    if alias.Update(nil, f) = 1 then
        // ... you might want to save the updated alias in your file here
    end
end

// f now describes the FolderItem again.
// It may not be existing any more, however, so here’s a check for that:
if not f.exists then
    MsgBox "oops! the file is not available any more. Select a new one, please"
//... let the user locate the file
end
Notes:
This Plugin implements a new Class for handling Mac OS Alias Records.

AliasRecords are like FolderItems, but can be made persistent: You can convert a FolderItem into a AliasRecord and store that AliasRecord in a file (like your Preferences file). Later you can retrieve that information again and convert it back into a FolderItem.

AliasRecords also appear inside Alias Files, that are usually created by the Finder. The enclosed sample application (Alias Mgr Plugin Demo.) shows how to create and resolve such Alias Files.

Additional Background Information
The purpose of the class is to store paths to files and/or folders between runs of a RB application. To store a path to a file/folder in an RB app, currently your only option is to get the absolute path as a string, and store that string in a file, usually your preferences file. However, there is problem with using this technique: If, between runs of your app, the user changes the path of the file by moving it, or by renaming the file or any of its parent folders (including the volume name), your app will fail to locate the file next time it is looking for it.
Fortunately, at least in Mac OS, there is a solution to this, which helps you to track your files in such a case. This is done by using Alias Records: they are the basic data structure that is also used in Alias Files as created and used in the Finder.
This class attempts to give the flexibility of Alias Records to your RB apps.

The meaning of the Relative path
When no relative path is specified, then the file is only located by its folder hierarchy down to the root of the volume. However, if a relative path is given, then the file is optionally located relative to that point. So, if you locate files relatively to some folder, like the folder your application is in, you should specify your app’s folder as the relative path so that the target is even found easily when the user moved the whole folder including your app and its related files. This is even more important when using this Alias class under Windows than under Mac OS (if files are moved in Mac OS, they often still can be found even without the help of the original folder hierarchy, while this is not possible under Windows 9x).

For Mac OS X 10.6 or newer, please also check CFBookmarkMBS module.

10.3.2 Methods

10.3.3 AliasInfo as AliasInfoMBS

Example:
10.3. **CLASS MACALIASMBS**

```
dim m as new MacAliasMBS
dim f as FolderItem = SpecialFolder.Desktop

if m.Create(nil, f) = 0 then
    dim info as AliasInfoMBS = m.AliasInfo
    MsgBox info.TargetName + EndOfLine + info.VolumeName + EndOfLine + info.PathString
end if
```

10.3.4 close

**Function:** The destructor. 
**Notes:**

There is no need to call this method except you want to free all resources of this object now without waiting 
for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

10.3.5 Create(relPath as FolderItem, target as FolderItem, isDirectory as boolean = false) as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an 
AliasRecord for a given file or folder.
**Example:**
```
dim m as new MacAliasMBS

dim e as Integer = m.Create(nil, SpecialFolder.Desktop.Child("test.txt"), true)

// shows -43 as we created alias for non existing file
MsgBox str(e)
MsgBox m.AliasInfo.TargetName
```

**Notes:**

Returns zero if successful, otherwise a negative Mac OS error code.

Version 16.0 can create alias for non existing files. In that case you can tell with function isDirectory whether 
the target should be a directory. Still returns fnfErr (-43) if file doesn’t exist but the alias will still be created.
10.3.6 CreateAliasFromPath(targetPath as string, fromFilePath as String = ", isDirectory as boolean = false) as Integer

Function: Creates an alias given a POSIX style utf-8 path to the target.  
Example:  

dim m as new MacAliasMBS  
dim e as Integer = m.CreateAliasFromPath("/Users/test", "", true)  
// shows -43 as we created alias for non existing file
MsgBox str(e)  
MsgBox m.AliasInfo.TargetName

Notes:  
Returns OS error code.  
If the target file does not exist but the path up to the leaf does then fnfErr (-43) will be returned but the alias will still be created.  

fromFilePath: The starting point for a relative search.  
targetPath: POSIX style UTF-8 path to target.  
IsDirectory: On input, if target does not exist, a flag to indicate whether or not the target is a directory.

10.3.7 CreateFSRef(relPath as memoryblock, target as memoryblock) as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
Function: Creates an AliasRecord for a given file or folder.  
Notes:  
The two memoryblocks are FSRefs which you can get by FolderItem.FSRef.  
Returns zero if successful, otherwise a negative Mac OS error code.

10.3.8 CreateMinimal(target as FolderItem, isDirectory as boolean = false) as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
Function: Creates an AliasRecord for a given file or folder.  
Returns zero if successful, otherwise a negative Mac OS error code.  
Notes:
Minimal creates an alias without path, so it is smaller.

Version 16.0 can create alias for non-existing files. In that case you can tell with function isDirectory whether the target should be a directory. Still returns fnfErr (-43) if file doesn’t exist but the alias will still be created.

10.3.9 CreateMinimalFSRef(target as memoryblock) as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a minimal AliasRecord for a given file or folder.

**Notes:**
The memoryblock is a FSRefs which you can get by Folderitem.FSRef.
Returns zero if successful, otherwise a negative Mac OS error code.

10.3.10 GetRecord as String

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the AliasRecord in a String so that you can store it in a file, and pass it SetRecord for re-creating the AliasRecord (this string might contain any byte values, including zeros, so you can not display it or store it in a text file - you have to store it in a binary file or in a resource, instead!).

**Notes:** Attention: The length of the String is not fixed! When the Alias changes, its length usually changes, too. If you want to save this string into a binary file, you must also save its current length so that you know how much bytes to retrieve if you read it back from the file later. An easier way to store Aliases in a file is by using the Resource Manager. The sample code "FolderItems in Preferences.rbp" shows how to accomplish this.

10.3.11 PathString as String

**Example:**
```vbnet
dim m as new MacAliasMBS
dim f as FolderItem = SpecialFolder.Desktop

if m.Create(nil, f) = 0 then
    MsgBox m.PathString
end if
```
10.3.12 Resolve(relPath as FolderItem, mode as Integer) as FolderItem

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts an AliasRecord back into a FolderItem. For values to the mode parameter see the class constants or pass in 0 for default searching (will not attempt to mount unavailable volumes). **Notes:** After calling this method, the property needsUpdate tells you whether the target has been renamed or moved, which suggests that you call Update in order to reflect the change in the AliasRecord. See the demo "FolderItems in Preferences.rbp" for an example.

10.3.13 SetRecord(record as String)

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Use this method to revive an AliasRecord with the string you inquired from GetRecord earlier.

10.3.14 TargetName as String

MBS MacClassic Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries target name of the alias. **Example:**

```vbnet
dim m as new MacAliasMBS
dim f as FolderItem = SpecialFolder.Desktop
if m.Create(nil, f) = 0 then
    MsgBox m.TargetName
end if
```

10.3.15 Update(relPath as FolderItem, target as FolderItem) as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates an already created AliasRecord. Returns either a negative Mac OS error code, zero if the update didn’t actually change the AliasRecord, or one if the record was changed (in this case you might want to update your record of the alias if you had stored it in a file).

10.3.16 VolumeName as String

MBS MacClassic Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries volume name of the alias. **Example:**
10.3. CLASS MACALIASMBS

```vbscript
dim m as new MacAliasMBS
dim f as FolderItem = SpecialFolder.Desktop
if m.Create(nil, f) = 0 then
    MsgBox m.VolumeName
end if
```

10.3.17 Properties

10.3.18 needsUpdate as boolean

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Does the Alias Record need no Update?

**Notes:**
after having called Resolve successfully, this property indicates whether the AliasRecord is still up to date:
true: the target of the Alias is still at the same location where it was last seen.
false: the target has been moved or renamed. The Update method should be invoked.
(Read only property)

10.3.19 Constants

10.3.20 allVols=8

MBS MacClassic Plugin, Plugin Version: 7.7. **Function:** One of the constants to use in Resolve.

**Notes:**
search on multiple volumes
This is the old constant name used for compatibility to older Realbasic code.
Use BitwiseOr or Bitwise.Or to combine this constants values.

10.3.21 attemptMount=1

MBS MacClassic Plugin, Plugin Version: 7.7. **Function:** One of the constants to use in Resolve.

**Notes:**
mount the volume automatically
This is the old constant name used for compatibility to older Realbasic code.
Use BitwiseOr or Bitwise.Or to combine this constants values.
10.3.22 exhaustive=& h200

MBS MacClassic Plugin, Plugin Version: 7.7. **Function:** One of the constants to use in Resolve.  
**Notes:**
- search further
- This is the old constant name used for compatibility to older Realbasic code.
- Use BitwiseOr or Bitwise.Or to combine this constants values.

10.3.23 kARMMountVol=1

MBS MacClassic Plugin, Plugin Version: 7.7. **Function:** One of the constants to use in Resolve.  
**Notes:**
- mount the volume automatically
- Use BitwiseOr or Bitwise.Or to combine this constants values.

10.3.24 kARMMultVols=8

MBS MacClassic Plugin, Plugin Version: 7.7. **Function:** One of the constants to use in Resolve.  
**Notes:**
- search on multiple volumes
- Use BitwiseOr or Bitwise.Or to combine this constants values.

10.3.25 kARMNoUI=2

MBS MacClassic Plugin, Plugin Version: 7.7. **Function:** One of the constants to use in Resolve.  
**Notes:**
- no user interface allowed during resolution
- Use BitwiseOr or Bitwise.Or to combine this constants values.

10.3.26 kARMSearch=& h100

MBS MacClassic Plugin, Plugin Version: 7.7. **Function:** One of the constants to use in Resolve.  
**Notes:**
- search quickly
- Use BitwiseOr or Bitwise.Or to combine this constants values.
10.3. CLASS MACALIASMBS

10.3.27  kARMSearchMore=& h200

Notes:
search further
Use BitwiseOr or Bitwise.Or to combine this constants values.

10.3.28  kARMSearchRelFirst=& h400

Notes:
search target on a relative path first
Use BitwiseOr or Bitwise.Or to combine this constants values.

10.3.29  kARMTryFileIDFirst=& h800

Notes:
search by file id before path
Use BitwiseOr or Bitwise.Or to combine this constants values.

10.3.30  noDialogs=2

Notes:
no user interface allowed during resolution
This is the old constant name used for compatibility to older Realbasic code.
Use BitwiseOr or Bitwise.Or to combine this constants values.

10.3.31  relFirst=& h400

Notes:
search target on a relative path first
This is the old constant name used for compatibility to older Realbasic code.
Use BitwiseOr or Bitwise.Or to combine this constants values.
Chapter 11

Apple Remote

11.1 class AppleRemoteMBS

11.1.1 class AppleRemoteMBS

Function: A class to handle an Apple Remote device from Realbasic.
Notes:
All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

With Mac OS X 10.6 Apple made changes to the behavior of the driver so the exclusive mode does no longer work.

11.1.2 Methods

11.1.3 startListening

11.1.4 stopListening

11.1.5 Properties

11.1.6 ClickCountEnabledButtons as Integer

MBS MacExtras Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Which buttons to enable for click counting.  
**Notes:** (Read and Write property)

11.1.7 ClickCountingEnabled as Boolean

MBS MacExtras Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to do click counting.  
**Notes:**  
Click counting makes it possible to recognize if the user has pressed a button repeatedly. Click counting does delay each event as it has to wait if there is another event (second click) therefore there is a slight time difference (maximumClickCountTimeDifference) between a single click of the user and the call of your delegate method. Click counting can be enabled individually for specific buttons. Use the property clickCountEnabledButtons to set the buttons for which click counting shall be enabled.  
(Read and Write property)

11.1.8 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the used AppleRemote Cocoa object.  
**Notes:** (Read and Write property)

11.1.9 ListeningOnAppActivate as Boolean

MBS MacExtras Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets an NSApplication delegate which starts listening when application is becoming active and stops listening when application resigns being active.  
**Notes:**  
If an NSApplication delegate has been already set all method calls will be forwarded to this delegate, too.  
(Read and Write property)
11.1. CLASS APPLEREMOTEMBS

11.1.10 ListeningToRemote as boolean

MBS MacExtras Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether object is currently listening to the devices. **Notes:**

True if yes and false if no. (Read and Write property)

11.1.11 MaximumClickCountTimeDifference as Double

MBS MacExtras Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum time difference till which clicks are recognized as multi clicks. **Notes:** (Read and Write property)

11.1.12 OpenInExclusiveMode as boolean

MBS MacExtras Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether device should be opened in exclusive mode. **Notes:**

True if yes and False if no. (Read and Write property)

11.1.13 ProcessesBacklog as Boolean

MBS Mac Extras Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** When your application needs too much time on the main thread when processing an event other events may already be received which are put on a backlog. **Notes:**

As soon as your main thread has some spare time this backlog is processed and may flood your delegate with calls. Backlog processing is turned off by default. (Read and Write property)

11.1.14 RemoteAvailable as boolean

MBS MacExtras Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the needed drivers are installed to handle the device. **Notes:**
11.1.15  remoteId as Integer

MBS MacExtras Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device ID.  
**Notes:** (Read only property)

11.1.16  SimulatesPlusMinusHold as Boolean

MBS MacExtras Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Simulating plus/minus hold does deactivate sending of individual requests for plus/minus pressed down/released.  
**Notes:** Instead special hold events are being triggered when the user is pressing and holding plus/minus for a small period. With simulating enabled the plus/minus buttons do behave as the left/right buttons.  
(Read and Write property)

11.1.17  Events

11.1.18  ButtonPressed(ButtonID as Integer, PressedDown as boolean, click-Count as Integer)

MBS MacExtras Plugin, Plugin Version: 7.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event being called whenever a button is pressed or released.  
**Notes:** ButtonID is one of the kRemote* constants in this class. PressedDown is true if the button was pressed down. If false the button is now no longer pressed after holding it.

11.1.19  Constants

11.1.20  kRemoteButtonFullscreen2009 = 32768

MBS MacExtras Plugin, Plugin Version: 15.0. **Function:** The constant for the fullscreen button (older modell).
11.1. CLASS APPLEREMOTEMBS

11.1.21 kRemoteButtonLeft = 64

MBS MacExtras Plugin, Plugin Version: 7.1. **Function:** The constant for the left button.

11.1.22 kRemoteButtonLeftHold = 256

MBS MacExtras Plugin, Plugin Version: 7.1. **Function:** The constant for the left button being hold.

11.1.23 kRemoteButtonMenu = 8

MBS MacExtras Plugin, Plugin Version: 7.1. **Function:** The constant for the menu button.

11.1.24 kRemoteButtonMenuHold = 512

MBS MacExtras Plugin, Plugin Version: 7.1. **Function:** The constant for the menu button being hold.

11.1.25 kRemoteButtonPlay = 16

MBS MacExtras Plugin, Plugin Version: 7.1. **Function:** The constant for the play button.

11.1.26 kRemoteButtonPlay2009 = 16384

MBS MacExtras Plugin, Plugin Version: 15.0. **Function:** The constant for the play button (older model).

11.1.27 kRemoteButtonPlaySleep = 1024

MBS MacExtras Plugin, Plugin Version: 7.1. **Function:** The constant for the play button being hold.

11.1.28 kRemoteButtonRight = 32

MBS MacExtras Plugin, Plugin Version: 7.1. **Function:** The constant for the right button.
11.1.29  \( k_{\text{RemoteButtonRightHold}} = 128 \)

MBS MacExtras Plugin, Plugin Version: 7.1. **Function:** The constant for the right button being hold.

11.1.30  \( k_{\text{RemoteButtonVolumeMinus}} = 4 \)

MBS MacExtras Plugin, Plugin Version: 7.1. **Function:** The constant for the volume minus button.

11.1.31  \( k_{\text{RemoteButtonVolumeMinus_Hold}} = 8192 \)

MBS MacExtras Plugin, Plugin Version: 15.0. **Function:** The constant for the volume minus button (hold).

11.1.32  \( k_{\text{RemoteButtonVolumePlus}} = 2 \)

MBS MacExtras Plugin, Plugin Version: 7.1. **Function:** The constant for the volume plus button.

11.1.33  \( k_{\text{RemoteButtonVolumePlus_Hold}} = 4096 \)

MBS MacExtras Plugin, Plugin Version: 15.0. **Function:** The constant for the volume plus button (hold).

11.1.34  \( k_{\text{RemoteControlSwitched}} = 2048 \)

MBS MacExtras Plugin, Plugin Version: 7.1. **Function:** The constant for the device switch event.
Chapter 12

Apple Script

12.1 class AppleScriptErrorMBS

12.1.1 class AppleScriptErrorMBS

Function: A class for detailed error information.
Example:

/* a simply example using the AppleScriptErrorMBS class: */

dim s As new AppleScriptMBS
dim ASErr As AppleScriptErrorMBS

dim text As string = "set x to 1" /* intentional error */
s.Compile text

if s.LastError<>0 Then
    dim errorMsg As String = "Compile error: " + str(s.Lasterror) + EndOfLine
    ASErr = s.Error
    MsgBox errorMessage + "Details: " + ASErr.BriefMessage
end if
12.1.2 Properties

12.1.3 AppName as String

Function: The name of the application.
Notes:
Value is "" if no application is used (e.g. on compiling).
(Read and Write property)

12.1.4 AppSerial as MemoryBlock

Function: The application serial number.
Notes:
Nil if no application is used.
You can create a ProcessMBS class using this serial.s
(Read and Write property)

12.1.5 BriefMessage as String

Function: The brief error message.
Example:
```
dim ASErr as AppleScriptErrorMBS
MsgBox "Details: " + ASErr.BriefMessage
```
Notes: (Read and Write property)

12.1.6 Errorcode as Integer

Function: The error code.
Example:
```
dim a as new AppleScriptMBS
a.Compile "hello"
```
12.1. CLASS APPLES CriPTERRORMBS

Do not hallucinate.
2644

12.1.9

CHAPTER 12. APPLE SCRIPT

RangeAvailable as Boolean

Function: whether the rangestart and rangeend properties have valid values.
Example:
dim a as new AppleScriptMBS
a.Compile ”hello”
a.Execute
MsgBox str(a.error.RangeAvailable)+”: ”+str(a.error.RangeStart)+”-”+str(a.error.RangeEnd)

Notes: (Read and Write property)

12.1.10

RangeEnd as Integer

Function: The end of the source text range.
Example:
dim a as new AppleScriptMBS
a.Compile ”hello”
a.Execute
MsgBox str(a.error.RangeAvailable)+”: ”+str(a.error.RangeStart)+”-”+str(a.error.RangeEnd)

Notes: (Read and Write property)

12.1.11

RangeStart as Integer

Function: The start of the source text range.
Example:
dim a as new AppleScriptMBS
a.Compile ”hello”
a.Execute
MsgBox str(a.error.RangeAvailable)+”: ”+str(a.error.RangeStart)+”-”+str(a.error.RangeEnd)


Notes: (Read and Write property)
12.2 class AppleScriptMBS

12.2.1 class AppleScriptMBS

**Function:** A class for compiling and executing Apple Scripts in RB.

**Example:**

```ruby
dim a as new AppleScriptMBS
dim lines(-1) as string

lines.Append "tell application " "Finder"
lines.Append " activate"
lines.Append " display dialog " "Now is " " & (current date)"
lines.Append "end tell"

a.Compile Join(lines, EndOfLine.Macintosh)
a.Execute
```

12.2.2 Methods

12.2.3 close

**Function:** The destructor.

**Example:**

```ruby
dim a as new AppleScriptMBS

// later
a.close
```

**Notes:**

There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.

(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

12.2.4 Compile(text as string)

**Function:** Compiles the given source code.
12.2. CLASS APPLESRIPTMBS

Example:

// the code below workarounds a limitation in AppleScript on processing unicode strings

dim theScript as new AppleScriptMBS
dim scripttext as string
dim chars(-1) as string
dim n as string
dim i,c as Integer

const text="Hello World" // add unicode characters here!

c=len(text)
for i=1 to c
  n=hex(asc(mid(text,i,1)))
  while len(n)<4
    n="0"+n
  wend
  chars.Append n
next

scripttext="display dialog (sdata utxt" +join(chars,"")+"t as Unicode text)"

MsgBox scripttext

// must use unicode to avoid error -1753
scripttext=ConvertEncoding(scripttext,encodings.UTF16)
theScript.UnicodeText=true
theScript.compile ScriptText
theScript.execute

Notes:

LastError is set.
Text should be in MacRoman or UTF16 text encoding for best results.

12.2.5 CountScriptProperties as Integer

Function: Returns the number of properties in the script.
Example:

dim s as String
dim a as AppleScriptMBS
dim i,c,cc as Integer
CHAPTER 12. APPLE SCRIPT

```javascript
dim z,t as String

s=s+"property hello : " "Hallo Leute""""+chr(13)
s=s+"property just : " "Just a test""""+chr(13)
s=s+"display dialog hello"+chr(13)
s=s+"return just"+chr(13)

MsgBox "The script:" +chr(13)+s
a=new AppleScriptMBS

a.Compile s

MsgBox str(a.CountScriptProperties)+" properties"

Notes: Lasterror is set.

12.2.6 Error as AppleScriptErrorMBS

Function: Returns an AppleScriptError object for details error information.

Example:

dim a as AppleScriptMBS
dim e as AppleScriptErrorMBS
a=new AppleScriptMBS

a.Compile "tell application ""Finder"" open file "test" end tell"+chr(13)

// You may check for errors here.

a.Execute

e=a.Error

// in a breakpoint you can see an error message here.

Notes:

Returns nil on any error.
The returned object may be empty.
The error information is changed whenever you compile or execute.
12.2.7 Execute

**Function:** Runs the current script.  
**Example:**

```applescript
dim a as new AppleScriptMBS

a.Compile "beep"

a.Execute
```

**Notes:**

Lasterror is set.  
If you use this method, please make sure your own Application’s HandleAppleEvent method doesn’t block executing by returning true for unknown events.

12.2.8 ExecuteEvent(eventname as string, parameters() as string)

**Function:** Executes an event inside the current script with the given parameters.  
**Example:**

```applescript
dim a as new AppleScriptMBS

dim lines(-1) as string

lines.append "on test(a,b,c)"
lines.append "display dialog a"
lines.append "display dialog b"
lines.append "display dialog c"
lines.append "end test"

a.Compile join(lines,EndOfLine.Macintosh)

a.Execute

dim s(2) as string

s(0)="Hello"
s(1)="World"
s(2)="!"

a.ExecuteEvent("test",s)
```

**Notes:**
The eventname must be the name of the event in pure ASCII or MacRoman encoding (and lowercase!).
The parameters can be unicode. The array is based on 0, so string in parameters(0) is the first parameter.

```
LastError is set.
```

### 12.2.9 Result as string

**Function:** The result of the executed script as a string.

**Example:**

```plaintext
dim a as new AppleScriptMBS

a.Compile "return " "hello"

a.Execute

MsgBox a.Result
```

**Notes:**

Returns "" on any error.

If unicode is enabled, this string is unicode (UTF16).

### 12.2.10 ResultAsStringArray as string()

**Function:** The result of the executed script as a string array.

**Example:**

```plaintext
dim a as new AppleScriptMBS

a.Compile "return { ""Hello"", ""World"" }"

a.Execute

MsgBox join(a.ResultAsStringArray, EndOfLine) // Shows Hello World in two lines

a.Compile "tell application "Mail" return name of every mailbox" + EndOfLine.Macintosh + "end tell"

a.Execute

MsgBox join(a.ResultAsStringArray, EndOfLine) // shows your Mailboxes
```
Notes:
On any error the array is empty.
If unicode is enabled, this strings are unicode (UTF16).

12.2.11 ResultDisplayString as string

Function: The result of the executed script as a string.
Example:

    dim a as new AppleScriptMBS

    a.Compile "return " "hello"
    a.Execute

    MsgBox a.ResultDisplayString

Notes:
This is the same as Result, but a flag is set to tell AppleScript that the string is for display to a human. So
it may not be good for input to the AppleScript compiler.

Returns "" on any error.
If unicode is enabled, this string is unicode (UTF16).

12.2.12 ScriptProperty(index as Integer) as string

Function: The name of the property with the given index.
Example:

    dim s as String
    dim a as AppleScriptMBS
    dim i,c,cc as Integer
    dim z,t as String

    s=s+"property hello : " "Hallo Leute"
    s=s+"property just : " "Just a test"
    s=s+"display dialog hello"
    s=s+"return just"
MsgBox "The script:" +chr(13)+s
a=new AppleScriptMBS

a.Compile s

c=a.CountScriptProperties

cc=c-1
for i=0 to cc
z=a.ScriptProperty(i)
if z<>"" then
if i=0 then
t=z
elseif i=cc then
t=t+" and "+z
else
t=t+, "+z
end if
end if
next

MsgBox str(c)+" properties in the script: "+t

t=a.ScriptProperty(0)
z=a.ScriptPropertyValue(t)
MsgBox "Value of the property named "+t+" is: "+z

a.ScriptPropertyValue(t)="Hello World!"

z=a.ScriptPropertyValue(t)
MsgBox "The new value of the property named "+t+" is: "+z

a.Execute

MsgBox "The result is: "+a.Result

Notes:

Index is from 0 to CountScriptProperties-1.
Lasterror is set.
12.2. CLASS APPLESCEPRTMBS

12.2.13 Source as string

Function: Decompiles the current script and returns the source code.
Example:

```applescript
dim a as new AppleScriptMBS
a.compile "beep"
MsgBox a.Source
```

12.2.14 SourceTextStyle as string

Function: Decompiles the current script and returns the source code text style.
Example:

```applescript
dim a as new AppleScriptMBS
a.compile "beep"
EditField1.SetTextAndStyle a.Source, a.SourceTextStyle
```

Notes: Doesn’t work for unicode text.

12.2.15 Properties

12.2.16 AllowInteraction as Boolean

Function: Whether to allow user interaction.
Notes:
Default is false to disallow.
You can set to true to allow GUI.
(Read and Write property)
12.2.17 CanUnicodeText as Boolean

**Function:** True if AppleScript can handle Unicode text.
**Example:**
```powershell
dim a as new AppleScriptMBS
MsgBox str(a.CanUnicodeText)
```

**Notes:**
This property is set to true if AppleScript 1.3 or newer is installed. (AppleScript 1.3 was introduced around the time of Mac OS 8.6) (Read only property)

12.2.18 Handle as Integer

**Function:** The handle of the used AppleScript component.
**Example:**
```powershell
dim a as new AppleScriptMBS
MsgBox str(a.Handle)
```

**Notes:** (Read and Write property)

12.2.19 Lasterror as Integer

**Function:** The last error code.
**Example:**
```powershell
dim a as new AppleScriptMBS
MsgBox str(a.Lasterror)
```

**Notes:**
Value is 0 for successful and -1 if function is not available. All other values are normal Mac OS error codes.
12.2. CLASS APPLEScriPtmbs

Some common error codes for this class:

- OSASystemError -1750
- OSAInvalidID -1751
- OSABadStorageType -1752
- OSAScriptError -1753
- OSABadSelector -1754
- OSASourceNotAvailable -1756
- OSAOutOfRangeDialect -1757
- OSADataFormatObsolete -1758
- OSADataFormatTooNew -1759
- OSACorruptData -1702
- OSARecordingIsAlreadyOn -1732
- OSAComponentMismatch -1761 Parameters are from 2 different components
- OSAComponentMismatch -1762 Can’t connect to scripting system with that ID
- OSAComponentMismatch -1763 Signaled when a value can’t be coerced to the desired type.
- OSAComponentMismatch -1764 Signaled when an object is not found in a container
- OSAComponentMismatch -1765 Signaled when an object cannot be set in a container.
- OSAComponentMismatch -1766 Signaled by user scripts or applications when no actual error code is to be returned.
- OSAComponentMismatch -1767 Signaled when there is an attempt to divide by zero
- OSAComponentMismatch -1768 Signaled when integer or real value is too large to be represented
- OSAComponentMismatch -1769 Signaled when application can’t be launched or when it is remote and program linking is not enabled
- OSAComponentMismatch -1770 Signaled when an application can’t respond to AppleEvents
- OSAComponentMismatch -1771 Signaled when an application’s terminology resource is not readable
- OSAComponentMismatch -1772 Signaled when the runtime stack overflows
- OSAComponentMismatch -1773 Signaled when a runtime internal data structure overflows
- OSAComponentMismatch -1774 Signaled when an intrinsic limitation is exceeded for the size of a value or data structure.

(Read and Write property)

12.2.20 ResultID as Integer

Function: The internal result ID for the current script.

Example:

```javascript
dim a as new AppleScriptMBS
a.Compile "return ""hello"
```

a.Execute

MsgBox str(a.ResultID)
CHAPTER 12. APPLE SCRIPT

Notes:
May be useful for Toolbox calls.
(Read and Write property)

12.2.21 ScriptID as Integer

Function: The internal script ID for the current script.
Example:

```plaintext
dim a as new AppleScriptMBS

a.compile "beep"

MsgBox str(a.ScriptID)
```

Notes:
May be useful for Toolbox calls.
(Read and Write property)

12.2.22 UnicodeText as Boolean

Function: True if you want to use unicode.
Example:

```plaintext
dim a as AppleScriptMBS

a=new AppleScriptMBS
a.UnicodeText=true

dim s as string="tell application ""iTunes""""+chr(13)+"set rating of (track ""Flintstones"" ) to 40""+chr(13)+"end tell"
a.compile ConvertEncoding(s,Encodings.UTF16)
MsgBox str(a.Lasterror)
a.Execute
MsgBox str(a.Lasterror)
MsgBox a.Result
```
Notes:
If this property is true, all functions try to get strings as 16 bit Unicode strings.
Strings you pass which are in 16 bit Unicode are passed in Unicode to AppleScript.
You may get trouble if the strings you give this class are not in the system encoding (MacRoman?) or 16
bit Unicode. UTF8 will not work!
(Read and Write property)

12.2.23 Binary as string

Function: The binary representation of the current compiled script.
Example:

// create our own compiled AppleScript file

    dim a as AppleScriptMBS
    dim b as BinaryStream
    dim f as FolderItem
    dim r as ResourceFork

    a=new AppleScriptMBS

    // compile a simply applescript:
    a.Compile "beep"

    // Mac OS X format
    f=GetFolderItem("My Apple Script X")

    b=f.CreateBinaryFile("applescript")
    b.Write a.Binary
    b.Close

    // Mac OS 9 format
    f=GetFolderItem("My Apple Script 9")

    r=f.CreateResourceFork("applescript")
    r.Close

Notes:
You can save and load this value to store scripts.
Lasterror is set.
12.2.24 ScriptPropertyValue(name as string) as string

**Function:** The value of a script property.

**Example:**

Sub NewEmailInMail(subject as string, body as string, sender as string, receiver as string)
// make a new email in Apple Mail using AppleScript

dim lines(-1) as string

lines.append ""
lines.append "property MySubject : " "My Subject"
lines.append "property MyBody : " "My Body"
lines.append "property MyReceiver : " "test@test.test"
lines.append "property MySender : " "test@test.test"
lines.append ""
lines.append "tell application " "Mail"
lines.append " activate"
lines.append " set NewMail to make new outgoing message with properties { visible:true, subject:MySubject, content:MyBody } "
lines.append ""
lines.append " tell NewMail"
lines.append " make new to recipient at beginning of to recipients with properties { address:MyReceiver } "
lines.append " end tell"
lines.append ""
lines.append " set the sender of NewMail to MySender"
lines.append " end tell"

dim a as new AppleScriptMBS

a.Compile Join(lines, EndOfLine.Macintosh)

// Change encoding
subject = ConvertEncoding(subject, encodings.MacRoman)
body = ConvertEncoding(body, encodings.MacRoman)
sender = ConvertEncoding(sender, encodings.MacRoman)
receiver = ConvertEncoding(receiver, encodings.MacRoman)

// replace line endings
subject = ReplaceLineEndings(subject, EndOfLine.Macintosh)
body = ReplaceLineEndings(body, EndOfLine.Macintosh)
sender = ReplaceLineEndings(sender, EndOfLine.Macintosh)
12.2. CLASS APPLESKRIPTMBS

receiver = ReplaceLineEndings(receiver, EndOfLine.Macintosh)

// set properties in Script
a.ScriptPropertyValue("MySubject")=subject
a.ScriptPropertyValue("MyBody")=body
a.ScriptPropertyValue("MySender")=sender
a.ScriptPropertyValue("MyReceiver")=receiver

a.Execute
End Sub

Notes:
If name or value are UTF16 encoding, than the plugin passes UTF16. Else it passes the bytes and AppleScript may assume MacRoman encoding.
(Read and Write computed property)

12.2.25 Events

12.2.26 Periodic as Integer

MBS MacClassic Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This event is called periodical on long operations like Compile or Execute. Notes: Return 0 to continue or some other value to report an error.
12.3  class NSAppleEventDescriptorMBS

12.3.1  class NSAppleEventDescriptorMBS

Function: An instance of NSAppleEventDescriptor represents a descriptor—the basic building block for
Apple events.

Notes: This class is a wrapper for the underlying Apple event descriptor data type, AEDesc. Scriptable Cocoa
applications frequently work with instances of NSAppleEventDescriptor, but should rarely need to work
directly with the AEDesc data structure.

A descriptor is a data structure that stores data and an accompanying four-character code. A descriptor
can store a value, or it can store a list of other descriptors (which may also be lists). All the information in
an Apple event is stored in descriptors and lists of descriptors, and every Apple event is itself a descriptor
list that matches certain criteria.

Important: An instance of NSAppleEventDescriptor can represent any kind of descriptor, from a simple
value descriptor, to a descriptor list, to a full-fledged Apple event.

Descriptors can be used to build arbitrarily complex containers, so that one Apple event can represent a
script statement such as tell application "TextEdit" to get word 3 of paragraph 6 of document 3.

In working with Apple event descriptors, it can be useful to understand some of the underlying data types.
You'll find terms such as descriptor, descriptor list, Apple event record, and Apple event defined in Building
an Apple Event in Apple Events Programming Guide. You'll also find information on the four-character
codes used to identify information within a descriptor. Apple event data types are defined in Apple Event
Manager Reference. The values of many four-character codes used by Apple (and in some cases reused by
developers) can be found in AppleScript Terminology and Apple Event Codes.

The most common reason to construct an Apple event with an instance of NSAppleEventDescriptor is to
supply information in a return Apple event. The most common situation where you might need to ex-
tract information from an Apple event (as an instance of NSAppleEventDescriptor) is when an Apple event
handler installed by your application is invoked, as described in "Installing an Apple Event Handler" in
How Cocoa Applications Handle Apple Events. In addition, if you execute an AppleScript script using the
NSAppleScript class, you get an instance of NSAppleEventDescriptor as the return value, from which you
can extract any required information.

When you work with an instance of NSAppleEventDescriptor, you can access the underlying descriptor
directly, if necessary, with the aeDesc method. Other methods, including descriptorWithDescriptorType
make it possible to create and initialize instances of NSAppleEventDescriptor without creating temporary
instances of memoryblock.

Cocoa doesn’t currently provide a mechanism for applications to directly send raw Apple events (though
compiling and executing an AppleScript script with NSAppleScript may result in Apple events being sent). However, Cocoa applications have full access to the Apple Event Manager C APIs for working with Apple events. So, for example, you might use an instance of NSAppleEventDescriptor to assemble an Apple event and call the Apple Event Manager function AESend to send it.

If you need to send Apple events, or if you need more information on some of the Apple event concepts described here, see Apple Events Programming Guide and Apple Event Manager Reference.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

### 12.3.2 Methods

**12.3.3 appleEventWithEventClass(eventClass as string, eventID as string, targetDescriptor as NSAppleEventDescriptorMBS, returnID as Int16, transactionID as UInt32) as NSAppleEventDescriptorMBS**

**Function:** Creates a descriptor that represents an Apple event, initialized according to the specified information.

**Notes:**

- `eventClass`: The event class to be set in the returned descriptor.
- `eventID`: The event ID to be set in the returned descriptor.
- `targetDescriptor`: A pointer to a descriptor that identifies the target application for the Apple event. Passing nil results in an Apple event descriptor that has no keyAddressAttr attribute (it is valid for an Apple event to have no target address attribute).
- `returnID`: The return ID to be set in the returned descriptor. If you pass a value of kAutoGenerateReturnID, the Apple Event Manager assigns the created Apple event a return ID that is unique to the current session. If you pass any other value, the Apple Event Manager assigns that value for the ID.
- `transactionID`: The transaction ID to be set in the returned descriptor. A transaction is a sequence of Apple events that are sent back and forth between client and server applications, beginning with the client’s initial request for a service. All Apple events that are part of a transaction must have the same transaction ID. You can specify kAnyTransactionID if the Apple event is not one of a series of interdependent Apple events.

Returns a descriptor for an Apple event, initialized according to the specified parameter values, or nil if an error occurs.

Constants such as kAutoGenerateReturnID and kAnyTransactionID are defined in AE.framework, a subframework of ApplicationServices.framework.
12.3.4 attributeDescriptorForKeyword(keyword as string) as NSAppleEventDescriptorMBS

Function: Returns a descriptor for the receiver’s Apple event attribute identified by the specified keyword.
Notes:
keyword: A keyword (a four-character code) that identifies the descriptor to obtain.

Returns the attribute descriptor for the specified keyword, or nil if an error occurs.

12.3.5 coerceToDescriptorType(descriptorType as string) as NSAppleEventDescriptorMBS

Function: Returns a descriptor obtained by coercing the receiver to the specified type.
Notes:
descriptorType: The descriptor type to coerce the receiver to.

Returns a descriptor of the specified type, or nil if an error occurs.

12.3.6 Constructor

12.3.7 copy as NSAppleEventDescriptorMBS

12.3.8 currentProcessDescriptor as NSAppleEventDescriptorMBS

Example:
12.3. CLASS NSAPPLEEVENTDESCRIPTORMBS

```ruby
dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.currentProcessDescriptor
MsgBox "Process ID: "+str(d.processIDValue)
```

Notes: The result is suitable for use as the ”targetDescriptor” parameter of appleEventWithEventClass.

12.3.9  descriptorAtIndex(index as Integer) as NSAppleEventDescriptorMBS

Function: Returns the descriptor at the specified (one-based) position in the receiving descriptor list.
Example:
```ruby
dim n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.listDescriptor
dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString("Hello")
dim e as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString("World")
n.insertDescriptor(d,1)
n.insertDescriptor(e,2)
MsgBox str(n.numberOfItems)
dim x1 as NSAppleEventDescriptorMBS = n.descriptorAtIndex(1)
dim x2 as NSAppleEventDescriptorMBS = n.descriptorAtIndex(2)
MsgBox x1.stringValue+" "+x2.stringValue
```

Notes:
Index: The one-based descriptor list position of the descriptor to return.

Returns the descriptor from the specified position (one-based) in the descriptor list, or nil if the specified descriptor cannot be obtained.

12.3.10  descriptorForKeyword(keyword as string) as NSAppleEventDescriptorMBS

Function: Returns the receiver’s descriptor for the specified keyword.
Example:
```ruby
dim n as new NSAppleScriptMBS("return system info")
dim r as NSAppleEventDescriptorMBS = n.execute
```
dim lines(-1) as string

dim u as Integer = r.numberOfItems
for i as Integer = 1 to u
  dim keyword as string = r.keywordForDescriptorAtIndex(i)
  dim value as string
  dim p as NSAppleEventDescriptorMBS = r.descriptorForKeyword(keyword)
  if p<>Nil then value = p.stringValue
  lines.Append keyword+": "+value
next

MsgBox Join(lines,EndOfLine)

Notes:

keyword: A keyword (a four-character code) that identifies the descriptor to obtain.

Returns a descriptor for the specified keyword, or nil if an error occurs.

12.3.11  descriptorWithAlias(item as folderitem) as NSAppleEventDescriptorMBS

Function: Creates a descriptor initialized with type typeAlias that stores the specified folderitem reference.
Example:

  // pick a folderitem
dim folder as FolderItem = SpecialFolder.Desktop

  // create value with file reference
  dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithAlias(folder)

  // convert back to FolderItem
  dim file as FolderItem = d.FSRefValue

  // show path
  MsgBox file.AbsolutePath

Notes: This type can be converted internally to FSRef descriptor.
12.3.12  

`descriptorWithApplicationURL(fileURL as string) as NSAppleEventDescriptorMBS`

**Function:** Create and return an application address descriptor using the file URL for an application.

**Example:**

```vba
dim f as FolderItem = SpecialFolder.Applications.Child("Stickies.app")
dim u as string = f.URLPath
dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithApplicationURL(u)
MsgBox d.applicationURLValue
```

**Notes:** The result is suitable for use as the "targetDescriptor" parameter of `appleEventWithEventClass`. See also:

- 12.3.13 `descriptorWithApplicationURL(item as folderitem) as NSAppleEventDescriptorMBS` 2665

12.3.13  

`descriptorWithApplicationURL(item as folderitem) as NSAppleEventDescriptorMBS`

**Function:** Create and return an application address descriptor using the folderitem for an application.

**Example:**

```vba
dim f as FolderItem = SpecialFolder.Applications.Child("Stickies.app")
dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithApplicationURL(f)
MsgBox d.applicationURLValue
```

**Notes:** The result is suitable for use as the "targetDescriptor" parameter of `appleEventWithEventClass`. See also:

- 12.3.12 `descriptorWithApplicationURL(fileURL as string) as NSAppleEventDescriptorMBS` 2665

12.3.14  

`descriptorWithBoolean(value as Boolean) as NSAppleEventDescriptorMBS`

**Function:** Creates a descriptor initialized with type `typeBoolean` that stores the specified Boolean value.

**Example:**

```vba
dim a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithBoolean(true)
MsgBox a.stringValue // shows true
```
Notes: Returns a descriptor with the specified Boolean value, or nil if an error occurs.

12.3.15 descriptorWithBundleIdentifier(BundleID as String) as NSAppleEventDescriptorMBS

Function: Create and return an application address descriptor using the bundle identifier.
Example:

```vba
dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithBundleIdentifier("com.apple.iCal")
MsgBox d.bundleIDValue
```

Notes: The result is suitable for use as the "targetDescriptor" parameter of appleEventWithEventClass.

12.3.16 descriptorWithCurrentProcessSerialNumber as NSAppleEventDescriptorMBS

Function: Creates descriptor with current process serial number.
Example:

```vba
dim n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithCurrentProcessSerialNumber
MsgBox n.stringValue // shows app name
```

12.3.17 descriptorWithDate(value as date) as NSAppleEventDescriptorMBS

Function: Creates a descriptor with a date value.
Example:

```vba
dim d as new date
dim n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithDate(d)
dim x as date = n.dateValue
MsgBox x.LongDate" "+x.LongTime // shows today
```
12.3.18  descriptorWithDescriptorType(descriptorType as string, data as memoryblock) as NSAppleEventDescriptorMBS

**Function:** Creates a descriptor initialized with the specified event type that stores the specified data.
**Notes:**

descriptorType: The descriptor type to be set in the returned descriptor.
data: The data, as a memoryblock, to be set in the returned descriptor.

Returns a descriptor with the specified type and data, or nil if an error occurs.

You can use this method to create a descriptor that you can build into a complete Apple event by calling methods such as setAttributeDescriptor, setDescriptor, and setParamDescriptor.

See also:

- 12.3.19 descriptorWithDescriptorType(descriptorType as string, data as memoryblock, offset as UInt32, length as UInt32) as NSAppleEventDescriptorMBS

12.3.19  descriptorWithDescriptorType(descriptorType as string, data as memoryblock, offset as UInt32, length as UInt32) as NSAppleEventDescriptorMBS

**Function:** Creates a descriptor initialized with the specified event type that stores the specified data (from a series of bytes).
**Notes:**
descriptorType: The descriptor type to be set in the returned descriptor.
bytes: The data, as a sequence of bytes, to be set in the returned descriptor.
offset: offset in memoryblock.
length: The length, in bytes, of the data to be set in the returned descriptor.

Returns a descriptor with the specified type and data, or nil if an error occurs.
See also:

- 12.3.18 descriptorWithDescriptorType(descriptorType as string, data as memoryblock) as NSAppleEventDescriptorMBS
12.3.20 descriptorWithDouble(value as Double) as NSAppleEventDescriptorMBS

**Function:** Creates a descriptor with a double value.
**Example:**
```
dim a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithDouble(5)
MsgBox a.stringValue // shows 5
```

12.3.21 descriptorWithEnumCode(enumerator as string) as NSAppleEventDescriptorMBS

**Function:** Creates a descriptor initialized with type typeEnumerated that stores the specified enumerator data type value.
**Notes:**
- **enumerator:** A type code that identifies the type of enumerated data to be stored in the returned descriptor.
Returns a descriptor with the specified enumerator data type value, or nil if an error occurs.

12.3.22 descriptorWithURL(fileURL as string) as NSAppleEventDescriptorMBS

**Function:** Creates a descriptor for a file URL.
**Example:**
```
Dim f as FolderItem = SpecialFolder.Applications.Child("Stickies.app")
Dim u as string = f.URLPath
Dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithURL(u)
MsgBox d.fileURLValue
```

See also:
- 12.3.23 descriptorWithURL(item as folderitem) as NSAppleEventDescriptorMBS
12.3. CLASS NSAPPLEEVENTDESCRIPTORMBS

12.3.23 descriptorWithURL(item as folderitem) as NSAppleEventDescriptorMBS

Function: Creates a descriptor for a file URL based on the folderitem.
Example:

dim f as FolderItem = SpecialFolder.Applications.Child("Stickies.app")
dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithURL(f)
MsgBox d.fileURLValue

See also:
- 12.3.22 descriptorWithURL(fileURL as string) as NSAppleEventDescriptorMBS

12.3.24 descriptorWithFSRef(item as folderitem) as NSAppleEventDescriptorMBS

Function: Creates a descriptor initialized with type typeFSRef that stores the specified folderitem reference.
Example:

// pick a folderitem
dim folder as FolderItem = SpecialFolder.Desktop

// create value with file reference
dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithFSRef(folder)

// show path
MsgBox d.stringValue

// convert back to FolderItem
dim file as FolderItem = d.FSRefValue

// show path
MsgBox file.AbsolutePath

Notes: This type can be converted internally to Alias or String descriptor.

12.3.25 descriptorWithInt16(value as Int16) as NSAppleEventDescriptorMBS

Function: Creates a descriptor initialized with Apple event type typeSInt16 that stores the specified integer
value.

Example:

```vbnet
dim a as NSAppleEventDescriptorMBS

a = NSAppleEventDescriptorMBS.descriptorWithInt16(5)

MsgBox a.stringValue // shows 5
```

### 12.3.26 descriptorWithInt32(value as Int32) as NSAppleEventDescriptorMBS

**Function:** Creates a descriptor initialized with Apple event type typeSInt32 that stores the specified integer value.

**Example:**

```vbnet
dim a as NSAppleEventDescriptorMBS

a = NSAppleEventDescriptorMBS.descriptorWithInt32(5)

MsgBox a.stringValue // shows 5
```

**Notes:** Returns a descriptor containing the specified integer value, or nil if an error occurs.

### 12.3.27 descriptorWithProcessIdentifier(PID as Integer) as NSAppleEventDescriptorMBS

**Function:** Create and return an application address descriptor using the process identifier.

**Example:**

```vbnet
// get my PID
dim p as new ProcessMBS
p.GetCurrentProcess

dim pid as Integer = p.ProcessID

// make process ID descriptor
dim n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithProcessIdentifier(pid)

// show it
MsgBox "ProcessID: "+str(n.processIDValue) + EndOfLine + n.stringValue
```
12.3. CLASS NSAPPLEEVENTDESCRIPTORMBS

Notes: The result is suitable for use as the "targetDescriptor" parameter of appleEventWithEventClass.

12.3.28 descriptorWithSingle(value as single) as NSAppleEventDescriptorMBS

Function: Creates a descriptor with a single value.
Example:

```vba
dim a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithSingle(5)
MsgBox a.stringValue // shows 5
```

12.3.29 descriptorWithString(text as string) as NSAppleEventDescriptorMBS

Function: Creates a descriptor initialized with type typeUnicodeText that stores the text from the specified string.
Example:

```vba
dim a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString(“Hello World”)
MsgBox a.stringValue
```

Notes: Returns a descriptor that contains the text from the specified string, or nil if an error occurs.

12.3.30 descriptorWithTypeCode(typeCode as string) as NSAppleEventDescriptorMBS

Function: Creates a descriptor initialized with type typeType that stores the specified type value.
Notes:

typeCode: The type value to be set in the returned descriptor.

Returns a descriptor with the specified type, or nil if an error occurs.
### 12.3.31 descriptorWithUInt32(value as UInt32) as NSAppleEventDescriptorMBS

**Function:** Creates a descriptor with an unsigned integer value.

**Example:**

```vbnet
dim a as NSAppleEventDescriptorMBS
da = NSAppleEventDescriptorMBS.descriptorWithUInt32(5)
MsgBox a.stringValue // shows 5
```

### 12.3.32 insertDescriptor(descriptor as NSAppleEventDescriptorMBS, index as Integer)

**Function:** Inserts a descriptor at the specified (one-based) position in the receiving descriptor list, replacing the existing descriptor, if any, at that position.

**Notes:**

- descriptor: The descriptor to insert in the receiver. Specifying an index of 0 or count + 1 causes appending to the end of the list.
- Index: The one-based descriptor list position at which to insert the descriptor.

Because it actually replaces the descriptor, if any, at the specified position, this method might better be called replaceDescriptor. The receiver must be a list descriptor. The indices are one-based. Currently provides no indication if an error occurs.

### 12.3.33 keywordForDescriptorAtIndex(index as Integer) as string

**Function:** Returns the keyword for the descriptor at the specified (one-based) position in the receiver.

**Example:**

```vbnet
dim n as new NSAppleScriptMBS("return system info")
dim r as NSAppleEventDescriptorMBS = n.execute

dim lines(-1) as string

dim u as Integer = r.numberOfItems
for i as Integer = 1 to u
    dim keyword as string = r.keywordForDescriptorAtIndex(i)
    dim value as string
    dim p as NSAppleEventDescriptorMBS = r.descriptorForKeyword(keyword)
    if p<>Nil then value = p.stringValue
```

---

2672

CHAPTER 12. APPLE SCRIPT

12.3.31 descriptorWithUInt32(value as UInt32) as NSAppleEventDescriptorMBS

**Function:** Creates a descriptor with an unsigned integer value.

**Example:**

```vbnet
dim a as NSAppleEventDescriptorMBS
da = NSAppleEventDescriptorMBS.descriptorWithUInt32(5)
MsgBox a.stringValue // shows 5
```

12.3.32 insertDescriptor(descriptor as NSAppleEventDescriptorMBS, index as Integer)

**Function:** Inserts a descriptor at the specified (one-based) position in the receiving descriptor list, replacing the existing descriptor, if any, at that position.

**Notes:**

- descriptor: The descriptor to insert in the receiver. Specifying an index of 0 or count + 1 causes appending to the end of the list.
- Index: The one-based descriptor list position at which to insert the descriptor.

Because it actually replaces the descriptor, if any, at the specified position, this method might better be called replaceDescriptor. The receiver must be a list descriptor. The indices are one-based. Currently provides no indication if an error occurs.

12.3.33 keywordForDescriptorAtIndex(index as Integer) as string

**Function:** Returns the keyword for the descriptor at the specified (one-based) position in the receiver.

**Example:**

```vbnet
dim n as new NSAppleScriptMBS("return system info")
dim r as NSAppleEventDescriptorMBS = n.execute

dim lines(-1) as string

dim u as Integer = r.numberOfItems
for i as Integer = 1 to u
    dim keyword as string = r.keywordForDescriptorAtIndex(i)
    dim value as string
    dim p as NSAppleEventDescriptorMBS = r.descriptorForKeyword(keyword)
    if p<>Nil then value = p.stringValue
```
lines.Append keyword+"": "+value
next
MsgBox Join(lines,EndOfLine)

Notes:
Index: The one-based descriptor list position of the descriptor to get the keyword for.

Returns the keyword (a four-character code) for the descriptor at the one-based location specified by anIndex, or 0 if an error occurs.

12.3.34  listDescriptor as NSAppleEventDescriptorMBS

Function: Creates and initializes an empty list descriptor.
Notes:
Returns an empty list descriptor, or nil if an error occurs.

A list descriptor is a descriptor whose data consists of one or more descriptors. You can add items to the list by calling insertDescriptor or remove them with removeDescriptorAtIndex.

12.3.35  nullDescriptor as NSAppleEventDescriptorMBS

Function: Creates and initializes a descriptor with no parameter or attribute values set.
Notes:
Returns a descriptor with no parameter or attribute values set, or nil if an error occurs.

You don’t typically call this method, as most NSAppleEventDescriptor instance methods can’t be safely called on the returned empty descriptor.

12.3.36  paramDescriptorForKeyword(keyword as string) as NSAppleEventDescriptorMBS

Function: Returns a descriptor for the receiver’s Apple event parameter identified by the specified keyword.
keyword: A keyword (a four-character code) that identifies the parameter descriptor to obtain.

Returns a descriptor for the specified keyword, or nil if an error occurs.

12.3.37 print

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Writes description for this event descriptor to the console. Notes: You can see result in Console.app.

12.3.38 recordDescriptor as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and initializes a descriptor for an Apple event record whose data has yet to be set. Notes: Returns an Apple event descriptor whose data has yet to be set, or nil if an error occurs.

An Apple event record is a descriptor whose data is a set of descriptors keyed by four-character codes. You can add information to the descriptor with methods such as setAttributeDescriptor, setDescriptor, and set-ParamDescriptor.

12.3.39 removeDescriptorAtIndex(index as Integer)

The receiver must be a list descriptor. The indices are one-based. Currently provides no indication if an error occurs.

12.3.40 removeDescriptorWithKeyword(keyword as string)

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Removes the receiver’s descriptor identified by the specified keyword.
12.3. **CLASS NSAPPLEEVENTDESCRIPTORMBS**

**Notes:**

keyword: A keyword (a four-character code) that identifies the descriptor to remove.

The receiver must be an Apple event or Apple event record. Currently provides no indication if an error occurs.

**12.3.41 removeParamDescriptorWithKeyword(keyword as string)**

**Function:** Removes the receiver’s parameter descriptor identified by the specified keyword.

**Notes:**

keyword: A keyword (a four-character code) that identifies the parameter descriptor to remove. Currently provides no indication if an error occurs.

The receiver must be an Apple event or Apple event record, both of which can contain parameters.

**12.3.42 send(options as Integer, timeoutInSeconds as Double, byref error as NSErrorMBS) as NSAppleEventDescriptorMBS**

**Function:** Sends an Apple event.

**Example:**

```cpp
// pick a file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
// make a descriptor for file
dim fd as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithFSRef(f)
// make a descriptor for target app. here by bundle id
dim bd as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithBundleIdentifier("com.apple.finder")
// make a descriptor for apple event, here OpenDocument event
dim ad as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.appleEventWithEventClass("aevt", ",odoc", bd, fd.kAutoGenerateReturnID, fd.kAnyTransactionID)

// assign parameter
ad.setParamDescriptor(fd, "—-")

// now run
dim e as NSErrorMBS
dim rd as NSAppleEventDescriptorMBS = ad.send(ad.NSAppleEventSendDefaultOptions, 0.1, e)

// error sending?
```
if e <> nil then
    MsgBox e.LocalizedDescription
end if

Break // inspect rd for success or failure of event?

12.3.43  setAttributeDescriptor(descriptor as NSAppleEventDescriptorMBS, keyword as string)

Function: Adds a descriptor to the receiver as an attribute identified by the specified keyword.
Notes:
descriptor: The attribute descriptor to add to the receiver.
keyword: A keyword (a four-character code) that identifies the attribute descriptor to add. If a descriptor
with that keyword already exists in the receiver, it is replaced.

The receiver must be an Apple event. Currently provides no indication if an error occurs.

12.3.44  setDescriptor(descriptor as NSAppleEventDescriptorMBS, keyword as string)

Function: Adds a descriptor, identified by a keyword, to the receiver.
Notes:
descriptor: The descriptor to add to the receiver.
keyword: A keyword (a four-character code) that identifies the descriptor to add. If a descriptor with that
keyword already exists in the receiver, it is replaced.

The receiver must be an Apple event or Apple event record. Currently provides no indication if an error
occurs.

12.3.45  setParamDescriptor(descriptor as NSAppleEventDescriptorMBS, keyword as string)

Function: Adds a descriptor to the receiver as an Apple event parameter identified by the specified keyword.
Notes:
12.3. **CLASS NSAPPLEEVENTDESCRIPTORMBS**

descriptor: The parameter descriptor to add to the receiver.

keyword: A keyword (a four-character code) that identifies the parameter descriptor to add. If a descriptor with that keyword already exists in the receiver, it is replaced.

The receiver must be an Apple event or Apple event record, both of which can contain parameters.

### 12.3.46 Properties

#### 12.3.47 aeDesc as Ptr

**Function:** Returns a pointer to the AEDesc structure that is encapsulated by the receiver, if it has one.

**Notes:**
If the receiver has a valid AEDesc structure, returns a pointer to it; otherwise returns nil.
(Read only property)

#### 12.3.48 applicationURLValue as String

**Function:** The application URL.

**Example:**
```
dim f as FolderItem = SpecialFolder.Applications.Child("Stickies.app")
dim u as string = f.URLPath
dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithApplicationURL(u)
MsgBox d.applicationURLValue
```

**Notes:** (Read only property)

#### 12.3.49 booleanValue as boolean

**Function:** Returns the contents of the receiver as a Boolean value, coercing (to typeBoolean) if necessary.

**Example:**
```
dim lines(-1) as string
lines.Append "set a to 1"
lines.Append "set b to 1"
```
lines.Append "return a = b" // return a boolean result

// compile, run and show value
dim source as string = Join(lines,EndOfLine)
dim n as new NSAppleScriptMBS(source)

dim error as Dictionary
dim d as NSAppleEventDescriptorMBS = n.execute(Error)

MsgBox str(d.booleanValue)

Notes:
Returns the contents of the descriptor, as a Boolean value, or false if an error occurs.
(Read only property)

12.3.50 bundleIDValue as String

Function: Queries the bundle identifier.
Example:
dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithBundleIdentifier("com.apple.iCal")
MsgBox d.bundleIDValue

Notes: (Read only property)

12.3.51 data as Memoryblock

Function: Returns the receiver’s data as a memoryblock.
Notes:
Returns an instance of memoryblock containing the receiver’s data, or nil if an error occurs.
(Read only property)
12.3.52    dateValue as date

Function: Returns the contents of the receiver as a date value.  
Example: 

    dim d as new date 
    dim n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithDate(d) 
    
    dim x as date = n.dateValue 
    MsgBox x.LongDate+” ”+x.LongTime  // shows today 

Notes: (Read only property)

12.3.53    description as string

Function: The descriptor for this event. 
Example: 

    dim n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString(“Hello”) 
    MsgBox n.description 

Notes: 
This is a text representation for debugging.  
(Read only property)

12.3.54    descriptorType as string

Function: Returns the descriptor type of the receiver. 
Notes: (Read only property)

12.3.55    doubleValue as Double

Function: Returns the contents of the receiver as a double. 
Example:
dim a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString("5")
MsgBox str(a.doubleValue) // shows 5

Notes: (Read only property)

12.3.56 enumCodeValue as string

Function: Returns the contents of the receiver as an enumeration type, coercing (to typeEnumerated) if necessary.
Notes: Returns the contents of the descriptor, as an enumeration type, or 0 if an error occurs.
(Read only property)

12.3.57 eventClass as string

Function: Returns the event class for the receiver.
Notes: Returns the event class (a four-character code) for the receiver, or 0 if an error occurs.
The receiver must be an Apple event. An Apple event is identified by its event class and event ID, a pair of four-character codes stored as 32-bit integers. For example, most events in the Standard suite have the four-character code 'core' (defined as the constant kAECoreSuite in AE.framework, a subframework of ApplicationServices.framework). For more information on event classes and event IDs, see Building an Apple Event in Apple Events in Apple Events Programming Guide.
(Read only property)

12.3.58 eventID as string

Function: Returns the event ID for the receiver.
Notes: The event ID (a four-character code) for the receiver, or 0 if an error occurs.
The receiver must be an Apple event. An Apple event is identified by its event class and event ID, a pair of
12.3. CLASS NSAPPLEEVENTDESCRIPTORMBS

four-character codes stored as 32-bit integers. For example, the open Apple event from the Standard suite has the four-character code 'odoc' (defined as the constant kAEOpen in AE.framework, a subframework of ApplicationServices.framework).

(Read only property)

12.3.59 fileURLValue as String

Function: The file URL.
Example:

```vbs
dim f as FolderItem = SpecialFolder.Applications.Child("Stickies.app")
dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithURL(f)
MsgBox d.fileURLValue
```

Notes: (Read only property)

12.3.60 FSRefValue as folderitem

Function: Resolves a folderitem reference.
Example:

```
// pick a folderitem
dim folder as FolderItem = SpecialFolder.Desktop

// create value with file reference
dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithURL(folder)

// show path
MsgBox d.stringValue

// convert back to FolderItem
dim file as FolderItem = d.FSRefValue

// show path
MsgBox file.AbsolutePath
```

Notes:

NSAppleEventDescriptorMBS objects with strings, FSRef or Alias data are converted automatically.
(Read only property)
12.3.61 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the internal reference to the NSAppleEventDescriptor object. **Notes:** (Read and Write property)

12.3.62 int16Value as Int16

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the contents of the receiver as an int16. **Example:**

```plaintext
dim a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString("5")
MsgBox str(a.int16Value) // shows 5
```

**Notes:** (Read only property)

12.3.63 int32Value as Int32

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the contents of the receiver as an integer, coercing (to typeSInt32) if necessary. **Example:**

```plaintext
dim a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString("5")
MsgBox str(a.int32Value) // shows 5
```

**Notes:**

Returns the contents of the descriptor, as an integer value, or 0 if an error occurs. (Read only property)

12.3.64 isRecordDescriptor as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return whether or not a descriptor is a record-like descriptor.
Notes:
Record-like descriptors function as records, but may have a descriptorType other than AERecord, such as ObjectSpecifier.
(Read only property)

12.3.65 numberOfItems as Integer

Function: Returns the number of descriptors in the receiver’s descriptor list.
Example:

```
dim n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.listDescriptor
dim d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString(“Hello”)
dim e as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString(“World”)

n.insertDescriptor(d,1)
n.insertDescriptor(e,2)

MsgBox str(n.numberOfItems)
```

Notes:
Returns the number of descriptors in the receiver’s descriptor list (possibly 0); returns 0 if an error occurs.
(Read only property)

12.3.66 processIDValue as Integer

Function: Queries the process ID.
Example:

```
// get my PID
dim p as new ProcessMBS
p.GetCurrentProcess
dim pid as Integer = p.ProcessID

// make process ID descriptor
dim n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithProcessIdentifier(pid)
```

Notes:
Returns the number of descriptors in the receiver’s descriptor list (possibly 0); returns 0 if an error occurs.
(Read only property)
CHAPTER 12. APPLE SCRIPT

// show it
MsgBox "ProcessID: " +str(n.processIDValue) + EndOfLine + n.stringValue

Notes: (Read only property)

12.3.67  returnID as Int16

Function: Returns the receiver’s return ID (the ID for a reply Apple event).
Notes:  
Returns the receiver’s return ID (an integer value), or 0 if an error occurs.  
(Read only property)

12.3.68  singleValue as single

Function: Returns the contents of the receiver as a single value.
Example:  
dim a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString("5")
MsgBox str(a.singleValue) // shows 5

Notes: (Read only property)

12.3.69  stringValue as string

Function: Returns the contents of the receiver as a Unicode text string, coercing (to typeUnicodeText) if necessary. 
Example: 

dim a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString("Hello World")
MsgBox a.stringValue
12.3. CLASS NSAPPLEEVENTDESCRIPTORMBS

Notes:

Returns the contents of the descriptor, as a string, or "" if an error occurs. (Read only property)

12.3.70 transactionID as Int32

**Function:** Returns the receiver’s transaction ID, if any.
**Notes:**

Returns the receiver’s transaction ID (an integer value), or 0 if an error occurs.

The receiver must be an Apple event. Currently provides no indication if an error occurs. For more information on transactions, see the description for appleEventWithEventClass. (Read only property)

12.3.71 typeCodeValue as string

**Function:** Returns the contents of the receiver as a type, coercing (to typeType) if necessary. 
**Notes:** (Read only property)

12.3.72 UInt32Value as UInt32

**Function:** Returns the contents of the receiver as an UInt32. 
**Example:**

dim a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString("5")
MsgBox str(a.UInt32Value) // shows 5

**Notes:** (Read only property)
12.3.73 Constants

12.3.74 \texttt{kAnyTransactionID} = 0

MBS MacCocoa Plugin, Plugin Version: 11.2. \textbf{Function}: Special constant for transaction ID. 
\textbf{Notes}: no transaction is in use

12.3.75 \texttt{kAutoGenerateReturnID} = -1

MBS MacCocoa Plugin, Plugin Version: 11.2. \textbf{Function}: Special constant for return ID. 
\textbf{Notes}: AECreatAppleEvent will generate a session-unique ID internally.

12.3.76 \texttt{NSAppleEventSendAlwaysInteract} = \& h30

MBS MacCocoa Plugin, Plugin Version: 16.2. \textbf{Function}: One of the send options. 
\textbf{Notes}: Server should always interact with user where appropriate.

12.3.77 \texttt{NSAppleEventSendCanInteract} = \& h20

MBS MacCocoa Plugin, Plugin Version: 16.2. \textbf{Function}: One of the send options. 
\textbf{Notes}: Server may try to interact with user.

12.3.78 \texttt{NSAppleEventSendCanSwitchLayer} = \& h40

MBS MacCocoa Plugin, Plugin Version: 16.2. \textbf{Function}: One of the send options. 
\textbf{Notes}: Interaction may switch layer.

12.3.79 \texttt{NSAppleEventSendDefaultOptions} = \& h23

MBS MacCocoa Plugin, Plugin Version: 16.2. \textbf{Function}: One of the send options. 
\textbf{Notes}: Default options: WaitForReply with CanInteract.
12.3. **CLASS NSAPPLEEVENTDESCRIPTORMBS**

### 12.3.80 NSAppleEventSendDontAnnotate = & h10000

MBS MacCocoa Plugin, Plugin Version: 16.2. **Function:** One of the send options. **Notes:** Don’t automatically add any sandbox or other annotations to the event.

### 12.3.81 NSAppleEventSendDontExecute = & h2000

MBS MacCocoa Plugin, Plugin Version: 16.2. **Function:** One of the send options. **Notes:** Don’t execute this event; used for recording.

### 12.3.82 NSAppleEventSendDontRecord = & H1000

MBS MacCocoa Plugin, Plugin Version: 16.2. **Function:** One of the send options. **Notes:** Don’t record this event.

### 12.3.83 NSAppleEventSendNeverInteract = & h10

MBS MacCocoa Plugin, Plugin Version: 16.2. **Function:** One of the send options. **Notes:** Server should not interact with user.

### 12.3.84 NSAppleEventSendNoReply = 1

MBS MacCocoa Plugin, Plugin Version: 16.2. **Function:** One of the send options. **Notes:** Sender doesn’t want a reply to event.

### 12.3.85 NSAppleEventSendQueueReply = 2

MBS MacCocoa Plugin, Plugin Version: 16.2. **Function:** One of the send options. **Notes:** Sender wants a reply but won’t wait.

### 12.3.86 NSAppleEventSendWaitForReply = 3

MBS MacCocoa Plugin, Plugin Version: 16.2. **Function:** One of the send options. **Notes:** Sender wants a reply and will wait.
12.4 class NSAppleEventHandlerMBS

12.4.1 class NSAppleEventHandlerMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for an apple event handler.

12.4.2 Methods

12.4.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

12.4.4 Destructor

12.4.5 Properties

12.4.6 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Internal object reference. **Notes:** (Read and Write property)

12.4.7 Events

12.4.8 handleAppleEvent(theEvent as NSAppleEventDescriptorMBS, replyEvent as NSAppleEventDescriptorMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when an event needs to be handled.
12.5. CLASS NSAPPLEEVENTMANAGERMBS

12.5 class NSAppleEventManagerMBS

12.5.1 class NSAppleEventManagerMBS

Function: The class for the Apple Event Manager.

Notes:
Provides a mechanism for registering handler routines for specific types of Apple events and dispatching events to those handlers.

Cocoa provides built-in scriptability support that uses scriptability information supplied by an application to automatically convert Apple events into script command objects that perform the desired operation. However, some applications may want to perform more basic Apple event handling, in which an application registers handlers for the Apple events it can process, then calls on the Apple Event Manager to dispatch received Apple events to the appropriate handler. NSAppleEventManager supports these mechanisms by providing methods to register and remove handlers and to dispatch Apple events to the appropriate handler, if one exists. For related information, see How Cocoa Applications Handle Apple Events (on Apple Developer Website).

For information about the Apple Event Manager, see Apple Event Manager Reference and Apple Events Programming Guide (on Apple Developer Website).

12.5.2 Methods

12.5.3 appleEventForSuspensionID(id as NSAppleEventManagerSuspensionIDMBS) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Given a suspensionID returned by an invocation of suspendCurrentAppleEvent, returns the descriptor for the event whose handling was suspended.

12.5.4 Constructor

12.5.5 currentAppleEvent as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the descriptor for currentAppleEvent if an Apple event is being handled on the current thread. **Notes:** An Apple event is being handled on the current thread if a handler that was registered with setEventHandler is being messaged at this instant or setCurrentAppleEventAndReplyEventWithSuspensionID has just been invoked. Returns nil otherwise. The effects of mutating or retaining the returned descriptor are undefined, although it may be copied.

12.5.6 currentReplyAppleEvent as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the corresponding reply event descriptor if an Apple event is being handled on the current thread. **Notes:** An Apple event is being handled on the current thread if currentAppleEvent does not return nil. Returns nil otherwise. This descriptor, including any mutations, will be returned to the sender of the current event when all handling of the event has been completed, if the sender has requested a reply. The effects of retaining the descriptor are undefined; it may be copied, but mutations of the copy are not returned to the sender of the current event.

12.5.7 NSAppleEventManagerWillProcessFirstEventNotification as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification names you can use with NSNotificationObserverMBS. **Notes:** Posted by NSAppleEventManager before it first dispatches an Apple event. Your application can use this notification to avoid registering any Apple event handlers until the first time at which they may be needed. The notification object is the NSAppleEventManager. This notification does not contain a userInfo dictionary.

12.5.8 removeEventHandlerForEventClass(eventClass as string, eventID as string)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If an Apple event handler has been registered for the event specified by eventClass and eventID, removes it.

12.5.9 replyAppleEventForSuspensionID(id as NSAppleEventManagerSuspensionIDMBS) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Given a nonzero suspensionID returned by an invocation of suspendCurrentAppleEvent, returns the
corresponding reply event descriptor.

**Notes:** This descriptor, including any mutations, will be returned to the sender of the suspended event when handling of the event is resumed, if the sender has requested a reply. The effects of retaining the descriptor are undefined; it may be copied, but mutations of the copy are returned to the sender of the suspended event. replyAppleEventForSuspensionID may be invoked in any thread, not just the one in which the corresponding invocation of suspendCurrentAppleEvent occurred.

### 12.5.10 resumeWithSuspensionID(id as NSAppleEventManagerSuspensionIDMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Given a suspensionID returned by an invocation of suspendCurrentAppleEvent, signal that handling of the suspended event may now continue.

**Notes:** This may result in the immediate sending of the reply event to the sender of the suspended event, if the sender has requested a reply. If suspensionID has been used in a previous invocation of setCurrentAppleEventAndReplyEventWithSuspensionID the effects of that invocation are completely undone. Redundant invocations of resumeWithSuspensionID are ignored. Subsequent invocations of other NSAppleEventManager methods using the same suspension ID are invalid. resumeWithSuspensionID may be invoked in any thread, not just the one in which the corresponding invocation of suspendCurrentAppleEvent occurred.

### 12.5.11 setCurrentAppleEventAndReplyEventWithSuspensionID(id as NSAppleEventManagerSuspensionIDMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Given a nonzero suspensionID returned by an invocation of suspendCurrentAppleEvent, sets the values that will be returned by subsequent invocations of currentAppleEvent and currentReplyAppleEvent to be the event whose handling was suspended and its corresponding reply event, respectively.

**Notes:** Redundant invocations of setCurrentAppleEventAndReplyEventWithSuspensionID are ignored.

### 12.5.12 setEventHandler(handler as NSAppleEventHandlerMBS, eventClass as string, eventID as string)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Registers the Apple event handler specified by handler for the event specified by eventClass and eventID.

### 12.5.13 suspendCurrentAppleEvent as NSAppleEventManagerSuspensionIDMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Suspends the handling of the current event and returns an ID that must be used to resume the
handling of the event if an Apple event is being handled on the current thread.

Notes: An Apple event is being handled on the current thread if currentAppleEvent does not return nil. Returns zero otherwise. The suspended event is no longer the current event after this method returns.

12.5.14 Properties

12.5.15 Handle as Integer

Notes: (Read and Write property)
12.6. class NSAppleEventManagerSuspensionIDMBS

12.6.1 class NSAppleEventManagerSuspensionIDMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Identifies an Apple event whose handling has been suspended. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

12.6.2 Methods

12.6.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

12.6.4 Properties

12.6.5 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Internal object reference. **Notes:** (Read and Write property)
12.7 class NSAppleScriptMBS

12.7.1 class NSAppleScriptMBS

Function: The NSAppleScriptMBS class provides the ability to load, compile, and execute scripts.

Example:

dim source as string = "tell Application ""iTunes"" to pause"
dim n as new NSAppleScriptMBS(source)
call n.execute

Notes:

Important: You should access NSAppleScriptMBS only from the main thread.

This class provides applications with the ability to

- load a script from a URL or from a text string
- compile or execute a script or an individual Apple event
- obtain an NSAppleEventDescriptorMBS containing the reply from an executed script or event
- obtain an attributed string for a compiled script, suitable for display in a script editor
- obtain various kinds of information about any errors that may occur

Important: NSAppleScriptMBS provides the execute method so that you can send an Apple event to invoke a handler in a script. (In an AppleScript script, a handler is the equivalent of a function.) However, you cannot use this method to send Apple events to other applications.

When you create an instance of NSAppleScriptMBS object, you can use a URL or a folderitem to specify a script that can be in either text or compiled form, or you can supply the script as a string. Should an error occur when compiling or executing the script, several of the methods return a dictionary containing error information. The keys for obtaining error information, such as NSAppleScriptErrorMessage, are described in the Constants section.

12.7.2 Methods

12.7.3 compile as boolean

Function: Compiles the receiver, if it is not already compiled.
12.7. CLASS NSAPPLESCRIPTMBS

Example:

```plaintext
dim source as string = "tell application ""iTunes"""" + EndOfLine + "pause" + EndOfLine + "end tell"
dim n as new NSAppleScriptMBS(source)

dim error as Dictionary
if n.compile then
    MsgBox "OK"
else
    MsgBox error.Value(n.NSAppleScriptErrorMessage)
end if
```

Notes:

error: Optional, on return, if an error occurs, an error information dictionary.
Return Value
Returns true for success or if the script was already compiled, false otherwise.
See also:

- 12.7.4 compile(byref error as dictionary) as boolean

12.7.4 compile(byref error as dictionary) as boolean

Function: Compiles the receiver, if it is not already compiled.
Example:

```plaintext
dim source as string = "tell application ""iTunes"""" + EndOfLine + "pause" + EndOfLine + "end tell"
dim n as new NSAppleScriptMBS(source)

dim error as Dictionary
if n.compile(error) then
    MsgBox "OK"
else
    MsgBox error.Value(n.NSAppleScriptErrorMessage)
end if
```

Notes:

error: Optional, on return, if an error occurs, an error information dictionary.
Return Value
Returns true for success or if the script was already compiled, false otherwise.
See also:

- 12.7.3 compile as boolean
12.7.5 Constructor(file as folderitem, byref error as Dictionary)

**Function:** Initializes a newly allocated script instance from the source identified by the passed folderitem.
**Example:**

```plaintext
dim file as FolderItem = SpecialFolder.Desktop.Child("test.scpt")
dim error as Dictionary
dim n as new NSAppleScriptMBS(file, error)
if n.handle = 0 then
    dim err as Integer = error.lookup(n.NSAppleScriptErrorNumber,0)
    if err = -43 then
        MsgBox "File not found."
    else
        MsgBox "Some other error. " + str(n)
    end if
else
    MsgBox n.source
end if
```

**Notes:**

file: A folderitem that locates a script, in either text or compiled form.
error: On return, if an error occurs, the error information dictionary.

Handle is zero in case of error.

See also:

- 12.7.6 Constructor(source as string) 2696
- 12.7.7 Constructor(sourceLines() as string) 2697
- 12.7.8 Constructor(URL as string, byref error as Dictionary) 2698

12.7.6 Constructor(source as string)

**Function:** Initializes a newly allocated script instance from the passed source.
**Example:**

```plaintext
dim source as string = "beep"
dim n as new NSAppleScriptMBS(source)
```
12.7. CLASS NSAPPLESCRIPTMBS

Notes: Handle is zero in case of error.
See also:

- 12.7.5 Constructor(file as folderitem, byref error as Dictionary) 2696
- 12.7.7 Constructor(sourceLines() as string) 2697
- 12.7.8 Constructor(URL as string, byref error as Dictionary) 2698

12.7.7 Constructor(sourceLines() as string)

Function: Initializes a newly allocated script instance from the passed source.
Example:

dim lines() as string

lines.Append "property hello : " "Hallo Leute"
lines.Append "property just : " "Just a test"
lines.Append "display dialog hello"
lines.Append "return just"

dim a as new NSAppleScriptMBS(lines)

// compile
call a.Compile

// show names
dim names() as string = a.properties
MsgBox Join(names,EndOfLine)

// query value
MsgBox a.valueDescriptorForProperty("hello").stringValue

// change value
dim o as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString("just a test")
call a.setValueDescriptorForProperty("hello", o)

// and query again
MsgBox a.valueDescriptorForProperty("hello").stringValue

Notes: Handle is zero in case of error.
See also:

- 12.7.5 Constructor(file as folderitem, byref error as Dictionary) 2696
- 12.7.6 Constructor(source as string) 2696
12.7.8 Constructor(URL as string, byref error as Dictionary)

**Function:** Initializes a newly allocated script instance from the source identified by the passed URL.

**Notes:**
- file: A folderitem that locates a script, in either text or compiled form.
- error: On return, if an error occurs, the error information dictionary.

Handle is zero in case of error.

See also:
- 12.7.5 Constructor(file as folderitem, byref error as Dictionary)
- 12.7.6 Constructor(source as string)
- 12.7.7 Constructor(sourceLines() as string)

12.7.9 copy as NSAppleScriptMBS

**Function:** Creates a copy of this object.

**Example:**

```vbs
dim source as string = "tell application ""iTunes"": pause" + EndOfLine + "end tell"
dim n as new NSAppleScriptMBS(source)

dim copy as NSAppleScriptMBS = n.copy
call copy.execute
```

12.7.10 execute as NSAppleEventDescriptorMBS

**Function:** Executes the receiver, compiling it first if it is not already compiled.

**Example:**

```vbs
dim source as string = "tell Application ""iTunes"" to pause"
dim n as new NSAppleScriptMBS(source)
call n.execute
```
12.7. CLASS NSAPPLESCRIPTMBS

Notes:
error: Optional, on return, if an error occurs, an error information dictionary.
Returns the result of executing the event, or nil if an error occurs.
Any changes to property values caused by executing the script do not persist.
See also:

- 12.7.11 execute(byref error as dictionary) as NSAppleEventDescriptorMBS

12.7.11 execute(byref error as dictionary) as NSAppleEventDescriptorMBS

Function: Executes the receiver, compiling it first if it is not already compiled.
Example:

dim source as string = "tello Application ""iTunes"" to play"
dim error as dictionary
dim n as new NSAppleScriptMBS(source)
dim p as NSAppleEventDescriptorMBS = n.execute(error)
if p <>nil then
    MsgBox "OK"
else
    MsgBox error.Lookup(n.NSAppleScriptErrorMessage,"unknown error")
end if

Notes:
error: Optional, on return, if an error occurs, an error information dictionary.
Returns the result of executing the event, or nil if an error occurs.
Any changes to property values caused by executing the script do not persist.
See also:

- 12.7.10 execute as NSAppleEventDescriptorMBS

12.7.12 executeAppleEvent(event as NSAppleEventDescriptorMBS, byref error as dictionary) as NSAppleEventDescriptorMBS

Function: Executes an Apple event in the context of the receiver, as a means of allowing the application
to invoke a handler in the script.
Notes:
event: The Apple event to execute.
error: On return, if an error occurs, an error information dictionary.
Returns the result of executing the event, or nil if an error occurs.

Compiles the receiver before executing it if it is not already compiled.

Important: You cannot use this method to send Apple events to other applications.

12.7.13 `executeSubroutine(Name as String, parameters() as NSAppleEventDescriptorMBS, byref error as dictionary) as NSAppleEventDescriptorMBS`

**Function:** Calls a subroutine in a script.

**Example:**

```vbnet
// our script

Dim CodeLines() as string

CodeLines.Append "on Add(Name1, Name2)"
CodeLines.Append "return Name1 & " " & Name2"
CodeLines.Append "end Add"

// now compile it
Dim a as new NSAppleScriptMBS(CodeLines)
Dim error as dictionary
Dim CompileOkay As Boolean = a.Compile(error)

if CompileOkay then

// script name and parameters
Dim ScriptFuncName As String = "Add"

Dim ScriptParams() As NSAppleEventDescriptorMBS
ScriptParams.Append NSAppleEventDescriptorMBS.descriptorWithString("Hello")
ScriptParams.Append NSAppleEventDescriptorMBS.descriptorWithString("World")

// now run it
Dim p as NSAppleEventDescriptorMBS

p = a.executeSubroutine(ScriptFuncName, ScriptParams, Error)
if error = nil then

// show result
Dim ScriptResult As String = p.stringValue

MsgBox "ScriptResult:" + EndOfLine + EndOfLine + ScriptResult
```
else
MsgBox "Error running script." + _
EndOfLine + EndOfLine + _
error.Lookup(a.NSAppleScriptErrorMessage, "Unknown error") + _
EndOfLine + EndOfLine + _
error.Lookup(a.NSAppleScriptErrorBriefMessage, "Unknown error") + _
EndOfLine + EndOfLine + _
error.Lookup(a.NSAppleScriptErrorNumber, "Unknown error")
end if
else
    // Compile Error
MsgBox "Error loading script." + _
EndOfLine + EndOfLine + _
error.Lookup(a.NSAppleScriptErrorMessage, "Unknown error") + _
EndOfLine + EndOfLine + _
error.Lookup(a.NSAppleScriptErrorBriefMessage, "Unknown error") + _
EndOfLine + EndOfLine + _
error.Lookup(a.NSAppleScriptErrorNumber, "Unknown error")
end if

Notes:
Similar to executeAppleEvent, but creates the apple event for you.

Name: The name of the subroutine to execute.
parameters: The parameters for the subroutine.
error: On return, if an error occurs, an error information dictionary.

Returns the result of executing the event, or nil if an error occurs.
Compiles the receiver before executing it if it is not already compiled.
Important: You cannot use this method to send Apple events to other applications.

12.7.14  NSAppleScriptErrorAppName as string

Notes: Value for this key is a string that specifies the name of the application that generated the error.
12.7.15 NSAppleScriptErrorBriefMessage as string

Function: One of the keys in the error dictionary.
Example:

```vbnet
dim source as string = "tell application ""iTunes"""" + EndOfLine + "pause" + EndOfLine + "end if"
dim n as new NSAppleScriptMBS(source)

dim error as Dictionary
if not n.compile(error) then
// shows error about missing tell where it found an if.
MsgBox error.Value(n.NSAppleScriptErrorBriefMessage)
end if
```

Notes: Value for this key is a string that provides a brief description of the error.

12.7.16 NSAppleScriptErrorMessage as string

Function: One of the keys in the error dictionary.
Example:

```vbnet
dim source as string = "tell application ""iTunes"""" + EndOfLine + "pause" + EndOfLine + "end if"
dim n as new NSAppleScriptMBS(source)

dim error as Dictionary
if n.compile(error) then
MsgBox "OK"
else
// shows error about missing tell where it found an if.
MsgBox error.Value(n.NSAppleScriptErrorMessage)
end if
```

Notes: Value for this key is a NSRangeMBS object.

12.7.17 NSAppleScriptErrorNumber as string

Function: One of the keys in the error dictionary.
Example:
12.7. CLASS "NSAPPLESCRIPTMBS"

```
dim source as string = "tell application ""iTunes"""" + EndOfString + "pause" + EndOfString + "end if"
dim n as new NSAppleScriptMBS(source)

   dim error as Dictionary
   if not n.compile(error) then
      // error about missing tell where it found an if.
      MsgBox error.Value(n.NSAppleScriptErrorNumber)  // shows -2741
   end if
```

Notes: Value for this key is a number that specifies the error number.

12.7.18 "NSAppleScriptErrorRange" as string

Function: One of the keys in the error dictionary.
Example:

```
dim source as string = "tell application ""iTunes"""" + EndOfString + "pause" + EndOfString + "end if"
dim n as new NSAppleScriptMBS(source)

   dim error as Dictionary
   if not n.compile(error) then
      // error about missing tell where it found an if.
      dim r as NSRangeMBS = error.Value(n.NSAppleScriptErrorRange)
      MsgBox r.String  // { 36,2 } , the position of the if
   end if
```

Notes: Value for this key is a string that supplies a detailed description of the error condition.

12.7.19 properties as string()

Function: Queries the names of all properties in the script.
Example:

```
dim s as String
   dim a as NSAppleScriptMBS
   dim i,c,cc as Integer
   dim z,t as String

   s=s+"property hello : ""Hallo Leute""""+chr(13)
```
CHAPTER 12. APPLE SCRIPT

s=s+"property just : " "Just a test"

s=s+"display dialog hello"

s=s+"return just"

MsgBox "The script:" +chr(13)
a=new NSAppleScriptMBS(s)

// compile
call a.Compile

// show names
dim names() as string = a.properties
MsgBox Join(names,EndOfLine)

// query value
MsgBox a.valueDescriptorForProperty("hello").stringValue

// change value
dim o as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString("just a test")
call a.setValueDescriptorForProperty("hello", o)

// and query again
MsgBox a.valueDescriptorForProperty("hello").stringValue

12.7.20 setValueDescriptorForProperty(propertyName as string, value as NSAppleEventDescriptorMBS) as boolean

12.7.21 valueDescriptorForProperty(propertyName as string) as NSAppleEventDescriptorMBS

12.7.22 Properties

12.7.23 Handle as Integer

12.7.24 isCompiled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a Boolean value that indicates whether the receiver’s script has been compiled. Example:

```vba
dim source as string = "tell Application ""iTunes"" to play"
dim n as new NSAppleScriptMBS(source)

MsgBox "isCompiled: "+str(n.isCompiled)
call n.compile

MsgBox "isCompiled: "+str(n.isCompiled)
```

Notes: (Read only property)

12.7.25 richTextSource as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the syntax-highlighted source code of the receiver if the receiver has been compiled and its source code is available. Example:

```vba
// init with some source
dim source as string = "tell Application ""iTunes"" to play"
dim n as new NSAppleScriptMBS(source)

// compile
call n.compile

// format text
dim richtext as NSAttributedStringMBS = n.richTextSource

if richtext = nil then
```
CHAPTER 12. APPLE SCRIPT

MsgBox "Failed to format source."
else
  // write to RTF file
  dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
  dim b as BinaryStream = file.CreateBinaryFile("")
  b.Write richtext.RTF
  b.close
  file.Launch
end if

Notes:
Returns nil otherwise. It is possible for an instance of NSAppleScript that has been instantiated with Constructor to be a script for which the source code is not available, but is nonetheless executable. (Read only property)

12.7.26 source as string

Notes:
Returns the script source code of the receiver if it is available, "" otherwise.

It is possible for an NSAppleScript that has been instantiated with Constructor to be a script for which the source code is not available but is nonetheless executable. (Read only property)
12.8. CLASS OSALANGUAGEINSTANCEMBS

12.8 class OSALanguageInstanceMBS

12.8.1 class OSALanguageInstanceMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for a language instance.

12.8.2 Methods

12.8.3 Constructor(language as OSALanguageMBS)

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new language instance with given language.

12.8.4 languageInstanceWithLanguage(language as OSALanguageMBS) as OSALanguageInstanceMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new language instance with given language.

12.8.5 richTextFromDescriptor(descriptor as NSAppleEventDescriptorMBS) as NSAttributedStringMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get source text for a descriptor using the language instance for context.

12.8.6 Properties

12.8.7 componentInstance as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The component instance handle. **Notes:** If this is the shared instance for the language, this is the same as the language’s component instance. (Read only property)
12.8.8  defaultTarget as NSAppleEventDescriptorMBS

Function: The default target application for Apple event sending. 
Notes: 
It also establishes the default target from which terminologies come. It is effectively like having an Apple- 
Script "tell" statement around the entire program. When nil, the default target is the current application. 
(Read and Write property)

12.8.9  Handle as Integer

Function: The internal object handle. 
Notes: (Read and Write property)

12.8.10  language as OSALanguageMBS

Function: The language for this instance. 
Notes: (Read only property)
12.9. class OSALanguageMBS

12.9.1 class OSALanguageMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for a language.

12.9.2 Methods

12.9.3 availableLanguages as OSALanguageMBS()

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries available languages.
**Notes:** For 32-bit apps this is just AppleScript, but 64-bit apps see more entries.

12.9.4 Constructor(ComponentHandle as Integer)

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new object with given component handle.

12.9.5 defaultLanguage as OSALanguageMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default language.
**Example:**

```vbnet
dim l as OSALanguageMBS = OSALanguageMBS.defaultLanguage
MsgBox l.Name+EndOfLine+l.Manufacturer+EndOfLine+l.Info
```

12.9.6 languageForName(name as String) as OSALanguageMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Finds language for given name.
**Example:**

```vbnet
dim l as OSALanguageMBS = OSALanguageMBS.languageForName("AppleScript")
MsgBox l.Name
```
12.9.7 **languageForScriptDataDescriptor(Descriptor as NSAppleEventDescriptorMBS) as OSALanguageMBS**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries language for an Apple Event descriptor.

12.9.8 **setDefaultLanguage(Language as OSALanguageMBS)**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** sets the default language.

12.9.9 **Properties**

12.9.10 **componentInstance as Integer**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries component instance handle.  
**Notes:** (Read only property)

12.9.11 **Features as Integer**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The language features.  
**Notes:** (Read only property)

12.9.12 **Handle as Integer**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

12.9.13 **Info as String**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries info string.  
**Example:**
12.9. CLASS OSALANGUAGEMBS

```vbscript
dim l as OSALanguageMBS = OSALanguageMBS.defaultLanguage
MsgBox l.Name + vbCrLf + l.Manufacturer + vbCrLf + l.Info
```

Notes: (Read only property)

12.9.14 isThreadSafe as Boolean

Function: Whether this language is thread safe.
Example:
```vbscript
dim l as OSALanguageMBS = OSALanguageMBS.defaultLanguage
MsgBox str(l.isThreadSafe)
```

Notes: (Read only property)

12.9.15 Manufacturer as String

Function: The manufacturer of the language.
Example:
```vbscript
dim l as OSALanguageMBS = OSALanguageMBS.defaultLanguage
MsgBox l.Name + vbCrLf + l.Manufacturer + vbCrLf + l.Info
```

Notes: (Read only property)

12.9.16 Name as String

Function: The name of the language.
Example:
```vbscript
dim l as OSALanguageMBS = OSALanguageMBS.defaultLanguage
MsgBox l.Name + vbCrLf + l.Manufacturer + vbCrLf + l.Info
```
12.9.17 sharedLanguageInstance as OSALanguageInstanceMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The shared language instance if available.  
**Notes:** (Read only property)

12.9.18 SubType as String

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The subtype.  
**Example:**
```plaintext
dim l as OSALanguageMBS = OSALanguageMBS.defaultLanguage  
MsgBox l.type+EndOfLine+l.SubType
```

**Notes:** (Read only property)

12.9.19 Type as String

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type code.  
**Example:**
```plaintext
dim l as OSALanguageMBS = OSALanguageMBS.defaultLanguage  
MsgBox l.type+EndOfLine+l.SubType
```

**Notes:** (Read only property)

12.9.20 version as String

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The version of this language.  
**Example:**
```plaintext
dim l as OSALanguageMBS = OSALanguageMBS.languageForName("AppleScript")  
MsgBox l.version
```
12.9. Constants

12.9.21 Constants

12.9.22 OSASupportsAECoercion = 8

MBS MacExtras Plugin, Plugin Version: 15.3. **Function:** One of the feature constants. **Notes:** Supports Apple Event coercion

12.9.23 OSASupportsAESending = 16

MBS MacExtras Plugin, Plugin Version: 15.3. **Function:** One of the feature constants. **Notes:** Supports Apple Event sending

12.9.24 OSASupportsCompiling = 2

MBS MacExtras Plugin, Plugin Version: 15.3. **Function:** One of the feature constants. **Notes:** Supports Compiling

12.9.25 OSASupportsConvenience = 64

MBS MacExtras Plugin, Plugin Version: 15.3. **Function:** One of the feature constants. **Notes:** Supports Convenience

12.9.26 OSASupportsDialects = 128

MBS MacExtras Plugin, Plugin Version: 15.3. **Function:** One of the feature constants. **Notes:** Supports Dialects

12.9.27 OSASupportsEventHandling = 256

MBS MacExtras Plugin, Plugin Version: 15.3. **Function:** One of the feature constants. **Notes:** Supports Event handling
12.9.28  OSASupportsGetSource = 4

MBS MacExtras Plugin, Plugin Version: 15.3. **Function:** One of the feature constants. **Notes:** Supports getting source

12.9.29  OSASupportsRecording = 32

MBS MacExtras Plugin, Plugin Version: 15.3. **Function:** One of the feature constants. **Notes:** Supports Recording
12.10 class OSAScriptControllerMBS

12.10.1 class OSAScriptControllerMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The script controller.

12.10.2 Methods

12.10.3 compileScript

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compiles the script.

12.10.4 Constructor

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

12.10.5 recordScript

12.10.6 runScript

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Runs current script.

12.10.7 stopScript

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops the current script.
12.10.8 Properties

12.10.9 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

12.10.10 isCompiling as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the view is currently compiling a script. **Notes:** (Read only property)

12.10.11 language as OSALanguageMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The language to use. **Notes:** (Read and Write property)

12.10.12 resultView as NSTextViewMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The view to show result of script run. **Notes:** (Read and Write property)

12.10.13 script as OSAScriptMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current script. **Notes:** (Read and Write property)

12.10.14 scriptState as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current script state. **Notes:**
12.10. CLASS OSASCRIPTCO... 2717

Can be OSAScriptStopped, OSAScriptRunning or OSAScriptRecording. (Read only property)

12.10.15  scriptView as OSAScriptViewMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The script view for this controller. Notes: (Read and Write property)

12.10.16  Constants

12.10.17  OSAScriptRecording = 2

MBS MacExtras Plugin, Plugin Version: 15.3. Function: The script state. Notes: Script is recording.

12.10.18  OSAScriptRunning = 1

MBS MacExtras Plugin, Plugin Version: 15.3. Function: The script state. Notes: Script is running.

12.10.19  OSAScriptStopped = 0

MBS MacExtras Plugin, Plugin Version: 15.3. Function: The script state. Notes: Script is stopped.
12.11 control OSAScriptControlMBS

12.11.1 control OSAScriptControlMBS

Function: The Xojo control for a OSAScriptView.
Notes:
This control embeds a special OSAScriptView subclass.
Designed for Xojo 2013r1 and newer. May work on Real Studio 2012, but not perfectly.
Please use view property to access the underlying object and set properties.

12.11.2 Properties

12.11.3 AcceptTabs as Boolean

Function: Whether the control should accept tab keys.
Notes:
If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch
to next control.
(Read and Write property)

12.11.4 ScrollView as Variant

Notes: (Read only property)

12.11.5 View as OSAScriptViewMBS

Function: The view used in the control.
Notes:
Use this object to set more options on the control.
(Read only property)
12.11.6 Events

12.11.7 BoundsChanged

MBS MacExtras Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the bounds, but not the frame, changed.

12.11.8 EnableMenuItems

MBS MacExtras Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event where you can enable menu items.

12.11.9 FrameChanged

MBS MacExtras Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the frame changed.

12.11.10 GotFocus

MBS MacExtras Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control itself got focus. **Notes:** This only fires if the control itself got focus and not a sub control.

12.11.11 LostFocus

MBS MacExtras Plugin, Plugin Version: 16.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The control lost focus. **Notes:** This only fires if the control itself lost focus and not a sub control.

12.11.12 MenuAction(HitItem as MenuItem) As Boolean

MBS MacExtras Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when a menuitem is choosen. **Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.
CHAPTER 12. APPLE SCRIPT

12.11.13 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

Function: The mouse button was pressed inside the controls region at the location passed in to x, y.

Notes:
The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

12.11.14 MouseDrag(x as Integer, y as Integer)

Function: This event fires continuously after the mouse button was pressed inside the Control.

Notes:
Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

12.11.15 MouseUp(x as Integer, y as Integer)

Function: The mouse button was released.

Notes: Use the x and y parameters to determine if the mouse button was released within the control’s boundaries.

12.11.16 ScaleFactorChanged(NewFactor as Double)

Function: The backing store scale factor has changed.

Notes: Please invalidate any cached bitmaps or other relevant state.
12.11.17  shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean

**Function:** Sent when a text view needs to determine if text in a specified range should be changed.  
**Notes:**  
affectedCharRange: The range of characters to be replaced.  
replacementString: The characters that will replace the characters in affectedCharRange; nil if only text attributes are being changed.  

Return true to allow the replacement, or false to reject the change.

12.11.18  textDidBeginEditing

**Function:** Informs you that the text object has begun editing (that the user has begun changing it).

12.11.19  textDidChange

**Function:** Informs you that the text object has changed its characters or formatting attributes.

12.11.20  textDidEndEditing

**Function:** Informs you that the text object has finished editing (that it has resigned first responder status).

12.11.21  textShouldBeginEditing as boolean

**Function:** Invoked when a text object begins to change its text, this method requests permission to begin editing.  
**Notes:** If the delegate returns false, the text object proceeds to make changes. If the delegate returns true, the text object abandons the editing operation. This method is also invoked when the user drags and drops a file onto the text object.
12.11.22 `textShouldEndEditing` as boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked from a text object’s implementation of resignFirstResponder, this method requests permission to end editing. **Notes:** If the delegate returns false, the text object proceeds to finish editing and resign first responder status. If the delegate returns true, the text object selects all of its text and remains the first responder.

12.11.23 `textViewDidChangeSelection`

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the selection changes in the text view.
12.12. CLASS OSAScriptMBS

12.12 class OSAScriptMBS

12.12.1 class OSAScriptMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for Open Scripting Architecture.

12.12.2 Methods

12.12.3 compile(byref error as dictionary) as boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compiles the script.

12.12.4 compiledDataForType(type as string, options as Integer, byref error as dictionary) as MemoryBlock

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compile data for a given type and options.

12.12.5 Constructor(Data as MemoryBlock, byref error as dictionary)

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates new script from compiled data.

- 12.12.15 Constructor(URL as String, language as OSALanguageMBS, byref error as dictionary) 2730
- 12.12.16 Constructor(URL as String, languageInstance as OSALanguageInstanceMBS, storageOptions as Integer, byref error as NSErrorMBS) 2730

12.12.11 Constructor(Source as String)

Function: Creates new script from source code.
Example:

```pascal
Dim s as new OSAScriptMBS("display dialog ""Hello!"")
MsgBox s.source
```

- 12.12.15 Constructor(URL as String, language as OSALanguageMBS, byref error as dictionary) 2730

12.12.17  copy as OSAScriptMBS

Function: Creates a copy of the script.

12.12.18  execute(byref error as dictionary) as NSAppleEventDescriptorMBS

Function: Executes the script.  
Example:

    dim s as new OSAScriptMBS("display dialog ""Hello"")
    dim d as Dictionary
    call s.execute(d)

12.12.19  executeAndReturnDisplayValue(byref displayValue as NSAttributedStringMBS, byref error as dictionary) as NSAppleEventDescriptorMBS

Function: Executes the script and returns the display value of result.

12.12.20  executeAppleEvent(event as NSAppleEventDescriptorMBS, byref error as dictionary) as NSAppleEventDescriptorMBS

Function: Executes an apple event in the script.
**executeHandlerWithName( Name as String, arguments() as String, byref error as dictionary) as NSAppleEventDescriptorMBS**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Executes an event handler in the script.

**OSAScriptErrorAppAddressKey as String**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Error Dictionary key for error app address.

**OSAScriptErrorAppNameKey as String**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the error dictionary. **Notes:** String containing the target application name.

**OSAScriptErrorBriefMessageKey as String**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the error dictionary. **Example:**

```
dim s as new OSAScriptMBS("display dialXXX ""Hello"")
dim d as Dictionary
call s.compile(d)
MsgBox d.Value(OSAScriptMBS.OSAScriptErrorBriefMessageKey)
```

**Notes:** String containing just the failure; may or may not be the same value as NSLocalizedFailureReason-ErrorKey

**OSAScriptErrorExpectedTypeKey as String**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the error dictionary. **Notes:** Should be NSAppleEventDescriptorMBS object in dictionary.
12.12.26 **OSAScriptErrorMessageKey as String**

**Function:** One of the keys for the error dictionary.

**Example:**

```vbscript
dim s as new OSAScriptMBS("display dialXXX ""Hello""")
dim d as Dictionary
call s.compile(d)
MsgBox d.Value(OSAScriptMBS.OSAScriptErrorMessageKey)
```

**Notes:** String containing entire error message; may or may not be the same value as NSLocalizedDescriptionKey.

12.12.27 **OSAScriptErrorNumberKey as String**

**Function:** One of the keys for the error dictionary.

**Example:**

```vbscript
dim s as new OSAScriptMBS("display dialXXX ""Hello""")
dim d as Dictionary
call s.compile(d)
// shows -2740
MsgBox d.Value(OSAScriptMBS.OSAScriptErrorNumberKey)
```

**Notes:** Number containing an OSAError; may or may not be the same value as the NSError code.

12.12.28 **OSAScriptErrorOffendingObjectKey as String**

**Function:** One of the keys for the error dictionary.

**Notes:** Should be NSAppleEventDescriptorMBS object in dictionary.
12.12.29 **OSAScriptErrorPartialResultKey as String**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the error dictionary. **Notes:** Should be NSObjectAppleEventDescriptorMBS object in dictionary.

12.12.30 **OSAScriptErrorRangeKey as String**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the error dictionary. **Example:**

```powershell
dim s as new OSAScriptMBS("display dialXXX ""Hello""")
dim d as Dictionary
call s.compile(d)

// shows { 0, 15 }
MsgBox d.Value(OSAScriptMBS.OSAScriptErrorRangeKey)
```

**Notes:** Value containing an range indicating the range of source characters where the error occurred.

12.12.31 **OSAStorageApplicationBundleType as String**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the storage types. **Notes:** Application Bundle

12.12.32 **OSAStorageApplicationType as String**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the storage types. **Notes:** Application file

12.12.33 **OSAStorageScriptBundleType as String**

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the storage types.
12.12. CLASS OSASCRIPTEMBS

Notes: Script bundle file

12.12.34 OSASTorageScriptType as String

MBS MacExtrax Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the storage types.
Notes: Script file

12.12.35 OSASTorageTextType as String

MBS MacExtrax Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the storage types.
Notes: Text file

12.12.36 richTextFromDescriptor(descriptor as NSAppleEventDescriptorMBS) as NSAttributedStringMBS

MBS MacExtrax Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries rich text for an Appleevent descriptor.

12.12.37 scriptDataDescriptorWithContentsOfFile(file as FolderItem) as NSAppleEventDescriptorMBS

MBS MacExtrax Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads script from file into AppleEventDescriptor.

12.12.38 scriptDataDescriptorWithContentsOfURL(URL as String) as NSAppleEventDescriptorMBS

MBS MacExtrax Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads script from file into AppleEventDescriptor.
12.12.39  writeToFile(File as FolderItem, type as String, byref error as dictionary) as boolean

Function: Writes script to a file.
See also:

- 12.12.40  writeToFile(File as FolderItem, type as String, storageOptions as Integer, byref error as dictionary) as boolean

12.12.40  writeToFile(File as FolderItem, type as String, storageOptions as Integer, byref error as dictionary) as boolean

Function: Writes script to a file.
See also:

- 12.12.39  writeToFile(File as FolderItem, type as String, byref error as dictionary) as boolean

12.12.41  writeToFile(URL as String, type as String, byref error as dictionary) as boolean

Function: Writes script to a file.
See also:

- 12.12.42  writeToFile(URL as String, type as String, storageOptions as Integer, byref error as dictionary) as boolean

12.12.42  writeToFile(URL as String, type as String, storageOptions as Integer, byref error as dictionary) as boolean

Function: Writes script to a file.
See also:

- 12.12.41  writeToFile(URL as String, type as String, byref error as dictionary) as boolean
12.12.43 Properties

12.12.44 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The internal object reference. Notes: (Read and Write property)

12.12.45 isCompiled as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Queries if script is compiled. Notes: (Read only property)

12.12.46 language as OSALanguageMBS

dim s as new OSAScriptMBS("display dialog \\"Hello\\"")
MsgBox s.language.Name

Notes: (Read and Write property)

12.12.47 languageInstance as OSALanguageInstanceMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The language instance of script. Notes: (Read and Write property)

12.12.48 richTextSource as NSAttributedStringMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Queries rich text of script. Notes: (Read only property)
12.12.49  Source as String

**Function:** The source code of script.  
**Example:**

```ruby
dim s as new OSAScriptMBS("display dialog ""Hello"")
MsgBox s.Source
```

**Notes:** (Read only property)

12.12.50  URL as String

**Function:** The URL if script has a solution.  
**Notes:** (Read only property)

12.12.51  Constants

12.12.52  OSACompileIntoContext = 2

MBS MacExtras Plugin, Plugin Version: 15.3.  
**Function:** One of the storage options.  
**Notes:**  
Compile in context.  
May be used when getting compiled data.

12.12.53  OSADontSetScriptLocation = & h01000000

MBS MacExtras Plugin, Plugin Version: 15.3.  
**Function:** One of the storage options.  
**Notes:**  
Set script location.  
May be used when initing with a URL or fromURL.

12.12.54  OSANull = 0

MBS MacExtras Plugin, Plugin Version: 15.3.  
**Function:** One of the storage options.  
**Notes:** No option set.
12.12.55  **OSAPreventGetSource = 1**

MBS MacExtras Plugin, Plugin Version: 15.3. **Function:** One of the storage options.  
**Notes:**
Prevent user from getting source.  
May be used when initing with a compiled script, writing or getting compiled data.

12.12.56  **OSAShowStartupScreen = & h20000000**

MBS MacExtras Plugin, Plugin Version: 15.3. **Function:** One of the storage options.  
**Notes:**
Show startup screen.  
May be used when writing

12.12.57  **OSASstayOpenApplet = & h10000000**

MBS MacExtras Plugin, Plugin Version: 15.3. **Function:** One of the storage options.  
**Notes:**
Applet should stay open.  
May be used when writing
12.13 class OSAScriptViewMBS

12.13.1 class OSAScriptViewMBS

12.13.2 Methods

12.13.3 Constructor

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates a new text field with size 100/100 and position 0/0 Example:

```vba
dim t as new OSAScriptViewMBS
```

Notes: On success the handle property is not zero. See also:

- 12.13.4 Constructor(Handle as Integer)
- 12.13.5 Constructor(left as Double, top as Double, width as Double, height as Double)

12.13.4 Constructor(Handle as Integer)

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates an object based on the given OSAScriptView handle. Example:

```vba
dim t as new OSAScriptViewMBS(0, 0, 100, 100)
dim v as new OSAScriptViewMBS(t.handle)
```

MsgBox str(v.Bounds.Width)+” x ”+str(v.Bounds.Height)

Notes: The handle is casted to a OSAScriptView and the plugin retains this handle. See also:

- 12.13.3 Constructor
- 12.13.5 Constructor(left as Double, top as Double, width as Double, height as Double)
12.13. CLASS OSASCRIPTRVIEWMBS

12.13.5 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new script view with the given size and position. 
**Example:**

```vbnet
dim x as new OSAScriptViewMBS(0, 0, 100, 100)
```

**Notes:** On success the handle property is not zero.

See also:

- 12.13.3 Constructor
- 12.13.4 Constructor(Handle as Integer)

12.13.6 Properties

12.13.7 indentsWrappedLines as Boolean

**Function:** Whether to indent wrapped lines. 
**Notes:** (Read and Write property)

12.13.8 indentWidth as Integer

**Function:** The indentation width. 
**Notes:** (Read and Write property)

12.13.9 source as String

**Function:** The source text of current script. 
**Notes:** (Read and Write property)

12.13.10 tabWidth as Integer

**Function:** The tab width.
12.13.11 usesScriptAssistant as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to use script assistant.
**Notes:** (Read and Write property)

12.13.12 usesTabs as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to use tab character.
**Notes:** (Read and Write property)

12.13.13 wrapsLines as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to wrap lines.
**Notes:** (Read and Write property)
Chapter 13

Apple Type Services for Fonts

13.1  Globals

13.1.1  ATSFontActivateFileMBS(File as FolderItem, OnlyLocal as boolean, Options as Integer, byref FontHandle as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Activates one or more fonts from a file specification.

**Example:**

```plaintext
dim f as FolderItem = SpecialFolder.Desktop.Child("Firecat.ttf")
dim FontHandle as Integer
dim e as Integer = ATSFontActivateFileMBS(f, true, 0, FontHandle)
```

Break // on success e = 0 and FontHandle > 0

**Notes:**

You can use the function ATSFontActivateFileMBS to activate one font or more fonts. Activating a font makes that font available for use either locally (available only to your application) or globally (available to all applications on the system). A font’s availability local or global is referred to as its context.

**file:**
A folderitem that specifies the name and location of a file or directory that contains the font data you want to activate.

**OnlyLocal:**
A value that specifies the context of the activated font. If you want the activated font to be accessible only from your application use the kATSFontContextLocal constant (=true). If you want the activated font to
be accessible to all applications use the constant kATSFontContextGlobal (=false).

options:
An options flag. Pass kATSOptionFlagsDefault (=0) unless the font’s data fork contains resource-fork information, you need to activate a directory of font directories, or you plan to call this function a number of times. If the font’s data fork contains resource-fork information, pass the option kATSOptionFlagsUseDataForkAsResourceFork (=256). If you want to activate a font directory that contains font directories, you must pass the option kATSOptionFlagsProcessSubdirectories (=64). If you plan to call this function a number of times, you can set the iOptions parameter to kATSOptionFlagsDoNotNotify (=128) set. When you are done activating fonts you can call the function ATSFontNotifyMBS with the action parameter set to kATSFontNotifyActionFontsChanged (=1). Then ATS notifies all applications who subscribe to notifications of the changes you made.

FontHandle:
On output, a reference to the font container that is activated from the file specification. You need this reference when you deactivate the font by calling the function ATSFontDeactivateMBS.

Requires Mac OS X 10.0 or newer.
Returns a Mac OS error code (0 for success).

13.1.2 ATSFontActivateStringMBS(FontData as string, OnlyLocal as boolean, Options as Integer, byref FontHandle as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Activates one or more fonts at the specified location in memory.

**Example:**
```pascal
    dim f as FolderItem = SpecialFolder.Desktop.Child("some font file.ttf")
    dim b as BinaryStream = BinaryStream.Open(f)
    dim s as string = b.Read(b.Length)
    dim FontHandle as Integer
    dim e as Integer = ATSFontActivateStringMBS(S, true, 0, FontHandle)
    Break // on success e = 0 and FontHandle >0
```

**Notes:**
FontData:
The binary data of the font you want to activate.

OnlyLocal:
A value that specifies the context of the activated font. If you want the activated font to be accessible only
from your application use the kATSFontContextLocal (=true) constant. If you want the activated font to be accessible to all applications use the constant kATSFontContextGlobal (=False).

options:
An ATSOptionFlags value. This parameter is currently reserved for future use, so you should pass kATSOptionFlagsDefault (=0).

FontHandle:
On output, a pointer to a font container reference that refers to the file that contains the activated font data.

You use this function to activate a streamed font, such as a font contained in a PDF file. Your application must first load the font data into a string and pass it to the ATSFontActivateStringMBS function.

Requires Mac OS X 10.0 or newer.
Returns a Mac OS error code (0 for success).

### 13.1.3 ATSFontCountMBS as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of installed fonts.

**Notes:**
Returns 0 on any error.
Value may change when the user installs or removes fonts while the application is working.

### 13.1.4 ATSFontDeactivateMBS(FontHandle as Integer, Options as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Deactivates one or more fonts.

**Notes:**
FontHandle:
The handle value you got from ATSFontActivateFileMBS or ATSFontActivateStringMBS.

options:
You should pass kATSOptionFlagsDefault (=0) unless to plan to call this function a number of times to deactivate many fonts. If you plan to call this function a number of times, you can set the iOptions parameter to kATSOptionFlagsDoNotNotify (=128) set. When you are done deactivateing fonts you can call the function ATSFontNotifyMBS with the action parameter set to kATSFontNotifyActionFontsChanged (=1). ATS notifies all applications who subscribe to notifications of the changes you made.
When you deactivate a font, you must supply the font handle you obtained when you activated the font. You can’t deactivate a font that you did not activate by calling the functions ATSFontActivateFileMBS or ATSFontActivateStringMBS.

You should use caution if you deactivate a font that is available globally, as its deactivation impacts any application that uses that font.

Requires Mac OS X 10.0 or newer.

13.1.5 ATSFontFamilyFindFromNameMBS(name as String) as ATSFontFamilyMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font family which matches the given name.  

**Example:**

```plaintext
// query postscript names for a font
const nameOfAFont = "Arial"

dim ATSFontName as string
dim ATSFontFamilyName as string
dim ATSFontPostscriptName as string
dim ATSFontPostscriptNameBold as string
dim ATSFontPostscriptNameItalic as string

dim f as ATSFontMBS
dim ATSFontFamily as ATSFontFamilyMBS = ATSFontFamilyFindFromNameMBS(nameOfAFont)
if ATSFontFamily <> nil then
    ATSFontFamilyName = ATSFontFamily.Name
    const normal = 0
    const bold = 1
    const italic = 2
    const underline = 4
    const outline = 8
    const shadow = & h10
    const condense = & h20
    const extend = & h40

    f = ATSFontFamily.Font(normal)
    if f <> nil then
        ATSFontName = f.Name
        ATSFontPostscriptName = f.PostscriptName
    end if
```
f = ATSFontFamily.Font(bold)
if f <> nil then
    ATSFontPostscriptNameBold = f.PostscriptName
end if

f = ATSFontFamily.Font(italic)
if f <> nil then
    ATSFontPostscriptNameItalic = f.PostscriptName
end if

end if

Break // read names in debugger

Notes: Returns nil on any error.

13.1.6 ATSFontFamilyFindFromQuickDrawNameMBS(qdname as string) as ATS-FontFamilyMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Returns the font family which matches the given quickdraw name.
Notes: Returns nil on any error.
The name must be encoded in MacRoman.

13.1.7 ATSFontFindFromContainerMBS(FontContainerHandle as Integer) as ATSFontMBS()

Example:
    // activate a font
dim f as FolderItem = GetFolderItem(“Gadget”)  
dim FontContainerHandle as Integer
    dim e as Integer = ATSFontActivateFileMBS(f, false, 0, FontContainerHandle)
if e = 0 then
    // find fonts
dim fonts() as atsFontMBS = ATSFontFindFromContainerMBS(FontContainerHandle)

dim names() as string

for each font as atsFontMBS in fonts
    names.Append font.PostscriptName + " - " + font.Name
next

// show names
MsgBox Join(names,EndOfLine)
end if

Notes: You activate a font and this function queries all the fonts in the font container.

13.1.8  ATSFontFindFromNameMBS(name as String) as ATSFontMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Returns the font matching the given name.
Notes: Returns nil on any error.

13.1.9  ATSFontFindFromPostScriptNameMBS(name as String) as ATSFontMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Returns the font matching the given name.
Notes: Returns nil on any error.

13.1.10 ATSFontGenerationMBS as Integer

Notes:
If somewhere on the system something changes, this counter is updated.
(You may need to update your font list if this counter changes)

13.1.11 ATSFontNotifyMBS(Action as Integer) as Integer

Notes:
The following is a list of actions you might wish the ATS server to perform and notify clients if appropriate.

kATSFontNotifyActionFontsChanged = 1
Used after a batch (de)activation of fonts occurs. Typically the caller has exercised multiple global (De)Activation calls with the kATSOptionFlagsDoNotNotify set. Once all calls are completed, one may use ATSFontNotify with this action to ask ATS to notify all clients.

kATSFontNotifyActionDirectoriesChanged = 2
The ATS system with the help of the Finder keeps track of changes to any of the font directories in the system domains (System, Local, Network, User, & Classic). However, one may wish to add/remove fonts to these locations programmatically. This action is used to let ATS server to rescan these directories and post notifications if necessary.

Requires Mac OS X 10.2 to work.
Returns -1 if function is not present on the Mac or else a Mac OS error code.
(0 for success)

13.1.12 ATSUFindFontFromNameMBS(name as string, code as Integer, platform as Integer, script as Integer, language as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Find a font by name.
**Example:**
```plaintext
const kFontFullName=4
const kFontNoPlatform=-1
const kFontNoScript=-1
const kFontNoLanguage=-1

msgbox str(ATSUFindFontFromNameMBS("Times Roman",kFontFullName,kFontNoPlatform, kFontNoScript, kFontNoLanguage))
```

**Notes:**
Returns the font ID for the given font or 0 on any error.

Some more constants:
13.1.13 ATSUFindFontNameMBS(FontID as Integer, code as Integer, platform as Integer, script as Integer, language as Integer) as string

MBS MacCF Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Obtains a name string for the first font in a name table that matches the specified ATSUI font ID, name code, platform, script, and/or language.

**Example:**

```plaintext
const kFontUnicodePlatform=0
const kFontMacintoshPlatform=1

const kFontRomanScript=0

const kFontEnglishLanguage=0

const kFontFamilyName=1
const kFontUniqueName=3
const kFontFullName=4
const kFontPostscriptName=6
const kFontNoPlatformCode=-1
const kFontNoScriptCode=-1
const kFontNoLanguageCode=-1

dim a as ATSFontListMBS
dim fontid as Integer

a=new ATSFontListMBS
fontid=a.FontID(0)
```
msgbox ATSUFindFontNameMBS(fontid,kFontPostscriptName,kFontNoPlatformCode,kFontNoScriptCode,kFontNoLanguageCode)

Notes:
To obtain an ATSUI font ID for the first font in a name table that matches the specified name string, name code, platform, script, and/or language, call the function ATSUFindFontFromNameMBS.

To obtain the font name string, name code, platform, script, and language for the font that matches an ATSUI font ID and name table index, use the ATSFontListMBS class.

Returns a Mac OS error code.

Parameters:

FontID:
The font for which to obtain a name string. Note that because Apple Type Services assigns ATSUFontID values systemwide at runtime, font IDs can change across system restarts.

Code:
A constant specifying the FontNameCode value of the font for which to obtain a name string.

Platform:
A constant specifying the encoding of the font. If you pass the kFontNoPlatformCode constant, ATSUFindFontName produces the first font in the name table matching the other specified parameters.

Script:
A constant specifying the script of the font.
If you pass the kFontNoScriptCode constant, ATSUFindFontName produces the first font in the name table matching the other specified parameters.

Language:
A constant specifying the language of the font you are searching for.

Available on Mac OS 8.5 and newer.

The following are special "don’t care" values to be used in interfaces

Language codes are zero based everywhere but within a ‘cmap’ table
13.1.14  GetATSFontFamilyFromFontFamilyMBS(font as FontFamilyMBS) as ATSFontFamilyMBS

MBS MacCF Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:**
Obtains the ATS font family reference associated with a font family object.
**Notes:**
Returns nil on any error.
Deprecated: Please move to NSFontMBS class.

13.1.15  GetATSFontFromFontMBS(font as FontMBS) as ATSFontMBS

MBS MacCF Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:**
Obtains the ATS font reference associated with a font object.
**Notes:**
Returns nil on any error.
Deprecated: Please move to NSFontMBS class.

13.1.16  GetFontFamilyFromATSFontFamilyMBS(font as ATSFontFamilyMBS) as FontFamilyMBS

MBS MacCF Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:**
Obtains the font family associated with an ATS font family reference.
**Notes:**
Returns nil on any error.
Deprecated: Please move to NSFontMBS class.

13.1.17  GetFontFromATSFontMBS(font as ATSFontMBS) as FontMBS

MBS MacCF Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:**
Obtains the font object associated with an ATS font reference.
**Notes:**

kFontNoPlatformCode  -1
kFontNoScriptCode    -1
kFontNoLanguageCode -1
13.2  class ATSFontFamilyIteratorMBS

13.2.1  class ATSFontFamilyIteratorMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to work through the list of installed font families. **Deprecated:** This item is deprecated and should no longer be used. You can use CTFontMBS instead.

13.2.2  Methods

13.2.3  NextFontFamily as ATSFontFamilyMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Finds the next font family in the list. **Notes:** Returns nil on any error. Lasterror is set.

13.2.4  Reset

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Resets the class to start again on the first font family if you call NextFontFamily. **Notes:** Lasterror is set.

13.2.5  Properties

13.2.6  Handle as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the used ATSFontFamilyIterator. **Notes:** Maybe useful for toolbox calls. (Read and Write property)
13.2.7 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The last error code returned by a function.

**Notes:**
- 0 for success, -1 for parameter error or out of memory.
- Else a Mac OS error code.
- (Read and Write property)

13.2.8 Release as Boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the destructor will release the handle.

**Notes:** (Read and Write property)

13.3 class ATSFontFamilyMBS

13.3.1 class ATSFontFamilyMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class representing an ATS font family. **Deprecated:** This item is deprecated and should no longer be used. You can use CTFontMBS instead.

13.3.2 Methods

13.3.3 Font(QuickDrawStyle as Integer) as ATSFontMBS

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Tries to find a matching ATSFont within the family for the given style. **Example:**

```vbnet
dim FontName as string = "Times"

dim f as ATSFontMBS
dim ATSFontFamily as ATSFontFamilyMBS = ATSFontFamilyFindFromNameMBS(Fontname)

if ATSFontFamily<>nil then

    const normal = 0
    const bold = 1
    const italic = 2
    const underline = 4
    const outline = 8
    const shadow = & h10
    const condense = & h20
    const extend = & h40

    f=ATSFontFamily.Font(normal)
    if f<>nil then
        MsgBox "Normal: " + f.PostscriptName
    end if

    f=ATSFontFamily.Font(bold)
    if f<>nil then
        MsgBox "Bold: " + f.PostscriptName
    end if

    f=ATSFontFamily.Font(italic)
```
if f<>nil then
MsgBox "Italic: " + f.PostscriptName
end if
end if

Notes: Returns nil on any error.

13.3.4 Properties

13.3.5 Encoding as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The encoding of this font.
Notes:
Some example values for common encodings:

<table>
<thead>
<tr>
<th>Encoding</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MacRoman</td>
<td>0</td>
<td>Also sometimes for ASCII or binary data used.</td>

<td>&amp; h0B01</td>
<td>NextStep encoding</td>
</tr>
<tr>
<td>Unicode</td>
<td>&amp; h0100</td>
<td>16 bit Unicode</td>
</tr>
<tr>
<td>UTF8</td>
<td>&amp; h08000100</td>
<td>8 bit Unicode</td>
</tr>
</tbody>
</table>

(Read only property)

13.3.6 GenerationCount as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The current font family generation counter value for this font family.
Notes:
If somewhere on the system something changes on this font family, this counter is updated.
(You may need to update your font list if this counter changes)
(Read only property)
13.3.7 Handle as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the ATSFontFamilyRef. 
**Notes:**
Maybe useful for toolbox calls. 
(Read and Write property)

13.3.8 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The last error code returned by a function.
**Notes:**
0 for success, -1 for parameter error or out of memory. 
Else a Mac OS error code.
(Read and Write property)

13.3.9 Name as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The name of this font.
**Notes:**
Lasterror is set. 
(Read only property)

13.3.10 QuickDrawName as String

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The postscript name of this font. 
**Notes:**
Lasterror is set. 
(Read only property)

13.3.11 Release as Boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the destructor will release the handle.
13.3. *CLASS ATSFONTFAMILYMBS*  

**Notes:** (Read and Write property)
13.4 class ATSFontGlyphListMBS

13.4.1 class ATSFontGlyphListMBS

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a list of ATS font glyphs. **Deprecated:** This item is deprecated and should no longer be used. You can use CTGlyphInfoMBS instead.

13.4.2 Methods

13.4.3 close

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The destructor. **Notes:** There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you. (e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

13.4.4 Item(index as Integer) as ATSFontGlyphMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the glyph with the given index. **Notes:** Index is from 0 to count-1.

13.4.5 Properties

13.4.6 Count as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The number of glyphs in this list. **Notes:** (Read only property)
13.5. CLASS ATSFontGlyphMBS

13.5. class ATSFontGlyphMBS

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for an ATS font glyph. **Deprecated:** This item is deprecated and should no longer be used. You can use CTGlyphInfoMBS instead.

13.5.2 Properties

13.5.3 CaretX as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The position in device coordinates where a trailing caret for this glyph intersects the baseline. **Notes:** (Read only property)

13.5.4 CharIndex as Integer

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The unicode char index. **Notes:** (Read only property)

13.5.5 DeltaY as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The cross-stream shift value for this glyph. **Notes:** (Read only property)

13.5.6 GlyphID as Integer

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The glyph ID for this character. **Notes:** (Read only property)

13.5.7 IdealAdvanceX as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The amount by which the pen is advanced after drawing the glyph.
13.5.8 IdealAdvanceY as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The amount by which the pen is advanced after drawing the glyph.
**Notes:** (Read only property)

13.5.9 IdealOtherSideBearingX as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The offset from the end of the glyph image to the end of the glyph advance.
**Notes:** (Read only property)

13.5.10 IdealOtherSideBearingY as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The offset from the end of the glyph image to the end of the glyph advance.
**Notes:** (Read only property)

13.5.11 IdealSideBearingX as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The offset from the glyph origin to the beginning of the glyph image.
**Notes:** (Read only property)

13.5.12 IdealSideBearingY as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The offset from the glyph origin to the beginning of the glyph image.
**Notes:** (Read only property)

13.5.13 IdealValues as boolean

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the ideal metrics values are present.
13.5.14 **IdealX as single**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The ideal with-stream offset from the origin of this layout.
**Notes:** (Read only property)

13.5.15 **LayoutFlags as Integer**

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The layout flags.
**Notes:** (Read only property)

13.5.16 **ScreenDeviceAdvanceX as single**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The number of pixels of the advance for the glyph as actually drawn on the screen.
**Notes:** (Read only property)

13.5.17 **ScreenDeviceAdvanceY as single**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The number of pixels of the advance for the glyph as actually drawn on the screen.
**Notes:** (Read only property)

13.5.18 **ScreenHeight as Integer**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The height of this glyph on the screen.
**Notes:** (Read only property)

13.5.19 **ScreenOtherSideBearingX as single**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The trailing-side bearing, in pixels.
CHAPTER 13. APPLE TYPE SERVICES FOR FONTS

Notes: (Read only property)

13.5.20 ScreenOtherSideBearingY as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The trailing-side bearing, in pixels. **Notes:** (Read only property)

13.5.21 ScreenSideBearingX as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The origin-side bearing, in pixels. **Notes:** (Read only property)

13.5.22 ScreenSideBearingY as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The origin-side bearing, in pixels. **Notes:** (Read only property)

13.5.23 ScreenTopLeftX as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The top-left point of the glyph in device coordinates. **Notes:** (Read only property)

13.5.24 ScreenTopLeftY as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The top-left point of the glyph in device coordinates. **Notes:** (Read only property)

13.5.25 ScreenValues as boolean

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the screen values have been filled in this object.
13.5. **CLASS ATSFONTGLYPHMBS**

**Notes:** (Read only property)

### 13.5.26 ScreenWidth as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The width of this glyph on the screen.
**Notes:** (Read only property)

### 13.5.27 ScreenX as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The position of this glyph on the screen.
**Notes:** (Read only property)
13.6 class ATSFontIteratorMBS

13.6.1 class ATSFontIteratorMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to work through the list of installed fonts. **Deprecated:** This item is deprecated and should no longer be used. You can use CTFontMBS instead.

13.6.2 Methods

13.6.3 NextFont as ATSFontMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Finds the next font in the list. **Notes:** Returns nil on any error. Lasterror is set.

13.6.4 Reset

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Resets the class to start again on the first font if you call NextFont. **Notes:** Lasterror is set.

13.6.5 Properties

13.6.6 Handle as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the internal used ATSFontIterator. **Notes:** Maybe useful for toolbox calls. (Read and Write property)

13.6.7 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The last error code returned by a function.
Notes:
0 for success, -1 for parameter error or out of memory.
Else a Mac OS error code.
(Read and Write property)

13.6.8 Release as Boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the destructor will release the handle.
**Notes:** (Read and Write property)
13.7 class ATSFontListMBS

13.7.1 class ATSFontListMBS

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for the list of ATS fonts. **Deprecated:** This item is deprecated and should no longer be used. You can use CTFontMBS instead.

13.7.2 Methods

13.7.3 close

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The destructor. **Notes:** There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you. (e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

13.7.4 FontID(index as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font id of the font with the given index.

13.7.5 FontName(index as Integer, fontnameindex as Integer) as ATSFontNameMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the font name with the given fontnameindex from the font with the given index. **Notes:** Lasterror is set.

13.7.6 FontNameCount(index as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name count for the font with the given index. **Notes:** Returns 0 on any error. Lasterror is set.
13.7.7 Update

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Updates the list of fonts.
**Notes:** Lasterror is set.

13.7.8 Properties

13.7.9 Count as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the count of fonts in the list.
**Notes:**
0 on any error.
(Read only property)

13.7.10 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The last error code reported.
**Notes:** (Read and Write property)
13.8  class ATSFontMBS

13.8.1  class ATSFontMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class representing an ATS font. **Deprecated:** This item is deprecated and should no longer be used. You can use CTFontMBS instead.

13.8.2  Methods

13.8.3  File as folderitem

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The file of this font. **Notes:** Lasterror is set.

13.8.4  FontFamilyResource as string

MBS MacCF Plugin, Plugin Version: 13.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries the resource for this font.

13.8.5  HorizontalMetrics(Optionflags as Integer = 0) as ATSFontMetricsMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Obtains the horizontal metrics for a font. **Notes:** Lasterror is set. Returns nil on any error.

13.8.6  VerticalMetrics(Optionflags as Integer = 0) as ATSFontMetricsMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Obtains the vertical metrics for a font. **Notes:** Lasterror is set. Returns nil on any error.
13.8. CLASS ATSFONTMBS

13.8.7 Properties

13.8.8 GenerationCount as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The current font family generation counter value for this font.

**Notes:**
If somewhere on the system something changes on this font, this counter is updated.
(You may need to update your font list if this counter changes)
(Read only property)

13.8.9 Handle as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the used ATSFontRef.

**Notes:**
Maybe useful for toolbox calls.
(Read and Write property)

13.8.10 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The last error code returned by a function.

**Notes:**
0 for success, -1 for parameter error or out of memory.
Else a Mac OS error code.
(Read and Write property)

13.8.11 Name as string

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The name of this font.

**Notes:**
Lasterror is set.
(Read only property)
13.8.12 PostscriptName as string

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The postscript name of this font.
**Notes:**
Laterror is set.
(Read only property)

13.8.13 Release as Boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the destructor will release the handle.
**Notes:** (Read and Write property)
13.9. CLASS ATSFontMetricsMBS  

13.9  class ATSFontMetricsMBS

13.9.1  class ATSFontMetricsMBS

**Function:**  
Contains metrics for a font.  
**Deprecated:**  
This item is deprecated and should no longer be used. You can use CTFontMBS instead.

13.9.2  Properties

13.9.3  Ascent as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:**  
The maximum height from the baseline to the ascent line of the glyphs in the font. For vertical text, the maximum distance from the center line to the ascent line of the glyphs in the font.  
**Notes:** (Read and Write property)

13.9.4  AvgAdvanceWidth as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:**  
The average advance width of the glyph in the font.  
**Notes:** (Read and Write property)

13.9.5  CapHeight as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:**  
The height of a capital letter in the font from the baseline to the top of the letter.  
**Notes:** (Read and Write property)

13.9.6  Descent as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:**  
The maximum distance from the baseline to the descent line of the glyphs in the font.  
**Notes:**  
For vertical text, the maximum distance from center line to the descent line of the glyphs in the font.  
(Read and Write property)
2776

CHAPTER 13. APPLE TYPE SERVICES FOR FONTS

13.9.7 ItalicAngle as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The angle (in degrees counterclockwise) at which glyphs in the font slant when italicized.
**Notes:** (Read and Write property)

13.9.8 Leading as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The spacing from the descent line to the ascent line below it.
**Notes:**
This defines the spacing between lines of text.
(Read and Write property)

13.9.9 maxAdvanceWidth as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The maximum advance width of the glyphs in the font.
**Notes:** (Read and Write property)

13.9.10 MinLeftSideBearing as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The minimum left-side bearing value of the glyphs in the font.
**Notes:**
For vertical text, the minimum top-side bearing value of the glyphs in the font.
(Read and Write property)

13.9.11 MinRightSideBearing as single

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The minimum right-side bearing value of the glyphs in the font.
**Notes:**
For vertical text, the minimum bottom side bearing of a glyph in the font.
(Read and Write property)
13.9. **CLASS ATSFONTMETRICSMBS**

13.9.12 **StemHeight as single**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The vertical width of the dominant horizontal stems of glyphs in the font.
**Notes:** (Read and Write property)

13.9.13 **StemWidth as single**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The width of the dominant vertical stems of the glyphs in the font.
**Notes:** (Read and Write property)

13.9.14 **UnderlinePosition as single**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The position at which an underline stroke should be placed for the font.
**Notes:** (Read and Write property)

13.9.15 **UnderlineThickness as single**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The thickness, in pixels, of the underscore character used to underline the glyphs in the font.
**Notes:** (Read and Write property)

13.9.16 **XHeight as single**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The height of lowercase characters in the font, specifically the letter x, excluding ascenders and descenders.
**Notes:** (Read and Write property)
13.10 class ATSFontNameMBS

13.10.1 class ATSFontNameMBS

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for the names of a font.
**Deprecated:** This item is deprecated and should no longer be used. You can use CTFontMBS instead.

13.10.2 Methods

13.10.3 FindEncoding(platform as Integer, script as Integer, language as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 7.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the encoding for the given parameters.
**Notes:**
The encoding is an integer which you can use for SetEncodingOfStringMBS.
The Name property of this class has already and encoding set by using this function.

13.10.4 Properties

13.10.5 LanguageCode as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The language code.
**Notes:**
some constants:

(Read and Write property)

13.10.6 Name as String

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The font name.
**Notes:** (Read and Write property)
13.10. **CLASS ATSFONTNAMEMEMBS**

13.10.7 **NameCode as Integer**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The name code of this font name.
**Notes:**

constants:

(Read and Write property)

13.10.8 **PlatformCode as Integer**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The platform code for this font.
**Notes:**

useful constants:

(Read and Write property)

13.10.9 **ScriptCode as Integer**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The script code for this font.
**Notes:** (Read and Write property)
2780

13.11 class ATSFontNotificationMBS

13.11.1 class ATSFontNotificationMBS

MBS MacCF Plugin, Plugin Version: 5.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to listen for font changed notifications. **Deprecated:** This item is deprecated and should no longer be used. You can use CoreTextMBS instead. **Notes:** Requires Mac OS X 10.2 or newer.

13.11.2 Methods

13.11.3 Close

MBS MacCF Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The destructor. **Notes:** There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you. (e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

13.11.4 Create(flags as Integer)

MBS MacCF Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Listens for font notifications. **Notes:** Requires Mac OS X 10.2 or newer. Pass 1 for the flags when you want to get events while your application is in background. Else pass 0.

13.11.5 Properties

13.11.6 Handle as Integer

MBS MacCF Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The handle for the ATSFontNotification. **Notes:** Only useful for declares to the ATS framework. Value is a ATSFontNotificationRef. (Read and Write property)
13.11. Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The last error code reported.
**Notes:** (Read and Write property)

13.11.8 Release as Boolean

MBS MacCF Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the destructor releases the handle.
**Notes:** (Read and Write property)

13.11.9 Events

13.11.10 Changed()

MBS MacCF Plugin, Plugin Version: 5.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called whenever the fonts changed.
13.12 class ATSPPathEventsMBS

13.12.1 class ATSPPathEventsMBS

MBS MacCF Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class to get events for ats path operations.

**Deprecated:** This item is deprecated and should no longer be used. **Notes:** This class is used with GlyphGetCubicPaths and GlyphGetQuadraticPaths function in the ATSUStyleMBS class.

13.12.2 Events

13.12.3 CubicClosePath as Integer

MBS MacCF Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The cubic close-path event.

**Notes:** Return any other value than 0 to stop processing outlines.

13.12.4 CubicCurveTo(x1 as Double, y1 as Double, x2 as Double, y2 as Double, x3 as Double, y3 as Double) as Integer

MBS MacCF Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The cubic curve-to event.

**Notes:**

x1/y1: The x and y coordinates for the relative point that defines the start of the curve (an on-curve point) for this segment of the glyph.

x2/y2: The x and y coordinates for the relative point that defines the off-curve point for this segment of the glyph.

x3/y3: The x and y coordinates for the relative point that defines the end of the curve (an on-curve point) for this segment of the glyph.

Return any other value than 0 to stop processing outlines.

13.12.5 CubicLineTo(x as Double, y as Double) as Integer

MBS MacCF Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The cubic line-to event.
13.12. CLASS ATSPATHEVENTSMBS

Notes:

x/y: the x and y coordinates for the relative point to which the pen should draw a line.

Return any other value than 0 to stop processing outlines.

13.12.6 CubicMoveTo(x as Double, y as Double) as Integer

Notes:

x/y: the x and y coordinates for the relative point to which the pen should move before it begins drawing this segment of the glyph.

Return any other value than 0 to stop processing outlines.

13.12.7 QuadraticClosePath as Integer

Notes: Return any other value than 0 to stop processing outlines.

13.12.8 QuadraticCurve(x1 as Double, y1 as Double, CX as Double, CY as Double, x2 as Double, y2 as Double) as Integer

Notes:

x1/y1: the relative point that defines the start of the curve (an on-curve point) for this segment of the glyph.

x2/y2: the relative point that defines the end of the curve (an on-curve point) for this segment of the glyph.

CX/CY: the relative point that defines the control point (an off-curve point) for this segment of the glyph.

Return any other value than 0 to stop processing outlines.
**CHAPTER 13. APPLE TYPE SERVICES FOR FONTS**

**13.12.9 QuadraticLine(x1 as Double, y1 as Double, x2 as Double, y2 as Double) as Integer**

MBS MacCF Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The quadratic line callback for drawing glyphs.

**Notes:**

x1/y1: the x and y coordinates for the relative point that defines the start of the line for this segment of the glyph.

x2/y2: the x and y coordinates for the relative point that defines the end of the line for this segment of the glyph.

Return any other value than 0 to stop processing outlines.

**13.12.10 QuadraticNewPath as Integer**

MBS MacCF Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The quadratic new-path event.

**Notes:** Return any other value than 0 to stop processing outlines.
13.13. CLASS ATSUSTYLEMBS

13.13.1 class ATSUSTYLEMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for an ATSUI style.

**Deprecated:** This item is deprecated and should no longer be used. You can use CTFontMBS instead.

13.13.2 Methods

13.13.3 clear

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Clears all style values.

**Notes:** Lasterror is set.

13.13.4 CompareStyles(other as ATSUSTYLEMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Compares two styles.

**Notes:**

ATSUSTYLEComparison is an enumeration with four values, and is used by CompareStyles function to indicate if the first style parameter contains as a proper subset, is equal to, or is contained by the second style parameter.

```
kATSUSTYLEUnequal 0
kATSUSTYLEContains 1
kATSUSTYLEEquals 2
kATSUSTYLEContainedBy 3
```

Lasterror is set.

13.13.5 Copy as ATSUSTYLEMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this style.

**Notes:** Lasterror is set.
13.13.6 CopyAttributes(destination as ATSUStyleMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Copies all style attributes to the target style object. **Notes:** Lasterror is set.

13.13.7 Create

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new style handle. **Notes:** Lasterror is set.

13.13.8 GlyphGetCubicPaths(pathEvents as ATSPathEventsMBS, glyphID as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Obtains the cubic outline paths for a glyph. **Notes:**

- pathEvents: The events to call for the paths.
- GlyphID: A GlyphID value identifying the glyph for which to obtain an outline path.

The glyph outlines that are returned are the hinted outlines at the font size specified in the style object. If you want to use unhinted outlines, set the font size to a very large size, (for example, 1000 points) and then scale down the returned curves to the desired size.

As of Mac OS X version 10.1, the curves returned by this function are derived from quadratic curves, irrespective of the native curve type of the font.

Lasterror is set.

13.13.9 GlyphGetQuadraticPaths(pathEvents as ATSPathEventsMBS, glyphID as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Obtains the quadratic outline paths for a glyph. **Notes:**

- pathEvents: The events to call for the paths.
- GlyphID: A GlyphID value identifying the glyph for which to obtain an outline path.
The glyph outlines that are returned are the hinted outlines at the font size specified in the style object. If you want to use unhinted outlines, set the font size to a very large size, (for example, 1000 points) and then scale down the returned curves to the desired size.
Lasterror is set.

13.13.10  **IsEmpty as boolean**

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the style is empty.  
**Notes:** Lasterror is set.

13.13.11  **OverwriteAttributes(destination as ATSUStyleMBS)**

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Copies to a destination style object the nondefault style attribute settings of the current style object.  
**Notes:** Lasterror is set.

13.13.12  **SetBooleanAttribute(value as boolean, AttributeTag as Integer)**

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets a style attribute with a boolean value.  
**Notes:** Lasterror is set.

13.13.13  **SetFixedAttribute(value as Double, AttributeTag as Integer)**

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the layout control tag with a fixed float value.  
**Notes:** Lasterror is set.

13.13.14  **SetFractAttribute(value as Double, AttributeTag as Integer)**

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets a style attribute with a fraction value.  
**Notes:** Lasterror is set.
13.13.15  **SetIntegerAttribute**(*value as Integer, AttributeTag as Integer*)

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets a style attribute with an integer value. **Notes:** Lasterror is set.

13.13.16  **SetPtrAttribute**(*value as memoryblock, AttributeTag as Integer*)

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets a style attribute with a pointer value. **Notes:** Lasterror is set.

13.13.17  **SetShortAttribute**(*value as Integer, AttributeTag as Integer*)

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets a style attribute with a short value. **Notes:** Lasterror is set.

13.13.18  **UnderwriteAttributes**(*destination as ATSUStyleMBS*)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Copies to a destination style object only those nondefault style attribute settings of the current style object that are at default settings in the destination object. **Notes:** Lasterror is set.

13.13.19  **Properties**

13.13.20  **Handle as Integer**

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The handle for this style. **Notes:** Useful for toolbox calls. (Read and Write property)
## 13.13.21 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The last error code reported.
**Notes:** (Read and Write property)

## 13.13.22 Release as Boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the destructor will release the handle.
**Notes:** (Read and Write property)

## 13.13.23 Bold as boolean

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
If true the text will be drawn with bold style.
**Example:**

```vbscript
Sub Paint(g As Graphics)
    // Window.paint event

    dim cg as CGContextMBS
    dim st as ATSUStyleMBS
    dim t as ATSUTextLayoutMBS
    dim s as string

    const kATSUFromTextBeginning = -1
    const kATSUToTextEnd = -1

    // Make UTF16 string
    s="Hello World"
    s=ConvertEncoding(s,Encodings.UTF16)

    // get context to draw into
    cg=window1.CGContextMBS

    st=new ATSUStyleMBS
    st.Create
    st.bold=true
    t=new ATSUTextLayoutMBS
    t.Create
    t.SetTextPointerLocation s,kATSUFromTextBeginning,kATSUToTextEnd,len(s)
    t.SetCGContext cg.Handle
    t.SetRunStyle st,kATSUFromTextBeginning,kATSUToTextEnd
```
CHAPTER 13. APPLE TYPE SERVICES FOR FONTS

```vbnet
Dim style As New ATSUStyleMBS
Style.Create
Style.condensed = True
```

Notes:
Lasterror is set.
(Read and Write computed property)

### 13.13.24 Condensed as boolean

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
If true the text will be drawn with condensed style.

**Example:**
```vbnet
Dim style As New ATSUStyleMBS
Style.Create
Style.condensed = True
```

Notes:
Lasterror is set.
(Read and Write computed property)

### 13.13.25 Extended as boolean

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
If true the text will be drawn with extended style.

**Example:**
```vbnet
Dim style As New ATSUStyleMBS
Style.Create
Style.extended = True
```

Notes:
Lasterror is set.
(Read and Write computed property)
13.13.26 FontID as Integer

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The font ID of this style.

**Notes:**
Lasterror is set.
(Read and Write computed property)

13.13.27 ForceHanging as boolean

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Whether to force the character to hang beyond line boundaries.

**Notes:**
default: false

You can treat glyphs in a style run as hanging punctuation, whether or not the font designer intended them to be.

Lasterror is set.
(Read and Write computed property)

13.13.28 ImposedWidth as Double

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Glyph widths, by default, are specified by font-defined advance widths.

**Notes:**
You can override the glyph’s default metrics by imposing a width for ATSUI to use.

Lasterror is set.
(Read and Write computed property)

13.13.29 Italic as boolean

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
If true the text will be drawn with italic style.

**Example:**
dim style as new ATSUStyleMBS

Style.Create
style.italic=true

Notes:
Lasterror is set.
(Read and Write computed property)

13.13.30 Language as Integer

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The language region attribute tag represents the regional language code for glyphs in a style run.
**Notes:**
ATSUI uses the value associated with this tag to determine how to render region-dependent characteristics.

Default: Region code for current region.

Lasterror is set.
(Read and Write computed property)

13.13.31 LineFlushFactor as Integer

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The line flush factor.
**Notes:**
Lasterror is set.
(Read and Write computed property)

13.13.32 NoCaretAngle as boolean

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The caret angle attribute tag specifies whether the text caret or edges of a highlighted area are always parallel to the slant of the style run’s text or always perpendicular to the baseline.
**Notes:**
Default value:false
The default setting is to use the character's angularity to determine caret angle and the edges of a highlighted area. For example, when the caret appears in italic text or text that has an intrinsic angle, you may want to display an angled (slanted) caret rather than a straight one. ATSUI supports this capability by using data present in a font that identifies the intrinsic font angle.

Lasterror is set.
(Read and Write computed property)

13.13.33 NoLigatureSplit as boolean

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Ligature splitting is the division of a ligature for hit-testing purposes into regions corresponding to each of its component glyphs.

**Notes:**
default: false

The default setting specifies that ligatures and compound characters in a style have divisible components. If the value set by the ligature splitting attribute tag is true and the caret position is adjacent to a ligature, ATSUI considers the next valid caret position to be at the other side of the entire ligature rather than at any point within it.

Lasterror is set.
(Read and Write computed property)

13.13.34 NoOpticalAlignment as boolean

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Optical alignment is the fine adjustment of glyph positions (as specified by the font) at the ends of lines to give a more even visual appearance to margins.

**Notes:**
default: false

The default setting specifies not to suppress automatic optical positioning alignment. In multiline text, glyphs may seem to line up incorrectly at the margins. This is accounted for by two factors. First, glyph advance widths contain a certain amount of extra white space (side bearing) to account for the normal interglyph spacing. This produces certain anomalies at line margins, because the side bearing varies with font size.

The second problem is that due to optical effects, curved lines do not appear to line up properly with straight
CHAPTER 13. APPLE TYPE SERVICES FOR FONTS

lines. To make them appear to line up, some compensation must occur. On baselines, for example, curved letters such as "C" or "S" are generally designed to extend slightly below the baseline, so that they appear to line up with straight letters such as "H".

This same effect should happen at the edges of lines. On the left side of Figure 2-13, the "O" in "Oregon" and the "C" in "Connecticut" appear to be indented compared to the "H" and "D" glyphs. However, as shown by the vertical line on the right, the outlines of the four glyphs are exactly aligned. The apparent indentation is an optical effect.

LastError is set.
(Read and Write computed property)

13.13.35 NoSpecialJustification as boolean

Notes:
default: false

Postcompensation justification is a set of processes (such as glyph stretching and ligature decomposition) that occur at the end of the justification process and should take place after glyph positions have been calculated.

LastError is set.
(Read and Write computed property)

13.13.36 Reference as Integer

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: An user defined integer value which is stored inside the style handle.
Notes:

LastError is set.
(Read and Write computed property)

13.13.37 Size as Double

**Example:**

```vbs
Sub Paint(g As Graphics)
    // Window.paint event
    dim cg as CGContextMBS
    dim st as ATSUStyleMBS
    dim t as ATSUTextLayoutMBS
    dim s as string

    const kATSUFromTextBeginning = -1
    const kATSUToTextEnd = -1

    // Make UTF16 string
    s="Hello World"
    s=ConvertEncoding(s,Encodings.UTF16)

    // get context to draw into
    cg=window1.CGContextMBS

    st=new ATSUStyleMBS
    st.Create
    st.Size=24
    t=new ATSUTextLayoutMBS
    t.Create
    t.SetTextPointerLocation s,kATSUFromTextBeginning,kATSUToTextEnd,len(s)
    t.SetCGContext cg.Handle
    t.SetRunStyle st,kATSUFromTextBeginning,kATSUToTextEnd
    t.DrawText kATSUFromTextBeginning,kATSUToTextEnd,100,100

End Sub
```

**Notes:**

Lasterror is set.
(Read and Write computed property)

---

**13.13.38  SuppressCrossKerning as boolean**

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Cross-stream kerning is the movement of glyphs (as specified by the font) perpendicular to the line orientation of the text.

**Notes:**

(For horizontal text, the automatic movement is vertical.) Cross-stream kerning is required for such scripts
as Taliq (used in Urdu). It can also be used to assist in the creation of automatic fractions.

Default value: false

The default setting specifies not to suppress automatic cross-kerning (defined by the font).

LastError is set.
(Read and Write computed property)

13.13.39 TextColor as Color

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The text color to use.
**Notes:**
LastError is set.
(Read and Write computed property)

13.13.40 Tracking as Double

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
What tracking should be used for drawing text.
**Notes:**
Tracking represents the relative proportion of font-defined adjustments to apply to interglyph positions. You can expand or contract the spacings of all glyphs in a style run by applying a tracking value, called the tracking setting, to that style run. You can set and retrieve the tracking setting using the following style attribute tag:

```
Attribute tag:kATSUTrackingTagData
type: FixedDefault
value: 0
```

Comment: No change to the font-defined adjustments.

Tracking is different from with-stream shifting because the actual amount of space added or removed is controlled by the font, not by your application. The positional shifts are the result of two-dimensional interpolation based on the tracking setting, the text size in points, and the threshold values present in the font’s tracking table. These threshold values are used to permit nonlinear tracking amounts. For example, a single tracking setting can specify different sets of spacings for text below 8 points, from 8 to 12 points, from 12 to 15, from 15 to 36, and over 36 points if the font designer specifies it.
Specifying a tracking setting of 0 means "space normally" according to the specifications set by the font designer. That does not necessarily mean that no adjustment to spacing occurs. The font designer may decide that "normal spacing" includes some spacing adjustment in certain point size ranges.

The glyph orientation also affects the tracking settings. A font designer can specify different spacings for a tracking setting of 0 (normal spacing) depending on the orientation of the glyphs.

Lasterror is set.
(Read and Write computed property)

13.13.41 Underline as boolean

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** If true the text will be drawn with underline style.  
**Example:**
```plaintext
dim style as new ATSUSTyleMBS
Style.Create
style.underline=true
```

**Notes:**
Lasterror is set.
(Read and Write computed property)

13.13.42 VerticalCharacter as Integer

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The glyph orientation of a style run specifies which direction (vertical or horizontal) glyphs should be drawn.  
**Notes:**

default: kATSUStronglyHorizontal

const kATSUStronglyHorizontal=0
const kATSUStronglyVertical=1

Lasterror is set.
(Read and Write computed property)
13.14 class ATSUTabMBS

13.14.1 class ATSUTabMBS

MBS MacCF Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The class for an ATS tab stop.

**Example:**

```vbs
dim a as new ATSUTabMBS

a.Type = a.kLeftTab
a.Position = 65536 * 5
```

**Deprecated:** This item is deprecated and should no longer be used. You can use CTTextTabMBS instead.

**Notes:** This class specifies the position and type of tab stop to be applied to a ATSUTextLayoutMBS set through the ATSUI routine SetTabs and returned through GetTabs.

13.14.2 Properties

13.14.3 Position as Integer

MBS MacCF Plugin, Plugin Version: 10.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The position of this tab.

**Notes:**
Value is a Fixed floating value in an integer. Which means the value is multiplied by 65536. That means 1.0 = 65536, 0.5 = 32768 and 2.0 = 131072.
(Read and Write property)

13.14.4 Type as Integer

MBS MacCF Plugin, Plugin Version: 10.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The type of this tab.

**Example:**

```vbs
dim a as new ATSUTabMBS

a.Type = a.kLeftTab
a.Position = 16384
```

**Notes:**
13.14. CLASS ATSUTABMBS

The type defines the characteristic of ATSUI tabs. A Left tab type specifies that the left side of affected text is to be maintained flush against the tab stop. A Right tab type specifies that the right side of affected text is to be maintained flush against the tab stop. A Center tab type specifies that the affected text centered about the tab stop. (Read and Write property)

13.14.5 Constants

13.14.6 kCenterTab = 1

MBS MacCF Plugin, Plugin Version: 10.3. **Function:** One of the tab constants. **Example:**
```
dim a as new ATSUTabMBS

a.Type = a.kCenterTab
a.Position = 65536
```

**Notes:** Center alignment.

13.14.7 kLeftTab = 0

MBS MacCF Plugin, Plugin Version: 10.3. **Function:** One of the tab constants. **Example:**
```
dim a as new ATSUTabMBS

a.Type = a.kLeftTab
a.Position = 32768
```

**Notes:** Left alignment.

13.14.8 kRightTab = 2

MBS MacCF Plugin, Plugin Version: 10.3. **Function:** One of the tab constants. **Example:**
```
dim a as new ATSUTabMBS
```
a.Type = a.kRightTab
a.Position = 65536 * 4

Notes: Right alignment.
13.15. CLASS ATSUTEXTLAYOUTMBS

13.15  class ATSUTextLayoutMBS

13.15.1  class ATSUTextLayoutMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A class for an ATSUI text layout.

**Deprecated:** This item is deprecated and should no longer be used. You can use CTFramesetterMBS instead. **Notes:**

For more information, you should also read the ATSUI help:

13.15.2  Methods

13.15.3  BreakLine(iLineStart as Integer, iLineWidth as Double, iUseAsSoftLineBreak as boolean) as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Calculates and, optionally, sets a soft line break in a range of text

**Example:**

```c
// See the example.
```

**Notes:**

Returns the new line end offset inside the source text.
iLineStart is the offset in the text.
iLineWidth is the width of the output area in pixels.
LastError is set.

**iUseAsSoftLineBreak:**

A Boolean value indicating whether BreakLine should automatically set the line break produced in the return value. If true, BreakLine sets the line break and clears any previously-set soft line breaks that precede the new break in the line but lie after the offset specified by iLineStart.

13.15.4  clearLayoutCache(iLineStart as Integer)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Clears the layout cache of a line or an entire text layout object.

**Notes:** LastError is set.
13.15.5  clearSoftLineBreaks(iRangeStart as Integer, iRangeLength as Integer)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Clears all soft line breaks in the given range of characters.
**Notes:** Lasterror is set.

13.15.6  Copy(dest as ATSUTextLayoutMBS)

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Duplicates the text layout handle into the destination text layout object.
**Notes:** Lasterror is set.

13.15.7  CopyLayoutControls(destination as ATSUTextLayoutMBS)

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Copies all layout controls to the target text layout object.
**Notes:** Lasterror is set.

13.15.8  Create

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new textlayout handle.
**Notes:** Lasterror is set.

13.15.9  CreateTextLayoutWithText(text as string, iTexOffset as Integer, iTexLength as Integer, iTexTotalLength as Integer, iNumberOfRuns as Integer, iRunLengths as memoryblock, iStyles as memoryblock)

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a text layout handle with given parameters.
**Notes:**
Text is UTF16 encoded string.
iTexOffset is the start offset inside the text.
iTexLength is the length of the text piece to use.
iTexTotalLength is len(text).
iNumberOfRuns is the number of style runs.
iRunLengths is a memoryblock with integers used to specify how long the style runs are.
iStyles is a memoryblock with integers filled with handles of style objects.
Lasterror is set.

### 13.15.10 DrawText(iLineOffset as Integer, iLineLength as Integer, iLocationX as Double, iLocationY as Double)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Draws text.
**Example:**

```vba
// inside the paint event of a window:

dim s as ATSUStyleMBS
dim t as ATSUTextLayoutMBS
dim a as string
dim cg as CGContextMBS

const kATSUFromTextBeginning=-1
cast kATSUToTextEnd=-1

cg=window1.CGContextMBS

a=\"Hello World!\"
a=ConvertEncoding(a,Encodings.UTF16)

s=new ATSUStyleMBS
s.Create

t=new ATSUTextLayoutMBS
t.Create
t.SetTextPointerLocation a,kATSUFromTextBeginning,kATSUToTextEnd,len(a)
t.SetRunStyle s,kATSUFromTextBeginning,kATSUToTextEnd
t.SetCGContext cg.Handle
t.DrawText kATSUFromTextBeginning, kATSUToTextEnd,100,100
```

**Notes:**
iLocationX/iLocationY is the location inside the Graphics context used. Note that CoreGraphics has y=0 on the bottom of a window.
iLineOffset is the number of the first character inside the text to use. (-1 or 0 for the beginning).
iLineLength is the count of characters to draw. (-1 for everything till end)
Lasterror is set.
13.15.11 GetSoftLineBreaks(iRangeStart as Integer, iRangeLength as Integer) as memoryblock

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a memoryblock with integers for the softlinebreaks offsets.

**Notes:**
The range is in characters inside the source text.
Returns nil on any error.
Lasterror is set.

13.15.12 GetTabs(iMaxTabCount as Integer = 100) as ATSUTabMBS()

MBS MacCF Plugin, Plugin Version: 10.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries the tabs.

**Example:**
```vba
    dim t as new ATSUTextLayoutMBS
    t.Create
    // setup textlayout... (see SetTabs)

    dim qtabs(-1) as ATSUTabMBS = t.GetTabs
    MsgBox "GetTabs: " + str(t.Lasterror)
    for each q as ATSUTabMBS in qtabs
        MsgBox str(q.Type) + " " + str(q.Position)
    next
```

**Notes:**
As we need to pass an array to the system to store the values, you need to think what may be the maximum count.
Lasterror is set.

13.15.13 GlyphInfo(iTextOffset as Integer, iTextLength as Integer, style as ATSUStyleMBS, iForcingAntiAlias as boolean, iAntiAliasSwitch as boolean) as ATSFonfesGlyphListMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This function returns the glyph information from an ATSUTextLayout.

**Notes:** Returns nil on any error.
13.15. CLASS ATSUTEXTLAYOUTMBS

13.15.14 HighlightText(iTextBasePointX as Double, iTextBasePointY as Double, iHighlightStart as Integer, iHighlightLength as Integer)

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Renders a highlighted range of text at a specified location in a QuickDraw graphics port or Quartz graphics context.

**Notes:**
Parameters like DrawText.
LastError is set.

When the user selects a series of glyphs, the characters in memory corresponding to the glyphs make up the selection range and should be highlighted to indicate where the next editing operation is to occur. The characters in a selection range are always contiguous in memory, but their corresponding glyphs are not necessarily so onscreen. If the selection range crosses a direction boundary, it is appropriate to display discontinuous highlighting. The HighlightText function renders a highlighted range of text at a specified location in a QuickDraw graphics port or Quartz graphics context, using the highlight information in the graphics port or context. ATSUHighlightText automatically produces discontinuous highlighting, if needed. You typically call the HighlightText function every time you need to draw or redraw highlighted text.

**Parameters:**

- **self:** A layout containing text to be highlighted.
- **TextBasePointX:** The x-coordinate of the origin (in either the current graphics port or in a Quartz graphics context) of the line containing the text range. Pass the constant kATSUUseGrafPortPenLoc (-1) to draw relative to the current pen location in the current graphics port.*
- **TextBasePointY:** The y-coordinate of the origin (in either the current graphics port or in a Quartz graphics context) of the line containing the text range. Pass the constant kATSUUseGrafPortPenLoc (-1) to draw relative to the current pen location in the current graphics port.*
- **HighlightStart:** The first character of the text range to be highlighted. If the text range spans multiple lines, you should call ATSUHighlightText for each line, passing the offset corresponding to the beginning of the new line to draw with each call. To indicate that the specified text range starts at the beginning of the text buffer, you can pass the constant kATSUFromTextBeginning. To specify the entire text buffer, pass kATSUFromTextBeginning (-1) in this parameter and kATSUToTextEnd (-1) in the HighlightLength parameter.
- **HighlightLength:** The length of the text range to be highlighted. To indicate that the text range extends to the end of the text buffer, pass the constant kATSUToTextEnd (-1).

*Internally the ATSUHighlightText function excepts the coordinates as Fixed datatype, so the plugin multiplies the values by 65536.0 and casts them to an integer. To pass -1 to the function, you need to divide -1 by 65536.0.
13.15.15 Idle

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Call this to give ATSUI some CPU time.
**Notes:** Seems not be required currently.

13.15.16 MeasureText(iTextOffset as Integer, iTextLength as Integer, byref oTextBefore as Double, byref oTextAfter as Double, byref oAscent as Double, byref oDescent as Double)

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Measures the space needed for the text to draw.
**Example:**

```plaintext
dim s as ATSUStyleMBS
dim t as ATSUTextLayoutMBS
dim a as string
dim cg as CGContextMBS
dim TextBefore as Double
dim TextAfter as Double
dim Ascent as Double
dim Descent as Double

const kATSUFromTextBeginning=-1
cost kATSUToTextEnd=-1

cg=window1.CGContextMBS

a="Hello World!"
a=UnicodeStringMBS(a)

s=new ATSUStyleMBS
s.Create
s.Size=64

t=new ATSUTextLayoutMBS
t.Create
t.SetTextPointerLocation a,kATSUFromTextBeginning,kATSUToTextEnd,len(a)
t.SetRunStyle s,kATSUFromTextBeginning, kATSUToTextEnd
t.SetCGContext cg.Handle
t.MeasureText kATSUFromTextBeginning, kATSUToTextEnd, TextBefore, TextAfter, Ascent, Descent
cg.SetRGBFillColor 0.5,0,0,0.1
```
13.15. CLASS ATSUTEXTLAYOUTMBS

cg.FillRect CGMakeRectMBS(100+TextBefore,100-Descent,TextAfter-TextBefore,ascent+descent)
cg.SetGrayFillColor 0,1

window1.Title=str(Descent)+" " +str(ascent)

t.DrawText kATSUFromTextBeginning, kATSUToTextEnd,100,100

Notes: Lasterror is set.

13.15.17 MeasureTextImage(iLineOffset as Integer, iLineLength as Integer, iLocationX as Double, iLocationY as Double, byref left as Integer, byref top as Integer, byref width as Integer, byref height as Integer) as boolean

Notes:

iLineOffset: An offset value specifying the offset from the beginning of the text buffer to the first character of the line to examine. To indicate that the specified line starts at the beginning of the text buffer, you can pass the constant kATSUFromTextBeginning. To specify the entire text buffer, pass kATSUFromTextBeginning in this parameter and kATSUToTextEnd in the iLineLength parameter.

iLineLength: A value specifying the length of the text range. If you want the range of text to extend to the end of the text buffer, you can pass the constant kATSUToTextEnd. However, the image bounds is restricted to the line in which iLineOffset resides.

iLocationX: An ATSUTextMeasurement value specifying the x-coordinate of the line’s origin in the current graphics port or Quartz graphics context. Pass the constant kATSUUseGrafPortPenLoc, described in “Convenience Constants”, for the dimensions of the bounds relative to the current pen location in the current graphics port or graphics context. You can pass 0 to obtain only the dimensions of the bounding rectangle relative to one another, not their actual onscreen position.

iLocationY: An ATSUTextMeasurement value specifying the y-coordinate of the line’s origin in the current graphics port or Quartz graphics context. Pass the constant kATSUUseGrafPortPenLoc, described in “Convenience Constants,” for the dimensions of the bounds relative to the current pen location in the current graphics port or graphics context. You can pass 0 to obtain only the dimensions of the bounding rectangle relative to one another, not their actual onscreen position.

left, top, width and height: A pointer to a Rect structure. On return, the structure contains the dimensions of the image bounding rectangle for the text, offset by the values specified in the iLocationX and iLocationY parameters. If the
line is rotated, the sides of the rectangle are parallel to the coordinate axis.

Returns true on success. And lasterror is set.

Discussion
The ATSUMeasureTextImage function obtains the image bounds of a laid-out line of text. These bounds are described by the smallest rectangle that completely encloses the filled or framed parts of a block of text that is, the text’s "inked" glyphs.

In measuring the line, the ATSUMeasureTextImage function takes into account line rotation, alignment, and justification, as well as other characteristics that affect layout, such as hanging punctuation. (If the line is rotated, the sides of the rectangle are parallel to the coordinate axes and encompass the rotated line.) If no attributes are set for the line, ATSUMeasureTextImage uses the global attributes set for the text layout object.

Because the height of the image bounding rectangle is determined by the actual device metrics, ATSUMeasureTextImage ignores any previously set line ascent and descent values for the line it is measuring.

Before calculating the image bounds for the text range, the ATSUMeasureTextImage function examines the text layout object to ensure that each of the characters in the range is assigned to a style run. If there are gaps between style runs, ATSUMeasureTextImage assigns the characters in the gap to the style run that precedes (in storage order) the gap. If there is no style run at the beginning of the text range, the ATSUMeasureTextImage function assigns these characters to the first style run it finds. If there is no style run at the end of the text range, ATSUMeasureTextImage assigns the remaining characters to the last style run it finds.

To obtain the final typographic bounds of a line, call the function ATSUGetGlyphBounds. To calculate the unjustified typographic bounds of a line, call the function ATSUGetUnjustifiedBounds.

### 13.15.18 SetBooleanLayoutControl(value as boolean, AttributeTag as Integer)

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the layout control tag with a boolean value. **Notes:** Lasterror is set.

### 13.15.19 SetCGContext(CGContextHandle as Integer)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the destination CoreGraphics Context as the drawing target. **Example:**

```dim t as ATSUTextLayoutMBS
dim cg as CGContextMBS```
13.15. CLASS ATSUTEXTLAYOUTMBS

cg=window1.CGContextMBS

t.SetCGContext cg.Handle

Notes: Lasterror is set.

13.15.20  SetFixedLayoutControl(value as Double, AttributeTag as Integer)

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the layout control tag with a fixed float value.
**Notes:** Lasterror is set.

13.15.21  SetFractLayoutControl(value as Double, AttributeTag as Integer)

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the layout control tag with a fract value.
**Notes:** Lasterror is set.

13.15.22  SetHighlightingMethod(HighlightMethod as Integer, red as Double, green as Double, blue as Double, alpha as Double)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the method ATSUI uses to highlight and unhighlight text for a text layout object.
**Notes:**
HighlightMethod: An integer value specifying the type of highlighting for ATSUI to use (kInvertHighlighting or kRedrawHighlighting). The default highlighting method, if you do not call ATSUSetHighlightingMethod, is inversion.
red, green, blue and alpha: The color for the background.

Lasterror is set.

You can read more about the ATSUSetHighlightingMethod method on Apple’s documentation. The plugin only supports the background color option and not the callback option.
13.15.23 SetPtrLayoutControl(value as memoryblock, AttributeTag as Integer)

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the layout control tag with a pointer value. **Notes:** Lasterror is set.

13.15.24 SetRunStyle(style as ATSUStyleMBS, iRunStart as Integer, iRunLength as Integer)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Defines a style run by associating style information with a run of text. **Notes:** Lasterror is set.

A text run consists of one or more characters that are contiguous in memory. If you associate these characters with a distinct style, you define a style run. You can use the SetRunStyle function to define a style run, by associating a style object with a run of text in a text layout object. There is a limit of 64K different styles for each ATSUI text layout object. Each text run must be assigned its own style object, which may or may not differ from other style objects assigned to other text runs in a given text layout object.

13.15.25 SetShortLayoutControl(value as Integer, AttributeTag as Integer)

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the layout control tag with a 16 bit integer value. **Notes:** Lasterror is set.

13.15.26 SetSoftLineBreak(iLineBreak as Integer)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Adds a soft linebreak at the given text offset. **Notes:** Lasterror is set.

13.15.27 SetTabs(tabs() as ATSUTabMBS)

MBS MacCF Plugin, Plugin Version: 10.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the tabs. **Example:**
13.15. **CLASS ATSUTEXTLAYOUTMBS**

dim t as new ATSUTextLayoutMBS

t.Create

dim t1 as new ATSUTabMBS

t1.Type = t1.kLeftTab

t1.Position = 65536

dim t2 as new ATSUTabMBS

t2.Type = t1.kRightTab

t2.Position = 65536*4

dim tabs(-1) as ATSUTabMBS

tabs.Append t1

tabs.Append t2

t.SetTabs tabs

MsgBox "SetTabs: " + str(t.Lasterror)

**Notes:** Lasterror is set.

---

13.15.28 **SetTextPointerLocation(text as string, iTextOffset as Integer, iTextLength as Integer, iTextTotalLength as Integer)**

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Associates text with a text layout object or updates previously associated text.

**Notes:**

text:
A string containing UTF-16 encoded text. ATSUI associates this string with the text layout object and analyzes the complete text of the buffer when obtaining the layout context for the current text range. Thus, for paragraph-format text, if you specify a buffer containing less than a complete paragraph, some of ATSUI’s layout results are not guaranteed to be accurate. For example, with a buffer of less than a full paragraph, ATSUI can neither reliably obtain the context for bidirectional processing nor reliably generate accent attachments and ligature formations.

iTextOffset:
An integer value specifying the offset from the beginning of the text buffer to the first character of the range to include in the layout. To indicate that the specified text range starts at the beginning of the text buffer, you can pass the constant kATSUFromTextBeginning. To specify the entire text buffer, pass kATSUFromTextBeginning in this parameter and kATSUToTextEnd in the iTextLength parameter.

iTextLength:
An integer value specifying the length of the text range. Note that iTextOffset + iTextLength must be less
than or equal to the value of the iTexTTotalLength parameter. If you want the range of text to extend to
the end of the text buffer, you can pass the constant kATSUToTextEnd.

iTexTTotalLength:
An integer value specifying the length of the entire text buffer. This value should be greater than or equal
to the range of text defined by the iTexTLength parameter.

LastError is set.

13.15.29 TextLength as Integer

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The current text length.
**Notes:**
You can set this using theSetTextPointerLocation method.
LastError is set.

13.15.30 TextOffset as Integer

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The current text offset.
**Notes:**
You can set this using theSetTextPointerLocation method.
LastError is set.

13.15.31 TextTotalLength as Integer

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The current text total length.
**Notes:**
You can set this using theSetTextPointerLocation method.
LastError is set.
13.15.32 UnhighlightText(iTextBasePointX as Double, iTextBasePointY as Double, iHighlightStart as Integer, iHighlightLength as Integer)

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Renders an unhighlighted range of text at a specified location in a QuickDraw graphics port or Quartz graphics context.
**Notes:**
Parameters like DrawText.
LastError is set.

13.15.33 Properties

13.15.34 Handle as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The handle of the textlayout.
**Notes:**
Useful for toolbox calls.
(Read and Write property)

13.15.35 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The last error code reported.
**Notes:** (Read and Write property)

13.15.36 Release as Boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the destructor will release the handle.
**Notes:** (Read and Write property)

13.15.37 Text as String

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The text used.
**Notes:**
You can set this using the SetTextPointerLocation method.
(Read only property)

13.15.38  Ascent as Double

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The ascent of the text layout.
**Notes:** (Read and Write computed property)

13.15.39  Descent as Double

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The descent of the text layout.
**Notes:** (Read and Write computed property)

13.15.40  FlushFactor as Double

**Notes:** (Read and Write computed property)

13.15.41  JustFactor as Double

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The just factor.
**Notes:** (Read and Write computed property)

13.15.42  Language as Integer

**Notes:**
Lasterror is set.
(Read and Write computed property)
13.15. **CLASS ATSUTEXTLAYOUTMBS**

### 13.15.43 LineAscent(offset as Integer) as Double

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The line ascent attribute tag represents the ascent associated with a line of text.
**Notes:**
Lasterror is set.
(Read and Write computed property)

### 13.15.44 LineDescent(offset as Integer) as Double

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The line descent attribute tag represents the sum of the descent and leading associated with a line of text
or a text layout object.
**Notes:**
Lasterror is set.
(Read and Write computed property)

### 13.15.45 LineDirection as boolean

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The line direction attribute specifies a left-to-right or right-to-left direction for the glyphs associated with a

The dominant direction of a line is the overall, controlling direction within which the individual glyph di-

crctions are set. If a Hebrew word is embedded in a line of Roman text, the dominant direction for that
gle is left to right, but the Hebrew word is still laid out right to left, as expected. Conversely, Roman text
embedded in a line of Hebrew, in which the dominant direction is right to left, is still displayed left to right.
For this reason, dominant direction has significance only in mixed-direction text.

The ATSUI text layout model accounts for dominant direction as well as glyph direction, automatically
performing any reordering needed for correct display of simple mixed-direction lines of text.

Lasterror is set.
(Read and Write computed property)
13.15.46 LineFlushFactor(offset as Integer) as Double

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Alignment, or flushness, is the process of placing text in relation to one or both margins, which are the left and right sides (or top and bottom sides) of the text area.

**Notes:**
- default: kATSUStartAlignment

Text is drawn to the right of the left margin for horizontal text, or below the top margin for vertical text. Text can be aligned left (kATSUStartAlignment), right (kATSUEndAlignment), or center (kATSUCenterAlignment), as shown in Figure 1-16. You can also specify a fractional value to align text at any location between the margins. Note in Figure 1-16 how the words of the text are spaced normally. Unlike justification (see "Justification Attribute Tag"), alignment does not affect the spacing between words or individual glyphs.

The alignment attribute has an effect only with text whose width is shorter than the width specified by the width attribute (kATSULineWidthTag), as shown in Figure 2-23. You must specify a width if you want to have any alignment other than kATSUStartAlignment.

```plaintext
const kATSUStartAlignment = & h00000000
const kATSUEndAlignment = & h40000000
const kATSUCenterAlignment = & h20000000
```

Lasterror is set.
(Read and Write computed property)

13.15.47 LineJustFactor(offset as Integer) as Double

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The line just factor.

**Notes:**
Lasterror is set.
(Read and Write computed property)

13.15.48 LineRotation(offset as Integer) as Double

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The rotation attribute specifies the angle (in degrees) by which the entire line should be rotated.

**Notes:**
In ATSUI, rotation is counterclockwise. To produce vertical text, set the rotation value to -90.0 degrees and
the value accessed by the style attribute tag kATSUVerticalCharacterTag to the constant kATSUStronglyVertical.

LastError is set.
(Read and Write computed property)

13.15.49 LineWidth(offset as Integer) as Double

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The width attribute specifies the desired width of a line of text, in typographic points, of the line when drawn as justified or right-aligned text.

**Notes:**
ATSUI treats vertical text as if it were horizontal. You can set and retrieve the width value using the following line and layout control attribute tag:

Attribute tag:kATSULineWidthTagData type: ATSUTextMeasurementDefault value: 0Comment: If you don’t set the line width, you can’t justify and align the text.
If a line is not justified or right-aligned, the value set by the width attribute tag kATSULineWidthTag is still used to apply negative justification (unless the kATSLineDisableNegativeJustification tag is set). Negative justification is the process of condensing text that exceeds the specified width so that the text fits the specified width. See Justification Attribute Tag for additional information on how the width, alignment, and justification attributes interact.

If the line contains glyphs with large negative side bearings, hanging punctuation, or optically aligned edges, the final width of the displayed text may be different from the value specified by the width attribute. See Hanging Punctuation Attribute Tag and Optical Alignment Attribute Tag for more information.

If you use the width of the image bounding rectangle and the typographic bounding rectangle as a measure of the overall line length, the measurements may be slightly different from each other. See Text Measurements for more information.

LastError is set.
(Read and Write computed property)

13.15.50 Reference as Integer

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
An user defined integer value which is stored inside the style handle.

**Notes:**
LastError is set.
CHAPTER 13. APPLE TYPE SERVICES FOR FONTS

(Read and Write computed property)

13.15.51 Rotation as Double

MBS MacCF Plugin, Plugin Version: 9.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The rotation of the text layout.
**Notes:** (Read and Write computed property)

13.15.52 TransientFontMatching as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether to use Transient Font Matching.
**Example:**

```vba
Dim atsLayout As ATSUTextLayoutMBS
Dim atsStyle As ATSUStyleMBS
Dim sFontName As String
Dim eFontEncoding As TextEncoding
Dim sDrawText As String
dim c as CGContextMBS=window1.CGContextMBS
const kATSUFromTextBeginning = -1
const kATSUToTextEnd = -1
const kFontFullName=4
const kFontNoPlatform =-1
const kFontNoScript=-1
const kFontNoLanguag=-1
sFontName = "Hiragino Mincho Pro W3"
sDrawText = " " // some umlauts, special characters and something asian
sDrawText = ConvertEncoding(sDrawText, Encodings.UTF16) //Converts to UTF-16 for ATS
window1.Title=sDrawText
atsStyle = New ATSUStyleMBS
atsStyle.Create
atsStyle.Size = 20
atsStyle.FontID = ATSUFindFontFromNameMBS(sFontName,kFontFullName,kFontNoPlatform, kFontNoScript, kFontNoLanguag) //Your method to find the FontID
atsLayout = New ATSUTextLayoutMBS
atsLayout.Create
atsLayout.SetCGContext(c.handle) //Handle to CGContext
atsLayout.SetTextPointerLocation sDrawText,kATSUFromTextBeginning,kATSUToTextEnd,Len(sDrawText)
```
13.15. CLASS ATSUTEXTLAYOUTMBS

atsLayout.SetRunStyle atsStyle, kATSUFromTextBeginning, kATSUToTextEnd
atsLayout.TransientFontMatching = True // must be defined after setting the style

//Now you can feel free to draw the text without worrying

atsLayout.DrawText kATSUFromTextBeginning, kATSUToTextEnd, 20, 20

Notes:
Lasterror is set.

If TransientFontMatching is on, ATSUI will search a replacement font for a character if it can’t be drawn using the current font.
(Read and Write computed property)

13.15.53 Constants

13.15.54 kInvertHighlighting = 0

MBS MacCF Plugin, Plugin Version: 10.5. Function: One of the text highlighting method constants. Notes: Specifies to use inversion for highlighting. You can use this when the background is a single color.

13.15.55 kRedrawHighlighting = 1

MBS MacCF Plugin, Plugin Version: 10.5. Function: One of the text highlighting method constants. Notes: Specifies to use your callback for highlighting. You should use this when the background is complex (containing, for example, multiple colors, patterns, or pictures).
Chapter 14

Archive

14.1 class ArchiveEntryMBS

14.1.1 class ArchiveEntryMBS

Function: The class for an archive entry.
Example:

dim data as string = "Hello World test file. Hello World again."

dim e as new ArchiveEntryMBS
e.PathName = "Hello World.txt"
e.Size = lenb(data)
e.Permissions = & o0644
e.FileType = e.kFileTypeRegular

14.1.2 Methods

14.1.3 Clone as ArchiveEntryMBS

Function: Creates a copy of the entry.
CHAPTER 14. ARCHIVE

14.1.4 Constructor

Function: Creates a new archive entry.
See also:

- 14.1.5 Constructor(Archive as ArchiverMBS)  

14.1.5 Constructor(Archive as ArchiverMBS)

Function: Creates a new archive entry for a given archive.
Notes: This will pick the character set from the archive.
See also:

- 14.1.4 Constructor  

14.1.6 Destructor

Function: The destructor.

14.1.7 GetFFlags(byref FlagsSet as UInt64, byref FlagsClear as UInt64)

Function: Queries file flags.

14.1.8 SetFFlags(FlagsSet as UInt64, FlagsClear as UInt64)

Function: Sets the file flags.

14.1.9 SetLink(link as string)

Function: Sets the link.
Notes: Update only. For a symlink, update the destination. Otherwise, make the entry a hardlink and alter the destination for that.
14.1. CLASS ARCHIVEENTRYMBS

14.1.10 UnsetATime

**Function:** Unsets the last access timestamp.

14.1.11 UnsetBTime

**Function:** Unsets the birth timestamp.

14.1.12 UnsetCTime

**Function:** Unsets the last modification timestamp.

14.1.13 UnsetGName

**Function:** Unsets the group name.

14.1.14 UnsetHardLink

**Function:** Unset the hard link field.

14.1.15 UnsetMTime

**Function:** Unsets the modification timestamp.

14.1.16 UnsetPathName

**Function:** Unsets the pathname field.
14.1.17  **UnsetSize**  
**Function:** Unsets the size.

14.1.18  **UnsetSymLink**  
**Function:** Unsets the symbolic link field.

14.1.19  **UnsetUName**  
**Function:** Unsets the user name field.

14.1.20  **Properties**  

14.1.21  **ATime as Date**  
**Function:** The last access timestamp.  
**Notes:** (Read and Write property)

14.1.22  **ATimeSet as Boolean**  
**Function:** Whether last access timestamp is set.  
**Notes:** (Read only property)

14.1.23  **BTime as Date**  
**Function:** The birth timestamp.  
**Notes:**  
This is the creation time.  
(Read and Write property)
14.1. CLASS ARCHIVEENTRYMBS

14.1.24 BTimeSet as Boolean

Function: Whether the birth timestamp field is set.
Notes: (Read only property)

14.1.25 CTime as Date

Function: The last modification timestamp.
Notes: Last time an inode property was changed.
(Read and Write property)

14.1.26 CTimeSet as Boolean

Function: Whether last modification timestamp is set.
Notes: (Read only property)

14.1.27 Dev as Integer

Function: The device number.
Notes: (Read and Write property)

14.1.28 DevMajor as Integer

Function: The minor part of the dev field.
Notes: (Read and Write property)

14.1.29 DevMinor as Integer

Function: The major part of the dev field.
14.1.30 DevSet as Boolean

**Function:** Whether dev is set.
**Notes:** (Read only property)

14.1.31 FFlags as String

**Function:** The file flags.
**Notes:** (Read and Write property)

14.1.32 FileType as Integer

**Function:** Queries file type.
**Example:**
```
dim e as new ArchiveEntryMBS
e.FileType = e.kFileTypeRegular
```

**Notes:**
Check the kFileType* constants.
(Read and Write property)

14.1.33 GID as Int64

**Function:** The group ID.
**Notes:** (Read and Write property)
14.1. CLASS ARCHIVEENTRYMBS

14.1.34 GName as String

Function: The group name.
Notes: (Read and Write property)

14.1.35 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

14.1.36 HardLink as String

Function: Destination of the hardlink.
Notes: (Read and Write property)

14.1.37 INo as Int64

Function: The inode number.
Notes: (Read and Write property)

14.1.38 INo64 as Int64

Function: The inode number.
Notes: (Read and Write property)

14.1.39 INoSet as Boolean

Function: Whether inode number is set.
Notes: (Read only property)
14.1.40 IsDataEncrypted as Boolean

Function: Whether data is encrypted.  
Notes: (Read and Write property)

14.1.41 IsMetaDataEncrypted as Boolean

Function: Whether metadata is encrypted.  
Notes: (Read and Write property)

14.1.42 MacMetadata as MemoryBlock

Function: The Mac Metadata.  
Notes: Storage for Mac OS-specific AppleDouble metadata information. Apple-format tar files store a separate binary blob containing encoded metadata with ACL, extended attributes, etc. This provides a place to store that blob.  
(Read and Write property)

14.1.43 Mode as Integer

Function: The permissions mode.  
Notes: (Read and Write property)

14.1.44 ModeString as String

Function: The permissions mode as string.  
Notes: (Read only property)
14.1. CLASS ARCHIVEENTRYMBS

14.1.45 MTime as Date

Function: The modification timestamp.
Notes: (Read and Write property)

14.1.46 MTimeSet as Boolean

Function: Whether the modification time stamp field is set.
Notes: (Read only property)

14.1.47 NLink as Integer

Function: The number of hardlinks.
Notes: (Read and Write property)

14.1.48 PathName as String

Function: Path in the archive.
Example:
```
dim e as new ArchiveEntryMBS
e.PathName = "Hello World.txt"
```
Notes:
Text encoding works partly.
Best to use only ASCII file paths.
(Read and Write property)

14.1.49 Permissions as Integer

Function: The permissions.
Example:
dim e as new ArchiveEntryMBS
e.Permissions = & o0644

Notes: (Read and Write property)

### 14.1.50 RDev as Integer

**Function:** The device ID (if special file).
**Notes:** (Read and Write property)

### 14.1.51 RDevMajor as Integer

**Function:** The major part of RDev field.
**Notes:** (Read and Write property)

### 14.1.52 RDevMinor as Integer

**Function:** The minor part of RDev field.
**Notes:** (Read and Write property)

### 14.1.53 Size as UInt64

**Function:** The size of the file.
**Notes:** (Read and Write property)

### 14.1.54 SizeSet as Boolean

**Function:** Whether size field is set.
**Notes:** (Read only property)
14.1. **CLASS ARCHIVEENTRYMBS**

14.1.55 **SourcePath as String**

**Function:** Path on the disk for use.  
**Notes:** (Read and Write property)

14.1.56 **SymLink as String**

**Function:** Destination of the symbolic link.  
**Notes:** (Read and Write property)

14.1.57 **UID as UInt64**

**Function:** The user ID.  
**Notes:** (Read and Write property)

14.1.58 **UName as String**

**Function:** The user name.  
**Notes:** (Read and Write property)

14.1.59 **Constants**

14.1.60 **kFileTypeBlock = & o0060000**

MBS Compression Plugin, Plugin Version: 16.2.  
**Function:** One of the file type constants.  
**Notes:** Block device.

14.1.61 **kFileTypeCharacter = & o0020000**

MBS Compression Plugin, Plugin Version: 16.2.  
**Function:** One of the file type constants.  
**Notes:** Character device.
14.1.62  kFileTypeDirectory = & o0040000

MBS Compression Plugin, Plugin Version: 16.2. **Function:** One of the file type constants.  
**Notes:** Directory

14.1.63  kFileTypeIFO = & o0010000

MBS Compression Plugin, Plugin Version: 16.2. **Function:** One of the file type constants.  
**Notes:** Named pipe (fifo)

14.1.64  kFileTypeLink = & o0120000

MBS Compression Plugin, Plugin Version: 16.2. **Function:** One of the file type constants.  
**Notes:** Symbolic link

14.1.65  kFileTypeMT = & o0170000

MBS Compression Plugin, Plugin Version: 16.2. **Function:** One of the file type constants.  
**Notes:** MT?

14.1.66  kFileTypeRegular = & o0100000

MBS Compression Plugin, Plugin Version: 16.2. **Function:** One of the file type constants.  
**Notes:** Regular file.

14.1.67  kFileTypeSOCK = & o0140000

MBS Compression Plugin, Plugin Version: 16.2. **Function:** One of the file type constants.  
**Notes:** Socket
14.2. CLASS ARCHIVEREADERMBS

14.2 class ArchiveReaderMBS

14.2.1 class ArchiveReaderMBS

Function: The class to read archive content.

Example:

```vbnet
dim a as new ArchiveReaderMBS
a.SupportFilterAll
a.SupportFormatAll

// open file

dim f as FolderItem = SpecialFolder.Desktop.Child("test.zip")

if not a.OpenFile(f) then
    Break // path invalid?
end if

dim e as ArchiveEntryMBS = a.NextHeader
while e <> nil

    print e.PathName

    e = a.NextHeader
wend
```

Notes:

Can be used to read zip, tar and other image formats.
Subclass of the ArchiverMBS class.

14.2.2 Methods

14.2.3 Constructor

Function: The constructor.
14.2.4 Destructor

Function: The destructor.

14.2.5 NextHeader(entry as ArchiveEntryMBS = nil) as ArchiveEntryMBS

Function: Reads next header.
Notes:
If you pass in an existing entry, we can recycle the object.
Returns nil in case of error.

14.2.6 OpenData(Data as String) as Boolean

Function: Opens an archive from memory.
Notes: Returns true on success and false on failure.

14.2.7 OpenFile(File as FolderItem, BlockSize as Integer = 10240) as Boolean

Function: Opens an archive from a folderitem.
Notes: Returns true on success and false on failure.

14.2.8 ReadDataMemory(ByteCount as Integer) as MemoryBlock

Function: Reads data from current file into memoryblock.

14.2.9 ReadDataString(ByteCount as Integer) as String

Function: Reads data from current file into string.
14.2.10  **Skip**

**Function:** Skips a file in the archive.

14.2.11  **SupportFilterAll**

**Function:** Enables all filters.

14.2.12  **SupportFilterBZip2**

**Function:** Enables bzip2 filter.

14.2.13  **SupportFilterCompress**

**Function:** Enables compress filter.

14.2.14  **SupportFilterGRZip**

**Function:** Enables GRZip filter.

14.2.15  **SupportFilterGZip**

**Function:** Enable gzip filter.

14.2.16  **SupportFilterLRZip**

**Function:** Enable LRZip filter.
14.2.17 SupportFilterLZip

Function: Enable LZip filter.

14.2.18 SupportFilterLzma

Function: Enable LZMA filter.

14.2.19 SupportFilterLzop

Function: Enable Lzop filter.

14.2.20 SupportFilterNone

Function: Enable none filter.

14.2.21 SupportFilterRpm

Function: Enable RPM filter.

14.2.22 SupportFilterUU

Function: Enable UU filter.

14.2.23 SupportFilterXz

Function: Enable XZ filter. 
Notes: xz is a lossless data compression program and file format which incorporates the LZMA/LZMA2
14.2. CLASS ARCHIVEREADERMBS

compression algorithms.

14.2.24 SupportFormat7zip

14.2.25 SupportFormatAll

14.2.26 SupportFormatAr

14.2.27 SupportFormatByCode(FilterCode as Integer)

14.2.28 SupportFormatCab

14.2.29 SupportFormatCpio

14.2.30 SupportFormatEmpty

**Function:** Enables empty format.

14.2.31 SupportFormatGnutar

**Function:** Enables gnutar format.

14.2.32 SupportFormatIso9660

**Function:** Enables iso 9660 format.

14.2.33 SupportFormatLha

**Function:** Enables lha format.

14.2.34 SupportFormatLZ4

**Function:** Enables support for LZ4 format.

14.2.35 SupportFormatMTree

**Function:** Enables mtree format.

14.2.36 SupportFormatRar

**Function:** Enables rar format.
14.2. CLASS ARCHIVEREADERMBS

14.2.37 SupportFormatRaw

Function: Enables raw format.

14.2.38 SupportFormatTar

Function: Enables tape archive files format.

14.2.39 SupportFormatWArc

Function: Enables support for WArc format.

14.2.40 SupportFormatXar

Function: Enables xar format.

14.2.41 SupportFormatZip

Function: Enables zip format.
Notes: Enables both streamable and seekable zip readers.

14.2.42 SupportFormatZipSeekable

Function: Allows only support for seekable zip archives.
Notes: Reads starting from central directory; requires seekable input.

14.2.43 SupportFormatZipStreamable

Function: Enables support only for streamable zip archives.
Notes: Reads Zip archives as stream from beginning to end. Doesn’t correctly handle SFX ZIP files or ZIP archives that have been modified in-place.

14.2.44 Properties

14.2.45 FormatCapabilities as Integer

Function: Returns a bitmask of capabilities that are supported by the archive format reader.
Notes:
If the reader has no special capabilities, kFormatCapabilitiesNone is returned.
See also kFormatCapabilitiesEncryptMetaData and kFormatCapabilitiesEncryptData.
(Read only property)

14.2.46 HasEncryptedEntries as Integer

Function: Returns 1 if the archive contains at least one encrypted entry.
Notes:
If the archive format not support encryption at all kEncryptionUnsupported is returned. If for any other reason (e.g. not enough data read so far) we cannot say whether there are encrypted entries, then kEncryptionDontKnow is returned. In general, this function will return values below zero when the reader is uncertain or totally incapable of encryption support. When this function returns 0 you can be sure that the reader supports encryption detection but no encrypted entries have been found yet.

If the metadata/header of an archive is also encrypted, you cannot rely on the number of encrypted entries. That is why this function does not return the number of encrypted entries but just shows that there are some.
(Read only property)

14.2.47 HeaderPosition as Int64

Function: The current header position.
Notes:
Retrieve the byte offset in uncompressed data where last-read header started.
(Read only property)
14.2. Class ArchiveReaderMBS

14.2.48 Constants

14.2.49 kEncryptionDontKnow = -1

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the Encryption Status constants. **Notes:** If the reader for some other reason (e.g. not enough bytes read) cannot say if there are encrypted entries, kEncryptionDontKnow is returned.

14.2.50 kEncryptionUnsupported = -2

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the Encryption Status constants. **Notes:** In case the archive does not support encryption detection at all kEncryptionUnsupported is returned.

14.2.51 kFormatCapabilitiesEncryptData = 1

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the encryption capabilities constants. **Notes:** Reader can detect encrypted data.

14.2.52 kFormatCapabilitiesEncryptMetaData = 2

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the encryption capabilities constants. **Notes:** Reader can detect encryptable metadata (pathname, mtime, etc.).

14.2.53 kFormatCapabilitiesNone = 0

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the encryption capabilities constants. **Notes:** Current format supports no encryption.
14.3 class ArchiverMBS

14.3.1 class ArchiverMBS

Function: The abstract super class for common archiver methods.
Notes:
Currently we build this library without lzma and lz4 support. That could be changed if needed.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

14.3.2 Methods

14.3.3 Constructor

Function: The private constructor.

14.3.4 Destructor

Function: The destructor.

14.3.5 NewReader as ArchiveReaderMBS

Function: Creates a new archive reader.

14.3.6 NewWriter as ArchiveWriterMBS

Function: Creates a new archive writer.
14.3. CLASS ARCHIVERMBS

14.3.7 Properties

14.3.8 BZLibVersion as String

Function: The bzlib version used in this plugin.
Notes: This is empty if we compiled plugin without this library.
(Read only property)

14.3.9 Handle as Integer

Function: The internal object reference.
Notes: (Read only property)

14.3.10 Lasterror as Integer

Function: The last error code.
Notes: See kArchive constants.
(Read only property)

14.3.11 LibVersion as Integer

Function: The version of the archive C++ library.
Notes: e.g. 3001002 for version 3.1.2.
(Read only property)

14.3.12 LibVersionDetails as String

Function: The detailed version string for libArchive.
Notes:
Detailed textual name/version of the library and its dependencies.

This has the form:
"libarchive x.y.z zlib/a.b.c liblzma/d.e.f ... etc ...

the list of libraries described here will vary depending on how libarchive was compiled.
(Read only property)

### 14.3.13 LibVersionString as String

**Function:** The version of the archive C++ library as text.
**Notes:**
e.g. "libarchive 3.1.2"
(Read only property)

### 14.3.14 LZ4Version as String

**Function:** The lz4 version used in this plugin.
**Notes:**
This is empty if we compiled plugin without this library.
(Read only property)

### 14.3.15 LzmaVersion as String

**Function:** The lzma version used in this plugin.
**Notes:**
This is empty if we compiled plugin without this library.
(Read only property)

### 14.3.16 Open as Boolean

**Function:** Whether an archive is currently open.
14.3. CLASS ARCHIVERMBS

Notes: (Read only property)

14.3.17 ZLibVersion as String

Function: The zlib version used in this plugin.
Notes: This is empty if we compiled plugin without this library.
(Read only property)

14.3.18 Events

14.3.19 Passphrase(byref password as String) as Boolean

Function: The event to query for passphrase.
Notes: Please set password property and return true if you have one.

14.3.20 Constants

14.3.21 kArchiveEOF = 1

MBS Compression Plugin, Plugin Version: 16.2. Function: One of the error constants.
Notes: Found end of archive.

14.3.22 kArchiveFailed = -25

MBS Compression Plugin, Plugin Version: 16.2. Function: One of the error constants.
Notes: Current operation cannot complete.
But if writeHeader is ”fatal,” then this archive is dead and useless.

14.3.23 kArchiveFatal = -30

MBS Compression Plugin, Plugin Version: 16.2. Function: One of the error constants.
Notes: No more operations are possible.
14.3.24  \( k_{\text{ArchiveOK}} = 0 \)

MBS Compression Plugin, Plugin Version: 16.2. **Function:** One of the error constants. **Notes:** Operation was successful.

14.3.25  \( k_{\text{ArchiveRetry}} = -10 \)

MBS Compression Plugin, Plugin Version: 16.2. **Function:** One of the error constants. **Notes:** Retry might succeed.

14.3.26  \( k_{\text{ArchiveWarn}} = -20 \)

MBS Compression Plugin, Plugin Version: 16.2. **Function:** One of the error constants. **Notes:**

Partial success.

For example, if writeHeader "fails", then you can’t push data.

14.3.27  \( k_{\text{FilterBZip2}} = 2 \)

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the filter values. **Notes:** bzip2 filter

14.3.28  \( k_{\text{FilterCompress}} = 3 \)

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the filter values. **Notes:** compress filter.

14.3.29  \( k_{\text{FilterGRZip}} = 12 \)

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the filter values. **Notes:** GRZip filter.
14.3.30 kFilterGZip = 1

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the filter values.
**Notes:** gzip filter.

14.3.31 kFilterLRZip = 10

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the filter values.
**Notes:** LRZip filter.

14.3.32 kFilterLZ4 = 13

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the filter values.
**Notes:** LZ4 Filter.

14.3.33 kFilterLZip = 9

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the filter values.
**Notes:** LZip filter.

14.3.34 kFilterLZMA = 5

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the filter values.
**Notes:** LZMA filter.

14.3.35 kFilterLZOP = 11

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the filter values.
**Notes:** Lzop filter.

14.3.36 kFilterNone = 0

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the filter values.
**Notes:** No filter.
14.3.37 kFilterProgram = 4

MBS Compression Plugin, Plugin Version: 16.3. Function: One of the filter values.
Notes: Program filter.

14.3.38 kFilterRPM = 8

MBS Compression Plugin, Plugin Version: 16.3. Function: One of the filter values.
Notes: RPM filter.

14.3.39 kFilterUU = 7

MBS Compression Plugin, Plugin Version: 16.3. Function: One of the filter values.
Notes: UU filter.

14.3.40 kFilterXZ = 6

MBS Compression Plugin, Plugin Version: 16.3. Function: One of the filter values.
Notes: XZ filter.

14.3.41 kFormat7Zip = & he0000

MBS Compression Plugin, Plugin Version: 16.3. Function: One of the format constants.
Notes: 7Zip

14.3.42 kFormatAr = & h70000

MBS Compression Plugin, Plugin Version: 16.3. Function: One of the format constants.
Notes: Unix Archive format, base type.

14.3.43 kFormatArBsd = & h70002

MBS Compression Plugin, Plugin Version: 16.3. Function: One of the format constants.
Notes: Archive, BSD format.
14.3. CLASS ARCHIVERMBS

14.3.44 kFormatArGnu = & h70001

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants. **Notes:** Archive, GNU format.

14.3.45 kFormatBaseMask = & hff0000

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants. **Notes:** Mask for Base Type.

14.3.46 kFormatCab = & hc0000

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants. **Notes:** Windows CAB format.

14.3.47 kFormatCpio = & h0000

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants. **Notes:** CPIO base format.

14.3.48 kFormatCpioAfioLarge = & h0006

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants. **Notes:** CPIO format, AFIO large variant.

14.3.49 kFormatCpioBinBe = & h0003

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants. **Notes:** CPIO format, BIN BE variant.

14.3.50 kFormatCpioBinLe = & h0002

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants. **Notes:** CPIO format, BIN LE variant.
14.3.51   kFormatCpioPosix = & h10001

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants.  
**Notes:** CPIO format, Posix variant.

14.3.52   kFormatCpioSvr4Crc = & h10005

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants.  
**Notes:** CPIO format, SVR4 CRC variant.

14.3.53   kFormatCpioSvr4Nocrc = & h10004

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants.  
**Notes:** CPIO format, SVR4 no CRC variant.

14.3.54   kFormatEmpty = & h60000

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants.  
**Notes:** Empty format.

14.3.55   kFormatIso9660 = & h40000

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants.  
**Notes:** IOS 9660 base type.

14.3.56   kFormatIso9660Rockridge = & h40001

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants.  
**Notes:** IOS 9660, Rockridge variant.

14.3.57   kFormatLha = & hb0000

MBS Compression Plugin, Plugin Version: 16.3. **Function:** One of the format constants.  
**Notes:** LHA format.
14.3.58  \texttt{kFormatMtree} = & h80000

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants.
\textbf{Notes:} MTree format.

14.3.59  \texttt{kFormatRar} = & h0000

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants.
\textbf{Notes:} RAR format.

14.3.60  \texttt{kFormatRaw} = & h0000

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants.
\textbf{Notes:} Raw format.

14.3.61  \texttt{kFormatShar} = & h0000

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants.
\textbf{Notes:} SHAR base format.

14.3.62  \texttt{kFormatSharBase} = & h0001

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants.
\textbf{Notes:} SHAR base format, base variant.

14.3.63  \texttt{kFormatSharDump} = & h0002

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants.
\textbf{Notes:} SHAR base format, dump variant.

14.3.64  \texttt{kFormatTar} = & h0000

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants.
\textbf{Notes:} Tar base format.
14.3.65 \texttt{kFormatTarGnutar} $= \texttt{& h30004}$

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants. 
\textbf{Notes:} Tar format, GNU variant.

14.3.66 \texttt{kFormatTarPaxInterchange} $= \texttt{& h30002}$

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants. 
\textbf{Notes:} Tar format, Pax Interchange variant.

14.3.67 \texttt{kFormatTarPaxRestricted} $= \texttt{& h30003}$

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants. 
\textbf{Notes:} Tar format, Pax Restricted variant.

14.3.68 \texttt{kFormatTarUstar} $= \texttt{& h30001}$

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants. 
\textbf{Notes:} Tar format, US variant.

14.3.69 \texttt{kFormatWarc} $= \texttt{& hf0000}$

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants. 
\textbf{Notes:} WArc format.

14.3.70 \texttt{kFormatXar} $= \texttt{& ha0000}$

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants. 
\textbf{Notes:} Xar format.

14.3.71 \texttt{kFormatZip} $= \texttt{& h50000}$

MBS Compression Plugin, Plugin Version: 16.3. \textbf{Function:} One of the format constants. 
\textbf{Notes:} Zip format.
14.4. class ArchiveWriterMBS

**Function:** The class to write archive content.

**Example:**

```vbs
Dim a As New ArchiveWriterMBS

a.SetFormatZip
a.ZipSetCompressionDeflate

Dim f As FolderItem = SpecialFolder.Desktop.Child("test.zip")
If Not a.CreateFile(f) Then
    Break ' // failed
Else

    Dim data As String = "Hello World test file. Hello World again."

    Dim e As New ArchiveEntryMBS
    e.PathName = "Hello World.txt"
    e.Size = Lenb(data)
    e.Permissions = &O0644
    e.FileType = e.kFileTypeRegular

    a.WriteHeader e
    Call a.WriteData data

    a.FinishEntry

    a.Close

End If
```

**Notes:**

Can be used to write zip, tar and other image formats.
Subclass of the ArchiverMBS class.
14.4.2 Methods

14.4.3 AddFilter(FilterCode as Integer)

**Function:** Adds filter by code number.

14.4.4 AddFilterB64encode

**Function:** Adds base 64 filter.

14.4.5 AddFilterByName(Name as String)

**Function:** Adds filter by name.

14.4.6 AddFilterBZip2

**Function:** Add bzip2 filter.

14.4.7 AddFilterCompress

**Function:** Add compress filter.

14.4.8 AddFilterGZip

**Function:** Add gzip filter.
14.4. CLASS ARCHIVEWRITERMBS

14.4.9 AddFilterGZip

**Function:** Add gzip filter.

14.4.10 AddFilterLRZip

**Function:** Add lrzip filter.

14.4.11 AddFilterLZ4

**Function:** Add support for LZ4 compression.  
**Notes:** Lasterror is set.

14.4.12 AddFilterLZip

**Function:** Add lzip filter.

14.4.13 AddFilterLZMA

**Function:** Add lzma filter.

14.4.14 AddFilterLZOOp

**Function:** Add lzop filter.

14.4.15 AddFilterNone

**Function:** Add none filter.
14.4.16  AddFilterProgram(Command as String)

**Function:** Adds a filter calling external application.

14.4.17  AddFilterUUEncode

**Function:** Add uu filter.

14.4.18  AddFilterXZ

**Function:** Add xy filter.

14.4.19  Close

**Function:** Closes the archive.

14.4.20  Constructor

**Function:** The constructor.

14.4.21  CreateFile(File as FolderItem) as boolean

**Function:** Creates a new archive file.  
**Notes:** Returns true on success.

14.4.22  Destructor

**Function:** The destructor.
14.4.23  Fail

Function: Marks archive as failed.
Notes: We will not close the archive properly and you can delete file.

14.4.24  FinishEntry

Function: Finishes an entry.

14.4.25  SetFormat(FormatCode as Integer)

Function: Sets format by code.

14.4.26  SetFormat7Zip

Function: Sets format to 7zip.

14.4.27  SetFormatArBsd

Function: Sets format to ar bsd.

14.4.28  SetFormatArSvr4

Function: Sets format to ar svr4.

14.4.29  SetFormatByExtension(FileName as String, defaultExtension as String = "")

Function: Set file format by extension of filename.
Notes:
e.g. pass "test.zip" for file name and ".zip" for default extension (if filename has none). Lasterror is set.

14.4.30 SetFormatByName(Name as String)
Function: Sets format by name.

14.4.31 SetFormatCpio
Function: Sets format to cpio.

14.4.32 SetFormatCpioNewc
Function: Sets format to cpio newc.

14.4.33 SetFormatGnutar
Function: Sets format to gnu tape archive files.

14.4.34 SetFormatIso9660
Function: Sets format to iso 9660.

14.4.35 SetFormatMTree
Function: Sets format to mtree.
14.4. CLASS ARCHIVEWRITERMBS

14.4.36 SetFormatMTreeClassic

Function: Sets format to mtree classic.

14.4.37 SetFormatPax

Function: Sets format to pax.

14.4.38 SetFormatPaxRestricted

Function: Sets format to pax restricted.

14.4.39 SetFormatRaw

Function: Sets raw format.

14.4.40 SetFormatShar

Function: Sets format to shar.

14.4.41 SetFormatSharDump

Function: Sets format to shar dump.

14.4.42 SetFormatUstar

Function: Sets format to Unix Standard TAR.
14.4.43 SetFormatV7tar

**Function:** Sets format to v7 tape archive files.

14.4.44 SetFormatWArc

**Function:** Sets format to web archive.

14.4.45 SetFormatXar

**Function:** Sets format to xar.

14.4.46 SetFormatZip

**Function:** Sets format to zip.
**Example:**

```vbnet
dim a as new ArchiveWriterMBS
a.SetFormatZip
a.ZipSetCompressionDeflate

dim f as FolderItem = SpecialFolder.Desktop.Child("test.zip")
if not a.CreateFile(f) then
    break // failed
else

dim data as string = "Hello World test file. Hello World again."

dim e as new ArchiveEntryMBS
e.PathName = "Hello World.txt"
e.Size = lenb(data)
e.Permissions = & o0644
e.FileType = e.kFileTypeRegular
a.WriteHeader e
call a.WriteData data
```
14.4. CLASS ARCHIVEWRITERMBS

a. FinishEntry

a. Close

end if

14.4.47 SetPassphrase(Password as String)

Function: Sets the passphrase to use.

Notes: Alternatively you can use the Passphrase event.

14.4.48 WriteData(data as MemoryBlock) as Int64

Function: Writes data to current file.

Notes: Returns number of bytes written.

See also:

- 14.4.49 WriteData(data as Ptr, Size as Int64) as Int64
- 14.4.50 WriteData(data as string) as Int64

14.4.49 WriteData(data as Ptr, Size as Int64) as Int64

Function: Writes data to current file.

Notes: Returns number of bytes written.

See also:

- 14.4.48 WriteData(data as MemoryBlock) as Int64
- 14.4.50 WriteData(data as string) as Int64

14.4.50 WriteData(data as string) as Int64

Function: Writes data to current file.

Notes: Returns number of bytes written.

See also:
14.4.48 WriteData(data as MemoryBlock) as Int64

14.4.49 WriteData(data as Ptr, Size as Int64) as Int64

14.4.51 WriteHeader(Entry as ArchiveEntryMBS)

Function: Writes an archive item.

14.4.52 ZipSetCompressionDeflate

Function: Sets compression for zip to deflate.

14.4.53 ZipSet CompressionStore

Function: Sets compression for zip to store.
Notes: Store is no compression.
Chapter 15

Audio

15.1 class AUPlayerMBS

15.1.1 class AUPlayerMBS

Notes:
This is a better Core Audio based player which has a lot of features like pitch, rate, volume, equalizer and other features.
Beside playing audio you can also use this class to get sample data from audio files.

Currently only stereo is supported (2 channels maximum).

15.1.2 Methods

15.1.3 ChannelMap as Integer()

Notes: The map should have an entry for each input channel and inside the number of the output channel or -1 to keep it silent.
15.1.4 Data as Memoryblock

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the data to play.

**Notes:**
The other data properties define what format this data has.
Typically 4 byte floats per sample interleaved for all channels.

15.1.5 LoadFile(file as folderitem, InputChannels as Integer = 2, OutputChannels as Integer = 2) as boolean

**Notes:**
InputChannels is the number of channels we want to get back from file reader.
OutputChannels is the number of channels we want to have for output.
Returns true on success or false on failure.

15.1.6 LoadFileMT(file as folderitem, InputChannels as Integer = 2, OutputChannels as Integer = 2) as boolean

**Notes:**
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

InputChannels is the number of channels we want to get back from file reader.
OutputChannels is the number of channels we want to have for output.
Returns true on success or false on failure.

15.1.7 Pause

**Notes:** Lasterror is set.
15.1.8 Play

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Starts playback. **Notes:** Lasterror is set.

15.1.9 Reset

MBS MacOSX Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Resets audio units. **Notes:** Useful after changing options.

15.1.10 setChannelMap(values() as Integer)

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a new channel map. **Notes:** The map should have an entry for each input channel and inside the number of the output channel or -1 to keep it silent.

15.1.11 updateEQ(eqBands() as Double)

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates equalizer. **Notes:** Please pass array of 32 values from -12 to 12. Lasterror is set. See also:

- 15.1.12 updateEQ(eqBands() as single) 2867

15.1.12 updateEQ(eqBands() as single)

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates equalizer. **Notes:** Please pass array of 32 values from -12 to 12. Lasterror is set. See also:

- 15.1.11 updateEQ(eqBands() as Double) 2867
15.1.13 Properties

15.1.14 ClientFormatString as String

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The input format description string. **Notes:** (Read only property)

15.1.15 ConverterHandle as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the converter audio unit. **Notes:** (Read and Write property)

15.1.16 CurrentDeviceID as UInt32

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get or set the current device. **Notes:** Please check OutputDevices dictionary for which devices are available. (Read and Write property)

15.1.17 CurrentTime as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current time in seconds. **Notes:** Lasterror is set. (Read and Write property)

15.1.18 DataIsFloat as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether data is floating point. **Notes:** (Read only property)
15.1.19  DataIsInterleaved as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether data is interleaved.  
**Notes:** (Read only property)

15.1.20  DataIsNativeEndian as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether data is native endian.  
**Notes:** (Read only property)

15.1.21  DataIsPCM as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether data is PCM format.  
**Notes:**  
Linear PCM.  
(Read only property)

15.1.22  DataIsSignedInteger as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether data is signed integers.  
**Notes:** (Read only property)

15.1.23  DataNumberChannels as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of channels.  
**Notes:** (Read only property)

15.1.24  DataNumberChannelStreams as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of channels.
CHAPTER 15. AUDIO

Notes: (Read only property)

15.1.25 DataNumberInterleavedChannels as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Number of interleaved channels. Notes: (Read only property)

15.1.26 DataSampleWordSize as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The size of a sample word. Notes: (Read only property)

15.1.27 DefaultDeviceID as UInt32

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Queries the Core Audio ID of the default device. Notes: (Read only property)

15.1.28 EnablePeakLocking as Boolean

MBS MacOSX Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether peak locking is enabled. Notes:

Default value is true.
Only if UseNewTimePitchUnit is set to true.
(Read and Write property)

15.1.29 EqualizerHandle as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The handle to the equalizer audio unit. Notes: (Read and Write property)
15.1.30  File as FolderItem

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The reference to the folderitem used to load audio file.  
**Notes:** (Read only property)

15.1.31  GraphHandle as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the audio graph.  
**Notes:** (Read and Write property)

15.1.32  Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code.  
**Notes:**  
Zero is no error.  
(Read and Write property)

15.1.33  LoopIn as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The position where loop starts.  
**Notes:** (Read and Write property)

15.1.34  Looping as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to loop.  
**Notes:** (Read and Write property)

15.1.35  LoopOut as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The position where loop ends.
15.1.36  **MaximumFramesPerSlice as Integer**

MBS MacOSX Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum number of frames per slice.  
**Notes:**  
Default seems to be 1156 by Core Audio.  
(Read and Write property)

15.1.37  **MeterLevel as Double**

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries meter level.  
**Notes:**  
Lasterror is set.  
Value is smaller than -120 if unknown.  
(Read only property)

15.1.38  **MixerHandle as Integer**

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the mixer audio unit.  
**Notes:**  
(Read and Write property)

15.1.39  **OutputDevices as Dictionary**

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries a dictionary with output devices.  
**Notes:**  
Key is the ID and value is the name of the device.  
(Read only property)
15.1.40 OutputFormatString as String

Notes: (Read only property)

15.1.41 OutputHandle as Integer

Notes: (Read and Write property)

15.1.42 OutputUnit as Integer

Notes: Apple offer various output units and here you can decide which one to use.
Setting takes effect the next time you call LoadFile.
(Read and Write property)

15.1.43 OutputVolume as Double

Notes: Lasterror is set.
From 0.0 to 1.0.
(Read and Write property)

15.1.44 Overlap as Double

Notes: Range is 3.0 to 32.0 and default is 8.0.
Only if UseNewTimePitchUnit is set to true.
15.1.45 Pan as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The output pan. 
**Notes:** 
From -1.0 to 1.0.  
Lasterror is set. 
(Read and Write property)

15.1.46 PitchRate as Double

**Notes:** 
Lasterror is set. 
(Read and Write property)

15.1.47 Playing as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the player is playing. 
**Notes:** (Read and Write property)

15.1.48 SampleRate as Double

**Notes:** (Read only property)

15.1.49 Tag as Variant

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The tag value. 
**Notes:**
You can use this property to store whatever you like.
(Read and Write property)

15.1.50 **TimePitchHandle as Integer**

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the time audio unit.
**Notes:** (Read and Write property)

15.1.51 **TimePitchUnit as Integer**

MBS MacOSX Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Which time pitch unit to use.
**Notes:**
Apple offer various time pitch units and here you can decide which one to use.
Setting takes effect the next time you call LoadFile.
(Read and Write property)

15.1.52 **TimeRate as Double**

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time rate.
**Notes:**
Lasterror is set.
(Read and Write property)

15.1.53 **TrackLength as Double**

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Length of the audio track in seconds.
**Notes:**
Lasterror is set.
(Read only property)
15.1.54 VariSpeedHandle as Integer

MBS MacOSX Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the vari speed audio unit.  
**Notes:** (Read and Write property)

15.1.55 InputEnabled(inputNum as UInt32) as boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enable or disable input.  
**Notes:**
Lasterror is set.  
(Read and Write computed property)

15.1.56 InputVolume(inputNum as UInt32) as Double

**Notes:**
Lasterror is set.  
(Read and Write computed property)

15.1.57 Constants

15.1.58 OutputUnitDefault = 0

MBS MacOSX Plugin, Plugin Version: 15.0. **Function:** One of the output units.  
**Notes:** Plugin default, currently HALOutput.

15.1.59 OutputUnitDefaultOutput = 3

MBS MacOSX Plugin, Plugin Version: 15.0. **Function:** One of the output units.  
**Notes:** A specialisation of AUHAL that is used to track the user’s selection of the default device as set in the Sound Prefs
15.1. CLASS AUPLAYERMBS

15.1.60 OutputUnitGenericOutput = 1

MBS MacOSX Plugin, Plugin Version: 15.0. **Function:** One of the output units.
**Notes:** A generic output unit provides the start/stop API, and provides the basic services to convert Linear PCM formats.

15.1.61 OutputUnitHALOutput = 2

MBS MacOSX Plugin, Plugin Version: 15.0. **Function:** One of the output units.
**Notes:** The audio unit that interfaces to any audio device. The user specifies which audio device to track. The audio unit can do input from the device as well as output to the device. Bus 0 is used for the output side, bus 1 is used to get audio input from the device.

15.1.62 OutputUnitSystemOutput = 4

MBS MacOSX Plugin, Plugin Version: 15.0. **Function:** One of the output units.
**Notes:** A specialisation of AUHAL that is used to track the user’s selection of the device to use for sound effects, alerts and other UI sounds.

15.1.63 TimePitchUnitDefault = 0

MBS MacOSX Plugin, Plugin Version: 15.0. **Function:** One of the time pitch units.
**Notes:** Default, plugin chooses one. (normal TimePitch)

15.1.64 TimePitchUnitTimePitch = 1

MBS MacOSX Plugin, Plugin Version: 15.0. **Function:** One of the time pitch units.
**Notes:** An audio unit that can be used to have independent control of both playback rate and pitch.

15.1.65 TimePitchUnitVarispeed = 2

MBS MacOSX Plugin, Plugin Version: 15.0. **Function:** One of the time pitch units.
**Notes:** An audio unit that can be used to control playback rate (as the rate is faster, the pitch is higher).
15.2 class CAPlayThroughMBS

15.2.1 class CAPlayThroughMBS

MBS MacOSX Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to do active play through on Mac OS X using CoreAudio. **Notes:** This class uses newer code than the AudioPlayThruMBS class and may work better for some people.

15.2.2 Methods

15.2.3 Constructor(InputDeviceID as Integer, OutputDeviceID as Integer)

MBS MacOSX Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor. **Notes:** Lasterror is set. Device IDs are the IDs you get in the CoreAudio classes.

15.2.4 IsRunning as boolean

MBS MacOSX Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether playthrough is running.

15.2.5 Start

MBS MacOSX Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Starts play through. **Notes:** Lasterror is set.

15.2.6 Stop

MBS MacOSX Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops play through. **Notes:** Lasterror is set.
15.2. **CLASS CAPLAYTHROUGHMBS**

15.2.7 **Properties**

15.2.8 **ExtraLatency as Integer**

MBS MacOSX Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Extra latency. **Notes:**

When the latency is calculated, we add this value.
Unit is bytes.

Calculation of the buffer size is like this:

```
if (UseMinimumLatency)
  InToOutSampleOffset = ExtraLatency + InputDevice.SafetyOffset + OutputDevice.SafetyOffset
else
```

(Read and Write property)

15.2.9 **Lasterror as Integer**

MBS MacOSX Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code reported. **Notes:** (Read and Write property)

15.2.10 **UseMinimumLatency as Boolean**

MBS MacOSX Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to reduce latency to the absolute minimum. **Notes:**

By default a large latency is used to ensure a smoother playthrough.
But you can have it set to the absolute minimum.

Calculation of the buffer size is like this:

```
if (UseMinimumLatency)
  InToOutSampleOffset = ExtraLatency + InputDevice.SafetyOffset + OutputDevice.SafetyOffset
else
```
15.2.11 Volume as Double

MBS MacOSX Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get or set the volume of the output audio unit.

**Notes:**

- Lasterror is set.
- Range is from 0.0 to 1.0.

(Read and Write computed property)
15.3 CLASS CoreAudioListenerMBS

15.3.1 class CoreAudioListenerMBS

MBS MacOSX Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The class to watch for changes to CoreAudio property.

15.3.2 Methods

15.3.3 Constructor(ObjectID as UInt32, PropertySelector as UInt32, PropertyScope as UInt32, PropertyElement as UInt32)

Notes:
Please pass object ID and property selector values (see example project).
Lasterror is zero on success.

15.3.4 Destructor

15.3.5 Properties

15.3.6 LastError as Integer

Notes: (Read only property)

15.3.7 ObjectID as UInt32

MBS MacOSX Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The object ID used in constructor.
Notes: (Read only property)
15.3.8 PropertyElement as UInt32

Notes: (Read only property)

15.3.9 PropertyScope as UInt32

Notes: (Read only property)

15.3.10 PropertySelector as UInt32

MBS MacOSX Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The selector value used in constructor.
Notes: (Read only property)

15.3.11 Events

15.3.12 Changed

15.4. **CLASS COREAUDIOMBS**

15.4  class CoreAudioMBS

15.4.1  class CoreAudioMBS

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for low level CoreAudio calls. **Notes:** Currently not finished for the 4.0 release.

15.4.2  Methods

15.4.3  **AudioDeviceGetPropertyCFString(AudioDeviceID as Integer, channel as Integer, isinput as boolean, propertyID as string) as string**

MBS MacOSX Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets a property value from the Audio Device. **Notes:** Lasterror is set. The property you query must be one of the CFString properties.

15.4.4  **AudioDeviceGetPropertyInfo(AudioDeviceID as Integer, channel as Integer, isinput as boolean, propertyID as string, byref size as Integer, byref writeable as boolean)**

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets property information from an Audio Unit. **Notes:** Lasterror is set.

15.4.5  **AudioDeviceGetPropertyMemory(AudioDeviceID as Integer, channel as Integer, isinput as boolean, propertyID as string) as memoryblock**

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets a property value from the Audio Device. **Notes:** Lasterror is set.
15.4.6 AudioDeviceGetPropertyString(AudioDeviceID as Integer, channel as Integer, isinput as boolean, propertyID as string) as string

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets a property value from the Audio Device.  
**Notes:** Lasterror is set.

15.4.7 AudioDeviceSetPropertyMemory(AudioDeviceID as Integer, when as memoryblock, channel as Integer, isinput as boolean, propertyID as string, data as memoryblock, offset as Integer, length as Integer)

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a property value for the Audio Device.  
**Notes:** Lasterror is set.

15.4.8 AudioDeviceSetPropertyString(AudioDeviceID as Integer, when as memoryblock, channel as Integer, isinput as boolean, propertyID as string, data as string)

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a property value for the Audio Device.  
**Notes:** Lasterror is set.

15.4.9 AudioHardwareGetPropertyCFString(propertyID as string) as string

MBS MacOSX Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets a property value from the Audio Hardware.  
**Notes:** Lasterror is set.  
The property you query must be one of the CFString properties.

15.4.10 AudioHardwareGetPropertyInfo(propertyID as string, byref size as Integer, byref writeable as boolean)

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets property information from the Audio Hardware.  
**Notes:** Lasterror is set.
15.4.11 AudioHardwareGetPropertyMemory(propertyID as string) as memoryblock

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Gets a property value from the Audio Hardware.
Notes: Lasterror is set.

15.4.12 AudioHardwareGetPropertyString(propertyID as string) as string

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Gets a property value from the Audio Hardware.
Notes: Lasterror is set.

15.4.13 AudioHardwareSetPropertyMemory(propertyID as string, data as memoryblock, offset as Integer, length as Integer)

Notes: Lasterror is set.

15.4.14 AudioHardwareSetPropertyString(propertyID as string, data as string)

Notes: Lasterror is set.

15.4.15 AudioObjectGetPropertyData(inObjectID as Integer, AddressSelector as UInt32, AddressScope as UInt32, AddressElement as UInt32, QualifierData as memoryblock = nil, InputData as Memoryblock = nil) as memoryblock

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Queries an AudioObject to get the data of the given property and places it in the provided buffer.
Notes:
The plugin queries size and creates a buffer for the result.
inObjectID: The AudioObject to query.
AddressSelector, AddressScope or AddressElement: An audio object property address indicating which prop-
AudioObjectGetPropertyDataSize

15.4.16 AudioObjectGetPropertyDataSize(inObjectID as Integer, AddressSelector as UInt32, AddressScope as UInt32, AddressElement as UInt32, QualifierData as memoryblock = nil) as UInt32

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries an AudioObject to find the size of the data for the given property. **Notes:**

inObjectID: The AudioObject to query.
AddressSelector, AddressScope or AddressElement: An audio object property address indicating which property is being queried.
QualifierData: A buffer of data to be used in determining the data of the property being queried. Note that not all properties require qualification, in which case this value will be nil.

Returns an UInt32 indicating how many bytes the data for the given property occupies. Lasterror is set.

AudioObjectSetPropertyData

15.4.17 AudioObjectSetPropertyData(inObjectID as Integer, AddressSelector as UInt32, AddressScope as UInt32, AddressElement as UInt32, Data as Memoryblock, QualifierData as memoryblock = nil)

MBS MacOSX Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Tells an AudioObject to change the value of the given property using the provided data. **Notes:**

inObjectID: The AudioObject to query.
AddressSelector, AddressScope or AddressElement: An audio object property address indicating which property is being queried.
QualifierData: A buffer of data to be used in determining the data of the property being queried. Note that not all properties require qualification, in which case this value will be nil.

Lasterror is set.
15.4.18  **AudioOutputUnitStart(componenthandle as Integer) as Integer**

MBS MacOSX Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Starts the Audio Unit.
**Notes:** Errorcode is returned.

15.4.19  **AudioOutputUnitStop(componenthandle as Integer) as Integer**

MBS MacOSX Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Stops the AudioUnit.
**Notes:** Errorcode is returned.

15.4.20  **AudioStreamGetPropertyCFString(AudioStreamID as Integer, channel as Integer, propertyID as string) as string**

MBS MacOSX Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets a property value from the Audio Stream.
**Notes:**
Lasterror is set.
The property you query must be one of the CFString properties.

15.4.21  **AudioStreamGetPropertyInfo(AudioStreamID as Integer, channel as Integer, propertyID as string, byref size as Integer, byref writeable as boolean)**

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets property information from an Audio Stream.
**Notes:** Lasterror is set.

15.4.22  **AudioStreamGetPropertyMemory(AudioStreamID as Integer, channel as Integer, propertyID as string) as memoryblock**

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets a property value from the Audio Stream.
**Notes:** Lasterror is set.
15.4.23 AudioStreamGetPropertyString(AudioStreamID as Integer, channel as Integer, propertyID as string) as string

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets a property value from the Audio Stream.  
**Notes:** Lasterror is set.

15.4.24 AudioStreamSetPropertyMemory(AudioStreamID as Integer, when as memoryblock, channel as Integer, propertyID as string, data as memoryblock, offset as Integer, length as Integer)

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a property value for the Audio Stream.  
**Notes:** Lasterror is set.

15.4.25 AudioStreamSetPropertyString(AudioStreamID as Integer, when as memoryblock, channel as Integer, propertyID as string, data as string)

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a property value for the Audio Stream.  
**Notes:** Lasterror is set.

15.4.26 AudioUnitGetParameter(AudioUnit as Integer, ParameterID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer) as single

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets an audio unit parameter.

15.4.27 AudioUnitGetPropertyCFString(AudioUnit as Integer, propertyID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer) as string

MBS MacOSX Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets a property of an Audio Unit.  
**Notes:**  
Lasterror is set.  
Constants for AudioUnitScope:
The property you query must be one of the CFString properties.

15.4.28  AudioUnitGetPropertyInfo(AudioUnit as Integer, propertyID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer, byref size as Integer, byref writeable as boolean)

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Gets property information from the Audio Unit.

**Notes:**
Lasterror is set.

Constants for AudioUnitScope:

```
kAudioUnitScope_Global  = 0
kAudioUnitScope_Input   = 1
kAudioUnitScope_Output  = 2
kAudioUnitScope_Group   = 3
kAudioUnitScope_Part    = 4
```

15.4.29  AudioUnitGetPropertyMemory(AudioUnit as Integer, propertyID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer) as memoryblock

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Gets a property of an Audio Unit.

**Notes:**
Lasterror is set.

Constants for AudioUnitScope:

```
kAudioUnitScope_Global  = 0
kAudioUnitScope_Input   = 1
kAudioUnitScope_Output  = 2
kAudioUnitScope_Group   = 3
kAudioUnitScope_Part    = 4
```
15.4.30 AudioUnitGetPropertyString(AudioUnit as Integer, propertyID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer) as string

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Gets a property of an Audio Unit.

**Notes:**

- Lasterror is set.
- Constants for AudioUnitScope:

  kAudioUnitScope_Global = 0
  kAudioUnitScope_Input = 1
  kAudioUnitScope_Output = 2
  kAudioUnitScope_Group = 3
  kAudioUnitScope_Part = 4

15.4.31 AudioUnitInitialize(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**

Initializes the Audio Unit.

**Notes:** Errorcode is returned.

15.4.32 AudioUnitReset(componenthandle as Integer, scope as Integer, element as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**

Resets the Audio Unit.

**Notes:**

- Errorcode is returned.

Useful constants:
15.4.33 AudioUnitSetParameter(AudioUnit as Integer, ParameterID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer, value as single, BufferOffsetInFrames as Integer)

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets an audio unit parameter.

15.4.34 AudioUnitSetPropertyMemory(AudioUnit as Integer, propertyID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer, data as memoryblock, offset as Integer, length as Integer)

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a property of an Audio Unit.

**Notes:**
Lasterror is set.

Constants for AudioUnitScope:

kAudioUnitScope_Global  = 0
kAudioUnitScope_Input   = 1
kAudioUnitScope_Output  = 2
kAudioUnitScope_Group   = 3
kAudioUnitScope_Part    = 4

15.4.35 AudioUnitSetPropertyString(AudioUnit as Integer, propertyID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer, data as string)

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a property value for the Audio Unit.

**Notes:**
Lasterror is set.

Constants for AudioUnitScope:
15.4.36  AudioUnitUninitialize(componenthandle as Integer) as Integer

15.4.37  CloseComponent(componenthandle as Integer)

MBS MacOSX Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Closes a component. Notes: Do not use the componenthandle any more after this call!

15.4.38  CoreAudioConvertHostTimeToNanosMBS(inHostTime as UInt64) as UInt64

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Convert the given host time to a time in Nanoseconds. Notes: Returns 0 on any error.

15.4.39  CoreAudioConvertNanosToHostTimeMBS(inNanos as UInt64) as UInt64

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Convert the given Nanoseconds time to a time in the host clock’s time base. Notes: Returns 0 on any error.

15.4.40  CoreAudioGetCurrentHostTimeMBS as UInt64

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Retrieve the current host time value. Notes: Returns 0 on any error.
15.4.41 CoreAudioGetHostClockFrequencyMBS as Double

MBS MacOSX Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieve the number of ticks per second of the host clock.

15.4.42 GetHostClockMinimumTimeDeltaMBS as Integer

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieve the smallest number of ticks difference between two succeeding values of the host clock. **Notes:**

For instance, if this value is 5 and the first value of the host clock is X then the next time after X will be at greater than or equal X+5.

Returns an unsigned integer value.

15.4.43 OpenDefaultComponent(type as string, subtype as string) as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens the default component for the given type and subtype string. **Notes:**

You can check the "QT Components list" example project for which components are installed.

Returns 0 on any error.

type and subtype must be 4 letter codes.

useful constans:

15.4.44 Properties

15.4.45 kAudioDeviceProcessorOverload as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.46 kAudioDevicePropertyActualSampleRate as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio.

Notes: (Read only property)

15.4.47  kAudioDevicePropertyAvailableNominalSampleRates as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio.

Notes: (Read only property)

15.4.48  kAudioDevicePropertyBufferFrameSize as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio.

Notes: (Read only property)

15.4.49  kAudioDevicePropertyBufferFrameSizeRange as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio.
15.4.50  kAudioDevicePropertyBufferSize as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.51  kAudioDevicePropertyBufferSizeRange as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.52  kAudioDevicePropertyClockSource as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.53  kAudioDevicePropertyClockSourceNameForID as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.54  kAudioDevicePropertyClockSourceNameForIDCFString as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.55  kAudioDevicePropertyClockSources as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.56  kAudioDevicePropertyDataSource as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.57  kAudioDevicePropertyDataSourceNameForID as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.58  kAudioDevicePropertyDataSourceNameForIDCFString as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.59  kAudioDevicePropertyDataSources as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.60  kAudioDevicePropertyDeviceCanBeDefaultDevice as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.61  kAudioDevicePropertyDeviceCanBeDefaultSystemDevice as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function: One of the constants for CoreAudio.
15.4.62 kAudioDevicePropertyDeviceIsAlive as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.63 kAudioDevicePropertyDeviceIsRunning as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.64 kAudioDevicePropertyDeviceIsRunningSomewhere as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.65 kAudioDevicePropertyDeviceManufacturer as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.66 kAudioDevicePropertyDeviceManufacturerCFString as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.67 kAudioDevicePropertyDeviceName as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio.
Notes: (Read only property)

15.4.68 kAudioDevicePropertyDeviceNameCFString as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.69 kAudioDevicePropertyDeviceUID as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.70 kAudioDevicePropertyDriverShouldOwniSub as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.71 kAudioDevicePropertyHogMode as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.72 kAudioDevicePropertyIOProcStreamUsage as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.73 kAudioDevicePropertyJackIsConnected as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
15.4. CLASS COREAUDIOMBS

Notes: (Read only property)

15.4.74 kAudioDevicePropertyLatency as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.75 kAudioDevicePropertyMute as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.76 kAudioDevicePropertyNominalSampleRate as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.77 kAudioDevicePropertyPlayThru as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.78 kAudioDevicePropertyPlugIn as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.79 kAudioDevicePropertyPreferredChannelsForStereo as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
15.4.80 kAudioDevicePropertyRegisterBufferList as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.81 kAudioDevicePropertySafetyOffset as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.82 kAudioDevicePropertyStreamConfiguration as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.83 kAudioDevicePropertyStreamFormat as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.84 kAudioDevicePropertyStreamFormatMatch as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.85 kAudioDevicePropertyStreamFormats as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
15.4. CLASS COREAUDIOMBS

Notes: (Read only property)

15.4.86  kAudioDevicePropertyStreamFormatSupported as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.87  kAudioDevicePropertyStreams as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.88  kAudioDevicePropertySubMute as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.89  kAudioDevicePropertySubVolumeDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.90  kAudioDevicePropertySubVolumeDecibelsToScalar as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.91  kAudioDevicePropertySubVolumeRangeDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
15.4.92 \texttt{kAudioDevicePropertySubVolumeScalar} as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function}: One of the constants for CoreAudio.
\textbf{Notes}: (Read only property)

15.4.93 \texttt{kAudioDevicePropertySubVolumeScalarToDecibels} as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function}: One of the constants for CoreAudio.
\textbf{Notes}: (Read only property)

15.4.94 \texttt{kAudioDevicePropertySupportsMixing} as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function}: One of the constants for CoreAudio.
\textbf{Notes}: (Read only property)

15.4.95 \texttt{kAudioDevicePropertyTransportType} as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function}: One of the constants for CoreAudio.
\textbf{Notes}: (Read only property)

15.4.96 \texttt{kAudioDevicePropertyUsesVariableBufferFrameSizes} as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function}: One of the constants for CoreAudio.
\textbf{Notes}: (Read only property)

15.4.97 \texttt{kAudioDevicePropertyVolumeDecibels} as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function}: One of the constants for CoreAudio.
15.4. CLASS COREAUDIOMBS

Notes: (Read only property)

15.4.98  kAudioDevicePropertyVolumeDecibelsToScalar as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.99  kAudioDevicePropertyVolumeRangeDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.100  kAudioDevicePropertyVolumeScalar as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.101  kAudioDevicePropertyVolumeScalarToDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.102  kAudioHardwarePropertyBootChimeVolumeDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes:
A Float32 that represents the value of the boot chime volume control in dB. This property is implemented by an AudioControl object that is a subclass of AudioBootChimeVolumeControl.
(Read only property)
15.4.103  kAudioHardwarePropertyBootChimeVolumeDecibelsToScalar as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)
15.4. CLASS COREAUDIOMBS

15.4.104 kAudioHardwarePropertyBootChimeVolumeRangeDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.105 kAudioHardwarePropertyBootChimeVolumeScalar as String

Notes: (Read only property)

15.4.106 kAudioHardwarePropertyBootChimeVolumeScalarToDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.107 kAudioHardwarePropertyDefaultInputDevice as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.108 kAudioHardwarePropertyDefaultOutputDevice as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.109 kAudioHardwarePropertyDefaultSystemOutputDevice as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio.
Notes: (Read only property)
15.4.110  **kAudioHardwarePropertyDeviceForUID as String**

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.111  **kAudioHardwarePropertyDevices as String**

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.112  **kAudioHardwarePropertyRunLoop as String**

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.113  **kAudioHardwarePropertySleepingIsAllowed as String**

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.114  **kAudioHardwarePropertyUnloadingIsAllowed as String**

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.115  **kAudioPropertyWildcardChannel as Integer**

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)
15.4. CLASS COREAUDIOMBS

15.4.116  kAudioPropertyWildcardPropertyID as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.117  kAudioPropertyWildcardSection as Integer

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.118  kAudioStreamPropertyDirection as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.119  kAudioStreamPropertyOwningDevice as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.120  kAudioStreamPropertyPhysicalFormat as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)

15.4.121  kAudioStreamPropertyPhysicalFormatMatch as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants for CoreAudio. **Notes:** (Read only property)
15.4.122 kAudioStreamPropertyPhysicalFormats as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio. Notes: (Read only property)

15.4.123 kAudioStreamPropertyPhysicalFormatSupported as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio. Notes: (Read only property)

15.4.124 kAudioStreamPropertyStartingChannel as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio. Notes: (Read only property)

15.4.125 kAudioStreamPropertyTerminalType as String

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the constants for CoreAudio. Notes: (Read only property)

15.4.126 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The last error code returned. Notes: 0 for success. (Read and Write property)
15.5. class CoreAudioPlayerMBS

15.5.1 class CoreAudioPlayerMBS

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to play sounds from a memoryblock using CoreAudio.

**Notes:**

This class uses an internal buffer of around 100000 samples which when played with a samplerate of 8000 will play for 10 seconds.
The music stops playing after this object is destroyed.
Mac OS X is required.

15.5.2 Methods

15.5.3 AddAudio(Data as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds integer audio.

**Notes:**

Data: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

You need to set NumberOfChannels before calling this method.
NumberOfChannels can be 1 or 2. For 2 channels, sound data must be interleaved.

Values for bitsize:

- 7 signed byte
- 8 unsigned byte
- 15 signed short
- 16 unsigned short
- 24 unsigned medium
- 31 signed integer
- 32 unsigned integer
This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.

15.5.4 AddAudioStereo(Data1 as memoryblock, Data2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

Notes:
This is a special version of PlayAudio which takes samples from both memoryblocks and interleaves them.

Data1: a memoryblock with the sound data
Data2: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

You need to set NumberOfChannels before calling this method.
NumberOfChannels must be 2 for this method.

Values for bitsize:

7 signed byte
8 unsigned byte
15 signed short
16 unsigned short
24 unsigned medium
31 signed integer
32 unsigned integer

This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.
15.5.5 AddFloatAudio(FloatData as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds float audio.

**Notes:**

FloatData: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

The samples are stored in 32bit float values (memoryblock.SingleValue)

You need to set NumberOfChannels before calling this method.
NumberOfChannels can be 1 or 2. For 2 channels, sound data must be interleaved.

This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.

15.5.6 AddFloatAudioStereo(FloatData1 as memoryblock, FloatData2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds float audio.

**Notes:**

This is a special version of PlayFloatAudio which takes samples from both memoryblocks and interleaves them.

FloatData1: a memoryblock with the sound data filled with single values.
FloatData2: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

The samples are stored in 32bit float values (memoryblock.SingleValue)

You need to set NumberOfChannels before calling this method.
NumberOfChannels must be 2 for this method.

This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.
15.5.7 Close

MBS MacOSX Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

**Notes:**

There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

15.5.8 FreeSpace as Integer

MBS MacOSX Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of buffer entries available in the queue.

**Notes:** The size of the buffers is not limited except your available memory.

15.5.9 HardwareNumberOfChannels as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the actual number of channels in the default device; to set the number of channels being output, use numberOfChannels.

**Notes:**

This class can only play stereo to 2 channel devices or mono to all channels.
Returns 0 on any error.

15.5.10 HardwareSampleRate as single

MBS MacOSX Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The hardware sample rate.

**Notes:** Today this is normally 44100 Hz. Or 0 on any error.

15.5.11 HasFreeSpace as boolean

MBS MacOSX Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns true if the internal sound buffer is not full.

**Notes:**
Returns true if freespace returns a value greater than zero.

This function was named IsQueueEmpty in plugin version 7.4.

15.5.12 PlayAudio(Data as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds integer audio and starts playback.  
**Notes:**  
Data: a memoryblock with the sound data  
offsetBytes: the number of the bytes to start playing (0=first)  
countBytes: the number of bytes to play from offset.

You need to set NumberOfChannels before calling this method.  
NumberOfChannels can be 1 or 2. For 2 channels, sound data must be interleaved.

Values for bitsize:

<table>
<thead>
<tr>
<th>Value</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>signed byte</td>
</tr>
<tr>
<td>8</td>
<td>unsigned byte</td>
</tr>
<tr>
<td>15</td>
<td>signed short</td>
</tr>
<tr>
<td>16</td>
<td>unsigned short</td>
</tr>
<tr>
<td>24</td>
<td>unsigned medium</td>
</tr>
<tr>
<td>31</td>
<td>signed integer</td>
</tr>
<tr>
<td>32</td>
<td>unsigned integer</td>
</tr>
</tbody>
</table>

This method only copies the data to the internal queue. It returns directly.  
If ClearBuffers is true the buffer list is cleared before this new data is added.

15.5.13 PlayAudioStereo(Data1 as memoryblock, Data2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds integer audio and starts playback.
Notes:

This is a special version of PlayAudio which takes samples from both memoryblocks and interleaves them.

Data1: a memoryblock with the sound data
Data2: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

You need to set NumberOfChannels before calling this method.
NumberOfChannels must be 2 for this method.

Values for bitsize:

7 signed byte
8 unsigned byte
15 signed short
16 unsigned short
24 unsigned medium
31 signed integer
32 unsigned integer

This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.

15.5.14 PlayFloatAudio(FloatData as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Adds float audio and starts playback.

Notes:

FloatData: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

The samples are stored in 32bit float values (memoryblock.SingleValue)

You need to set NumberOfChannels before calling this method.
NumberOfChannels can be 1 or 2. For 2 channels, sound data must be interleaved.
This method only copies the data to the internal queue. It returns directly. If ClearBuffers is true the buffer list is cleared before this new data is added.

### 15.5.15 PlayFloatAudioStereo

**Function:**

Adds float audio and starts playback.

**Notes:**

This is a special version of PlayFloatAudio which takes samples from both memoryblocks and interleaves them.

- **FloatData1:** a memoryblock with the sound data filled with single values.
- **FloatData2:** a memoryblock with the sound data filled with single values.
- **offsetBytes:** the number of the bytes to start playing (0=first)
- **countBytes:** the number of bytes to play from offset.

The samples are stored in 32bit float values (memoryblock.SingleValue)

You need to set NumberOfChannels before calling this method.

**NumberOfChannels** must be 2 for this method.

This method only copies the data to the internal queue. It returns directly. If ClearBuffers is true the buffer list is cleared before this new data is added.

### 15.5.16 Start

**Function:**

Starts playback.

**Notes:**

use AddAudio, AddAudioStereo, AddFloatAudio and AddFloatAudioStereo first to fill buffers.

### 15.5.17 Stop

**Function:**

Stops playback.
15.5.18 Properties

15.5.19 HadUnderflow as Boolean

MBS MacOSX Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A flag set if a data underflow was found while NoUnderflow is true.
**Notes:**
You may want to set this to false after your application recovered from a data underflow.
(Read and Write property)

15.5.20 IsRunning as Boolean

MBS MacOSX Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the class is playing something.
**Notes:**
Returns true while playing.
(Read only property)

15.5.21 NoUnderflow as Boolean

MBS MacOSX Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether underflows should be prevented.
**Notes:**
If no audio data is there and NoUnderflow=true, the flag HadUnderflow is set to true and 0 values (Silence) is played.
Switching from sound to no sound and back may add some noise.
(Read and Write property)

15.5.22 NumberOfChannels as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of output channels.
**Notes:**
Currently only 1 (default) and 2 are supported.
(Read and Write property)
15.5.23 OutputDeviceID as Integer

MBS MacOSX Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The output device to use. **Notes:**

0 for the default output device. If you set this property to a bad value you risk a crash. (Read and Write property)

15.5.24 OutputPosition as Double

MBS MacOSX Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current position in the playing stream. **Notes:**

May point between samples. (Read only property)

15.5.25 OutputPositionRelative as Double

MBS MacOSX Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current position in the playing buffer. **Notes:**

May point between samples. Will reset to 0 when a new buffer is used. (Read only property)

15.5.26 SampleRate as Single

MBS MacOSX Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The sample rate to use. **Notes:**

You can use any value between 4000 and 100000. Default is 44100 Hz. (Read and Write property)
15.6  class PortAudioDeviceInfoMBS

15.6.1  class PortAudioDeviceInfoMBS

MBS Audio Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A class providing information and capabilities of PortAudio devices.
**Notes:**
Devices may support input, output or both input and output.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

15.6.2  Methods

15.6.3  Constructor

MBS Audio Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The private constructor.

15.6.4  Properties

15.6.5  DefaultHighInputLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Default latency values for robust non-interactive applications (eg. playing sound files).
**Notes:** (Read only property)

15.6.6  DefaultHighOutputLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Default latency values for robust non-interactive applications (eg. playing sound files).
**Notes:** (Read only property)

15.6.7  DefaultLowInputLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Default latency values for interactive performance.
**Notes:** (Read only property)
15.6. CLASS PORTAUDIODEVICEINFOMBS

15.6.8 DefaultLowOutputLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Default latency values for interactive performance.
**Notes:** (Read only property)

15.6.9 DefaultSampleRate as Double

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The default sample rate.
**Notes:** (Read only property)

15.6.10 HostApiIndex as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The host API index for this device.
**Notes:** (Read only property)

15.6.11 Index as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The index of this device.
**Notes:** (Read only property)

15.6.12 MaxInputChannels as Integer

MBS Audio Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The number of input channels.
**Notes:**
Returns 0 on any error.
(Read only property)

15.6.13 MaxOutputChannels as Integer

MBS Audio Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The number of output channels for this device.
**Notes:**
0 on any error.

Seems like an iMac returns two here, but the internal microphone has only one channel. So be aware that the memory blocks in the events do have the actual size of the data that is coming in. So stereo has there a larger buffer.
(Read only property)

15.6.14 Name as String

MBS Audio Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The name of this device.
**Notes:**
Returns "" on any error.
(Read only property)
15.7. CLASS PORTAUDIOHOSTAPIINFOMBS

15.7  class PortAudioHostApiInfoMBS

15.7.1  class PortAudioHostApiInfoMBS

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class containing information about a particular host API. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

15.7.2  Methods

15.7.3  Constructor

MBS Audio Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

15.7.4  Properties

15.7.5  defaultInputDevice as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The default input device for this host API. **Notes:** The value will be a device index ranging from 0 to (PortAudioHostApiInfoMBS.deviceCount-1), or paNoDevice (-1) if no default input device is available. (Read only property)

15.7.6  defaultOutputDevice as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The default output device for this host API. **Notes:** The value will be a device index ranging from 0 to (PortAudioHostApiInfoMBS.deviceCount-1), or paNoDevice (-1) if no default output device is available. (Read only property)
15.7.7 deviceCount as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The number of devices belonging to this host API.
**Notes:**
This field may be used in conjunction with HostApiDeviceIndexToDeviceIndex() to enumerate all devices for this host API.
(Read only property)

15.7.8 Index as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The index of this host API.
**Notes:** (Read only property)

15.7.9 Name as String

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A textual description of the host API for display on user interfaces.
**Notes:** (Read only property)

15.7.10 Type as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The well known unique identifier of this host API.
**Notes:**
Useful constants for the different types:

(Read only property)
paInDevelopment = 0
paDirectSound = 1
paMME = 2
paASIO = 3
paSoundManager = 4
paCoreAudio = 5
paOSS = 7
paALSA = 8
paAL = 9
paBeOS = 10
paWDMKS = 11
paJACK = 12
paWASAPI = 13
paAudioScienceHPI = 14
15.8 class PortAudioHostErrorInfoMBS

15.8.1 class PortAudioHostErrorInfoMBS

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A class used to return information about a host error condition.
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

15.8.2 Methods

15.8.3 Constructor

MBS Audio Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The private constructor.

15.8.4 Properties

15.8.5 ErrorCode as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
the error code returned.
**Notes:** (Read only property)

15.8.6 ErrorText as String

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A textual description of the error if available, otherwise a zero-length string.
**Notes:** (Read only property)

15.8.7 HostApiType as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The host API which returned the error code.
**Notes:** (Read only property)
15.9. CLASS PORTAUDIOMBS

15.9 class PortAudioMBS

15.9.1 class PortAudioMBS

MBS Audio Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class to run the opensource PortAudio library in Realbasic.

**Notes:**

Constants for error codes:

- `paNoError` = 0
- `Plugin parameter error` = -1
- `paNotInitialized` = -10000
- `paUnanticipatedHostError` = -9999
- `paInvalidChannelCount` = -9998
- `paInvalidSampleRate` = -9997
- `paInvalidDevice` = -9996
- `paInvalidFlag` = -9995
- `paSampleFormatNotSupported` = -9994
- `paBadIODeviceCombination` = -9993
- `paInsufficientMemory` = -9992
- `paBufferTooBig` = -9991
- `paBufferTooSmall` = -9990
- `paNullCallback` = -9889
- `paBadStreamPtr` = -9988
- `paTimedOut` = -9987
- `paInternalError` = -9986
- `paDeviceUnavailable` = -9985
- `paIncompatibleHostApiSpecificStreamInfo` = -9984
- `paStreamIsStopped` = -9983
- `paStreamIsNotStopped` = -9982
- `paInputOverfilled` = -9981
- `paOutputUnderflowed` = -9980
- `paHostApiNotFound` = -9979
- `paInvalidHostApi` = -9978
- `paCanNotReadFromACallbackStream` = -9977
- `paCanNotWriteToACallbackStream` = -9976
- `paCanNotReadFromAnOutputOnlyStream` = -9975
- `paCanNotWriteToAnInputOnlyStream` = -9974
- `paIncompatibleStreamHostApi` = -9973
- `paBadBufferPtr` = -9972

Initialization and Termination of the PortAudio library are done in background automatically.

Requires libasound.so.2 on Linux to be installed.
15.9.2 Methods

15.9.3 CountDevices as Integer

MBS Audio Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve the number of available devices.

**Example:**

```vba
Dim c as Integer = pa.CountDevices
msgbox str(c)+" devices found"
for i as Integer = 0 to c-1
    MsgBox pa.DeviceInfo(i).Name
next
```

**Notes:**

The number of available devices may be zero.

Returns a non-negative value indicating the number of available devices or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

15.9.4 DefaultHostApiIndexd as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve the index of the default host API.

**Example:**

```vba
Dim d as PortAudioHostApiInfoMBS = pa.HostApiInfo(DefaultHostApiIndexd)
MsgBox "Default host API is: "+d.Name
```

**Notes:**

Returns a non-negative value indicating the number of available devices or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.
The default host API will be the lowest common denominator host API on the current platform and is unlikely to provide the best performance.

Returns a non-negative value ranging from 0 to (HostApiCount-1) indicating the default host API index or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

### 15.9.5 DefaultInputDeviceID as Integer

MBS Audio Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve the index of the default input device. **Example:**

```vbscript
dim pa as new PortAudioMBS

dim DefaultInputDeviceID as Integer = pa.DefaultInputDeviceID

if DefaultInputDeviceID>=0 then
    dim d as PortAudioDeviceInfoMBS = paDeviceInfo(DefaultInputDeviceID)
    MsgBox "Default input device is: " + d.Name
else
    MsgBox "No default input device."
end if
```

**Notes:**
The result can be used in the inputDevice parameter to OpenStream().

Returns the default input device index for the default host API, or paNoDevice (-1) if no default input device is available or an error was encountered.

### 15.9.6 DefaultOutputDeviceID as Integer

MBS Audio Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve the index of the default output device. **Example:**

```vbscript
dim pa as new PortAudioMBS

dim DefaultOutputDeviceID as Integer = pa.DefaultOutputDeviceID

if DefaultOutputDeviceID>=0 then
    dim d as PortAudioDeviceInfoMBS = paDeviceInfo(DefaultOutputDeviceID)
    MsgBox "Default output device is: " + d.Name
else
    MsgBox "No default output device."
end if
```
**CHAPTER 15. AUDIO**

```vba
MsgBox "Default output device is: " + d.Name
else
MsgBox "No default output device."
end if
```

**Notes:**

The result can be used in the outputDevice parameter to OpenStream().

Returns the default output device index for the default host API, or paNoDevice (-1) if no default output device is available or an error was encountered.

On the PC, the user can specify a default device by setting an environment variable. For example, to use device # 1.

```vba
set PA.RECOMMENDED_OUTPUT_DEVICE=1
```

The user should first determine the available device ids by using the supplied application "pa_devs".

### 15.9.7 DeviceInfo(DeviceIndex as Integer) as PortAudioDeviceInfoMBS

**MBS Audio Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.**

**Function:**

Retrieve an object containing information about the specified device.

**Example:**

```vba
dim pa as new PortAudioMBS

Dim u as Integer = pa.CountDevices - 1
for i as Integer = 0 to u
    dim d as PortAudioDeviceInfoMBS = pa.DeviceInfo(i)
    MsgBox d.Name + " with default " + str(D.DefaultSampleRate) + " Hz"
next
```

**Notes:**

Returns an object of class PortAudioDeviceInfoMBS with the requested information. If the device parameter is out of range the function returns nil.

DeviceIndex: A valid device index in the range 0 to (PortAudioMBS.CountDevices - 1)
15.9. **CLASS PORTAUDIOMBS**

### 15.9.8 DisableHostAPI(API as string) as boolean

MBS Audio Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Enables a PortAudio Host API. **Example:**

```
if PortAudioMBS.DisableHostAPI("Core Audio") then // for Mac
    MsgBox "OK"
else
    MsgBox "Failed"
end if
```

**Notes:**

This must be called before using any PortAudio function. It removes the API from the list of APIs to be used when PortAudio initializes. This way you can avoid loading interfaces you don’t need. API name can be "MME", "Windows DirectSound", "Windows WASAPI", "ASIO", "Core Audio", "ALSA", "OSS". Returns true on success.

### 15.9.9 ErrorText(ErrorNumber as Integer) as string

MBS Audio Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Translate the error number into a human readable message.

### 15.9.10 GetSampleSize(Format as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the sample size in bytes of the given format. **Example:**

```
dim pa as new PortAudioMBS
const paFloat32 = 1

MsgBox str(pa.GetSampleSize(paFloat32)) + “ bytes per sample”
```
15.9.11 HostApiCount as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve the number of available host APIs.  
**Example:**

```vba
dim pa as new PortAudioMBS
Dim c as Integer = pa.HostApiCount
msgbox str(c)+“ host APIs found”
```

**Notes:**

Even if a host API is available it may have no devices available.

Returns a non-negative value indicating the number of available host APIs or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

15.9.12 HostApiDeviceIndexToDeviceIndex(hostApiIndex as Integer, hostApiDeviceIndex as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert a host-API-specific device index to standard PortAudio device index.  
**Notes:**

This function may be used in conjunction with the deviceCount field of PaHostApiInfo to enumerate all devices for the specified host API.

```vba
hostApiIndex: A valid host API index ranging from 0 to (HostApiCount-1)
hostApiDeviceIndex: A valid per-host device index in the range 0 to (HostApiInfo(hostApi).deviceCount-1)
```

Returns a non-negative device index ranging from 0 to (DeviceCount-1) or, an error code (which are always negative) if PortAudio is not initialized or an error is encountered.

A paInvalidHostApi (-9978) error code indicates that the host API index specified by the hostApi parameter is out of range.

A paInvalidDevice (-9996) error code indicates that the hostApiDeviceIndex parameter is out of range.
15.9.13 HostApiInfo(hostApiIndex as Integer) as PortAudioHostApiInfoMBS

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve an PortAudioHostApiInfoMBS object containing information about a specific host Api. **Example:**

```vbscript
dim pa as new PortAudioMBS
Dim u as Integer = pa.HostApiCount - 1

for i as Integer = 0 to u
    dim d as PortAudioHostApiInfoMBS = pa.HostApiInfo(i)
    MsgBox d.name
next
```

**Notes:**

- hostApiIndex: A valid host API index ranging from 0 to (HostApiCount-1)

Returns the information object. If the hostApi parameter is out of range or an error is encountered, the function returns nil.

15.9.14 HostApiTypeIdToHostApiIndex(type as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert a static host API unique identifier, into a runtime host API index. **Example:**

```vbscript
dim IndexDirectSound as Integer
dim p as new PortAudioMBS
const paDirectSound=1
IndexDirectSound=p.HostApiTypeIdToHostApiIndex(paDirectSound)
```

**Notes:**

- type: A unique host API identifier. See PortAudioHostApiInfoMBS.Type for the list of constants.

Returns a valid PaHostApiIndex ranging from 0 to (HostApiCount-1) or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

The paHostApiNotFound (-9979) error code indicates that the host API specified by the type parameter is not available.
15.9.15 HostError as PortAudioHostErrorInfoMBS

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Return information about the last host error encountered.

**Notes:**
This function is provided as a last resort, primarily to enhance debugging by providing clients with access to all available error information.

Returns an object containing information about the host error. The values in this structure will only be valid if a PortAudio function has previously returned the paUnanticipatedHostError.

15.9.16 IsFormatSupported(input as PortAudioStreamParametersMBS, output as PortAudioStreamParametersMBS, sampleRate as Double) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Determine whether it would be possible to open a stream with the specified parameters.

**Notes:**
- input: An object that describes the input parameters used to open a stream. The suggestedLatency field is ignored. inputParameters must be nil for output-only streams.
- output: An object that describes the output parameters used to open a stream. The suggestedLatency field is ignored. outputParameters must be nil for input-only streams.
- sampleRate: The required sampleRate. For full-duplex streams it is the sample rate for both input and output

Returns 0 if the format is supported, and an error code indicating why the format is not supported otherwise. The constant paFormatIsSupported (0) is provided to compare with the return value for success.

15.9.17 SampleSize(theFormat as Integer) as Integer

MBS Audio Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Return size in bytes of a single sample in a given sample format or paSampleFormatNotSupported (-9994).

**Notes:**
Returns 0 on any error.

Constants for sample format:
15.9. CLASS PORTAUDIOMBS

const paFloat32 = 1
const paInt32 = 2
const paInt24 = 4
const paInt16 = 8
const paInt8 = 16
const paUInt8 = 32
const paCustomFormat = 65536
const paNonInterleaved = negative sign

The standard formats paFloat32, paInt16, paInt32, paInt24, paInt8 and aUInt8 are usually implemented by all implementations.

The floating point representation (paFloat32) uses +1.0 and -1.0 as the maximum and minimum respectively.

paUInt8 is an unsigned 8 bit format where 128 is considered "ground"

The paNonInterleaved flag indicates that a multichannel buffer is passed as a set of non-interleaved pointers.

15.9.18 SetDebugLogFile(File as FolderItem) as boolean

Notes:
Pass nil to stop logging.
Returns true on success or false on failure.

15.9.19 Sleep(msec as Integer)

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Put the caller to sleep for at least 'msec' milliseconds.
Notes:
This function is provided only as a convenience for authors of portable code (such as the tests and examples in the PortAudio distribution.)
The function may sleep longer than requested so don’t rely on this for accurate musical timing.
15.9.20 Version as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve the release number of the currently running PortAudio build.
**Notes:** e.g. 1900

15.9.21 VersionControlRevision as String

MBS Audio Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve a version control revision text.

15.9.22 VersionText as String

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve a textual description of the current PortAudio build.
**Notes:** e.g. "PortAudio V19-devel 13 October 2002"
15.10. **CLASS PORTAUDIOSTREAMBASEMBS**

15.10 class PortAudioStreamBaseMBS

15.10.1 class PortAudioStreamBaseMBS

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The base class for the portaudio streams.

15.10.2 Methods

15.10.3 Abort as Integer

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Terminates audio processing immediately without waiting for pending buffers to complete.

15.10.4 Close as Integer

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Closes an audio stream.
**Notes:** If the audio stream is active it discards any pending buffers as if Abort() had been called.

15.10.5 CPULoad as Double

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Retrieve CPU usage information for the specified stream.
**Notes:**
The "CPU Load" is a fraction of total CPU time consumed by a callback stream’s audio processing routines including, but not limited to the client supplied stream callback. This function does not work with blocking read/write streams.

This function may be called from the stream callback function or the application.

Returns a floating point value, typically between 0.0 and 1.0, where 1.0 indicates that the stream event is consuming the maximum number of CPU cycles possible to maintain real-time operation. A value of 0.5 would imply that PortAudio and the stream event was consuming roughly 50% of the available CPU time. The return value may exceed 1.0. A value of 0.0 will always be returned for a blocking read/write stream, or if an error occurs.
15.10.6 HostError as PortAudioHostErrorInfoMBS

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Return information about the last host error encountered.

**Notes:**
This function is provided as a last resort, primarily to enhance debugging by providing clients with access to all available error information.

Returns an object containing information about the host error. The values in this structure will only be valid if a PortAudio function has previously returned the paUnanticipatedHostError.

15.10.7 Info as PortAudioStreamInfoMBS

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Retrieve a PortAudioStreamInfoMBS object containing information about the specified stream.

**Notes:** If the stream parameter invalid, or an error is encountered, the function returns nil.

15.10.8 IsStreamActive as Integer

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Determine whether the stream is active.

**Notes:**
A stream is active after a successful call to Start(), until it becomes inactive either as a result of a call to Stop() or Abort(), or as a result of a return value other than paContinue from the stream callback. In the latter case, the stream is considered inactive after the last buffer has finished playing.

Returns one (1) when the stream is active (ie playing or recording audio), zero (0) when not playing or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

15.10.9 IsStreamStopped as Integer

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Determine whether the stream is stopped.

**Notes:**
A stream is considered to be stopped prior to a successful call to Start and after a successful call to Stop or Abort.
If a stream value returns a value other than paContinue (0) the stream is NOT considered to be stopped.
15.10. CLASS PORTAUDIOSTREAMBASEMBS

Returns one (1) when the stream is stopped, zero (0) when the stream is running or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

15.10.10 Start as Integer

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Commences audio processing.
**Notes:**
Returns an error code.
(0 for success, -1 for no stream)

15.10.11 Stop as Integer

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Terminates audio processing.
**Notes:** It waits until all pending audio buffers have been played before it returns.

15.10.12 Time as Double

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Determine the current time for the stream according to the same clock used to generate buffer timestamps.
**Notes:**
This time may be used for synchronizing other events to the audio stream, for example synchronizing audio to MIDI.

Returns the stream’s current time in seconds, or 0 if an error occurred.

15.10.13 Properties

15.10.14 UseSafeThreading as boolean

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Enables or disables thread safe event handling.
**Notes:**
Realbasic works normally only on one preemptive thread as the framework is not reentrant and not in general preemptive thread safe.
Still newer Realbasic versions get better so you can switch it off and get a better performance.
For most usages you need to turn it off. See the examples. A lot of pragma lines are needed to disable
everything which can slow down processing. Also you are limited in a preemptive thread to do only math
and no object creating/deleting.
(Read and Write computed property)
15.11. CLASS PORTAUDIOSTREAMBUFFEREDMBS

15.11 class PortAudioStreamBufferedMBS

15.11.1 class PortAudioStreamBufferedMBS

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A portaudio stream class to use an internal buffer to feed its callback. 
**Notes:**
Currently this class allows you to add 200 buffers to the internal playlist. The buffer size is not limited. FreeSpace returns you the number of buffers you have currently. Buffers are freed after they are played. Subclass of the PortAudioStreamBaseMBS class.

15.11.2 Methods

15.11.3 **AddAudio(Data as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean**

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds audio to the queue. 
**Notes:**
Data: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock’s size property is used.

You need to set numOutputChannels to 1 or 2 when opening the stream. For 2 channels, sound data must be interleaved.

Values for bitsize:

7 signed byte
8 unsigned byte
15 signed short
16 unsigned short
24 unsigned medium
31 signed integer
32 unsigned integer
This method copies the data to the internal queue. It returns directly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.

Returns true on success and false on failure (e.g. out of memory).

15.11.4 AddAudioStereo(Data1 as memoryblock, Data2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

Notes:

This is a special version of AddAudio which takes samples from both memoryblocks and interleaves them.

Data1: a memoryblock with the sound data  
Data2: a memoryblock with the sound data  
offsetBytes: the number of the bytes to start playing (0=first)  
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock’s size property is used.

The stream must use 2 channels for this method to work correctly.

Values for bitsize:

7 signed byte  
8 unsigned byte  
15 signed short  
16 unsigned short  
24 unsigned medium  
31 signed integer  
32 unsigned integer  

This method copies the data to the internal queue. It returns directly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.
15.11. CLASS PORTAUDIOSTREAMBUFFEREDMBS

Returns true on success and false on failure (e.g. out of memory).

15.11.5 AddFloatAudio(FloatData as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds audio to the queue.

**Notes:**
FloatData: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock’s size property is used.

You need to set numOutputChannels to 1 or 2 when opening the stream. For 2 channels, sound data must be interleaved.

The samples are stored in 32bit float values (memoryblock.SingleValue)

This method copies the data to the internal queue. It returns directly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.

Returns true on success and false on failure (e.g. out of memory).

15.11.6 AddFloatAudioStereo(FloatData1 as memoryblock, FloatData2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds audio to the queue.

**Notes:**
This is a special version of AddFloatAudio which takes samples from both memoryblocks and interleaves them.

FloatData1: a memoryblock with the sound data filled with single values.
FloatData2: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock’s size property is used.

The samples are stored in 32bit float values (memoryblock.SingleValue)

This method copies the data to the internal queue. It returns directly.

The stream must use 2 channels for this method to work correctly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.

Returns true on success and false on failure (e.g. out of memory).

### 15.11.7 FreeSpace as Integer

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of buffer entries available in the queue. **Notes:** The size of the buffers is not limited except your available memory.

### 15.11.8 HasFreeSpace as boolean

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns true if the internal sound buffer has free space. **Notes:**

Returns true if freespace returns a value greater than zero.

This function was named IsQueueEmpty in plugin version 7.4.

### 15.11.9 OpenDefaultStream(numOutputChannels as Integer, sampleRate as Double) as Integer

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A simplified version of OpenStream() that opens the default input and/or output devices. **Notes:**
Sample format is always 32bit float in this class. All data you add the queue is converted to float internally.

numOutputChannels: The number of channels of sound to be delivered to the stream callback or passed to Write. It can range from 1 to the value of maxOutputChannels in the PortAudioDeviceInfoMBS object for the default output device. If 0 the stream is opened as an output-only stream.

sampleRate: Same as OpenStream parameter of the same name.

Returns an error code.

**15.11.10 OpenStream(outputParameters as PortAudioStreamParametersMBS, sampleRate as Double, framesPerBuffer as Integer, streamFlags as Integer) as Integer**

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Opens a stream for either input, output or both.

**Notes:**
Sample format is always 32bit float in this class. All data you add the queue is converted to float internally.

outputParameters: A object that describes the output parameters used by the opened stream. See PortAudioStreamParametersMBS for a description of these parameters.

sampleRate: The desired sample rate. For full-duplex streams it is the sample rate for both input and output

framesPerBuffer: The number of frames passed to the stream callback function, or the preferred block granularity for a blocking read/write stream. The special value paFramesPerBufferUnspecified (0) may be used to request that the stream callback will receive an optimal (and possibly varying) number of frames based on host requirements and the requested latency settings.

Note: With some host APIs, the use of non-zero framesPerBuffer for a callback stream may introduce an additional layer of buffering which could introduce additional latency. PortAudio guarantees that the additional latency will be kept to the theoretical minimum however, it is strongly recommended that a non-zero framesPerBuffer value only be used when your algorithm requires a fixed number of frames per stream callback.

const paFramesPerBufferUnspecified=0

streamFlags: Flags which modify the behaviour of the streaming process. This parameter may contain a combination of flags ORed together. Some flags may only be relevant to certain buffer formats.
const paNoFlag = 0 no flags
const paClipOff = 1 Disable default clipping of out of range samples.
const paDitherOff = 2 Flag requests that where possible a full duplex stream will not discard over-
flowed input samples without calling the stream callback. This flag is only valid
for full duplex callback streams and only when used in combination with the
paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag
incorrectly results in a paInvalidFlag error being returned from OpenStream
and OpenDefaultStream.

const paNeverDropInput = 4 Flag requests that where possible a full duplex stream will not discard over-
flowed input samples without calling the stream callback. This flag is only valid
for full duplex callback streams and only when used in combination with the
paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag
incorrectly results in a paInvalidFlag error being returned from OpenStream
and OpenDefaultStream.

const paPrimeOutputBuffersUsingStreamCallback = 8 Call the stream callback to fill initial output buffers, rather than the default
behavior of priming the buffers with zeros (silence). This flag has no effect for
input-only and blocking read/write streams.

Upon success OpenStream() returns paNoError and places a pointer to a valid PaStream in the stream
argument. The stream is inactive (stopped).
If a call to OpenStream() fails, a non-zero error code is returned (see PaError for possible error codes) and
the value of stream is invalid.

15.11.11 PlayAudio(Data as memoryblock, offsetBytes as Integer=0, count-
Bytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Adds audio to the queue and starts playback.
Notes:
Data: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock’s size property
is used.

You need to set numOutputChannels to 1 or 2 when opening the stream. For 2 channels, sound data must
be interleaved.

Values for bitsize:

This method copies the data to the internal queue. It returns directly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the
next minute in the buffers and still do a change in the stream quick.
15.11.12 PlayAudioStereo(Data1 as memoryblock, Data2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds audio to the queue and starts playback. **Notes:** This is a special version of AddAudio which takes samples from both memoryblocks and interleaves them.

Data1: a memoryblock with the sound data
Data2: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock’s size property is used.

The stream must use 2 channels for this method to work correctly.

Values for bitsize:

7  signed byte
8  unsigned byte
15 signed short
16 unsigned short
24 unsigned medium
31 signed integer
32 unsigned integer

This method copies the data to the internal queue. It returns directly.
If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.

### 15.11.13 PlayFloatAudio(FloatData as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds audio to the queue and starts playback.  
**Notes:**

- FloatData: a memoryblock with the sound data filled with single values.  
- offsetBytes: the number of the bytes to start playing (0=first)  
- countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock’s size property is used.

You need to set numOutputChannels to 1 or 2 when opening the stream. For 2 channels, sound data must be interleaved.

The samples are stored in 32bit float values (memoryblock.SingleValue)

This method copies the data to the internal queue. It returns directly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.

### 15.11.14 PlayFloatAudioStereo(FloatData1 as memoryblock, FloatData2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds audio to the queue and starts playback.  
**Notes:**

- FloatData1: a memoryblock with the sound data filled with single values.  
- FloatData2: a memoryblock with the sound data filled with single values.  
- offsetBytes: the number of the bytes to start playing (0=first)  
- countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock’s size property is used.

This is a special version of AddFloatAudio which takes samples from both memoryblocks and interleaves them.
The samples are stored in 32bit float values (memoryblock.SingleValue)

This method copies the data to the internal queue. It returns directly.

The stream must use 2 channels for this method to work correctly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.

15.11.15 Properties

15.11.16 HadUnderflow as Boolean

MBS Audio Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: A flag set if a data underflow was found while NoUnderflow is true. Notes: You may want to set this to false after your application recovered from a data underflow. (Read and Write property)

15.11.17 NoUnderflow as Boolean

MBS Audio Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Whether underflows should be prevented. Notes: If no audio data is there and NoUnderflow=true, the flag HadUnderflow is set to true and 0 values (Silence) is played. Switching from sound to no sound and back may add some noise. (Read and Write property)

15.11.18 OutputPosition as Double

15.11.19 OutputPositionRelative as Double

MBS Audio Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The current position in the playing buffer.

**Notes:**
May point between samples.
Will reset to 0 when a new buffer is used.
(Read only property)

15.11.20 Events

15.11.21 Finished

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This event is implemented by PortAudio clients.

**Notes:**
Once registered they are called when the stream becomes inactive (ie once a call to Stop() will not block).
A stream will become inactive after the stream callback returns non-zero, or when Stop or Abort is called.
For a stream providing audio output, if the stream callback returns paComplete, or Stop is called, the stream finished callback will not be called until all generated sample data has been played.
15.12.1 class PortAudioStreamInfoMBS

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class to hold time information of the current stream. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

15.12.2 Methods

15.12.3 Constructor

MBS Audio Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

15.12.4 Properties

15.12.5 InputLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The input latency of the stream in seconds. **Notes:** This value provides the most accurate estimate of input latency available to the implementation. It may differ significantly from the suggestedLatency value passed to OpenStream(). The value of this field will be zero (0.) for output-only streams. (Read only property)

15.12.6 OutputLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The output latency of the stream in seconds. **Notes:** This value provides the most accurate estimate of output latency available to the implementation. It may differ significantly from the suggestedLatency value passed to OpenStream(). The value of this field will be zero (0.) for input-only streams. (Read only property)
15.12.7 SampleRate as Double

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The sample rate of the stream in Hertz (samples per second).

**Notes:**
In cases where the hardware sample rate is inaccurate and PortAudio is aware of it, the value of this field
may be different from the sampleRate parameter passed to OpenStream(). If information about the actual
hardware sample rate is not available, this field will have the same value as the sampleRate parameter passed
to OpenStream().

(Read only property)
15.13. CLASS PORTAUDIOSTREAMMBS

15.13 class PortAudioStreamMBS

15.13.1 class PortAudioStreamMBS

MBS Audio Plugin, Plugin Version: 6.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A single PortAudioStreamMBS can provide multiple channels of real-time streaming audio input and output to a client application.

**Notes:**

A stream provides access to audio hardware represented by one or more devices. Depending on the underlying Host API, it may be possible to open multiple streams using the same device, however this behavior is implementation defined. Portable applications should assume that a device may be simultaneously used by at most one PortAudioStreamMBS.

Subclass of the PortAudioStreamBaseMBS class.

15.13.2 Methods

15.13.3 OpenDefaultStream(numInputChannels as Integer, numOutputChannels as Integer, sampleFormat as Integer, sampleRate as Double, framesPerBuffer as Integer, Flags as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A simplified version of OpenStream() that opens the default input and/or output devices.

**Notes:**

numInputChannels: The number of channels of sound that will be supplied to the stream callback or returned by ReadStream. It can range from 1 to the value of maxInputChannels in the PaDeviceInfo record for the default input device. If 0 the stream is opened as an output-only stream.

numOutputChannels: The number of channels of sound to be delivered to the stream callback or passed to Write. It can range from 1 to the value of maxOutputChannels in the PaDeviceInfo record for the default output device. If 0 the stream is opened as an output-only stream.

sampleFormat: The sample format of both the input and output buffers provided to the callback or passed to and from Read and Write.

sampleFormat may be any of the formats described by the PaSampleFormat enumeration.

sampleRate: Same as OpenStream parameter of the same name.
framesPerBuffer: Same as OpenStream parameter of the same name.

constants for the flags value:
const paNoFlag = 0 no flags
const paClipOff = 1 Disable default clipping of out of range samples.
const paDitherOff = 2 Flag requests that where possible a full duplex stream will not discard overflowed input samples without calling the stream callback. This flag is only valid for full duplex callback streams and only when used in combination with the paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag incorrectly results in a paInvalidFlag error being returned from OpenStream and OpenDefaultStream.
const paNeverDropInput = 4 Flag requests that where possible a full duplex stream will not discard overflowed input samples without calling the stream callback. This flag is only valid for full duplex callback streams and only when used in combination with the paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag incorrectly results in a paInvalidFlag error being returned from OpenStream and OpenDefaultStream.
const paPrimeOutputBuffersUsingStreamCallback = 8 Call the stream callback to fill initial output buffers, rather than the default behavior of priming the buffers with zeros (silence). This flag has no effect for input-only and blocking read/write streams.

Returns an error code.

15.13.4 OpenStream(inputParameters as PortAudioStreamParametersMBS, outputParameters as PortAudioStreamParametersMBS, sampleRate as Double, framesPerBuffer as Integer, streamFlags as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens a stream for either input, output or both.

**Notes:**

inputParameters: A object that describes the input parameters used by the opened stream. See PortAudioStreamParametersMBS for a description of these parameters. inputParameters must be nil for output-only streams.

outputParameters: A object that describes the output parameters used by the opened stream. See PortAudioStreamParametersMBS for a description of these parameters. outputParameters must be nil for input-only streams.

sampleRate: The desired sampleRate. For full-duplex streams it is the sample rate for both input and output.

framesPerBuffer: The number of frames passed to the stream callback function, or the preferred block granularity for a blocking read/write stream. The special value paFramesPerBufferUnspecified (0) may be used to request that the stream callback will recieve an optimal (and possibly varying) number of frames based on host requirements and the requested latency settings.

Note: With some host APIs, the use of non-zero framesPerBuffer for a callback stream may introduce an additional layer of buffering which could introduce additional latency. PortAudio guarantees that the additional latency will be kept to the theoretical minimum however, it is strongly recommended that a non-zero framesPerBuffer value only be used when your algorithm requires a fixed number of frames per stream callback.
const paFramesPerBufferUnspecified = 0

streamFlags: Flags which modify the behaviour of the streaming process. This parameter may contain a combination of flags ORed together. Some flags may only be relevant to certain buffer formats.

const paNoFlag = 0 no flags
const paClipOff = 1 Disable default clipping of out of range samples.
const paDitherOff = 2 Flag requests that where possible a full duplex stream will not discard overflowed input samples without calling the stream callback. This flag is only valid for full duplex callback streams and only when used in combination with the paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag incorrectly results in a paInvalidFlag error being returned from OpenStream and OpenDefaultStream.
const paNeverDropInput = 4 Flag requests that where possible a full duplex stream will not discard overflowed input samples without calling the stream callback. This flag is only valid for full duplex callback streams and only when used in combination with the paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag incorrectly results in a paInvalidFlag error being returned from OpenStream and OpenDefaultStream.
const paPrimeOutputBuffersUsingStreamCallback = 8 Call the stream callback to fill initial output buffers, rather than the default behavior of priming the buffers with zeros (silence). This flag has no effect for input-only and blocking read/write streams.

If this the callback event is left empty the stream will be opened in ‘blocking read/write’ mode. In blocking mode, the client can receive sample data using Read and write sample data using Write, the number of samples that may be read or written without blocking is returned by ReadAvailable and WriteAvailable respectively.

Upon success OpenStream() returns paNoError and places a pointer to a valid PaStream in the stream argument. The stream is inactive (stopped).
If a call to OpenStream() fails, a non-zero error code is returned (see PaError for possible error codes) and the value of stream is invalid.

15.13.5 Read(buffer as memoryblock, frameCount as Integer) as Integer

Notes: The function doesn’t return until the entire buffer has been filled - this may involve waiting for the operating system to supply the data.

buffer: A buffer of sample frames. The buffer contains samples in the format specified by the input.sampleFormat field used to open the stream, and the number of channels specified by input.numChannels. If
non-interleaved samples were requested, buffer is a pointer to the first element of an array of non-interleaved buffer pointers, one for each channel.

frameCount: The number of frames to be read into buffer. This parameter is not constrained to a specific range, however high performance applications will want to match this parameter to the framesPerBuffer parameter used when opening the stream.

Returns on success PaNoError will be returned, or PaInputOverflowed (-9981) if input data was discarded by PortAudio after the previous call and before this call.

15.13.6 ReadAvailable as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve the number of frames that can be read from the stream without waiting.

**Notes:** Returns a non-negative value representing the maximum number of frames that can be read from the stream without blocking or busy waiting or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

15.13.7 Write(buffer as memoryblock, frameCount as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Write samples to an output stream.

**Notes:**

This function doesn’t return until the entire buffer has been consumed - this may involve waiting for the operating system to consume the data.

buffer: A buffer of sample frames. The buffer contains samples in the format specified by the outputParameters.sampleFormat field used to open the stream, and the number of channels specified by outputParameters.numChannels. If non-interleaved samples were requested, buffer is a pointer to the first element of an array of non-interleaved buffer pointers, one for each channel.

frameCount: The number of frames to be written from buffer. This parameter is not constrained to a specific range, however high performance applications will want to match this parameter to the framesPerBuffer parameter used when opening the stream.

On success PaNoError (0) will be returned, or paOutputUnderflowed (-9980) if additional output data was inserted after the previous call and before this call.
15.13. CLASS PORTAUDIOSTREAMMBS

15.13.8 WriteAvailable as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieve the number of frames that can be written to the stream without waiting. **Notes:** Returns a non-negative value representing the maximum number of frames that can be written to the stream without blocking or busy waiting or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

15.13.9 Events

15.13.10 Callback(InputBuffer as memoryblock, outputBuffer as memoryblock, FrameCount as Integer, inputBufferAdcTime as Double, currentTime as Double, outputBufferDacTime as Double, statusFlags as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when new data is needed or received. **Notes:** This event is implemented by PortAudio clients. They consume, process or generate audio in response to requests from an active PortAudio stream.

InputBuffer and outputBuffer are arrays of interleaved samples, the format, packing and number of channels used by the buffers are determined by parameters to OpenStream().

frameCount: The number of sample frames to be processed by the stream callback.

inputBufferAdcTime, currentTimeTiming and outputBufferDacTime: The time in seconds when the first sample of the input buffer was received at the audio input, the time in seconds when the first sample of the output buffer will begin being played at the audio output, and the time in seconds when the stream callback was called.

statusFlags: Flags indicating whether input and/or output buffers have been inserted or will be dropped to overcome underflow or overflow conditions.

Returns the stream callback should return one of the values in the PaStreamCallbackResult enumeration. To ensure that the callback continues to be called, it should return paContinue (0). Either paComplete or paAbort can be returned to finish stream processing, after either of these values is returned the callback will not be called again. If paAbort is returned the stream will finish as soon as possible. If paComplete is returned, the stream will continue until all buffers generated by the callback have been played. This may be useful in applications such as soundfile players where a specific duration of output is required. However, it is not necessary to utilise this mechanism as Stop(), Abort() or Close() can also be used to stop the stream. The callback must always fill the entire output buffer irrespective of its return value.
With the exception of CpuLoad() it is not permissable to call PortAudio API functions from within the stream callback.

Flag bit constants for the statusFlags to Callback:

paInputUnderflow = 1
In a stream opened with paFramesPerBufferUnspecified, indicates that input data is all silence (zeros) because no real data is available. In a stream opened without paFramesPerBufferUnspecified, it indicates that one or more zero samples have been inserted into the input buffer to compensate for an input underflow.

paInputOverflow = 2
In a stream opened with paFramesPerBufferUnspecified, indicates that data prior to the first sample of the input buffer was discarded due to an overflow, possibly because the stream callback is using too much CPU time. Otherwise indicates that data prior to one or more samples in the input buffer was discarded.

paOutputUnderflow = 4
Indicates that output data (or a gap) was inserted, possibly because the stream callback is using too much CPU time.

paOutputOverflow = 8
Indicates that output data will be discarded because no room is available.

paPrimingOutput = 16
Some of all of the output data will be used to prime the stream, input data may be zero.

Allowable return values for the callback: (PaStreamCallbackResult)

const paContinue = 0
const paComplete = 1
const paAbort = 2

15.13.11 Finished

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: This event is implemented by PortAudio clients.
Notes:
Once registered they are called when the stream becomes inactive (ie once a call to Stop() will not block). A stream will become inactive after the stream callback returns non-zero, or when Stop or Abort is called.
For a stream providing audio output, if the stream callback returns paComplete, or Stop is called, the stream finished callback will not be called until all generated sample data has been played.
15.14 class PortAudioStreamParametersMBS

15.14.1 class PortAudioStreamParametersMBS

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Parameters for one direction (input or output) of a stream.

15.14.2 Properties

15.14.3 ChannelCount as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The requested channel count. 
**Notes:** 
The number of channels of sound to be delivered to the stream callback or accessed by Read() or Write(). It can range from 1 to the value of maxInputChannels in the DeviceInfo object for the device specified by the device parameter. 
(Read and Write property)

15.14.4 Device as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The device ID to be used. 
**Notes:** 
A valid device index in the range 0 to (PortAudioMBS.CountDevices-1) specifying the device to be used or the special constant paUseHostApiSpecificDeviceSpecification which indicates that the actual device(s) to use are specified in hostApiSpecificStreamInfo. This field must not be set to paNoDevice (-1). 
(Read and Write property)

15.14.5 SampleFormat as Integer

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The sample format of the buffer provided to the stream callback, Read() or Write(). 
**Notes:** 
Constants for sample format:
The standard formats paFloat32, paInt16, paInt32, paInt24, paInt8 and aUInt8 are usually implemented by
15.14. CLASS PORTAUDIOSTREAMPARAMETERSMBS

const paFloat32 = 1
const paInt32 = 2
const paInt24 = 4
const paInt16 = 8
const paInt8 = 16
const paUInt8 = 32
const paCustomFormat = 65536
const paNonInterleaved = negative sign

custom format. Not supported by plugin.

The floating point representation (paFloat32) uses +1.0 and -1.0 as the maximum and minimum respectively.

paUInt8 is an unsigned 8 bit format where 128 is considered "ground"

The paNonInterleaved flag indicates that a multichannel buffer is passed as a set of non-interleaved pointers. (Read and Write property)

15.14.6 SuggestedLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
The desired latency in seconds.
Notes:
Where practical, implementations should configure their latency based on these parameters, otherwise they may choose the closest viable latency instead. Unless the suggested latency is greater than the absolute upper limit for the device implementations should round the suggestedLatency up to the next practical value - ie to provide an equal or higher latency than suggestedLatency wherever possible.
Actual latency values for an open stream may be retrieved using the inputLatency and outputLatency fields of the PortAudioStreamInfoMBS object returned by PortAudioStreamMBS.Info(). (Read and Write property)

15.14.7 Constants

15.14.8 paCustomFormat = 65536

MBS Audio Plugin, Plugin Version: 15.1. Function: One of the sample format constants.
Notes: Custom format. Not supported by plugin.
15.14.9  paFloat32 = 1

MBS Audio Plugin, Plugin Version: 15.1. **Function:** One of the sample format constants. **Notes:** Uses +1.0 and -1.0 as the maximum and minimum respectively.

15.14.10  paInt16 = 8

MBS Audio Plugin, Plugin Version: 15.1. **Function:** One of the sample format constants. **Notes:** Signed 16 bit.

15.14.11  paInt24 = 4

MBS Audio Plugin, Plugin Version: 15.1. **Function:** One of the sample format constants. **Notes:** Packed 24 bit format

15.14.12  paInt32 = 2

MBS Audio Plugin, Plugin Version: 15.1. **Function:** One of the sample format constants. **Notes:** Signed 32 bit.

15.14.13  paInt8 = 16

MBS Audio Plugin, Plugin Version: 15.1. **Function:** One of the sample format constants. **Notes:** 8 bit integer.

15.14.14  paNonInterleaved = & h80000000

MBS Audio Plugin, Plugin Version: 15.1. **Function:** One of the sample format constants. **Notes:** Non interleaved. The paNonInterleaved flag indicates that audio data is passed as an array of pointers to separate buffers, one buffer for each channel. Usually, when this flag is not used, audio data is passed as a single buffer with all channels interleaved.
15.14.15  \text{paNonInterleavedFloat32} = \& \text{h80000001} \\

MBS Audio Plugin, Plugin Version: 15.1. \textbf{Function}: One of the sample format constants. 
\textbf{Notes}: Non interleaved, Uses +1.0 and -1.0 as the maximum and minimum respectively.

15.14.16  \text{paNonInterleavedInt16} = \& \text{h80000008} \\

MBS Audio Plugin, Plugin Version: 15.1. \textbf{Function}: One of the sample format constants. 
\textbf{Notes}: Non interleaved, signed 16 bit.

15.14.17  \text{paNonInterleavedInt24} = \& \text{h80000004} \\

MBS Audio Plugin, Plugin Version: 15.1. \textbf{Function}: One of the sample format constants. 
\textbf{Notes}: Non interleaved, Packed 24 bit format

15.14.18  \text{paNonInterleavedInt32} = \& \text{h80000002} \\

MBS Audio Plugin, Plugin Version: 15.1. \textbf{Function}: One of the sample format constants. 
\textbf{Notes}: Non interleaved, signed 32 bit.

15.14.19  \text{paNonInterleavedInt8} = \& \text{h80000010} \\

MBS Audio Plugin, Plugin Version: 15.1. \textbf{Function}: One of the sample format constants. 
\textbf{Notes}: Non interleaved, 8 bit integer.

15.14.20  \text{paNonInterleavedUInt8} = \& \text{h80000020} \\

MBS Audio Plugin, Plugin Version: 15.1. \textbf{Function}: One of the sample format constants. 
\textbf{Notes}: Non interleaved, unsigned 8 bit format where 128 is considered "ground".

15.14.21  \text{paUInt8} = 32 \\

MBS Audio Plugin, Plugin Version: 15.1. \textbf{Function}: One of the sample format constants. 
\textbf{Notes}: unsigned 8 bit format where 128 is considered "ground"
15.15  class PortAudioStreamRecorderMBS

15.15.1  class PortAudioStreamRecorderMBS

MBS Audio Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A portaudio stream class to use an internal buffer to record audio.

**Notes:**
This class has a ring buffer to store the audio samples which they are being recorded. Your application can
in a timer or thread process this samples.
Subclass of the PortAudioStreamBaseMBS class.

15.15.2  Methods

15.15.3  Constructor(BufferSize as Integer)

MBS Audio Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new object using a buffer of the given size.

**Notes:**
The buffer must be a power of 2. For example one Megabyte (2\(^20\)). This defines the ring buffer used to
buffer samples between data coming from sound device and you call ReadFrames method.

Automatically we take paFloat32 as format for sample buffer.

At 44100 Hz, and 4 bytes per value and 2 channels, you will need 352800 bytes per second on storage.

15.15.4  Flush

MBS Audio Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Clears the buffer and discards all current samples.

15.15.5  OpenDefaultStream(numInputChannels as Integer, sampleRate as Double) as Integer

MBS Audio Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A simplified version of OpenStream() that opens the default input devices.

**Notes:**
Sampleformat is always 32bit float in this class. (use memoryblock.singlevalue)
numInputChannels: The number of channels of sound to be delivered. It can range from 1 to the value of maxInputChannels in the PortAudioDeviceInfoMBS object for the default output device. If 0 the stream is opened as an output-only stream.

sampleRate: Same as OpenStream parameter of the same name.

Returns an error code.
Error -2 is from the plugin and reports that the buffer was not created before.

15.15.6 OpenStream(inputParameters as PortAudioStreamParametersMBS, sampleRate as Double, framesPerBuffer as Integer, streamFlags as Integer) as Integer

Notes:
Sampleformat is always 32bit float in this class. (use memoryblock.singlevalue)

outputParameters: A object that describes the input parameters used by the opened stream. See PortAudioStreamParametersMBS for a description of these parameters.

sampleRate: The desired sampleRate.

framesPerBuffer: The number of frames passed to the stream callback function, or the preferred block granularity for a blocking read/write stream. The special value paFramesPerBufferUnspecified (0) may be used to request that the stream callback will receive an optimal (and possibly varying) number of frames based on host requirements and the requested latency settings.
Note: With some host APIs, the use of non-zero framesPerBuffer for a callback stream may introduce an additional layer of buffering which could introduce additional latency. PortAudio guarantees that the additional latency will be kept to the theoretical minimum however, it is strongly recommended that a non-zero framesPerBuffer value only be used when your algorithm requires a fixed number of frames per stream callback.

const paFramesPerBufferUnspecified=0

streamFlags: Flags which modify the behaviour of the streaming process. This parameter may contain a combination of flags ORed together. Some flags may only be relevant to certain buffer formats.

Upon success OpenStream() returns paNoError and places a pointer to a valid PaStream in the stream argument. The stream is inactive (stopped).
const `paNoFlag` = 0 no flags
const `paClipOff` = 1 Disable default clipping of out of range samples.
const `paDitherOff` = 2 Flag requests that where possible a full duplex stream will not discard over-flowed input samples without calling the stream callback. This flag is only valid for full duplex callback streams and only when used in combination with the `paFramesPerBufferUnspecified` (0) `framesPerBuffer` parameter. Using this flag incorrectly results in a `paInvalidFlag` error being returned from `OpenStream` and `OpenDefaultStream`.

const `paNeverDropInput` = 4 Call the stream callback to fill initial output buffers, rather than the default behavior of priming the buffers with zeros (silence). This flag has no effect for input-only and blocking read/write streams.

const `paPrimeOutputBuffersUsingStreamCallback` = 8 Call the stream callback to fill initial output buffers, rather than the default behavior of priming the buffers with zeros (silence). This flag has no effect for input-only and blocking read/write streams.

If a call to `OpenStream()` fails, a non-zero error code is returned (see `PaError` for possible error codes) and the value of `stream` is invalid.

Error -2 is from the plugin and reports that the buffer was not created before.

### 15.15.7 ReadFrames(mem as memoryblock, SizeInBytes as Integer) as Integer

MBS Audio Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads frames into the memoryblock.

**Example:**

```pascal
dim s as PortAudioStreamRecorderMBS
dim m as memoryblock

m=newmemoryblock(1024*1024)  // initialize
dim frames as Integer

frames=s.ReadFrames(m,m.size)
msgbox "we got "+str(frames)+" frames."
```

**Notes:**

You pass a memoryblock and the size of this memoryblock in bytes. Values are stored in floats (memoryblock.singlevalue) so you get at maximum SizeInBytes/4 values. And if you use more than one channel, you will receive them interlaced.

ReadFrames uses a mutex to access share data, so this call is expensive. Use a big buffer.
15.15.8 ResizeBuffer(BufferSize as Integer)

MBS Audio Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Resizes the buffer.
**Notes:**
Do not resize while you are recording (this can crash).

The buffer must be a power of 2. For example one Megabyte \(2^{20}\).

At 44100 Hz, and 4 bytes per value and 2 channels, you will need 352800 bytes per second on storage.

15.15.9 Properties

15.15.10 Buffer as Memoryblock

MBS Audio Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a memoryblock which points to the ring buffer used in the recorder object.
**Notes:**
This memoryblock has no size.
It is only for debugging and only valid as long as the PortAudioStreamRecorderMBS object is living.
(Read only property)

15.15.11 BufferReadIndex as Integer

MBS Audio Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The read index inside the ring buffer.
**Notes:**
Only for debugging.
(Read only property)

15.15.12 BufferSize as Integer

MBS Audio Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The size of the ring buffer in bytes.
**Notes:** (Read only property)
15.15.13 **BufferWriteIndex as Integer**

MBS Audio Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The write index inside the ring buffer.  
**Notes:** Only for debugging. (Read only property)

15.15.14 **FramesAvailable as Integer**

MBS Audio Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The number of frames available in the buffer.  
**Notes:** FramesAvailable uses a mutex to access share data, so this call is expensive. Do not call it to decide whether to call ReadFrames. ReadFrames calls FramesAvailable itself. (Read only property)

15.15.15 **NumInputChannels as Integer**

MBS Audio Plugin, Plugin Version: 9.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The number of input channels used with the OpenStream function.  
**Notes:** (Read only property)
15.16.1 GetSoundMuteMBS as boolean

MBS Util Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Checks the mute state of the sound output.

**Example:**

```plaintext
if GetSoundMuteMBS then
    Title="on"
else
    Title="off"
end if
```

**Notes:** Returns false on any error.

15.16.2 GetSoundVolumeLeftMBS as Double

MBS Util Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Gets the current volume for the left channel.

**Notes:** Same as GetSoundVolumeMBS, but only for the left channel.

15.16.3 GetSoundVolumeMBS as Double

MBS Util Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Gets the current volume.

**Example:**

```plaintext
dim d as Double

d=GetSoundVolumeMBS
```

**Notes:**

Volume is from 0 to 1.0
Uses QuickTime on Mac OS Classic, CoreAudio on Mac OS X and the Mixer on Windows.
15.16.4 GetSoundVolumeRightMBS as Double

MBS Util Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Gets the current volume for the right channel. **Notes:** Same as GetSoundVolumeMBS, but only for the right channel.

15.16.5 SetSoundMuteMBS(mute as boolean)

MBS Util Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Sets sound mute to the give state. **Example:**

SetSoundMuteMBS true // set mute on

15.16.6 SetSoundVolumeLeftMBS(percent as Double)

MBS Util Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Sets the volume on the left channel. **Notes:**

Volume is from 0 to 1.0
Uses QuickTime on Mac OS Classic, CoreAudio on Mac OS X and the Mixer on Windows.

15.16.7 SetSoundVolumeMBS(percent as Double)

MBS Util Plugin, Plugin Version: 5.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Sets the volume. **Example:**

SetSoundVolumeMBS 1.0

**Notes:**

Volume is from 0 to 1.0
Uses QuickTime on Mac OS Classic, CoreAudio on Mac OS X and the Mixer on Windows.
15.16.8  SetSoundVolumeRightMBS(percent as Double)

MBS Util Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:**
Sets the volume on the right channel.

**Notes:**
Volume is from 0 to 1.0
Uses QuickTime on Mac OS Classic, CoreAudio on Mac OS X and the Mixer on Windows.

15.17  class SoundFileInfoMBS

15.17.1  class SoundFileInfoMBS

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for the file info of a sound file.

**Notes:**
When you open a sound file, the library will fill this and provide you the file format details.
When writing a sound file, you need to build valid format.

15.17.2  Properties

15.17.3  Channels as Integer

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The number of channels.

**Notes:**  (Read and Write property)

15.17.4  Format as Integer

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The format ID.

**Notes:**
See kFormat constants.
(Read and Write property)
CHAPTER 15. AUDIO

15.17.5 FormatEndianName as String

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The endian description for the format.
**Notes:** (Read only property)

15.17.6 FormatName as String

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The format description for the format.
**Notes:** (Read only property)

15.17.7 FormatSubName as String

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The sub format description for the format.
**Notes:** (Read only property)

15.17.8 Frames as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The number of frames.
**Notes:** (Read and Write property)

15.17.9 IsValid as Boolean

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether format is valid.
**Notes:**
Returns true if valid.
(Read only property)

15.17.10 SampleRate as Integer

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The sample rate in Hz.
15.17. **CLASS SOUNDFILEINFOMBS**

Notes: (Read and Write property)

15.17.11 **Sections as Integer**

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The number of sections.
Notes: (Read and Write property)

15.17.12 **Seekable as Boolean**

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether format is seekable.
Notes: (Read and Write property)

15.17.13 **Constants**

15.17.14 **kFormatAIFF = & h020000**

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants.
Notes: Apple/SGI AIFF format (big endian).

15.17.15 **kFormatALAC16 = & h0070**

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.
Notes: Apple Lossless Audio Codec (16 bit).

15.17.16 **kFormatALAC20 = & h0071**

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.
Notes: Apple Lossless Audio Codec (20 bit).

15.17.17 **kFormatALAC24 = & h0072**

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.
Notes: Apple Lossless Audio Codec (24 bit).
15.17.18  \texttt{kFormatALAC32 = & h0073}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function}: One of the sub format constants. 
\textbf{Notes}: Apple Lossless Audio Codec (32 bit). 

15.17.19  \texttt{kFormatALAW = & h0011}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function}: One of the sub format constants. 
\textbf{Notes}: A-Law encoded. 

15.17.20  \texttt{kFormatAU = & h030000}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function}: One of the format constants. 
\textbf{Notes}: Sun/NeXT AU format (big endian). 

15.17.21  \texttt{kFormatAVR = & h120000}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function}: One of the format constants. 
\textbf{Notes}: Audio Visual Research 

15.17.22  \texttt{kFormatCAF = & h180000}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function}: One of the format constants. 
\textbf{Notes}: Core Audio File format 

15.17.23  \texttt{kFormatDouble = & h0007}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function}: One of the sub format constants. 
\textbf{Notes}: 64 bit float data 

15.17.24  \texttt{kFormatDPCM_16 = & h0051}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function}: One of the sub format constants. 
\textbf{Notes}: 16 bit differential PCM (XI only)
15.17. CLASS SOUNDFILEINFOMBS

15.17.25 kFormatDPCM_8 = & h0050

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.  
**Notes:** 8 bit differential PCM (XI only)

15.17.26 kFormatDWVW_12 = & h0040

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.  
**Notes:** 12 bit Delta Width Variable Word encoding.

15.17.27 kFormatDWVW_16 = & h0041

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.  
**Notes:** 16 bit Delta Width Variable Word encoding.

15.17.28 kFormatDWVW_24 = & h0042

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.  
**Notes:** 24 bit Delta Width Variable Word encoding.

15.17.29 kFormatDWVW_N = & h0043

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.  
**Notes:** N bit Delta Width Variable Word encoding.

15.17.30 kFormatEndianBig = & h20000000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the endian format constants.  
**Notes:** Force big endian-ness.

15.17.31 kFormatEndianCPU = & h30000000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the endian format constants.  
**Notes:** Force CPU endian-ness.
15.17.32  kFormatEndianFile = \& h00000000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the endian format constants.  
**Notes:** Default file endian-ness.

15.17.33  kFormatEndianLittle = \& h10000000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the endian format constants.  
**Notes:** Force little endian-ness.

15.17.34  kFormatEndianMask = \& h30000000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants.  
**Notes:** Bitmask for the endian format.

15.17.35  kFormatFLAC = \& h170000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants.  
**Notes:** FLAC lossless file format

15.17.36  kFormatFloat = \& h0006

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.  
**Notes:** 32 bit float data

15.17.37  kFormatG721_32 = \& h0030

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.  
**Notes:** 32kbs G721 ADPCM encoding.

15.17.38  kFormatG723_24 = \& h0031

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.  
**Notes:** 24kbs G723 ADPCM encoding.
15.17. CLASS SOUNDFILEINFOMBS

15.17.39  kFormatG723_40 = & h0032

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.  
**Notes:** 40kbs G723 ADPCM encoding.

15.17.40  kFormatGSM610 = & h0020

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.  
**Notes:** GSM 6.10 encoding.

15.17.41  kFormatHTK = & h100000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants.  
**Notes:** HMM Tool Kit format

15.17.42  kFormatIMA_ADPCM = & h0012

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.  
**Notes:** IMA ADPCM.

15.17.43  kFormatIRCAM = & h0A0000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants.  
**Notes:** Berkeley/IRCAM/CARL

15.17.44  kFormatMAT4 = & h0C0000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants.  
**Notes:** Matlab (tm) V4.2 / GNU Octave 2.0

15.17.45  kFormatMAT5 = & h0D0000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants.  
**Notes:** Matlab (tm) V5.0 / GNU Octave 2.1
15.17.46 kFormatMPC2K = & h210000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants. 
*Notes:* Akai MPC 2000 sampler

15.17.47 kFormatMS_ADPCM = & h0013

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants. 
*Notes:* Microsoft ADPCM.

15.17.48 kFormatNIST = & h070000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants. 
*Notes:* Sphere NIST format.

15.17.49 kFormatOGG = & h200000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants. 
*Notes:* Xiph OGG container

15.17.50 kFormatPAF = & h050000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants. 
*Notes:* Ensoniq PARIS file format.

15.17.51 kFormatPCM16 = & h0002

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants. 
*Notes:* Signed 16 bit data

15.17.52 kFormatPCM24 = & h0003

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants. 
*Notes:* Signed 24 bit data
15.17. **CLASS SOUNDFILEINFOMBSS**

15.17.53  kFormatPCM32 = & h0004

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants. 
**Notes:** Signed 32 bit data

15.17.54  kFormatPCMS8 = & h0001

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants. 
**Notes:** Signed 8 bit data

15.17.55  kFormatPCMU8 = & h0005

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants. 
**Notes:** Unsigned 8 bit data (WAV and RAW only)

15.17.56  kFormatPVF = & h0E0000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants. 
**Notes:** Portable Voice Format

15.17.57  kFormatRAW = & h040000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants. 
**Notes:** RAW PCM data.

15.17.58  kFormatRF64 = & h220000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants. 
**Notes:** RF64 WAV file

15.17.59  kFormatSD2 = & h160000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants. 
**Notes:** Sound Designer 2
15.17.60  \texttt{kFormatSDS = \& h110000}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function:} One of the format constants.
\textbf{Notes:} Midi Sample Dump Standard

15.17.61  \texttt{kFormatSubMask = \& h0000FFFF}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function:} One of the format constants.
\textbf{Notes:} Bitmask for the sub format.

15.17.62  \texttt{kFormatSVX = \& h060000}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function:} One of the format constants.
\textbf{Notes:} Amiga IFF / SVX8 / SV16 format.

15.17.63  \texttt{kFormatTypeMask = \& h0FFF0000}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function:} One of the format constants.
\textbf{Notes:} Bitmask for the type format.

15.17.64  \texttt{kFormatULAW = \& h0010}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function:} One of the sub format constants.
\textbf{Notes:} U-Law encoded.

15.17.65  \texttt{kFormatVOC = \& h080000}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function:} One of the format constants.
\textbf{Notes:} VOC files.

15.17.66  \texttt{kFormatVORBIS = \& h0060}

MBS Tools Plugin, Plugin Version: 17.4. \textbf{Function:} One of the sub format constants.
\textbf{Notes:} Xiph Vorbis encoding.
15.17. CLASS SOUNDFILEINFOMBS

15.17.67 kFormatVOX_ADPCM = & h0021

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the sub format constants.  
**Notes:** OKI / Dialogix ADPCM

15.17.68 kFormatW64 = & h0B0000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants.  
**Notes:** Sonic Foundry’s 64 bit RIFF/WAV

15.17.69 kFormatWAV = & h010000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants.  
**Notes:** Microsoft WAV format (little endian default).

15.17.70 kFormatWAVEX = & h130000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants.  
**Notes:** MS WAVE with WAVEFORMATEX

15.17.71 kFormatWVE = & h190000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants.  
**Notes:** Psion WVE format

15.17.72 kFormatXI = & h0F0000

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the format constants.  
**Notes:** Fasttracker 2 Extended Instrument
15.18 class SoundFileMBS

15.18.1 class SoundFileMBS

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A cross platform class to use sndfile library to read/write audio samples.  
**Notes:**  
As sndfile library is LGPL, you need to include library within your app folder and load it at runtime.  
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

15.18.2 Methods

15.18.3 Close

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Closes file now.  
**Notes:** Same as destructor, but you can call it early.

15.18.4 Constructor

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Private constructor.

15.18.5 Create(file as folderitem, Info as SoundFileInfoMBS) as SoundFileMBS

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new audio file with given format.  
**Notes:** On success returns new sound file object.

15.18.6 ErrorMessage(errorNumber as integer) as string

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries error message for error number.  
See also:

- 15.18.38 ErrorMessage as String
15.18.7  GetString(type as Integer) as string

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries one of the strings.  
**Notes:**  
See kString* constants.  
Returns "" in case of error.

15.18.8  Loaded as Boolean

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether library is loaded.

15.18.9  LoadErrorMessage as String

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The error message from loading library.

15.18.10  LoadLibrary(file as folderitem) as boolean

**Notes:** Returns true on error.

15.18.11  Open(data as MemoryBlock) as SoundFileMBS

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens an audio file from in memory data.  
**Notes:** On success returns the sound file object.  
See also:  
- 15.18.12 Open(data as String) as SoundFileMBS  
- 15.18.13 Open(file as folderitem, readwrite As Boolean = False) as SoundFileMBS

15.18.12  Open(data as String) as SoundFileMBS

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens an audio file from in memory data.
Notes: On success returns the sound file object.
See also:

- 15.18.11 Open(data as MemoryBlock) as SoundFileMBS
- 15.18.13 Open(file as folderitem, readwrite As Boolean = False) as SoundFileMBS

15.18.13 Open(file as folderitem, readwrite As Boolean = False) as SoundFileMBS

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Opens an audio file.
**Notes:**
On success returns the sound file object.
Pass readwrite = true to write to the file.
See also:

- 15.18.11 Open(data as MemoryBlock) as SoundFileMBS
- 15.18.12 Open(data as String) as SoundFileMBS

15.18.14 ReadDouble(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Reads data as double values, converts if necessary.
**Notes:**
Pointer should point to memmoryblock with 8 * Items in size.
Returns number of items read.

15.18.15 ReadDoubleFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Reads frames as double values, converts if necessary.
**Notes:**
Pointer should point to memmoryblock with 8 * Items * Channels in size.
Returns number of items read.

15.18.16 ReadInt(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Reads data as Int32 values, converts if necessary.
Notes:
Pointer should point to memory block with 4 * Items in size.
Returns number of items read.

15.18.17 ReadIntFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Reads frames as Int32 values, converts if necessary.
Notes:
Pointer should point to memory block with 4 * Items * Channels in size.
Returns number of items read.

15.18.18 ReadRaw(p as ptr, bytes as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Read raw data.
Notes:
Pointer should point to memory block with Bytes in size.
Returns number of bytes read.

15.18.19 ReadShort(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Reads data as Int16 values, converts if necessary.
Notes:
Pointer should point to memory block with 2 * Items in size.
Returns number of items read.

15.18.20 ReadShortFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Reads frames as Int16 values, converts if necessary.
Notes:
Pointer should point to memory block with 2 * Items * Channels in size.
Returns number of items read.
15.18.21 ReadSingle(p as ptr, items as Int64) as Int64

Notes:
Pointer should point to memory block with 4 * Items in size.
Returns number of items read.

15.18.22 ReadSingleFrames(p as ptr, items as Int64) as Int64

Notes:
Pointer should point to memory block with 4 * Items * Channels in size.
Returns number of items read.

15.18.23 Seek(frames as Int64, whence as Integer) as Int64

Notes: See kSeek* constants for whence parameter.

15.18.24 SetString(type as Integer, data as Memoryblock) as Integer

Notes:
See kString* constants.
Returns zero on success.
See also:
- 15.18.25 SetString(type as Integer, text as string) as Integer

15.18.25 SetString(type as Integer, text as string) as Integer

Notes:
15.18. CLASS SOUNDFILEMBS

See kString* constants.
Returns zero on success.
See also:

- 15.18.24 SetString(type as Integer, data as Memoryblock) as Integer

15.18.26 Version as string

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries version of the library.

15.18.27 WriteDouble(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes data to file in double format.
**Notes:**
Pointer should point to memory block with 8 * Items in size.
Returns number of items written.

15.18.28 WriteDoubleFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes frames to file in double format.
**Notes:**
Pointer should point to memory block with 8 * Items * Channels in size.
Returns number of items written.

15.18.29 WriteInt(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes data to file in Int32 format.
**Notes:**
Pointer should point to memory block with 4 * Items in size.
Returns number of items written.
15.18.30 WriteIntFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes frames to file in Int32 format.  
**Notes:**  
Pointer should point to memory block with 4 * Items * Channels in size.  
Returns number of items written.

15.18.31 WriteRaw(p as ptr, bytes as Int64) as Int64

**Notes:**  
Pointer should point to memory block with Bytes in size.  
Returns number of bytes written.

15.18.32 WriteShort(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes data to file in Int16 format.  
**Notes:**  
Pointer should point to memory block with 2 * Items in size.  
Returns number of items written.

15.18.33 WriteShortFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes frames to file in Int16 format.  
**Notes:**  
Pointer should point to memory block with 2 * Items * Channels in size.  
Returns number of items written.

15.18.34 WriteSingle(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes data to file in single format.  
**Notes:**
15.18. **CLASS SOUNDFILEMBS**

Pointer should point to memory block with 4 * Items in size.
Returns number of items written.

15.18.35 **WriteSingleFrames**(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Writes frames to file in single format.
**Notes:**
Pointer should point to memory block with 4 * Items * Channels in size.
Returns number of items written.

15.18.36 **WriteSync**

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Writes recent changes in file to disk.

15.18.37 **Properties**

15.18.38 **ErrorMessage** as String

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The last error message.
**Notes:** (Read only property)
See also:

- 15.18.6 ErrorMessage(errorNumber as integer) as string

15.18.39 **ErrorNumber** as Integer

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The last error number.
**Notes:** (Read only property)

15.18.40 **Handle** as Integer

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The internal object reference.
15.18.41 Info as SoundFileInfoMBS

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries current format.  
**Notes:** (Read and Write property)

15.18.42 Constants

15.18.43 $k\text{SeekCurrent} = 1$

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the seek mode constants.  
**Notes:** Seek relative to current position.

15.18.44 $k\text{SeekEnd} = 2$

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the seek mode constants.  
**Notes:** Seek relative to end.

15.18.45 $k\text{SeekSet} = 0$

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the seek mode constants.  
**Notes:** Seek relative to begin.

15.18.46 $k\text{StringAlbum} = 7$

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the string constants.  
**Notes:** Album

15.18.47 $k\text{StringArtist} = 4$

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the string constants.  
**Notes:** Artist
15.18.48  kStringComment = 5

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the string constants.  
**Notes:** Comment

15.18.49  kStringCopyright = 2

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the string constants.  
**Notes:** Copyright

15.18.50  kStringDate = 6

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the string constants.  
**Notes:** Date

15.18.51  kStringGenre = 10

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the string constants.  
**Notes:** Genre

15.18.52  kStringLicense = 8

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the string constants.  
**Notes:** License

15.18.53  kStringSoftware = 3

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the string constants.  
**Notes:** Software

15.18.54  kStringTitle = 1

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the string constants.  
**Notes:** Title
15.18.55  kStringTrackNumber = 9

MBS Tools Plugin, Plugin Version: 17.4. **Function:** One of the string constants.
**Notes:** Track Number.
15.19. class TagLibAudioPropertiesMBS

15.19.1 class TagLibAudioPropertiesMBS

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for audio properties.

15.19.2 Properties

15.19.3 Bitrate as Integer

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The bit rate for the sound.
**Notes:**
Returns the most appropriate bit rate for the file in kb/s. For constant bitrate formats this is simply the bitrate of the file. For variable bitrate formats this is either the average or nominal bitrate.
(Read and Write property)

15.19.4 Channels as Integer

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The number of channels.
**Notes:** (Read and Write property)

15.19.5 Length as Integer

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The length of the file in second.
**Notes:** (Read and Write property)

15.19.6 SampleRate as Integer

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The sample rate in Hz.
**Notes:** (Read and Write property)
15.20 class TagLibFileRefMBS

15.20.1 class TagLibFileRefMBS

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for file loading in TagLib.

15.20.2 Methods

15.20.3 Constructor(file as folderitem)

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.
**Notes:** May raise error exception.

15.20.4 Save as Boolean

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Saves changes to the file.

15.20.5 Properties

15.20.6 audioProperties as TagLibAudioPropertiesMBS

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Queries audio properties of the audio file.
**Notes:** (Read only property)

15.20.7 Handle as Integer

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The internal object reference.
**Notes:** (Read and Write property)
15.20.8 tags as TagLibTagMBS

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tags in that file. **Notes:** (Read only property)
### 15.21 class TagLibTagMBS

#### 15.21.1 class TagLibTagMBS

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for tags.

**Notes:**
We do have common values in properties like title, comment and track.
Other properties can be found in tags dictionary.

Please use TagLibFileRefMBS to load file and query it for the tags.

This is an attempt to abstract away the difference in the meta data formats of various audio codecs and tagging schemes. As such it is generally a subset of what is available in the specific formats but should be suitable for most applications. This is meant to compliment the generic APIs found in TagLibAudioPropertiesMBS and TagLibFileRefMBS.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

#### 15.21.2 Methods

#### 15.21.3 Constructor

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The private constructor.

#### 15.21.4 setTags(Values as Dictionary) as Dictionary

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the tags.
**Notes:** Returns a new dictionary with values which are not supported.

#### 15.21.5 Properties

#### 15.21.6 Album as String

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The name of the album.
**Notes:** (Read and Write property)
15.21. **CLASS TAGLIBTAGMBS**

15.21.7 **Artist as String**

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The name of the artist.  
**Notes:** (Read and Write property)

15.21.8 **Comment as String**

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The comment field.  
**Notes:** (Read and Write property)

15.21.9 **Genre as String**

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The genre.  
**Notes:** (Read and Write property)

15.21.10 **Handle as Integer**

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

15.21.11 **isEmpty as Boolean**

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Wether this tag set is empty.  
**Notes:** (Read only property)

15.21.12 **Tags as Dictionary**

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries list of properties.  
**Notes:**  
You get a copy as a dictionary with all keys and values.  
Values could be strings or array of strings.
15.21.13 Title as String

15.21.14 Track as Integer

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The track number. Notes: (Read and Write property)

15.21.15 Year as Integer

MBS Tools Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The year. Notes: (Read and Write property)
15.22. **class WindowsAudioMixerMBS**

15.22.1 **class WindowsAudioMixerMBS**

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The Windows Audio Mixer is a device to control the volume and mute state of all attached audio devices.
**Notes:**
Not all devices are present on all Windows machines.
What device is source and destination is a bit unlogic from Microsoft.

15.22.2 **Methods**

15.22.3 **DeviceCount as Integer**

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Number of Mixer devices found in the system.

15.22.4 **DeviceName(index as Integer) as string**

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Name of the device with the given index.
**Notes:**
Index goes from 0 to DeviceCount-1.
Returns "" on invalid index.

15.22.5 **Properties**

15.22.6 **DeviceIndex as Integer**

MBS Audio Plugin, Plugin Version: 7.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The index of the current used device.
**Notes:**
Default is 0.
(Read and Write property)
15.22.7 Lasterror as Integer

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code reported.
**Notes:** (Read and Write property)

15.22.8 DestinationDigitalMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether digital device is muted.
**Notes:**
Audio line is a digital destination (for example, digital input to a DAT or CD audio device).
Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.9 DestinationDigitalVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Volume of digital device.
**Notes:**
Audio line is a digital destination (for example, digital input to a DAT or CD audio device).
Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.10 DestinationHeadPhonesMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether head phones are muted.
**Notes:**
Audio line is an adjustable (gain and/or attenuation) destination intended to drive headphones. Most audio
cards use the same audio destination line for speakers and headphones, in which case the mixer device simply
uses the DestinationSpeakers.
Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.11 **DestinationHeadPhonesVolume as Double**

**Notes:**
Audio line is an adjustable (gain and/or attenuation) destination intended to drive headphones. Most audio cards use the same audio destination line for speakers and headphones, in which case the mixer device simply uses the DestinationSpeakers.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.12 **DestinationLineMute as boolean**

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether line is muted.  
**Notes:**
Audio line is a line level destination (for example, line level input from a CD audio device) that will be the final recording source for the analog-to-digital converter (ADC). Because most audio cards for personal computers provide some sort of gain for the recording audio source line, the mixer device will use the DestinationWaveIn.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.13 **DestinationLineVolume as Double**

**Notes:**
Audio line is a line level destination (for example, line level input from a CD audio device) that will be the final recording source for the analog-to-digital converter (ADC). Because most audio cards for personal computers provide some sort of gain for the recording audio source line, the mixer device will use the DestinationWaveIn.

LastError is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.14 DestinationMonitorMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether audio monitor is muted.
**Notes:**
Audio line is a destination used for a monitor.

LastError is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.15 DestinationMonitorVolume as Double

**Notes:**
Audio line is a destination used for a monitor.

LastError is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.16 DestinationSpeakersMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether speakers are muted.
**Notes:**
Audio line is an adjustable (gain and/or attenuation) destination intended to drive speakers. This is the typical component type for the audio output of audio cards for personal computers.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.17 DestinationSpeakersVolume as Double

**Notes:**
Audio line is an adjustable (gain and/or attenuation) destination intended to drive speakers. This is the typical component type for the audio output of audio cards for personal computers.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.18 DestinationTelephoneMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether telephone is muted.  
**Notes:**
Audio line is a destination that will be routed to a telephone line.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.19 DestinationTelephoneVolume as Double

**Notes:**
Audio line is a destination that will be routed to a telephone line.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.20  **DestinationVoiceInMute as boolean**

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether voice input is muted.
**Notes:**
Audio line is a destination that will be the final recording source for voice input. This component type is exactly like DestinationWaveIn but is intended specifically for settings used during voice recording/recognition. Support for this line is optional for a mixer device. Many mixer devices provide only DestinationWaveIn.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.21  **DestinationVoiceInVolume as Double**

**Notes:**
Audio line is a destination that will be the final recording source for voice input. This component type is exactly like DestinationWaveIn but is intended specifically for settings used during voice recording/recognition. Support for this line is optional for a mixer device. Many mixer devices provide only DestinationWaveIn.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.22  **DestinationWaveInMute as boolean**

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether wave in is muted.
Notes:
Audio line is a destination that will be the final recording source for the waveform-audio input (ADC). This line typically provides some sort of gain or attenuation. This is the typical component type for the recording line of most audio cards for personal computers.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.23 DestinationWaveInVolume as Double

Notes:
Audio line is a destination that will be the final recording source for the waveform-audio input (ADC). This line typically provides some sort of gain or attenuation. This is the typical component type for the recording line of most audio cards for personal computers.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.24 SourceAnalogMute as boolean

Notes:
Audio line is an analog source (for example, analog output from a video-cassette tape).

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)
15.22.25 SourceAnalogVolume as Double

**Notes:**
Audio line is an analog source (for example, analog output from a video-cassette tape).

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.26 SourceAuxiliaryMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether auxiliary is muted.

**Notes:**
Audio line is a source originating from the auxiliary audio line. This line type is intended as a source with gain or attenuation that can be routed to the DestinationSpeakers destination and/or recorded from the DestinationWaveIn destination.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.27 SourceAuxiliaryVolume as Double

**Notes:**
Audio line is a source originating from the auxiliary audio line. This line type is intended as a source with gain or attenuation that can be routed to the DestinationSpeakers destination and/or recorded from the DestinationWaveIn destination.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)
15.22. **SourceCompactDiscMute as boolean**

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the CD device is muted.  
**Notes:**  
Audio line is a source originating from the output of an internal audio CD. This component type is provided for audio cards that provide an audio source line intended to be connected to an audio CD (or CD-ROM playing an audio CD).

Lasterror is set.  
Value is true if device is muted, else false.  
On any error or non Windows platforms value is always false.  
(Read and Write computed property)

15.22. **SourceCompactDiscVolume as Double**

**Notes:**  
Audio line is a source originating from the output of an internal audio CD. This component type is provided for audio cards that provide an audio source line intended to be connected to an audio CD (or CD-ROM playing an audio CD).

Lasterror is set.  
Range is from 0 for no volume to 1.0 for maximum volume.  
On any error or non Windows platforms the value is always 0.  
(Read and Write computed property)

15.22. **SourceDigitalMute as boolean**

**Notes:**  
Audio line is a digital source (for example, digital output from a DAT or audio CD).

Lasterror is set.  
Value is true if device is muted, else false.  
On any error or non Windows platforms value is always false.  
(Read and Write computed property)
15.22.31 SourceDigitalVolume as Double

**Notes:**
Audio line is a digital source (for example, digital output from a DAT or audio CD).

LastError is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.32 SourceLineMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether line is muted.

**Notes:**
Audio line is a line-level source (for example, line-level input from an external stereo) that can be used as an optional recording source. Because most audio cards for personal computers provide some sort of gain for the recording source line, the mixer device will use the SourceAuxiliary type.

LastError is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.33 SourceLineVolume as Double

**Notes:**
Audio line is a line-level source (for example, line-level input from an external stereo) that can be used as an optional recording source. Because most audio cards for personal computers provide some sort of gain for the recording source line, the mixer device will use the SourceAuxiliary type.

LastError is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)
15.22. CLASS WINDOWSAUDIO\_MIXER MGMBS

15.22.34 SourceMicrophoneMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether microphone is muted.

**Notes:**

Audio line is a microphone recording source. Most audio cards for personal computers provide at least two types of recording sources: an auxiliary audio line and microphone input. A microphone audio line typically provides some sort of gain. Audio cards that use a single input for use with a microphone or auxiliary audio line should use the SourceMicrophone component type.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.35 SourceMicrophoneVolume as Double

**Notes:**

Audio line is a microphone recording source. Most audio cards for personal computers provide at least two types of recording sources: an auxiliary audio line and microphone input. A microphone audio line typically provides some sort of gain. Audio cards that use a single input for use with a microphone or auxiliary audio line should use the SourceMicrophone component type.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.36 SourcePCSpeakerMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether PC Speaker is muted.

**Notes:**

Audio line is a source originating from personal computer speaker. Several audio cards for personal computers provide the ability to mix what would typically be played on the internal speaker with the output of an audio card. Some audio cards support the ability to use this output as a recording source.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.37 **SourcePCSpeakerVolume as Double**

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Volume of PC Speakers.

**Notes:**
Audio line is a source originating from personal computer speaker. Several audio cards for personal comput-
ers provide the ability to mix what would typically be played on the internal speaker with the output of an audio card. Some audio cards support the ability to use this output as a recording source.

LastError is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.38 **SourceSynthesizerMute as boolean**

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether synthesizer is muted.

**Notes:**
Audio line is a source originating from the output of an internal synthesizer. Most audio cards for personal computers provide some sort of MIDI synthesizer (for example, an Adlib-compatible or OPL/3 FM synthe-
sizer).

LastError is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.39 **SourceSynthesizerVolume as Double**

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Volume of synthesizer.

**Notes:**
Audio line is a source originating from the output of an internal synthesizer. Most audio cards for personal computers provide some sort of MIDI synthesizer (for example, an Adlib-compatible or OPL/3 FM synthe-
Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.40  **SourceTelephoneMute as boolean**

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether telephone is muted.
**Notes:**
Audio line is a source originating from an incoming telephone line.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.41  **SourceTelephoneVolume as Double**

**Notes:**
Audio line is a source originating from an incoming telephone line.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.42  **SourceWaveOutMute as boolean**

**Notes:**
Audio line is a source originating from the waveform-audio output digital-to-analog converter (DAC). Most audio cards for personal computers provide this component type as a source to the DestinationSpeakers
destination. Some cards also allow this source to be routed to the DestinationWaveIn destination.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.43 SourceWaveOutVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Volume of wave out device.
**Notes:**
Audio line is a source originating from the waveform-audio output digital-to-analog converter (DAC). Most audio cards for personal computers provide this component type as a source to the DestinationSpeakers destination. Some cards also allow this source to be routed to the DestinationWaveIn destination.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)
15.23 class WindowsMCIMBS

15.23.1 class WindowsMCIMBS

MBS Audio Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Access to the Video for Windows API.

**Example:**

```// open the CD Device and set time format to Track:Minute:Second:Frame```

```dim v as new WindowsMCIMBS
v.Command="open cdaudio"
v.run```

```v.Command="set cdaudio time format TMSF"
v.run```

**Notes:**

Without QuickTime you can’t play a movie in Windows with the Movieplayer control. This class allows you to play movies.

Possible devices:

- vcr (ME, 98)
- videodisc (ME, 98)
- overlay
cd audio (2000, ME, 98)
dat
scanner
animation
digitalvideo
wave audio (2000, ME, 98)
sequencer (2000, ME, 98)
avivideo (2000, ME, 98)
mpeg video (2000, ME, 98)

(I added on which OS I find the devices on my installation.)

On Windows 2000 we have this connection between devices and file extensions:

You can find this list in the Registry on Windows 2000 at "HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\Currentversion\MCI Extensions".
vcr:
videodisc:
overlay:
cdaudio: cda.
dat:
scanner:
animation:
digitalvideo:
waveaudio: wav.
sequencer: mdi, midi, rmi.
avi
mpegvideo: aif*, asx, asf, au, dat, ivf, m1v, m3z, mov, mp*, qt, snd, wax, wm, wma, wmv, wvx.

Possible states of a device:

not ready
stopped
playing
recording
seeking
paused
open

Possible time units:

milliseconds - Default
hms - Hour:Minute:Second
msf - Minute:Second:Frame
frames
smpte 24
smpte 25
smpte 30
smpte 30 drop
bytes
samples
tmsf - Track:Minute:Second:Frame -> use for CD

A list of all commands can be found on the Microsoft Website at:
15.23.2 Methods

15.23.3 Run

MBS Audio Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Executes a command.

**Example:**

```vbs
Dim v As New WindowsMCIMBS

v.command = "pause cdaudio" ' pauses the CD
v.run
```

15.23.4 Properties

15.23.5 Command as string

MBS Audio Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Here you can store the next Command for the MCI.

**Example:**

```vbs
Dim v As New WindowsMCIMBS

v.command = "pause cdaudio" ' pauses the CD
v.run
```

**Notes:** (Read and Write property)

15.23.6 Errorcode as Integer

MBS Audio Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The error code for the last error.

**Example:**

```vbs
Dim v As New WindowsMCIMBS

MsgBox Str(v.errorcode) + " " + v.errorstring
```
Notes:
This property can be set to make a list of possible error messages like in the example "List MCI Errormes-
sages".
(Read and Write property)

15.23.7 Errorstring as string

MBS Audio Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The error description
for the last error.
**Example:**
```v
dim v as new WindowsMCIMBS

msgbox str(v.errorcode)+" " +v.errorstring
```

Notes:
Here is a list of some error messages:

(Read and Write property)

15.23.8 Result as string

MBS Audio Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The result of the last
operation.
**Example:**
```v
dim v as WindowsMCIMBS

// get the current position, track and track count to display for the CD Audio.

v.Command="Status cdaudio Current Track"
v.run
MsgBox v.result

v.command="Status cdaudio Number of Tracks"
v.run
MsgBox v.result

v.command="Status cdaudio position"
v.run
MsgBox v.result
```
Notes: (Read and Write property)
The specified command was carried out.

Undefined external error.

A device ID has been used that is out of range for your system.

The driver was not enabled.

The specified device is already in use. Wait until it is free, and then try again.

The specified device handle is invalid.

There is no driver installed on your system.

There is not enough memory available for this task. Quit one or more applications to increase available memory, and then try again.

This function is not supported. Use the Capabilities function to determine which functions and messages the driver supports.

An error number was specified that is not defined in the system.

An invalid flag was passed to a system function.

An invalid parameter was passed to a system function.

Handle being used simultaneously on another thread (eg callback).

Specified alias not found in WIN.INI.

The registry database is corrupt.

The specified registry key was not found.

The registry could not be opened or could not be read.

The registry could not be written to.

The specified registry key could not be deleted.

The specified registry key value could not be found.

The driver did not generate a valid OPEN callback.

The specified format is not supported or cannot be translated. Use the Capabilities function to determine the supported formats.

Cannot perform this operation while media data is still playing. Reset the device, or wait until the data is finished playing.

The wave header was not prepared. Use the Prepare function to prepare the header, and then try again.

Cannot open the device without using the WAVE_ALLOWSYNC flag. Use the flag, and then try again.

The MIDI header was not prepared. Use the Prepare function to prepare the header, and then try again.

The specified device is already in use. Wait until it is free, and then try again.

Cannot perform this operation while media data is still playing. Reset the device, or wait until the data is finished playing.

A MIDI map was not found. There may be a problem with the driver, or the MIDIMAP.CFG file may be corrupt or missing.

The port is transmitting data to the device. Wait until the data has been transmitted, and then try again.

The current MIDI Mapper setup refers to a MIDI device that is not installed on the system. Use MIDI Mapper to edit the setup.

The current MIDI setup is damaged. Copy the original MIDIMAP.CFG file to the Windows SYSTEM directory, and then try again.

A MIDI call was made which is invalid with the current open mode. Reopen the device with the correct mode.

Driver condition - do not callback this input event

Invalid MCI device ID. Use the ID returned when opening the MCI device.

The driver cannot recognize the specified command parameter.

The device cannot recognize the specified command parameter.
15.24. **CLASS WINDOWSPLAYERMBS**

15.24  **class WindowsPlayerMBS**

15.24.1  **class WindowsPlayerMBS**

MBS Audio Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The Windows MP3 Player class.

**Notes:**
This is a little class to play a MP3 file (or data in memory).
Written for 44100 Hz, 2 channel MP3 files.

With plugin version 16.1 this class should work fine with any sample rate, any channel count and other formats as long as Microsoft drivers support them.

15.24.2  **Methods**

15.24.3  **Constructor(data as MemoryBlock)**

MBS Audio Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Initializes the class with given data.
See also:

- 15.24.4 Constructor(data as String)
- 15.24.5 Constructor(file as folderitem)

15.24.4  **Constructor(data as String)**

MBS Audio Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Initializes the class with given data.
See also:

- 15.24.3 Constructor(data as MemoryBlock)
- 15.24.5 Constructor(file as folderitem)

15.24.5  **Constructor(file as folderitem)**

MBS Audio Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Initializes the class with a given file.
See also:

- 15.24.3 Constructor(data as MemoryBlock)
15.24.6  GetVolume(byref VolumeLeft as Double, byref VolumeRight as Double)

MBS Audio Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries left and right volume.

15.24.7  Pause

MBS Audio Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Pauses current playback.

15.24.8  Play(offset as Double = 0.0)

MBS Audio Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Starts playing the sound. **Notes:** With offset you can define the start point in seconds from beginning of sound. Range from 0 seconds to duration-1.

15.24.9  Resume

MBS Audio Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Resumes current playback.

15.24.10  SetVolume(VolumeLeft as Double, VolumeRight as Double)

MBS Audio Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the left and right volume independent.

15.24.11  Stop

MBS Audio Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Stops current playback.
### 15.24.12 Properties

#### 15.24.13 Buffer as MemoryBlock

MBS Audio Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The buffer with audio samples.
**Notes:**
You get a copy of the buffer as memoryblock.
Please use BufferLength, SampleRate and ChannelCount to read it.
Data is always 16 bit with 2 * ChannelCount * SampleRate bytes per second.
(Read only property)

#### 15.24.14 BufferLength as Integer

MBS Audio Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The buffer length for audio samples.
**Notes:** (Read only property)

#### 15.24.15 ChannelCount as Integer

MBS Audio Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The channel count of the audio file.
**Notes:** (Read only property)

#### 15.24.16 Duration as Double

MBS Audio Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Returns duration of sound in seconds.
**Notes:** (Read only property)

#### 15.24.17 Lasterror as Integer

MBS Audio Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.
**Notes:** (Read and Write property)
15.24.18 Pitch as Double

Notes:
Default 1.0.
pass e.g. 0.5 for half pitch or 2.0 to double pitch.
(Read and Write property)

15.24.19 Position as Double

Notes: (Read only property)

15.24.20 Rate as Double

Notes:
Default 1.0.
pass e.g. 0.5 for half speed or 2.0 to double speed.
(Read and Write property)

15.24.21 SampleRate as Integer

Notes: (Read only property)

15.24.22 Volume as Double

Notes: (Read and Write property)
Chapter 16

Authorization

16.1  class AuthorizationItemMBS

16.1.1  class AuthorizationItemMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
A class for an authorization right.

16.1.2  Properties

16.1.3  Flags as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Flags for this item.
Notes:
Flags returned in the flags field of ItemSet Items when calling Authorize:

kAuthorizationFlagCanNotPreAuthorize  1

(Read and Write property)

16.1.4  Name as String

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The name of the item.
Notes: (Read and Write property)

16.1.5 Value as String

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of the item.
**Notes:** (Read and Write property)
16.2. CLASS AUTHORIZATIONITEMSETMBS

16.2  class AuthorizationItemSetMBS

16.2.1  class AuthorizationItemSetMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a set of authorization rights.

16.2.2  Methods

16.2.3  Append(item as AuthorizationItemMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Adds a new item to the list.

16.2.4  Remove(index as Integer)

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Removes the item with the given index.

16.2.5  Properties

16.2.6  Count as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the number of items in the list.
**Notes:** (Read and Write property)

16.2.7  Item(index as Integer) as AuthorizationItemMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns an item from the list.
**Notes:** (Read and Write computed property)
16.3 class AuthorizationMBS

16.3.1 class AuthorizationMBS

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to run a root shell on Mac OS X.

**Notes:**

Some notes from Ilija Injac on this usage of this class:

The main problem for the execution of the perl script was, that perl is not able to find the required perl-modules at execution with the option "-U" (this switch is set for security reasons). It was also neccessary to include the perl-modules from inside the perl script wich has to be executed. Inside the Realbasic code i created a AuthorizationItemMBS with the value "/usr/bin/perl":

```plaintext
i = new AuthorizationItemMBS

i.name = a.kAuthorizationItemRightExecute
i.value = "/usr/bin/perl"
```

... Actually it is the same source as in Christians "Authorization 1" example within the "test1" function. And it works!

16.3.2 Methods

16.3.3 Authorize(rights as AuthorizationItemSetMBS, flags as Integer)

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Short for Authorize without the resulting rights set.

**Example:**

```plaintext
dim a as AuthorizationMBS
dim s as AuthorizationItemSetMBS
dim i as AuthorizationItemMBS
dim Flags as Integer

// check whether use is admin

a=new AuthorizationMBS
s=new AuthorizationItemSetMBS
i=new AuthorizationItemMBS
```
if a.NewAuthorization(nil,a.kAuthorizationFlagDefaults) then  // create
Flags=BitwiseOr(a.kAuthorizationFlagExtendRights,a.kAuthorizationFlagInteractionAllowed)
a.Authorize(s,flags)
MsgBox str(a.LastError)
// -60006 for cancel = no admin
// 0 on success
end if

See also:

- 16.3.4 Authorize(rights as AuthorizationItemSetMBS, flags as Integer, byref outrights as AuthorizationItemSetMBS)

16.3.4 Authorize(rights as AuthorizationItemSetMBS, flags as Integer, byref outrights as AuthorizationItemSetMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Tries to extend authorization to have root rights.

**Notes:**
The Authorized property is set if this function was successful.
LastError is set.
outrights is on return a list of the rights which are authorized.

Extends the rights of the class.

When the kAuthorizationFlagInteractionAllowed flag is set, user interaction will happen when required. Failing to set this flag will result in this call failing with a errAuthorizationInteractionNotAllowed status when interaction is required.

Setting the kAuthorizationFlagExtendRights flag will extend the currently available rights.

Setting the kAuthorizationFlagPartialRights flag will cause this call to succeed if only some of the requested rights are being granted by the system. Unless this flag is set this API will fail if not all the requested rights could be obtained.

Setting the kAuthorizationFlagDestroyRights flag will prevent any additional rights obtained during this call from being preserved after returning from this API.
Setting the kAuthorizationFlagPreAuthorize flag will pre authorize the requested rights so that at a later time – by calling GetExternalForm() follow by NewAuthorizationFromExternalForm() – the obtained rights can be used in a different process. Rights that can’t be preauthorized will be treated as if they were authorized for the sake of returning an error (in other words if all rights are either authorized or could not be preauthorized this call will still succeed).

The rights which could not be preauthorized are not currently authorized and may fail to authorize when a later call to Authorize() is made, unless the kAuthorizationFlagExtendRights and kAuthorizationFlagInteractionAllowed flags are set. Even then they might still fail if the user does not supply the correct credentials.

The reason for passing in this flag is to provide correct audit trail information and to avoid unnecessary user interaction.

Error codes:

- **errAuthorizationSuccess** 0 No error.
- **errAuthorizationInvalidRef** -60002 The authorization parameter is invalid.
- **errAuthorizationInvalidSet** -60001 The rights parameter is invalid.
- **errAuthorizationInvalidPointer** -60004 The authorizedRights parameter is invalid.

See also:

- 16.3.3 Authorize(rights as AuthorizationItemSetMBS, flags as Integer)

### 16.3.5 Available as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns true if the Authorization Framework was loaded correctly.
**Notes:** Returns false on any error.

### 16.3.6 close

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The destructor.
**Notes:**
Strings made with the ExternalForm function will become invalid!

There is no need to call this method except you want to free all resources used by this object now without waiting for Realbasic to do it for you.
16.3. CLASS AUTHORIZATIONMBS

(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

16.3.7 closeStream

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the stream.

16.3.8 EOFStream as boolean

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the Stream is at the end.

16.3.9 Execute(toolpath as string, parameters() as string)

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Executes a command line application in the background. **Notes:** You may make some small shell script which you launch in background. This script can change some other utility to run as root (Setuid), so you can do admin stuff using the normal shell class. Lasterror is set. Currently this function is not available to RB versions before 3.5. Note that the parameters parameter is an array of strings and not just one. toolpath should use an absolute path in unix style. Lasterror is set to -1 if the path is empty or you are not using Mac OS X. See also:

- 16.3.10 Execute(toolpath as string, parameters() as string, openstream as boolean)

16.3.10 Execute(toolpath as string, parameters() as string, openstream as boolean)

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Same as Execute, but you can specify if the stream to the command line application should be opened. **Notes:** Currently this function is not available to RB versions before 3.5. Note that the parameters parameter is an array of strings and not just one. toolpath should use an absolute path in unix style.
Lasterror is set to -1 if the path is empty or you are not using Mac OS X.
See also:

- 16.3.9 Execute(toolpath as string, parameters() as string)

16.3.11 ExternalForm as string

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string with binary data about this Authorization object.  
**Notes:**  
This external representation depends on your process. You can’t save it to disk or keep it longer than the Authorization object exists.  
If the Authorization object is destroyed, your application quits or the authorization times out, this external form becomes invalid.

16.3.12 FlushStream

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Flushs the stream to the background application.

16.3.13 Info as AuthorizationItemSetMBS

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the list of currently authorized rights.  
**Notes:** Returns nil on any error.

16.3.14 MakeStreamAsyncron

16.3.15 NewAuthorization(rights as AuthorizationItemSetMBS, flags as Integer) as Boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new Authorization object.  
**Notes:**
16.3. CLASS AUTHORIZATIONMBS

Laerror is set. Returns true if successfull.

Create a new authorization object which can be used in other authorization calls.

When the kAuthorizationFlagInteractionAllowed flag is set, user interaction will happen when required. Failing to set this flag will result in this call failing with a errAuthorizationInteractionNotAllowed status in the laerror property when interaction is required.

Setting the kAuthorizationFlagExtendRights flag will extend the currently available rights. If this flag is set the class will grant all the rights requested when errAuthorizationSuccess is returned in the laerror property. If this flag is not set the operation will almost certainly succeed, but no attempt will be made to make the requested rights available.

Call the Info function to figure out which of the requested rights are granted by the system.

Setting the kAuthorizationFlagPartialRights flag will cause this call to succeed if only some of the requested rights are being granted by the system. Unless this flag is set this API will fail if not all the requested rights could be obtained.

Setting the kAuthorizationFlagPreAuthorize flag will pre authorize the requested rights so that at a later time – by calling GetExternalForm() follow by NewAuthorizationFromExternalForm() in a different object – the obtained rights can be used in a different process. Rights that can’t be preauthorized will be treated as if they were authorized for the sake of returning an error (in other words if all rights are either authorized or could not be preauthorized this call will still succeed).

The rights which could not be preauthorized are not currently authorized and may fail to authorize when a later call to Authorize() is made, unless the kAuthorizationFlagExtendRights and kAuthorizationFlagInteractionAllowed flags are set. Even then they might still fail if the user does not supply the correct credentials.

The reason for passing in this flag is to provide correct audit trail information and to avoid unnecessary user interaction.

rights (input/optional):
An AuthorizationItemSet containing rights for which authorization is being requested. If nil are specified the class will authorize nothing at all.

flags (input) options specified using the different constants from this class.

Error codes:
errAuthorizationSuccess 0 Authorization or all requested rights succeeded.
errAuthorizationDenied -60005 The authorization for one or more of the requested rights was denied.
errAuthorizationCanceled -60006 The authorization was canceled by the user.
errAuthorizationInteractionNotAllowed -60007 The authorization was denied since no interaction with the user was allowed.

16.3.16 NewAuthorizationFromExternalForm(s as string) as Boolean

Notes:
You can store an authorization in a string for use in a subprocess. For example your application can ask the user for Root rights and you pass this string to a launched terminal application which will use it without having it’s own interface.
LastError is set. Returns true if successfull.

16.3.17 ReadStream(count as Integer) as string

Example:

dim s(0) as String
dim a as AuthorizationMBS
dim e as Integer

s(0)="-show"

a=new AuthorizationMBS

if a.SimpleNewAuthorization then // create

a.Execute("/usr/sbin/dsconfigad",s,true) // and run it

if a.LastError<>0 then MsgBox "LastError on Execute: "+str(a.LastError) else
e=a.Wait // wait for process to terminate. Returns PID
if a.LastError<>0 then MsgBox "LastError on Wait: "+str(a.LastError) end if
end if

msgbox aReadStream(1024)
end if
16.3. CLASS AUTHORIZATIONMBS

Notes:
Tries to read count bytes.

LastError is set.
The returned string will be as long as the number of strings read.

LastError is set to -1 by the plugin if the stream is not open, or you are not using Mac OS X or the memory allocation failed.

16.3.18 SimpleAuthorize

Notes: This is the function from MBS Plugin 3.0.

16.3.19 SimpleNewAuthorization as Boolean

Example:

```vbnet
// uses chmod on test.pdf on the desktop to make
// it read-, write- and executable by everyone.

dim s(1) as String
dim a as AuthorizationMBS

a=new AuthorizationMBS

if a.SimpleNewAuthorization then
    s(0)=“777”
    s(1)=SpecialFolder.Desktop.Child(“test.pdf”).UnixpathMBS

    MsgBox s(1)
a.execute(“/bin/chmod”,s)
    msgbox “Executed:”+str(aLastError)
end if
```

Notes: This is the function from MBS Plugin 3.0.
16.3.20  Wait as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Waits till the background application is done.
**Notes:**
Returns the Process ID or -1 on an error. Lasterror is set.

16.3.21  WriteStream(s as string) as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Writes the given bytes in the string to the stream.

16.3.22  Properties

16.3.23  Authorized as Boolean

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Set to true if the last call to Authorizate was successfull.
**Notes:** (Read and Write property)

16.3.24  Handle as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The handle to the Mac OS authorization object.
**Notes:**
The C type is AuthorizationRef.
(Read and Write property)

16.3.25  KeepRights as Boolean

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
whether the destructor will keep the rights allive for the next use.
**Notes:**
Normally the rights will be destroyed in the destructor so on the next use of the class the user has to reenter
the password. If KeepRights=true the rights will not be destroyed.
(Read and Write property)
16.3. LastError as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code reported.

**Notes:**

Lasterror is -1 if the function is not supported (e.g. on Windows).

Authorization error codes:

- errAuthorizationSuccess 0, The operation completed successfully.
- errAuthorizationInvalidSet -60001, The set parameter is invalid.
- errAuthorizationInvalidRef -60002, The authorization parameter is invalid.
- errAuthorizationInvalidTag -60003, The tag parameter is invalid.
- errAuthorizationInvalidPointer -60004, The authorizedRights parameter is invalid.
- errAuthorizationDenied -60005, The authorization was denied.
- errAuthorizationCanceled -60006, The authorization was canceled by the user.
- errAuthorizationInteractionNotAllowed -60007, The authorization was denied since no user interaction was possible.
- errAuthorizationInternal -60008, Something else went wrong.
- errAuthorizationInvalidFlags -60011, Invalid option flag(s).
- errAuthorizationToolExecuteFailure -60031, Cannot execute privileged tool.

Other Mac OS error codes like -50 for wrong parameters are also possible.

(Read and Write property)

16.3.27 StreamHandle as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the stream for the terminal running in the background with your command line application.

**Notes:** (Read and Write property)

16.3.28 Constants

16.3.29 errAuthorizationCanceled = -60006

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes.

**Notes:** The authorization was cancelled by the user.
16.3.30  errAuthorizationDenied = -60005

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes. **Notes:** The authorization was denied.

16.3.31  errAuthorizationExternalizeNotAllowed = -60009

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes. **Notes:** The authorization is not allowed to be converted to an external format.

16.3.32  errAuthorizationInteractionNotAllowed = -60007

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes. **Notes:** The authorization was denied since no user interaction was possible.

16.3.33  errAuthorizationInternal = -60008

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes. **Notes:** Unable to obtain authorization for this operation.

16.3.34  errAuthorizationInternalizeNotAllowed = -60010

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes. **Notes:** The authorization is not allowed to be created from an external format.

16.3.35  errAuthorizationInvalidFlags = -60011

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes. **Notes:** The provided option flag(s) are invalid for this authorization operation.

16.3.36  errAuthorizationInvalidPointer = -60004

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes. **Notes:** The returned authorization is invalid.
16.3.37  **errAuthorizationInvalidRef = -60002**

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes.  
**Notes:** The authorization reference is invalid.

16.3.38  **errAuthorizationInvalidSet = -60001**

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes.  
**Notes:** The authorization rights are invalid.

16.3.39  **errAuthorizationInvalidTag = -60003**

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes.  
**Notes:** The authorization tag is invalid.

16.3.40  **errAuthorizationSuccess = 0**

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes.  
**Notes:** No error.

16.3.41  **errAuthorizationToolEnvironmentError = -60032**

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes.  
**Notes:** An invalid status was returned during execution of a privileged tool.

16.3.42  **errAuthorizationToolExecuteFailure = -60031**

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the error codes.  
**Notes:** The specified program could not be executed.

16.3.43  **kAuthorizationEmptyEnvironment = nil**

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** Indicates an empty environment. You should pass this constant in functions with an environment parameter if you have no environment data to provide.
16.3.44  \texttt{kAuthorizationExternalFormLength} = 32

MBS MacCF Plugin, Plugin Version: 14.2.  \textbf{Function:} Indicates, in number of bytes, the length of the array in the AuthorizationExternalForm structure.

16.3.45  \texttt{kAuthorizationFlagCanNotPreAuthorize} = 1

MBS MacCF Plugin, Plugin Version: 14.2.  \textbf{Function:} One of the flag values.  \textbf{Notes:} Indicates the Security Server could not preauthorize the right.

16.3.46  \texttt{kAuthorizationFlagDefaults} = 0

MBS MacCF Plugin, Plugin Version: 14.2.  \textbf{Function:} One of the flag values.  \textbf{Notes:} If no bits are set, none of the following features are available.

16.3.47  \texttt{kAuthorizationFlagDestroyRights} = 8

MBS MacCF Plugin, Plugin Version: 14.2.  \textbf{Function:} One of the flag values.  \textbf{Notes:} If the bit specified by this mask is set, the Security Server revokes authorization from the process as well as from any other process that is sharing the authorization. If the bit specified by this mask is not set, the Security Server revokes authorization from the process but not from other processes that share the authorization.

16.3.48  \texttt{kAuthorizationFlagExtendRights} = 2

MBS MacCF Plugin, Plugin Version: 14.2.  \textbf{Function:} One of the flag values.  \textbf{Notes:} If the bit specified by this mask is set, the Security Server attempts to grant the rights requested. Once the Security Server denies one right, it ignores the remaining requested rights.

16.3.49  \texttt{kAuthorizationFlagInteractionAllowed} = 1

MBS MacCF Plugin, Plugin Version: 14.2.  \textbf{Function:} One of the flag values.  \textbf{Notes:} If the bit specified by this mask is set, you permit the Security Server to interact with the user when necessary.
16.3.50  kAuthorizationFlagPartialRights = 4

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the flag values.
**Notes:** If the bit specified by this mask and the kAuthorizationFlagExtendRights mask are set, the Security Server grants or denies rights on an individual basis and all rights are checked.

16.3.51  kAuthorizationFlagPreAuthorize = 16

MBS MacCF Plugin, Plugin Version: 14.2. **Function:** One of the flag values.
**Notes:** If the bit specified by this mask is set, the Security Server preauthorizes the rights requested.
Chapter 17

AVFoundation

17.1 class AVAssetExportSessionMBS

17.1.1 class AVAssetExportSessionMBS

Function: The AVFoundation class for media export.

Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
dim p as string = AVAssetExportSessionMBS.AVAssetExportPresetAppleM4VCellular
dim e as new AVAssetExportSessionMBS(a, p)

dim FileTypes() as string = e.supportedFileTypes
e.outputFileType = FileTypes(0)
e.OutputFile = SpecialFolder.Desktop.Child("small.m4v")
e.exportAsynchronously

// instead of waiting for event, we simply wait for it to finish
do
app.YieldToNextThread
loop until e.status <> e.AVAssetExportSessionStatusExporting

Notes:

An AVAssetExportSession object transcodes the contents of an AVAsset source object to create an output of the form described by a specified export preset.

Prior to initializing an instance of AVAssetExportSession, you can use allExportPresets to get the complete
list of presets available. Use exportPresetsCompatibleWithAsset to get a list of presets that are compatible with a specific asset.

After you have initialized an export session with the asset that contains the source media, the export preset name (presetName), and the output file type (outputFileType), you can start the export running by invoking exportAsynchronously. Because the export is performed asynchronously, this method returns immediately you can use progress to check on the progress. Depending on the capabilities of the device, some exports may be queued when multiple exports are attempted. When this happens, the status of a queued export will indicate that it’s waiting (AVAssetExportSessionStatusWaiting).

The exportAsynchronouslyCompleted event on AVFoundationMBS is called whether the export fails, completes, or is cancelled. Upon completion, the status property indicates whether the export has completed successfully. If it has failed, the value of the error property supplies additional information about the reason for the failure.

Available in OS X v10.7 and later.

17.1.2 Methods

17.1.3 allExportPresets as string()

Function: Returns all available export preset names.
Notes: Returns an array containing a string constant for each of the available preset names.

17.1.4 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

17.1.5 AVAssetExportPreset1280x720 as string

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: Specifies output at 1280x720 pixels.
17.1.6 AVAssetExportPreset1920x1080 as string

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: Specifies output at 1920x1080 pixels.

17.1.7 AVAssetExportPreset3840x2160 as string

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: Specifies output at 3840x2160 pixels (4K video).

17.1.8 AVAssetExportPreset640x480 as string

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: Specifies output at 640x480 pixels.

17.1.9 AVAssetExportPreset960x540 as string

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: Specifies output at 960x540 pixels.

17.1.10 AVAssetExportPresetAppleM4A as string

Function: You use this export option to produce an audio-only .m4a file with appropriate iTunes gapless playback data.
Notes: Specifies an audio-only .m4a file with appropriate iTunes gapless playback data.

17.1.11 AVAssetExportPresetAppleM4V1080pHD as string

Function: One of the export option presets to produce files that can be played on the specific Apple devices.
Notes: Specifies a 1080p High Definition format suitable for playing on Apple devices.
17.1.12 **AVAssetExportPresetAppleM4V480pSD** as string

**Function:** One of the export option presets to produce files that can be played on the specific Apple devices.
**Notes:** Specifies a 480p Standard Definition format suitable for playing on Apple devices.

17.1.13 **AVAssetExportPresetAppleM4V720pHD** as string

**Function:** One of the export option presets to produce files that can be played on the specific Apple devices.
**Notes:** Specifies a 720p High Definition format suitable for playing on Apple devices.

17.1.14 **AVAssetExportPresetAppleM4VAppleTV** as string

**Function:** One of the export option presets to produce files that can be played on the specific Apple devices.
**Notes:** Specifies a format suitable for playing on AppleTV.

17.1.15 **AVAssetExportPresetAppleM4VCellular** as string

**Function:** One of the export option presets to produce files that can be played on the specific Apple devices.
**Notes:** Specifies a format suitable for playing on Apple devices when streamed over a cellular network.

17.1.16 **AVAssetExportPresetAppleM4ViPod** as string

**Function:** One of the export option presets to produce files that can be played on the specific Apple devices.
**Notes:** Specifies a format suitable for playing on an iPod.

17.1.17 **AVAssetExportPresetAppleM4VWiFi** as string

**Function:** One of the export option presets to produce files that can be played on the specific Apple devices.
**Notes:** Specifies a format suitable for playing on Apple devices when streamed over a WiFi network.
17.1. CLASSES AVASSETEXPORTSESSIONMBS

17.1.18 AVAssetExportPresetAppleProRes422LPCM as string

**Function:** One of the export option presets to produce files that can be played on the specific Apple devices.
**Notes:** Specifies a QuickTime movie with Apple ProRes 422 video and LPCM audio.

17.1.19 AVAssetExportPresetPassthrough as string

**Function:** You use this export option to let all tracks pass through.
**Notes:** Specifies that all tracks pass through, unless it is not possible.

17.1.20 cancelExport

**Function:** Cancels the execution of an export session.

17.1.21 Constructor(asset as AVAssetMBS, presetName as string)

**Function:** Initializes an asset export session with a specified asset and preset.
**Notes:**

- **asset:** The asset you want to export.
- **presetName:** A string constant specifying the name of the preset template for the export.

17.1.22 determineCompatibilityOfExportPreset(presetName as string, asset as AVAssetMBS, outputFileType as string, tag as Variant = nil)

**Function:** Reports the compatibility of an export present, asset, and output file type to the event.
**Notes:**

- Calls later AVAssetExportSessionMBS.determineCompatibilityOfExportPresetCompleted event.

- **presetName:** The name of the preset template for the export operation. For possible values, see "Export Preset Names for Device-Appropriate QuickTime Files," "Export Preset Names for QuickTime Files of a Given Size," AVAssetExportSessionStatusCancelled, "Export Preset Name for iTunes Audio," and "Export Preset Name for Pass-Through."
- **asset:** The asset object that you are planning to export.
outputFileType: The UTI string corresponding to the file type. For example, to specify a QuickTime movie file format, you could specify the constant AVFileTypeQuickTimeMovie. For a list of constants specifying UTIs for standard file types, see AV Foundation Constants Reference.

Because not all export presets are compatible with all assets and file types, you can use this method to query the compatibility of specific combos before using them. To ensure that the export operation succeeds, you should not make any significant changes to the asset between the time of calling this method and performing the export operation.

This method performs its checks asynchronously on a secondary thread and returns immediately. The results are similarly reported to the event later.

Available in OS X v10.9 and later.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

17.1.23 determineCompatibleFileTypes(tag as Variant = nil)

Function: Reports the compatible file types for the current export session to the event.

Notes:
calls later AVFoundationMBS.determineCompatibleFileTypesCompleted event.

This method operates on the asset object and preset information that was used to initialize the export session. It uses this information to determine the file types that the export session can write.

This method performs its checks asynchronously on a secondary thread and returns immediately. The results are similarly reported to the specified block on a secondary thread. Because this method actually inspects the asset’s tracks, the tracks are loaded if they have not been already.
Available in OS X v10.9 and later.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.
17.1.24 exportAsynchronously(tag as Variant = nil)

**Function:** Starts the asynchronous execution of an export session.

**Example:**

```vbscript
dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
dim p as string = AVAssetExportSessionMBS.AVAssetExportPresetAppleM4VCellular
dim e as new AVAssetExportSessionMBS(a, p)

dim FileTypes() as string = e.supportedFileTypes
e.outputFileType = FileTypes(0)
e.outputFile = SpecialFolder.Desktop.Child("small.m4v")
e.exportAsynchronously

// instead of waiting for event, we simply wait for it to finish
do
    app.YieldToNextThread
loop until e.status <> e.AVAssetExportSessionStatusExporting
```

**Notes:**

This method starts an asynchronous export operation and returns immediately. status signals the terminal state of the export session, and if a failure occurs, error describes the problem.

This method calls AVFoundationMBS.exportAsynchronouslyCompleted event later. Tag is passed so you can pass information needed to finish work.

If internal preparation for export fails, event is invoked synchronously. The event may also be called asynchronously, after the method returns, in the following cases:

- If a failure occurs during the export, including failures of loading, re-encoding, or writing media data to the output.
- If cancelExport is invoked.
- After the export session succeeds, having completely written its output to the outputURL.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.
17.1.25  exportMT

Function: Starts the synchronous execution of an export session.
Notes:
Same as exportAsynchronously, but run synchronous, so the plugin waits.
If called in a Xojo thread yields time to other threads.

17.1.26  exportPresetsCompatibleWithAsset(asset as AVAssetMBS) as string()

Function: Returns the identifiers compatible with a given asset.
Notes:
asset: An asset that is ready to be exported.
Returns an array of strings representing the identifiers compatible with asset.
The array is a complete list of the valid identifiers that can be used with exportSessionWithAsset with the specified asset.
Not all export presets are compatible with all assets. For example, a video-only asset is not compatible with an audio-only preset. This method returns only the identifiers for presets that are compatible with the given asset.
In order to ensure that the setup and running of an export operation will succeed using a given preset, you should not make significant changes to the asset (such as adding or deleting tracks) between retrieving compatible identifiers and performing the export operation.
If the asset’s tracks are not currently loaded, they may be loaded by this method before any checks are performed.

17.1.27  exportSessionWithAsset(asset as AVAssetMBS, presetName as string) as AVAssetExportSessionMBS

Function: Returns an asset export session configured with a specified asset and preset.
Notes:
asset: The asset you want to export.
presetName: A string constant specifying the name of the preset template for the export.
Returns an asset export session initialized to export asset using preset presetName.

### 17.1.28  metadata as AVMetadataItemMBS()

**Function:** Returns the metadata to be written to the output file by the export session.

### 17.1.29  outputFileExtension as string

**Function:** Convenience method to query the preferred file extension for current output file type.
**Example:**
```
    dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
    dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
    dim p as string = AVAssetExportSessionMBS.AVAssetExportPresetAppleM4VCellular
    dim e as new AVAssetExportSessionMBS(a, p)
    dim filetypes() as string = e.supportedFileTypes
    e.outputFileExtension = FileTypes(0)

    // shows the output file extension
    MsgBox "outputFileExtension: " + e.outputFileExtension
```

### 17.1.30  setMetadata(items() as AVMetadataItemMBS)

**Function:** Sets the metadata to be written to the output file by the export session.
**Example:**
```
    dim e as AVAssetExportSessionMBS // your export session
    dim asset as AVAssetMBS // your asset

    // query metadata
    dim a() as AVMetadataItemMBS = asset.metadata

    // make new
    dim m as new AVMutableMetadataItemMBS

    // add common key with author
    m.keySpace = AVFoundationMBS.AVMetadataKeySpaceCommon
```
m.key = AVFoundationMBS.AVMetadataCommonKeyAuthor
m.Value = "Hello World"

// append to array and use as metadata:
a.Append m
e.setMetadata a

Notes: If the array is empty, any existing metadata in the exported asset will be translated as accurately as possible into the appropriate metadata key space for the output file and written to the output.

17.1.31 supportedFileTypes as string()

Function: The types of files the session can write. (read-only)
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
dim p as string = AVAssetExportSessionMBS.AVAssetExportPresetAppleM4VCellular
dim e as new AVAssetExportSessionMBS(a, p)
// shows supported file types
MsgBox join(e.supportedFileTypes, EndOfLine)

Notes: The types of files the session can write are determined by the asset and and export preset with which the session was initialized. If you need to determine the compatible file formats before initiating the export operation, use the determineCompatibleFileTypesWithCompletionHandler: method.

17.1.32 Properties

17.1.33 asset as AVAssetMBS

Function: The asset with which the export session was initialized. (read-only)
Notes: (Read only property)

17.1.34 audioMix as AVAudioMixMBS

Function: Indicates whether non-default audio mixing is enabled for export, and supplies the parameters
17.1. CLASS AVASSETEXPORTSESSIONMBS

for audio mixing.

Notes: (Read and Write property)

17.1.35 audioTimePitchAlgorithm as String

Function: Indicates the processing algorithm used to manage audio pitch for scaled audio edits.

Notes:

An exception (NSInvalidArgumentException) is raised if this property is set to a value other than the constants defined in TimePitchAlgorithmSettings.

The default value is AVAudioTimePitchAlgorithmSpectral.

Available in OS X v10.9 and later.

(Read and Write property)

17.1.36 canPerformMultiplePassesOverSourceMediaData as Boolean

Function: Determines whether the export session can perform multiple passes over the source media to achieve better results.

Notes:

When the value for this property is true, the export session can produce higher quality results at the expense of longer export times. Setting this property to true may also require the export session to write temporary data to disk during the export. To control the location of temporary data, use the property directoryForTemporaryFiles.

The default value is false. Not all export session configurations can benefit from performing multiple passes over the source media. In these cases, setting this property to true has no effect.

This property cannot be set after the export has started.

Available in Mac OS X 10.10 and newer.

(Read and Write property)

17.1.37 customVideoCompositor as AVVideoCompositingMBS

Function: Indicates the custom video compositor instance used, if any. (read-only)
Notes:

The custom video compositor instance that is used during image generation is accessible via this property after the value of videoComposition is set to an AVVideoComposition instance that specifies a custom video compositor class. Any additional communication between the application and that instance of the custom video compositor, if any is required for configuration or other purposes, can only occur once that has happened.

If the value of videoComposition is changed from an AVVideoComposition that specifies a custom video compositor class to another instance of AVVideoComposition that specifies the same custom video compositor class, the instance of the custom video compositor that was previously created will receive the renderContextChanged: message and remain in use for subsequent image generation.

This property is nil if there is no video compositor, or if the internal video compositor is in use. Available in OS X v10.9 and later. (Read only property)

17.1.38 directoryForTemporaryFiles as Folderitem

Function: Specifies a directory that is suitable for containing temporary files generated during the export process.

Notes: AVAssetExportSession may need to write temporary files when configured in certain ways, such as when canPerformMultiplePassesOverSourceMediaData is set to true. This property can be used to control where in the filesystem those temporary files are created. All temporary files will be deleted when the export is completed, is canceled, or fails.

When the value of this property is nil, the export session will choose a suitable location when writing temporary files. The default value is nil.

This property cannot be set after the export has started. The export will fail if the URL points to a location that is not a directory, does not exist, is not on the local file system, or if a file cannot be created in this directory (for example, due to insufficient permissions or sandboxing restrictions).

Available in Mac OS X 10.10 and newer. (Read and Write property)
17.1.39  directoryForTemporaryFilesURL as String

**Function:** Specifies a directory that is suitable for containing temporary files generated during the export process.
**Notes:**

AVAssetExportSession may need to write temporary files when configured in certain ways, such as when canPerformMultiplePassesOverSourceMediaData is set to true. This property can be used to control where in the filesystem those temporary files are created. All temporary files will be deleted when the export is completed, is canceled, or fails.

When the value of this property is empty, the export session will choose a suitable location when writing temporary files. The default value is nil.

This property cannot be set after the export has started. The export will fail if the URL points to a location that is not a directory, does not exist, is not on the local file system, or if a file cannot be created in this directory (for example, due to insufficient permissions or sandboxing restrictions).

Available in Mac OS X 10.10 and newer.
(Read and Write property)

17.1.40  error as NSErrorMBS

**Function:** Describes the error that occurred if the export status is AVAssetExportSessionStatusFailed or AVAssetExportSessionStatusCancelled. (read-only)
**Notes:**

If there is no error to report, the value of this property is nil.
(Read only property)

17.1.41  estimatedOutputFileLength as Int64

**Function:** Indicates the estimated size in bytes of the exported file. (read-only)
**Notes:**

Available in OS X v10.9 and later.
(Read only property)
17.1.42 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

17.1.43 metadataItemFilter as AVMetadataItemFilterMBS

**Function:** Specifies a filter object to be used during export to determine which metadata items should be transferred from the source asset.
**Notes:**
If the value of this key is nil, no filter will be applied. This is the default.

The filter will not be applied to metadata set with via the metadata property. To apply the filter to metadata before it is set on the metadata property, see AVMetadataItem.

Available in OS X v10.9 and later.
(Read and Write property)

17.1.44 OutputFile as folderitem

**Function:** The file of the export session’s output.
**Notes:** (Read and Write property)

17.1.45 outputFileType as string

**Function:** The type of file to be written by the session.
**Notes:**
The value is a UTI string corresponding to the file type to use when writing the asset. For a list of constants specifying UTIs for standard file types, see AV Foundation Constants Reference.
(Read and Write property)
17.1.46  outputURL as string

Function: The URL of the export session’s output.
Notes: (Read and Write property)

17.1.47  presetName as string

Function: The name of the preset with which the session was initialized. (read-only)
Notes: (Read only property)

17.1.48  progress as Double

Function: The progress of the export on a scale from 0 to 1. (read-only)
Notes: A value of 0 means the export has not yet begun, 1 means the export is complete.
(Read only property)

17.1.49  shouldOptimizeForNetworkUse as boolean

Function: Indicates whether the movie should be optimized for network use.
Notes: (Read and Write property)

17.1.50  status as Integer

Function: The status of the export session. (read-only)
Notes: (Read only property)

17.1.51  videoComposition as AVVideoCompositionMBS

Function: Indicates whether video composition is enabled for export, and supplies the instructions for video composition.
CHAPTER 17. AVFOUNDATION

Notes: (Read and Write property)

17.1.52 timeRange as CMTimeRangeMBS

Function: The time range to be exported from the source.

Example:

```vba
dim a as AVAssetMBS // your asset to export
dim preset as string = AVAssetExportSessionMBS.AVAssetExportPresetPassthrough // your settings
dim e as new AVAssetExportSessionMBS(a, preset)

dim t as CMTimeMBS = CMTimeMBS.MakeWithSeconds(5) // start at 5
dim d as CMTimeMBS = CMTimeMBS.MakeWithSeconds(10) // duration 10
dim r as CMTimeRangeMBS = CMTimeRangeMBS.Make(t, d)

e.timeRange = r // or your time range!
e.shouldOptimizeForNetworkUse = true

dim filetypes() as string = e.supportedFileTypes
e.outputFileType = FileTypes(0)

e.exportAsynchronously(nil)

// keep e and check for events

// or instead of waiting for event, we simply wait for it to finish
do
app.YieldToNextThread
loop until e.status <> e.AVAssetExportSessionStatusExporting
```

Notes:
The default time range of an export session is kCMTimeZero to kCMTimePositiveInfinity, meaning that (modulo a possible limit on file length) the full duration of the asset will be exported.

(Read and Write computed property)
17.1.53 Constants

17.1.54 AVAssetExportSessionStatusCancelled = 5

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the status of the session. 
**Notes:** Indicates that the export session was cancelled.

17.1.55 AVAssetExportSessionStatusCompleted = 3

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the status of the session. 
**Notes:** Indicates that the export session completed successfully.

17.1.56 AVAssetExportSessionStatusExporting = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the status of the session. 
**Notes:** Indicates that the export session is in progress.

17.1.57 AVAssetExportSessionStatusFailed = 4

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the status of the session. 
**Notes:** Indicates that the export session failed.

17.1.58 AVAssetExportSessionStatusUnknown = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the status of the session. 
**Notes:** Indicates that the status is unknown.

17.1.59 AVAssetExportSessionStatusWaiting = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the status of the session.
Notes: Indicates that the session is waiting to export more data.
17.2. **CLASS AVASSETIMAGEGENERATORMBS**

### 17.2 class AVAssetImageGeneratorMBS

**Function:** An AVAssetImageGenerator object provides thumbnail or preview images of assets independently of playback.

**Notes:**

AVAssetImageGenerator uses the default enabled video track(s) to generate images. Generating a single image in isolation can require the decoding of a large number of video frames with complex interdependencies. If you require a series of images, you can achieve far greater efficiency using the asynchronous method, CGImageAtTime, which employs decoding efficiencies similar to those used during playback.

You create an asset generator using initWithAsset: or assetImageGeneratorWithAsset. These methods may succeed even if the asset possesses no visual tracks at the time of initialization. You can test whether an asset has any tracks with the visual characteristic using tracksWithMediaCharacteristic (AVAsset).

The actual time of a generated image is within the range \([\text{requestedTime}-\text{requestedTimeToleranceBefore}, \text{requestedTime}+\text{requestedTimeToleranceAfter}]\) and may differ from the requested time for efficiency.

Assets that represent mutable compositions or mutable movies may gain visual tracks after initialization of an associated image generator.

### 17.2.2 Methods

#### 17.2.3 assetImageGeneratorWithAsset(asset as AVAssetMBS) as AVAssetImageGeneratorMBS

**Function:** Returns an image generator for use with a specified asset.

**Notes:**

asset: The asset from which images will be extracted.

Returns an image generator for use with asset.

This method may succeed even if the asset possesses no visual tracks at the time of initialization.
17.2.4 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

17.2.5 AVAssetImageGeneratorApertureModeCleanAperture as string

Function: One of the constants to specify the aperture mode.
Notes: Both pixel aspect ratio and clean aperture will be applied.

17.2.6 AVAssetImageGeneratorApertureModeEncodedPixels as string

Function: One of the constants to specify the aperture mode.
Notes: Neither pixel aspect ratio nor clean aperture will be applied.

17.2.7 AVAssetImageGeneratorApertureModeProductionAperture as string

Function: One of the constants to specify the aperture mode.
Notes: Only pixel aspect ratio will be applied.

17.2.8 cancelAllCGImageGeneration

Function: Cancels all pending image generation requests.
Notes: This method calls the AVFoundationMBS.generateCGImagesAsynchronouslyForTimesCompleted event with AVAssetImageGeneratorCancelled for each image time in every previous invocation of generate-CGImagesAsynchronouslyForTimes for which images have not yet been supplied.

17.2.9 CGImageAtTime(time as CMTimeMBS, byref actualTime as CMTimeMBS, byref error as NSErrorMBS) as Variant

Function: Returns a CGImage for the asset at or near a specified time.
Example:
17.2. CLASS AVASSETIMAGEGENERATORMBS

// open asset
dim f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)

// prepare generator
dim g as new AVAssetImageGeneratorMBS(a)
dim timeRequested as CMTimeMBS = CMTimeMBS.MakeWithSeconds(5, 30)
dim actualTime as CMTimeMBS
dim error as NSErrorMBS
// ask for an image
dim c as CGImageMBS = g.CGImageAtTime(timeRequested, actualTime, error)
// and show it
dim p as Picture = c.Picture
window1.backdrop = p

Notes:

requestedTime: The time at which the image of the asset is to be created.
actualTime: Upon return, contains the time at which the image was actually generated.
Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns a CGImageMBS for the asset at or near a specified time, or nil if the image could not be created.
This method returns the image synchronously.

17.2.10 Constructor(asset as AVAssetMBS)

Function: Initializes an image generator for use with a specified asset.
Notes:

asset: The asset from which images will be extracted.
This method may succeed even if the asset possesses no visual tracks at the time of initialization.

17.2.11 generateCGImagesAsynchronouslyForTimes(times() as CMTimeMBS, tag as Variant = nil)

Function: Creates a series of CGImage objects for an asset at or near specified times.
Notes:

requestedTimes: An array of CMTimeMBS, specifying the asset times at which an image is requested.
This method uses an efficient “batch mode” to get images in time order.

The client receives exactly one event call to AVFoundationMBS.generateCGImagesAsynchronouslyForTimesCompleted for each requested time in requestedTimes. Changes to the generator’s properties (snap behavior, maximum size, and so on) do not affect pending asynchronous image generation requests.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

17.2.12  Properties

17.2.13  apertureMode as string

Function: Specifies the aperture mode for the generated image.  
Notes: (Read and Write property)

17.2.14  appliesPreferredTrackTransform as boolean

Function: Specifies whether to apply the track matrix (or matrices) when extracting an image from the asset.  
Notes:  
The default is false. AVAssetImageGenerator only supports rotation by 90, 180, or 270 degrees. This property is ignored if you set a value for the videoComposition property.  
(Read and Write property)

17.2.15  asset as AVAssetMBS

Function: The asset with which the export session was initialized. (read-only)  
Notes:  
Available in OS X v10.8 and later.  
(Read only property)
17.2.16 customVideoCompositor as AVVideoCompositingMBS

Function: Indicates the custom video compositor instance used, if any. (read-only)
Notes:
The custom video compositor instance that is used during image generation is accessible via this property after the value of videoComposition is set to an AVVideoComposition instance that specifies a custom video compositor class. Any additional communication between the application and that instance of the custom video compositor, if any is required for configuration or other purposes, can only occur once that has happened.

If the value of videoComposition is changed from an AVVideoComposition that specifies a custom video compositor class to another instance of AVVideoComposition that specifies the same custom video compositor class, the instance of the custom video compositor that was previously created will receive the renderContextChanged message and remain in use for subsequent image generation.

This property is nil if there is no video compositor, or if the internal video compositor is in use. Available in OS X v10.9 and later.
(Read only property)

17.2.17 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.2.18 videoComposition as AVVideoCompositionMBS

Function: The video composition to use when extracting images from assets with multiple video tracks.
Notes:
If no video composition is specified, only the first enabled video track will be used. If a video composition is specified, the appliesPreferredTrackTransform property is ignored.
(Read and Write property)

17.2.19 maximumSize as CGSizeMBS

Function: Specifies the maximum dimensions for generated image.
Notes:
The default value is CGSizeZero, which specifies the asset’s unscaled dimensions.

AVAssetImageGenerator scales images such that they fit within the defined bounding box. Images are never scaled up. The aspect ratio of the scaled image is defined by the apertureMode property.
(Read and Write computed property)

17.2.20 **requestedTimeToleranceAfter as CMTimeMBS**

**Function:** The maximum length of time after a requested time for which an image may be generated.
**Notes:**
The default value is kCMTimePositiveInfinity.

Set the values of requestedTimeToleranceBefore and requestedTimeToleranceAfter to kCMTimeZero to request frame-accurate image generation; this may incur additional decoding delay.
(Read and Write computed property)

17.2.21 **requestedTimeToleranceBefore as CMTimeMBS**

**Function:** The maximum length of time before a requested time for which an image may be generated.
**Notes:**
The default value is kCMTimePositiveInfinity.

Set the values of requestedTimeToleranceBefore and requestedTimeToleranceAfter to kCMTimeZero to request frame-accurate image generation; this may incur additional decoding delay.
(Read and Write computed property)

17.2.22 **Constants**

17.2.23 **AVAssetImageGeneratorCancelled = 2**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the outcome of image generation.
**Notes:** Indicates that generation was cancelled.
17.2.24 AVAssetImageGeneratorFailed = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the outcome of image generation.  
**Notes:** Indicates that generation failed.

17.2.25 AVAssetImageGeneratorSucceeded = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the outcome of image generation.  
**Notes:** Indicates that generation succeeded.
17.3 class AVAssetMBS

17.3.1 class AVAssetMBS

Function: AVAsset is an abstract class to represent timed audiovisual media such as videos and sounds.

Notes:

Each asset contains a collection of tracks that are intended to be presented or processed together, each of a uniform media type, including but not limited to audio, video, text, closed captions, and subtitles.

An AVAsset object defines the collective properties of the tracks that comprise the asset. (You can access the instances of AVAssetTrack representing tracks of the collection, so you can examine each of these independently if you need to.) You often instantiate an asset using a concrete subclass of AVAsset; for example, you can initialize an instance of AVURLAsset using an URL that refers to an audiovisual media file, such as a QuickTime movie file or an MP3 files (amongst other types). You can also instantiate an asset using other concrete subclasses that extend the basic model for audiovisual media in useful ways, as AVComposition does for temporal editing. To assemble audiovisual constructs from one or more source assets, you can insert assets into instances of AVMutableComposition.

You often instantiate an asset using AVURLAsseta concrete subclass of AVAssetwith URLs that refer to audiovisual media resources, such as streams (including HTTP live streams), QuickTime movie files, MP3 files, and files of other types. You can also instantiate an asset using other concrete subclasses that extend the basic model for audiovisual media in useful ways, as AVComposition does for temporal editing.

Properties of assets as a whole are defined by AVAsset. Additionally, references to instances of AVAssetTrack representing tracks of the collection can be obtained, so that each of these can be examined independently.

Because of the nature of timed audiovisual media, upon successful initialization of an asset some or all of the values for its keys may not be immediately available. The value of any key can be requested at any time, and asset will always return its value synchronously, although it may have to block the calling thread in order to do so. In order to avoid blocking, you can register your interest in particular keys and to become notified when their values become available. For further details, see AVAsynchronousKeyValueLoading.

To play an instance of AVAsset, initialize an instance of AVPlayerItem with it, use the player item tem to set up its presentation state (such as whether only a limited timeRange of the asset should be played, etc.), and provide the player item to an AVPlayer object according to whether the items is to be played by itself or together with a collection of other items.

You can insert AVAsset objects can also be inserted into an AVMutableComposition object in order to assemble audiovisual constructs from one or more source assets.

Subclassing Notes
It is not currently possible to subclass AVAsset to handle streaming protocols or file formats that are not supported by the framework. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

### 17.3.2 Methods

#### 17.3.3 assetWithData(Data as MemoryBlock, Options as Dictionary = nil) as AVAssetMBS

**Function:** Creates an AVMovie object from a movie header stored in an data parameter.  
**Notes:**
- data: An Memoryblock/String containing a movie header. We make a copy of that.  
- options: Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.  
  
- Returns An AVMovie object or nil in case of error.  
You can use this method to operate on movie headers that are not stored in files; this might include movie headers on the pasteboard (which do not contain media data). In general you should avoid loading an entire movie file with its media data into an instance of Memoryblock/String! By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack’s mediaDataStorage property will be nil.  
If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.  
See also:

- 17.3.4 assetWithData(Data as String, Options as Dictionary = nil) as AVAssetMBS

#### 17.3.4 assetWithData(Data as String, Options as Dictionary = nil) as AVAssetMBS

**Function:** Creates an AVMovie object from a movie header stored in an data parameter.  
**Example:**

```// load movie in memory
dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim b as BinaryStream = BinaryStream.Open(f)

// now open it from memory
dim s as string = b.Read(b.Length)
dim m as AVAssetMBS = AVAssetMBS.movieWithData(s)

MsgBox str(m.duration.Seconds)+” seconds.”```
Notes:

data: An Memoryblock/String containing a movie header. We make a copy of that.
options: Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
Returns An AVMovie object or nil in case of error.
You can use this method to operate on movie headers that are not stored in files; this might include movie headers on the pasteboard (which do not contain media data). In general you should avoid loading an entire movie file with its media data into an instance of Memoryblock/String! By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack’s mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.
See also:

- 17.3.3 assetWithData(Data as MemoryBlock, Options as Dictionary = nil) as AVAssetMBS

17.3.5 assetWithFile(file as folderitem) as AVAssetMBS

Function: Returns an asset for inspection of a media resource.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
MsgBox str(a.duration.Seconds)+" seconds"

17.3.6 assetWithURL(URL as string) as AVAssetMBS

Function: Returns an asset for inspection of a media resource.

17.3.7 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.
17.3. **CLASS AVASSETMBS**

17.3.8 **availableChapterLocales as NSLocaleMBS()**

**Function:** The locales available for chapters in the asset. (read-only)

17.3.9 **availableMediaCharacteristicsWithMediaSelectionOptions as string()**

**Function:** An array of media characteristics for which a media selection option is available. (read-only)

**Notes:** The value of this property is an array of strings, each string indicating a media characteristic for which a media selection option is available.

17.3.10 **availableMetadataFormats as string()**

**Function:** An array of strings, each representing a metadata format that’s available to the asset. (read-only)

**Notes:** Metadata formats may include ID3, iTunes metadata, and so on. For more details, see AVMetadataItem.

17.3.11 **cancelLoading**

**Function:** Cancels the loading of all values for all observers.

**Notes:** Deallocation of an instance of the asset will implicitly invoke this method if any loading requests are still outstanding.

17.3.12 **chapterMetadataGroupsBestMatchingPreferredLanguages as AVTimedMetadataGroupMBS()**

**Function:** Returns an array of chapters whose locale best matches the list of preferred languages.

**Notes:**

preferredLanguages: Optional, an array of strings, each of which contains a canonicalized IETF BCP 47 language identifier. The order of the identifiers in the array reflects the preferred language order, with the most preferred language being first in the array. Typically, you pass the user’s preferred languages by retrieving this array from the preferredLanguages class method of NSLocale. If you don’t pass an array, the plugin automatically passes NSLocaleMBS.preferredLanguages.
CHAPTER 17. AVFOUNDATION

Returns an array of AVTimedMetadataGroup objects.

Each object in the returned array contains an AVMetadataItem object representing the chapter title. The time range property of the AVTimedMetadataGroup object is equal to the time range of the chapter title item.

All of the available chapter metadata is included in the metadata groups, including items with the common key AVMetadataCommonKeyArtwork, if such items are present. Items not carrying chapter titles are added to an existing AVTimedMetadataGroup object if the time range (timestamp and duration) of the metadata item and that of the metadata group overlaps. The locale of such items need not match the locale of the chapter titles.

You can use the metadataItemsFromArray:filteredAndSortedAccordingToPreferredLanguages: method to further filter the metadata items in each group. You can also filter the returned items based on locale using the metadataItemsFromArray:withLocale: method.

Special Considerations
Becomes callable without blocking when the data in the availableChapterLocales property is already loaded.

See also:

- 17.3.13 chapterMetadataGroupsBestMatchingPreferredLanguages(preferredLanguages() as string) as AVTimedMetadataGroupMBS()

17.3.13  chapterMetadataGroupsBestMatchingPreferredLanguages(preferredLanguages() as string) as AVTimedMetadataGroupMBS()

Function: Returns an array of chapters whose locale best matches the the list of preferred languages.

Notes:

preferredLanguages: Optional, an array of strings, each of which contains a canonicalized IETF BCP 47 language identifier. The order of the identifiers in the array reflects the preferred language order, with the most preferred language being first in the array. Typically, you pass the user’s preferred languages by retrieving this array from the preferredLanguages class method of NSLocale. If you don’t pass an array, the plugin automatically passes NSLocaleMBS.preferredLanguages.

Returns an array of AVTimedMetadataGroup objects.

Each object in the returned array contains an AVMetadataItem object representing the chapter title. The time range property of the AVTimedMetadataGroup object is equal to the time range of the chapter title item.

All of the available chapter metadata is included in the metadata groups, including items with the common
17.3. CLASS AVASSETMBS

key AVMetadataCommonKeyArtwork, if such items are present. Items not carrying chapter titles are added to an existing AVTimedMetadataGroup object if the time range (timestamp and duration) of the metadata item and that of the metadata group overlaps. The locale of such items need not match the locale of the chapter titles.

You can use the metadataItemsFromArray:filteredAndSortedAccordingToPreferredLanguages: method to further filter the metadata items in each group. You can also filter the returned items based on locale using the metadataItemsFromArray:withLocale: method.

Special Considerations
Becomes callable without blocking when the data in the availableChapterLocales property is already loaded. See also:

- 17.3.12 chapterMetadataGroupsBestMatchingPreferredLanguages as AVTimedMetadataGroupMBS()

17.3.14 chapterMetadataGroupsWithTitleLocale(locale as NSLocaleMBS, commonKeys() as string) as AVTimedMetadataGroupMBS()

Function: Returns an array of chapters with a given title locale and containing specified keys.

Notes:
locale: The locale of the metadata items carrying chapter titles to be returned (the method supports the IETF BCP 47 specification of locales).
commonKeys: An array of common keys of AVMetadataItem to include in the returned array. AVMetadataCommonKeyArtwork is the only supported key.

Returns an array of AVTimedMetadataGroup objects.

Each object in the returned array contains an AVMetadataItem object representing the chapter title, and the time range property of the AVTimedMetadataGroup object is equal to the time range of the chapter title item.

An AVMetadataItem with the specified common key is added to an existing AVTimedMetadataGroup object if the time range (timestamp and duration) of the metadata item and the metadata group overlap.

The locale of items not carrying chapter titles need not match the specified locale parameter. You can filter the returned items based on locale using metadataItemsFromArray.
17.3.15 **commonMetadata as AVMetadataItemMBS()**

**Function:** An array of metadata items for each common metadata key for which a value is available. (read-only)
**Notes:** The value is an array of AVMetadataItem objects, one for each common metadata key for which a value is available. You can filter the array by locale using metadataItemsFromArray (AVMetadataItem) or by key using metadataItemsFromArray (AVMetadataItem).

17.3.16 **Constructor**

**Function:** The private constructor.

17.3.17 **copy as AVAssetMBS**

**Function:** Creates a copy of the object.

17.3.18 **duration as CMTimeMBS**

**Function:** The duration of the asset. (read-only)

**Example:**
```
    dim f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
    dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
    MsgBox str(a.duration.Seconds)+" seconds"
```

**Notes:** If providesPreciseDurationAndTiming is false, a best-available estimate of the duration is returned. You can set the degree of precision required for timing-related properties at initialization time for assets initialized with URLs (see AVURLAssetPreferPreciseDurationAndTimingKey in AVURLAsset).
17.3. CLASS AVASSETMBS

17.3.19 loadValuesAsynchronouslyForKeys(keys() as string, tag as Variant = nil)

Function: Tells the asset to load the values of any of the specified keys that are not already loaded.

Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)

if a = nil then
    MsgBox "failed to read file at all"
    Return
end if

// request duration property
a.loadValuesAsynchronouslyForKeys array("duration")

dim e as NSErrorMBS
dim Status as Integer = a.statusOfValueForKey("duration", e)
while status <> a.AVKeyValueStatusLoaded
    // wait for loading in background
    status = a.statusOfValueForKey("duration", e)
wend

// got it?
if status <> a.AVKeyValueStatusLoaded then
    MsgBox "Failed to load duration."
    if e <> nil then
        MsgBox e.LocalizedDescription
    end if
else
    MsgBox str(a.duration.Seconds)+" seconds long."
end if

Notes:

keys: An array containing the required keys.

Calls AVFoundationMBS.AssetLoadValuesAsynchronouslyForKeysFinished on completion. The completion event will be invoked exactly once per invocation of this method:

- Synchronously if an I/O error or other format-related error occurs immediately.
- Asynchronously at a subsequent time if a loading error occurs at a later stage of processing, or if
cancelLoading is invoked on an AVAsset instance.

The completion states of the keys you specify in keys are not necessarily the same; some may be loaded, and others may have failed. You must check the status of each key individually.

If you want to receive error reporting for loading that’s still pending, you can call this method at any time even after an asset has begun to load data for operations in progress or already completed. If a fatal error has already occurred, the completion event is invoked synchronously.

17.3.20 mediaSelectionGroupForMediaCharacteristic(mediaCharacteristic as string) as AVMediaSelectionGroupMBS

**Function:** Returns an AVMediaSelectionGroup object that contains one or more options with the specified media characteristic.

**Notes:**
- mediaCharacteristic: A media characteristic for which you wish to obtain the available media selection options.
- Only AVMediaCharacteristicAudible and AVMediaCharacteristicLegible are currently supported.
- Pass AVMediaCharacteristicAudible to obtain the group of available options for audio media in various languages and for various purposes, such as descriptive audio.
- Pass AVMediaCharacteristicLegible to obtain the group of available options for subtitles in various languages and for various purposes.

Returns an AVMediaSelectionGroup object that contains one or more options with the media characteristic specified by mediaCharacteristic, or nil if none could be found.

You can invoke this method without blocking when the key availableMediaCharacteristicsWithMediaSelectionOptions has been loaded.
You can filter the options in the returned media selection group according to playability, locale, and additional media characteristics can be accomplished using the filtering methods defined in the AVMediaSelectionGroup class.

17.3.21 metadata as AVMetadataItemMBS()
### 17.3.22 `metadataForFormat(Format as string) as AVMetadataItemMBS()`

**Function:** Returns an array of AVMetadataItem objects, one for each metadata item in the container of the specified format.

**Notes:**

- `format`: The metadata format for which you want items.

Returns an array of AVMetadataItem objects, one for each metadata item in the container of the specified format, or nil if there is no metadata of the specified format.

You can filter the array by locale using `metadataItemsFromArray (AVMetadataItem)` or by key using `metadataItemsFromArray (AVMetadataItem)`. Becomes callable without blocking when `availableMetadataFormats` has been loaded.

### 17.3.23 `naturalSize as CGSizeMBS`

**Function:** The encoded or authored size of the visual portion of the asset.

### 17.3.24 `preferredTransform as CGAffineTransformMBS`

**Function:** The preferred transform to apply to the visual content of the asset for presentation or processing. (read-only)

**Notes:** The value is often, but not always, the identity transform.

### 17.3.25 `readTimeCodeObjects as AVTimeCodeMBS()`

**Function:** Reads time codes from asset.

**Notes:**

- Raises exception if not possible.
- Returns empty array if nothing found.

Provides details on time codes.
17.3.26  readTimeCodes as String()

**Function:** Reads time codes from asset.
**Example:**
```vba
dim f as FolderItem = SpecialFolder.Desktop.Child(“test.m4v”)  
dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)  
dim timecodes() as string = a.readTimeCodes

break // see in debugger
```

**Notes:**
Raises exception if not possible.
Returns empty array if nothing found.
Format is 2 digit hours, double colon, 2 digit minutes, double colon, 2 digit seconds, double colon, 2 digit frames.
e.g. ”01:02:03:04”
Please use readTimeCodeObjects for more options.

17.3.27  statusOfValueForKey(key as string, byref error as NSErrorMBS) as Integer

**Function:** Reports whether the value for a given key is immediately available without blocking. (required)
**Example:**
```vba
dim f as FolderItem = SpecialFolder.Desktop.Child(“test.m4v”)  
dim a as AVAssetMBS = AVAssetmbs.assetWithFile(f)
if a = nil then  
    MsgBox ”failed to read file at all”  
    Return
end if

// request duration property
a.loadValuesAsynchronouslyForKeys array(”duration”)  

dim e as NSErrorMBS  
dim Status as Integer = a.statusOfValueForKey(”duration”, e)  
while status <a.AVKeyValueStatusLoaded
```
17.3. CLASS AVASSETMBS

// wait for loading in background
status = a.statusOfValueForKey("duration", e)
wend

// got it?
if status <> a.AVKeyValueStatusLoaded then
MsgBox "Failed to load duration."
if e <> nil then
MsgBox e.LocalizedDescription
end if
else
MsgBox str(a.duration.Seconds)+" seconds long."
end if

Notes:
key: The key whose status you want.
error: If the status of the value for the key is AVKeyValueStatusFailed, upon return contains an NSError object that describes the failure that occurred.

Returns the current loading status of the value for key. For possible values, see "Protocol Methods."

You use this method to determine the availability of the value for a key. This method does not cause an asset to load the value of a key that’s not yet available. To request values for keys that may not already be loaded without blocking, use loadValuesAsynchronouslyForKeys and wait for invocation of the completion handler to be informed of availability.

17.3.28 trackGroups as AVAssetTrackGroupMBS()

Function: An array containing all of the track groups in the asset. (read-only)
Notes:
This is an array of AVAssetTrackGroup instances, each representing a different grouping of tracks in the asset.
Available in OS X v10.9 and later.

17.3.29 tracks as AVAssetTrackMBS()

Function: The tracks contained by the asset. (read-only)
Notes: Tracks are instances of AVAssetTrack.

17.3.30  tracksWithMediaCharacteristic(mediaCharacteristic as string) as AVAssetTrackMBS()

Function: Returns an array of AVAssetTrack objects of the asset that present media with a specified characteristic.
Notes:
mediaCharacteristic: The media characteristic according to which receiver filters its asset tracks.
Return an array of AVAssetTrack objects that present media with mediaCharacteristic, or nil if no tracks with the specified characteristic are available.
You can call this method without blocking when tracks has been loaded.

17.3.31  tracksWithMediaType(mediaType as string) as AVAssetTrackMBS()

Function: Returns an array of the asset tracks of the asset that present media of a specified type.
Notes:
mediaType: The media type according to which the asset filters its tracks.
Media types are defined in AVAssetTrack.
Returns an array of AVAssetTrack objects of the asset that present media of mediaType.
You can call this method without blocking when tracks has been loaded.

17.3.32  trackWithTrackID(PersistentTrackID as Integer) as AVAssetTrackMBS

Function: Returns the track with a specified track ID.
Notes:
trackID: The trackID of the requested asset track.
Returns the track with track ID trackID, or nil if no track with the specified ID is available.
You can call this method without blocking when tracks has been loaded.
17.3. CLASS AVASSETMBS

17.3.33 unusedTrackID as Integer

Function: Returns an ID that is currently unused by any of the tracks in the asset.

17.3.34 Properties

17.3.35 ClassName as String

Function: Returns the class name for the Objective-C class.
Notes:
Sometimes useful for debugging.
(Read only property)

17.3.36 creationDate as AVMetadataItemMBS

Function: Indicates the creation date of the asset. (read-only)
Example:
```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)

dim creationDate as date = a.creationDate.dateValue
MsgBox creationDate.LongDate + " " + creationDate.LongTime
```

Notes:
The value of this property may be nil.

If a creation date has been stored by the asset in a form that can be converted to an Date object, the
dateValue property of the metadata item will provide an instance of NSDate. Otherwise the creation date
is available only as a string value, using the AVMetadataItem stringValue method.
(Read only property)
### 17.3.37 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

### 17.3.38 hasProtectedContent as boolean

**Function:** Indicates whether the asset has protected content. (read-only)
**Notes:** (Read only property)

### 17.3.39 isComposable as boolean

**Function:** Indicates whether the asset can be used within a segment of an AVCompositionTrack object. (read-only)
**Notes:** (Read only property)

### 17.3.40 isExportable as boolean

**Function:** Indicates whether the asset can be exported using AVAssetExportSession. (read-only)
**Notes:** (Read only property)

### 17.3.41 isPlayable as boolean

**Function:** Indicates whether the asset, or its URL, can be used to initialize an instance of AVPlayerItem. (read-only)
**Notes:** (Read only property)

### 17.3.42 isReadable as boolean

**Function:** Indicates whether the asset’s media data can be extracted using AVAssetReader. (read-only)
**Notes:** (Read only property)
17.3. **CLASS AVASSETMBS**

17.3.43 **lyrics as string**

**Function:** The lyrics of the asset suitable for the current locale. (read-only)

**Example:**

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
MsgBox "Lyrics: " + a.lyrics
```

**Notes:** (Read only property)

17.3.44 **preferredRate as Double**

**Function:** The natural rate at which the asset is to be played. (read-only)

**Notes:**

This value is often, but not always, 1.0.
(Read only property)

17.3.45 **preferredVolume as Double**

**Function:** The preferred volume at which the audible media of asset is to be played. (read-only)

**Notes:**

This value is often, but not always, 1.0.
(Read only property)

17.3.46 **providesPreciseDurationAndTiming as boolean**

**Function:** Indicates whether the asset provides precise timing. (read-only)

**Notes:**

You can set the degree of precision required for timing-related properties at initialization time for assets initialized with URLs (see AVURLAssetPreferPreciseDurationAndTimingKey in AVURLAsset).
(Read only property)
17.3.47 referenceRestrictions as Integer

**Function:** The reference restrictions being used by the receiver. (read-only)  
**Notes:**
For AVURLAsset, this property reflects the value passed in for AVURLAssetReferenceRestrictionsKey, if any.

The default value for this property is AVAssetReferenceRestrictionForbidNone. See AVURLAssetReferenceRestrictionsKey for a full discussion of reference restrictions.  
(Read only property)

17.3.48 Constants

17.3.49 AVAssetReferenceRestrictionForbidAll = & hFFFF

MBS AVFoundation Plugin, Plugin Version: 13.2.  
**Function:** One of the constants for use with AVURLAssetReferenceRestrictionsKey to control the resolution of references to external media data.  
**Notes:** Indicates that only references to media data stored within the asset’s container file should be allowed.

17.3.50 AVAssetReferenceRestrictionForbidCrossSiteReference = 4

MBS AVFoundation Plugin, Plugin Version: 13.2.  
**Function:** One of the constants for use with AVURLAssetReferenceRestrictionsKey to control the resolution of references to external media data.  
**Notes:** Indicates that references from a remote asset to remote media data stored at a different site should not be followed.

17.3.51 AVAssetReferenceRestrictionForbidLocalReferenceToLocal = 8

MBS AVFoundation Plugin, Plugin Version: 13.2.  
**Function:** One of the constants for use with AVURLAssetReferenceRestrictionsKey to control the resolution of references to external media data.  
**Notes:** Indicates that references from a local asset to local media data stored outside the asset’s container file should not be followed.

17.3.52 AVAssetReferenceRestrictionForbidLocalReferenceToRemote = 2

MBS AVFoundation Plugin, Plugin Version: 13.2.  
**Function:** One of the constants for use with AVURLAssetReferenceRestrictionsKey to control the resolution of references to external media data.
17.3. CLASS AVASSETMBS

Notes: Indicates that references from a local asset to remote media data should not be followed.

17.3.53 AVAssetReferenceRestrictionForbidNone = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants for use with AVURLAssetReferenceRestrictionsKey to control the resolution of references to external media data. Notes: Indicates that all types of references should be followed.

17.3.54 AVAssetReferenceRestrictionForbidRemoteReferenceToLocal = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants for use with AVURLAssetReferenceRestrictionsKey to control the resolution of references to external media data. Notes: Indicates that references from a remote asset (for example, referenced via http URL) to local media data (for example, stored in a local file) should not be followed.

17.3.55 AVKeyValueStatusCancelled = 4

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants to indicate the load status of a property. Notes: Indicates that the attempt to load the property was cancelled.

17.3.56 AVKeyValueStatusFailed = 3

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants to indicate the load status of a property. Notes: Indicates that the attempt to load the property failed.

17.3.57 AVKeyValueStatusLoaded = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants to indicate the load status of a property. Example:

```dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim a as AVAssetMBS = AVAssetmbs.assetWithFile(f)
if a = nil then
    MsgBox "failed to read file at all"
```
Return
end if

// request duration property
a.loadValuesAsynchronouslyForKey(array("duration"))

dim e as NSErrorMBS
dim Status as Integer = a.statusOfValueForKey("duration", e)
while status < a.AVKeyValueStatusLoaded
    // wait for loading in background
    status = a.statusOfValueForKey("duration", e)
wend

// got it?
if status ^= a.AVKeyValueStatusLoaded then
    MsgBox "Failed to load duration."
if e ^= nil then
    MsgBox e.LocalizedDescription
wend
else
    MsgBox str(a.duration.Seconds) + " seconds long."
end if

Notes: Indicates that the property is ready for use.

17.3.58 AVKeyValueStatusLoading = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants to indicate the load status of a property.
Notes: Indicates that the property is not fully loaded.

17.3.59 AVKeyValueStatusUnknown = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants to indicate the load status of a property.
Notes: Indicates that the property status is unknown.
17.4. class AVAssetReaderAudioMixOutputMBS

17.4.1 class AVAssetReaderAudioMixOutputMBS

Function: AVAssetReaderAudioMixOutput is a concrete subclass of AVAssetReaderOutput that defines an interface for reading audio samples that result from mixing the audio from one or more tracks of an AVAssetReader object’s asset.

Notes:
You can read the audio data mixed from one or more asset tracks by adding an instance of AVAssetReaderAudioMixOutput to an asset reader using addOutput. The samples can be read in a default format or can be converted to a different format.
Subclass of the AVAssetReaderOutputMBS class.

17.4.2 Methods

17.4.3 assetReaderAudioMixOutputWithAudioTracks(audioTracks() as AVAssetTrackMBS, outputSettings as dictionary) as AVAssetReaderAudioMixOutputMBS

Function: Returns an instance of AVAssetReaderAudioMixOutput for reading mixed audio from the specified audio tracks, with optional audio settings.

Notes:
audioTracks: An array of AVAssetTrack objects from which the created object should read sample buffers to be mixed.
Each track must be one of the tracks owned by the target AVAssetReader object’s asset and must be of media type AVMediaTypeAudio.
audioSettings: The audio settings to be used for audio output; the dictionary must contain values for keys in AVAudioSettings.h (linear PCM only). Pass nil if you want to receive decoded samples in a convenient uncompressed format, with properties determined according to the properties of the specified audio tracks.

Returns an instance of AVAssetReaderAudioMixOutput for reading mixed audio from audioTracks, with audio settings specified by audioSettings.
Initialization will fail if audioSettings cannot be used with audioTracks.

17.4.4 audioSettings as dictionary

Function: The audio settings used for audio output. (read-only)

Notes:
CHAPTER 17. AVFOUNDATION

The dictionary must contain values for keys in AVAudioSettings.h (linear PCM only). nil indicates that the samples will be returned in the default format.

17.4.5 audioTracks as AVAssetTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The tracks from which the receiver reads mixed audio. (read-only) Notes: The value is an array of AVAssetTrack objects owned by the target AVAssetReader object’s asset.

17.4.6 Constructor(audioTracks() as AVAssetTrackMBS, outputSettings as dictionary)

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes an instance of AVAssetReaderAudioMixOutput for reading mixed audio from the specified audio tracks, with optional audio settings. Notes: audioTracks: An array of AVAssetTrack objects from which the created object should read sample buffers to be mixed. Each track must be one of the tracks owned by the target AVAssetReader object’s asset and must be of media type AVMediaTypeAudio. audioSettings: The audio settings to be used for audio output; the dictionary must contain values for keys in AVAudioSettings.h (linear PCM only). Pass nil if you want to receive decoded samples in a convenient uncompressed format, with properties determined according to the properties of the specified audio tracks.

Returns an instance of AVAssetReaderAudioMixOutput initialized for reading mixed audio from audioTracks, with audio settings specified by audioSettings.

Initialization will fail if audioSettings cannot be used with audioTracks. So please check handle property.

17.4.7 Properties

17.4.8 audioMix as AVAudioMixMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The output’s audio mix. Notes: You use the audio mix to specify how the volume of audio samples read from each source track will change over the timeline of the source asset.
17.4. CLASS AVASSETREADERAUDIOMIXOUTPUTMBS

(Read and Write property)

17.4.9 audioTimePitchAlgorithm as String

Function: The processing algorithm used to manage audio pitch for scaled audio edits.

Notes:
The supported constants are defined in Time Pitch Algorithm Settings.
An NSInvalidArgumentException will be raised if this property is set to a value other than the defined constants.
Available in OS X v10.9 and later.
(Read and Write property)
17.5 class AVAssetReaderMBS

17.5.1 class AVAssetReaderMBS

**Function:** You use an AVAssetReader object to obtain media data of an asset, whether the asset is file-based or represents an assemblage of media data from multiple sources (as with an AVComposition object).
**Notes:**

AVAssetReader lets you:

Read raw un-decoded media samples directly from storage, obtain samples decoded into renderable forms. Mix multiple audio tracks of the asset and compose multiple video tracks (by using AVAssetReaderAudioMixOutput and AVAssetReaderVideoCompositionOutput).

AVAssetReader’s pipelines are multithreaded internally. After you initiate reading with initWithAsset:error:, a reader loads and processes a reasonable amount of sample data ahead of use so that retrieval operations such as copyNextSampleBuffer (AVAssetReaderOutput) can have very low latency. Note, however, that AVAssetReader is not intended for use with real-time sources, and its performance is not guaranteed for real-time operations.

17.5.2 Methods

17.5.3 addOutput(output as AVAssetReaderOutputMBS)

**Function:** Adds a given output to the receiver.
**Notes:**

output: The reader output to add.

Outputs are created with a reference to one or more AVAssetTrack objects. Adding an output to an asset reader indicates to the reader that it should source from those tracks. The tracks must be owned by the asset returned by the reader’s asset property.

You cannot add an output after reading has started.

17.5.4 asset as AVAssetMBS

**Function:** The asset with which the receiver was initialized. (read-only)
**Notes:** Concrete instances of AVAssetReader with specific AVAssetTrack instances must obtain those tracks from the asset returned by this property.
17.5. \texttt{CLASS AVASSETREADERMBS}

17.5.5 \texttt{assetReaderWithAsset(item as AVAssetMBS, byref error as NSErrorMBS) as AVAssetReaderMBS}

\textbf{Function}: Returns an asset reader for reading media data from a specified asset.

\textbf{Notes}:

asset: The asset from which media data is to be read.
Error: If initialization of the reader fails, upon return contains an error that describes the problem.

Returns an asset reader, initialized for reading media data from asset.

17.5.6 \texttt{available as boolean}

\textbf{Function}: Whether this class is available.

\textbf{Notes}: Returns true on Mac OS X 10.7 and newer.

17.5.7 \texttt{canAddOutput(output as AVAssetReaderOutputMBS) as boolean}

\textbf{Function}: Returns a Boolean value that indicates whether a given output can be added to the receiver.

\textbf{Notes}:

output: The reader output to be tested.

Returns true if output can be added to the receiver, otherwise false.
You cannot add an output that reads from a track of an asset other than the asset used to initialize the receiver.

17.5.8 \texttt{cancelReading}

\textbf{Function}: Cancels any background work and prevents the receiver’s outputs from reading more samples.

\textbf{Notes}: If you want to stop reading samples from the receiver before reaching the end of its time range, you should call this method to stop any background read ahead operations that the may have been in progress.
17.5.9  Constructor(item as AVAssetMBS, byref error as NSErrorMBS)

Function: Initializes an asset reader for reading media data from a specified asset.
Notes:
asset: The asset from which media data is to be read.
Error: If initialization of the reader fails, upon return contains an error that describes the problem.

17.5.10  error as NSErrorMBS

Function: Describes the error that occurred if the status is AVAssetReaderStatusFailed. (read-only)
Notes:
This property is thread safe.
The value of this property describes what caused the reader to no longer be able to read its asset. If the reader’s status is not AVAssetReaderStatusFailed, the value of this property is nil.

17.5.11  outputs as AVAssetReaderOutputMBS()

Function: The outputs from which clients of reader can read media data. (read-only)
Notes: The array contains concrete instances of AVAssetReaderOutput associated with the reader.

17.5.12  startReading

Function: Prepares the receiver for obtaining sample buffers from the asset.
Notes:
Returns true if the reader is able to start reading, otherwise false.
This method validates the entire collection of settings for outputs for tracks, for audio mixdown, and for video composition and initiates reading of all outputs.
status signals the terminal state of the asset reader, and if a failure occurs, error describes the failure.
17.5.13 status as Integer

**Function:** The status of the reading of sample buffers from the asset. (read-only)
**Notes:**
This property is thread safe. For possible values, see "Reader Status Constants."

The value of this property indicates whether reading is in progress, has completed successfully, has been canceled, or has failed. You should check the value of this property copyNextSampleBuffer (AVAssetReader-Output) returns nil to determine why no more samples could be read.

17.5.14 Properties

17.5.15 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

17.5.16 timeRange as CMTimeRangeMBS

**Function:** The time range of the asset that should be read.
**Notes:**
The intersection of the value of this property and CMTimeRangeMake(kCMTimeZero, asset.duration) determines the time range of the asset from which media data will be read.

The default value is CMTimeRangeMake(kCMTimeZero, kCMTimePositiveInfinity). You cannot change the value of this property after reading has started.
(Read and Write computed property)

17.5.17 Constants

17.5.18 AVAssetReaderStatusCancelled = 4

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the reader’s status values.
**Notes:** Indicates that reading was cancelled using cancelReading.
17.5.19 AVAssetReaderStatusCompleted = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the reader’s status values. Notes: Indicates that the reader has provided all available sample buffers to all of its outputs.

17.5.20 AVAssetReaderStatusFailed = 3

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the reader’s status values. Notes: Indicates that reading failed.

17.5.21 AVAssetReaderStatusReading = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the reader’s status values. Notes: Indicates that the reader is ready to provide more sample buffers to its outputs.

17.5.22 AVAssetReaderStatusUnknown = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the reader’s status values. Notes: Indicates that startReading has not yet been invoked.
17.6. CLASS AVASSETREADEROUTPUTMBS

17.6 class AVAssetReaderOutputMBS

17.6.1 class AVAssetReaderOutputMBS

Function: AVAssetReaderOutput is an abstract class that defines an interface for reading a single collection of samples of a common media type from an AVAssetReader object.
Notes:
There are several subclasses of AVAssetReaderOutput for specific tasks, such as AVAssetReaderTrackOutput or AVAssetReaderVideoCompositionOutput.
You can read the media data of an asset by adding one or more concrete instances of AVAssetReaderOutput to an AVAssetReader object using addOutput.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.6.2 Methods

17.6.3 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

17.6.4 Constructor

Function: The private constructor.

17.6.5 NextSampleBuffer as CMSampleBufferMBS

Function: Synchronously copies the next sample buffer for the output.
Notes:
The output sample buffer, or nil if there are no more sample buffers available for the output within the time range specified by the asset reader’s timeRange property.

If this method returns nil, you should check the value of the associated AVAssetReader object’s status property to determine why no more samples could be read.
17.6.6 Properties

17.6.7 alwaysCopiesSampleData as boolean

Function: Indicates whether the data in buffers gets copied before being vended.
Notes: When the value of this property is true, the output always vends a buffer with copied data; you can freely modify data in such buffers.

When the value of this property is false, the buffers vended may not be copied; such buffers may still be referenced by other entities. The result of modifying a buffer whose data hasn’t been copied is undefined. Requesting buffers whose data hasn’t been copied when possible can lead to performance improvements. The default value of this property is true.
Available in OS X v10.8 and later.
(Read and Write property)

17.6.8 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.6.9 mediaType as string

Function: A string representing the media type of the track (or tracks) represented by the output. (read-only)
Notes: The value of this property is one of the media type strings defined in AVMediaFormat.h.
(Read only property)

17.6.10 supportsRandomAccess as Boolean

Function: Indicates whether the asset reader output supports reconfiguration of the time ranges to read.
Notes:
When the value of this property is true, the time ranges read by the asset reader output can be reconfigured during reading using the -resetForReadingTimeRanges method. This also prevents the attached AVAssetReader from progressing to AVAssetReaderStatusCompleted until markConfigurationAsFinal has been invoked.

The default value is false, which means that the asset reader output may not be reconfigured once reading has begin. When the value of this property is false, AVAssetReader may be able to read media data more efficiently, particularly when multiple asset reader outputs are attached.

This property may not be set after startReading has been called on the attached asset reader.

(Read and Write property)
17.7 class AVAssetReaderOutputMetadataAdaptorMBS

17.7.1 class AVAssetReaderOutputMetadataAdaptorMBS

Function: Creates a new timed metadata group adaptor for retrieving timed metadata group objects from
an asset reader output.

Notes:

assetReaderOutput: An instance of AVAssetReaderTrackOutput that vends sample buffers containing meta-
data, e.g. an AVAssetReaderTrackOutput object initialized with a track of media type AVMediaTypeMeta-
data and nil outputSettings.

Returns an instance of AVAssetReaderOutputMetadataAdaptor

It is an error to create a timed metadata group adaptor with an asset reader output that does not vend
metadata. It is also an error to create a timed metadata group adaptor with an asset reader output whose
asset reader has already started reading, or an asset reader output that already has been used to initialize
another timed metadata group adaptor.

Clients should not mix calls to AVAssetReaderTrackOutput.NextSampleBuffer and AVAssetReaderOutput-
MetadataAdaptor.nextTimedMetadataGroup. Once an AVAssetReaderTrackOutput instance has been used
to initialize an AVAssetReaderOutputMetadataAdaptor, calling NextSampleBuffer on that instance will re-
sult in an exception being thrown.

Available on Mac OS X 10.10 or newer.

17.7.2 Methods

17.7.3 assetReaderOutputMetadataAdaptorWithAssetReaderTrackOutput(track-
Output as AVAssetReaderTrackOutputMBS) as AVAssetReaderOutput-
MetadataAdaptorMBS

Function: Creates a new timed metadata group adaptor for retrieving timed metadata group objects from
an asset reader output.

Notes:

Parameter: an instance of AVAssetReaderTrackOutput that vends sample buffers containing metadata, e.g.
an AVAssetReaderTrackOutput object initialized with a track of media type AVMediaTypeMetadata and
nil outputSettings.
Returns an instance of AVAssetReaderOutputMetadataAdaptor

It is an error to create a timed metadata group adaptor with an asset reader output that does not vend metadata. It is also an error to create a timed metadata group adaptor with an asset reader output whose asset reader has already started reading, or an asset reader output that already has been used to initialize another timed metadata group adaptor.

Clients should not mix calls to AVAssetReaderTrackOutput.NextSampleBuffer and AVAssetReaderOutputMetadataAdaptor.nextTimedMetadataGroup. Once an AVAssetReaderTrackOutput instance has been used to initialize an AVAssetReaderOutputMetadataAdaptor, calling NextSampleBuffer on that instance will result in an exception being thrown.

### 17.7.4 available as boolean

**Function:** Whether this class is available.

**Notes:** Should be true on Mac OS X 10.10 and newer.

### 17.7.5 Constructor(trackOutput as AVAssetReaderTrackOutputMBS)

**Function:** Creates a new timed metadata group adaptor for retrieving timed metadata group objects from an asset reader output.

**Notes:**

assetReaderOutput: An instance of AVAssetReaderTrackOutput that vends sample buffers containing metadata, e.g. an AVAssetReaderTrackOutput object initialized with a track of media type AVMediaTypeMetadata and nil outputSettings.

Returns an instance of AVAssetReaderTrackOutputTimedMetadataGroupAdaptor

It is an error to create a timed metadata group adaptor with an asset reader output that does not vend metadata. It is also an error to create a timed metadata group adaptor with an asset reader output whose asset reader has already started reading, or an asset reader output that already has been used to initialize another timed metadata group adaptor.

Clients should not mix calls to AVAssetReaderTrackOutput.NextSampleBuffer and AVAssetReaderOutputMetadataAdaptor.nextTimedMetadataGroup. Once an AVAssetReaderTrackOutput instance has been used to initialize an AVAssetReaderOutputMetadataAdaptor, calling NextSampleBuffer on that instance will result in an exception being thrown.
17.7.6 nextTimedMetadataGroup as AVTimedMetadataGroupMBS

Function: Returns the next timed metadata group for the asset reader output, synchronously.

Notes: Returns an instance of AVTimedMetadataGroup, representing the next logical segment of metadata coming from the source asset reader output.

This method will return nil when all timed metadata groups have been read from the asset reader output, or if there is an error that prevents the timed metadata group adaptor from reading more timed metadata groups. When this method returns nil, clients should check the value of the associated AVAssetReader's status property to determine why no more samples could be read.

Before calling this method, you must ensure that the output which underlies the receiver is attached to an AVAssetReader via a prior call to addOutput and that startReading has been called on the asset reader.

17.7.7 Properties

17.7.8 assetReaderTrackOutput as AVAssetReaderTrackOutputMBS

Function: The asset reader track output from which the receiver pulls timed metadata groups.

Notes: (Read only property)

17.7.9 Handle as Integer

Function: The internal object reference.

Notes: (Read and Write property)
17.8. CLASS AVASSETREADERSAMPLEREFERENCEOUTPUTMBS

17.8  class AVAssetReaderSampleReferenceOutputMBS

17.8.1  class AVAssetReaderSampleReferenceOutputMBS

**Function:** AVAssetReaderSampleReferenceOutput is a concrete subclass of AVAssetReaderOutput that defines an interface for reading sample references from a single AVAssetTrack of an AVAssetReader’s AVAsset.

**Notes:**
Clients can extract information about the location (file URL and offset) of samples in a track by adding an instance of AVAssetReaderSampleReferenceOutput to an AVAssetReader using the AVAssetReader.addOutput method. No actual sample data can be extracted using this class. The location of the sample data is described by the kCMSampleBufferAttachmentKey SampleReferenceURL and kCMSampleBufferAttachmentKey SampleReferenceByteOffset attachments on the extracted sample buffers. More information about sample buffers describing sample references can be found in the CMSampleBuffer documentation.

Sample buffers extracted using this class can also be appended to an AVAssetWriterInput to create movie tracks that are not self-contained and reference data in the original file instead. Currently, only instances of AVAssetWriter configured to write files of type AVFileTypeQuickTimeMovie can be used to write tracks that are not self-contained.

Since no sample data is ever returned by instances of AVAssetReaderSampleReferenceOutput, the value of the alwaysCopiesSampleData property is ignored.

Available on Mac OS X 10.10 or newer.
Subclass of the AVAssetReaderOutputMBS class.

17.8.2  Methods

17.8.3  assetReaderSampleReferenceOutputWithTrack(track as AVAssetTrackMBS) as AVAssetReaderSampleReferenceOutputMBS

**Function:** Returns an instance of AVAssetReaderSampleReferenceOutput for supplying sample references.

**Notes:**
Track: The AVAssetTrack for which the resulting AVAssetReaderSampleReferenceOutput should provide sample references.

Returns an instance of AVAssetReaderSampleReferenceOutput.
The track must be one of the tracks contained by the target AVAssetReader’s asset.
17.8.4 Constructor(Track as AVAssetTrackMBS)

Function: Returns an instance of AVAssetReaderSampleReferenceOutput for supplying sample references.

Notes:

Track: The AVAssetTrack for which the resulting AVAssetReaderSampleReferenceOutput should provide sample references.

The track must be one of the tracks contained by the target AVAssetReader’s asset.

17.8.5 Properties

17.8.6 track as AVAssetTrackMBS

Function: The track from which the receiver extracts sample references.

Notes:

The value of this property is an AVAssetTrack owned by the target AVAssetReader’s asset.
(Read only property)
17.9. class AVAssetReaderTrackOutputMBS

17.9.1 class AVAssetReaderTrackOutputMBS

**Function:** AVAssetReaderTrackOutput defines an interface for reading media data from a single AVAssetTrack object of an asset reader’s asset.

**Notes:**

You can read the media data of an asset track by adding an instance of AVAssetReaderTrackOutput to an asset reader using the AVAssetReader’s addOutput method. The samples in the track can be read in read in the format in which they are stored in the asset, or can be converted to a different format.

Subclass of the AVAssetReaderOutputMBS class.

17.9.2 Methods

17.9.3 assetReaderTrackOutputWithTrack(track as AVAssetTrackMBS, outputSettings as dictionary) as AVAssetReaderTrackOutputMBS

**Function:** Returns an asset reader wrapping a specified track, with optional output settings.

**Notes:**

- **track:** The track from which the reader should source sample buffers.
- **outputSettings:** A dictionary of output settings to be used for sample output. Pass nil to receive samples as stored in the track.

You use keys from one of AVAudioSettings.h, AVVideoSettings.h, or `<CoreVideo/CVPixelBuffer.h>`, depending on the media type and the output format you want.

Initialization fails if the output settings cannot be used with the specified track. Those keys are available in AVFoundationMBS class.

17.9.4 Constructor(track as AVAssetTrackMBS, outputSettings as dictionary)

**Function:** Initializes an asset reader to wrap a specified track, with optional output settings.

**Notes:**

- **track:** The track from which the reader should source sample buffers.
- **outputSettings:** A dictionary of output settings to be used for sample output. Pass nil to receive samples as stored in the track.

You use keys from one of AVAudioSettings.h, AVVideoSettings.h, or `<CoreVideo/CVPixelBuffer.h>`, depending on the media type and the output format you want.

Initialization fails if the output settings cannot be used with the specified track.
Those keys are available in AVFoundationMBS class.

17.9.5 outputSettings as dictionary

Function: The output settings used by the output. (read-only)
Notes:
The value is a dictionary that contains values for keys from either AVAudioSettings.h (linear PCM only) for audio tracks or <CoreVideo/CVPixelBuffer.h> for video tracks. A value of nil indicates that the output will return samples in their original format as stored in the target track. Those keys are available in AVFoundationMBS class.

17.9.6 track as AVAssetTrackMBS

Function: The track from which the receiver reads sample buffers. (read-only)

17.9.7 Properties

17.9.8 audioTimePitchAlgorithm as string

Function: The processing algorithm used to manage audio pitch for scaled audio edits.
Notes:
The supported constants are defined in Time Pitch Algorithm Settings. An NSInvalidArgumentException will be raised if this property is set to a value other than the defined constants. Available in OS X v10.9 and later. (Read and Write computed property)
17.10. class AVAssetReaderVideoCompositionOutputMBS

17.10.1 class AVAssetReaderVideoCompositionOutputMBS

**Function:** AVAssetReaderVideoCompositionOutput is a subclass of AVAssetReaderOutput you use to read 
video frames that have been composited together from the frames in one or more tracks of an AVAssetReader 
object’s asset. 
**Notes:** 
You can read the video frames composited from one or more asset tracks by adding an instance of AVAsset-
ReaderVideoCompositionOutput to an AVAssetReader object using the addOutput method. 
Subclass of the AVAssetReaderOutputMBS class.

17.10.2 Methods

17.10.3 assetReaderVideoCompositionOutputWithVideoTracks(videoTracks() as AVAssetTrackMBS, videoSettings as dictionary) as AVAssetReaderVideoCompositionOutputMBS

**Function:** Returns an instance of AVAssetReaderVideoCompositionOutput for reading composited video 
from the specified video tracks, using optional video settings. 
**Notes:**
videoTracks: An array of AVAssetTrack objects from which the created object should read video frames for 
compositing. 
videoSettings: A dictionary of video settings to be used for sample output, or nil if you want to receive de-
coded samples in a convenient uncompressed format, with properties determined according to the properties 
of the specified video tracks. 
You use keys from `<CoreVideo/CVPixelBuffer.h>`, depending on the output format you want. 
Initialization will fail if the video settings cannot be used with the specified video tracks. 

Return an instance of AVAssetReaderVideoCompositionOutput wrapping videoTracks, using the settings 
specified by videoSettings, or nil if initialization failed.

17.10.4 Constructor(videoTracks() as AVAssetTrackMBS, videoSettings as dictionary)

**Function:** Returns an instance of AVAssetReaderVideoCompositionOutput for reading composited video
from the specified video tracks, using optional video settings.

**Notes:**

- **videoTracks**: An array of AVAssetTrack objects from which the created object should read video frames for compositing.
- It is an error to include tracks of media types other than AVMediaTypeVideo.
- **videoSettings**: A dictionary of video settings to be used for sample output, or nil if you want to receive decoded samples in a convenient uncompressed format, with properties determined according to the properties of the specified video tracks.
- You use keys from `<CoreVideo/CVPixelBuffer.h>`, depending on the output format you want.
- Initialization will fail if the video settings cannot be used with the specified video tracks.
- In that case handle property will be 0.

### 17.10.5 customVideoCompositor as AVVideoCompositingMBS

**MBS AVFoundation Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns the custom video compositor instance used by the receiver, if any. (read-only)

**Notes:**

The custom video compositor instance that is used during image generation is accessible via this property after the value of videoComposition is set to an AVVideoComposition instance that specifies a custom video compositor class. Any additional communication between the application and that instance of the custom video compositor, if any is required for configuration or other purposes, can only occur once that has happened.

If the value of videoComposition is changed from an AVVideoComposition that specifies a custom video compositor class to another instance of AVVideoComposition that specifies the same custom video compositor class, the instance of the custom video compositor that was previously created will receive the renderContextChanged message and remain in use for subsequent image generation.

This property is nil if there is no video compositor, or if the internal video compositor is in use.

**Available in OS X v10.9 and later.**

### 17.10.6 videoSettings as dictionary

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The video settings used by the output. (read-only)

**Notes:**

A value of nil indicates that the receiver will return video frames in a convenient uncompressed format, with properties determined according to the properties of the receiver’s video tracks.

The dictionary’s keys are from `<CoreVideo/CVPixelBuffer.h>`. 
17.10.7 videoTracks as AVAssetTrackMBS()

Function: The tracks from which the output reads composited video. (read-only)
Notes: The array contains AVAssetTrack objects owned by the target asset reader’s asset.

17.10.8 Properties

17.10.9 videoComposition as AVVideoCompositionMBS

Function: The video composition to use for the output.
Notes: The value is an AVVideoComposition object that can be used to specify the visual arrangement of video frames read from each source track over the timeline of the source asset.

See AVVideoComposition for options for configuring a video composition.
(Read and Write computed property)
17.11 class AVAssetResourceLoaderMBS

Function: The asset resource loader class.

Notes:

An AVAssetResourceLoader object mediates resource requests from an AVURLAsset object with a delegate object that you provide. When a request arrives, the resource loader asks your delegate if it is able to handle the request and reports the results back to the asset.

You do not create resource loader objects yourself. Instead, you retrieve a resource loader from the resourceLoader property of an AVURLAsset object and use it to assign your custom delegate object.

The delegate you associate with this object must adopt the AVAssetResourceLoaderDelegate protocol. For more information, see AVAssetResourceLoaderDelegate Protocol Reference.

17.11.2 Methods

17.11.3 available as boolean

Function: Whether this class is available.

Notes: Returns true on Mac OS X 10.9 and newer.

17.11.4 Constructor

Function: The constructor.

17.11.5 Properties

17.11.6 Handle as Integer

Function: The internal object reference.

Notes: (Read and Write property)
17.12. CLASS AVAssetResourceLoadingContentInformationRequestMBS

17.12 class AVAssetResourceLoadingContentInformationRequestMBS

**Function:** The AVAssetResourceLoadingContentInformationRequest class represents a query for essential information about a resource referenced by an asset resource loading request.

**Notes:**

The event AVFoundationMBS.resourceLoaderShouldWaitForLoadingOfRequestedResource is invoked and accepts responsibility for loading the resource it must check whether the contentInformationRequest property of the AVAssetResourceLoadingRequest is not nil. Whenever the value is not nil, the request includes a query for the information that AVAssetResourceLoadingContentInformationRequest encapsulates. In response to such queries, the resource loading delegate should set the values of the content information request’s properties appropriately before invoking the AVAssetResourceLoadingRequest method finishLoading.

When finishLoading is invoked, the values of the properties of its contentInformationRequest property will, in part, determine how the requested resource is processed. For example, if the requested resource’s URL is the URL of an AVURLAsset and contentType is set by the resource loading delegate to a value that the underlying media system doesn’t recognize as a supported media file type, operations on the AVURLAsset, such as playback, are likely to fail.

17.12.2 Methods

17.12.3 available as boolean

**Function:** Whether this class is available.

**Notes:** Returns true on Mac OS X 10.9 and newer.

17.12.4 Constructor

**Function:** The constructor.
17.12.5 Properties

17.12.6 ByteRangeAccessSupported as Boolean

Function: A Boolean value that indicates whether random access to arbitrary ranges of bytes of the resource is supported.

Notes:

Before finishing loading an AVAssetResourceLoadingRequest instance, if its contentInformationRequest property is not nil, set the value of this property to true if it supports random access to arbitrary ranges of bytes of the resource.

If this property is not true for resources that must be loaded incrementally, loading of the resource may fail. Such resources include anything that contains media data.

If byte range access is supported portions of the resource can be requested more than once.
Available in OS X v10.9 and later.
(Read and Write property)

17.12.7 contentLength as Int64

Function: The length, in bytes, of the requested resource.

Notes:

Before finishing loading an AVAssetResourceLoadingRequest instance, if its contentInformationRequest property is not nil, set the value of the contentLength property to the number of bytes contained by the requested resource.
Available in OS X v10.9 and later.
(Read and Write property)

17.12.8 contentType as String

Function: The UTI that specifies the type of data contained by the requested resource.

Notes:

Before finishing loading an AVAssetResourceLoadingRequest instance, if its contentInformationRequest property is not nil, set the value of this property to a UTI indicating the type of data contained by the requested resource.
Available in OS X v10.9 and later.
(Read and Write property)
17.12.9 Handle as Integer

**Function:** The internal object reference.

**Notes:** (Read and Write property)
17.13 class AVAssetResourceLoadingDataRequestMBS

17.13.1 class AVAssetResourceLoadingDataRequestMBS

Function: Use the AVAssetResourceLoadingDataRequest class to request data from a resource referenced by an AVAssetResourceLoadingRequest instance.

Notes:

The AVAssetResourceLoaderDelegate uses the AVAssetResourceLoadingDataRequest class to do the actual data reading, and its methods will be invoked, as necessary, to acquire data for the AVAssetResourceLoadingRequest instance.

When the resource loading delegate, which implements the AVAssetResourceLoaderDelegate protocol, receives an instance of AVAssetResourceLoadingRequest as the second parameter of the delegate’s resourceLoader:should-WaitForLoadingOfRequestedResource: method, it has the option of accepting responsibility for loading the referenced resource. If it accepts that responsibility, by returning YES, it must check whether the dataRequest property of the AVAssetResourceLoadingRequest instance is not nil. If it is not nil, the resource loading delegate is informed of the range of bytes within the resource that are required by the underlying media system. In response, the data is provided by one or more invocations of respondWithData: as required to provide the requested data. The data can be provided in increments determined by the resource loading delegate according to convenience or efficiency.

When the AVAssetResourceLoadingRequest method finishLoading is invoked, the data request is considered fully satisfied. If the entire range of bytes requested has not yet been provided, the underlying media system assumes that the resource’s length is limited to the provided content.

Available in OS X v10.9 and later.

17.13.2 Methods

17.13.3 available as boolean

Function: Whether this class is available.

17.13.4 Constructor

Function: The constructor.
17.13.5 **respondWithData(data as MemoryBlock)**

**Function:** Provides data to the loading request.
**Notes:**

- data: An instance of NSData containing some or all of the requested bytes.

This method may be invoked multiple times on the same instance of AVAssetResourceLoadingDataRequest to provide the full range of requested data incrementally. Upon each invocation, the value of the currentOffset property is updated to match the amount of data provided.

Available in OS X v10.9 and later.

---

17.13.6 **Properties**

17.13.7 **currentOffset as Integer**

**Function:** The position within the resource of the next byte. (read-only)
**Notes:**

- When incrementally loading data you should begin loading at this offset, returning the data by invoking the respondWithData: method. Bytes previous to this value have already been provided.

Available in OS X v10.9 and later.
(Read only property)

---

17.13.8 **Handle as Integer**

**Function:** The internal object reference.
**Notes:** (Read and Write property)

---

17.13.9 **requestedLength as Int64**

**Function:** The length, in bytes, of the data requested. (read-only)
**Notes:**
If the content length of the resource is unknown, the sum of the requestedLength and requestedOffset properties may be greater than the actual content length. When this situation occurs, an application must attempt to provide as much of the requested data beginning at the requestedOffset property as the resource contains. The application must then invoke either the AVAssetResourceLoadingRequest instance’s finishLoading method upon success, or the finishLoadingWithError: method if an error is encountered during the loading. Available in OS X v10.9 and later.

(Read only property)

17.13.10 requestedOffset as Int64

**Function:** The position within the resource of the first byte requested. (read-only)

**Notes:**

When all of the requested bytes that can be provided have been loaded, including the possible contentInformationRequest data in the AVAssetResourceLoadingRequest instance that contains the receiver, the delegate should respond by invoking finishLoading.

If the requestedOffset value is beyond the content length of the resource, the AVAssetResourceLoadingRequest instance is sent a finishLoading message without any prior invocations of respondWithData. Available in OS X v10.9 and later.

(Read only property)
17.14. class AVAssetResourceLoadingRequestMBS

17.14.1 class AVAssetResourceLoadingRequestMBS

**Function:** An AVAssetResourceLoadingRequest object encapsulates information about a resource request issued from a resource loader object.

**Notes:**
When an AVURLAsset object needs help loading a resource, it asks its AVAssetResourceLoader object to assist. The resource loader encapsulates the request information by creating an instance of this object, which it then hands to its delegate object for processing. The delegate uses the information in this object to perform the request and report on the success or failure of the operation.
Available on Mac OS X 10.9 and later.

17.14.2 Methods

17.14.3 available as boolean

**Function:** Whether this class is available.

17.14.4 Constructor

**Function:** The constructor.

17.14.5 finishLoading

**Function:** Causes the receiver to treat the processing of the request as complete.

**Notes:**
If a dataRequest is present and the resource does not contain the full extent of the data that has been requested according to the values of the requestedOffset and requestedLength properties of the request, invoke finishLoading after providing as much of the requested data as the resource contains.

Available in OS X v10.9 and later.

See also:

- 17.14.6 finishLoading(error as NSErrorMBS)
17.14.6 finishLoading(error as NSErrorMBS)

**Function:** Causes the receiver to handle the failure to load a resource for which a resource loader’s delegate took responsibility.
**Notes:**
- error: An error object indicating the reason for the failure.
- When a resource loader’s delegate takes responsibility for loading a resource, it calls this method when a failure occurred when loading the resource. This method marks the loading request as finished and notifies the resource loader object that the resource could not be loaded.
- Available in OS X v10.9 and later.
- See also:
  - 17.14.5 finishLoading

17.14.7 streamingContentKeyRequestDataForApp(appIdentifier as Memoryblock, contentIdentifier as Memoryblock, options as Dictionary, byref error as NSErrorMBS) as Memoryblock

**Function:** Obtains key request data for a specific combination of application and content.
**Notes:**
- appIdentifier: An opaque content identifier for the application. The value of this identifier depends on the particular system used to provide the decryption key.
- contentIdentifier: An opaque identifier for the content. The value of this identifier depends on the particular system used to provide the decryption key.
- options: Additional information necessary to obtain the key, or nil if no additional information is required.
- Error: If an error occurs while obtaining the streaming content key, the pointer is set to an appropriate error object on output.
- Returns the key request data that must be transmitted to the key vendor to obtain the content key.
- Available in OS X v10.9 and later.

17.14.8 Properties

17.14.9 contentInformationRequest as AVAssetResourceLoadingContentInformationRequestMBS

**Function:** Information about the requested resource. (read-only)
**Notes:**
An instance of AVAssetResourceLoadingContentInformationRequest that you populate with information about the resource. The value of this property is nil if no such information is being requested.
Available in OS X v10.9 and later.
(Read only property)

**17.14.10 dataRequest as AVAssetResourceLoadingDataRequestMBS**

Function: The range of requested resource data. (read-only)
Notes:
An instance of AVAssetResourceLoadingDataRequest that indicates the range of resource data that’s being requested. The value of this property is nil if no data is being requested.
Available in OS X v10.9 and later.
(Read only property)

**17.14.11 Handle as Integer**

Function: The internal object reference.
Notes: (Read and Write property)

**17.14.12 isCancelled as Boolean**

Function: A Boolean value that indicates whether the request has been cancelled. (read-only)
Notes:
True when the resource loader cancels the loading of a request, just prior to sending the message resourceLoaderDidCancelLoadingRequest to the delegate.
(Read only property)

**17.14.13 isFinished as Boolean**

Function: A Boolean value that indicates whether loading of the resource has finished. (read-only)
Notes:
The value of this property is NO initially. The value changes to YES when the delegate object handling the request calls the finishLoadingWithResponse or finishLoadingWithError method.
Available in OS X v10.9 and later.
17.14.14 redirect as Variant

Function: An URL request instance if the loading request was redirected.

Notes:

Value is NSURLRequestMBS.
Set this property to an instance of NSURLRequest indicating a redirection of the loading request to another URL.
If no redirection is needed, the value of this property must be nil, which is the default.
Available in OS X v10.9 and later.
(Read only property)

17.14.15 request as Variant

Function: The URL request object for the resource. (read-only)

Notes:

Value is NSURLRequestMBS.
Use the value in this property to identify the requested resource and to formulate an appropriate response object.
Available in OS X v10.9 and later.
(Read only property)

17.14.16 response as Variant

Function: The URL response for the loading request.

Notes:

Value is NSURLResponseMBS.
The value of this property to an instance of NSURLResponse, indicating a response to the loading request.
If no response is needed, the value of this property is nil.
Available in OS X v10.9 and later
(Read only property)
17.15. **CLASS AVASSETTRACKGROUPMBS**

17.15 **class AVAssetTrackGroupMBS**

**17.15.1 class AVAssetTrackGroupMBS**

**Function:** The AVAssetTrackGroup class encapsulates a single group of related tracks in an asset.

**Notes:**

Instances of AVAssetTrackGroup describe a single group of related alternate tracks, only one of which should be played at a time. Groups of alternate tracks typically contain variations of the same content, such as subtitles in multiple translations.

Clients can inspect the track groups contained in an asset (AVAsset) instance by loading and obtaining the value of the asset’s trackGroups property.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.15.2 **Methods**

17.15.3 **available as boolean**

**Function:** Whether this class is available.

**Notes:** Returns true on Mac OS X 10.9 and newer.

17.15.4 **Constructor**

**Function:** The private constructor.

17.15.5 **copy as AVAssetTrackGroupMBS**

**Function:** Creates a copy of the track group.

17.15.6 **trackIDs as Integer()**

**Function:** The IDs of the tracks in the group. (read-only)

**Notes:**
The value of this property is an array of NSNumber instances that are interpreted as CMPersistentTrackID values, one for each track in the group.
Available in OS X v10.9 and later.

17.15.7 Properties

17.15.8 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
17.16  class AVAssetTrackMBS

17.16.1  class AVAssetTrackMBS

Function: An AVAssetTrack object provides provides the track-level inspection interface for all assets.
Notes:

AVAssetTrack adopts the AVAsynchronousKeyValueLoading protocol. You should use methods in the protocol
to access a track’s properties without blocking the current thread. To cancel load requests for all keys
of AVAssetTrack you must message the parent AVAsset object (for example, | track.asset cancelLoading | ).
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.16.2  Methods

17.16.3  associatedTracksOfType(trackAssociationType as string) as AVAssetTrackMBS()

Function: An array containing other tracks associated with the track using the specified association type.
Notes:

trackAssociationType: The association type for which associated tracks are requested.

Returns an array of AVAssetTrack objects associated with the track by trackAssociationType. May be empty
if no tracks are associated through the specified association type.

You can call this method without blocking after availableTrackAssociationTypes has been loaded.
Available in OS X v10.9 and later.

17.16.4  available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

17.16.5  availableMetadataFormats as string()

Function: An array containing the metadata formats available for the track. (read-only)
CHAPTER 17. AVFOUNDATION

Notes: The array contains String objects, one for each metadata format that’s available for the track (such as QuickTime user data). For possible values, see AVMetadataItem.

17.16.6 availableTrackAssociationTypes as string()

Function: An array of association types used to associate other tracks with the track. (read-only)
Notes:
The array contains strings, one for each type of association for which the track has associated tracks. For possible values, see "Track Association Types" in Apple’s documentation.
Available in OS X v10.9 and later.

17.16.7 commonMetadata as AVMetadataItemMBS()

Function: An array of AVMetadataItem objects for each common metadata key for which a value is available. (read-only)

17.16.8 Constructor

Function: The private constructor.

17.16.9 copy as AVAssetTrackMBS

Function: Creates a copy of the object.

17.16.10 formatDescriptions as CMFormatDescriptionMBS()

Function: The formats of media samples referenced by the track. (read-only)
Notes: The array contains CMFormatDescriptions, each of which indicates the format of media samples referenced by the track. A track that presents uniform media (for example, encoded according to the same encoding settings) will provide an array with a count of 1.
17.16.11 hasMediaCharacteristic(mediaCharacteristic as string) as boolean

**Function:** Returns a Boolean value that indicates whether the track references media with the specified media characteristic.

**Notes:**
mediaCharacteristic: The media characteristic of interest.
For possible values, see "Media Characteristics" in AV Foundation Constants Reference, for example AVMediaCharacteristicVisual, AVMediaCharacteristicAudible, or AVMediaCharacteristicLegible.

Returns true if the track references media with the specified characteristic, otherwise false.

17.16.12 loadValuesAsynchronouslyForKeys(keys() as string, tag as Variant = nil)

**Function:** Tells the asset to load the values of any of the specified keys that are not already loaded.

**Notes:**
keys: An array containing the required keys.

Calls AVFoundationMBS.AssetTrackLoadValuesAsynchronouslyForKeysFinished on completion. 
The completion event will be invoked exactly once per invocation of this method:

- Synchronously if an I/O error or other format-related error occurs immediately.
- Asynchronously at a subsequent time if a loading error occurs at a later stage of processing, or if cancelLoading is invoked on an AVAsset instance.

The completion states of the keys you specify in keys are not necessarily the same—some may be loaded, and others may have failed. You must check the status of each key individually.

If you want to receive error reporting for loading that’s still pending, you can call this method at any time, even after an asset has begun to load data for operations in progress or already completed. If a fatal error has already occurred, the completion event is invoked synchronously.

17.16.13 metadataForFormat(Format as string) as AVMetadataItemMBS()

**Function:** An array of metadata items, one for each metadata item in the container of the specified format.

**Notes:**
format: The metadata format for which items are requested.

Returns an array of AVMetadataItem objects, one for each metadata item in the container of the format specified by format, or empty array if there is no metadata of the specified format.

You can call this method without blocking after availableMetadataFormats has been loaded.

17.16.14 preferredTransform as CGAffineTransformMBS

Function: The transform specified in the track’s storage container as the preferred transformation of the visual media data for display purposes. (read-only)

Notes: The value of this property is often, but not always, CGAffineTransformIdentity.

17.16.15 samplePresentationTimeForTrackTime(trackTime as CMTimeMBS) as CMTimeMBS

Function: Maps the specified track time through the appropriate time mapping and returns the resulting sample presentation time.

Notes:

trackTime: The track time for which a sample presentation time is requested.
Returns the sample presentation time corresponding to trackTime; the value will be invalid if trackTime is out of range.

17.16.16 segmentForTrackTime(trackTime as CMTimeMBS) as AVAssetTrackSegmentMBS

Function: The track segment that corresponds to the specified track time.

Notes:

trackTime: The track time for which you want the segment.
Returns the track segment from the segments array that corresponds to trackTime, or nil if trackTime is out of range.
17.16. **CLASS AVASSETTRACKMBS**

17.16.17 **segments as AVAssetTrackSegmentMBS()**

**Function:** The time mappings from the track’s media samples to the timeline of the track. (read-only)
**Notes:**

The array contains instances of AVAssetTrackSegment.

Empty edits (that is, time ranges for which no media data is available to be presented) have source.start and source.duration equal to kCMTimeInvalid.

17.16.18 **statusOfValueForKey(key as string, byref error as NSErrorMBS) as Integer**

**Function:** Reports whether the value for a given key is immediately available without blocking. (required)
**Notes:**

key: The key whose status you want.
error: If the status of the value for the key is AVKeyValueStatusFailed, upon return contains an NSError object that describes the failure that occurred.

Returns the current loading status of the value for key. For possible values, see "Protocol Methods."

You use this method to determine the availability of the value for a key. This method does not cause an asset to load the value of a key that’s not yet available. To request values for keys that may not already be loaded without blocking, use loadValuesAsynchronouslyForKeys and wait for invocation of the completion handler to be informed of availability.

17.16.19 **timeRange as CMTimeRangeMBS**

**Function:** The time range of the track within the overall timeline of the asset. (read-only)
**Notes:** A track with CMT imeCompare(timeRange.start, kCMTimeZero) == 1 will initially present an empty time range.

17.16.20 **trackSamples(formatOptions as Dictionary) as MemoryBlock**

MBS AVFoundation Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Queries the track Samples
**Example:**
dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
dim tracks() as AVAssetTrackMBS = a.tracksWithMediaType(AVFoundationMBS.AVMediaTypeAudio)
dim track as AVAssetTrackMBS = tracks(0)

dim d as new Dictionary
dim n as Integer = OSTypeFromStringMBS(AVFoundationMBS.kAudioFormatLinearPCM)
d.Value(AVFoundationMBS.AVFormatIDKey) = n
d.Value(AVFoundationMBS.AVLinearPCMBitDepthKey) = 16
d.Value(AVFoundationMBS.AVLinearPCMIsmBigEndianKey) = false
d.Value(AVFoundationMBS.AVLinearPCMIsmFloatKey) = false
d.Value(AVFoundationMBS.AVLinearPCMIsmNonInterleaved) = false

dim SampleData as MemoryBlock = track.trackSamples(d)

window1.Backdrop = RenderSamplesMBS(SampleData, SampleData.Size / 2, 1, window1.Width, window1.Height, 1, & c88B5C4, & c274C5A, & c203F4E, 15)

Notes:
Returns nil in case of errors.
Track should be an audio or muxed track.

17.16.21 Properties

17.16.22 asset as AVAssetMBS

Function: The asset of which the track is a part. (read-only)
Notes: (Read only property)

17.16.23 estimatedDataRate as Double

Function: The estimated data rate of the media data referenced by the track, in bits per second. (read-only)
Notes: (Read only property)
17.16. CLASS AVASSETTRACKMBS

17.16.24 extendedLanguageTag as string

Function: The language tag associated with the track, as an RFC 4646 language tag. (read-only)
Notes:
The value may be nil if no language tag is indicated. (Read only property)

17.16.25 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.16.26 isEnabled as boolean

Function: Indicates whether the track is enabled according to state stored in its container or construct. (read-only)
Notes: (Read only property)

17.16.27 isPlayable as boolean

Function: Indicates whether the track is playable in the current environment. (read-only)
Notes:
If the value of this property is true, an AVPlayerItemTrack of an AVPlayerItem initialized with the the track's asset can be enabled for playback. Available in OS X v10.8 and later. (Read only property)

17.16.28 isSelfContained as boolean

Function: Indicates whether the track references sample data only within its storage container. (read-only)
Notes:
The value is true if the track references sample data only within its storage container, otherwise it is false. (Read only property)
17.16.29  languageCode as string

**Function:** The language associated with the track, as an ISO 639-2/T language code. (read-only) 
**Notes:**  
The value may be "" if no language is indicated. 
(Read only property)

17.16.30  mediaType as string

**Function:** The media type for the track. (read-only) 
**Notes:**  
For possible values, see "Media Types" in AV Foundation Constants Reference. 
(Read only property)

17.16.31  naturalSize as CGSizeMBS

**Function:** The natural dimensions of the media data referenced by the track. (read-only) 
**Example:**
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")  
dim m as new AVMovieMBS(f, nil)  

dim videotracks() as AVMovieTrackMBS = m.movieTracksWithMediaCharacteristic(AVFoundationMBS.AV-  
MediaCharacteristicFrameBased)  

for each videotrack as AVMovieTrackMBS in videotracks  
dim s as CGSizeMBS = videotrack.naturalSize  
MsgBox str(s.Width)+" x "+ str(s.Height)  
next
```

**Notes:** (Read only property)
17.16.32 naturalTimeScale as Integer

Function: A timescale in which time values for the track can be operated upon without extraneous numerical conversion. (read-only)
Notes: (Read only property)

17.16.33 nominalFrameRate as Double

Function: The frame rate of the track, in frames per second. (read-only)
Example:
```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.mp4")
dim a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
dim tracks() as AVAssetTrackMBS = a.tracksWithMediaCharacteristic(AVFoundationMBS.AVMediaCharacteristicFrameBased)
for each t as AVAssetTrackMBS in tracks
    MsgBox str(t.nominalFrameRate)
next
```
Notes: (Read only property)

17.16.34 preferredVolume as Double

Function: The volume specified in the track’s storage container as the preferred volume of the audible media data. (read-only)
Notes: (Read only property)

17.16.35 totalSampleDataLength as Int64

Function: The total number of bytes of sample data required by the track. (read-only)
Notes: (Read only property)
17.16.36  trackID as Integer

Function: The persistent unique identifier for this track of the asset. (read-only)
Notes: (Read only property)

17.16.37  Constants

17.16.38  AVKeyValueStatusCancelled = 4

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants to indicate the load
status of a property.
Notes: Indicates that the attempt to load the property was cancelled.

17.16.39  AVKeyValueStatusFailed = 3

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants to indicate the load
status of a property.
Notes: Indicates that the attempt to load the property failed.

17.16.40  AVKeyValueStatusLoaded = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants to indicate the load
status of a property.
Notes: Indicates that the property is ready for use.

17.16.41  AVKeyValueStatusLoading = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants to indicate the load
status of a property.
Notes: Indicates that the property is not fully loaded.

17.16.42  AVKeyValueStatusUnknown = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants to indicate the load
status of a property.
Notes: Indicates that the property status is unknown.
17.17 class AVAssetTrackSegmentMBS

17.17.1 class AVAssetTrackSegmentMBS

Function: An AVAssetTrackSegment object represents a segment of an AVAssetTrack object, comprising of a time mapping from the source to the asset track timeline.

17.17.2 Methods

17.17.3 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

17.17.4 Constructor

Function: The constructor.

17.17.5 isEmpty as boolean

Function: Indicates whether the segment is an empty segment (read-only)
Notes: True if the segment is empty, otherwise false.

17.17.6 timeMapping as CMTimeMappingMBS

Function: The time range of the track of the container file of the media presented by the segment. (read-only)
17.17.7 Properties

17.17.8 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
17.18 class AVAssetWriterInputGroupMBS

17.18.1 class AVAssetWriterInputGroupMBS

**Function:** The AVAssetWriterInputGroup class associates tracks corresponding to inputs with each other in a mutually exclusive relationship.

**Notes:**

This class is used to associate tracks corresponding to multiple AVAssetWriterInput instances as mutually exclusive to each other for playback or other processing.

For example, if you are creating an asset with multiple audio tracks using different spoken languages and only one track should be played at a time, group the inputs corresponding to those tracks into a single instance of AVAssetWriterInputGroup and add the group to the AVAssetWriter instance using the AVAssetWriter method addInputGroup:. If the output format supports mutually exclusive relationships among tracks, the AVAssetWriter marks the tracks as mutually exclusive to each other.

Because the AVAssetWriterInputGroup class is a subclass of the AVMediaSelectionGroup class, clients can examine the media selection options that are available on the output asset before the asset is written. The best results for examining the options of the AVAssetWriterInputGroup are obtained after associating the AVAssetWriterInput instances of the AVAssetTrack objects as appropriate using the AVAssetWriterInput method addTrackAssociationWithTrackOfInput and by initializing each AVAssetWriterInput with a source format hint, where appropriate.

Subclass of the AVMediaSelectionGroupMBS class.

17.18.2 Methods

17.18.3 assetWriterInputGroupWithInputs(inputs() as AVAssetWriterInputMBS, defaultInput as AVAssetWriterInputMBS) as AVAssetWriterInputGroupMBS

**Function:** Creates and initializes an instance of an asset writer input group.

**Notes:**

inputs: An array of AVAssetWriterInput instances to be grouped together.

defaultInput: The instance of AVAssetWriterInput to designate as the default input for the group.

Returns an initialized instance of AVAssetWriterInputGroup.

When the input group is added to an AVAssetWriter instance using the addInputGroup: method, the AVAssetWriterInput property marksOutputTrackAsEnabled is automatically set to true for defaultInput and false for all of the other inputs in the group.

Available in OS X v10.9 and later.
17.18.4 Constructor(inputs() as AVAssetWriterInputMBS, defaultInput as AVAssetWriterInputMBS)

Function: Initializes an instance of an asset writer input group.
Notes:
inputs: An array of AVAssetWriterInput instances to be grouped together.
defaultInput: The instance of AVAssetWriterInput to designate as the default input for the group.

When the input group is added to an AVAssetWriter instance using the addInputGroup method, the AVAssetWriterInput property marksOutputTrackAsEnabled is automatically set to true for defaultInput and false for all of the other inputs in the group.
Available in OS X v10.9 and later.

17.18.5 inputs as AVAssetWriterInputMBS()

Function: The the inputs array. (read-only)
Notes: Available in OS X v10.9 and later.

17.18.6 Properties

17.18.7 defaultInput as AVAssetWriterInputMBS

Function: The the default input object. (read-only)
Notes:
Available in OS X v10.9 and later.
(Read only property)
17.19 class AVAssetWriterInputMBS

17.19.1 class AVAssetWriterInputMBS

**Function:** You use an AVAssetWriterInput to append media samples packaged as CMSampleBuffer objects, or collections of metadata, to a single track of the output file of an AVAssetWriter object.

**Notes:**

When there are multiple inputs, AVAssetWriter tries to write media data in an ideal interleaving pattern for efficiency in storage and playback. Each of its inputs signals its readiness to receive media data for writing according to that pattern via the value of readyForMoreMediaData. If readyForMoreMediaData is true, an input can accept additional media data while maintaining appropriate interleaving. If media data is appended to an input after readyForMoreMediaData becomes false, AVAssetWriter may need to write media data to its output without regard for ideal interleaving.

You can only append media data to an input while its readyForMoreMediaData property is true.

- If you’re writing media data from a non-real-time source, such as an instance of AVAssetReader, you should hold off on generating or obtaining more media data to append to an input when the value of readyForMoreMediaData is false. To help with control of the supply of non-real-time media data, you can use requestMediaDataWhenReadyOnQueue:usingBlock: to specify a block that the input should invoke whenever it’s ready for input to be appended.

- If you’re writing media data from a real-time source, you should set the input’s expectsMediaDataInRealTime property to true to ensure that the value of readyForMoreMediaData is calculated appropriately. When expectsMediaDataInRealTime is true, readyForMoreMediaData will become false only when the input cannot process media samples as quickly as they are being provided by the client. If readyForMoreMediaData becomes false for a real-time source, the client may need to drop samples or consider reducing the data rate of appended samples.

The value of readyForMoreMediaData will often change from false to true asynchronously, as previously-supplied media data is processed and written to the output. It is possible for all of an asset writer’s inputs temporarily to return false for readyForMoreMediaData.

17.19.2 Methods

17.19.3 addTrackAssociationWithTrackOfInput(input as AVAssetWriterInputMBS, trackAssociationType as string)

**Function:** Associates the track corresponding to the specified input with the track corresponding with the receiver.

**Notes:**
input: The instance of AVAssetWriterInput with a corresponding track to associate with track corresponding with the receiver.

trackAssociationType: The type of track association to add. Common track association types, such as AVTrackAssociationTypeTimecode are defined in Track Association Types.

If the type of association requires tracks of specific media types that don’t match the media types of the inputs, or if the output file type does not support track associations, an NSInvalidArgumentException is raised.

Note: Track associations cannot be added after writing on the receiver’s AVAssetWriter instance has started. Available in OS X v10.9 and later.

17.19.4  appendSampleBuffer(sampleBuffer as CMSampleBufferMBS) as boolean

Function: Appends samples to the receiver.
Notes:
sampleBuffer: The CMSampleBuffer to be appended.

Returns true if sampleBuffer as appended successfully, otherwise false.

The timing information in the sample buffer, considered relative to the time passed to the asset writer’s startSessionAtSourceTime: will be used to determine the timing of those samples in the output file.

Do not modify sampleBuffer or its contents after you have passed it to this method.

17.19.5  assetWriterInputWithMediaType(MediaType as string, outputSettings as dictionary = nil) as AVAssetWriterInputMBS

Function: Returns a new input of the specified media type to receive sample buffers for writing to the output file.
Notes:

mediaType: The media type of samples that will be accepted by the input.
Media types are defined in AVMediaFormat.h.
outputSettings: The settings used for encoding the media appended to the output. Pass nil to specify that appended samples should not be re-encoded.
Audio output settings keys are defined in AVAudioSettings.h. Video output settings keys are defined in AVVideoSettings.h. Video output settings with keys from <CoreVideo/CVPixelBuffer.h>are not currently supported.
Returns a new input of the specified media type to receive sample buffers for writing to the output file.

Each new input accepts data for a new track of the asset writer’s output file. You add an input to an asset writer using the AVAssetWriter method addInput:

Passing nil for outputSettings instructs the input to pass through appended samples, doing no processing before they are written to the output file. This is useful if, for example, you are appending buffers that are already in a desirable compressed format. However, passthrough is currently supported only when writing to QuickTime Movie files (i.e. the AVAssetWriter was initialized with AVFileTypeQuickTimeMovie). For other file types, you must specify non-nil output settings.

See also:

- 17.19.6 assetWriterInputWithMediaType(MediaType as string, outputSettings as dictionary, sourceFormatHint as CMFormatDescriptionMBS) as AVAssetWriterInputMBS

17.19.6 assetWriterInputWithMediaType(MediaType as string, outputSettings as dictionary, sourceFormatHint as CMFormatDescriptionMBS) as AVAssetWriterInputMBS

**Function:** Returns a new input of the specified media type to receive sample buffers for writing to the output file.

See also:

- 17.19.5 assetWriterInputWithMediaType(MediaType as string, outputSettings as dictionary = nil) as AVAssetWriterInputMBS

17.19.7 available as boolean

**Function:** Whether this class is available.

**Notes:** Returns true on Mac OS X 10.7 and newer.

17.19.8 canAddTrackAssociationWithTrackOfInput(input as AVAssetWriterInputMBS, trackAssociationType as string) as Boolean

**Function:** Whether an association between the tracks corresponding to a pair of inputs is valid.

**Notes:**
input: The instance of AVAssetWriterInput with a corresponding track to associate with track corresponding with the receiver.

trackAssociationType: The type of track association to test. Common track association types, such as AVTrackAssociationTypeTimecode are defined in Track Association Types.

Returns true if the track association can be added; otherwise false.

If the type of association requires tracks of specific media types that don’t match the media types of the inputs, or if the output file type does not support track associations, returns NO.

Available in OS X v10.9 and later.

17.19.9 Constructor(MediaType as string, outputSettings as dictionary = nil)

Function: Initialized a new input of the specified media type to receive sample buffers for writing to the output file.

Notes:

mediaType: The media type of samples that will be accepted by the input.

Media types are defined in AVMediaFormat.h.

outputSettings: The settings used for encoding the media appended to the output. Pass nil to specify that appended samples should not be re-encoded.

Audio output settings keys are defined in AVAudioSettings.h. Video output settings keys are defined in AVVideoSettings.h. Video output settings with keys from <CoreVideo/CVPixelBuffer.h> are not currently supported.

Returns an input of the specified media type initialized to receive sample buffers for writing to the output file.

Each new input accepts data for a new track of the asset writer’s output file. You add an input to an asset writer using the AVAssetWriter method addInput:.

Passing nil for outputSettings instructs the input to pass through appended samples, doing no processing before they are written to the output file. This is useful if, for example, you are appending buffers that are already in a desirable compressed format. However, passthrough is currently supported only when writing to QuickTime Movie files (i.e. the AVAssetWriter was initialized with AVFileTypeQuickTimeMovie). For other file types, you must specify non-nil output settings.

See also:

• 17.19.10 Constructor(MediaType as string, outputSettings as dictionary, sourceFormatHint as CMFormatDescriptionMBS)
17.19.10 Constructor(MediaType as string, outputSettings as dictionary, source-FormatHint as CMFormatDescriptionMBS)

Function: Initialized a new input of the specified media type to receive sample buffers for writing to the output file.
See also:

- 17.19.9 Constructor(MediaType as string, outputSettings as dictionary = nil)

17.19.11 markAsFinished

Function: Tells the writer that no more buffers will be appended to this input.
Notes: If you are monitoring each input’s expectsMediaDataInRealTime value to keep the output file well interleaved, it is important to call this method when you have finished adding buffers to a track. This is necessary to prevent other inputs from stalling, as they may otherwise wait forever for that input’s media data, attempting to complete the ideal interleaving pattern.

17.19.12 metadata as AVMetadataItemMBS()

Function: The collection of track-level metadata for association with the asset and for carriage in the output file.
Notes: The array contains AVMetadataItem objects representing the collection of track-level metadata to be written in the output file.
See also setMetadata method.

17.19.13 outputSettings as dictionary

Function: The settings used for encoding the media appended to the output. (read-only)
Notes: A value of nil specifies that appended samples should not be re-encoded.
17.19.14  requestMediaDataWhenReadyOnQueue(assetWriterInput as AVAssetWriterInputMBS, AssetReaderOutput as AVAssetReaderOutputMBS, tag as Variant = nil)

Function: Instructs the receiver to invoke an event repeatedly, at its convenience, in order to gather media data for writing to the output.

Notes:

This is a special version of that method where the plugin does the required work.
The plugin provides the block to do the work to copy samples from input to output.
You receive AVFoundationMBS.requestMediaDataWhenReadyOnQueueProgress events and on the end an AVFoundationMBS.requestMediaDataWhenReadyOnQueueFinished event, when assetReaderOutput.NextSampleBuffer does not provide the next buffer.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

See also:

- 17.19.15 requestMediaDataWhenReadyOnQueue(tag as Variant = nil)

17.19.15  requestMediaDataWhenReadyOnQueue(tag as Variant = nil)

Function: Instructs the receiver to invoke an event repeatedly, at its convenience, in order to gather media data for writing to the output.

Notes:

Calls later AVFoundationMBS.requestMediaDataWhenReadyOnQueueCompleted event.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

See also:

- 17.19.14 requestMediaDataWhenReadyOnQueue(assetWriterInput as AVAssetWriterInputMBS, AssetReaderOutput as AVAssetReaderOutputMBS, tag as Variant = nil)

17.19.16  setMetadata(items() as AVMetadataItemMBS)

Function: Sets the collection of track-level metadata for association with the asset and for carriage in the output file.

Notes:
The array contains AVMetadataItem objects representing the collection of track-level metadata to be written in the output file.
You cannot set this property after writing on the receiver’s asset writer has started.

### 17.19.17 sourceFormatHint as CMFormatDescriptionMBS

**Function:** A hint about the format of buffers that will be appended.
**Notes:** An AVAssetWriterInput object may be able to use this hint to fill in missing output settings or perform more upfront validation. To guarantee successful file writing, if you set this property you should ensure that subsequently-appended buffers are of the specified format. An NSInvalidArgumentException will be thrown if the media type of the format description does not match the media type of the writer input.

### 17.19.18 Properties

#### 17.19.19 expectsMediaDataInRealTime as boolean

**Function:** Indicates whether the input should tailor its processing of media data for real-time sources.
**Notes:**
If you are appending media data to an input from a real-time source, such as an AVCaptureOutput, you should set expectsMediaDataInRealTime to true. This will ensure that readyForMoreMediaData is calculated appropriately for real-time usage.
(Read and Write property)

#### 17.19.20 extendedLanguageTag as String

**Function:** Language tag to associate with the track corresponding to the receiver.
**Notes:**
The value is specified as an RFC 4646 language tag; can be nil in which case no tag is written to the track.

Extended language tags are normally set only when an ISO 639-2/T language code by itself is ambiguous, as in cases in which media data should be distinguished not only by language but also by the regional dialect in use or the writing system employed.
Available in OS X v10.9 and later.
(Read and Write property)
17.19. CLASS AVASSETWRITERINPUTMBS

17.19.21 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.19.22 isReadyForMoreMediaData as boolean

Function: Indicates the readiness of the input to accept more media data. (read-only)
Notes: This property is observable using key-value observing (see Key-Value Observing Programming Guide). Observers should not assume that they will be notified of changes on a specific thread.
(Read only property)

17.19.23 languageCode as String

Function: Language to associate with the track corresponding to the receiver.
Notes: The value is specified as an ISO 639-2/T language code; can be nil in which case no language code is written to the track.
Available in OS X v10.9 and later.
(Read and Write property)

17.19.24 marksOutputTrackAsEnabled as Boolean

Function: Returns whether the receiver’s track is enabled.
Notes: For file types that support enabled and disabled tracks, such as QuickTime Movie files, specifies whether the track corresponding to the receiver should be enabled by default for playback and processing.
The default value is true.
Available in OS X v10.9 and later.
(Read and Write property)
17.19.25 mediaTimeScale as Integer

Function: Specifies the media time scale to be used.

Notes:
For file types that support media time scales, such as QuickTime Movie files, specifies the media time scale to be used.
The default value is 0, which indicates that you should choose a convenient value, if applicable.
You cannot set this property after writing has started.
(Read and Write property)

17.19.26 mediaType as string

Function: The media type of the samples that can be appended to the input. (read-only)

Notes:
The value of this property is one of the media type strings defined in AVMediaFormat.
(Read only property)

17.19.27 naturalSize as CGSizeMBS

Function: Size specified in the output file as the natural dimensions of the visual media data for display.

Notes:
If the default value, (0,0), is specified, the naturalSize of the track corresponding to the receiver is set according to dimensions indicated by the format descriptions that are ultimately written to the output track.

Note: This property cannot be set after writing on the receiver’s AVAssetWriter has started.
Available in OS X v10.9 and later.
(Read only property)

17.19.28 preferredVolume as Double

Function: Preferred volume level to be stored in the output file.

Notes:
The value for this property should typically be in the range of 0.0 to 1.0.
The default value is 1.0, which is equivalent to a "normal" volume level.
17.19. CLASS AVASSETWRITERINPUTMBS

Note: This property cannot be set after writing on the receiver’s AVAssetWriter has started.
Available in OS X v10.9 and later.
(Read and Write property)

17.19.29 transform as CGAffineTransformMBS

Function: The transform specified in the output file as the preferred transformation of the visual media data for display purposes.
Notes:
If no value is specified, the identity transform is used.
(Read and Write computed property)
17.20 class AVAssetWriterInputPixelBufferAdaptorMBS

17.20.1 class AVAssetWriterInputPixelBufferAdaptorMBS

Function: You use an AVAssetWriterInputPixelBufferAdaptor to append video samples packaged as CVPixelBuffer objects to a single AVAssetWriterInput object.

Notes: Instances of AVAssetWriterInputPixelBufferAdaptor provide a CVPixelBufferPool that you can use to allocate pixel buffers for writing to the output file. Using the provided pixel buffer pool for buffer allocation is typically more efficient than appending pixel buffers allocated using a separate pool.

17.20.2 Methods

17.20.3 appendPicture(pic as picture, presentationTime as CMTimeMBS) as boolean

Function: Appends a picture to the receiver.

Notes: Internally creates a copy of the picture to create a PixelBuffer and calls appendPixelBuffer. Works in Cocoa and Carbon. Using appendPixelBuffer directly with PixelBuffer objects may be more efficient depending on what your app does.

17.20.4 appendPixelBuffer(pixelBuffer as CVPixelBufferMBS, presentationTime as CMTimeMBS) as boolean

Function: Appends a pixel buffer to the receiver.

Notes: pixelBuffer: The CVPixelBuffer to be appended.
presentationTime: The presentation time for the pixel buffer to be appended. This time will be considered relative to the time passed to AVAssetWriter.startSessionAtSourceTime to determine the timing of the frame in the output file.

Returns true if the pixel buffer was successfully appended, otherwise false.

If the operation was unsuccessful, you might invoke the AVAssetWriter object’s finishWriting method in order to save a partially completed asset. Do not modify a CVPixelBuffer or its contents after you have passed it to this method.
17.20. CLASS AVASSETWRITERINPUTPIXELBUFFERADAPTORMBS

17.20.5 assetWriterInput as AVAssetWriterInputMBS

Function: The asset writer input to which the adaptor should append pixel buffers. (read-only)

17.20.6 assetWriterInputPixelBufferAdaptorWithAssetWriterInput(input as AVAssetWriterInputMBS, sourcePixelBufferAttributes as dictionary) as AVAssetWriterInputPixelBufferAdaptorMBS

Function: Returns a new pixel buffer adaptor to receive pixel buffers for writing to the output file.
Notes:
input: The asset writer input to which the receiver should append pixel buffers. Currently, only asset writer inputs that accept media data of type AVMediaTypeVideo can be used to initialize a pixel buffer adaptor. It is an error to pass a sample buffer input that is already attached to another instance of AVAssetWriterInputPixelBufferAdaptor.
sourcePixelBufferAttributes: The attributes of pixel buffers that will be vended by the input’s CVPixelBufferPool. Pixel buffer attributes keys for the pixel buffer pool are defined in `<CoreVideo/CVPixelBuffer.h>`. To take advantage of the improved efficiency of appending buffers created from the adaptor’s pixel buffer pool, you should specify pixel buffer attributes that most closely accommodate the source format of the video frames being appended. Pass nil if you do not need a pixel buffer pool for allocating buffers.

Returns a new pixel buffer adaptor to receive pixel buffers for writing to the output file.

To specify the pixel format type, the pixelBufferAttributes dictionary should contain a value for kCVPixelBufferPixelFormatTypeKey. For example, use kCVPixelFormatType_32BGRA as Integer for 8-bit-per-channel BGRA, or use kCVPixelFormatType_420YpCbCr8BiPlanarVideoRange as Integer for 2-plane YCbCr.

17.20.7 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.
17.20.8 Constructor(input as AVAssetWriterInputMBS, sourcePixelBufferAttributes as dictionary)

Function: Creates a new pixel buffer adaptor to receive pixel buffers for writing to the output file.
Notes:
input: The asset writer input to which the receiver should append pixel buffers.
Currently, only asset writer inputs that accept media data of type AVMediaTypeVideo can be used to initialize a pixel buffer adaptor.
It is an error to pass a sample buffer input that is already attached to another instance of AVAssetWriterInputPixelBufferAdaptor.

sourcePixelBufferAttributes: The attributes of pixel buffers that will be vended by the input’s CVPixelBufferPool.
Pixel buffer attributes keys for the pixel buffer pool are defined in `<CoreVideo/CVPixelBuffer.h>`. To take advantage of the improved efficiency of appending buffers created from the adaptor’s pixel buffer pool, you should specify pixel buffer attributes that most closely accommodate the source format of the video frames being appended.
Pass nil if you do not need a pixel buffer pool for allocating buffers.

Returns a new pixel buffer adaptor to receive pixel buffers for writing to the output file.

To specify the pixel format type, the pixelBufferAttributes dictionary should contain a value for kCVPixelBufferPixelFormatTypeKey. For example, use kCVPixelFormatType_32BGRA as Integer for 8-bit-per-channel BGRA, or use kCVPixelFormatType_420YpCbCr8BiPlanarVideoRange as Integer for 2-plane YCbCr.

17.20.9 sourcePixelBufferAttributes as Dictionary

Function: The pixel buffer attributes of pixel buffers that will be vended by the adaptor’s CVPixelBufferPool. (read-only)
Notes: The value of this property is a dictionary containing pixel buffer attributes keys defined in `<CoreVideo/CVPixelBuffer.h>`.

17.20.10 Properties

17.20.11 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
17.21 class AVAssetWriterMBS

17.21.1 class AVAssetWriterMBS

**Function:** You use an AVAssetWriter object to write media data to a new file of a specified audiovisual container type, such as a QuickTime movie file or an MPEG-4 file, with support for automatic interleaving of media data for multiple concurrent tracks.

**Notes:**

You can get the media data for one or more assets from instances of AVAssetReader or even from outside the AV Foundation API set. Media data is presented to AVAssetWriter for writing in the form of CMSampleBuffers. Sequences of sample data appended to the asset writer inputs are considered to fall within "sample-writing sessions." You must call startSessionAtSourceTime to begin one of these sessions.

Using AVAssetWriter, you can optionally re-encode media samples as they are written. You can also optionally write metadata collections to the output file.

You can only use a given instance of AVAssetWriter once to write to a single file. If you want to write to files multiple times, you must use a new instance of AVAssetWriter each time.

17.21.2 Methods

17.21.3 addInput(input as AVAssetWriterInputMBS)

**Function:** Adds an input to the receiver.

**Notes:**

input: The asset writer input to be added.

Inputs are created with a media type and output settings. These both must be compatible with the receiver. You cannot add inputs after writing has started.

17.21.4 addInputGroup(inputGroup as AVAssetWriterInputGroupMBS)

**Function:** Adds an asset writer input group instance to the asset writer.

**Notes:**

inputGroup: The asset writer input group to be added.
The asset writer will mark the tracks associated with grouped inputs as mutually exclusive to each other for playback or other processing, if the output container format supports mutually exclusive relationships among tracks.

When an input group is added to an asset writer, the value of marksOutputTrackAsEnabled for the AVAssetWriterInput instance set as the default input will automatically be set to true and all other inputs in the group will be set to false.

Input groups cannot be added after writing has started.

Available in OS X v10.9 and later.

17.21.5 assetWriterWithFile(outputFile as folderitem, outputFileType as string, byref error as NSErrorMBS) as AVAssetWriterMBS

Function: Returns an asset writer for writing to the file identified by a given folderitem in a format specified by a given UTI.

Notes:

outputFile: The location of the file to be written.
outputFileType: The UTI-identified format of the file to be written.
For example, AVFileTypeQuickTimeMovie for a QuickTime movie file, AVFileTypeMPEG4 for an MPEG-4 file, and AVFileTypeAMR for an adaptive multi-rate audio format file.
Error: If initialization of the asset writer fails, upon return contains an error object that describes the problem.

Returns an asset writer for writing to the file identified by URL in the format specified by outputFileType, or nil if the writer could not be initialized.
Writing will fail if a file already exists at URL. UTIs for container formats that can be written are declared in AVMediaFormat.h.

17.21.6 assetWriterWithURL(outputURL as string, outputFileType as string, byref error as NSErrorMBS) as AVAssetWriterMBS

Function: Returns an asset writer for writing to the file identified by a given URL in a format specified by a given UTI.

Notes:

outputURL: The location of the file to be written. The URL must be a file URL.
outputFileType: The UTI-identified format of the file to be written.
For example, AVFileTypeQuickTimeMovie for a QuickTime movie file, AVFileTypeMPEG4 for an MPEG-4 file, and AVFileTypeAMR for an adaptive multi-rate audio format file.
Error: If initialization of the asset writer fails, upon return contains an error object that describes the problem.
Returns an asset writer for writing to the file identified by URL in the format specified by outputFileType, or nil if the writer could not be initialized. Writing will fail if a file already exists at URL. UTIs for container formats that can be written are declared in AVMediaFormat.h.

### 17.21.7 available as boolean

**Function:** Whether this class is available.

**Notes:** Returns true on Mac OS X 10.7 and newer.

### 17.21.8 availableMediaTypes as string()

**Function:** The media types for which inputs can be added (read-only)

**Notes:** Some media types may not be accepted within the type of file with which the writer was initialized.

### 17.21.9 canAddInput(input as AVAssetWriterInputMBS) as boolean

**Function:** Returns a Boolean value that indicates whether a given input can be added to the receiver.

**Notes:**

input: The asset writer input to be tested.

Returns true if input can be added, otherwise false.

You cannot add an input that accepts media data of a type that is not compatible with the receiver, or with output settings that are not compatible with the receiver.

### 17.21.10 canAddInputGroup(input as AVAssetWriterInputGroupMBS) as boolean

**Function:** Returns whether an input group can be added to the receiver.

**Notes:**

inputGroup: The asset writer input group to be added.

Returns true if inputGroup can be added to the inputGroups, otherwise false.

If outputFileType specifies a container format that does not support mutually exclusive relationships among
tracks, or if the specified instance of AVAssetWriterInputGroup contains inputs with media types that cannot be related, the group cannot be added.
Available in OS X v10.9 and later.

17.21.11 **canApplyOutputSettings**(outputSettings as dictionary, mediaType as string) as boolean

**Function:** Returns a Boolean value that indicates whether give output settings are supported for a specified media type.
**Notes:**

outputSettings: The output settings to validate.
mediaType: The media type for which the output settings are validated.

Returns true if the output settings in outputSettings are supported for mediaType, otherwise false.
You can use this method to test, for example, whether video output settings that specify H.264 compression will fail (as would be the case if the container format for which the writer was initialized does not support the carriage of H.264-compressed video).

17.21.12 **cancelWriting**

**Function:** Instructs the writer to cancel writing.
**Notes:** This method blocks until writing is canceled.

17.21.13 **Constructor**(outputFile as folderitem, outputFileType as string, byref error as NSErrorMBS)

**Function:** Initializes an asset writer for writing to the file identified by a given URL in a format specified by a given UTI.
**Notes:**

outputFile: The location of the file to be written.
outputFileType: The UTI-identified format of the file to be written.
For example, AVFileTypeQuickTimeMovie for a QuickTime movie file, AVFileTypeMPEG4 for an MPEG-4 file, and AVFileTypeAMR for an adaptive multi-rate audio format file.
Error: If initialization of the asset writer fails, upon return contains an error object that describes the problem.
Returns an asset writer for writing to the file identified by URL in the format specified by outputFileType, or nil if the writer could not be initialized.

Writing will fail if a file already exists at URL. UTIs for container formats that can be written are declared in AVMediaFormat.h.

See also:

- 17.21.14 Constructor(outputURL as string, outputFileType as string, byref error as NSErrorMBS)

### 17.21.14 Constructor(outputURL as string, outputFileType as string, byref error as NSErrorMBS)

**Function:** Initializes an asset writer for writing to the file identified by a given URL in a format specified by a given UTI.
**Notes:**
outputURL: The location of the file to be written. The URL must be a file URL.
outputFileType: The UTI-identified format of the file to be written.
For example, AVFileTypeQuickTimeMovie for a QuickTime movie file, AVFileTypeMPEG4 for an MPEG-4 file, and AVFileTypeAMR for an adaptive multi-rate audio format file.
Error: If initialization of the asset writer fails, upon return contains an error object that describes the problem.

Returns an asset writer for writing to the file identified by URL in the format specified by outputFileType, or nil if the writer could not be initialized.

Writing will fail if a file already exists at URL. UTIs for container formats that can be written are declared in AVMediaFormat.h.

See also:

- 17.21.13 Constructor(outputFile as folderitem, outputFileType as string, byref error as NSErrorMBS)

### 17.21.15 endSessionAtSourceTime(endTime as CMTimeMBS)

**Function:** Concludes an explicit sample-writing session.
**Notes:**
endTime: The ending asset time for the sample-writing session, in the timeline of the source samples.
You may invoke this method to complete a session you began by invoking `startSessionAtSourceTime`.

You do not need to call this method; if you call `finishWriting` without calling this method, the session’s effective end time will be the latest end timestamp of the session’s samples (that is, no samples will be edited out at the end).

The `endTime` defines the moment on the timeline of source samples at which the session ends. In the case of the QuickTime movie file format, each sample-writing session’s `startTime`-`endTime` pair corresponds to a period of movie time into which the session’s samples are inserted. Samples with later timestamps will be still be added to the media but will be edited out of the movie. So if the first session has duration $D_1 = endTime - startTime$, it will be inserted into the movie at movie time $0$ through $D_1$; the second session would be inserted into the movie at movie time $D_1$ through $D_1+D_2$, and so on.

It is legal to have a session with no samples; this will cause creation of an empty edit of the prescribed duration.

### 17.21.16 error as NSErrorMBS

**Function:** If the receiver’s status is `AVAssetWriterStatusFailed`, describes the error that caused the failure. (read-only)

**Notes:** The value of this property is an error object that describes what caused the receiver to no longer be able to write to its output file. If the receiver’s status is not `AVAssetWriterStatusFailed`, the value of this property is nil.

### 17.21.17 finishWriting as boolean

**Function:** Completes the writing of the output file.

**Notes:**

Returns true if writing can be finished, otherwise false.

This method blocks until writing is finished. When this method returns successfully, the file being written by the receiver is complete and ready to use. You can check the values of the status and error properties for more information on why writing could not be finished.
17.21.18  \texttt{finishWritingWithCompletionHandler(tag as Variant = nil)}

\textbf{Function:} Marks all unfinished inputs as finished and completes the writing of the output file.
\textbf{Notes:} 
Calls later AVFoundationMBS.finishWritingCompleted event.

This method returns immediately and causes its work to be performed asynchronously. To determine whether
the operation succeeded, you can check the value of the status property within the handler parameter. If
the status is AVAssetWriterStatusFailed, then the error property will contain an instance of NSError that
describes the failure.

To guarantee that all sample buffers are successfully written, you must ensure that all calls to appendSampleBuffer
and appendPixelBuffer have returned before invoking this method.

Available in OS X v10.9 and later.

With tag you can pass any value you like to the event later. This can be for example an object reference or
a number in an array. Be aware that the reference to this tag value is kept until the event is called and can
cause memory reference cycles.

17.21.19  \texttt{inputGroups as AVAssetWriterInputGroupMBS()}

\textbf{Function:} An array of asset writer input groups that have been added to the asset writer. (read-only)
\textbf{Notes:} 
The value of this property is an array containing concrete instances of AVAssetWriterInputGroup.
Input groups are added to the receiver using the addInputGroup method.
Available in OS X v10.9 and later.

17.21.20  \texttt{inputs as AVAssetWriterInputMBS()}

\textbf{Function:} The asset writer inputs associated with the asset writer. (read-only)
\textbf{Notes:} The array contains AVAssetWriterInput objects.
17.21. CLASS AVASSETWRITERMBS

17.21.21 metadata as AVMetadataItemMBS()

Function: The collection of metadata for association with the asset and for carriage in the output file.
Notes:
The array contains AVMetadataItem objects.
See also SetMetaData.

17.21.22 movieFragmentInterval as CMTimeMBS

Function: The time to elapse between writing movie fragments.
Notes:
This property only applies to the QuickTime movie file type.

Sometimes a write operation may be unexpectedly interrupted (because a process crashes, for example). By using movie fragments, such a partially-written QuickTime movie file can be successfully opened and played up to the largest multiple of movieFragmentInterval smaller than the point at which the write operation was interrupted.

The default value is kCMTimeInvalid, which means that movie fragments should not be used, that only a movie atom describing all of the media in the file should be written.

You cannot set the value after writing has started.

17.21.23 movieTimeScale as Double

Function: Specifies the asset-level time scale to be used.
Notes:
For file types that contain a moov atom, such as QuickTime Movie files, specifies the asset-level time scale to be used.
The default value is 0, which indicates that you should choose a convenient value, if applicable.
You cannot set the value after writing has started.
17.21.24  outputFileType as string

Function: The file format of the writer’s output. (read-only)
Notes: The format is identified by the UTI, specified when the writer is initialized.

17.21.25  outputURL as string

Function: The URL to which output is directed. (read-only)
Notes: The URL is the same as that specified when the writer is initialized.

17.21.26  setMetadata(items() as AVMetadataItemMBS)

Function: Set the collection of metadata for association with the asset and for carriage in the output file.
Notes:
The array contains AVMetadataItem objects.
You cannot set the value after writing has started.

17.21.27  shouldOptimizeForNetworkUse as boolean

Function: Indicates whether the output file should be written in way that makes it more suitable for playback over a network.
Notes:
When the value of this property is true, the output file will be written in such a way that playback can start after only a small amount of the file is downloaded.
The default value is false.
You cannot set the value after writing has started.

17.21.28  startSessionAtSourceTime(startTime as CMTimeMBS)

Function: Initiates a sample-writing session for the output asset.
Notes:
startTime: The starting asset time for the sample-writing session, in the timeline of the source samples.

Sequences of sample data appended to the asset writer inputs are considered to fall within "sample-writing sessions." You must call this method to begin one of these sessions.

Each writing session has a start time which, where allowed by the file format being written, defines the mapping from the timeline of source samples onto the file's timeline. In the case of the QuickTime movie file format, the first session begins at movie time 0, so a sample appended with timestamp T will be played at movie time (T - startTime). Samples with timestamps before startTime will still be added to the output media but will be edited out of the movie. If the earliest buffer for an input is later than startTime, an empty edit will be inserted to preserve synchronization between tracks of the output asset.

It is an error to invoke this method twice in a row without invoking endSessionAtSourceTime in between.

17.21.29 startWriting as boolean

Function: Tells the writer to start writing its output.
Notes:
Returns true if writing can be started, otherwise false.

You must call this method after all inputs have added and other configuration properties have been set to tell the receiver to prepare for writing. After invoking this method, you can start writing sessions using startSessionAtSourceTime and can write media samples using the methods provided by each of the writer’s inputs.

status signals the terminal state of the asset reader, and if a failure occurs, error describes the failure.

17.21.30 status as Integer

Function: The status of writing samples to the receiver’s output file. (read-only)
Notes: The value of this property is an AVAssetWriterStatus constant that indicates whether writing is in progress, has completed successfully, has been canceled, or has failed. If an attempt to append samples fails, you can check the value of this property to determine why no more samples could be written.
17.21.31 Properties

17.21.32 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.21.33 Constants

17.21.34 AVAssetWriterStatusCancelled = 4

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the status constants.
Notes: Cancelled

17.21.35 AVAssetWriterStatusCompleted = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the status constants.
Notes: Completed

17.21.36 AVAssetWriterStatusFailed = 3

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the status constants.
Notes: Failed

17.21.37 AVAssetWriterStatusUnknown = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the status constants.
Notes: Unknown

17.21.38 AVAssetWriterStatusWriting = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the status constants.
Notes: Writing
17.22 class AVAsynchronousVideoCompositionRequestMBS

17.22.1 class AVAsynchronousVideoCompositionRequestMBS

Function: An AVAsynchronousVideoCompositionRequest instance contains the information necessary for a video compositor to render an output pixel buffer.
Notes:
The video compositor must implement the AVVideoCompositing protocol.
Available in OS X v10.9 and later.

17.22.2 Methods

17.22.3 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9.

17.22.4 Constructor

Function: The constructor.

17.22.5 copy as AVAsynchronousVideoCompositionRequestMBS

Function: Creates a copy of the object.

17.22.6 finishCancelledRequest

Function: Invoked by the custom compositor when the composition request was canceled.
Notes: Available in OS X v10.9 and later.
17.22.7  finishWithComposedVideoFrame(composedVideoFrame as CVPixelBufferMBS)

Function: Invoked by the custom compositor when the composition request succeeded.
Notes:
composedVideoFrame: The successfully composed pixel buffer.
Available in OS X v10.9 and later.

17.22.8  finishWithError(error as NSErrorMBS)

Function: Invoked by the custom compositor when the composition request failed.
Notes:
error: Returns the error encountered during the compositing.
Available in OS X v10.9 and later.

17.22.9  sourceFrameByTrackID(trackID as Integer) as CVPixelBufferMBS

Function: Returns the source pixel buffer for the specified track ID.
Notes:
trackID: The track ID for the requested source frame.
Returns the source CVPixelBufferRef for trackID.
Available in OS X v10.9 and later.

17.22.10  sourceTrackIDs as Integer()

Function: The track IDs of all the source buffers that are available to compose the frame. (read-only)
Notes: Available in OS X v10.9 and later.

17.22.11  Properties

17.22.12  compositionTime as CMTimeMBS

Function: The time for which the frame should be composed. (read-only)
Notes:
17.22. CLASS AVASYNCHRONOUSVIDEOCOMPOSITIONREQUESTMBS

Available in OS X v10.9 and later.
(Read only property)

17.22.13 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

17.22.14 renderContext as AVVideoCompositionRenderContextMBS

**Function:** The video composition render context making the request. (read-only)
**Notes:**
Available in OS X v10.9 and later.
(Read only property)

17.22.15 videoCompositionInstruction as AVVideoCompositionInstructionMBS

**Function:** The video composition instruction to use to compose the frame. (read-only)
**Notes:**
Available in OS X v10.9 and later.
(Read only property)
17.23 class AVAudioMixInputParametersMBS

17.23.1 class AVAudioMixInputParametersMBS

Function: An AVAudioMixInputParameters object represents the parameters that should be applied to an audio track when it is added to a mix.

Notes:

Audio volume is currently supported as a time-varying parameter. AVAudioMixInputParameters has a mutable subclass, AVMutableAudioMixInputParameters.

You use an instance AVAudioMixInputParameters to apply audio volume ramps for an input to an audio mix. Mix parameters are associated with audio tracks via the trackID property.

Before the first time at which a volume is set, a volume of 1.0 used; after the last time for which a volume has been set, the last volume is used. Within the time range of a volume ramp, the volume is interpolated between the start volume and end volume of the ramp. For example, setting the volume to 1.0 at time 0 and also setting a volume ramp from a volume of 0.5 to 0.2 with a timeRange of [4.0, 5.0] results in an audio volume parameters that hold the volume constant at 1.0 from 0.0 sec to 4.0 sec, then cause it to jump to 0.5 and descend to 0.2 from 4.0 sec to 9.0 sec, holding constant at 0.2 thereafter.

17.23.2 Methods

17.23.3 available as boolean

Function: Whether this class is available.

Notes: Returns true on Mac OS X 10.7 and newer.

17.23.4 Constructor

Function: The default constructor.

17.23.5 copy as AVAudioMixInputParametersMBS

Function: Creates a copy of the object.
17.23.6 getVolumeRampForTime(time as CMTimeMBS, byref startVolume as Double, byref endVolume as Double, byref timeRange as CMTimeRangeMBS) as boolean

**Function:** Obtains the volume ramp that includes the specified time.

**Notes:**
- time: If a ramp with a time range that contains the specified time has been set, information about the effective ramp for that time is supplied. Otherwise, information about the first ramp that starts after the specified time is supplied.
- startVolume: A variable to receive the starting volume value for the volume ramp.
- endVolume: A variable to receive the ending volume value for the volume ramp.
- timeRange: A variable to a CMTimeRange to receive the time range of the volume ramp.

Returns true if the values were retrieved successfully, otherwise false. Returns false if time is beyond the duration of the last volume ramp that has been set.

17.23.7 mutableCopy as AVMutableAudioMixInputParametersMBS

**Function:** Creates an editable copy of the object.

17.23.8 trackID as Integer

**Function:** The ID of the audio track to which the parameters should be applied. (read-only)

17.23.9 Properties

17.23.10 Handle as Integer

**Function:** The internal object reference.

**Notes:** (Read and Write property)
17.24 class AVAudioMixMBS

17.24.1 class AVAudioMixMBS

Function: An AVAudioMix object manages the input parameters for mixing audio tracks.
Notes: It allows custom audio processing to be performed on audio tracks during playback or other operations. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.24.2 Methods

17.24.3 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

17.24.4 Constructor

Function: The private constructor.

17.24.5 copy as AVAudioMixMBS

Function: Creates a copy of the object.

17.24.6 inputParameters as AVAudioMixInputParametersMBS()

Function: The parameters for inputs to the mix (read-only)
Notes: The array contains instances of AVAudioMixInputParameters. Note that an instance of AVAudioMixInputParameters is not required for each audio track that contributes to the mix; audio for those without associated AVAudioMixInputParameters objects will be included in the mix, processed according to default behavior.
17.24.7  mutableCopy as AVMutableAudioMixMBS

MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a mutable copy.

17.24.8  Properties

17.24.9  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
17.25   class AVAudioPlayerMBS

17.25.1   class AVAudioPlayerMBS

Function: An instance of the AVAudioPlayer class, called an audio player, provides playback of audio data from a file or memory.

Example:

```vbs
    dim f as FolderItem = SpecialFolder.Desktop.Child("test.mp3")
    dim e as NSErrorMBS
    dim u as new AVAudioPlayerMBS(f,e)
    if e<>nil then
        MsgBox e.localizedDescription
    else
        MsgBox str(u.duration)+" seconds"
    end if
```

Notes:

Apple recommends that you use this class for audio playback unless you are playing audio captured from a network stream or require very low I/O latency. For an overview of audio technologies, see Audio & Video Starting Point and "Using Audio" in Multimedia Programming Guide.

Using an audio player you can:

- Play sounds of any duration
- Play sounds from files or memory buffers
- Loop sounds
- Play multiple sounds simultaneously, one sound per audio player, with precise synchronization
- Control relative playback level, stereo positioning, and playback rate for each sound you are playing
- Seek to a particular point in a sound file, which supports such application features as fast forward and rewind
- Obtain data you can use for playback-level metering

The AVAudioPlayer class lets you play sound in any audio format available in OS X. The plugin provides the events for this audio player in AVFoundationMBS class.

To play, pause, or stop an audio player, call one of its playback control methods, described in "Configuring and Controlling Playback."
To configure an appropriate audio session for playback, refer to AVAudioSession Class Reference and AVAudioSessionDelegate Protocol Reference. To learn how your choice of file formats impacts the simultaneous playback of multiple sounds, refer to "iPhone Hardware and Software Audio Codecs" in Multimedia Programming Guide.

17.25.2 Methods

17.25.3 audioPlayerWithData(Data as MemoryBlock, byref error as NSErrorMBS) as AVAudioPlayerMBS

Function: Initializes and returns an audio player for playing a designated memory buffer.
Notes:

data: A block of data containing a sound to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.
Error: Pass in the address of a nil-initialized NSError object. If an error occurs, upon return the NSError object describes the error. If you do not want error information, pass in NULL.

On success, you get an initialized AVAudioPlayer object. Else the handle property is 0 and the Error parameter contains a code that describes the problem.
See also:

- 17.25.4 audioPlayerWithData(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS
- 17.25.5 audioPlayerWithData(Data as String, byref error as NSErrorMBS) as AVAudioPlayerMBS
- 17.25.6 audioPlayerWithData(Data as String, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS

17.25.4 audioPlayerWithData(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS

Function: Initializes and returns an audio player using the specified data and file type hint.
Notes:

data: The data object containing the audio.
fileTypeHintUtiString: A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs.
error: If an error occurs, upon return the NSError object describes the error.
The utiString file type hint tells the parser what kind of sound data to expect so that data that may possibly be corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without filetypehint on older versions.

See also:

- 17.25.3 `audioPlayerWithData(Data as MemoryBlock, byref error as NSErrorMBS) as AVAudioPlayerMBS`
- 17.25.5 `audioPlayerWithData(Data as String, byref error as NSErrorMBS) as AVAudioPlayerMBS`
- 17.25.6 `audioPlayerWithData(Data as String, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS`

### 17.25.5 `audioPlayerWithData(Data as String, byref error as NSErrorMBS) as AVAudioPlayerMBS`

MBS AVFoundation Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Initializes and returns an audio player for playing a designated memory buffer.

**Notes:**

- **data:** A block of data containing a sound to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.
- **Error:** Pass in the address of a nil-initialized NSError object. If an error occurs, upon return the NSError object describes the error. If you do not want error information, pass in NULL.

On success, you get an initialized AVAudioPlayer object. Else the handle property is 0 and the Error parameter contains a code that describes the problem.

See also:

- 17.25.3 `audioPlayerWithData(Data as MemoryBlock, byref error as NSErrorMBS) as AVAudioPlayerMBS`
- 17.25.4 `audioPlayerWithData(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS`
- 17.25.6 `audioPlayerWithData(Data as String, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS`

### 17.25.6 `audioPlayerWithData(Data as String, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS`

MBS AVFoundation Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Initializes and returns an audio player using the specified data and file type hint.

**Notes:**

- **data:** A block of data containing a sound to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.
- **Error:** Pass in the address of a nil-initialized NSError object. If an error occurs, upon return the NSError object describes the error. If you do not want error information, pass in NULL.

On success, you get an initialized AVAudioPlayer object. Else the handle property is 0 and the Error parameter contains a code that describes the problem.
data: The data object containing the audio.

fileTypeHintUtiString: A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs.

error: If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that data that may possibly be corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without filetypehint on older versins.

See also:

- 17.25.3 audioPlayerWithData(Data as MemoryBlock, byref error as NSErrorMBS) as AVAudioPlayerMBS
- 17.25.4 audioPlayerWithData(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS
- 17.25.5 audioPlayerWithData(Data as String, byref error as NSErrorMBS) as AVAudioPlayerMBS

17.25.7 audioPlayerWithFile(File as folderitem, byref error as NSErrorMBS) as AVAudioPlayerMBS

Function: Initializes and returns an audio player for playing a designated sound file.

Example:

```vbs
Dim f As FolderItem = SpecialFolder.Desktop.Child("test.mp3")
Dim e As NSErrorMBS
Dim u As AVAudioPlayerMBS.audioPlayerWithFile(f, e)
If e <> nil Then
    MsgBox e.localizedDescription
Else
    MsgBox str(u.duration) & " seconds"
End If
```

Notes:

File: A folderitem identifying the sound file to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.

Error: If an error occurs, upon return the NSError object describes the error.

On success, you have an initialized AVAudioPlayer object. On failure, the Error parameter contains a code that describes the problem.

See also:
17.25.8  **audioPlayerWithFile(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS**

**Function:** Initializes and returns an audio player using the specified URL and file type hint.

**Notes:**

- **url:** A URL identifying the sound file to play. The audio data must be in a format supported by Core Audio.
- **utiString:** A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs. See AVFileType* strings.
- **Error:** If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that files which are not self identifying, or possibly even corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without hint for older versions.

See also:

- 17.25.7 audioPlayerWithFile(File as folderitem, byref error as NSErrorMBS) as AVAudioPlayerMBS 3167

17.25.9  **audioPlayerWithURL(URL as string, byref error as NSErrorMBS) as AVAudioPlayerMBS**

**Function:** Initializes and returns an audio player for playing a designated sound file.

**Notes:**

- **url:** A URL identifying the sound file to play. The audio data must be in a format supported by Core Audio.
- For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.
- **Error:** If an error occurs, upon return the NSError object describes the error.

On success, you have an initialized AVAudioPlayer object. On failure, the Error parameter contains a code that describes the problem.

See also:

- 17.25.10 audioPlayerWithURL(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS 3169
17.25.10 audioPlayerWithURL(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS

Function: Initializes and returns an audio player using the specified URL and file type hint.

Notes:

url: A URL identifying the sound file to play. The audio data must be in a format supported by Core Audio.
utiString: A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs. See AVFileType* strings.
Error: If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that files which are not self identifying, or possibly even corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without hint for older versions.

See also:

- 17.25.9 audioPlayerWithURL(URL as string, byref error as NSErrorMBS) as AVAudioPlayerMBS 3168

17.25.11 available as boolean

Function: Whether this class is available.

Notes: Returns true on Mac OS X 10.7 and newer.

17.25.12 averagePowerForChannel(channel as Integer) as Double

Function: Returns the average power for a given channel, in decibels, for the sound being played.

Notes:

channelNumber: The audio channel whose average power value you want to obtain. Channel numbers are zero-indexed. A monaural signal, or the left channel of a stereo signal, has channel number 0.

Returns a floating-point representation, in decibels, of a given audio channel’s current average power. A return value of 0 dB indicates full scale, or maximum power; a return value of -160 dB indicates minimum power (that is, near silence).

If the signal provided to the audio player exceeds full scale, then the return value may exceed 0 (that is, it may enter the positive range).
CHAPTER 17. AVFOUNDATION

To obtain a current average power value, you must call the updateMeters method before calling this method.

17.25.13 Constructor(Data as MemoryBlock, byref error as NSErrorMBS)

Function: Initializes and returns an audio player for playing a designated memory buffer.

Notes:

data: A block of data containing a sound to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.

Error: Pass in the address of a nil-initialized NSError object. If an error occurs, upon return the NSError object describes the error. If you do not want error information, pass in NULL.

On success, you get an initialized AVAudioPlayer object. Else the handle property is 0 and the Error parameter contains a code that describes the problem.

- 17.25.15 Constructor(File as folderitem, byref error as NSErrorMBS) 3171
- 17.25.16 Constructor(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3172
- 17.25.17 Constructor(URL as string, byref error as NSErrorMBS) 3172
- 17.25.18 Constructor(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3173

17.25.14 Constructor(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS)

Function: Initializes and returns an audio player using the specified data and file type hint.

Notes:

data: The data object containing the audio.

fileTypeHintUtiString: A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs.

error: If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that data that may possibly be corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without filetypehint on older versins.

- 17.25.18 Constructor(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3173

### 17.25.15 Constructor(File as folderitem, byref error as NSErrorMBS)

**Function:** Initializes and returns an audio player for playing a designated sound file.  
**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child(“test.mp3”)  
dim e as NSErrorMBS  
dim u as new AVAudioPlayerMBS(f,e)  
if e<>nil then  
MsgBox e.localizedDescription  
else  
MsgBox str(u.duration)+” seconds”  
end if
```

**Notes:**

File: A folderitem identifying the sound file to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.  
Error: If an error occurs, upon return the NSError object describes the error.

On success, you have an initialized AVAudioPlayer object. On failure, the Error parameter contains a code that describes the problem.  
**See also:**

- 17.25.13 Constructor(Data as MemoryBlock, byref error as NSErrorMBS) 3170

- 17.25.16 Constructor(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3172
- 17.25.17 Constructor(URL as string, byref error as NSErrorMBS) 3172
- 17.25.18 Constructor(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3173
17.25.16 Constructor(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS)

Function: Initializes and returns an audio player using the specified URL and file type hint.

Notes:

url: A URL identifying the sound file to play. The audio data must be in a format supported by Core Audio.
utiString: A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs. See AVFileType* strings.
Error: If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that files which are not self identifying, or possibly even corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without hint for older versions.

See also:

- 17.25.15 Constructor(File as folderitem, byref error as NSErrorMBS) 3171
- 17.25.17 Constructor(URL as string, byref error as NSErrorMBS) 3172
- 17.25.18 Constructor(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3173

17.25.17 Constructor(URL as string, byref error asNSErrorMBS)

Function: Initializes and returns an audio player for playing a designated sound file.

Notes:

url: A URL identifying the sound file to play. The audio data must be in a format supported by Core Audio.
For a list of supported formats, see ”Using Audio” in Multimedia Programming Guide.
Error: If an error occurs, upon return the NSError object describes the error.

On success, you have an initialized AVAudioPlayer object. On failure, the Error parameter contains a code that describes the problem.

See also:

- 17.25.13 Constructor(Data as MemoryBlock, byref error as NSErrorMBS) 3170

17.25. **CLASS AVAUDIOPLAYERMBS**

- 17.25.15 Constructor(File as folderitem, byref error as NSErrorMBS)
- 17.25.16 Constructor(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS)
- 17.25.18 Constructor(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS)

### 17.25.18 Constructor(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS)

**Function:** Initializes and returns an audio player using the specified URL and file type hint.

**Notes:**
- **url:** A URL identifying the sound file to play. The audio data must be in a format supported by Core Audio.
- **utiString:** A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs. See AVFileType* strings.
- **Error:** If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that files which are not self-identifying, or possibly even corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without hint for older versions.

See also:
- 17.25.13 Constructor(Data as MemoryBlock, byref error as NSErrorMBS)

- 17.25.17 Constructor(URL as string, byref error as NSErrorMBS)

### 17.25.19 pause

**Function:** Pauses playback; sound remains ready to resume playback from where it left off.

**Notes:** Calling pause leaves the audio player prepared to play; it does not release the audio hardware that was acquired upon calling play or prepareToPlay.
17.25.20  peakPowerForChannel(channel as Integer) as Double

**Function:** Returns the peak power for a given channel, in decibels, for the sound being played.

**Notes:**

channelNumber: The audio channel whose peak power value you want to obtain. Channel numbers are zero-indexed. A monaural signal, or the left channel of a stereo signal, has channel number 0.

Returns a floating-point representation, in decibels, of a given audio channel's current peak power. A return value of 0 dB indicates full scale, or maximum power; a return value of -160 dB indicates minimum power (that is, near silence).

If the signal provided to the audio player exceeds full scale, then the return value may exceed 0 (that is, it may enter the positive range).

To obtain a current peak power value, you must call the updateMeters method before calling this method.

17.25.21  play as boolean

**Function:** Plays a sound asynchronously.

**Notes:**

Returns true on success, or false on failure.

Calling this method implicitly calls the prepareToPlay method if the audio player is not already prepared to play.

17.25.22  playAtTime(time as Double = 0.0) as boolean

**Function:** Plays a sound asynchronously, starting at a specified point in the audio output device's timeline.

**Notes:**

time: The number of seconds to delay playback, relative to the audio output device's current time.

Returns true on success, or false on failure.

To learn about the virtual audio output device's timeline, read the description for the deviceCurrentTime property.

Calling this method implicitly calls the prepareToPlay method if the audio player is not already prepared to play.
17.25.23 prepareToPlay as boolean

Function: Prepares the audio player for playback by preloading its buffers.
Notes:
Returns true on success, or false on failure.

Calling this method preloads buffers and acquires the audio hardware needed for playback, which minimizes the lag between calling the play method and the start of sound output.
Calling the stop method, or allowing a sound to finish playing, undoes this setup.

17.25.24 stop

Function: Stops playback and undoes the setup needed for playback.
Notes:
Calling this method, or allowing a sound to finish playing, undoes the setup performed upon calling the play or prepareToPlay methods.

The stop method does not reset the value of the currentTime property to 0. In other words, if you call stop during playback and then call play, playback resumes at the point where it left off.

17.25.25 updateMeters

Function: Refreshes the average and peak power values for all channels of an audio player.
Notes: To obtain current audio power values, you must call this method before calling averagePowerForChannel or peakPowerForChannel.

17.25.26 Properties

17.25.27 currentTime as Double

Function: The playback point, in seconds, within the timeline of the sound associated with the audio player.
Notes:
If the sound is playing, `currentTime` is the offset of the current playback position, measured in seconds from the start of the sound. If the sound is not playing, `currentTime` is the offset of where playing starts upon calling the play method, measured in seconds from the start of the sound.

By setting this property you can seek to a specific point in a sound file or implement audio fast-forward and rewind functions.

(Read and Write property)

**17.25.28 data as MemoryBlock**

**Function:** The data object containing the sound associated with the audio player. (read-only)

**Notes:**
Returns nil if the audio player has no data (that is, if it was not initialized with an `MemoryBlock`).
(Read only property)

**17.25.29 deviceCurrentTime as Double**

**Function:** The time value, in seconds, of the audio output device. (read-only)

**Notes:**
The value of this property increases monotonically while an audio player is playing or paused.

If more than one audio player is connected to the audio output device, device time continues incrementing as long as at least one of the players is playing or paused.

If the audio output device has no connected audio players that are either playing or paused, device time reverts to 0.

Use this property to indicate "now" when calling the `playAtTime` instance method. By configuring multiple audio players to play at a specified offset from `deviceCurrentTime`, you can perform precise synchronization as described in the discussion for that method.
(Read only property)

**17.25.30 duration as Double**

**Function:** Returns the total duration, in seconds, of the sound associated with the audio player. (read-only)
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.mp3")
dim e as NSErrorMBS
dim u as new AVAudioPlayerMBS(f,e)
if e<>nil then
  MsgBox e.localizedDescription
else
  MsgBox str(u.duration)+" seconds"
end if

Notes: (Read only property)

17.25.31 enableRate as boolean

Function: A Boolean value that specifies whether playback rate adjustment is enabled for an audio player.
Notes:
To enable adjustable playback rate for an audio player, set this property to YES after you initialize the
player and before you call the prepareToPlay instance method for the player.
Available in OS X v10.8 and later.
(Read and Write property)

17.25.32 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.25.33 isPlaying as boolean

Function: A Boolean value that indicates whether the audio player is playing (true) or not (false). (read-only)
Notes:
To find out when playback has stopped, use the AVFoundationMBS.audioPlayerDidFinishPlaying event.
Important: Do not poll this property (that is, do not use it inside of a loop) in an attempt to discover when
playback has stopped.
17.25.34  meteringEnabled as boolean

Function: A Boolean value that specifies the audio-level metering on/off state for the audio player.
Notes: The default value for the meteringEnabled property is off (Boolean false). Before using metering for an audio player, you need to enable it by setting this property to true.
(Read and Write property)

17.25.35  numberOfChannels as Integer

Function: The number of audio channels in the sound associated with the audio player. (read-only)
Notes: (Read only property)

17.25.36  numberOfLoops as Integer

Function: The number of times a sound will return to the beginning, upon reaching the end, to repeat playback.
Notes: A value of 0, which is the default, means to play the sound once. Set a positive integer value to specify the number of times to return to the start and play again. For example, specifying a value of 1 results in a total of two plays of the sound. Set any negative integer value to loop the sound indefinitely until you call the stop method.
(Read only property)

17.25.37  pan as Double

Function: The audio player’s stereo pan position.
Notes: By setting this property you can position a sound in the stereo field. A value of 1.0 is full left, 0.0 is center, and 1.0 is full right.
(Read and Write property)
17.25.38 rate as Double

Function: The audio player’s playback rate.
Example:

```javascript
dim s as sound // your sound
dim a as AVAudioPlayerMBS = s.AVAudioPlayerMBS
a.rate = 0.5
```

Notes:
This property’s default value of 1.0 provides normal playback rate. The available range is from 0.5 for
deleaf-speed playback through 2.0 for double-speed playback.

To set an audio player’s playback rate, you must first enable rate adjustment as described in the enableRate
property description.
Available in OS X v10.8 and later.
(Read and Write property)

17.25.39 settings as Dictionary

Function: The audio player’s settings dictionary, containing information about the sound associated with
the player. (read-only)
Notes:
An audio player’s settings dictionary contains keys for the following information about the player’s associated
sound:

- Channel layout (AVChannelLayoutKey)
- Encoder bit rate (AVEncoderBitRateKey)
- Audio data format (AVFormatIDKey)
- Channel count (AVNumberOfChannelsKey)
- Sample rate (AVSampleRateKey)

The settings keys are described in AV Foundation Audio Settings Constants.
(Read only property)
### 17.25.40 URL as string

**Function:** The URL for the sound associated with the audio player. (read-only)  
**Example:**

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test.mp3")
dim e as NSErrorMBS
dim u as new AVAudioPlayerMBS(f,e)
if e<>nil then
    MsgBox e.localizedDescription
else
    MsgBox u.URL
end if
```

**Notes:**

Returns "" if the audio player was not initialized with a URL.  
(Read only property)

---

### 17.25.41 volume as Double

**Function:** The playback gain for the audio player, ranging from 0.0 through 1.0.  
**Notes:** (Read and Write property)
17.26. CLASS AVAudioRecorderMBS

17.26 class AVAudioRecorderMBS

**Function:** An instance of the AVAudioRecorder class, called an audio recorder, provides audio recording capability in your application.

**Example:**

```vbs
dim f as FolderItem = SpecialFolder.Desktop.Child("test.caf")
dim recordSetting as new Dictionary

dim n as Integer = OSTypeFromStringMBS(AVFoundationMBS.kAudioFormatLinearPCM)
recordSetting.Value(AVFoundationMBS.AVFormatIDKey) = n
recordSetting.Value(AVFoundationMBS.AVSampleRateKey) = 44100.0
recordSetting.Value(AVFoundationMBS.AVNumberOfChannelsKey) = 2
recordSetting.Value(AVFoundationMBS.AVLinearPCMBitDepthKey) = 16
recordSetting.Value(AVFoundationMBS.AVLinearPCMIsBigEndianKey) = false
recordSetting.Value(AVFoundationMBS.AVLinearPCMIsFloatKey) = false

dim error as NSErrorMBS
dim recorder as new AVAudioRecorderMBS(f, recordSetting, error)

if error<>Nil then
    MsgBox error.localizedDescription
    Return
end if

if recorder.recordForDuration(10) then
    // ok
else
    MsgBox "Failed to start recording."
end if
```

**Notes:**

Using an audio recorder you can:

- Record until the user stops the recording
- Record for a specified duration
- Pause and resume a recording
- Obtain input audio-level data that you can use to provide level metering
In OS X, the audio comes from the system’s default audio input device as set by a user in System Preferences.

You can implement a subclass of AVFoundationMBS to respond to audio interruptions and audio decoding errors, and to the completion of a recording.

To configure a recording, including options such as bit depth, bit rate, and sample rate conversion quality, configure the audio recorder’s settings dictionary. Use the settings keys described in AV Foundation Audio Settings Constants.

To configure an appropriate audio session for recording, refer to AVAudioSession Class Reference and AVAudioSessionDelegate Protocol Reference.

The AVAudioRecorder class is intended to allow you to make audio recordings with very little programming overhead. Other classes that can be used for recording audio in OS X include AVCaptureAudioDataOutput and the Audio Queue services described in the Audio Queue Services Programming Guide.

In OS X, you can also use the AVCaptureAudioFileOutput class to record audio. Available in OS X v10.7 and later.

Calls audioRecorderEncodeErrorDidOccur and audioRecorderDidFinishRecording events on AVFoundationMBS class.

17.26.2 Methods

17.26.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether this class is available. Notes: Returns true on Mac OS X 10.7 and newer.

17.26.4 averagePowerForChannel(channelNumber as Integer) as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the average power for a given channel, in decibels, for the sound being recorded. Notes: channelNumber: The number of the channel that you want the average power value for. Returns the current average power, in decibels, for the sound being recorded. A return value of 0 dB indicates full scale, or maximum power; a return value of -160 dB indicates minimum power (that is, near silence).
If the signal provided to the audio recorder exceeds full scale, then the return value may exceed 0 (that is, it may enter the positive range).

To obtain a current average power value, you must call the updateMeters method before calling this method.

17.26.5 Constructor(file as folderitem, settings as Dictionary, byref error as NSErrorMBS)

Function: Initializes an audio recorder.
Notes:
url: The file system location to record to. The file type to record to is inferred from the file extension included in this parameter’s value.
settings: Settings for the recording session. For information on the settings available for an audio recorder, see AV Foundation Audio Settings Constants.
Error: Pass in the address of a nil-initialized NSError object. If an error occurs, upon return the NSError object describes the error. If you do not want error information, pass in NULL.
See also:
• 17.26.6 Constructor(URL as string, settings as Dictionary, byref error as NSErrorMBS) 3183

17.26.6 Constructor(URL as string, settings as Dictionary, byref error as NSErrorMBS)

Function: Initializes an audio recorder.
Notes:
url: The file system location to record to. The file type to record to is inferred from the file extension included in this parameter’s value.
settings: Settings for the recording session. For information on the settings available for an audio recorder, see AV Foundation Audio Settings Constants.
Error: Pass in the address of a nil-initialized NSError object. If an error occurs, upon return the NSError object describes the error. If you do not want error information, pass in NULL.
See also:
• 17.26.5 Constructor(file as folderitem, settings as Dictionary, byref error as NSErrorMBS) 3183

17.26.7 currentTime as Double

Function: The time, in seconds, since the beginning of the recording. (read-only)
Notes:
When the audio recorder is stopped, calling this method returns a value of 0. Available in OS X v10.7 and later.

### 17.26.8 deleteRecording

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Deletes a recorded audio file.

**Notes:**

Returns true on success, or false on failure.

The audio recorder must be stopped before you call this method.

### 17.26.9 pause

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Pauses a recording.

**Notes:** Call record to resume recording.

### 17.26.10 peakPowerForChannel(channelNumber as Integer) as Double

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns the peak power for a given channel, in decibels, for the sound being recorded.

**Notes:**

channelNumber: The number of the channel that you want the peak power value for.

Returns the current peak power, in decibels, for the sound being recorded. A return value of 0 dB indicates full scale, or maximum power; a return value of -160 dB indicates minimum power (that is, near silence).

If the signal provided to the audio recorder exceeds full scale, then the return value may exceed 0 (that is, it may enter the positive range).

To obtain a current peak power value, call the updateMeters method immediately before calling this method.

### 17.26.11 prepareToRecord

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Creates an audio file and prepares the system for recording.

**Notes:**
17.26. CLASS AVAUDIORECORDERMBS

Returns true on success, or false on failure.

Creates an audio file at the location specified by the url parameter in the Constructor method. If a file already exists at that location, this method overwrites it.
The preparation invoked by this method takes place automatically when you call record. Use prepareToRecord when you want recording to start as quickly as possible upon calling record.

17.26.12 record as boolean

Function: Starts or resumes recording.
Notes:
Returns true on success, or false on failure.
Calling this method implicitly calls prepareToRecord, which creates (or erases) an audio file and prepares the system for recording.

17.26.13 recordForDuration(duration as Double) as boolean

Function: Records for a specified duration of time.
Notes:
duration: The maximum duration, in seconds, for the recording.
Returns true on success, or false on failure.
The recorder stops when the duration of recorded audio reaches the value in the duration parameter.
Calling this method implicitly calls prepareToRecord, which creates (or erases) an audio file and prepares the system for recording.

17.26.14 Recording as boolean

Function: A Boolean value that indicates whether the audio recorder is recording (true), or not (false).
(read-only)
17.26.15 settings as Dictionary

**Function:** The audio settings for the audio recorder. (read-only)
**Notes:** Audio recorder settings are in effect only after you explicitly call the prepareToRecord method, or after you call it implicitly by starting recording. The audio settings keys are described in AV Foundation Audio Settings Constants.

17.26.16 stop

**Function:** Stops recording and closes the audio file.

17.26.17 updateMeters

**Function:** Refreshes the average and peak power values for all channels of an audio recorder.
**Notes:** To obtain current audio power values, you must call this method before you call averagePowerForChannel or peakPowerForChannel.

17.26.18 url as string

**Function:** The URL for the audio file associated with the audio recorder. (read-only)

17.26.19 Properties

17.26.20 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

17.26.21 MeteringEnabled as boolean

**Function:** A Boolean value that indicates whether audio-level metering is enabled (true), or not (false).
Notes:

By default, audio level metering is off for an audio recorder. Because metering uses computing resources, turn it on only if you intend to use it.
Available in OS X v10.7 and later.
(Read and Write computed property)
17.27  class AVCaptureAudioChannelMBS

17.27.1  class AVCaptureAudioChannelMBS

Function: You use an AVCaptureAudioChannel to monitor the average and peak power levels in an audio
channel in a capture connection (see AVCaptureConnection).
Notes:
An AVCaptureConnection object from an input producing audio to an output receiving audio exposes an
array of AVCaptureAudioChannel objects, one for each channel of audio available. You can poll for audio
levels by iterating through these audio channel objects.
You cannot create instances of AVCaptureAudioChannel directly.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.27.2  Methods

17.27.3  averagePowerLevel as Double

Function: The instantaneous average power level, in dB. (read-only)

17.27.4  Constructor

Function: The private constructor.

17.27.5  peakHoldLevel as Double

Function: The peak hold power level, in dB. (read-only)

17.27.6  Properties

17.27.7  Handle as Integer

Function: The internal object reference.
17.27. **CLASS AVCAPTUREAUDIOCHANNELMBS**

Notes: (Read and Write property)

17.27.8 **Enabled as boolean**

Function: Indicates whether the channel is currently enabled for data capture.
Notes: By default, all AVCaptureAudioChannel objects exposed by a connection are enabled. You may set enabled to false to stop the flow of data for a particular channel.
(Read and Write computed property)

17.27.9 **volume as Double**

Function: The current volume (gain) of the channel.
Notes: The volume property indicates the current volume or gain of the receiver as a floating point value between 0.0 and 1.0. If you want to boost the gain in software, you may specify a value greater than 1.0.
(Read and Write computed property)
17.28 class AVCaptureAudioDataOutputMBS

17.28.1 class AVCaptureAudioDataOutputMBS

Function: AVCaptureAudioDataOutput is a concrete sub-class of AVCaptureOutput that you use, via its
delegate, to process audio sample buffers from the audio being captured.
Notes: Subclass of the AVCaptureOutputMBS class.

17.28.2 Methods

17.28.3 Constructor

Function: The constructor.
Notes: Enables events on the new object.

17.28.4 EnableEvents

Function: Enables the event for an existing audio data output object.
Notes: For the audio data output, the plugin will with enabled events call captureOutputDidOutputSam-
pleBuffer event.

17.28.5 Properties

17.28.6 audioSettings as dictionary

Function: The settings used to decode or re-encode audio before it is output.
Notes:
The value of this property is a dictionary containing values for audio settings keys defined in AVAudioSet-
tings.h.
If the value of this property is nil, samples are output in their device native format.
(Read and Write computed property)
17.29. **CLASS AVCaptureAudioFileOutputMBS**

17.29 **class AVCaptureAudioFileOutputMBS**

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** AVCaptureMovieFileOutput is a concrete sub-class of AVCaptureFileOutput that writes captured audio to any audio file type supported by CoreAudio. **Notes:** AVCaptureAudioFileOutput implements the complete file recording interface declared by AVCaptureFileOutput for writing media data to audio files. In addition, you can configure options specific to the audio file formats, including writing metadata collections to each file and specifying audio encoding options. AVCaptureAudioFileOutput does not, however, support startRecordingToOutputFileURL use startRecordingToOutputFileURL with outputFiletype parameter instead. Subclass of the AVCaptureFileOutputMBS class.

17.29.2 **Methods**

17.29.3 **availableOutputFileTypes as string()**

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns array containing UTIs identifying the file types AVCaptureAudioFileOutput can write.

17.29.4 **Constructor**

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

17.29.5 **EnableEvents**

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables the events for this output. **Notes:** Those are normally handled automatically, but if you add event with AddHandler you need to call this method.

17.29.6 **metadata as AVMetadataItemMBS()**

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A collection of metadata to be written to the receiver’s output files.
Notes: The value of this property is an array of AVMetadataItem objects representing the collection of top-level metadata to be written in each output file. Only ID3 v2.2, v2.3, or v2.4 style metadata items are supported.

17.29.7 setMetadata(items() as AVMetadataItemMBS)

Function: Sets the metadata array.

17.29.8 startRecordingToOutputFile(file as folderitem, outputFileType as string)

Function: Tells the receiver to start recording to a new file of the specified format, and specifies a delegate that will be notified when recording is finished.
Notes:
file: The output file. If a file already exists when capturing starts, recording to the new file will fail.
fileType: A UTI indicating the format of the file to be written. UTIs for common audio file types are declared in AVMediaFormat.h.
You do not need not to call stopRecording before calling this method while another recording is in progress. If this method is invoked while an existing output file was already being recorded, no media samples will be discarded between the old file and the new file.

When recording is stopped by calling stopRecording, by changing files using this method, or because of an error, the remaining data that needs to be included to the file will be written in the background. Therefore, you must specify a delegate that will be notified when all data has been written to the file using the captureOutputDidFinishRecordingToOutputFileAtURL method. The recording delegate can also optionally implement methods that inform it when data starts being written, when recording is paused and resumed, and when recording is about to be finished.

On OS X, if this method is called within the captureOutputDidOutputSampleBuffer event method, the first samples written to the new file are guaranteed to be those contained in the sample buffer passed to that method.

17.29.9 startRecordingToOutputFileURL(URL as string, outputFileType as string)

Function: Tells the receiver to start recording to a new file of the specified format, and specifies a delegate that will be notified when recording is finished.
Notes:

URL: The URL of the output file. This method throws an NSInvalidArgumentException if the URL is not a valid file URL. If a file at the given URL already exists when capturing starts, recording to the new file will fail.

fileType: A UTI indicating the format of the file to be written. UTIs for common audio file types are declared in AVMediaFormat.h.

You do not need not to call stopRecording before calling this method while another recording is in progress. If this method is invoked while an existing output file was already being recorded, no media samples will be discarded between the old file and the new file.

When recording is stopped by calling stopRecording, by changing files using this method, or because of an error the remaining data that needs to be included to the file will be written in the background. Therefore, you must specify a delegate that will be notified when all data has been written to the file using the captureOutputDidFinishRecordingToOutputFileAtURL method. The recording delegate can also optionally implement methods that inform it when data starts being written, when recording is paused and resumed, and when recording is about to be finished.

On OS X, if this method is called within the captureOutputDidOutputSampleBuffer event method, the first samples written to the new file are guaranteed to be those contained in the sample buffer passed to that method.

17.29.10 Properties

17.29.11 audioSettings as dictionary

Function: The settings used to decode or re-encode audio before it is output by the receiver.

Notes:

The value of this property is a dictionary containing values for audio settings keys defined in AVAudioSettings.h. If you set the value of this property to nil, the output vends samples in their device native format. (Read and Write computed property)
17.30 class AVCaptureAudioPreviewOutputMBS

17.30.1 class AVCaptureAudioPreviewOutputMBS

Function: AVCaptureAudioPreviewOutput is a concrete subclass of AVCaptureOutput that you use to preview audio being captured.
Notes:
Instances of AVCaptureAudioPreviewOutput are associated with a Core Audio output device that can be used to play audio being captured by the capture session. You can obtain the unique ID of a Core Audio device using its kAudioDevicePropertyDeviceUID property.
Subclass of the AVCaptureOutputMBS class.

17.30.2 Methods

17.30.3 Constructor

Function: The default constructor.

17.30.4 Properties

17.30.5 outputDeviceUniqueID as string

Function: Indicates the unique ID of the Core Audio output device being used to play preview audio.
Notes:
The value of this property is a string containing the unique ID of the Core Audio device to be used for output, or "" if the default system output should be used.
(Read and Write computed property)

17.30.6 volume as Double

Function: Indicates the preview volume of the output.
Notes:
The value of this property is the preview volume of the receiver, where 1.0 is the maximum volume and 0.0 is muted.
17.30. CLASS AVCAPTUREAUDIOPREVIEWOUTPUTMBS

(Read and Write computed property)
17.31 class AVCaptureConnectionMBS

17.31.1 class AVCaptureConnectionMBS

Function: An AVCaptureConnection object represents a connection between capture input and capture output objects associated with a capture session.
Notes:
Capture inputs (instances of AVCaptureInput) have one or more input ports (instances of AVCaptureInputPort). Capture outputs (instances of AVCaptureOutput) can accept data from one or more sources (for example, an AVCaptureMovieFileOutput object accepts both video and audio data).

You can only add an AVCaptureConnection instance to a session using addConnection: if canAddConnection: returns true. When using addInput or addOutput, connections are formed automatically between all compatible inputs and outputs. You only need to add connections manually when adding an input or output with no connections. You can also use connections to enable or disable the flow of data from a given input or to a given output.

17.31.2 Methods

17.31.3 audioChannels as AVCaptureAudioChannelMBS()

Function: An array of AVCaptureAudioChannel objects. (read-only)
Notes: This property is only applicable to connections involving audio.

17.31.4 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

17.31.5 connectionWithInputPort(port as AVCaptureInputPortMBS, layer as AVCaptureVideoPreviewLayerMBS) as AVCaptureConnectionMBS

Function: Returns a capture connection describing a connection between the specified input port and the specified video preview layer.
Notes:
port: An AVCaptureInputPort object associated with an AVCaptureInput object.
layer: An AVCaptureVideoPreviewLayer object.

Returns a capture connection describing a connection between the port and layer.

You can add the connection returned by this method to an AVCaptureSession instance using addConnection:

When using addInput or addOutput, connections are automatically formed between all compatible inputs and outputs. You do not need to manually create and add connections to the session unless you use the primitive addInputWithNoConnections or addOutputWithNoConnections methods.

17.31.6  connectionWithInputPorts(ports() as AVCaptureInputPortMBS, output as AVCaptureOutputMBS) as AVCaptureConnectionMBS

Function: Returns a capture connection describing a connection between the specified input ports and the specified output.
Notes:
ports: An array of AVCaptureInputPort objects associated with AVCaptureInput objects.
output: An AVCaptureOutput object.

Returns a capture connection describing a connection between inputPorts and the output.

You can add the connection returned by this method to an AVCaptureSession instance using addConnection.

When using addInput or addOutput, connections are automatically formed between all compatible inputs and outputs. You do not need to manually create and add connections to the session unless you use the primitive addInputWithNoConnections or addOutputWithNoConnections methods.

17.31.7  Constructor(port as AVCaptureInputPortMBS, layer as AVCaptureVideoPreviewLayerMBS)

Function: Initializes a capture connection to describe a connection between the specified input port and the specified video preview layer.
Notes:
port: An AVCaptureInputPort object associated with an AVCaptureInput object.
layer: An AVCaptureVideoPreviewLayer object.
Returns a capture connection describing a connection between the port and layer.

You can add the connection returned by this method to an AVCaptureSession instance using addConnection.

When using addInput or addOutput, connections are automatically formed between all compatible inputs and outputs. You do not need to manually create and add connections to the session unless you use the primitive addInputWithNoConnections or addOutputWithNoConnections methods.

See also:

- 17.31.7 Constructor(port as AVCaptureInputPortMBS, layer as AVCaptureVideoPreviewLayerMBS) 3197

### 17.31.8 Constructor(ports() as AVCaptureInputPortMBS, output as AVCaptureOutputMBS)

**Function:** Initializes a capture connection to describe a connection between the specified input ports and the specified output.

**Notes:**

- ports: An array of AVCaptureInputPort objects associated with AVCaptureInput objects.
- output: An AVCaptureOutput object.

Returns a capture connection initialized to describe a connection between inputPorts and the output.

You can add the connection returned by this method to an AVCaptureSession instance using addConnection.

When using addInput or addOutput, connections are automatically formed between all compatible inputs and outputs. You do not need to manually create and add connections to the session unless you use the primitive addInputWithNoConnections or addOutputWithNoConnections methods.

See also:

- 17.31.7 Constructor(port as AVCaptureInputPortMBS, layer as AVCaptureVideoPreviewLayerMBS) 3197

### 17.31.9 inputPorts as AVCaptureInputPortMBS()

**Function:** The connection’s input ports. (read-only)

**Notes:** Input ports are instances of AVCaptureInputPort.
17.31.10 Properties

17.31.11 Active as boolean

Function: Indicates whether the connection is active. (read-only)
Notes: (Read only property)

17.31.12 automaticallyAdjustsVideoMirroring as boolean

Function: A Boolean value that indicates whether the value of videoMirrored can change based on configuration of the session.
Notes:
For some session configurations, video data flowing through the connection will be mirrored by default. When the value of this property is true, the value of videoMirrored may change depending on the configuration of the session, for example after switching to a different capture device input.

The default value is true.
(Read and Write property)

17.31.13 Enabled as boolean

Function: Indicates whether the connection is enabled.
Notes: (Read and Write property)

17.31.14 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.31.15 output as AVCaptureOutputMBS

Function: The connection’s output port. (read-only)
17.31.16  videoFieldMode as Integer

Function: An indicator of how interlaced video flowing through the connection should be treated.
Notes:
This property is only applicable to connections involving video.
You can only set this value if supportsVideoFieldMode is true.
(Read and Write property)

17.31.17  VideoFieldModeSupported as boolean

Function: A Boolean value that indicates whether the connection supports setting the videoFieldMode
property. (read-only)
Notes:
This property is only applicable to connections involving video.
(Read only property)

17.31.18  videoMaxFrameDuration as CMTimeMBS

Function: The maximum time interval between which the receiver should output consecutive video frames.
Notes:
The value of this property specifies the maximum duration of each video frame output by the connection,
placing an upper bound on the amount of time that should separate consecutive frames. The value is equiv-
alent to the reciprocal of the minimum frame rate.
A value of kCMTimeZero or kCMTimeInvalid indicates an unlimited minimum frame rate.
The default value is kCMTimeInvalid.
You can only set this value if supportsVideoMaxFrameDuration is true.
Available in OS X v10.9 and later.
(Read and Write property)

17.31.19  VideoMaxFrameDurationSupported as Boolean

Function: A Boolean value that indicates whether the connection supports setting the videoMaxFrameDu-
17.31. CLASS AVCAPTURECONNECTIONMBS

```
ration property. (read-only)

Notes:
This property is only applicable to connections involving video.
Available in OS X v10.9 and later.
(Read only property)
```

17.31.20 videoMinFrameDuration as CMTimeMBS

```
Function: The minimum time interval between which the receiver should output consecutive video frames.
Notes:
The value of this property specifies the minimum duration of each video frame output by the connection,
placing a lower bound on the amount of time that should separate consecutive frames. The value is equiva-
ient to the reciprocal of the maximum frame rate.

A value of kCMTimeZero or kCMTimeInvalid indicates an unlimited maximum frame rate.

The default value is kCMTimeInvalid.

You can only set this value if supportsVideoMinFrameDuration is true.
(Read and Write property)
```

17.31.21 VideoMinFrameDurationSupported as boolean

```
Function: A Boolean value that indicates whether the connection supports setting the videoMinFrameDu-
ration property. (read-only)
Notes:
This property is only applicable to connections involving video.
(Read only property)
```

17.31.22 VideoMirrored as boolean

```
Function: A Boolean value that indicates whether the video flowing through the connection should be
mirrored about its vertical axis.
Notes:
```
This property is only applicable to connections involving video.

If the value of supportsVideoMirroring is true, you can set videoMirrored to true to flip the video about its vertical axis and produce a mirror-image effect. (Read and Write property)

### 17.31.23 VideoMirroringSupported as boolean

**Function:** A Boolean value that indicates whether the connection supports video mirroring. (read-only)

**Notes:** (Read only property)

### 17.31.24 videoOrientation as Integer

**Function:** The orientation of the video.

**Notes:**

This property is only applicable to connections involving video.

If the value of supportsVideoOrientation is true, you can set videoOrientation to rotate the video buffers being consumed by the connection’s output. Setting videoOrientation does not necessarily result in a physical rotation of video buffers. For example, a video connection to an AVCaptureMovieFileOutput object handles orientation using a Quicktime track matrix; using an AVCaptureStillImageOutput object, orientation is handled using Exif tags. (Read and Write property)

### 17.31.25 VideoOrientationSupported as boolean

**Function:** A Boolean value that indicates whether the connection supports changing the orientation of the video. (read-only)

**Notes:** (Read only property)

### 17.31.26 videoPreviewLayer as AVCaptureVideoPreviewLayerMBS

**Function:** The video preview layer associated with the connection. (read-only)

**Notes:**
This property is the set if you initialized the connection using Constructor or connectionWithInputPort. (Read only property)

### 17.31.27 Constants

#### 17.31.28 AVCaptureVideoOrientationLandscapeLeft = 4

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants indicating video orientation.  
**Notes:** Indicates that video should be oriented horizontally, top on the right.

#### 17.31.29 AVCaptureVideoOrientationLandscapeRight = 3

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants indicating video orientation.  
**Notes:** Indicates that video should be oriented horizontally, top on the left.

#### 17.31.30 AVCaptureVideoOrientationPortrait = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants indicating video orientation.  
**Notes:** Indicates that video should be oriented vertically, top at the top.

#### 17.31.31 AVCaptureVideoOrientationPortraitUpsideDown = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants indicating video orientation.  
**Notes:** Indicates that video should be oriented vertically, top at the bottom.

#### 17.31.32 AVVideoFieldModeBoth = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants indicating video field mode, for use with the videoFieldMode property.  
**Notes:** Indicates that both top and bottom video fields in interlaced content should be passed through.
17.31.33 AVVideoFieldModeBottomOnly = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants indicating video field mode, for use with the videoFieldMode property. 
**Notes:** Indicates that the bottom video field only in interlaced content should be passed through.

17.31.34 AVVideoFieldModeDeinterlace = 3

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants indicating video field mode, for use with the videoFieldMode property. 
**Notes:** Indicates that top and bottom video fields in interlaced content should be deinterlaced.

17.31.35 AVVideoFieldModeTopOnly = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants indicating video field mode, for use with the videoFieldMode property. 
**Notes:** Indicates that only the top video field in interlaced content should be passed through.
17.32 class AVCaptureDeviceFormatMBS

17.32.1 class AVCaptureDeviceFormatMBS

**Function:** The class for device format information.
**Notes:**
An AVCaptureDeviceFormat object wraps a CMFormatDescription (see CMFormatDescriptionRef) and other format-related information, such as minimum and maximum frame rate.

An AVCaptureDeviceFormat object is immutable. AVCaptureDevice uses AVCaptureDeviceFormat objects to describe supported formats and the active format of an instance.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.32.2 Methods

17.32.3 Constructor

**Function:** The private constructor.

17.32.4 DisplayName as string

**Function:** The display text for this object.
**Notes:** The plugin formats a string with the device format for displaying.

17.32.5 formatDescription as CMFormatDescriptionMBS

**Function:** A CMFormatDescription describing an AVCaptureDevice active or supported format. (read-only).

17.32.6 mediaType as string

**Function:** An string describing the media type of an AVCaptureDevice active or supported format. (read-only)
3206

CHAPTER 17. AVFOUNDATION

Notes: Supported media types are listed in AVMediaFormat.h.

17.32.7  videoSupportedFrameRateRanges as AVFrameRateRangeMBS()

Function: Indicates the format’s supported frame rate ranges/ (read-only)  
Notes: The value is an array of AVFrameRateRange objects, one for each of the format’s supported video frame rate ranges.

17.32.8  Properties

17.32.9  Handle as Integer

Function: The internal object reference.  
Notes: (Read and Write property)
17.33. **CLASS AVCaptureDeviceInputMBS**

### 17.33.1 class AVCaptureDeviceInputMBS

**Function:** AVCaptureDeviceInput is a concrete sub-class of AVCaptureInput you use to capture data from an AVCaptureDevice object.  
**Notes:** Subclass of the AVCaptureInputMBS class.

### 17.33.2 Methods

#### 17.33.3 Constructor(Device as AVCaptureDeviceMBS, byref error as NSErrorMBS)

**Function:** Initializes an input to use a specified device.  
**Notes:**  
- **device:** The device from which to capture input.  
- **Error:** If an error occurs during initialization, upon return contains an NSErrorMBS object describing the problem.

#### 17.33.4 device as AVCaptureDeviceMBS

**Function:** The device with which the input is associated. (read-only)

#### 17.33.5 deviceInputWithDevice(device as AVCaptureDeviceMBS, byref error as NSErrorMBS) as AVCaptureDeviceInputMBS

**Function:** Returns an input initialized to use a specified device.  
**Notes:**  
- **device:** The device from which to capture input.  
- **Error:** If an error occurs during initialization, upon return contains an NSError object describing the problem.  

Returns an input initialized to use device.
17.34 class AVCaptureDeviceInputSourceMBS

17.34.1 class AVCaptureDeviceInputSourceMBS

**Function:** An AVCaptureDeviceInputSource object represents a distinct input source on an AVCaptureDevice object.

**Notes:**

An AVCaptureDevice object may optionally present an array of input sources, representing distinct mutually exclusive inputs to the device. For example, an audio capture device might have ADAT optical and analog input sources; a video capture device might have an HDMI input source, or a component input source. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.34.2 Methods

17.34.3 Constructor

**Function:** The private constructor.

17.34.4 inputSourceID as string

**Function:** The input source ID. (read-only)

**Notes:** The ID is unique among the input sources exposed by a given AVCaptureDevice object.

17.34.5 localizedName as string

**Function:** A localized, human-readable, name for the input source. (read-only)

**Notes:** You can use this property to display the name of the capture device input source in a user interface.

17.34.6 Properties

17.34.7 Handle as Integer

**Function:** The internal object reference.
17.34. CLASS AVCAPTUREDEVICEINPUTSOURCEMBS

Notes: (Read and Write property)
17.35 class AVCaptureDeviceMBS

17.35.1 class AVCaptureDeviceMBS

**Function:** An AVCaptureDevice object represents a physical capture device and the properties associated with that device.

**Example:**

```javascript
dim device as AVCaptureDeviceMBS = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox device.localizedName
```

**Notes:**

You use a capture device to configure the properties of the underlying hardware. A capture device also provides input data (such as audio or video) to an AVCaptureSession object.

You use the methods of the AVCaptureDevice class to enumerate the available devices, query their capabilities, and be informed about when devices come and go. Before you attempt to set properties of a capture device (its focus mode, exposure mode, and so on), you must first acquire a lock on the device using the lockForConfiguration method. You can then set the properties and release the lock using the unlockForConfiguration method. You may hold the lock if you want all settable device properties to remain unchanged. However, holding the device lock unnecessarily may degrade capture quality in other applications sharing the device and is not recommended.

May work for all built-in cameras and microphones as well as external USB webcams, as far as Apple supports them.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.35.2 Methods

17.35.3 available as boolean

**Function:** Whether this class is available.

**Notes:** Returns true on Mac OS X 10.7 and newer.
17.35. **CLASS AVCAPTUREDEVICEMBS**

### 17.35.4 AVCaptureMaxAvailableTorchLevel as Double

**Function:** The maximum torch level.

**Notes:**

This constant always represents the maximum available torch level, independent of the actual maximum value currently supported by the device. Thus, pass this constant to the setTorchModeOnWithLevel:error: in situations where you want to specify the maximum torch level without having to worry about whether the device is overheating and might not accept a value of 1.0 as the maximum.

Available in OS X v10.9 and later.

### 17.35.5 Constructor

**Function:** The private constructor.

### 17.35.6 defaultDeviceWithMediaType(mediaType as string) as AVCaptureDeviceMBS

**Function:** Returns the default device used to capture data of a given media type.

**Example:**

```vbnet
dim device as AVCaptureDeviceMBS = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeAudio)
MsgBox device.localizedName
```

**Notes:**

- **mediaType:** A media type identifier.
- For possible values, see AV Foundation Constants Reference.

### 17.35.7 devices as AVCaptureDeviceMBS()

**Function:** Returns an array of the available capture devices on the system.

**Example:**

```vbnet
dim devices() as AVCaptureDeviceMBS = AVCaptureDeviceMBS.devices
dim names() as string
```
for each d as AVCaptureDeviceMBS in devices
    names.Append d.localizedDescription
next

    // show all names in a message dialog
    MsgBox Join(names, EndOfLine)

17.35.8 devicesWithMediaType(mediaType as string) as AVCaptureDeviceMBS()

Function: Returns an array of the devices able to capture data of a given media type.
Example:

    dim devices() as AVCaptureDeviceMBS = AVCaptureDeviceMBS.devicesWithMediaType(AVFoundation-
        MBS.AVMediaTypeAudio)
    dim names() as string

    for each d as AVCaptureDeviceMBS in devices
        names.Append d.localizedDescription
    next

    // show all names of audio devices in a message dialog
    MsgBox Join(names, EndOfLine)

Notes:
mediaType: A media type identifier.
For possible values, see AV Foundation Constants Reference.

17.35.9 deviceWithUniqueID(deviceUniqueID as string) as AVCaptureDeviceMBS

Function: Returns the device with a given ID.
Notes: deviceUniqueID: The ID of a capture device.

17.35.10 formats as AVCaptureDeviceFormatMBS()

Function: An array of AVCaptureDeviceFormat objects representing the formats supported by the device
17.35. **CLASS AVCAPTUREDEVICEMBS**

(read-only)

**Notes:**

You can use this property to enumerate the formats natively supported by the receiver. You can set modelID to any of the formats in this array. You can observe changes to the value of this property using key-value observing.

17.35.11 **hasMediaType(mediaType as string) as boolean**

**Function:** Returns a Boolean value that indicates whether the device provides media with a given type.

**Example:**

```vbs
dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox str(device.hasMediaType(AVFoundationMBS.AVMediaTypeVideo)) ' true
MsgBox str(device.hasMediaType(AVFoundationMBS.AVMediaTypeAudio)) ' false
```

**Notes:**

mediaType: A media type, such as AVMediaTypeVideo, AVMediaTypeAudio, or AVMediaTypeMuxed. For a complete list of supported media type constants, see AV Foundation Constants Reference.

Returns true if the device provides media of type mediaType, otherwise false.

17.35.12 **inputSources as AVCaptureDeviceInputSourceMBS()**

**Function:** An array of AVCaptureDeviceInputSource objects representing the input sources supported by the device. (read-only)

**Notes:**

Some devices can capture data from one of multiple data sources (different input jacks on the same audio device, for example). For devices with multiple possible data sources, you can use this property to enumerate the possible choices.

You can observe changes to the value of this property using key-value observing.
17.35.13 isExposureModeSupported(exposureMode as Integer) as boolean

Function: Returns a Boolean value that indicates whether the given exposure mode is supported.
Example:

```vba
Dim device As AVCaptureDeviceMBS
Device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox Str(device.isExposureModeSupported(device.AVCaptureExposureModeAutoExposure))
```

Notes:

exposureMode: An exposure mode. See "AVCaptureExposureMode" for possible values.
Returns true if exposureMode is supported, otherwise false.

17.35.14 isFlashModeSupported(FlashMode as Integer) as boolean

Function: Returns a Boolean value that indicates whether the given flash mode is supported.
Example:

```vba
Dim device As AVCaptureDeviceMBS
Device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox Str(device.isFlashModeSupported(device.AVCaptureFlashModeAuto))
```

Notes:

flashMode: A flash mode. See "AVCaptureFlashMode" for possible values.
Returns true if flashMode is supported, otherwise false.

17.35.15 isFocusModeSupported(focusMode as Integer) as boolean

Function: Returns a Boolean value that indicates whether the given focus mode is supported.
Example:

```vba
Dim device As AVCaptureDeviceMBS
Device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox Str(device.isFocusModeSupported(device.AVCaptureFocusModeContinuousAutoFocus))
```

Notes:
focusMode: A focus mode. See "AVCaptureFocusMode" for possible values.

Returns true if focusMode is supported, otherwise false.

17.35.16 isTorchModeSupported(torchMode as Integer) as boolean

Function: Returns a Boolean value that indicates whether the device supports the specified torch mode.
Example:

dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox str(device.isTorchModeSupported(device.AVCaptureTorchModeAuto))

Notes:
torchMode: The desired torch mode. For a list of possible values, see "AVCaptureTorchMode."
Returns true if torchMode is supported, otherwise false.

17.35.17 isWhiteBalanceModeSupported(mode as Integer) as boolean

Function: Returns a Boolean value that indicates whether the given white balance mode is supported.
Example:

dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox str(device.isWhiteBalanceModeSupported(device.AVCaptureWhiteBalanceModeAutoWhiteBalance))

Notes:
whiteBalanceMode: A focus mode. See "AVCaptureWhiteBalanceMode" for possible values.
Returns true if whiteBalanceMode is supported, otherwise false.

17.35.18 linkedDevices as AVCaptureDeviceMBS()

Function: An array of AVCaptureDevice objects representing the devices physically linked to the receiver.
(read-only)
Example:
dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeAudio)

dim linkedDevices() as AVCaptureDeviceMBS
linkedDevices = device.linkedDevices

for each d as AVCaptureDeviceMBS in linkedDevices
MsgBox device.localizedName+” “+d.localizedName
next

Notes: The value of this property is an array of AVCaptureDevice objects that are a part of the same physical device as the receiver. For example, for an external iSight camera, the array contains an AVCaptureDevice instance representing the external iSight microphone.

17.35.19 lockForConfiguration(byref error as NSErrorMBS) as boolean

Function: Requests exclusive access to the device’s hardware properties.
Notes:
Error: If a lock cannot be acquired, this pointer contains an NSError object that describes the problem.
Returns true if a lock was acquired or false if it was not.

You must call this method before attempting to configure the hardware related properties of the device. This method returns true when it successfully locks the device for configuration by your code. After configuring the device properties, call unlockForConfiguration to release the configuration lock and allow other apps to make changes.

You may hold onto a lock (instead of releasing it) if you require the device properties to remain unchanged. However, holding the device lock unnecessarily may degrade capture quality in other apps sharing the device.

17.35.20 setTransportControlsPlaybackMode(mode as Integer, speed as Double)

Function: Sets the transport control’s playback mode and speed.
Notes:
mode: An AVCaptureDeviceTransportControlsPlaybackMode constant indicating whether the deck should be put into play mode.
speed: A float value indicating the speed at which to wind or play the tape.

Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device’s configuration properties. If you do not, this method raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

**17.35.21 supportsAVCaptureSessionPreset(preset as string) as boolean**

**Function:** Returns a Boolean value that indicates whether the receiver can be used in an capture session configured with the given preset.

**Example:**

```vbnet
dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox str(device.supportsAVCaptureSessionPreset(AVFoundationMBS.AVCaptureSessionPreset1280x720))
```

**Notes:**

preset: A capture session preset.

Returns true if the receiver can be used with preset, otherwise false.

An AVCaptureSession instance can be associated with a preset that configures its inputs and outputs to fulfill common use cases. You can use this method to determine if the receiver can be used in a capture session with the given preset. For a list of preset constants, see AVCaptureSession Class Reference.

**17.35.22 unlockForConfiguration**

**Function:** Relinquishes exclusive control over the device’s configuration.

**Notes:** Call this method to release the lock acquired using the lockForConfiguration method when you are done configuring the device.

**17.35.23 Properties**

**17.35.24 activeFormat as AVCaptureDeviceFormatMBS**

**Function:** The currently active format of the receiver.
Notes:
You use this property to get or set the currently active device format.

To set the format, you must first obtain exclusive access to the receiver using focusMode. If you do not obtain exclusive access, setActiveFormat throws an NSGenericException.

The set method, setActiveFormat, throws an NSInvalidArgumentException if you pass a format not present in the supportsAVCaptureSessionPreset array.

You can observe changes to the value of this property using key-value observing.
(Read and Write property)

17.35.25 activeInputSource as AVCaptureDeviceInputSourceMBS

Function: The currently active input source.
Notes:
You use this property to get or set the currently active input source.

To set the format, you must first obtain exclusive access to the receiver using focusMode. If you do not obtain exclusive access, setActiveInputSource throws an NSGenericException.

The set method, setActiveInputSource, throws an NSInvalidArgumentException if you pass a format not present in the activeInputSource array.

You can observe changes to the value of this property using key-value observing.
(Read only property)

17.35.26 activeVideoMaxFrameDuration as CMTimeMBS

Function: The currently active maximum frame duration.
Notes:
A device’s maximum frame duration is the reciprocal of its minimum frame rate. You can set the value of this property to limit the minimum frame rate during a capture session. The capture device automatically chooses a default maximum frame duration based on its active format. After changing the value of this property, you can return to the default maximum frame duration by setting this property’s value to kCMTimeInvalid. Choosing a new preset for the capture session also resets this property to its default value.
Attempting to set this property to a value not found in the active format’s `videoSupportedFrameRateRanges` array raises an exception (`NSInvalidArgumentException`).

Before changing the value of this property, you must call `lockForConfiguration` to acquire exclusive access to the device’s configuration properties. Otherwise, setting the value of this property raises an exception. When you are done configuring the device, call `unlockForConfiguration` to release the lock and allow other devices to configure the settings.

You can observe changes to the value of this property using Key-value observing. Available in OS X v10.9 and later.
(Read and Write property)

### 17.35.27 `activeVideoMinFrameDuration` as `CMTimeMBS`

**Function:** The currently active minimum frame duration.

**Notes:**
You use this property to get or set the currently active minimum frame duration.

The value of this property is the reciprocal of its maximum frame rate. To limit the maximum frame rate, you can set the value of this property to a value supported by the receiver’s `modelID` (see `videoSupportedFrameRateRanges`).

Before changing the value of this property, you must call `lockForConfiguration` to acquire exclusive access to the device’s configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call `unlockForConfiguration` to release the lock and allow other devices to configure the settings.

The device object throws `NSInvalidArgumentException` if you try to assign an unsupported value to this property.

You can observe changes to the value of this property using key-value observing.
(Read and Write property)

### 17.35.28 `exposureMode` as `Integer`

**Function:** The exposure mode for the device.
Notes:

Before changing the value of this property, you must call lockForConfiguration: to acquire exclusive access to the device's configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

You can observe changes to the value of this property using key-value observing.
See "AVCaptureExposureMode" for possible values.
(Read and Write property)

17.35.29 exposurePointOfInterest as CGPointMBS

Function: The point of interest for exposure.
Notes:

Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device's configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.
(Read and Write property)

17.35.30 flashMode as Integer

Function: The current flash mode.
Notes:

Before changing the value of this property, you must call lockForConfiguration: to acquire exclusive access to the device's configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

You can observe changes to the value of this property using key-value observing.

See "AVCaptureFlashMode" for possible values.
(Read and Write property)
17.35. **CLASS AVCAPTUREDEVICEMBS**

### 17.35.31 focusMode as Integer

**Function:** The device’s focus mode.
**Notes:**

Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device’s configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

You can observe changes to the value of this property using key-value observing.

See "AVCaptureFocusMode" for possible values.
(Read and Write property)

### 17.35.32 focusPointOfInterest as CGPointMBS

**Function:** The point of interest for focusing.
**Notes:**

This property represents a CGPoint where { 0,0 } corresponds to the top left of the picture area, and { 1,1 } corresponds to the bottom right in landscape mode with the home button on the right this applies even if the device is in portrait mode.

Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device’s configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.
(Read and Write property)

### 17.35.33 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)
### 17.35.34 hasFlash as boolean

**Function:** Indicates whether the capture device has a flash. (read-only)

**Example:**
```vbnet
Dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox str(device.hasFlash)
```

**Notes:**
You can observe changes to the value of this property using key-value observing.
(Read only property)

### 17.35.35 hasTorch as boolean

**Function:** A Boolean value that specifies whether the capture device has a torch. (read-only)

**Example:**
```vbnet
Dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox str(device.hasTorch)
```

**Notes:**
A torch is a light source, such as an LED flash, that is available on the device and used for illuminating captured content or providing general illumination. This property reflects whether the current device has such illumination hardware built-in.

Even if the device has a torch, that torch might not be available for use. Thus, you should also check the value of the torchAvailable property before using it.

You can observe changes to the value of this property using key-value observing.
(Read only property)

### 17.35.36 isAdjustingExposure as boolean

**Function:** The transport type of the receiver. (read-only)
Example:

```dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox str(device.isAdjustingExposure)
```

Notes:
The value of this property represents the transport type of the device (USB, PCI, etc). Transport types are defined in `<IOKit/audio/IOAudioTypes.h>` as `kIOAudioDeviceTransportType*`. (Read only property)

### 17.35.37 `isAdjustingFocus` as boolean

**Function:** Indicates whether the device is currently adjusting its focus setting. (read-only)  
**Example:**

```dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox str(device.isAdjustingFocus)
```

Notes:
You can observe changes to the value of this property using key-value observing.  
(Read only property)

### 17.35.38 `isAdjustingWhiteBalance` as boolean

**Function:** Indicates whether the device is currently adjusting the white balance. (read-only)  
**Example:**

```dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox str(device.isAdjustingWhiteBalance)
```

Notes:
You can observe changes to the value of this property using key-value observing.  
(Read only property)
17.35.39 isConnected as boolean

Function: Indicates whether the device is currently connected. (read-only)
Example:

```
    dim device as AVCaptureDeviceMBS
    device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
    MsgBox str(device.isConnected)
```

Notes:
The value of this property indicates whether the device represented by the receiver is connected and available for use as a capture device. When the value of this property becomes false for a given instance, however, it will not become true again. If the same physical device again becomes available to the system, it will be represented using a new instance of AVCaptureDevice.

You can observe the value of this property using key-value observing to be notified when a device is no longer available.
(Read only property)

17.35.40 isExposurePointOfInterestSupported as boolean

Function: Indicates whether the device supports a point of interest for exposure. (read-only)
Example:

```
    dim device as AVCaptureDeviceMBS
    device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
    MsgBox str(device.isExposurePointOfInterestSupported)
```

Notes:
You can observe changes to the value of this property using key-value observing.
(Read only property)
17.35. **CLASS AVCAPTUREDEVICEMBS**

### 17.35.41 `isFocusPointOfInterestSupported` as boolean

**Function:** Indicates whether the device supports a point of interest for focus. (read-only)  
**Example:**

```vbnet
dim device as AVCaptureDeviceMBS  
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)  
MsgBox str(device.isFocusPointOfInterestSupported)
```

**Notes:**  
You can observe changes to the value of this property using key-value observing.  
(Read only property)

### 17.35.42 `isInUseByAnotherApplication` as boolean

**Function:** Indicates whether the device is in use by another application. (read-only)  
**Example:**

```vbnet
dim device as AVCaptureDeviceMBS  
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)  
MsgBox str(device.isInUseByAnotherApplication)
```

**Notes:**  
You can observe changes to the value of this property using key-value observing.  
(Read only property)

### 17.35.43 `isSuspended` as boolean

**Function:** Indicates whether the device is suspended. (read-only)  
**Example:**

```vbnet
dim device as AVCaptureDeviceMBS  
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)  
MsgBox str(device.isSuspended)
```

**Notes:**
Some devices disallow data capture due to a feature on the device.

For example, isSuspended returns true for an external iSight camera when its privacy iris is closed, or for the internal iSight camera on a notebook when the notebook’s display is closed.

You can observe changes to the value of this property using key-value observing.
(Read only property)

17.35.44 localizedName as string

Function: A localized human-readable name for the receiver. (read-only)
Example:

dim device as AVCaptureDeviceMBS = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeAudio)
MsgBox device.localizedName

Notes:
You can use this property to display the name of a capture device in a user interface.
(Read only property)

17.35.45 manufacturer as String

Function: The human-readable manufacturer name for the receiver.
Notes:
This property can be used to identify capture devices from a particular manufacturer. All Apple devices return "Apple Inc.". Devices from third party manufacturers may return an empty string.
Available on Mac OS X 10.9 or later.
(Read only property)

17.35.46 modelID as string

Function: The model ID of the device. (read-only)
Example:
17.35. CLASS AVCaptureDeviceMBS

```plaintext
dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)

MsgBox "modelID: " + device.modelID
```

Notes:
The value of this property is an identifier unique to all devices of the same model. The value is persistent across device connections and disconnections, and across different systems. For example, the model ID of the camera built in to two identical iPhone models will be the same even though they are different physical devices.
(Read only property)

17.35.47 position as Integer

Function: Indicates the physical position of the device hardware on the system. (read-only)
Notes:
You can observe changes to the value of this property using key-value observing.
See "AVCaptureDevicePosition" for possible values.
(Read only property)

17.35.48 torchMode as Integer

Function: The current torch mode.
Notes:
Setting the value of this property also sets the torch level to its maximum current value.

Before setting the value of this property, call the isTorchModeSupported method to make sure the device supports the desired mode. Setting the device to an unsupported torch mode results in the raising of an exception. For a list of possible values for this property, see "AVCaptureTorchMode."

Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device’s configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

You can observe changes to the value of this property using key-value observing.
(Read and Write property)
17.35.49 transportControlsPlaybackMode as Integer

**Function:** The current playback mode. (read-only)

**Notes:**
This property is only valid for devices that support transport control.
You can observe changes to the value of this property using key-value observing.
(Read-only property)

17.35.50 transportControlsSpeed as Double

**Function:** The current playback speed. (read-only)

**Notes:**
For devices that support transport control, the value of this property indicates the current playback speed of the deck. The following table gives examples of the meaning of values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0</td>
<td>Stopped</td>
</tr>
<tr>
<td>1.0</td>
<td>Forward at normal speed.</td>
</tr>
<tr>
<td>-1.0</td>
<td>Reverse at normal speed.</td>
</tr>
<tr>
<td>2.0</td>
<td>Forward at 2x normal speed.</td>
</tr>
</tbody>
</table>

You can observe changes to the value of this property using key-value observing.
(Read-only property)

17.35.51 transportControlsSupported as boolean

**Function:** Indicates whether the device supports transport control commands. (read-only)

**Example:**
```
dim device as AVCaptureDeviceMBS = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox str(device.transportControlsSupported)
```
Notes:
For devices with transport controls, such as AVC tape-based camcorders or pro capture devices with RS422 deck control, the value of this property is true. If transport controls are not supported, none of the associated transport control methods and properties are available on the receiver.

You can observe changes to the value of this property using key-value observing. (Read only property)

17.35.52 transportType as Integer

**Function:** The transport type of the receiver. (read-only)
**Notes:**
The value of this property represents the transport type of the device (USB, PCI, etc). Transport types are defined in `<IOKit/audio/IOAudioTypes.h>` as `kIOAudioDeviceTransportType*`. (Read only property)

17.35.53 uniqueID as string

**Function:** An ID unique to the model of device corresponding to the receiver. (read-only)
**Example:**
```vba
dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
dim u as string = device.uniqueID
MsgBox "uniqueID: " + u
```

**Notes:**
Every available capture device has a unique ID that persists on one system across device connections and disconnections, application restarts, and reboots of the system itself. You can store the value returned by this property to recall or track the status of a specific device in the future. (Read only property)

17.35.54 whiteBalanceMode as Integer

**Function:** The current white balance mode.
Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device’s configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

You can observe changes to the value of this property using key-value observing. See "AVCaptureWhiteBalanceMode" for possible values.

(Read and Write property)

17.35.55 Constants

17.35.56 AVCaptureDevicePositionBack = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the position of a capture device.
**Notes:** The capture device is on the back of the unit.

17.35.57 AVCaptureDevicePositionFront = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the position of a capture device.
**Notes:** The capture device is on the front of the unit.

17.35.58 AVCaptureDevicePositionUnspecified = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the position of a capture device.
**Notes:** The capture device’s position relative to the system hardware is unspecified.

17.35.59 AVCaptureDeviceTransportControlsNotPlayingMode = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants that indicate the transport controls’ current mode of playback, if it has one.
**Notes:** Indicates that the tape transport is not threaded through the play head.
17.35. **CLASS AVCaptureDeviceMBS**

**17.35.60 AVCaptureDeviceTransportControlsPlayingMode = 1**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants that indicate the transport controls' current mode of playback, if it has one.  
**Notes:** Indicates that the tape transport is threaded through the play head.

**17.35.61 AVCaptureExposureModeAutoExpose = 1**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the exposure mode of a capture device.  
**Notes:** The device continuously monitors exposure levels and auto exposes when necessary.

**17.35.62 AVCaptureExposureModeContinuousAutoExposure = 2**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the exposure mode of a capture device.  
**Example:**

```vbnet
dim device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MsgBox str(device.isExposureModeSupported(device.AVCaptureExposureModeContinuousAutoExposure))
```

**Notes:** The device performs an auto-expose operation now.

**17.35.63 AVCaptureExposureModeLocked = 0**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the exposure mode of a capture device.  
**Notes:** The exposure setting is locked.

**17.35.64 AVCaptureFlashModeAuto = 2**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the flash mode of a capture device.  
**Notes:** The capture device continuously monitors light levels and uses the flash when necessary.
17.35.65  AVCaptureFlashModeOff = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the flash mode of a capture device.
**Notes:** The capture device flash is always off.

17.35.66  AVCaptureFlashModeOn = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the flash mode of a capture device.
**Notes:** The capture device flash is always on.

17.35.67  AVCaptureFocusModeAutoFocus = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the focus mode of a capture device.
**Notes:** The capture device performs an autofocus operation now.

17.35.68  AVCaptureFocusModeContinuousAutoFocus = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the focus mode of a capture device.
**Notes:** The capture device continuously monitors focus and auto focuses when necessary.

17.35.69  AVCaptureFocusModeLocked = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the focus mode of a capture device.
**Notes:** The focus is locked.

17.35.70  AVCaptureTorchModeAuto = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the direction in which a capture device faces.
**Notes:** The capture device continuously monitors light levels and uses the torch when necessary.
17.35. **CLASS AVCAPTUREDEVICEMBS**

17.35.71 **AVCaptureTorchModeOff = 0**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the direction in which a capture device faces. **Notes:** The capture device torch is always off.

17.35.72 **AVCaptureTorchModeOn = 1**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the direction in which a capture device faces. **Notes:** The capture device torch is always on.

17.35.73 **AVCaptureWhiteBalanceModeAutoWhiteBalance = 1**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the white balance mode of a capture device. **Notes:** The device performs an auto white balance operation now.

17.35.74 **AVCaptureWhiteBalanceModeContinuousAutoWhiteBalance = 2**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the white balance mode of a capture device. **Notes:** The device continuously monitors white balance and adjusts when necessary.

17.35.75 **AVCaptureWhiteBalanceModeLocked = 0**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to specify the white balance mode of a capture device. **Notes:** The white balance setting is locked.
17.36 class AVCaptureFileOutputMBS

17.36.1 class AVCaptureFileOutputMBS

Function: AVCaptureFileOutput is an abstract sub-class of AVCaptureOutput that describes a file output destination to an AVCaptureSession.

Notes:

For example, you use an instance of its concrete subclass, AVCaptureMovieFileOutput, to save capture output to a QuickTime movie file. The concrete subclasses of AVCaptureFileOutput are AVCaptureMovieFileOutput, which records media to a QuickTime movie file, and AVCaptureAudioFileOutput, which writes audio media to a variety of audio file formats.

This abstract superclass defines the interface for outputs that record media samples to files. File outputs can start recording to a new file using startRecordingToOutputFileURL method.

In OS X, on successive invocations of this method the output file can be changed dynamically without losing media samples. A file output can stop recording using the stopRecording method. Because files are recorded in the background, you need to specify a delegate for each new file to be notified when recorded files are finished.

In OS X, you can also set a delegate on the file output itself that can be used to control recording along exact media sample boundaries using the captureOutputDidOutputSampleBuffer event in AVFoundationMBS. Subclass of the AVCaptureOutputMBS class.

17.36.2 Methods

17.36.3 Constructor

Function: The constructor.

17.36.4 EnableEvents

Function: Enables the events for this output.

Notes: Those are normally handled automatically, but if you add event with AddHandler you need to call this method.
17.36. CLASS AVCAPTUREFILEOUTPUTMBS

17.36.5  isRecording as boolean

**Function:** Indicates whether recording is in progress.
**Notes:** The value of this property is true when the file output currently has a file to which it is writing new samples, false otherwise.

17.36.6  isRecordingPaused as boolean

**Function:** Indicates whether recording to the current output file is paused.
**Notes:** This property indicates recording to the file returned by outputFileURL has been previously paused using the pauseRecording method. When a recording is paused, captured samples are not written to the output file, but new samples can be written to the same file in the future by calling resumeRecording.

17.36.7  outputFileURL as string

**Function:** The URL to which output is directed. (read-only)

17.36.8  pauseRecording

**Function:** Pauses recording to the current output file.
**Notes:**
This method causes the receiver to stop writing captured samples to the current output file returned by outputFileURL, but leaves the file open so that samples can be written to it in the future, if resumeRecording is called. This allows you to record multiple media segments that are not contiguous in time to a single file.

In OS X, if this method is called within the AVFoundationMBS captureOutputDidFinishRecordingToOutputFileAtURL event, the last samples written to the current file are guaranteed to be those that were output immediately before those in the sample buffer passed to that method.

17.36.9  recordedDuration as CMTimeMBS

**Function:** Indicates the duration of the media recorded to the current output file. (read-only)
Notes: If recording is in progress, this property returns the total time recorded so far.

17.36.10  recordedFileSize as Int64

Function: Indicates the size, in bytes, of the data recorded to the current output file. (read-only)
Notes: If a recording is in progress, this property returns the size in bytes of the data recorded so far.

17.36.11  resumeRecording

Function: Resumes recording to the current output file after it was previously paused using pauseRecording.
Notes:
This method causes the receiver to resume writing captured samples to the current output file returned
by outputFileURL, after recording was previously paused using pauseRecording. This allows you to record
multiple media segments that are not contiguous in time to a single file.

In OS X, if this method is called within the AVFoundationMBS captureOutputDidFinishRecordingToOut-
putFileAtURL event, the first samples written to the current file are guaranteed to be those contained in
the sample buffer passed to that method.

17.36.12  startRecordingToOutputFile(file as folderitem)

Function: Starts recording to a given file.
Notes: Same as startRecordingToOutputFileURL, but with folderitem.

17.36.13  startRecordingToOutputFileURL(URL as string)

Function: Starts recording to a given URL.
Notes:
URL: The URL of the output file. This method throws an NSInvalidArgumentException if the URL is not
a valid file URL.

The method sets the file URL to which the receiver is currently writing output media. If a file at the given
URL already exists when capturing starts, recording to the new file will fail.
In OS X, you do not need to call stopRecording before calling this method while another recording is in progress. If this method is invoked while an existing output file was already being recorded, no media samples will be discarded between the old file and the new file.

In iOS, this frame accurate file switching is not supported. You must call stopRecording before calling this method again to avoid any errors.

When recording is stopped either by calling stopRecording, by changing files using this method, or because of an error, the remaining data that needs to be included to the file will be written in the background. Therefore, you must specify a delegate that will be notified when all data has been written to the file using the AVFoundationMBS.captureOutputDidFinishRecordingToOutputFileAtURL event. The recording delegate can also optionally implement methods that inform it when data starts being written, when recording is paused and resumed, and when recording is about to be finished.

In OS X, if this method is called within the AVFoundationMBS.captureOutputDidOutputSampleBuffer event, the first samples written to the new file are guaranteed to be those contained in the sample buffer passed to that method.

Note: AVCaptureAudioFileOutput does not support startRecordingToOutputFileURL without filetype.

17.36.14 stopRecording

Function: Tells the receiver to stop recording to the current file.

Notes:

You can call this method when they want to stop recording new samples to the current file, and do not want to continue recording to another file. If you want to switch from one file to another, you should not call this method. Instead you should simply call startRecordingToOutputFileURL with the new file URL.

When recording is stopped either by calling this method, by changing files using startRecordingToOutputFileURL, or because of an error, the remaining data that needs to be included to the file will be written in the background. Therefore, before using the file, you must wait until the delegate that was specified in startRecordingToOutputFileURL is notified when all data has been written to the file using the AVFoundationMBS.captureOutputDidFinishRecordingToOutputFileAtURL method.

In OS X, if this method is called within the AVFoundationMBS.captureOutputDidOutputSampleBuffer event, the last samples written to the current file are guaranteed to be those that were output immediately before those in the sample buffer passed to that method.
17.36.15 Properties

17.36.16 maxRecordedDuration as CMTimeMBS

Function: The longest duration allowed for the recording.
Notes:
This property specifies a hard limit on the duration of recorded files. Recording is stopped when the limit
is reached and the AVFoundationMBS.captureOutputDidFinishRecordingToOutputFileAtURL event is in-
voked with an appropriate error. The default value of this property is kCMTimeInvalid, which indicates no
limit.
(Read and Write computed property)

17.36.17 maxRecordedFileSize as Int64

Function: The maximum size, in bytes, of the data that should be recorded by the receiver.
Notes:
This property specifies a hard limit on the data size of recorded files. Recording is stopped when the limit
is reached and the AVFoundationMBS captureOutputDidFinishRecordingToOutputFileAtURL event is in-
voked with an appropriate error. The default value of this property is 0, which indicates no limit.
(Read and Write computed property)

17.36.18 minFreeDiskSpaceLimit as Int64

Function: The minimum amount of free space, in bytes, required for recording to continue on a given
volume.
Notes:
This property specifies a hard lower limit on the amount of free space that must remain on a target volume
for recording to continue. Recording is stopped when the limit is reached and the AVFoundationMBS cap-
tureOutputDidFinishRecordingToOutputFileAtURL event is invoked with an appropriate error.
(Read and Write computed property)
17.37 class AVCaptureInputMBS

17.37.1 class AVCaptureInputMBS

Function: AVCaptureInput is an abstract base-class describing an input data source to an AVCaptureSession object.

Notes:
To associate an AVCaptureInput object with a session, call addInput on the session.

AVCaptureInput objects have one or more ports (instances of AVCaptureInputPort), one for each data stream they can produce. For example, an AVCaptureDevice object presenting one video data stream has one port.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.37.2 Methods

17.37.3 available as boolean

Function: Whether this class is available.

Notes: Returns true on Mac OS X 10.7 and newer.

17.37.4 Constructor

Function: The private constructor.

17.37.5 ports as AVCaptureInputPortMBS()

Function: The capture input’s ports. (read-only)

Notes:
The array contains one or more instances of AVCaptureInputPort.

Each individual AVCaptureInputPort instance posts an AVCaptureInputPortFormatDescriptionDidChangeNotification when the formatDescription of that port changes.
17.37.6  `portWithMediaType(mediaType as string) as AVCaptureInputPortMBS`

**Function:** Finds the port in the ports array with given mediatype.
**Notes:** Returns nil if not found.

17.37.7  Properties

17.37.8  Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)
17.38. class AVCaptureInputPortMBS

17.38.1 class AVCaptureInputPortMBS

Function: An AVCaptureInputPort represents a stream of data from a capture input.

Notes:
Instances of AVCaptureInput have one or more input ports, one for each data stream they can produce. For example, an AVCaptureDeviceInput presenting one video data stream has one port. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.38.2 Methods

17.38.3 available as boolean

Function: Whether this class is available.

Notes: Returns true on Mac OS X 10.7 and newer.

17.38.4 Constructor

Function: The private constructor.

17.38.5 formatDescription as CMFormatDescriptionMBS

Function: A description of the port format. (read-only)

17.38.6 input as AVCaptureInputMBS

Function: The port’s input. (read-only)
17.38.7  mediaType as string

Function: The port’s media type. (read-only)

17.38.8  Properties

17.38.9  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.38.10  Enabled as boolean

Function: Indicates whether the port is enabled.
Notes: (Read and Write computed property)
17.39  class AVCaptureMovieFileOutputMBS

17.39.1  class AVCaptureMovieFileOutputMBS

Function: AVCaptureMovieFileOutput is a concrete sub-class of AVCaptureFileOutput you use to capture
data to a QuickTime movie.
Notes:
The timeMapping.target.start of the first track segment must be kCMT imeZero, and the timeMapping.tar-
get.start of each subsequent track segment must equal CMT imeRangeGetEnd(# the previous AVCompo-
sitionTrackSegment’s timeMapping.target # ). You can use validateTrackSegments to ensure that an array
of track segments conforms to this rule.
Subclass of the AVCaptureFileOutputMBS class.

17.39.2  Methods

17.39.3  Constructor

Function: The constructor.

17.39.4  EnableEvents

Function: Enables the events for this output.
Notes: Those are normally handled automatically, but if you add event with AddHandler you need to call
this method.

17.39.5  metadata as AVMetadataItemMBS()

Function: The metadata for the output file.
Notes: The array contains AVMetadataItem objects. You use this array to add metadata such as copyright,
creation date, and so on, to the recorded movie file.
17.39.6  setMetadata(items() as AVMetadataItemMBS)

**Function:** Sets the metadata for the output file.
**Notes:** The array contains AVMetadataItem objects. You use this array to add metadata such as copyright, creation date, and so on, to the recorded movie file.

17.39.7  Properties

17.39.8  movieFragmentInterval as CMTimeMBS

**Function:** Indicates the number of seconds of output that are written per fragment.
**Notes:**
The default is 10 seconds. Set to kCMTimeInvalid to disable movie fragment writing (not typically recommended).

A QuickTime movie is comprised of media samples and a sample table identifying their location in the file. A movie file without a sample table is unreadable.

In a processed file, the sample table typically appears at the beginning of the file. It may also appear at the end of the file, in which case the header contains a pointer to the sample table at the end. When a new movie file is being recorded, it is not possible to write the sample table since the size of the file is not yet known. Instead, the table is must be written when recording is complete. If no other action is taken, this means that if the recording does not complete successfully (for example, in the event of a crash), the file data is unusable (because there is no sample table). By periodically inserting "movie fragments" into the movie file, the sample table can be built up incrementally. This means that if the file is not written completely, the movie file is still usable (up to the point where the last fragment was written).
(Read and Write computed property)

17.39.9  outputSettingsForConnection(connection as AVCaptureConnectionMBS) as Dictionary

**Function:** Returns the options the receiver uses to re-encode media from the given connection as it is being recorded.
**Notes:**
connection: The connection delivering the media to be re-encoded.
Returns an Dictionary of output settings.
See AVAudioSettings.h for audio connections or AVVideoSettings.h for video connections for more information on how to construct an output settings dictionary. If the returned value is an empty dictionary (i.e. new dictionary, the format of the media from the connection will not be changed before being written to the file. If setOutputSettings was called with a nil dictionary, this method returns a non-nil dictionary reflecting the settings used by the AVCaptureSession’s current sessionPreset.
(Read and Write computed property)
17.40 class AVCaptureOutputMBS

17.40.1 class AVCaptureOutputMBS

Function: AVCaptureOutput is an abstract base-class describing an output destination of an AVCaptureSession object.
Notes:
AVCaptureOutput provides an abstract interface for connecting capture output destinations, such as files and video previews, to an capture session (an instance of AVCaptureSession). A capture output can have multiple connections represented by AVCaptureConnection objects, one for each stream of media that it receives from a capture input (an instance of AVCaptureInput). A capture output does not have any connections when it is first created. When you add an output to a capture session, connections are created that map media data from that session’s inputs to its outputs.
You can add concrete AVCaptureOutput instances to an capture session using addOutput.

17.40.2 Methods

17.40.3 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

17.40.4 connections as AVCaptureConnectionMBS()

Function: The capture output object’s connections. (read-only)
Notes: The value of this property is an array of AVCaptureConnection objects, each describing the mapping between the receiver and the capture input ports (see AVCaptureInputPort) of one or more capture inputs (see AVCaptureInput).

17.40.5 connectionWithMediaType(mediaType as string) as AVCaptureConnectionMBS

Function: Returns the first connection in the connections array with an input port of a specified media
Returns the first capture connection in the connections array that has an AVCaptureInputPort with media type mediaType, or nil if no connection with the specified media type is found.

17.40.6 Constructor

17.40.7 Properties

17.40.8 Handle as Integer

17.41 class AVCaptureScreenInputMBS

17.41.1 class AVCaptureScreenInputMBS

Function: AVCaptureScreenInput is a concrete subclass of AVCaptureInput that provides an interface for capturing media from a screen or a portion of a screen.

Notes:
Instances of AVCaptureScreenInput are input sources for AVCaptureSession objects that provide media data from one of the screens connected to the system, represented by CGDirectDisplayIDs.
Subclass of the AVCaptureInputMBS class.

17.41.2 Methods

17.41.3 Constructor(CGDisplay as Variant)

Function: Initializes a capture screen input that provides media data from a given display.

Notes:
CGDisplay: The display from which to capture video. Must be CGDisplayMBS object.
Handle is non zero on success.

17.41.4 minFrameDuration as CMTimeMBS

Function: The screen input’s minimum frame duration.

Notes:
The minFrameDuration is the reciprocal of its maximum frame rate.

You use this property to request a maximum frame rate at which the input produces video frames. The requested rate may not be achievable due to overall bandwidth, so actual frame rates may be lower.

17.41.5 scaleFactor as Double

Function: Indicates the factor by which video buffers captured from the screen are to be scaled.

Notes: By default, AVCaptureScreenInput captures the video buffers from the display at a scale factor of 1.0 (no scaling). Set this property to scale the buffers by a given factor; for example a 320x240 capture area
with a scaleFactor of 2.0 produces video buffers at 640x480.

### 17.41.6 Properties

#### 17.41.7 capturesCursor as boolean

**Function:** A property indicating whether the cursor should be rendered to the captured output.  
**Notes:**  
By default, AVCaptureScreenInput draws the cursor in its captured output. If this property is set to false, the captured output contains only the windows on the screen. Cursor is omitted. Note that cursor position and mouse button state at the time of capture is preserved in CMSampleBuffers emitted from AVCaptureScreenInput. See the inline documentation for kCMIOSampleBufferAttachmentKey_MouseAndKeyboardModifiers in `<CoreMediaIO/CMIOSampleBuffer.h>`

Available in Mac OS X 10.8 and newer.  
(Read and Write computed property)

#### 17.41.8 capturesMouseClicks as boolean

**Function:** Indicates whether mouse clicks should be highlighted in the captured output.  
**Notes:**  
By default, AVCaptureScreenInput does not highlight mouse clicks in its captured output.  
If you set this property is set to true, mouse clicks are highlighted (a circle is drawn around the mouse for the duration of the click) in the captured output.  
(Read and Write computed property)

#### 17.41.9 cropRect as CGRectMBS

**Function:** Indicates the bounding rectangle of the screen area to be captured, in pixels.  
**Notes:**  
By default, AVCaptureScreenInput captures the entire area of the displayID with which it is associated.  
Set the value of this property to limit the capture rectangle to a subsection of the screen.
The rectangle should define a smaller section of the screen in the screen’s coordinate system. The origin (0,0) is the bottom-left corner of the screen.

(Read and Write computed property)

17.41.10 **removesDuplicateFrames as boolean**

*Function:* A property indicating whether duplicate frames should be removed by the input.

*Notes:*

By default, AVCaptureScreenInput performs frame differencing and when it detects duplicate frames, it drops them. If this property is set to false, the captured output receives all frames from the input.

Available in Mac OS X 10.8 and newer.

(Read and Write computed property)
17.42. **CLASS AVCaptureSessionMBS**

### 17.42 class AVCaptureSessionMBS

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** An AVCaptureConnection object represents a connection between capture input and capture output objects associated with a capture session.

**Notes:**

Capture inputs (instances of AVCaptureInput) have one or more input ports (instances of AVCaptureInputPort). Capture outputs (instances of AVCaptureOutput) can accept data from one or more sources (for example, an AVCaptureMovieFileOutput object accepts both video and audio data).

You can only add an AVCaptureConnection instance to a session using addConnection if canAddConnection returns true. When using addInput or addOutput, connections are formed automatically between all compatible inputs and outputs. You only need to add connections manually when adding an input or output with no connections. You can also use connections to enable or disable the flow of data from a given input or to a given output.

### 17.42.2 Methods

#### 17.42.3 addConnection(connection as AVCaptureConnectionMBS)

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Adds a given capture connection to the session.

**Notes:**

connection: The capture connection to add to the session.

You can only add an AVCaptureConnection instance to a session using this method if canAddConnection returns true. When using addInput or addOutput, connections are formed automatically between all compatible inputs and outputs. Manually adding connections is only necessary when adding an input or output with no connections.

#### 17.42.4 addInput(connection as AVCaptureInputMBS)

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Adds a given input to the session.

**Notes:**

input: An input to add to the session.
You can only add an input to a session using this method if `canAddInput` returns true. You can invoke this method while the session is running.

### 17.42.5 addInputWithNoConnections(input as AVCaptureInputMBS)

**Function:** Adds an capture input to the session without forming any connections.

**Notes:**
- `input`: The capture input to add to the session.
- You can invoke this method while the session is running.
- Typically you should use `addInput` to add an input to a session. You use this method if you need fine-grained control over which inputs are connected to which outputs.

### 17.42.6 addOutput(connection as AVCaptureOutputMBS)

**Function:** Adds a given output to the session.

**Notes:**
- `output`: An output to add to the session.
- You can only add an output to a session using this method if `canAddOutput` returns true.
- You can invoke this method while the session is running.

### 17.42.7 addOutputWithNoConnections(output as AVCaptureOutputMBS)

**Function:** Adds an capture output to the session without forming any connections.

**Notes:**
- `output`: The capture output to add to the session.
- You can invoke this method while the session is running.
- Typically you should use `addOutput` to add an output to a session. You use this method if you need fine-grained control over which inputs are connected to which outputs.

### 17.42.8 available as boolean

**Function:** Whether this class is available.
17.42.9 beginConfiguration

Function: Indicates the start of a set of configuration changes to be made atomically.
Notes:
You use beginConfiguration and commitConfiguration to batch multiple configuration operations on a running session into an atomic update.

After calling beginConfiguration, you can for example add or remove outputs, alter the sessionPreset, or configure individual capture input or output properties. No changes are actually made until you invoke commitConfiguration, at which time they are applied together.

17.42.10 canAddConnection(connection as AVCaptureConnectionMBS) as boolean

Function: Returns a Boolean value that indicates whether a given connection can be added to the receiver.
Notes:
connection: An AVCaptureConnection instance.
Returns true if connection can be added to the receiver, otherwise false.

17.42.11 canAddInput(input as AVCaptureInputMBS) as boolean

Function: Returns a Boolean value that indicates whether a given input can be added to the session.
Notes:
input: An input that you want to add to the session.
Returns true if input can be added to the session, otherwise false.

17.42.12 canAddOutput(output as AVCaptureOutputMBS) as boolean

Function: Returns a Boolean value that indicates whether a given output can be added to the session.
Notes:
output: An output that you want to add to the session.
Returns true if output can be added to the session, otherwise false.
17.42.13 canSetSessionPreset(preset as string) as boolean

**Function:** Returns a Boolean value that indicates whether the receiver can use the given preset.
**Notes:**

preset: A preset you would like to set for the receiver. For possible values, see AVFoundationMBS.
Returns true if the receiver can use preset, otherwise false.

17.42.14 commitConfiguration

**Function:** Commits a set of configuration changes.
**Notes:** For discussion, see beginConfiguration.

17.42.15 Constructor

**Function:** The constructor.

17.42.16 inputs as AVCaptureInputMBS()

**Function:** The capture session’s inputs. (read-only)
**Notes:** The array contains instances of subclasses of AVCaptureInput.

17.42.17 isRunning as boolean

**Function:** Indicates whether the receiver is running. (read-only)
**Notes:** You can observe the value of this property using key-value observing.
17.42. CLASS AVCaptureSessionMBS

17.42.18 outputs as AVCaptureOutputMBS()

Function: The capture session’s outputs. (read-only)
Notes: The array contains instances of subclasses of AVCaptureOutput.

17.42.19 removeConnection(connection as AVCaptureConnectionMBS)

Function: Removes a capture connection from the session.
Notes: connection: The capture connection to remove from the session.
You can invoke this method while the session is running.

17.42.20 removeInput(connection as AVCaptureInputMBS)

Function: Removes a given input.
Notes: input: An input to remove from the receiver.
You can invoke this method while the session is running.

17.42.21 removeOutput(connection as AVCaptureOutputMBS)

Function: Removes a given output.
Notes: output: An output to remove from the receiver.
You can invoke this method while the session is running.

17.42.22 startRunning

Function: Tells the receiver to start running.
Notes: startRunning and stopRunning are asynchronous operations. If an error occurs during a
capture session, you receive an AVCaptureSessionRuntimeErrorNotification.
17.42.23 stopRunning

Function: Tells the receiver to stop running.
Notes: startRunning and stopRunning are asynchronous operations. If an error occurs during a capture session, you receive an AVCaptureSessionRuntimeErrorNotification.

17.42.24 Properties

17.42.25 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.42.26 sessionPreset as string

Function: A constant value indicating the quality level or bitrate of the output.
Notes:
You use this property to customize the quality level or bitrate of the output. For possible values of sessionPreset, see AVFoundationMBS. The default value is AVCaptureSessionPresetHigh.
You can set this value while the session is running.
You can only set a preset if canSetSessionPreset: returns true for that preset.
(Read and Write computed property)
17.43. **CLASS AVCAPTURESTILLIMAGEOUTPUTMBS**

17.43 **class AVCaptureStillImageOutputMBS**

17.43.1 **class AVCaptureStillImageOutputMBS**

**Function:** AVCaptureStillImageOutput is a concrete sub-class of AVCaptureOutput that you use to capture a high-quality still image with accompanying metadata.  
**Notes:** Subclass of the AVCaptureOutputMBS class.

17.43.2 **Methods**

17.43.3 **availableImageDataCodecTypes as string()**

**Function:** The supported image codec formats that can be specified in outputSettings. (read-only)  
**Example:**

```vbs
dim a as new AVCaptureStillImageOutputMBS
MsgBox join(a.availableImageDataCodecTypes)
```

**Notes:** The value of this property is an array of Strings that you can use as values for the AVVideoCodecKey in the outputSettings property.

17.43.4 **availableImageDataCVPixelFormatTypes as Integer()**

**Function:** The supported image pixel formats that can be specified in outputSettings. (read-only)  
**Example:**

```vbs
dim a as new AVCaptureStillImageOutputMBS
dim availableImageDataCVPixelFormatTypes() as Integer = a.availableImageDataCVPixelFormatTypes()
break // check array in debugger
```

**Notes:**

The value of this property is an array of numbers that you can use as values for the kCVPixelBufferPixelFormatTypeKey in the outputSettings property.  
Currently only "jpeg".  
Available in OS X v10.7 and later.
17.43.5 captureStillImageAsynchronously(connection as AVCaptureConnectionMBS, prepareJpegStillImage as boolean, tag as Variant = nil)

Function: Initiates a still image capture and returns immediately.

Notes:
connection: The connection from which to capture the image.

Pass true for prepareJpegStillImage to have the plugin prepare jpeg data for you.

The buffer attachments may contain metadata appropriate to the image data format. For example, a buffer containing JPEG data may carry a kCGImagePropertyExifDictionary as an attachment. See ImageIO/CGImageProperties.h for a list of keys and value types.

error
If the request could not be completed, an NSError object that describes the problem; otherwise nil.

This method returns immediately after it is invoked, later calling the AVFoundationMBS.captureStillImageAsynchronouslyCompleted event when image data is ready. If the request could not be completed, the error parameter will contain an NSError object describing the failure.

Available in OS X v10.7 and later.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

17.43.6 Constructor

Function: The constructor.

17.43.7 jpegStillImageNSDataRepresentation(jpegSampleBuffer as CMSampleBufferMBS) as memoryblock

Function: Returns an memoryblock representation of a still image data and metadata attachments in a JPEG sample buffer.

Notes:
jpegSampleBuffer: The sample buffer carrying JPEG image data, optionally with Exif metadata sample
buffer attachments.
This method throws an NSInvalidArgumentException if jpegSampleBuffer is nil or not in the JPEG format.

Returns memory block representation of jpegSampleBuffer.

This method merges the image data and Exif metadata sample buffer attachments without re-compressing the image.
The returned memory block object is suitable for writing to disk.

Available in OS X v10.7 and later.

17.43.8 Properties

17.43.9 isCapturingStillImage as boolean

Function: A boolean value that becomes true when a still image is being captured.
Notes: The value of this property is a BOOL that becomes true when a still image is being captured, and false when no still image capture is underway. This property is key-value observable.
(Read only property)

17.43.10 outputSettings as dictionary

Function: The compression settings for the output.
Notes: You specify the compression settings using keys from AVVideoSettings.h, or a dictionary of pixel buffer attributes using keys from CVPixelBuffer.h.

Currently the only supported keys are AVVideoCodecKey and kCVPixelBufferPixelFormatTypeKey. The recommended values are kCMVideoCodecType_JPEG, kCVPixelFormatType_420YpCrCb8BiPlanarFullRange and kCVPixelFormatType_32BGRA.

Available in OS X v10.7 and later.
(Read and Write computed property)
17.44 class AVCaptureVideoDataOutputMBS

17.44.1 class AVCaptureVideoDataOutputMBS

Function: AVCaptureVideoDataOutput is a concrete sub-class of AVCaptureOutput you use to process uncompressed frames from the video being captured, or to access compressed frames.
Notes:
An instance of AVCaptureVideoDataOutput produces video frames you can process using other media APIs. You can access the frames with the AVFoundationMBS.captureOutputDidOutputSampleBuffer event. Subclass of the AVCaptureOutputMBS class.

17.44.2 Methods

17.44.3 availableVideoCodecTypes as string()

Function: Indicates the supported video codec formats that can be specified in videoSettings. (read-only)
Notes: The value of this property is an array of String objects you can use as values for the AVVideoCodecKey in the videoSettings property. The first format in the returned list is the most efficient output format.

17.44.4 Constructor

Function: The constructor.

17.44.5 EnableEvents

Function: Enables the events for this output.
Notes: Those are normally handled automatically, but if you add event with AddHandler you need to call this method.
17.44.6 Properties

17.44.7 alwaysDiscardsLateVideoFrames as boolean

Function: Indicates whether video frames are dropped if they arrive late.

Notes:

When the value of this property is true, the object immediately discards frames that are captured while the dispatch queue handling existing frames is blocked in the AVFoundationMBS.capturcOutputDidOutputSampleBuffer event.

When the value of this property is false, delegates are allowed more time to process old frames before new frames are discarded, but application memory usage may increase significantly as a result.

The default is true.
(Read and Write computed property)

17.44.8 videoSettings as dictionary

Function: The compression settings for the output.

Notes:

The dictionary contains values for compression settings keys defined in AVVideoSettings.h, or pixel buffer attributes keys defined in `<CoreVideo/CVPixelBuffer.h>`(see CVPixelBufferRef). The only key currently supported is the kCVPixelBufferPixelFormatTypeKey key.
(The plugin defines such keys in AVFoundationMBS)

To get possible values for the supported video pixel formats (kCVPixelBufferPixelFormatTypeKey) and video codec formats (AVVideoCodecKey), see availableVideoCVPixelFormatTypes and availableVideoCodecTypes respectively.

To receive samples in their device native format, set this property to nil:

If you set this property to nil and then subsequently query it, you will get a dictionary reflecting the settings used by the capture session's current sessionPreset.
(Read and Write computed property)
17.45 class AVCaptureVideoPreviewLayerMBS

17.45.1 class AVCaptureVideoPreviewLayerMBS

**Function:** AVCaptureVideoPreviewLayer is a subclass of CALayer that you use to display video as it is being captured by an input device.
**Notes:**
You use the videoGravity property to influence how content is viewed relative to the layer bounds. On some hardware configurations, you can manipulate the orientation of the layer using orientation and mirrored. Subclass of the CALayerMBS class.

17.45.2 Methods

17.45.3 connection as AVCaptureConnectionMBS

**Function:** The capture connection describing the AVCaptureInputPort to which the preview layer is connected. (read-only)
**Notes:** If you invoke Constructor, layerWithSession, or set session with a valid AVCaptureSession instance, a connection is formed to the first eligible video AVCaptureInput object. If the preview layer is detached from a session, the connection property becomes nil.

17.45.4 Constructor(session as AVCaptureSessionMBS, WithConnection as boolean = true)

**Function:** Initializes a preview layer with a given capture session.
**Notes:** Only pass WithConnection=false here if you intend to manually form a connection between a desired AVCaptureInputPort object and the receiver using addConnection.

17.45.5 layerWithSession(session as AVCaptureSessionMBS) as AVCaptureVideoPreviewLayerMBS

**Function:** Returns a preview layer initialized with a given capture session.
**Notes:**
session: The capture session from which to derive the preview.
Returns a preview layer initialized to use session.

### 17.45.6 `layerWithSessionWithNoConnection(session as AVCaptureSessionMBS)` as AVCaptureVideoPreviewLayerMBS

**Function:** Returns a preview layer using a given capture session but without making any connections.

**Notes:**
- `session`: The capture session to be previewed.
- Return a preview layer initialized with session but with no connections to any of the session’s eligible video inputs.

Only use this method if you intend to manually form a connection between a desired AVCaptureInputPort object and the receiver using addConnection.

### 17.45.7 `setSessionWithNoConnection(session as AVCaptureSessionMBS)`

**Function:** Attaches the receiver to a given session without implicitly forming a connection.

**Notes:**
- This method attaches the receiver to a given session without implicitly forming a connection to the first eligible video AVCaptureInputPort object. You should only use this method if you intend to manually form a connection between a desired AVCaptureInputPort object and the receiver using addConnection.

### 17.45.8 Properties

### 17.45.9 `session as AVCaptureSessionMBS`

**Function:** The capture session instance being previewed.

**Notes:** (Read and Write computed property)

### 17.45.10 `videoGravity as string`

**Function:** Indicates how the video is displayed within a player layer’s bounds rect.

**Notes:**
- Options are AVLayerVideoGravityResizeAspect, AVLayerVideoGravityResizeAspectFill and AVLayerVideoGravityResize. The default is AVLayerVideoGravityResizeAspect.
This property is animatable.
(Read and Write computed property)
17.46. **CLASS AVCOMPOSITIONMBS**

17.46 **class AVCompositionMBS**

**17.46.1 class AVCompositionMBS**

**Function:** An AVComposition object combines media data from multiple file-based sources in a custom temporal arrangement, in order to present or process media data from multiple sources together.  
**Notes:**  
All file-based audiovisual assets are eligible to be combined, regardless of container type. The tracks in an AVComposition object are fixed; to change the tracks, you use an instance of its subclass, AVMutableComposition.  

At its top-level, AVComposition is a collection of tracks, each presenting media of a specific media type, e.g. audio or video, according to a timeline. Each track is represented by an instance of AVCompositionTrack. Each track is comprised of an array of track segments, represented by instances of AVCompositionTrackSegment. Each segment presents a portion of the media data stored in a source container, specified by URL, a track identifier, and a time mapping. The URL specifies the source container, and the track identifier indicates the track of the source container to be presented.

The time mapping specifies the temporal range of the source track that’s to be presented and also specifies the temporal range of its presentation in the composition track. If the durations of the source and destination ranges of the time mapping are the same, the media data for the segment will be presented at its natural rate. Otherwise, the segment will be presented at a rate equal to the ratio source.duration / target.duration.

You can access the track segments of a track using the segments property (an array of AVCompositionTrackSegment objects) of AVCompositionTrack. The collection of tracks with media type information for each, and each with its array of track segments (URL, track identifier, and time mapping), form a complete low-level representation of a composition. This representation can be written out by clients in any convenient form, and subsequently the composition can be reconstituted by instantiating a new AVMutableComposition with AVMutableCompositionTrack objects of the appropriate media type, each with its segments property set according to the stored array of URL, track identifier, and time mapping.

A higher-level interface for constructing compositions is also presented by AVMutableComposition and AVMutableCompositionTrack, offering insertion, removal, and scaling operations without direct manipulation of the trackSegment arrays of composition tracks. This interface makes use of higher-level constructs such as AVAsset and AVAssetTrack, allowing the client to make use of the same references to candidate sources that it would have created in order to inspect or preview them prior to inclusion in a composition.  
**Subclass of the AVAssetMBS class.**  
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.
17.46.2 Methods

17.46.3 CompositionTracks as AVCompositionTrackMBS()

Function: An array of AVCompositionTrack objects contained by the composition. (read-only)

17.46.4 Constructor

Function: The private constructor.

17.46.5 mutableCopy as AVMutableCompositionMBS

Function: Creates an editable copy of the object.

17.46.6 naturalSize as CGSizeMBS

Function: Indicates the authored size of the visual portion of the composition. (read-only)
17.47 class AVCompositionTrackMBS

17.47.1 class AVCompositionTrackMBS

**Function:** The class for a composition track.

**Notes:**

An AVCompositionTrack object provides the low-level representation of tracks in an AVComposition object, comprising a media type, a track identifier, and an array of AVCompositionTrackSegment objects, each comprising a URL, and track identifier, and a time mapping.

The timeMapping.target.start of the first track segment in a composition track is kCMTimeZero, and the timeMapping.target.start of each subsequent track segment equals CMTimestampGetEnd(<# previous-TrackSegment#>).timeMapping.target).

The AVFoundation framework also provides a mutable subclass, AVMutableCompositionTrack.

Subclass of the AVAssetTrackMBS class.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.47.2 Methods

17.47.3 CompositionTrackSegments as AVCompositionTrackSegmentMBS()

**Function:** The composition track’s track segments. (read-only)

17.47.4 Constructor

**Function:** The private constructor.
17.48  **class AVCompositionTrackSegmentMBS**

17.48.1  **class AVCompositionTrackSegmentMBS**

**Function:** An AVCompositionTrackSegment object represents a segment of an AVCompositionTrack object, comprising a URL, and track identifier, and a time mapping from the source track to the composition track.

**Notes:**
You typically use this class to save the low-level representation of a composition to storage formats of your choosing and to reconstitute them from storage.
Subclass of the AVAssetTrackSegmentMBS class.

17.48.2  **Methods**

17.48.3  **compositionTrackSegmentWithTimeRange(timeRange as CMTimeRangeMBS)** as AVCompositionTrackSegmentMBS

**Function:** Returns a composition track segment that presents an empty track segment.

**Notes:**
- timeRange: The time range of the empty composition track segment.

Returns a composition track segment that presents an empty track segment.

This method invokes Constructor with an empty URL, a trackID of kCMPersistentTrackID_Invalid, a time mapping with source.start and source.duration equal to kCMTimeInvalid, and with a target equal to timeRange.

This is the standard low-level representation of an empty track segment.

17.48.4  **Constructor(timeRange as CMTimeRangeMBS)**

**Function:** Initializes a track segment that presents an empty track segment.

**Notes:**
- timeRange: The time range of the empty track segment.

This method invokes Constructor with an empty URL, a trackID of kCMPersistentTrackID_Invalid, a
time mapping with source.start and source.duration equal to kCMTimeInvalid, and with a target equal to timeRange.

This is the standard low-level representation of an empty track segment.

### 17.48.5 isEmpty as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Indicates whether the segment is empty. (read-only) **Notes:** An empty segment has a valid target time range but sourceURL is nil and the source start time is kCMTimeInvalid; all other fields are undefined.

### 17.48.6 sourceTrackID as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The track ID of the container file of the media presented by the track segment. (read-only)

### 17.48.7 sourceURL as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The container file of the media presented by the track segment. (read-only)
17.49 class AVEdgeWidthsMBS

17.49.1 class AVEdgeWidthsMBS

Function: Defines the thickness of the edge processing region, in pixels.

17.49.2 Properties

17.49.3 Bottom as Double

Function: The thickness, in pixels, of the bottom-edge processing region of the edgeWidths property.
Notes: (Read only property)

17.49.4 Left as Double

Function: The thickness, in pixels, of the left-edge processing region of the edgeWidths property.
Notes: (Read only property)

17.49.5 Right as Double

Function: The thickness, in pixels, of the right-edge processing region of the edgeWidths property.
Notes: (Read only property)

17.49.6 Top as Double

Function: The thickness, in pixels, of the top-edge processing region of the edgeWidths property.
Notes: (Read only property)
17.50. CLASS AVFOUNDATIONMBS

17.50 class AVFoundationMBS

17.50.1 class AVFoundationMBS

Function: The central AVFoundation class for receiving events and getting constants.
Notes:
All events from AVFoundation classes (delegates, notifications) are routed to your subclass of AVFounda-
tionMBS.
Events received on a helper thread a routed to main thread in order to allow you to use Real Studio code
which is not thread safe.
Please use available property on classes to check if they are available. Some classes are only for Mac OS X
10.8 or future versions.

If you need some new methods/classes in AVFoundation from Mac OS X 10.10 or newer, please email us.

17.50.2 Methods

17.50.3 available as boolean

Function: Whether AVFoundation is available.
Notes: Returns true on Mac OS X 10.7 and newer.

17.50.4 AVAudioBitRateStrategy_Constant as string

Function: One of the values for the AVEncoderBitRateStrategyKey encoder setting.
Notes: Available in OS X v10.9 and later.

17.50.5 AVAudioBitRateStrategy_LongTermAverage as string

Function: One of the values for the AVEncoderBitRateStrategyKey encoder setting.
Notes: Available in OS X v10.9 and later.
17.50.6 AVAudioBitRateStrategy_Variable as string

Function: One of the values for the AVEncoderBitRateStrategyKey encoder setting.
Notes: Available in OS X v10.9 and later.

17.50.7 AVAudioBitRateStrategy_VariableConstrained as string

Function: One of the values for the AVEncoderBitRateStrategyKey encoder setting.
Notes: Available in OS X v10.9 and later.

17.50.8 AVAudioTimePitchAlgorithmSpectral as string

Function: One of the values for the time pitch algorithms.
Notes:
Highest quality, most computationally expensive. Suitable for music. Variable rate from 1/32 to 32.
Available in OS X v10.9 and later.
Default for Mac OS X.

17.50.9 AVAudioTimePitchAlgorithmTimeDomain as string

Function: One of the values for the time pitch algorithms.
Notes:
Modest quality pitch algorithm that is less computationally intensive. Suitable for voice. Variable rate from 1/32 to 32.
Available in OS X v10.9 and later.

17.50.10 AVAudioTimePitchAlgorithmVarispeed as string

Function: One of the values for the time pitch algorithms.
Notes:
High quality, no pitch correction. Pitch varies with rate. Variable rate from 1/32 to 32.
Available in OS X v10.9 and later.
17.50.11 **AVCaptureDeviceWasConnectedNotification** as string

**Function:** Notification that is posted when a new device becomes available.

17.50.12 **AVCaptureDeviceWasDisconnectedNotification** as string

**Function:** Notification that is posted when an existing device becomes unavailable.

17.50.13 **AVCaptureInputPortFormatDescriptionDidChangeNotification** as string

**Function:** Posted if the formatDescription of the capture input port changes.

17.50.14 **AVCaptureSessionDidStartRunningNotification** as string

**Function:** Posted when a capture session starts.

17.50.15 **AVCaptureSessionDidStopRunningNotification** as string

**Function:** Posted when a capture session stops.

17.50.16 **AVCaptureSessionErrorKey** as string

**Function:** Key to retrieve information from a notification from a capture session.

**Notes:** Key to retrieve the error object from the user info dictionary of an AVCaptureSessionRuntimeErrorNotification.

17.50.17 **AVCaptureSessionPreset1280x720** as string

**Function:** One of the constants to define capture setting presets using the sessionPreset property.
CHAPTER 17. AVFOUNDATION

Notes: Specifies capture settings suitable for 720p quality (1280x720 pixel) video output.

17.50.18 AVCaptureSessionPreset320x240 as string

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for 320x240 pixel video output.

17.50.19 AVCaptureSessionPreset352x288 as string

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for CIF quality (352x288 pixel) video output.

17.50.20 AVCaptureSessionPreset640x480 as string

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for VGA quality (640x480 pixel) video output.

17.50.21 AVCaptureSessionPreset960x540 as string

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for quarter HD quality (960x540 pixel) video output.

17.50.22 AVCaptureSessionPresetHigh as string

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for high quality video and audio output.

17.50.23 AVCaptureSessionPresetiFrame1280x720 as string

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes:
Specifies capture settings to achieve 1280x720 quality iFrame H.264 video at about 40 Mbits/sec with AAC audio.
QuickTime movies captured in iFrame format are optimal for editing applications.
Available in OS X v10.9 and later.

17.50.24 AVCaptureSessionPresetiFrame960x540 as string

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes:
Specifies capture settings to achieve 960x540 quality iFrame H.264 video at about 30 Mbits/sec with AAC audio.
QuickTime movies captured in iFrame format are optimal for editing applications.
Available in OS X v10.9 and later.

17.50.25 AVCaptureSessionPresetLow as string

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for output video and audio bitrates suitable for sharing over 3G.

17.50.26 AVCaptureSessionPresetMedium as string

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for output video and audio bitrates suitable for sharing over WiFi.

17.50.27 AVCaptureSessionPresetPhoto as string

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for high resolution photo quality output.
17.50.28 AVCaptureSessionRuntimeErrorNotification as string

**Function:** Posted if an error occurred during a capture session.
**Notes:** You retrieve the underlying error from the notification’s user info dictionary using the key AVCaptureSessionErrorKey.

17.50.29 AVChannelLayoutKey as string

**Function:** Key to retrieve channel layout information for playback.
**Notes:** The corresponding value is an Memoryblock containing an AudioChannelLayout structure.

17.50.30 AVCaptureSessionBeginTimeAtZero as Double

**Function:** Support for integration with Core Animation.
**Notes:** Use this constant to set the CoreAnimation’s animation beginTime property to be time 0. The constant is a small, non-zero, positive value which prevents CoreAnimation from replacing 0.0 with CACurrentMediaTime.

17.50.31 AVEncoderAudioQualityForVBRKey as string

**Function:** One of the Sample rate converter audio quality settings.

17.50.32 AVEncoderAudioQualityKey as string

**Function:** One of the audio encoder setting keys for the AVAudioRecorder class.
**Notes:** Value is a AVAudioQuality* constant.

17.50.33 AVEncoderBitDepthHintKey as string

**Function:** One of the audio encoder setting keys for the AVAudioRecorder class.
17.50. CLASS AVFOUNDATIONMBS

Notes: An integer ranging from 8 through 32.

17.50.34 AVEncoderBitRateKey as string

Function: One of the audio encoder setting keys for the AVAudioRecorder class.
Notes: An integer that identifies the audio bit rate.

17.50.35 AVEncoderBitRatePerChannelKey as string

Function: One of the audio encoder setting keys for the AVAudioRecorder class.
Notes: An integer that identifies the audio bit rate per channel.

17.50.36 AVEncoderBitRateStrategyKey as string

Function: One of the Sample rate converter audio quality settings.

17.50.37 AVErrorDeviceKey as string

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is a string with the name of the device.

17.50.38 AVErrorDiscontinuityFlagsKey as string

Function: One of the keys in the user info dictionary in errors AVFoundation creates.

17.50.39 AVErrorFileSizeKey as string

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is a number containing the size of the file in bytes.
17.50.40 AVErrorMediaSubTypeKey as string

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is an array of integers that specify media subtypes.
The types are represented by four character codes (4ccs), as defined in CoreAudioTypes.h for audio media
and in CMFormatDescription.h for video media.

17.50.41 AVErrorMediaTypeKey as string

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is a string that specified a media format.

17.50.42 AVErrorPIDKey as string

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is a number containing a process ID number.

17.50.43 AVErrorRecordingSuccessfullyFinishedKey as string

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is a Boolean value indicating whether recording finished successfully.

17.50.44 AVErrorTimeKey as string

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is an NSValue object containing a CMTime.

17.50.45 AVFileType3GPP as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
The value of this UTI is "public.3gpp".
Files are identified with the .3gp, .3gpp, and .sdv extensions.
Available in macOS 10.11 or newer.

17.50.46 AVFileType3GPP2 as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
The value of this UTI is "public.3gpp2".
Files are identified with the .3g2, .3gp2 extensions.
Available in macOS 10.11 or newer.

17.50.47 AVFileTypeAC3 as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
UTI for the AC-3 audio file format.
The value of this UTI is public.ac3-audio. Files are identified with the .ac3 extension.
Available in OS X v10.9 and later.

17.50.48 AVFileTypeAIFC as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
UTI for the AIFC audio file format.
The value of this UTI is public.aifc-audio. Files are identified with the .aifc and .cdda extensions.

17.50.49 AVFileTypeAIFF as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
UTI for the AIFF audio file format. The value of this UTI is public.aiff-audio. Files are identified with the .aif and .aiff extensions.

17.50.50 AVFileTypeAMR as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
UTI for the adaptive multi-rate audio file format. The value of this UTI is org.3gpp.adaptive-multi-rate-audio. Files are identified with the .amr extension.

17.50.51 AVFileTypeAppleM4A as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
UTI for the Apple m4a audio file format. The value of this UTI is com.apple.m4a-audio. Files are identified with the .m4a extension.

17.50.52 AVFileTypeAppleM4V as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
UTI for the iTunes video file format. The value of this UTI is com.apple.mpeg-4-video. Files are identified with the .m4v extension.

17.50.53 AVFileTypeAVCI as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
The value of this UTI is "public.avci". Files are identified with the .avci extension. Available in macOS 10.13 or newer.
17.50.54  AVFileTypeCoreAudioFormat as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
UTI for the CoreAudio file format.
The value of this UTI is com.apple.coreaudio-format. Files are identified with the .caf extension.

17.50.55  AVFileTypeDNG as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
The value of this UTI is "com.adobe.raw-image".
Files are identified with the .dng extension.
Available in macOS 10.13 or newer.

17.50.56  AVFileTypeEnhancedAC3 as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
The value of this UTI is "public.ac3-audio".
Files are identified with the .ac3 extension.
Available in macOS 10.9 or newer.

17.50.57  AVFileTypeHEIC as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
The value of this UTI is "public.heic".
Files are identified with the .heic extension.
Available in macOS 10.13 or newer.
17.50.58 AVFileTypeHEIF as string

Function: One of the file format uniform type identifiers (UTIs).
Notes: The value of this UTI is "public.heif".
Files are identified with the .heif extension.
Available in macOS 10.13 or newer.

17.50.59 AVFileTypeJPEG as string

Function: One of the file format uniform type identifiers (UTIs).
Notes: The value of this UTI is "public.jpeg".
Files are identified with the .jpg or .jpeg extension.
Available in macOS 10.13 or newer.

17.50.60 AVFileTypeMPEG4 as string

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the MPEG-4 file format.
The value of this UTI is public.mpeg-4. Files are identified with the .mp4 extension.

17.50.61 AVFileTypeMPEGLayer3 as string

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the MPEG layer 3 audio file format.
The value of this UTI is public.mp3. Files are identified with the .mp3 extension.
Available in OS X v10.9 and later.
17.50.62  AVFileTypeQuickTimeMovie as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
UTI for the QuickTime movie file format.
The value of this UTI is com.apple.quicktime-movie. Files are identified with the .mov and .qt extensions.

17.50.63  AVFileTypeSunAU as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
UTI for the Sun/NeXT audio file format.
The value of this UTI is public.au-audio. Files are identified with the .au and .snd extensions.
Available in OS X v10.9 and later.

17.50.64  AVFileTypeTIFF as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
The value of this UTI is "public.tiff".
Files are identified with the .tiff or .tif extension.
Available in macOS 10.13 or newer.

17.50.65  AVFileTypeWAVE as string

Function: One of the file format uniform type identifiers (UTIs).
Notes:
A UTI for the WAVE audio file format.
The value of this UTI is com.microsoft.wavform-audio. Files are identified with the .wav, .wave, and .bwf extensions.
17.50.66 AVFormatIDKey as string

**Function:** One of the audio setting keys that apply to all audio formats handled by the AVAudioPlayer and AVAudioRecorder classes.
**Notes:** A format identifier. See the "Audio Data Format Identifiers" enumeration in Core Audio Data Types Reference.

17.50.67 AVFoundationErrorDomain as string

**Function:** Domain for AVFoundation errors.

17.50.68 AVLayerVideoGravityResize as string

**Function:** The constants define how the video is displayed within a layer’s bounds rectangle.
**Notes:** Specifies that the video should be stretched to fill the layer’s bounds.

17.50.69 AVLayerVideoGravityResizeAspect as string

**Function:** The constants define how the video is displayed within a layer’s bounds rectangle.
**Notes:** Specifies that the player should preserve the video’s aspect ratio and fit the video within the layer’s bounds.

17.50.70 AVLayerVideoGravityResizeAspectFill as string

**Function:** The constants define how the video is displayed within a layer’s bounds rectangle.
**Notes:** Specifies that the player should preserve the video’s aspect ratio and fill the layer’s bounds.

17.50.71 AVLinearPCMBitDepthKey as string

**Function:** One of the audio setting keys that apply to linear PCM audio formats.
**Notes:** An integer that indicates the bit depth for a linear PCM audio formatone of 8, 16, 24, or 32.
17.50. CLASS AVFOUNDATIONMBS

17.50.72 AVLinearPCMIsBigEndianKey as string

**Function:** One of the Audio setting keys that apply to linear PCM audio formats.
**Notes:** A Boolean value that indicates whether the audio format is big endian (true) or little endian (false).

17.50.73 AVLinearPCMIsFloatKey as string

**Function:** One of the Audio setting keys that apply to linear PCM audio formats.
**Notes:** A Boolean value that indicates that the audio format is floating point (true) or fixed point (false).

17.50.74 AVLinearPCMIsNonInterleaved as string

**Function:** One of the Audio setting keys that apply to linear PCM audio formats.
**Notes:** A Boolean value that indicates that the audio format is non-interleaved (true) or interleaved (false).

17.50.75 AVMakeRectWithAspectRatioInsideRect(aspectRatio as CGSizeMBS, boundingRect as CGRectMBS) as CGRectMBS

**Function:** Returns a scaled CGRect that maintains the aspect ratio specified by a CGSize within a bounding CGRect.
**Notes:**
- aspectRatio: The width and height ratio (aspect ratio) you want to maintain.
- boundingRect: The bounding rectangle you want to fit into.

Returns a scaled CGRect that maintains the aspect ratio specified by aspectRatio that fits within boundingRect.

This is useful when attempting to fit the naturalSize property of an AVPlayerItem object within the bounds of another CALayer. You would typically use the return value of this function as an AVPlayerLayer frame property value. For example:

```swift
myPlayerLayer.frame = AVMakeRectWithAspectRatioInsideRect(myPlayerItem.naturalSize, mySuperLayer.bounds)
```
CHAPTER 17. AVFOUNDATION

17.50.76 AVMediaCharacteristicAudible as string

Function: One of the characteristics of media types.
Notes: Indicates that the media is audible.

17.50.77 AVMediaCharacteristicContainsOnlyForcedSubtitles as string

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: Indicates that the options presents only forced subtitles.
Media options with forced-only subtitles are typically selected when 1) the user has not selected a legible option with an accessibility characteristic or an auxiliary purpose and 2) its locale matches the locale of the selected audible media selection option.
The value of this characteristic is "public.subtitles.forced-only".
The presence of this characteristic for a legible media option is inferred from the format description of the associated track that presents the subtitle media.
Available in OS X v10.8 and later.

17.50.78 AVMediaCharacteristicDescribesMusicAndSoundForAccessibility as string

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: Indicates that the option includes legible content in the language of its specified locale that describes music and sound effects occurring in program audio.
It is possible for a legible media option to include both transcriptions of spoken dialog and descriptions of music and sound effects.
The value of this characteristic is "public.accessibility.describes-music-and-sound".
For QuickTime movie and .m4v files, a media option is considered to have the characteristic AVMediaCharacteristicDescribesMusicAndSoundForAccessibility only if it’s explicitly tagged with that characteristic.
Available in OS X v10.8 and later.

17.50.79 AVMediaCharacteristicDescribesVideoForAccessibility as string

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: Indicates that the option includes audible content that describes the visual portion of the presentation.
It is possible for a legible media option to include both transcriptions of spoken dialog and descriptions of music and sound effects.

The value of this characteristic is "public.accessibility.describes-video".
For QuickTime movie and .m4v files a media option is considered to have the characteristic AVMediaCharacteristicDescribesVideoForAccessibility only if it’s explicitly tagged with that characteristic.
Available in OS X v10.8 and later.

**17.50.80 AVMediaCharacteristicEasyToRead as string**

**Function:** One of the media characteristic that may be present in an AVMediaSelectionOption object.
**Notes:**
Indicates that the option provides legible content in the language of its specified locale and that the content has been edited for ease of reading.
Closed caption tracks that carry "easy reader" captions (per the CEA-608 specification) should be tagged with this characteristic. Subtitle tracks can also be tagged with this characteristic, where appropriate.
The value of this characteristic is "public.easy-to-read".
For QuickTime movie and .m4v files a media option is considered to have the characteristic AVMediaCharacteristicEasyToRead only if it’s explicitly tagged with that characteristic.

**17.50.81 AVMediaCharacteristicFrameBased as string**

**Function:** One of the characteristics of media types.
**Notes:** Indicates that the media is frame-based.

**17.50.82 AVMediaCharacteristicIsAuxiliaryContent as string**

**Function:** One of the media characteristic that may be present in an AVMediaSelectionOption object.
**Notes:**
Indicates that the option includes content that’s marked by the content author as auxiliary to the presentation of the asset.
Example: an option that presents audio media containing commentary on the presentation would typically have this characteristic.
The value of this characteristic is "public.auxiliary-content".
For QuickTime movie and .m4v files, a media option is considered to have the characteristic AVMediaCharacteristicIsAuxiliaryContent if it’s explicitly tagged with that characteristic or if, as a member of an alternate track group, its associated track is excluded from autoselection.
Available in OS X v10.8 and later.
17.50.83 AVMediaCharacteristicIsMainProgramContent as string

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes:
Indicates that the option includes content that’s marked by the content author as intrinsic to the presentation of the asset.
Example: an option that presents the main program audio for the presentation, regardless of locale, would typically have this characteristic.
The value of this characteristic is "public.main-program-content".
The presence of this characteristic for a media option is inferred; any option that does not have the characteristic AVMediaCharacteristicIsAuxiliaryContent is considered to have the characteristic.
Available in OS X v10.8 and later.

17.50.84 AVMediaCharacteristicLegible as string

Function: One of the characteristics of media types.
Notes: Indicates that the media is legible.

17.50.85 AVMediaCharacteristicTranscribesSpokenDialogForAccessibility as string

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes:
Indicates that the option includes legible content in the language of its specified locale that transcribes spoken dialog.
It is possible for a legible media option to include both transcriptions of spoken dialog and descriptions of music and sound effects.
The value of this characteristic is "public.accessibility.transcribes-spoken-dialog".
For QuickTime movie and .m4v files, a media option is considered to have the characteristic AVMediaCharacteristicTranscribesSpokenDialogForAccessibility only if it’s explicitly tagged with that characteristic.
Available in OS X v10.8 and later.

17.50.86 AVMediaCharacteristicVisual as string

Function: One of the characteristics of media types.
Notes: Indicates that the media is visual.
17.50. **CLASS AVFOUNDATIONMBS**

17.50.87 **AVMediaTypeAudio as string**

**Function:** One of the media types.
**Notes:** Specifies audio.

17.50.88 **AVMediaTypeClosedCaption as string**

**Function:** One of the media types.
**Notes:** Specifies closed-caption content.

17.50.89 **AVMediaTypeMetadata as string**

**Function:** One of the media types.
**Notes:** Specifies metadata.

17.50.90 **AVMediaTypeMuxed as string**

**Function:** One of the media types.
**Notes:** Specifies muxed media.

17.50.91 **AVMediaTypeSubtitle as string**

**Function:** One of the media types.
**Notes:** Specifies subtitles.

17.50.92 **AVMediaTypeText as string**

**Function:** One of the media types.
**Notes:** Specifies text.
17.50.93 AVMediaTypeTimecode as string

Function: One of the media types.
Notes: Specifies a time code.

17.50.94 AVMediaTypeVideo as string

Function: One of the media types.
Notes: Specifies video.

17.50.95 AVMetadata3GPUserDataKeyAlbumAndTrack as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.96 AVMetadata3GPUserDataKeyAuthor as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.97 AVMetadata3GPUserDataKeyCollection as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.98 AVMetadata3GPUserDataKeyCopyright as string

17.50.334  **AVMetadataQuickTimeUserDataKeyCredits as string**

**Function:** One of the possible metadata keys for QuickTime UserData.

17.50.335  **AVMetadataQuickTimeUserDataKeyDescription as string**

**Function:** One of the possible metadata keys for QuickTime UserData.
17.50.336 AVMetadataQuickTimeUserDataKeyDirector as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.337 AVMetadataQuickTimeUserDataKeyDisclaimer as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.338 AVMetadataQuickTimeUserDataKeyEncodedBy as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.339 AVMetadataQuickTimeUserDataKeyFullName as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.340 AVMetadataQuickTimeUserDataKeyGenre as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.341 AVMetadataQuickTimeUserDataKeyHostComputer as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.342 AVMetadataQuickTimeUserDataKeyInformation as string

Function: One of the possible metadata keys for QuickTime UserData.
17.50. AVFoundationMBS

17.50.343 AVMetadataQuickTimeUserDataKeyKeywords as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.344 AVMetadataQuickTimeUserDataKeyLocationISO6709 as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.345 AVMetadataQuickTimeUserDataKeyMake as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.346 AVMetadataQuickTimeUserDataKeyModel as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.347 AVMetadataQuickTimeUserDataKeyOriginalArtist as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.348 AVMetadataQuickTimeUserDataKeyOriginalFormat as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.349 AVMetadataQuickTimeUserDataKeyOriginalSource as string

Function: One of the possible metadata keys for QuickTime UserData.
17.50.350  AVMetadataQuickTimeUserDataKeyPerformers as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.351  AVMetadataQuickTimeUserDataKeyPhonogramRights as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.352  AVMetadataQuickTimeUserDataKeyProducer as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.353  AVMetadataQuickTimeUserDataKeyProduct as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.354  AVMetadataQuickTimeUserDataKeyPublisher as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.355  AVMetadataQuickTimeUserDataKeySoftware as string

Function: One of the possible metadata keys for QuickTime UserData.

17.50.356  AVMetadataQuickTimeUserDataKeySpecialPlaybackRequirements as string

Function: One of the possible metadata keys for QuickTime UserData.
17.50. **CLASS AVFOUNDATIONMBS**

17.50.357 **AVMetadataQuickTimeUserDataKeyTaggedCharacteristic as string**

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible metadata keys for QuickTime UserData.

17.50.358 **AVMetadataQuickTimeUserDataKeyTrack as string**

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible metadata keys for QuickTime UserData.

17.50.359 **AVMetadataQuickTimeUserDataKeyTrackName as string**

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible metadata keys for QuickTime UserData.

17.50.360 **AVMetadataQuickTimeUserDataKeyURLLink as string**

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible metadata keys for QuickTime UserData.

17.50.361 **AVMetadataQuickTimeUserDataKeyWarning as string**

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible metadata keys for QuickTime UserData.

17.50.362 **AVMetadataQuickTimeUserDataKeyWriter as string**

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible metadata keys for QuickTime UserData.

17.50.363 **AVNumberOfChannelsKey as string**

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the Audio setting keys that apply to all audio formats handled by the AVAudioPlayer and AVAudioRecorder classes.
Notes: The number of channels expressed as an integer value.

17.50.364  AVPlayerItemDidPlayToEndTimeNotification as string

Function: Posted when the item has played to its end time.
Notes: The notification’s object is the item that finished playing.

17.50.365  AVPlayerItemFailedToPlayToEndTimeErrorKey as string

Function: Key to retrieve information from a notification’s user info dictionary.
Notes: The key to retrieve an error object (NSError) from the user info dictionary of an AVPlayerItem-
TimeJumpedNotification notification.

17.50.366  AVPlayerItemFailedToPlayToEndTimeNotification as string

Function: Posted when the item failed to play to its end time.
Notes: The notification’s object is the item that finished playing.
The user info dictionary contains an error object that describes the problemseeAVPlayerItemFailedToPlay-
ToEndTimeErrorKey.

17.50.367  AVPlayerItemNewAccessLogEntryNotification as string

Function: The notification name to use with NSNotificationObserverMBS class.
Notes: Posted when a new access log entry has been added.
The notification’s object is the player item. The new log entry is accessible via accessLog.
Available on Mac OS X 10.9 or later.

17.50.368  AVPlayerItemNewErrorLogEntryNotification as string

Function: The notification name to use with NSNotificationObserverMBS class.
Notes:
Posted when a new error log entry has been added.
The notification's object is the player item. The new log entry is accessible via errorLog, respectively.
Available on Mac OS X 10.9 or later.

17.50.369 AVPlayerItemPlaybackStalledNotification as string

Function: The notification name to use with NSNotificationCenterMBS class.
Notes:
Posted when some media did not arrive in time to continue playback.
The notification's object is the AVPlayerItem instance whose playback was unable to continue because the necessary media isn't available yet, usually because it didn't arrive in a timely fashion from its source over a network. Playback will continue once a sufficient amount of media has subsequently been delivered.
Available on Mac OS X 10.9 or later.

17.50.370 AVPlayerItemTimeJumpedNotification as string

Function: Posted when the item’s current time has changed discontinuously.
Notes: The notification’s object is the item.

17.50.371 AVSampleRateConverterAlgorithmKey as string

Function: The algorithm for the rate conversion.
Notes:
Can be AVSampleRateConverterAlgorithm_Mastering or AVSampleRateConverterAlgorithm_Normal.
Available in OS X v10.9 and later.

17.50.372 AVSampleRateConverterAlgorithm_Mastering as string

Function: One of the supported values for the AVEncoderBitRateStrategyKey encoder setting.
Notes: Available in OS X v10.9 and later.
17.50.373 AVSampleRateConverterAlgorithm_Normal as string

Function: One of the supported values for the AVEncoderBitRateStrategyKey encoder setting.
Notes: Available in OS X v10.9 and later.

17.50.374 AVSampleRateConverterAudioQualityKey as string

Function: Sample rate converter audio quality settings.
Notes: Value is an integer value. See AVAudioQuality* constants.

17.50.375 AVSampleRateKey as string

Function: One of the Audio setting keys that apply to all audio formats handled by the AVAudioPlayer and AVAudioRecorder classes.
Notes: A sample rate, in hertz, expressed as a floating point value.

17.50.376 AVTrackAssociationTypeAudioFallback as string

Function: Constants for identifying how other tracks are associated with a track.
Notes:
An association from one audio track to another audio track. This constant indicates when one track contains the same content as another but in a more widely supported format. A player that does not support the format of the original track can use the "fallback" track instead.
For example, an asset may contain both stereo and a 5.1-channel audio tracks. In this case, marking the stereo track as the fallback for the 5.1-channel track would ensure that devices not capable of playing 5.1-channel audio can still play an equivalent track.
Available in OS X v10.9 and later.

17.50.377 AVTrackAssociationTypeChapterList as string

Function: Constants for identifying how other tracks are associated with a track.
Notes:
An association from a track to another track containing chapter information, which may be a text track, a
video track, or a timed metadata track. Available in OS X v10.9 and later.

17.50.378 AVTrackAssociationTypeForcedSubtitlesOnly as string

Function: Constants for identifying how other tracks are associated with a track.
Notes:
An association from one subtitle track, containing both forced and nonforced subtitles, to another subtitle track containing only forced subtitles for the same content.
Nonforced subtitles usually transcribe all "normal" dialogue in a media asset and are typically not presented by default. Forced subtitles are those that are essential for presentation even when normal subtitles are disabled (for example, when a character speaks in a language foreign to that of the audio track). Available in OS X v10.9 and later.

17.50.379 AVTrackAssociationTypeSelectionFollower as string

Function: Constants for identifying how other tracks are associated with a track.
Notes:
An association from one track to another specifying that when the user selects the first track, the second should be considered an appropriate default selection.
For example, a follower for an audio track could be a subtitle track in the same language. When the user chooses a language for audio, the subtitle language "follows" the audio language selection. Available in OS X v10.9 and later.

17.50.380 AVTrackAssociationTypeTimecode as string

Function: Constants for identifying how other tracks are associated with a track.
Notes:
An association from one track (of any type) to a timecode track containing timing information for the original track. Available in OS X v10.9 and later.
17.50.381 AVURLAssetHTTPCookiesKey as string

Function: HTTP cookies that the AVURLAsset may send with HTTP requests.
Notes:
Standard cross-site policy still applies: cookies will only be sent to domains to which they apply.

HTTP cookies do not apply to non-HTTP(S) URLs.
In HLS, many HTTP requests (e.g., media, crypt key, variant index) might be issued to different paths or hosts.
In both of these cases, HTTP requests will be missing any cookies that do not apply to the AVURLAsset’s URL.
This init option allows the AVURLAsset to use additional HTTP cookies for those HTTP(S) requests.

17.50.382 AVURLAssetPreferPreciseDurationAndTimingKey as string

Function: One of the keys for AVAsset creations.
Notes:
The corresponding value is a boolean, contained in an NSValue object, that indicates whether the asset should be prepared to indicate a precise duration and provide precise random access by time.
True indicates that longer loading times are acceptable in cases in which precise timing is required. Such precision, however, may require additional parsing of the resource in advance of operations that make use of any portion of it, depending on the specifics of its container format.
Many container formats provide sufficient summary information for precise timing and do not require additional parsing to prepare for it; QuickTime movie files and MPEG-4 files are examples of such formats. Other formats do not provide sufficient summary information, and precise random access for them is possible only after a preliminary examination of a file’s contents.
If you only intend that the asset be played, the default value of false will suffice (because AVPlayer supports approximate random access by time when full precision isn’t available). If you intend to insert the asset into an AVMutableComposition object, precise random access is typically desirable, and the value of true is recommended.

17.50.383 AVURLAssetReferenceRestrictionsKey as string

Function: One of the keys for AVAsset creations.
Notes:
The corresponding value is a number wrapping an “AVAssetReferenceRestrictions” enum value or the logical
combination of multiple such values that indicates the restrictions used by the asset when resolving references to external media data. Some assets can contain references to media data stored outside the asset’s container file, for example in another file. This key can be used to specify a policy to use when these references are encountered. If an asset contains one or more references of a type that is forbidden by the reference restrictions, loading of asset properties will fail. In addition, such an asset cannot be used with other AVFoundation modules, such as AVPlayerItem or AVAssetExportSession.

17.50.384 AVVideoAverageBitRateKey as string

Function: One of the constants for the dictionary with video settings.
Notes:
Specifies a key to access the average bit rate (as bits per second) used in encoding. The corresponding value is a number.

17.50.385 AVVideoCleanApertureHeightKey as string

Function: One of the constants for the dictionary with video settings.
Notes:
Specifies a key to access the clean aperture height. The corresponding value is a number.

17.50.386 AVVideoCleanApertureHorizontalOffsetKey as string

Function: One of the constants for the dictionary with video settings.
Notes:
Specifies a key to access the clean aperture horizontal offset. The corresponding value is a number.

17.50.387 AVVideoCleanApertureKey as string

Function: One of the constants for the dictionary with video settings.
Notes:
CHAPTER 17. AVFOUNDATION

Specifies a key to access the clean aperture.
The corresponding value is a dictionary.

17.50.388 AVVideoCleanApertureVerticalOffsetKey as string

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the clean aperture vertical offset.
The corresponding value is a number.

17.50.389 AVVideoCleanApertureWidthKey as string

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the clean aperture width.
The corresponding value is a number.

17.50.390 AVVideoCodecAppleProRes422 as string

Function: One of the constants for the dictionary with video settings.
Notes: Specifies that the video was encoded using the ProRes 422 Standard Definition encoder.
Files are identified with the .apcn extension.

17.50.391 AVVideoCodecAppleProRes4444 as string

Function: One of the constants for the dictionary with video settings.
Notes: Specifies that the video was encoded using the Apple ProRes 4444 encoder.
Files are identified with the .ap4h extension.
17.50. **CLASS AVFOUNDATIONMBS**

17.50.392 **AVVideoCodecH264** as string

**Function:** One of the constants for the dictionary with video settings.  
**Notes:** Specifies that the video was encoded using H264.

17.50.393 **AVVideoCodecJPEG** as string

**Function:** One of the constants for the dictionary with video settings.  
**Notes:** Specifies that the video was encoded using the JPEG encoder.

17.50.394 **AVVideoCodecKey** as string

**Function:** One of the constants for the dictionary with video settings.  
**Notes:** Specifies a key to access the name of the codec used to encode the video.  
The corresponding value is a string; equivalent to CMVideoCodecType.

17.50.395 **AVVideoColorPrimariesKey** as string

**Function:** The key to identify color primaries in a color properties dictionary.

17.50.396 **AVVideoColorPrimaries_EBU_3213** as string

**Function:** One of the values to use with AVVideoColorPrimariesKey.

17.50.397 **AVVideoColorPrimaries_ITU_R_709_2** as string

**Function:** One of the values to use with AVVideoColorPrimariesKey.
17.50.398  **AVVideoColorPrimaries_SMPTE_C** as string

**Function:** One of the values to use with AVVideoColorPrimariesKey.

17.50.399  **AVVideoColorPropertiesKey** as string

**Function:** The key for a dictionary that contains properties specifying video color.
**Notes:** The dictionary must contain the keys AVVideoColorPrimariesKey, AVVideoTransferFunctionKey, and AVVideoYCbCrMatrixKey.

17.50.400  **AVVideoCompressionPropertiesKey** as string

**Function:** One of the constants for the dictionary with video settings.
**Notes:**
Specifies a key to access the compression properties.
The corresponding value is a Dictionary.

17.50.401  **AVVideoHeightKey** as string

**Function:** One of the constants for the dictionary with video settings.
**Notes:**
Specifies a key to access the height of the video in pixels.
The corresponding value is a number.

17.50.402  **AVVideoMaxKeyFrameIntervalDurationKey** as string

**Function:** One of the constants for the dictionary with video settings.
**Notes:** Number (1 means key frames only, H.264 only)
17.50. AVFoundationMBS

17.50.403 AVVideoMaxKeyFrameIntervalKey as string

Function: One of the constants for the dictionary with video settings.
Notes:
Specifies a key to access the maximum interval between key frames.
The corresponding value is a number. 1 means key frames only.

17.50.404 AVVideoPixelAspectRatioHorizontalSpacingKey as string

Function: One of the constants for the dictionary with video settings.
Notes:
Specifies a key to access the pixel aspect ratio horizontal spacing.
The corresponding value is a number.

17.50.405 AVVideoPixelAspectRatioKey as string

Function: One of the constants for the dictionary with video settings.
Notes:
Specifies a key to access the pixel aspect ratio.
The corresponding value is a dictionary.

17.50.406 AVVideoPixelAspectRatioVerticalSpacingKey as string

Function: One of the constants for the dictionary with video settings.
Notes:
Specifies a key to access the pixel aspect ratio vertical spacing.
The corresponding value is a number.

17.50.407 AVVideoProfileLevelH264Baseline30 as string

Function: One of the constants for the dictionary with video settings.
Notes:
CHAPTER 17. AVFOUNDATION

Specifies a baseline level 3.0 profile.
Available in OS X v10.8 and later.

17.50.408 AVVideoProfileLevelH264Baseline31 as string

Function: One of the constants for the dictionary with video settings.
Notes:
Specifies a baseline level 3.1 profile.
Available in OS X v10.8 and later.

17.50.409 AVVideoProfileLevelH264Baseline41 as string

Function: One of the constants for the dictionary with video settings.
Notes:
Specifies a baseline level 4.1 profile.
Available in OS X v10.8 and later.

17.50.410 AVVideoProfileLevelH264BaselineAutoLevel as string

Function: One of the constants for the dictionary with video settings.
Notes:
Baseline Profile Auto Level.
Available on Mac OS X 10.9.

17.50.411 AVVideoProfileLevelH264High40 as string

Function: One of the constants for the dictionary with video settings.
Notes:
High Profile Level 4.0
Available on Mac OS X 10.9.
17.50. CLASS AVFOUNDATIONMBS

17.50.412 AVVideoProfileLevelH264High41 as string

Function: One of the constants for the dictionary with video settings.
Notes:
High Profile Level 4.1
Available on Mac OS X 10.9.

17.50.413 AVVideoProfileLevelH264HighAutoLevel as string

Function: One of the constants for the dictionary with video settings.
Notes:
High Profile Auto Level
Available on Mac OS X 10.9.

17.50.414 AVVideoProfileLevelH264Main30 as string

Function: One of the constants for the dictionary with video settings.
Notes:
Specifies a main level 3.0 profile.
Available in OS X v10.8 and later.

17.50.415 AVVideoProfileLevelH264Main31 as string

Function: One of the constants for the dictionary with video settings.
Notes:
Specifies a main level 3.1 profile.
Available in OS X v10.8 and later.

17.50.416 AVVideoProfileLevelH264Main32 as string

Function: One of the constants for the dictionary with video settings.
Notes:
CHAPTER 17. AVFOUNDATION

Specifies a main level 3.2 profile.
Available in OS X v10.8 and later.

17.50.417 AVVideoProfileLevelH264Main41 as string

**Function:** One of the constants for the dictionary with video settings.
**Notes:**
Specifies a main level 4.2 profile.
Available in OS X v10.8 and later.

17.50.418 AVVideoProfileLevelH264MainAutoLevel as string

**Function:** One of the constants for the dictionary with video settings.
**Notes:**
Main Profile Auto Level
Available on Mac OS X 10.9.

17.50.419 AVVideoProfileLevelKey as string

**Function:** One of the constants for the dictionary with video settings.
**Notes:**
Specifies a key to access the video profile.
Available in OS X v10.8 and later.

17.50.420 AVVideoQualityKey as string

**Function:** One of the constants for the dictionary with video settings.
**Notes:**
Specifies a key to access the JPEG coded quality.
The corresponding value is a number 0.0-1.0.
17.50.421 AVVideoScalingModeFit as string

Function: One of the constants to specify how video should be scaled to fit a given area.
Notes: Crop to remove edge processing region; preserve aspect ratio of cropped source by reducing specified width or height if necessary.
This mode does not scale a small source up to larger dimensions.

17.50.422 AVVideoScalingModeKey as string

Function: One of the constants to specify how video should be scaled to fit a given area.
Notes: A key to retrieve the video scaling mode from a dictionary.

17.50.423 AVVideoScalingModeResize as string

Function: One of the constants to specify how video should be scaled to fit a given area.
Notes: Crop to remove edge processing region; scale remainder to destination area.
This mode does not preserve the aspect ratio.

17.50.424 AVVideoScalingModeResizeAspect as string

Function: One of the constants to specify how video should be scaled to fit a given area.
Notes: Preserve aspect ratio of the source, and fill remaining areas with black to fit destination dimensions.

17.50.425 AVVideoScalingModeResizeAspectFill as string

Function: One of the constants to specify how video should be scaled to fit a given area.
Notes: Preserve aspect ratio of the source, and crop picture to fit destination dimensions.
17.50.426  AVVideoTransferFunctionKey as string

Function: The key to identify the transfer function in a color properties dictionary.

17.50.427  AVVideoTransferFunction_ITU_R_709_2 as string

Function: One of the values to use with AVVideoTransferFunctionKey.

17.50.428  AVVideoTransferFunction_SMPTE_240M_1995 as string

Function: One of the values to use with AVVideoTransferFunctionKey.

17.50.429  AVVideoWidthKey as string

Function: One of the constants for the dictionary with video settings.  
Notes:  
Specifies a key to access the width of the video in pixels.  
The corresponding value is a number.

17.50.430  AVVideoYCbCrMatrixKey as string

Function: The key to identify the Y’CbCr matrix in a color properties dictionary.

17.50.431  AVVideoYCbCrMatrix_ITU_R_601_4 as string

Function: One of the values to use with AVVideoYCbCrMatrixKey.
17.50.432  AVVideoYCbCrMatrix_ITU_R_709_2 as string

Function: One of the values to use with AVVideoYCbCrMatrixKey.

17.50.433  AVVideoYCbCrMatrix_SMPTE_240M_1995 as string

Function: One of the values to use with AVVideoYCbCrMatrixKey.

17.50.434  WriteCGImageToFile(File as Folderitem, Type as String, Image as Variant, options as Dictionary = nil, tag as Variant = nil) as boolean

Function: Writes a CGImage to a file on disk on another thread.
Notes:
Image must be a CGImageMBS.

If this method returns true (parameters are correct), it starts the compression and writing of the image on a helper thread and later calls WriteCGImageToFileCompleted event to inform you about success or failure. Returns false in case of bad parameters.

Tag is the value you passed when calling the original method.

17.50.435  Events

17.50.436  AssetLoadValuesAsynchronouslyForKeysFinished(MetadataItem as AVMeta-
dataItemMBS, keys() as string, tag as Variant)

Function: Called by AVAssetMBS.loadValuesAsynchronouslyForKeys method on completion.
Notes: Tag is the value you passed when calling the original method.
17.50.437 AssetTrackLoadValuesAsynchronouslyForKeysFinished(MetadataItem as AVMetadataItemMBS, keys() as string, tag as Variant)

Function: Called by AVAssetTrackMBS.loadValuesAsynchronouslyForKeys method on completion.
Notes: Tag is the value you passed when calling the original method.

17.50.438 audioPlayerDecodeErrorDidOccur(player as AVAudioPlayerMBS, error as NSErrorMBS)

Function: Called when an audio player encounters a decoding error during playback.
Notes:
player: The audio player that encountered the decoding error.
error: The decoding error.

17.50.439 audioPlayerDidFinishPlaying(player as AVAudioPlayerMBS, successful as boolean)

Function: Called when a sound has finished playing.
Notes:
player: The audio player that finished playing.
flag: True on successful completion of playback; false if playback stopped because the system could not decode the audio data.

This method is not called upon an audio interruption. Rather, an audio player is paused upon interruption the sound has not finished playing.

17.50.440 audioRecorderDidFinishRecording(recorder as AVAudioRecorderMBS, successful as boolean)

Function: Called by the system when a recording is stopped or has finished due to reaching its time limit.
Notes:
recorder: The audio recorder that has finished recording.
flag: True on successful completion of recording; False if recording stopped because of an audio encoding error.
This method is not called by the system if the audio recorder stopped due to an interruption.

17.50.441 audioRecorderEncodeErrorDidOccur(recorder as AVAudioRecorderMBS, error as NSErrorMBS)

**Function:** Called when an audio recorder encounters an encoding error during recording.
**Notes:**
recorder: The audio recorder that encountered the encoding error.
error: The encoding error.

17.50.442 BoundaryTimeObserver(Player as AVPlayerMBS, tag as Variant)

**Function:** Called by addBoundaryTimeObserverForTimes.
**Notes:** Tag is the value you passed when calling the original method.

17.50.443 CaptureDeviceSubjectAreaDidChange(device as AVCaptureDeviceMBS, notification as Variant)

**Function:** Notification that is posted when the instance of AVCaptureDevice has detected a substantial change to the video subject area.
**Notes:**
notification is a NSNotificationMBS object.
This notification is only sent if you first set subjectAreaChangeMonitoringEnabled to True.

17.50.444 CaptureDeviceWasConnected(device as AVCaptureDeviceMBS, notification as Variant)

**Function:** Notification that is posted when a new device becomes available.
**Notes:** notification is a NSNotificationMBS object.
CaptureDeviceWasDisconnected(device as AVCaptureDeviceMBS, notification as Variant)

Function: Notification that is posted when an existing device becomes unavailable.
Notes: notification is a NSNotificationMBS object.

CaptureInputPortFormatDescriptionDidChange(InputPort as AVCaptureInputPortMBS, notification as Variant)

Function: Posted if the formatDescription of the capture input port changes.
Notes: notification is a NSNotificationMBS object.

captureOutputDidDropSampleBuffer(captureOutput as AVCaptureOutputMBS, OutputSampleBuffer as CMSampleBufferMBS, connection as AVCaptureConnectionMBS)

Function: Notifies the delegate that a video frame was discarded.
Notes:
captureOutput: The capture output object.
sampleBuffer: A CMSampleBuffer object containing information about the dropped frame, such as its format and presentation time. This sample buffer contains none of the original video data.
connection: The connection from which the video was received.

Delegates receive this message whenever a late video frame is dropped. This method is called once for each dropped frame. It is called on the main thread, so please make your event code run very fast.

captureOutputDidFinishRecordingToOutputFileAtURL(captureOutput as AVCaptureFileOutputMBS, outputFileURL as string, connections() as AVCaptureConnectionMBS, error as NSErrorMBS)

Function: Informs the delegate when all pending data has been written to an output file.
Notes:
captureOutput: The capture file output that has finished writing the file.
outputFileURL: The file URL of the file that is being written.
connections: An array of AVCaptureConnection objects attached to the file output that provided the data.
that is being written to the file.

error: If the file was not written successfully, an error object that describes the problem; otherwise nil.

This method is called whenever a file is finished. If the file was forced to be finished due to an error, the error is described in the error parameter otherwise, the error parameter is nil.

This method is called when the file output has finished writing all data to a file whose recording was stopped, either because startRecordingToOutputFileURL or stopRecording were called, or because an error (described by the error parameter), occurred (if no error occurred, the error parameter is nil).

This method is always called for each recording request, even if no data is successfully written to the file.

17.50.449 captureOutputDidOutputMetadataObjects(captureOutput as AVCaptureOutputMBS, metadataObjects() as AVMetadataObjectMBS, connection as AVCaptureConnectionMBS)

Function: Called by AVCaptureMetadataOutputMBS class if new metadata is available.

17.50.450 captureOutputDidOutputSampleBuffer(captureOutput as AVCaptureOutputMBS, OutputSampleBuffer as CMSampleBufferMBS, connection as AVCaptureConnectionMBS)

Function: Called for frames being outputted.
Notes: Called by AVCaptureFileOutputMBS, AVCaptureVideoDataOutputMBS and AVCaptureAudioDataOutputMBS.

17.50.451 captureOutputDidPauseRecordingToOutputFileAtURL(captureOutput as AVCaptureFileOutputMBS, fileURL as string, connections() as AVCaptureConnectionMBS)

Function: Called whenever the output is recording to a file and successfully pauses the recording at the request of a client.
Notes:
captureOutput: The capture file output that has paused its file recording.
fileURL: The file URL of the file that is being written.
connections: An array of AVCaptureConnection objects attached to the file output that provided the data that is being written to the file.

This method is called whenever a request to pause recording is actually respected.

It is safe for delegates to change what the file output is currently doing (starting a new file, for example) from within this method. If recording to a file is stopped, either manually or due to an error, this method is not guaranteed to be called, even if a previous call to pauseRecording was made.

17.50.452 captureOutputDidResumeRecordingToOutputFileAtURL(captureOutput as AVCaptureFileOutputMBS, fileURL as string, connections() as AVCaptureConnectionMBS)

Function: Called whenever the output, at the request of the client, successfully resumes a file recording that was paused.
Notes:
captureOutput: The capture file output that has resumed its paused file recording.
fileURL: The file URL of the file that is being written.
connections: An array of AVCaptureConnection objects attached to the file output that provided the data that is being written to the file.

Delegates can use this method to be informed when a request to resume recording is actually respected.

It is safe for delegates to change what the file output is currently doing (starting a new file, for example) from within this method. If recording to a file is stopped, either manually or due to an error, this method is not guaranteed to be called, even if a previous call to resumeRecording was made.

17.50.453 captureOutputDidStartRecordingToOutputFileAtURL(captureOutput as AVCaptureFileOutputMBS, fileURL as string, connections() as AVCaptureConnectionMBS)

Function: Informs the delegate when the output has started writing to a file.
Notes:
captureOutput: The capture file output that started writing the file.
fileURL: The file URL of the file that is being written.
connections: An array of AVCaptureConnection objects attached to the file output that provided the data that is being written to the file.
If an error condition prevents any data from being written, this method may not be called. captureOutputWillFinishRecordingToOutputFileAtURL and captureOutputdidFinishRecordingToOutputFileAtURL are always called, even if no data is written.

17.50.454 captureOutputWillFinishRecordingToOutputFileAtURL(captureOutput as AVCaptureFileOutputMBS, fileURL as string, connections() as AVCaptureConnectionMBS, error as NSErrorMBS)

Function: Informs the delegate when the output will stop writing new samples to a file.
Notes:
captureOutput: The capture file output that will finish writing the file.
fileURL: The file URL of the file that is being written.
connections: An array of AVCaptureConnection objects attached to the file output that provided the data that is being written to the file.
error: An error describing what caused the file to stop recording, or nil if there was no error.

This method is called when the file output will stop recording new samples to the file at outputFileURL, either because startRecordingToOutputFileURL or stopRecording were called, or because an error (described by the error parameter), occurred (if no error occurred, the error parameter is nil).

This method is always called for each recording request, even if no data is successfully written to the file.

17.50.455 CaptureSessionDidStartRunning(session as AVCaptureSessionMBS, notification as Variant)

Function: Posted when a capture session starts.
Notes: notification is a NSNotificationMBS object.

17.50.456 CaptureSessionDidStopRunning(session as AVCaptureSessionMBS, notification as Variant)

Function: Posted when a capture session stops.
Notes: notification is a NSNotificationMBS object.
CHAPTER 17. AVFOUNDATION

17.50.457 CaptureSessionRuntimeError(session as AVCaptureSessionMBS, error as NSErrorMBS, notification as Variant)

Function: Posted if an error occurred during a capture session.
Notes:
notification is a NSNotificationMBS object.
You retrieve the underlying error from the notification’s user info dictionary using the key AVCaptureSessionErrorKey.

17.50.458 captureStillImageAsynchronouslyCompleted(output as AVCaptureStillImageOutputMBS, prepareJpegStillImage as boolean, tag as Variant, error as NSErrorMBS, imageDataSampleBuffer as CMSampleBufferMBS, JpegStillImage as memoryblock)

Function: The event called when still image was captured.
Notes:
If prepareJpegStillImage is true, the plugin will prepare the jpeg data and pass it as JpegStillImage, so the preparation is done on the capture thread.
imageDataSampleBuffer: The data that was captured.
The buffer attachments may contain metadata appropriate to the image data format. For example, a buffer containing JPEG data may carry a kCGImagePropertyExifDictionary as an attachment. See ImageIO/CGImageProperties.h for a list of keys and value types.
error
If the request could not be completed, an NSError object that describes the problem; otherwise nil.
Tag is the value you passed when calling the original method.

17.50.459 determineCompatibilityOfExportPresetCompleted(presetName as string, asset as AVAssetMBS, outputFileType as string, compatible as boolean, tag as Variant)

Function: The event called by AVAssetExportSessionMBS.determineCompatibilityOfExportPreset.
Notes:
The event to execute with the results of your call to determineCompatibilityOfExportPreset.
The compatible parameter contains the value true if the combination of options is compatible or false if they
Tag is the value you passed when calling the original method.

### 17.50.460 determineCompatibleFileTypesCompleted

**Function:** The event called when you call `AVAssetExportSessionMBS.determineCompatibleFileTypesCompleted` method.

**Notes:**

The event to execute with the results.

You receive an array parameter and return no result. The array contains zero or more strings with the UTIs of the compatible file types. The file types are in no particular order. For a list of constants specifying UTIs for standard file types, see AV Foundation Constants Reference.

Tag is the value you passed when calling the original method.

### 17.50.461 exportAsynchronouslyCompleted

**Function:** Export finished.

**Notes:**

Called by `AVAssetExportSessionMBS.exportAsynchronouslyCompleted` when the export is done or failed.

Tag is the value you passed when calling the original method.

### 17.50.462 finishWritingCompleted

**Function:** Event called from `AVAssetWriterMBS.finishWritingWithCompletionHandler`.

**Notes:**

The event is invoked once the writing of the output file is finished or if a failure or cancellation occurs in the meantime.
Tag is the value you passed when calling the original method.

17.50.463  generateCGImagesAsynchronouslyForTimesCompleted(generator as AVAssetImageGeneratorMBS, requestedTime as CMTimeMBS, image as Variant, actualTime as CMTimeMBS, result as Integer, error as NSErrorMBS, tag as Variant)

Function: Called when image generation is completed or cancelled.
Notes: Image is a CGImageMBS object.
Called by AVAssetImageGeneratorMBS.generateCGImagesAsynchronouslyForTimes method.

Tag is the value you passed when calling the original method.

17.50.464  legibleOutputDidOutputAttributedStrings(output as AVPlayerItemLegibleOutputMBS, strings() as Variant, nativeSamples() as CMSampleBufferMBS, itemTime as CMTimeMBS)

Function: The legible output did output an attributed string.
Notes: Strings array contains NSAttributedStringMBS objects.

17.50.465  MetadataItemLoadValuesAsynchronouslyForKeysFinished(MetadataItem as AVMetadataItemMBS, keys() as string, tag as Variant)

Function: Called by AVMetadataItemMBS.loadValuesAsynchronouslyForKeys method on completion.
Notes: Tag is the value you passed when calling the original method.

17.50.466  outputMediaDataWillChange(output as AVPlayerItemOutputMBS)

Function: Tells you that new samples are about to arrive.
Notes: You can use this method to prepare for any new sample data. This method is called at some point after a call to your video output object’s requestNotificationOfMediaDataChangeWithAdvanceInterval method.
17.50.467  outputSequenceWasFlushed(output as AVPlayerItemOutputMBS)

Function: Tells the delegate that a new sample sequence is commencing.
Notes:
output: The output object that sent the message.

This method is called after any attempt to seek or change the playback direction of the item’s content. If you are maintaining any queued future samples, you can use your implementation of this method to discard those samples.

17.50.468  PeriodicTimeObserver(Player as AVPlayerMBS, time as CMTimeMBS, tag as Variant)

Function: Called by addPeriodicTimeObserverForInterval.
Notes:
time: The time at which the block is invoked.

Tag is the value you passed when calling the original method.

17.50.469  PlayerItemDidPlayToEndTime(PlayerItem as AVPlayerItemMBS, notification as Variant)

Function: Posted when the item has played to its end time.
Notes:
notification is a NSNotificationMBS object.
The notification’s object is the item that finished playing.

17.50.470  PlayerItemFailedToPlayToEndTime(PlayerItem as AVPlayerItemMBS, error as NSErrorMBS, notification as Variant)

Function: Posted when the item failed to play to its end time.
Notes:
notification is a NSNotificationMBS object.
The notification’s object is the item that finished playing.
The user info dictionary contains an error object that describes the problem see AVPlayerItemFailedToPlayToEndTimeErrorKey.

17.50.471 PlayerItemNewAccessLogEntry(PlayerItem as AVPlayerItemMBS, notification as Variant)
Function: A new access log entry is available to a player item.
Notes:
notification is a NSNotificationMBS object.
Posted when a new access log entry has been added.
The notification's object is the player item. The new log entry is accessible via accessLog.

17.50.472 PlayerItemNewErrorLogEntry(PlayerItem as AVPlayerItemMBS, notification as Variant)
Function: A new error log entry is available to a player item.
Notes:
notification is a NSNotificationMBS object.
Posted when a new error log entry has been added.
The notification's object is the player item. The new log entry is accessible via errorLog, respectively.

17.50.473 PlayerItemPlaybackStalled(PlayerItem as AVPlayerItemMBS, notification as Variant)
Function: The player item playback is stalled.
Notes:
notification is a NSNotificationMBS object.
Posted when some media did not arrive in time to continue playback.
The notification's object is the AVPlayerItem instance whose playback was unable to continue because the necessary media isn’t available yet, usually because it didn’t arrive in a timely fashion from its source over a network. Playback will continue once a sufficient amount of media has subsequently been delivered.
17.50.474 `playerItemSeekToDateFinished(player as AVPlayerItemMBS, date as date, finished as boolean, tag as Variant)`

**Function:** The seek operation to date finished.
**Notes:** Tag is the value you passed when calling the original method.

17.50.475 `playerItemSeekToTimeFinished(player as AVPlayerItemMBS, time as CMTimeMBS, toleranceBefore as CMTimeMBS, toleranceAfter as CMTimeMBS, finished as boolean, tag as Variant)`

**Function:** A seek operation has finished.
**Notes:**

finished: Indicates whether the seek operation completed.

Tag is the value you passed when calling the original method.

17.50.476 `PlayerItemTimeJumped(PlayerItem as AVPlayerItemMBS, notification as Variant)`

**Function:** Posted when the item’s current time has changed discontinuously.
**Notes:**

notification is a NSNotificationMBS object.
The notification’s object is the item.

17.50.477 `playerSeekToDateFinished(player as AVPlayerMBS, date as date, finished as boolean, tag as Variant)`

**Function:** Event called by AVPlayerMBS.seekToDate method when seeking is done.
**Notes:** Tag is the value you passed when calling the original method.
CHAPTER 17. AVFOUNDATION

17.50.478  playerSeekToTimeFinished(player as AVPlayerMBS, time as CMTimeMBS, toleranceBefore as CMTimeMBS, toleranceAfter as CMTimeMBS, finished as boolean, tag as Variant)

Function: Called by AVPlayerMBS.seekToTime when seeking is done.
Notes:
finished: Indicates whether the seek operation completed.
Tag is the value you passed when calling the original method.

17.50.479  prerollAtRateFinished(player as AVAudioPlayerMBS, rate as Double, finished as boolean, tag as Variant)

Function: The event called when preroll is done.
Notes:
Finished: True if the data was loaded or false if there was a problem.
The value might be false if the preroll was interrupted by a time change or incompatible rate change.
Tag is the value you passed when calling the original method.

17.50.480  requestContentAuthorizationCompleted(PlayerItem as AVPlayerItemMBS, timeoutInterval as Double, tag as Variant)

Function: The event called when a request started with AVPlayerItemMBS.requestContentAuthorizationAsynchronously completed.
Notes: Tag is the value you passed when calling the original method.

17.50.481  requestMediaDataWhenReadyOnQueueCompleted(assetWriterInput as AVAssetWriterInputMBS, tag as Variant)

Function: Called when media is ready.
Notes:
You called requestMediaDataWhenReadyOnQueue on an AVAssetWriterInputMBS before.
Tag is the value you passed when calling the original method.

17.50.482  requestMediaDataWhenReadyOnQueueFinished(assetWriterInput as AVAssetWriterInputMBS, assetReaderOutput as AVAssetReaderOutputMBS, tag as Variant)

Function: Called when copying data from input to output by plugin is done.
Notes: Tag is the value you passed when calling the original method.

17.50.483  requestMediaDataWhenReadyOnQueueProgress(assetWriterInput as AVAssetWriterInputMBS, assetReaderOutput as AVAssetReaderOutputMBS, convertedByteCount as Int64, LastBuffer as CMSampleBufferMBS, tag as Variant)

Function: Called when media is processed from input to output from plugin.
Notes: LastBuffer: The last buffer processed.
Tag is the value you passed when calling the original method.

17.50.484  resourceLoaderDidCancelLoadingRequest(resourceLoader as AVAssetResourceLoaderMBS, loadingRequest as AVAssetResourceLoadingRequestMBS)

Function: Invoked to inform the delegate that a prior loading request has been cancelled.
Notes: resourceLoader: The resource loader.
loadingRequest: The loading request that has been cancelled.
Previously issued loading requests can be cancelled when data from the resource is no longer required or when a loading request is superseded by new requests for data from the same resource.
For example, if to complete a seek operation it becomes necessary to load a range of bytes that’s different from a range previously requested, the prior request may be cancelled while the delegate is still handling it.
17.50.485 resourceLoaderShouldWaitForLoadingOfRequestedResource(resourceLoader as AVAssetResourceLoaderMBS, loadingRequest as AVAssetResourceLoadingRequestMBS) as boolean

Function: Asks the delegate if it wants to load the requested resource.

Notes:
resourceLoader: The resource loader object that is making the request.
loadingRequest: The loading request object that contains information about the requested resource.

Returns true if your delegate can load the resource specified by the loadingRequest parameter or false if it cannot.

The resource loader object calls this method when assistance is required of your code to load the specified resource. For example, the resource loader might call this method to load decryption keys that have been specified using a custom URL scheme.

Returning true from this method, implies only that the receiver will load, or at least attempt to load, the resource. In some implementations, the actual work of loading the resource might be initiated on another thread, running asynchronously to the resource loading delegate; whether the work begins immediately or merely soon is an implementation detail of the client application.

You can load the resource synchronously or asynchronously. In both cases, you must indicate success or failure of the operation by calling the finishLoadingWithResponse or finishLoadingWithError: method of the request object when you finish. If you load the resource asynchronously, you must also store a strong reference to the object in the loadingRequest parameter before returning from this method.

If you return false from this method, the resource loader treats the loading of the resource as having failed.

Available in OS X v10.9 and later.

17.50.486 SampleBufferDisplayLayerMediaDataWhenReady(tag as Variant)

Function: Event called by AVSampleBufferDisplayLayerMBS.requestMediaDataWhenReady when media data is ready.

Notes: Tag is the value you passed when calling the original method.
17.50.487  videoCompositionShouldContinueValidatingAfterFindingEmptyTimeRange(videoComposition as AVVideoCompositionMBS, timeRange as CMTimeRangeMBS) as boolean

**Function:** Reports a time range that has no corresponding video composition instruction.
**Notes:**
- videoComposition: The video composition being validated.
- timeRange: The time range that has no corresponding video composition instruction.

Return true if the video composition should continue validation in order to report additional problems that may exist, otherwise false.

17.50.488  videoCompositionShouldContinueValidatingAfterFindingInvalidTimeRangeInInstruction(videoComposition as AVVideoCompositionMBS, Instruction as AVVideoCompositionInstructionMBS) as boolean

**Function:** Reports a video composition instruction with a time range that is invalid, that overlaps with the time range of a prior instruction, or that contains times earlier than the time range of a prior instruction.
**Notes:**
- videoComposition: The video composition being validated.
- videoCompositionInstruction: The video composition instruction.

Return true if the video composition should continue validation in order to report additional problems that may exist, otherwise false.

17.50.489  videoCompositionShouldContinueValidatingAfterFindingInvalidTrackIDInInstruction(videoComposition as AVVideoCompositionMBS, videoCompositionInstruction as AVVideoCompositionInstructionMBS, layerInstruction as AVVideoCompositionLayerInstructionMBS, asset as AVAssetMBS) as boolean

**Function:** Reports a video composition layer instruction with a track ID that does not correspond either to the track ID used for the composition’s animation tool or to a track of the asset specified in isValidForAsset.
**Notes:**
- videoComposition: The video composition being validated.
- videoCompositionInstruction: The video composition instruction.
- layerInstruction: The layer instruction.
- asset: The underlying asset.
Return true if the video composition should continue validation in order to report additional problems that may exist, otherwise false.

17.50.490 videoCompositionShouldContinueValidatingAfterFindingInvalidValueForKey(videoComposition as AVVideoCompositionMBS, key as string) as boolean

Function: Reports that a key that has an invalid value.
Notes:
videoComposition: The video composition being validated.
key: The key being validated.

Return true if the video composition should continue validation in order to report additional problems that may exist, otherwise false.

17.50.491 WriteCGImageToFileCompleted(file as folderitem, type as string, image as Variant, options as dictionary, success as boolean, tag as Variant)

Function: The call to WriteCGImageToFile method finished.
Notes:
Image is a CGImageMBS.
Success property tells you whether or not the write was successful.

Tag is the value you passed when calling the original method.

17.50.492 Constants

17.50.493 AVAudioQualityHigh = & h60

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the values that specify sample rate conversion quality, used for the AVSampleRateConverterAudioQualityKey property.
Notes: High quality sample rate conversion.
17.50. CLASS AVFOUNDATIONMBS

17.50.494  AVAudioQualityLow = &h20

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the values that specify sample rate conversion quality, used for the AVSampleRateConverterAudioQualityKey property. **Notes:** Low quality rate conversion.

17.50.495  AVAudioQualityMax = &h7F

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the values that specify sample rate conversion quality, used for the AVSampleRateConverterAudioQualityKey property. **Notes:** Maximum quality sample rate conversion.

17.50.496  AVAudioQualityMedium = &h40

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the values that specify sample rate conversion quality, used for the AVSampleRateConverterAudioQualityKey property. **Notes:** Medium quality sample rate conversion.

17.50.497  AVAudioQualityMin = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the values that specify sample rate conversion quality, used for the AVSampleRateConverterAudioQualityKey property. **Notes:** The minimum quality for sample rate conversion.

17.50.498  AVErrorApplicationIsNotAuthorized = -11836

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** The application is not authorized to play media.

17.50.499  AVErrorApplicationIsNotAuthorizedToUseDevice = -11852

MBS AVFoundation Plugin, Plugin Version: 14.0. **Function:** One of the error constants. **Notes:** The user has denied this application permission for media capture. Available in OS X v10.9 and later.
17.50.500  **AVErrorCompositionTrackSegmentsNotContiguous = -11824**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.  
**Notes:** The source media can’t be added because it contains gaps.

17.50.501  **AVErrorContentIsNotAuthorized = -11835**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.  
**Notes:** The user is not authorized to play the media.

17.50.502  **AVErrorContentIsProtected = -11831**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.  
**Notes:** The application is not authorized to open the media.

17.50.503  **AVErrorDecodeFailed = -11821**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.  
**Notes:** The operation could not be completed because some source media could not be decoded.

17.50.504  **AVErrorDecoderNotFound = -11833**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.  
**Notes:** The decoder for the given media was not found.  
The error’s userInfo may contain values for the keys AVErrorMediaTypeKey and AVErrorMediaSubTypeKey, if they are available.

17.50.505  **AVErrorDecoderTemporarilyUnavailable = -11839**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.  
**Notes:** The appropriate decoder is currently not available.  
The error’s userInfo may contain AVErrorMediaTypeKey and AVErrorMediaSubTypeKey, if they are available.
17.50. CLASS AVFOUNDATIONMBS

17.50.506  AVErrorDeviceAlreadyUsedByAnotherSession = -11804

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.
**Notes:** Media could not be captured from the device because it is already in use elsewhere in this application.

17.50.507  AVErrorDeviceInUseByAnotherApplication = -11815

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.
**Notes:** The device could not be opened because it is in use by another application.

17.50.508  AVErrorDeviceLockedForConfigurationByAnotherProcess = -11817

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.
**Notes:** Settings for the device could not be changed because the device is being controlled by another application.

17.50.509  AVErrorDeviceNotConnected = -11814

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.
**Notes:** The device could not be opened because it is not connected or turned on.

17.50.510  AVErrorDeviceWasDisconnected = -11808

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.
**Notes:** Recording stopped because the device was turned off or disconnected.

17.50.511  AVErrorDiskFull = -11807

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.
**Notes:** Recording stopped because the disk is getting full.

17.50.512  AVErrorDisplayWasDisabled = -11845

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.
**Notes:** Screen capture failed because the display was inactive.
17.50.513  AVErrorEncoderNotFound = -11834

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.
**Notes:**
The requested encoder was not found.
The error’s `userInfo` may contain values for the keys `AVErrorMediaTypeKey` and `AVErrorMediaSubType-Key`, if they are available.

17.50.514  AVErrorEncoderTemporarilyUnavailable = -11840

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.
**Notes:**
The appropriate encoder is currently not available.
The error’s `userInfo` may contain `AVErrorMediaTypeKey` and `AVErrorMediaSubTypeKey`, if they are available.

17.50.515  AVErrorExportFailed = -11820

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.
**Notes:** The export could not be completed.

17.50.516  AVErrorFailedToLoadMediaData = -11849

MBS AVFoundation Plugin, Plugin Version: 14.0. **Function:** One of the error constants.
**Notes:**
The media resource does not contain all of the data required and cannot be loaded.
Available in OS X v10.9 and later.

17.50.517  AVErrorFileAlreadyExists = -11823

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.
**Notes:** The file could not be created because a file with the same name already exists in the same location.
17.50.518 AVErrorFileFailedToParse = -11829

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the error constants.  
Notes: The media could not be opened because the file is damaged or not in a recognized format.

17.50.519 AVErrorFileFormatNotRecognized = -11828

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the error constants.  
Notes: The media could not be opened because it is not in a recognized format.

17.50.520 AVErrorIncompatibleAsset = -11848

MBS AVFoundation Plugin, Plugin Version: 14.0. Function: One of the error constants.  
Notes: The media could not be displayed because the iOS device is not capable of playing the content. This might occur if the device does not support playing a particular video profile level.  
Available in OS X v10.9 and later.

17.50.521 AVErrorInvalidCompositionTrackSegmentDuration = -11825

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the error constants.  
Notes: The source media can’t be added because its duration in the destination is invalid.

17.50.522 AVErrorInvalidCompositionTrackSegmentSourceDuration = -11827

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the error constants.  
Notes: The source media can’t be added because it has no duration.

17.50.523 AVErrorInvalidCompositionTrackSegmentSourceStartTime= -11826

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the error constants.  
Notes: The source media can’t be added because its start time in the destination is invalid.
17.50.524  AVErrorInvalidOutputURLPathExtension = -11843

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** The path extension of the URL was invalid.

17.50.525  AVErrorInvalidSourceMedia = -11822

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** The operation could not be completed because some source media could not be read.

17.50.526  AVErrorInvalidVideoComposition = -11841

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** You attempted to perform an operation with the asset that is not supported.

17.50.527  AVErrorMaximumDurationReached = -11810

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** Recording stopped because the maximum duration for the file was reached.

17.50.528  AVErrorMaximumFileSizeReached = -11811

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** Recording stopped because the maximum size for the file was reached.

17.50.529  AVErrorMaximumNumberOfSamplesForFileFormatReached = -11813

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** Recording stopped because the maximum number of samples for the file was reached.

17.50.530  AVErrorMaximumStillImageCaptureRequestsExceeded = -11830

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** The photo could not be taken because there are too many photo requests that haven’t completed yet.
17.50.531 AVErrorMediaChanged = -11809

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** Recording stopped because the format of the source media changed.

17.50.532 AVErrorMediaDiscontinuity = -11812

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** Recording stopped because there was an interruption in the input media.

17.50.533 AVErrorNoDataCaptured = -11805

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** Recording failed because no data was received.

17.50.534 AVErrorNoImageAtTime = -11832

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** There is no image at that time in the media.

17.50.535 AVErrorOperationInterrupted = -11847

MBS AVFoundation Plugin, Plugin Version: 14.0. **Function:** One of the error constants. **Notes:** Operation was interrupted.

17.50.536 AVErrorOperationNotSupportedForAsset = -11838

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** You attempted to perform an operation with the asset that is not supported.

17.50.537 AVErrorOutOfMemory = -11801

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants. **Notes:** The operation could not be completed because there is not enough memory to process all of the media.
17.50.538 AVErrorReferenceForbiddenByReferencePolicy = -11842

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the error constants. Notes: You attempted to perform an operation with the asset that attempted to follow a reference that was not allowed.

17.50.539 AVErrorScreenCaptureFailed = -11844

17.50.540 AVErrorServerIncorrectlyConfigured = -11850

MBS AVFoundation Plugin, Plugin Version: 14.0. Function: One of the error constants. Notes: The HTTP server sending the media resource is not configured as expected. This might mean that the server does not support byte range requests. Available in OS X v10.9 and later.

17.50.541 AVErrorSessionConfigurationChanged = -11806

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the error constants. Notes: Recording stopped because the configuration of media sources and destinations changed.

17.50.542 AVErrorSessionNotRunning = -11803

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the error constants. Notes: Recording could not be started because no data is being captured.

17.50.543 AVErrorTorchLevelUnavailable = -11846

MBS AVFoundation Plugin, Plugin Version: 14.0. Function: One of the error constants. Notes: The specified torch level is valid but currently unavailable. This might be due to the device being overheated currently.
Available in OS X v10.9 and later.

17.50.544 **AVErrorUnknown = -11800**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the error constants.  
**Notes:** Reason for the error is unknown.

17.50.545 **kAudioFormat60958AC3 = ”cac3”**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** A key that specifies an AC-3 codec that provides data packaged for transport over an IEC 60958 compliant digital audio interface. Uses the standard format flags in "AudioStreamBasicDescription Flags".

17.50.546 **kAudioFormatAC3 = ”ac-3”**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** A key that specifies an AC-3 codec. Uses no flags.

17.50.547 **kAudioFormatAES3 = ”aes3”**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** The format defined by the AES3-2003 standard. Adopted into MXF and MPEG-2 containers and SDTI transport streams with SMPTE specs 302M-2002 and 331M-2000. Uses no flags.

17.50.548 **kAudioFormatALaw = ”alaw”**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** aLaw 2:1. Uses no flags.

17.50.549 **kAudioFormatAMR = ”samr”**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** The AMR (Adaptive Multi-Rate) narrow band speech codec.
CHAPTER 17. AVFOUNDATION

17.50.550  kAudioFormatAppleIMA4 = "ima4"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** A key that specifies Apple’s implementation of the IMA 4:1 ADPCM codec. Uses no flags.

17.50.551  kAudioFormatAppleLossless = "alac"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** Apple Lossless. Uses no flags.

17.50.552  kAudioFormatAudible = "AUDB"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** The codec used for Audible, Inc. audio books. Uses no flags.

17.50.553  kAudioFormatDVIIntelIMA = &h6D730011

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** DVI/Intel IMA ADPCM - ACM code 17.

17.50.554  kAudioFormatiLBC = "ilbc"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** The iLBC (internet Low Bitrate Codec) narrow band speech codec. Uses no flags.

17.50.555  kAudioFormatLinearPCM = "lpcm"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** A key that specifies linear PCM, a noncompressed audio data format with one frame per packet. Uses the linear PCM format flags in "AudioStreamBasicDescription Flags".

17.50.556  kAudioFormatMACE3 = "MAC3"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** MACE 3:1. Uses no flags.
17.50. **CLASS AVFOUNDATIONMBS**

17.50.557 \( \text{kAudioFormatMACE6} = "\text{MAC6}" \)

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** MACE 6.1. Uses no flags.

17.50.558 \( \text{kAudioFormatMicrosoftGSM} = \& \text{h6D730031} \)

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** Microsoft GSM 6.10 - ACM code 49.

17.50.559 \( \text{kAudioFormatMIDISTream} = "\text{midi}" \)

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** A stream of MIDIPacketList structures where the time stamps in the MIDIPacket structures are sample offsets in the stream. The mSampleRate field in the AudioStreamBasicDescription structure is used to describe how time is passed in this kind of stream and an audio unit that receives or generates this stream can use this sample rate together with the number of frames it is rendering and the sample offsets within the MIDIPacketList to define the time for any MIDI event within this list. Uses no flags.

17.50.560 \( \text{kAudioFormatMPEG4AAC} = "\text{aac }" \)

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** A key that specifies an MPEG-4 AAC codec. The flags field contains the MPEG-4 audio object type constant listed in "MPEG-4 Audio Object Type Constants" indicating the specific kind of data.

17.50.561 \( \text{kAudioFormatMPEG4AAC_ELD} = "\text{aace}" \)

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** MPEG-4 AAC Enhanced Low Delay audio object. Uses no flags.

17.50.562 \( \text{kAudioFormatMPEG4AAC_ELD_SBR} = "\text{aacf}" \)

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** MPEG-4 AAC Enhanced Low Delay audio object with SBR (spectral band replication) extension layer. Uses no flags.
17.50.563  kAudioFormatMPEG4AAC_ELD_V2 = "aacg"
MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.

17.50.564  kAudioFormatMPEG4AAC_HE = "aach"
MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** MPEG-4 High Efficiency AAC audio object. Uses no flags.

17.50.565  kAudioFormatMPEG4AAC_HE_V2 = "aacp"
MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** MPEG-4 High Efficiency AAC Version 2 audio object. Uses no flags.

17.50.566  kAudioFormatMPEG4AAC_LD = "aacl"
MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** MPEG-4 AAC Low Delay audio object. Uses no flags.

17.50.567  kAudioFormatMPEG4AAC_Spatial = "aacs"
MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** MPEG-4 Spatial Audio audio object. Uses no flags.

17.50.568  kAudioFormatMPEG4CELP = "celp"
MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** A key that specifies an MPEG-4 CELP codec. The flags field contains the MPEG-4 audio object type constant listed in "MPEG-4 Audio Object Type Constants" indicating the specific kind of data.

17.50.569  kAudioFormatMPEG4HVXC = "hvxc"
MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** A key that specifies an MPEG-4 HVXC codec. The flags field contains the MPEG-4 audio object type constant listed in "MPEG-4 Audio Object Type Constants" indicating the specific kind of data.
17.50. CLASS AVFOUNDATIONMBS

17.50.570 kAudioFormatMPEG4TwinVQ = "twvq"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** A key that specifies an MPEG-4 TwinVQ codec. The flags field contains the MPEG-4 audio object type constant listed in "MPEG-4 Audio Object Type Constants" indicating the specific kind of data.

17.50.571 kAudioFormatMPEGLayer1 = ".mp1"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** MPEG-1/2, Layer 1 audio. Uses no flags

17.50.572 kAudioFormatMPEGLayer2 = ".mp2"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** MPEG-1/2, Layer 2 audio. Uses no flags

17.50.573 kAudioFormatMPEGLayer3 = ".mp3"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** MPEG-1/2, Layer 3 audio. Uses no flags

17.50.574 kAudioFormatParameterValueStream = "apvs"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** A "side-chain" of Float32 data that can be fed or generated by an audio unit and that is used to send a high density of parameter value control information. An audio unit typically runs a parameter value stream at either the sample rate of the audio unit’s audio data, or some integer quotient of this (say a half or a third of the sample rate of the audio). The mSampleRate field in the AudioStreamBasicDescription structure describes this relationship. Uses no flags.

17.50.575 kAudioFormatQDesign = "QDMC"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats. **Notes:** QDesign music. Uses no flags
17.50.576  kAudioFormatQDesign2 = "QDM2"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** QDesign2 music. Uses no flags.

17.50.577  kAudioFormatQUALCOMM = "Qclp"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** QUALCOMM PureVoice. Uses no flags.

17.50.578  kAudioFormatTimeCode = "time"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** A stream of IOAudioTimeStamp structures. Uses the IOAudioTimeStamp flags (see "Audio Time Stamp Flags" and "Audio Time Stamp Flag Combination Constant").

17.50.579  kAudioFormatULaw = "ulaw"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the audio formats.  
**Notes:** Law 2:1. Uses no flags.
17.51 class AVFrameRateRangeMBS

17.51.1 class AVFrameRateRangeMBS

**Function:** An AVFrameRateRange object expresses a range of valid frame rates as minimum and maximum rate and minimum and maximum duration.  
**Notes:**  
An AVFrameRateRange object is immutable.  
An AVCaptureDeviceFormat object wraps a CMFormatDescription and expresses a range of valid video frame rates as an array of AVFrameRateRange objects.  
An AVCaptureDevice object uses AVCaptureDeviceFormat to describe the formats it supports and the currently-active format.  
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.51.2 Methods

17.51.3 Constructor

**Function:** The private constructor.

17.51.4 DisplayName as string

**Function:** The display text for this object.  
**Notes:** The plugin formats a string with the frame rate range for displaying.

17.51.5 maxFrameDuration as CMTimeMBS

**Function:** The maximum frame duration supported by the range. (read-only)  
**Notes:** This value is the reciprocal of minFrameRate, and expresses the minimum frame rate as a duration.

17.51.6 maxFrameRate as Double

**Function:** The maximum frame rate supported by the range. (read-only)
Notes: The frame is given in frames per second.

17.51.7 minFrameDuration as CMTimeMBS

Function: The minimum frame duration supported by the range. (read-only)
Notes: This value is the reciprocal of maxFrameRate, and expresses the maximum frame rate as a duration.

17.51.8 minFrameRate as Double

Function: The minimum frame rate supported by the range. (read-only)
Notes: The frame is given in frames per second.

17.51.9 Properties

17.51.10 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
17.52. **CLASS AVMEDIASELECTIONGROUPMBS**

17.52 class AVMediaSelectionGroupMBS

17.52.1 class AVMediaSelectionGroupMBS

**Function:** AVMediaSelectionGroup provides a collection of mutually exclusive options for the presentation of media within an asset.

17.52.2 Methods

17.52.3 available as boolean

**Function:** Whether this class is available.
**Notes:** Returns true on Mac OS X 10.7 and newer.

17.52.4 Constructor

**Function:** The constructor.

17.52.5 copy as AVMediaSelectionGroupMBS

**Function:** Creates a copy of the object.

17.52.6 mediaSelectionOptionsFromArrayFilteredAndSortedAccordingToPreferred-Languages(mediaSelectionOptions() as AVMediaSelectionOptionMBS) as AVMediaSelectionOptionMBS()

**Function:** Filters an array of AVMediaSelectionOptions according to whether their locales match any language identifier in the specified array of preferred languages. The returned array is sorted according to the order of preference of the language each matches.
**Notes:**
mediaSelectionOptions: An array of AVMediaSelectionOptions to be filtered and sorted.
preferredLanguages: An array of language identifiers in order of preference, each of which is an IETF BCP 47 (RFC 4646) language identifier. Use NSLocaleMBS.preferredLanguages to obtain the user’s list of preferred
languages. Plugins passes NSLocaleMBS.preferredLanguages if you don't provide an array of languages.

Returns an instance of NSArray containing media selection options of the specified NSArray that match a preferred language, sorted according to the order of preference of the language each matches.

See also:

- 17.52.7 mediaSelectionOptionsFromArrayFilteredAndSortedAccordingToPreferredLanguages(mediaSelectionOptions() as AVMediaSelectionOptionMBS, preferredLanguages() as string) as AVMediaSelectionOptionMBS()

17.52.7 mediaSelectionOptionsFromArrayFilteredAndSortedAccordingToPreferredLanguages(mediaSelectionOptions() as AVMediaSelectionOptionMBS, preferredLanguages() as string) as AVMediaSelectionOptionMBS()

Function: Filters an array of AVMediaSelectionOptions according to whether their locales match any language identifier in the specified array of preferred languages. The returned array is sorted according to the order of preference of the language each matches.

Notes:

mediaSelectionOptions: An array of AVMediaSelectionOptions to be filtered and sorted.
preferredLanguages: An array of language identifiers in order of preference, each of which is an IETF BCP 47 (RFC 4646) language identifier. Use NSLocaleMBS.preferredLanguages to obtain the user’s list of preferred languages. Plugins passes NSLocaleMBS.preferredLanguages if you don’t provide an array of languages.

Returns an instance of NSArray containing media selection options of the specified NSArray that match a preferred language, sorted according to the order of preference of the language each matches.

See also:

- 17.52.6 mediaSelectionOptionsFromArrayFilteredAndSortedAccordingToPreferredLanguages(mediaSelectionOptions() as AVMediaSelectionOptionMBS) as AVMediaSelectionOptionMBS()

17.52.8 mediaSelectionOptionsFromArrayWithLocale(mediaSelectionOptions() as AVMediaSelectionOptionMBS, locale as NSLocaleMBS) as AVMediaSelectionOptionMBS()

Function: Filters an array of AVMediaSelectionOptions according to locale.

Notes:

mediaSelectionOptions: An array of AVMediaSelectionOption to be filtered by locale.
locale: The NSLocale that must be matched for a media selection option to be copied to the output array.

Returns an instance of Array containing the media selection options of the specified Array that match the specified locale.
17.52.9 mediaSelectionOptionsFromArrayWithMediaCharacteristics(mediaSelectionOptions() as AVMediaSelectionOptionMBS, mediaCharacteristics() as string) as AVMediaSelectionOptionMBS()

**Function:** Filters an array of AVMediaSelectionOptions according to one or more media characteristics.
**Notes:**
mediaSelectionOptions: An array of AVMediaSelectionOptions to be filtered by media characteristic.
mediaCharacteristics: The media characteristics that must be matched for a media selection option to be copied to the output array.

Returns an instance of NSArray containing the media selection options of the specified NSArray that match the specified media characteristics.

17.52.10 mediaSelectionOptionsFromArrayWithoutMediaCharacteristics(mediaSelectionOptions() as AVMediaSelectionOptionMBS, mediaCharacteristics() as string) as AVMediaSelectionOptionMBS()

**Function:** Filters an array of AVMediaSelectionOptions according to whether they lack one or more media characteristics.
**Notes:**
mediaSelectionOptions: An array of AVMediaSelectionOptions to be filtered by media characteristic.
mediaCharacteristics: The media characteristics that must not be present for a media selection option to be copied to the output array.
Returns an instance ofNSArray containing the media selection options of the specified NSArray that lack the specified media characteristics.

17.52.11 mediaSelectionOptionWithPropertyList(plist as Variant) as AVMediaSelectionOptionMBS

**Function:** Returns the instance of AVMediaSelectionOption with properties that match the specified property list.
**Notes:**
plist: A property list previously obtained from an option in the group via AVMediaSelectionOption.propertyList.
If the specified properties match those of an option in the group, an instance of AVMediaSelectionOption. Otherwise nil.
CHAPTER 17. AVFOUNDATION

17.52.12 **options as AVMediaSelectionOptionMBS()**

**Function:** A collection of mutually exclusive media selection options.

17.52.13 **playableMediaSelectionOptionsFromArray(mediaSelectionOptions() as AVMediaSelectionOptionMBS) as AVMediaSelectionOptionMBS()**

**Function:** Filters an array of AVMediaSelectionOptions according to whether they are playable.
**Notes:**
mediaSelectionOptions: An array of AVMediaSelectionOption to be filtered according to whether they are playable.

Returns an instance of NSArray containing the media selection options of the specified NSArray that are playable.

17.52.14 **Properties**

17.52.15 **allowsEmptySelection as boolean**

**Function:** Indicates whether it’s possible to present none of the options in the group when an associated AVPlayerItem is played.
**Notes:**
If allowsEmptySelection is true, all of the available media options in the group can be deselected by passing nil as the specified AVMediaSelectionOption to AVPlayerItem.selectMediaOption.
(Read only property)

17.52.16 **Handle as Integer**

**Function:** The internal object reference.
**Notes:** (Read and Write property)
17.53. **CLASS AVMEDIAELECTIONOPTIONMBS**

17.53  class AVMediaSelectionOptionMBS

17.53.1  class AVMediaSelectionOptionMBS

**Function:** AVMediaSelectionOption represents a specific option for the presentation of media within a group of options.

**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.53.2  Methods

17.53.3  associatedMediaSelectionOptionInMediaSelectionGroup(mediaSelectionGroup as AVMediaSelectionGroupMBS) as AVMediaSelectionOptionMBS

**Function:** If a media selection option in another group is associated with the specified option, returns a reference to the associated option.

**Notes:**

mediaSelectionGroup: A media selection group in which an associated option is to be sought.

Returns an instance of AVMediaSelectionOption.

Audible media selection options often have associated legible media selection options; in particular, audible options are typically associated with forced-only subtitle options with the same locale. See AVMediaCharacteristicContainsOnlyForcedSubtitles in AVMediaFormat.h for a discussion of forced-only subtitles.

17.53.4  available as boolean

**Function:** Whether this class is available.

**Notes:** Returns true on Mac OS X 10.7 and newer.

17.53.5  availableMetadataFormats as string()

**Function:** Provides an NSArray of NSStrings, each representing a metadata format that contains metadata
associated with the option (e.g. ID3, iTunes metadata, etc.).

17.53.6  **commonMetadata as AVMetadataItemMBS()**

**Function:** Provides an array of AVMetadataItems for each common metadata key for which a value is available.

17.53.7  **Constructor**

**Function:** The private constructor.

17.53.8  **copy as AVMediaSelectionOptionMBS**

**Function:** Creates a copy of the object.

17.53.9  **displayNameWithLocale(locale as NSLocaleMBS) as String**

**Function:** Provides an string suitable for display.
**Notes:**
Available on Mac OS X 10.9 or newer.
Localize manufactured portions of the string using the specified locale.
May use this option’s common metadata, media characteristics and locale properties in addition to the provided locale to formulate an NSString intended for display.

17.53.10  **hasMediaCharacteristic(mediaCharacteristic as string) as boolean**

**Function:** Reports whether the media selection option includes media with the specified media characteristic.
**Notes:**
The media characteristic of interest, e.g. AVMediaCharacteristicVisual, AVMediaCharacteristicAudible, AVMediaCharacteristicLegible, etc.
Returns true if the media selection option includes media with the specified characteristic, otherwise false.

17.53.11 mediaSubTypes as Integer()

Function: The mediaSubTypes of the media data associated with the option.
Notes:
An Array of numbers carrying four character codes as defined in CoreAudioTypes.h for audio media and in CMFormatDescription.h for video media. Also see CMFormatDescriptionGetMediaSubType in CMFormatDescription.h for more information about media subtypes.

Note that if no information is available about the encoding of the media presented when a media option is selected, the value of mediaSubTypes will be an empty array. This can occur, for example, with streaming media. In these cases the value of mediaSubTypes should simply not be used as a criteria for selection.

17.53.12 metadataForFormat(Format as string) as AVMetadataItemMBS()

Function: Provides an Array of AVMetadataItems, one for each metadata item in the container of the specified format.
Notes:
format: The metadata format for which items are requested.
An Array containing AVMetadataItems; may be nil if there is no metadata of the specified format.

17.53.13 propertyList as Variant

Function: Returns a serializable property list that can be used to obtain an instance of AVMediaSelectionOption representing the same option as the receiver via AVMediaSelectionGroup.mediaSelectionOptionWithPropertyList.
Notes: Returns a serializable property list that’s sufficient to identify the option within its group. For serialization utilities, see NSPropertyList.h.
17.53.14 Properties

17.53.15 displayName as String

**Function:** Provides an String suitable for display using the current system locale.  
**Notes:**  
Available on Mac OS X 10.9 or newer.  
May use this option’s common metadata, media characteristics and locale properties in addition to the current system locale to formulate a string intended for display. Equivalent to displayNameWithLocale(NSLocaleMBS.currentLocale).  
(Read only property)

17.53.16 extendedLanguageTag as String

**Function:** Indicates the RFC 4646 language tag associated with the option. May be nil.  
**Notes:**  
Available on Mac OS X 10.9 or newer.  
(Read only property)

17.53.17 Handle as Integer

**Function:** The internal object reference.  
**Notes:** (Read and Write property)

17.53.18 isPlayable as boolean

**Function:** Indicates whether a media selection option is playable.  
**Notes:**  
If the media data associated with the option cannot be decoded or otherwise rendered, playable is false.  
(Read only property)
17.53. **CLASS AVMEDIASELECTIONOPTIONMBS**

17.53.19 **locale as NSLocaleMBS**

**Function:** Indicates the locale for which the media option was authored.
**Notes:** (Read only property)

17.53.20 **mediaType as string**

**Function:** The media type of the media data, e.g. AVMediaTypeAudio, AVMediaTypeSubtitle, etc.
**Notes:** (Read only property)
17.54 class AVMetadataItemFilterMBS

17.54.1 class AVMetadataItemFilterMBS

Function: AVMetadataItemFilter is a tool used to filter AVMetadataItems.
Notes: Instances of AVMetadataItemFilter are used to filter AVMetadataItems. They are opaque, unmodifiable objects, created via AVMetadataItemFilter class methods.

17.54.2 Methods

17.54.3 Add(keySpace as String, Key as String)

MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Adds a new key to the whitelist.
Example:

dim e as AVAssetExportSessionMBS // your export session

// make new filter
dim n as new AVMetadataItemFilterMBS

// add new keys
n.Add(AVFoundationMBS.AVMetadataKeySpaceCommon, AVFoundationMBS.AVMetadataCommonKeyAuthor)
n.Add(AVFoundationMBS.AVMetadataKeySpaceCommon, AVFoundationMBS.AVMetadataCommonKeyTitle)
n.Add(AVFoundationMBS.AVMetadataKeySpaceCommon, AVFoundationMBS.AVMetadataCommonKeySubject)

// now use the filter
e.metadataItemFilter = n

17.54.4 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9 and newer.
17.54. CLASS AVMETADATAIMEFILTERMBS

17.54.5 Constructor

Function: The constructor for a new empty filter.

17.54.6 metadataItemFilterForSharing as AVMetadataItemFilterMBS

Function: Provides an instance of an AVMetadataItemFilter useful for sharing assets.
Notes: Removes many user-identifying metadata items, such as location information, leaving only playback-, copyright- and commercial-related metadata (such as the purchaser’s Apple ID), along with metadata either derivable from the media itself or necessary for its proper behavior.

17.54.7 Properties

17.54.8 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.54.9 whitelist as Dictionary

MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Queries white list for this filter.
Notes: This is dictionary. Keys are key spaces and values are arrays of keys.
(Read only property)
17.55 class AVMetadataItemMBS

17.55.1 class AVMetadataItemMBS

**Function:** An AVMetadataItem object represents an item of metadata associated with an audiovisual asset  
or with one of its tracks.  
**Notes:** To create metadata items for your own assets, you use the mutable subclass, AVMutableMetadataItem.  
Metadata items have keys that accord with the specification of the container format from which they’re  
drawn. Full details of the metadata formats, metadata keys, and metadata key spaces supported by AV  
Foundation are available among the defines in AVMetadataFormat.h.

You can load values of a metadata item "lazily" using the methods from the AVAsynchronousKeyVal-  
ueLoading protocol (see “Asynchronous Loading”). The AVAsset class and other classes in turn provide  
their metadata lazily so that you can obtain objects from those arrays without incurring overhead for items  
you don’t ultimately inspect.

You can filter arrays of metadata items using the methods of this class. For example, you can filter by key  
and key space, by locale, and by preferred language.

17.55.2 Methods

17.55.3 available as boolean

**Function:** Whether this class is available.  
**Notes:** Returns true on Mac OS X 10.7 and newer.

17.55.4 Constructor

**Function:** The constructor.
17.55. CLASS AVMETADATAITEMMBS

17.55.5 copy as AVMetadataItemMBS

Function: Creates a copy of the object.

17.55.6 loadValuesAsynchronouslyForKeys(keys() as string, tag as Variant = nil)

Function: Tells the asset to load the values of any of the specified keys that are not already loaded.
Notes:
keys: An array containing the required keys.

Calls AVFoundationMBS.MetadataItemLoadValuesAsynchronouslyForKeysFinished on completion. The completion event will be invoked exactly once per invocation of this method:

- Synchronously if an I/O error or other format-related error occurs immediately.
- Asynchronously at a subsequent time if a loading error occurs at a later stage of processing, or if cancelLoading is invoked on an AVAsset instance.

The completion states of the keys you specify in keys are not necessarily the same; some may be loaded, and others may have failed. You must check the status of each key individually.

If you want to receive error reporting for loading that’s still pending, you can call this method at any time; even after an asset has begun to load data for operations in progress or already completed. If a fatal error has already occurred, the completion event is invoked synchronously.

17.55.7 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, key as Variant, keySpace as string) as AVMetadataItemMBS()

Function: Returns from a given array an array of metadata items that match a specified key or key space.
Notes:
array: The array of AVMetadataItem objects to be filtered.
key: The key that must be matched for a metadata item to be included in the output array. The key is compared to the keys in the metadata in the array using isEqual. If you do not want to filter by key, pass nil.
keySpace: The key space that must be matched for a metadata item to be included in the output array. The key space is compared to the key spaces in the metadata in the array using isEqualToString:. If you do not
CHAPTER 17. AVFOUNDATION

want to filter by key space, pass nil.

Returns an array of the metadata items from array that match key or keySpace.

If the value in the keySpace parameter is AVMetadataKeySpaceCommon, the value of the metadata item’s commonKey property must match the value in the key parameter for the item to be returned. If the key parameter is nil, then all metadata items in the common key space are returned.

If the value in the keySpace parameter is nil or is not the constant for the common key space, the value of the metadata item’s key property must match the value in the key parameter for the item to be returned. If the key parameter itself is nil, then all metadata items in the specified key space are returned.

• 17.55.8 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, locale as NSLocaleMBS) as AVMetadataItemMBS() 3394

• 17.55.9 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, metadataItemFilter as AVMetadataItemFilterMBS) as AVMetadataItemMBS() 3395

• 17.55.10 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, preferredLanguages() as string) as AVMetadataItemMBS() 3395

17.55.8 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, locale as NSLocaleMBS) as AVMetadataItemMBS()

Function: Returns from a given array an array of metadata items that match a specified locale.  
Notes:  
array: The array of AVMetadataItem objects to be filtered.  
locale: The locale that must be matched for a metadata item to be included in the output array.

Returns an array containing the AVMetadataItem objects from the array parameter that match the specified locale.

See also:

• 17.55.7 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, key as Variant, keySpace as string) as AVMetadataItemMBS() 3393

• 17.55.9 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, metadataItemFilter as AVMetadataItemFilterMBS) as AVMetadataItemMBS() 3395

• 17.55.10 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, preferredLanguages() as string) as AVMetadataItemMBS() 3395
17.55.9  metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, metadataItemFilter as AVMetadataItemFilterMBS) as AVMetadataItemMBS()

**Function:** Filters an array of metadata items using the metadata item filter.  
**Notes:**  
metadataItems: An array of AVMetadataItems to be filtered.  
metadataItemFilter: The AVMetadataItemFilter object for filtering the metadataItems.  

Returns an instance of NSArray containing the metadata items in metadataItems that have not been removed by metadataItemFilter.  
Available in OS X v10.9 and later.  
See also:  
- 17.55.7 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, key as Variant, keySpace as string) as AVMetadataItemMBS()  
- 17.55.8 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, locale as NSLocaleMBS) as AVMetadataItemMBS()  
- 17.55.10 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, preferredLanguages() as string) as AVMetadataItemMBS()  

17.55.10  metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, preferredLanguages() as string) as AVMetadataItemMBS()

**Function:** Returns the subset of metadata items whose locales match one of the specified language identifiers.  
**Notes:**  
metadataItems: An array of AVMetadataItem objects to be filtered and sorted.  
preferredLanguages: An array of strings, each of which contains a canonicalized IETF BCP 47 language identifier.  
The order of the identifiers in the array reflects the preferred language order, with the most preferred language being first in the array.  
Typically, you pass the user’s preferred languages by retrieving this array from the preferredLanguages class method of NSLocale.  

Returns an array containing the AVMetadataItem objects from the metadataItems parameter that match one of the specified languages.  
See also:  
- 17.55.7 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, key as Variant, keySpace as string) as AVMetadataItemMBS()  
- 17.55.8 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, locale as NSLocaleMBS) as AVMetadataItemMBS()  
- 17.55.10 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, preferredLanguages() as string) as AVMetadataItemMBS()
• 17.55.9 metadataItemsFromArray(metadataItems() as AVMetadataItemMBS, metadataItemFilter as AVMetadataItemFilterMBS) as AVMetadataItemMBS()

17.55.11 mutableCopy as AVMutableMetadataItemMBS

MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Creates a mutable copy.

17.55.12 statusOfValueForKey(key as string, byref error as NSErrorMBS) as Integer

**Function:** Reports whether the value for a given key is immediately available without blocking. (required)
**Notes:**
key: The key whose status you want.
error: If the status of the value for the key is AVKeyValueStatusFailed, upon return contains an NSError object that describes the failure that occurred.

Returns the current loading status of the value for key. For possible values, see "Protocol Methods."

You use this method to determine the availability of the value for a key. This method does not cause an asset to load the value of a key that’s not yet available. To request values for keys that may not already be loaded without blocking, use loadValuesAsynchronouslyForKeys and wait for invocation of the completion handler to be informed of availability.

17.55.13 Properties

17.55.14 commonKey as string

**Function:** The common key of the metadata item. (read-only)
**Notes:**
This property contains the key that most closely corresponds to the key in the key property but that belongs to the common key space (AVMetadataKeySpaceCommon) as opposed to a format-specific key space. You can use this key to locate metadata items irrespective of the underlying media format.

If the value of the keySpace property is AVMetadataKeySpaceCommon, this property contains the same key as the key property.
(Read only property)
17.55.15  dataValue as Memoryblock

Function: Provides the raw bytes of the value of the metadata item. (read-only)
Notes: (Read only property)

17.55.16  dateValue as date

Function: The value of the metadata item formatted as a date. (read-only)
Notes:
The value of this property is nil if the metadata value cannot be represented as a date.
(Read only property)

17.55.17  duration as CMTimeMBS

Function: The duration of the metadata item. (read-only)
Notes: (Read only property)

17.55.18  extraAttributes as Dictionary

Function: The additional attributes supplied by the metadata item. (read-only)
Notes: (Read only property)

17.55.19  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
**17.55.20  key as Variant**

**Function:** The key of the metadata item. (read-only)  
**Notes:**  
The key property contains the true key used to identify the contents of the metadata item. This value is specific to the key space of the metadata item.  
(Read only property)

**17.55.21  keySpace as string**

**Function:** The key space of metadata item’s key. (read-only)  
**Notes:**  
The key space specified by this property is typically the default key space for the metadata container in which the metadata item is stored.  
AV Foundation uses key spaces to group related sets of keys. For example, the framework defines different key spaces for common keys, iTunes keys, ID3 keys, and QuickTime keys. Key spaces aid in filtering arrays of metadata items.  
(Read only property)

**17.55.22  locale as NSLocaleMBS**

**Function:** The locale of the metadata item. (read-only)  
**Notes:**  
The locale may be nil if no locale information is available for the metadata item.  
(Read only property)

**17.55.23  numberValue as Double**

**Function:** The value of the metadata item formatted as a number. (read-only)  
**Notes:**  
The value of this property is nil if the metadata value cannot be represented as a number.  
(Read only property)
17.55. **CLASS AVMETADATAITEMMBS**

17.55.24 **stringValue as string**

**Function:** The value of the metadata item formatted as a string. (read-only)
**Notes:**
The value of this property is nil if the metadata value cannot be represented as a string.
(Read only property)

17.55.25 **time as CMTimeMBS**

**Function:** The timestamp of the metadata item. (read-only)
**Notes:** (Read only property)

17.55.26 **value as Variant**

**Function:** The value of the metadata item. (read-only)
**Notes:** (Read only property)

17.55.27 **Constants**

17.55.28 **AVKeyValueStatusCancelled = 4**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the load status of a property.
**Notes:** Indicates that the attempt to load the property was cancelled.

17.55.29 **AVKeyValueStatusFailed = 3**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the load status of a property.
**Notes:** Indicates that the attempt to load the property failed.
17.55.30  **AVKeyValueStatusLoaded = 2**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the load status of a property.
**Notes:** Indicates that the property is ready for use.

17.55.31  **AVKeyValueStatusLoading = 1**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the load status of a property.
**Notes:** Indicates that the property is not fully loaded.

17.55.32  **AVKeyValueStatusUnknown = 0**

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the constants to indicate the load status of a property.
**Notes:** Indicates that the property status is unknown.
17.56   class AVMetadataObjectMBS

17.56.1  class AVMetadataObjectMBS

Function: The class for a metadata object.

17.56.2  Methods

17.56.3  available as boolean

Function: Whether this class is available.

17.56.4  Constructor

Function: The constructor.

17.56.5  Properties

17.56.6  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
17.57 class AVMutableAudioMixInputParametersMBS

17.57.1 class AVMutableAudioMixInputParametersMBS

Function: An AVMutableAudioMixInputParameters object represents the parameters that should be applied to an audio track when it is added to a mix.

Notes: Subclass of the AVAudioMixInputParametersMBS class.

17.57.2 Methods

17.57.3 audioMixInputParameters as AVMutableAudioMixInputParametersMBS

Function: Creates and returns a mutable input parameters object with no volume ramps and trackID initialized to kCMPersistentTrackIDInvalid.

17.57.4 audioMixInputParametersWithTrack(track as AVAssetTrackMBS) as AVMutableAudioMixInputParametersMBS

Function: Creates and returns a mutable input parameters object for a given track.

Notes: track: The track to associate with the input parameters object.

Returns a mutable input parameters object with no volume ramps and trackID set to track’s ID.

17.57.5 Constructor

Function: Creates and returns a mutable input parameters object with no volume ramps and trackID initialized to kCMPersistentTrackIDInvalid.

See also:

- 17.57.6 Constructor(other as AVAudioMixInputParametersMBS) 3403

- 17.57.7 Constructor(track as AVAssetTrackMBS) 3403
17.57. **CLASS AVMUTABLEAUDIOMIXINPUTPARAMETERSMBS**

17.57.6 **Constructor(other as AVAudioMixInputParametersMBS)**

MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The copy constructor to initialize with a mutable copy of the given object.

See also:

- 17.57.5 Constructor
- 17.57.7 Constructor(track as AVAssetTrackMBS)

17.57.7 **Constructor(track as AVAssetTrackMBS)**

**Function:** Creates and returns a mutable input parameters object for a given track.

**Notes:**

track: The track to associate with the input parameters object.

Initializes input parameters object with no volume ramps and trackID set to track’s ID.

See also:

- 17.57.5 Constructor
- 17.57.6 Constructor(other as AVAudioMixInputParametersMBS)

17.57.8 **setVolume(volume as Double, atTime as CMTimeMBS)**

**Function:** Sets the value of the audio volume starting at the specified time.

**Notes:**

volume: The volume.

time: The start time at which to set the volume.

This method adds a volume ramp starting at time. This volume setting remains in effect until the end of the track unless you set a different volume level to start at a later time.

17.57.9 **setVolumeRamp(startVolume as Double, endVolume as Double, timeRange as CMTimeRangeMBS)**

**Function:** Sets a volume ramp to apply during a specified time range.

**Notes:**

startVolume: The starting volume.

dendVolume: The end volume.
timeRange: The time range over which to apply the ramp.

### 17.57.10 Properties

#### 17.57.11 trackID as Integer

**Function:** The ID of the audio track to which the parameters should be applied.

**Notes:** (Read and Write computed property)
17.58. **CLASS AVMUTABLEAUDIOMIXMBS**

### 17.58 class AVMutableAudioMixMBS

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** An AVMutableAudioMix object manages the input parameters for mixing audio tracks.

**Notes:**

It allows custom audio processing to be performed on audio tracks during playback or other operations. Subclass of the AVAudioMixMBS class.

### 17.58.2 Methods

#### 17.58.3 audioMix as AVMutableAudioMixMBS

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns a new mutable audio mix.

### 17.58.4 Constructor

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The constructor.

See also:

- 17.58.5 Constructor(other as AVAudioMixMBS)

### 17.58.5 Constructor(other as AVAudioMixMBS)

**MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The copy constructor to initialize with a mutable copy of the given object.

See also:

- 17.58.4 Constructor

### 17.58.6 setInputParameters(items() as AVAudioMixInputParametersMBS)

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Sets the parameters for inputs to the mix.

**Notes:**

The array contains instances of AVAudioMixInputParameters. Note that an instance of AVAudioMixInputParameters is not required for each audio track that contributes to the mix; audio for those without associated AVAudioMixInputParameters will be included in the mix, processed according to default
behavior.
17.59. **CLASS AVMutableCompositionMBS**

17.59 **class AVMutableCompositionMBS**

Function: AVMutableComposition is a mutable subclass of AVComposition you use when you want to create a new composition from existing assets.  
Notes:  
You can add and remove tracks, and you can add, remove, and scale time ranges.  
You can make an immutable snapshot of a mutable composition for playback or inspection with the copy method.  
Subclass of the AVCompositionMBS class.

17.59.2 **Methods**

17.59.3 **addMutableTrackWithMediaType**(mediaType as string, preferredTrackID as Integer) as AVMutableCompositionTrackMBS

Function: Adds an empty track to the receiver.  
Notes:  
mediaType: The media type of the new track.  
preferredTrackID: The preferred track ID for the new track. If you do not need to specify a preferred track ID, pass kCMPersistentTrackID_Invalid. The preferred track ID will be used for the new track provided that it is not currently in use and has not previously been used. If the preferred track ID you specify is not available, or if you pass in kCMPersistentTrackID_Invalid, a unique track ID is generated.

Returns an instance of AVMutableCompositionTrack representing the new track.  
You can get the actual trackID of the new track through its "trackID" key.

17.59.4 **append**(asset as AVAssetMBS, byref error as NSErrorMBS) as boolean

Function: Appends all the tracks to the receiver.  
Notes:  
asset: An asset that contains the tracks to be inserted.  
Error: If the insertion was not successful, on return contains an NSError object that describes the problem.

Return true if the insertion was successful, otherwise false.
This method may add new tracks to ensure that all tracks of the asset are represented in the inserted time range.
Existing content at the specified start time is pushed out by the duration of the time range.
Media data for the inserted time range is presented at its natural duration; you can scale it to a different duration using `scaleTimeRange`.

### 17.59.5 appendTimeRange(timeRange as CMTimeRangeMBS, asset as AVAssetMBS, byref error as NSErrorMBS) as boolean

**Function:** Appends all the tracks within a given time range of a specified asset into the receiver.
**Notes:**
timeRange: The time range of the asset to be inserted.
asset: An asset that contains the tracks to be inserted.
Error: If the insertion was not successful, on return contains an NSError object that describes the problem.
Return true if the insertion was successful, otherwise false.

This method may add new tracks to ensure that all tracks of the asset are represented in the inserted time range.
Existing content at the specified start time is pushed out by the duration of the time range.
Media data for the inserted time range is presented at its natural duration; you can scale it to a different duration using `scaleTimeRange`.

### 17.59.6 composition as AVMutableCompositionMBS

**Function:** Returns a new, empty, mutable composition.

### 17.59.7 Constructor

**Function:** The constructor.
See also:
- 17.59.8 Constructor(other as AVCompositionMBS)
17.59. **CLASS AVMUTABLECOMPOSITIONMBS**

### 17.59.8 Constructor(other as AVCompositionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The copy constructor to initialize with a mutable copy of the given object.

See also:

- 17.59.7 Constructor

### 17.59.9 insert(asset as AVAssetMBS, startTime as CMTimeMBS, byref error as NSErrorMBS) as boolean

**Function:** Inserts all the tracks of a specified asset into the receiver.

**Notes:**

- asset: An asset that contains the tracks to be inserted.
- startTime: The time at which the inserted tracks should be presented by the receiver.
- Error: If the insertion was not successful, on return contains an NSError object that describes the problem.

Return true if the insertion was successful, otherwise false.

This method may add new tracks to ensure that all tracks of the asset are represented in the inserted time range.

Existing content at the specified start time is pushed out by the duration of the time range.

Media data for the inserted time range is presented at its natural duration; you can scale it to a different duration using scaleTimeRange.

### 17.59.10 insertEmptyTimeRange(timeRange as CMTimeRangeMBS)

**Function:** Adds or extends an empty timeRange within all tracks of the composition.

**Notes:**

- timeRange: The empty time range to insert.

If you insert an empty time range into the composition, any media that was presented during that interval prior to the insertion will be presented instead immediately afterward. You can use this method to reserve an interval in which you want a subsequently created track to present its media.
17.59.11 insertTimeRange(timeRange as CMTimeRangeMBS, asset as AVAssetMBS, startTime as CMTimeMBS, byref error as NSErrorMBS) as boolean

Function: Inserts all the tracks within a given time range of a specified asset into the receiver.
Notes:

timeRange: The time range of the asset to be inserted.
asset: An asset that contains the tracks to be inserted.
startTime: The time at which the inserted tracks should be presented by the receiver.
Error: If the insertion was not successful, on return contains an NSError object that describes the problem.

Return true if the insertion was successful, otherwise false.

This method may add new tracks to ensure that all tracks of the asset are represented in the inserted time range. Existing content at the specified start time is pushed out by the duration of the time range. Media data for the inserted time range is presented at its natural duration; you can scale it to a different duration using scaleTimeRange.

17.59.12 MutableCompositionTracks as AVMutableCompositionTrackMBS()

Function: An array of AVMutableCompositionTrack objects contained by the composition. (read-only)

17.59.13 mutableTrackCompatibleWithTrack(track as AVAssetTrackMBS) as AVMutableCompositionTrackMBS

Function: Returns a track in the receiver into which any time range of a given asset track can be inserted.
Notes:

track: An AVAssetTrack from which a time range may be inserted.

Returns a mutable track in the receiver into which any time range of track can be inserted. If no such track is available, the returns nil.

For best performance, you should keep the number of tracks of a composition should be kept to a minimum, corresponding to the number for which media data must be presented in parallel. If you want to present media data of the same type serially, even from multiple assets, you should use a single track of that media.
type. You use this method to identify a suitable existing target track for an insertion.

If there is no compatible track available, you can create a new track of the same media type as track using addMutableTrackWithMediaType.

This method is similar to compatibleTrackForCompositionTrack (AVAsset).

### 17.59.14 removeTimeRange(timeRange as CMTimeRangeMBS)

**Function:** Removes a specified timeRange from all tracks of the composition.

**Notes:**

- timeRange: The time range to be removed.

After removing, existing content after the time range will be pulled in. Removal of a time range does not cause any existing tracks to be removed from the composition, even if removing timeRange results in an empty track. Instead, it removes or truncates track segments that intersect with the time range.

### 17.59.15 removeTrack(track as AVCompositionTrackMBS)

**Function:** Removes a specified track from the receiver.

**Notes:**

- track: The track to remove.

When it is removed track’s @"composition" key is set to nil. The values of its other keys remain intact, for arbitrary use.

### 17.59.16 scaleTimeRange(timeRange as CMTimeRangeMBS, duration as CMTimeMBS)

**Function:** Changes the duration of all tracks in a given time range.

**Notes:**

- timeRange: The time range of the composition to be scaled.
- duration: The new duration of timeRange.
Each track segment affected by the scaling operation will be presented at a rate equal to source.duration / target.duration of its resulting time mapping.

17.59.17 Properties

17.59.18 naturalSize as CGSizeMBS

**Function:** The encoded or authored size of the visual portion of the asset.

**Notes:**

If this value is not set, the default behavior is as defined by AVAsset; set the value to CGSizeZero to revert to the default behavior.
Available in OS X v10.7 and later.
Deprecated in OS X v10.8.
(Read and Write computed property)
17.60. **CLASS AVMUTABLECOMPOSITIONTRACKMBS**

17.60  **class AVMutableCompositionTrackMBS**

17.60.1  **class AVMutableCompositionTrackMBS**

**Function:** AVMutableCompositionTrack is a mutable subclass of AVCompositionTrack that lets you for insert, remove, and scale track segments without affecting their low-level representation (that is, the operations you perform are non-destructive on the original).  
**Notes:** AVCompositionTrack defines constraints for the temporal alignment of the track segments. If you set the array of track segments in a mutable composition (see trackSegments), you can test whether the segments meet the constraints using validateTrackSegments.  
Subclass of the AVCompositionTrackMBS class.

17.60.2  **Methods**

17.60.3  **Constructor**

**Function:** The constructor.  
See also:  
- 17.60.4 Constructor(other as AVCompositionTrackMBS)

17.60.4  **Constructor(other as AVCompositionTrackMBS)**

MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
**Function:** The copy constructor to initialize with a mutable copy of the given object.  
See also:  
- 17.60.3 Constructor

17.60.5  **insertEmptyTimeRange(timeRange as CMTimeRangeMBS)**

**Function:** Adds or extends an empty time range within the receiver.  
**Notes:**  
timeRange: The empty time range to be inserted.

If you insert an empty time range into the track, any media that was presented during that interval prior to the insertion will be presented instead immediately afterward.
The nature of the data inserted depends upon the media type of the track. For example, an empty time range in a sound track presents silence.

17.60.6  insertTimeRange(timeRange as CMTimeRangeMBS, AssetTrack as AVAssetTrackMBS, startTime as CMTimeMBS, byref error as NSErrorMBS) as boolean

Function: Inserts a time range of a source track.
Notes:
timeRange: The time range of the track to be inserted.
track: The source track to be inserted.
startTime: The time at which track is to be presented by the composition track.
error: If track is not inserted successfully, contains an NSError object that describes the problem.

Returns true if track was inserted successfully, otherwise false.

By default, the inserted track’s time range is presented at its natural duration and rate. You can scale it to a different duration (so that it is presented at a different rate) using scaleTimeRange:toDuration:.

Insertion might fail if, for example, the asset that you try to insert is restricted by copy-protection.

17.60.7  insertTimeRanges(timeRanges() as CMTimeRangeMBS, tracks() as AVAssetTrackMBS, startTime as CMTimeMBS, byref error as NSErrorMBS) as boolean

Function: Inserts time ranges of source tracks.
Notes:
Requires Mac OS X 10.8.

Inserts the timeRanges of multiple source tracks into a track of a composition.
timeRanges: Specifies the timeRanges to be inserted.
tracks: Specifies the source tracks to be inserted. Only AVAssetTracks of AVURLAssets are supported.
startTime: Specifies the time at which the inserted tracks are to be presented by the composition track. You may pass kCMTimeInvalid for startTime to indicate that the timeRanges should be appended to the end of the track.
error: Describes failures that may be reported to the user, e.g. the asset that was selected for insertion in
the composition is restricted by copy-protection.
Returns a boolean value indicating the success of the insertion.

This method is equivalent to (but more efficient than) calling insertTimeRange for each timeRange/track pair.
If this method returns an error, none of the time ranges will be inserted into the composition track.
To specify an empty time range, pass NSNull for the track and a time range of starting at kCMTIMEInvalid
with a duration of the desired empty edit.

17.60.8 removeTimeRange(timeRange as CMTimeRangeMBS)

Function: Removes a specified time range from the receiver.
Notes:
timeRange: The time range to be removed.

Removing a time range does not cause the track to be removed from the composition. Instead it removes or
truncates track segments that intersect with the time range.

17.60.9 scaleTimeRange(timeRange as CMTimeRangeMBS, duration as CM-
TimeMBS)

Function: Changes the duration of a time range in the receiver.
Notes:
timeRange: The time range of the track to be scaled.
duration: The new duration of timeRange.

Each track segment affected by the scaling operation will be presented at a rate equal to source.duration /
target.duration of its resulting timeMapping.

17.60.10 setCompositionTrackSegments(segments() as AVCompositionTrackSe-
gmentMBS)

Function: Sets the composition track’s array of track segments.
Notes: The timeMapping.target.start of the first track segment must be kCMTIMEZero, and the timeMap-
ing.target.start of each subsequent track segment must equal CMTimeRangeGetEnd(<# previousTrack-
CHAPTER 17. AVFOUNDATION

Segment# > .timeMapping.target). You can use validateTrackSegments to ensure that an array of track segments conforms to this rule.

17.60.11 validateTrackSegments(trackSegments() as AVCompositionTrackSegmentMBS, byref error as NSErrorMBS) as boolean

Function: Returns a Boolean value that indicates whether a given array of track segments conform to the timing rules for a composition track.
Notes:

trackSegments: An array of AVCompositionTrackSegment objects.
error: If validation fails, on return contains an NSError object that describes the problem.

Returns true if the track segments in trackSegments conform to the timing rules for a composition track, otherwise false.

You can use this method to ensure that an array of track segments is suitable for setting as the value of the trackSegments property. The timeMapping.target.start of the first track segment must be kCMTimeZero, and the timeMapping.target.start of each subsequent track segment must equal CMTimingRangeGetEnd(<# previousTrackSegment# > .timeMapping.target).

If you want to modify the existing trackSegments array, you can create a mutable copy of it, modify the mutable array, and then validate the mutable array using this method.

17.60.12 Properties

17.60.13 extendedLanguageTag as string

Function: The language tag associated with the track, as an RFC 4646 language tag.
Notes:

If not set, the value is nil.
(Read and Write computed property)

17.60.14 languageCode as string

Function: The language associated with the track, as an ISO 639-2/T language code.
Notes:
If not set, the value is nil.
(Read and Write computed property)

17.60.15 naturalTimeScale as Integer

Function: The timescale in which time values for the track can be operated upon without extraneous numerical conversion.
Notes:
If not set, the value is the natural time scale of the first non-empty edit, or 600 if there are no non-empty edits.

Set the value to 0 to revert to the default behavior.
(Read and Write computed property)

17.60.16 preferredTransform as CGAffineTransformMBS

Function: The preferred transformation of the visual media data for display purposes.
Notes:
If not set, the value is CGAffineTransformIdentity.
(Read and Write computed property)

17.60.17 preferredVolume as Double

Function: The preferred volume of the audible media data.
Notes:
If not set, the value is 1.0.
(Read and Write computed property)
17.61 class AVMutableMetadataItemMBS

17.61.1 class AVMutableMetadataItemMBS

**Function:** AVMutableMetadataItem is a mutable subclass of AVMetadataItem that lets you build collections of metadata to be written to asset files using AVAssetExportSession.  
**Notes:** 
You can initialize a mutable metadata item from an existing AVMetadataItem object or with a one or more of the basic properties of a metadata item: a key, a key space, a locale, and a value.  
Subclass of the AVMetadataItemMBS class.

17.61.2 Methods

17.61.3 Constructor

**Function:** The constructor.  
**Example:**

```plaintext
dim e as AVAssetExportSessionMBS // your export session
dim asset as AVAssetMBS // your asset

// query metadata
dim a() as AVMetadataItemMBS = asset.metadata

// make new
dim m as new AVMutableMetadataItemMBS

// add common key with author
m.keySpace = AVFoundationMBS.AVMetadataKeySpaceCommon
m.key = AVFoundationMBS.AVMetadataCommonKeyAuthor
m.Value = "Hello World"

// append to array and use as metadata:
a.Append m
e.setMetadata a
```

See also:

- 17.61.4 Constructor(other as AVMetadataItemMBS)
17.61. **CLASS AVMUTABLEMETADATAITEMMBS**

### 17.61.4 Constructor(other as AVMetadataItemMBS)

MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** The copy constructor to initialize with a mutable copy of the given object.
See also:
- 17.61.3 Constructor

### 17.61.5 metadataItem as AVMutableMetadataItemMBS

**Function:** Returns a new mutable metadata item.

### 17.61.6 Properties

#### 17.61.7 duration as CMTimeMBS

**Function:** Indicates the metadata item’s duration.
**Notes:** (Read and Write computed property)

#### 17.61.8 extraAttributes as Dictionary

**Function:** Provides a dictionary of the metadata item’s additional attributes.
**Notes:** (Read and Write computed property)

#### 17.61.9 key as Variant

**Function:** Indicates the metadata item’s key.
**Notes:** (Read and Write computed property)

#### 17.61.10 keySpace as string

**Function:** Indicates the key space of the metadata item’s key.
**Notes:**
This is typically the default key space for the metadata container in which the metadata item is stored.
(Read and Write computed property)

17.61.11 locale as NSLocaleMBS

Function: Indicates the metadata item’s locale.
Notes:
The locale may be nil if no locale information is available for the item.
(Read and Write computed property)

17.61.12 time as CMTimeMBS

Function: Indicates the metadata item’s timestamp.
Notes: (Read and Write computed property)

17.61.13 value as Variant

Function: Indicates the metadata item’s value.
Notes: (Read and Write computed property)
17.62. **CLASS AVMUTABLETIMEDMETADATAGROUPMBS**

17.62  **class AVMutableTimedMetadataGroupMBS**

17.62.1  **class AVMutableTimedMetadataGroupMBS**

**Function:** You use an AVMutableTimedMetadataGroup object to represent a mutable collection of metadata items.  
**Notes:** Subclass of the AVTimedMetadataGroupMBS class.

17.62.2  **Methods**

17.62.3  **Constructor(items() as AVMetadataItemMBS, timeRange as CMTimeRangeMBS)**

**Function:** The constructor.  
See also:

- 17.62.4 **Constructor(other as AVTimedMetadataGroupMBS)**

17.62.4  **Constructor(other as AVTimedMetadataGroupMBS)**

MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
**Function:** The copy constructor to initialize with a mutable copy of the given object.  
See also:

- 17.62.3 **Constructor(items() as AVMetadataItemMBS, timeRange as CMTimeRangeMBS)**

17.62.5  **items as AVMetadataItemMBS()**

**Function:** The metadata items in the group.

17.62.6  **setItems(items() as AVMetadataItemMBS)**

**Function:** Sets the metadata items in the group.
17.62.7 Properties

17.62.8 timeRange as CMT impeRangeMBS

Function: The time range of the metadata.
Notes: (Read and Write computed property)
17.63  class AVMutableVideoCompositionInstructionMBS

17.63.1  class AVMutableVideoCompositionInstructionMBS

**Function:**  An AVMutableVideoCompositionInstruction object represents an operation to be performed by a compositor.

**Notes:**

An AVVideoComposition object maintains an array of instructions to perform its composition. Subclass of the AVVideoCompositionInstructionMBS class.

17.63.2  Methods

17.63.3  Constructor

**Function:**  The constructor.

See also:

- 17.63.4 Constructor(other as AVVideoCompositionInstructionMBS)

17.63.4  Constructor(other as AVVideoCompositionInstructionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:**  The copy constructor to initialize with a mutable copy of the given object.

See also:

- 17.63.3 Constructor

17.63.5  layerInstructions as AVVideoCompositionLayerInstructionMBS()

**Function:**  An array of instances of AVVideoCompositionLayerInstruction that specify how video frames from source tracks should be layered and composed.

**Notes:**

Tracks are layered in the composition according to the top-to-bottom order of the layerInstructions array; the track with trackID of the first instruction in the array will be layered on top, with the track with the trackID of the second instruction immediately underneath, and so on.

If the property value is nil, the output is a fill of the background color.
17.63.6 setLayerInstructions(items() as AVVideoCompositionLayerInstruction-MBS)

**Function:** Sets an array of instances of AVVideoCompositionLayerInstruction that specify how video frames from source tracks should be layered and composed.

**Notes:**
Tracks are layered in the composition according to the top-to-bottom order of the layerInstructions array; the track with trackID of the first instruction in the array will be layered on top, with the track with the trackID of the second instruction immediately underneath, and so on.

If the property value is nil, the output is a fill of the background color.

17.63.7 videoCompositionInstruction as AVMutableVideoCompositionInstructionMBS

**Function:** Returns a new mutable video composition instruction.

17.63.8 Properties

17.63.9 backgroundColor as Variant

**Function:** The background color of the composition.

**Notes:**
Value must be CGColorMBS.
Only solid BGRA colors are supported; patterns and other supported colors are ignored. If the rendered pixel buffer does not have alpha, the alpha value of the background color is ignored.

If the background color is nil, the video compositor uses a default background color of opaque black.
(Read and Write computed property)

17.63.10 enablePostProcessing as boolean

**Function:** Indicates whether post processing is required for the video composition instruction.

**Notes:**
If no post processing is required for the whole duration of the video composition instruction, set this property to false to make the composition process more efficient.

The value is true by default.
(Read and Write computed property)

**17.63.11 timeRange as CMTimeRangeMBS**

**Function:** The time range during which the instruction is effective.
**Notes:**
If the time range is invalid, the video compositor will ignore it.
(Read and Write computed property)
CHAPTER 17. AVFOUNDATION

17.64 class AVMutableVideoCompositionLayerInstructionMBS

17.64.1 class AVMutableVideoCompositionLayerInstructionMBS

Function: AVMutableVideoCompositionLayerInstruction is a mutable subclass of AVVideoComposition-
LayerInstruction that you use to modify the transform and opacity ramps to apply to a given track in an
AV composition.

Notes: Subclass of the AVVideoCompositionLayerInstructionMBS class.

17.64.2 Methods

17.64.3 Constructor

Function: The constructor.

See also:

- 17.64.4 Constructor(other as AVMutableVideoCompositionLayerInstructionMBS)

17.64.4 Constructor(other as AVMutableVideoCompositionLayerInstructionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: The copy constructor to initialize with a mutable copy of the given object.

See also:

- 17.64.3 Constructor

17.64.5 setCropRectangle(cropRectangle as CGRectMBS, time as CMTimeMBS)

Function: Sets a value of the crop rectangle at a time within the time range of the instruction.

Notes:

cropRectangle: The crop rectangle to be applied at the specified time.
time: A time value within the timeRange of the composition instruction.

The origin of the crop rectangle is the top-left corner of the buffer clean aperture rectangle. The crop
rectangle is defined in square pixel space, that is, without taking the pixel aspect ratio into account. Crop
rectangles extending outside of the clean aperture, are cropped to the clean aperture.
17.64. CLASS AVMUTABLEVIDEOCOMPOSITIONLAYERINSTRUCTIONMBS

Sets a fixed crop rectangle to apply from time until the next time at which a crop rectangle is set; this is the same as setting a flat ramp for that time range.

Before the first specified time for which a crop rectangle is set, the crop rectangle is held constant to CGRect-Infinite and after the last time for which a crop rectangle is set, the crop rectangle is held constant at that last value.
Available in OS X v10.9 and later.

17.64.6 setCropRectangleRampFromStartCropRectangle(startCropRectangle as CGRectMBS, endCropRectangle as CGRectMBS, timeRange as CM-TimeRangeMBS)

Function: Sets a crop rectangle ramp to apply during the specified time range.
Notes:
startCropRectangle: The crop rectangle to be applied at the starting time of the timeRange.
endCropRectangle: The crop rectangle to be applied at the end time of the timeRange.
timeRange: The time range over which the value of the opacity is interpolated between startCropRectangle and endCropRectangle.

The origin of the crop rectangle is the top-left corner of the buffer clean aperture rectangle. The crop rectangle is defined in square pixel space, that is, without taking the pixel aspect ratio into account. Crop rectangles extending outside of the clean aperture, are cropped to the clean aperture.

During a crop rectangle ramp, the rectangle is interpolated between the values set at the ramp’s start time and end time. When the starting or ending rectangle is empty, interpolations take into account the origin and size of the empty rectangle.

Before the first specified time for which a crop rectangle is set, the crop rectangle is held constant to CGRect-Infinite and after the last time for which a crop rectangle is set, the crop rectangle is held constant at that last value.
Available in OS X v10.9 and later.

17.64.7 setOpacity(opacity as Double, time as CMTimeMBS)

Function: Sets a value of the opacity at a time within the time range of the instruction.
Notes:
opacity: The opacity to be applied at time. The value must be between 0.0 and 1.0.
time: A time value within the time range of the composition instruction.
Sets a fixed opacity to apply from the specified time until the next time at which an opacity is set; this is the same as setting a flat ramp for that time range. Before the first time for which an opacity is set, the opacity is held constant at 1.0; after the last specified time, the opacity is held constant at the last value.

See also:

- 17.64.8 setOpacity(startOpacity as Double, endOpacity as Double, timeRange as CMTimeRangeMBS)

17.64.8 setOpacity(startOpacity as Double, endOpacity as Double, timeRange as CMTimeRangeMBS)

**Function:** Sets an opacity ramp to apply during a specified time range.

**Notes:**

- startOpacity: The opacity to be applied at the start time of timeRange. The value must be between 0.0 and 1.0.
- endOpacity: The opacity to be applied at the end time of timeRange. The value must be between 0.0 and 1.0.
- timeRange: The time range over which the value of the opacity will be interpolated between startOpacity and endOpacity.

During an opacity ramp, opacity is computed using a linear interpolation. Before the first time for which an opacity is set, the opacity is held constant at 1.0; after the last specified time, the opacity is held constant at the last value.

See also:

- 17.64.7 setOpacity(opacity as Double, time as CMTimeMBS)

17.64.9 setTransform(transform as CGAffineTransformMBS, time as CMTimeMBS)

**Function:** Sets a value of the transform at a time within the time range of the instruction.

**Notes:**

- transform: The transform to be applied at time.
- time: A time value within the time range of the composition instruction.

Sets a fixed transform to apply from the specified time until the next time at which a transform is set. This is the same as setting a flat ramp for that time range. Before the first specified time for which a transform is set, the affine transform is held constant at the value of CGAffineTransformIdentity; after the last time for which a transform is set, the affine transform is held constant at that last value.
17.64. CLASS AVMUTABLEVIDEOCOMPOSITIONLAYERINSTRUCTIONMBS

17.64.10 setTransformRamp(startTransform as CGAffineTransformMBS, endTransform as CGAffineTransformMBS, timeRange as CMTimeRangeMBS)

Function: Sets a transform ramp to apply during a given time range.
Notes:
startTransform: The transform to be applied at the starting time of timeRange.
endTransform: The transform to be applied at the end time of timeRange.
timeRange: The time range over which the value of the transform is interpolated between startTransform and endTransform.

During a transform ramp, the affine transform is interpolated between the values set at the ramp’s start time and end time. Before the first specified time for which a transform is set, the affine transform is held constant at the value of CGAffineTransformIdentity; after the last time for which a transform is set, the affine transform is held constant at that last value.

Available in OS X v10.7 and later.

17.64.11 videoCompositionLayerInstruction as AVMutableVideoCompositionLayerInstructionMBS

Function: Returns a new mutable video composition layer instruction.
Notes: Returns a new mutable video composition layer instruction with no transform or opacity ramps and trackID initialized to kCMPersistentTrackID_Invalid.

17.64.12 videoCompositionLayerInstructionWithAssetTrack(track as AVAssetTrackMBS) as AVMutableVideoCompositionLayerInstructionMBS

Function: Returns a new mutable video composition layer instruction for the given track.
Notes:
track: The asset track to which to apply the instruction.

Returns a new mutable video composition layer instruction with no transform or opacity ramps and trackID initialized to the track ID of track.
17.64.13 Properties

17.64.14 trackID as Integer

**Function:** The trackID of the source track to which the compositor will apply the instruction.

**Notes:** (Read and Write computed property)
17.65. CLASS AVMUTABLEVIDEOCOMPOSITIONMBS

17.65 class AVMutableVideoCompositionMBS

17.65.1 class AVMutableVideoCompositionMBS

Function: An AVMutableVideoComposition object represents a mutable video composition.
Notes: Subclass of the AVVideoCompositionMBS class.

17.65.2 Methods

17.65.3 Constructor

Function: Creates a new mutable video composition.
See also:

- 17.65.4 Constructor(other as AVVideoCompositionMBS)

17.65.4 Constructor(other as AVVideoCompositionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The copy constructor to initialize with a mutable copy of the given object.
See also:

- 17.65.3 Constructor

17.65.5 setInstructions(items() as AVVideoCompositionInstructionMBS)

Function: Sets the video composition instructions.

17.65.6 videoComposition as AVMutableVideoCompositionMBS

Function: Returns a new mutable video composition.
17.65.7 videoCompositionWithPropertiesOfAsset(asset as AVAssetMBS) as AVVideoCompositionMBS

Function: Returns a new mutable video composition with the specified asset properties.
Notes:
asset: An instance of AVAsset. Ensure that the duration and tracks properties of the asset are already loaded before invoking this method.
Returns a newly created and initialized instance of AVMutableVideoComposition.

The returned AVMutableVideoComposition has instructions that respect the spatial properties and time ranges of the specified asset’s video tracks.

It also has the following values for its properties:

- A value for frameDuration short enough to accommodate the greatest nominalFrameRate among the asset’s video tracks. If the nominalFrameRate of all of the asset’s video tracks is 0, a default framerate of 30fps is used.

- If the specified asset is an instance of AVComposition, the renderSize is set to the naturalSize of the AVComposition; otherwise the renderSize will be set to a value that encompasses all of the asset’s video tracks.

- A renderScale of 1.0.

- The animationTool property set to nil.

Available in OS X v10.9 and later.

17.65.8 Properties

17.65.9 animationTool as AVVideoCompositionCoreAnimationToolMBS

Function: A special video composition tool for use with Core Animation.
Notes:
This attribute may be nil.
(Read and Write computed property)
17.65.10 frameDuration as CMTimeMBS

Function: The interval for which the video composition should render composed video frames.
Notes: (Read and Write computed property)

17.65.11 renderSize as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The render size.
Notes: (Read and Write computed property)
17.66  class AVOutputSettingsAssistantMBS

17.66.1  class AVOutputSettingsAssistantMBS

Function: The helper class to configure output settings.
Notes:
A class, each instance of which specifies a set of parameters for configuring objects that use output settings
dictionaries, for example AVAssetWriter & AVAssetWriterInput, so that the resulting media file conforms to
some specific criteria.

Instances of AVOutputSettingsAssistant are typically created using a string constant representing a specific
preset configuration, such as AVOutputSettingsPreset1280x720. Once you have an instance, its properties
can be used as a guide for creating and configuring an AVAssetWriter object and one or more AVAssetWri-
terInput objects. If all the suggested properties are respected, the resulting media file will conform to the
criteria implied by the preset. Alternatively, the properties of an instance can be used as a "base" configu-
ration which can be customized to suit your individual needs.

The recommendations made by an instance get better as you tell it more about the format of your source
data. For example, if you set the sourceVideoFormat property, the recommendation made by the videoSet-
tings property will ensure that your video frames are not scaled up from a smaller size.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.66.2  Methods

17.66.3  available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9 or later.

17.66.4  AVOutputSettingsPreset1280x720 as string

Function: One of the predefined presets.
17.66.  CLASS AVOUTPUTSETTINGSASSISTANTMBS

17.66.5  AVOutputSettingsPreset1920x1080 as string

Function: One of the predefined presets.

17.66.6  AVOutputSettingsPreset640x480 as string

Function: One of the predefined presets.

17.66.7  AVOutputSettingsPreset960x540 as string

Function: One of the predefined presets.

17.66.8  Constructor

Function: The private constructor.

17.66.9  outputSettingsAssistantWithPreset(presetIdentifier as string) as AVOutputSettingsAssistantMBS

Function: Returns an instance of AVOutputSettingsAssistant corresponding to the given preset.
Notes:
presetIdentifier: The string identifier, for example AVOutputSettingsPreset1280x720, for the desired preset.

Returns an instance of AVOutputSettingsAssistant with properties corresponding to the given preset, or nil
if there is no such preset.

The properties of the returned object can be used as a guide for creating and configuring an AVAssetWriter
object and one or more AVAssetWriterInput objects. If all the suggested properties are respected in creating
the AVAssetWriter, the resulting media file will conform to the criteria implied by the preset.
CHAPTER 17. AVFOUNDATION

17.66.10 Properties

17.66.11 audioSettings as Dictionary

Function: A dictionary of key/value pairs, as specified in AVAudioSettings.h, to be used when e.g. creating
an instance of AVAssetWriterInput.
Notes:
The value of this property may change as a result of setting a new value for the sourceAudioFormat property.
(Read only property)

17.66.12 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.66.13 outputFileType as String

Function: A UTI indicating the type of file to be written, to be used when e.g. creating an instance of
AVAssetWriter.
Notes:
Use UTTypeCopyPreferredTagWithClass / kUTTagClassFilenameExtension to get a suitable file extension
for a given file type.
(Read only property)

17.66.14 videoSettings as Dictionary

Function: A dictionary of key/value pairs, as specified in AVVideoSettings.h, to be used when e.g. creating
an instance of AVAssetWriterInput.
Notes:
The value of this property may change as a result of setting a new value for the sourceVideoFormat property.
(Read only property)
17.67. CLASS AVPIXELASPECTRATIO MBS

17.67  class AVPixelAspectRatioMBS

17.67.1  class AVPixelAspectRatioMBS

Function: The class for pixel aspect ratio.

17.67.2  Properties

17.67.3  horizontalSpacing as Integer

Function: The horizontal spacing of the pixelAspectRatio property.
Notes: (Read and Write property)

17.67.4  verticalSpacing as Integer

Function: The vertical spacing of the pixelAspectRatio property.
Notes: (Read and Write property)
17.68 class AVPlayerItemAccessLogEventMBS

17.68.1 class AVPlayerItemAccessLogEventMBS

**Function:** An AVPlayerItemAccessLogEvent object represents a single item in an AVPlayerItem object’s
access log.
**Notes:**
An AVPlayerItemAccessLog object provides named properties for accessing the data fields of each log event.
None of the properties of this class are observable using key-value observing.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.68.2 Methods

17.68.3 Constructor

**Function:** The private constructor.

17.68.4 Properties

17.68.5 downloadOverdue as Integer

**Function:** The total number of times the download of the segments took too long. (read-only)
**Notes:**
The value of the property is negative if unknown.
This property corresponds to "c-overdue".
This property is not compatible with key-value observing.
Available in OS X v10.9 and later.
(Read only property)

17.68.6 durationWatched as Double

**Function:** The accumulated duration of the media played, in seconds. (read-only)
**Notes:**
The value of this property is negative if unknown.
(Read only property)
17.68.7 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.68.8 indicatedBitrate as Double

Function: The throughput required to play the stream, as advertised by the server, in bits per second.
(Read-only)
Notes:
The value of this property is negative if unknown.
(Read only property)

17.68.9 mediaRequestsWWAN as Integer

Function: Number of network read requests over WWAN. (read-only)
Notes:
The value of the property is negative if unknown.
Corresponds to "sc-wwan-count".
This property is not compatible with key-value observing.
Available in OS X v10.9 and later.
(Read only property)

17.68.10 numberOfBytesTransferred as Int64

Function: The accumulated number of bytes transferred by the item. (read-only)
Notes:
The value of this property is negative if unknown.
(Read only property)
17.68.11  **numberOfDroppedVideoFrames as Integer**

**Function:** The total number of dropped video frames (read-only)
**Notes:**
The value of this property is negative if unknown.
(Read only property)

17.68.12  **numberOfMediaRequests as Integer**

**Function:** A count of media read requests from the server to this client. (read-only)
**Notes:**
For HTTP live streaming, this property contains the count of media requests downloaded from the server. For progressive-style HTTP media downloads, it contains a count of HTTP GET (byte-range) requests for the resource.
The value of this property is negative if unknown.
Available in OS X v10.9 and later.#
(Read only property)

17.68.13  **numberOfSegmentsDownloaded as Integer**

**Function:** A count of the media segments downloaded from the server to this client. (read-only)
**Notes:**
The value of this property is negative if unknown.
(Read only property)

17.68.14  **numberOfServerAddressChanges as Integer**

**Function:** A count of changes to the server address over the last uninterrupted period of playback. (read-only)
**Notes:**
The value of this property is negative if unknown.
(Read only property)
17.68.15  **numberOfStalls as Integer**

**Function:** The total number of playback stalls encountered. (read-only)

**Notes:**
The value of this property is negative if unknown.
(Read only property)

17.68.16  **observedBitrate as Double**

**Function:** The empirical throughput across all media downloaded, in bits per second. (read-only)

**Notes:**
The value of this property is negative if unknown.
(Read only property)

17.68.17  **observedBitrateStandardDeviation as Double**

**Function:** Standard deviation of observed segment download bit rates. (read-only)

**Notes:**
The value of the property is negative if unknown.
Available in OS X v10.9 and later.
(Read only property)

17.68.18  **observedMaxBitrate as Double**

**Function:** Maximum observed segment download bit rate. (read-only)

**Notes:**
The value of the property is negative if unknown.
Available in OS X v10.9 and later.
(Read only property)
17.68.19  observedMinBitrate as Double

Function: Minimum observed segment download bit rate. (read-only)
Notes:
The value of the property is negative if unknown.
Available in OS X v10.9 and later.
(Read only property)

17.68.20  playbackSessionID as string

Function: A GUID that identifies the playback session. (read-only)
Notes:
This value is used in HTTP requests.
The value of this property is nil if unknown.
(Read only property)

17.68.21  playbackStartDate as date

Function: The date and time at which playback began for this event. (read-only)
Notes:
The value of this property is nil if unknown.
(Read only property)

17.68.22  playbackStartOffset as Double

Function: An offset into the playlist where the last uninterrupted period of playback began, in seconds
(readonly)
Notes:
The value of this property is negative if unknown.
(Read only property)
### 17.68.23 playbackType as String

**Function:** The playback type: live, VOD, or from a file. (read-only)
**Notes:**
- If nil is returned the playback type is unknown.
- Available in OS X v10.9 and later.
- (Read only property)

### 17.68.24 segmentsDownloadedDuration as Double

**Function:** The accumulated duration of the media downloaded, in seconds. (read-only)
**Notes:**
- The value of this property is negative if unknown.
- (Read only property)

### 17.68.25 serverAddress as string

**Function:** The IP address of the server that was the source of the last delivered media segment. (read-only)
**Notes:**
- The value of this property is nil if unknown.
- (Read only property)

### 17.68.26 startupTime as Double

**Function:** The accumulated duration, in seconds, until player item is ready to play. (read-only)
**Notes:**
- The value of the property is negative if unknown.
- Available in OS X v10.9 and later.
- (Read only property)
17.68.27  switchBitrate as Double

Function: Bandwidth that caused a switch (up or down). (read-only)
Notes:
The value of the property is negative if unknown.
Available in OS X v10.9 and later.
(Read only property)

17.68.28  transferDuration as Double

Function: The accumulated duration, in seconds, of active network transfer of bytes. (read-only)
Notes:
The value of the property is negative if unknown.
Corresponds to "c-transfer-duration".
This property is not compatible with key-value observing.
Available in OS X v10.9 and later.
(Read only property)

17.68.29  URI as string

Function: The URI of the playback item (read-only)
Notes:
The value of this property may be nil if the URI is unknown.
(Read only property)
class AVPlayerItemAccessLogMBS

**Function:** You use an AVPlayerItemAccessLog object to retrieve the access log associated with an AVPlayerItem object.

**Notes:**
An AVPlayerItemAccessLog object accumulates key metrics about network playback and presents them as a collection of AVPlayerItemAccessLogEvent instances. Each event instance collates the data that relates to each uninterrupted period of playback.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

Methods

**Constructor**

**Function:** The private constructor.

**events as AVPlayerItemAccessLogEventMBS()**

**Function:** A chronologically ordered array of AVPlayerItemAccessLogEvent objects. (read-only)

**Notes:**
The array contains AVPlayerItemAccessLogEvent objects that represent the chronological sequence of events contained in the access log.
This property is not observable using key-value observing.

**extendedLogData as MemoryBlock**

**Function:** Returns a serialized representation of the access log in the Extended Log File Format.

**Notes:**
A serialized representation of the access log in the Extended Log File Format.
CHAPTER 17. AVFOUNDATION

This method converts the web server access log into a textual format that conforms to the W3C Extended Log File Format for web server log files. For more information, see http://www.w3.org/pub/WWW/TR/WD-logfile.html.

17.69.6 extendedLogDataStringEncoding as Integer

Function: Returns the string encoding of the extended log data.
Notes: The string encoding of the data returned by extendedLogData.

17.69.7 Properties

17.69.8 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
17.70. **CLASS AVPLAYERITEMERRORLOGEVENTMBS**

17.70 class AVPlayerItemErrorLogEventMBS

17.70.1 class AVPlayerItemErrorLogEventMBS

**Function:** An AVPlayerItemErrorLogEvent object represents a single item in an AVPlayerItem object’s error log.
**Notes:**
An AVPlayerItemErrorLogEvent object provides named properties for accessing the data fields of each log event. None of the properties of this class are observable using key-value observing.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.70.2 Methods

17.70.3 Constructor

**Function:** The private constructor.

17.70.4 date as date

**Function:** The date and time when the error occurred. (read-only)
**Notes:**
The property corresponds to "date".
The value of this property may be nil if the date is unknown.

17.70.5 errorComment as string

**Function:** A description of the error encountered (read-only)
**Notes:** The value of this property may be nil if further information is not available.

17.70.6 errorDomain as string

**Function:** The domain of the error. (read-only)
17.70.7  errorStatusCode as Integer

Function: A unique error code identifier. (read-only)

17.70.8  playbackSessionID as string

Function: A GUID that identifies the playback session. (read-only)
Notes: The value of this property is used in HTTP requests, and may be nil if the GUID is unknown.

17.70.9  serverAddress as string

Function: The IP address of the server that was the source of the error. (read-only)
Notes: The value of this property can be either an IPv4 or IPv6 address, and may be nil if the address is unknown.

17.70.10  URI as string

Function: The URI of the playback item (read-only)
Notes: The value of this property may be nil if the URI is unknown.

17.70.11  Properties

17.70.12  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
17.71 class AVPlayerItemErrorLogMBS

17.71.1 class AVPlayerItemErrorLogMBS

**Function:** You use an AVPlayerItemErrorLog object to retrieve the error log associated with an AV-PlayerItem object.  
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.71.2 Methods

17.71.3 Constructor

**Function:** The private constructor.

17.71.4 events as AVPlayerItemErrorLogEventMBS()

**Function:** A chronologically ordered array of AVPlayerItemErrorLogEvent objects. (read-only)  
**Notes:**  
The array contains AVPlayerItemErrorLogEvent objects that represent the chronological sequence of events contained in the error log.

This property is not observable using key-value observing.

17.71.5 extendedLogData as MemoryBlock

**Function:** Returns a serialized representation of the error log in the Extended Log File Format.  
**Notes:**  
A serialized representation of the error log in the Extended Log File Format.

**Discussion**  
This method converts the web server error log into a textual format that conforms to the W3C Extended Log File Format for web server log files. For more information, see http://www.w3.org/pub/WWW/TR/WD-logfile.html.
17.71.6 extendedLogDataStringEncoding as Integer

**Function:** Returns the string encoding of the extended log data.

**Notes:** The string encoding of the data returned by extendedLogData.

17.71.7 Properties

17.71.8 Handle as Integer

**Function:** The internal object reference.

**Notes:** (Read and Write property)
17.72. CLASS AVPLAYERITEMLEGIBLEOUTPUTMBS

17.72 class AVPlayerItemLegibleOutputMBS

17.72.1 class AVPlayerItemLegibleOutputMBS

Function: A subclass of AVPlayerItemOutput that can vend media with a legible characteristic as NSAttributedString.
Notes: Subclass of the AVPlayerItemOutputMBS class.

17.72.2 Methods

17.72.3 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9 or later.

17.72.4 AVPlayerItemLegibleOutputTextStylingResolutionDefault as string

Function: One of the text styling mode.
Notes: Specify this level of text styling resolution to receive attributed strings from an AVPlayerItemLegibleOutput that include the same level of styling information that AVFoundation would use itself to render text within an AVPlayerLayer. The text styling will accommodate user-level Media Accessibility settings.

17.72.5 AVPlayerItemLegibleOutputTextStylingResolutionSourceAndRulesOnly as string

Function: One of the text styling mode.
Notes: Specify this level of text styling resolution to receive only the styling present in the source media and the styling provided via AVPlayerItem.textStyleRules.
This level of resolution excludes styling provided by the user-level Media Accessibility settings. You would typically use it if you wish to override the styling specified in source media. If you do this, you are strongly encouraged to allow your custom styling in turn to be overridden by user preferences for text styling that are available as Media Accessibility settings.
17.72.6 Constructor

**Function:** The standard constructor.  
See also:  
- 17.72.7 Constructor(subTypes() as string)

17.72.7 Constructor(subTypes() as string)

**Function:** The constructor.  
**Notes:**  
Returns an instance of AVPlayerItemLegibleOutput with filtering enabled for AVPlayerItemLegibleOutput-PushDelegate’s legibleOutput:didOutputAttributedStrings:nativeSampleBuffers:forItemTime:.  

subtypes: Array of strings with 4 letter codes.

Add media subtype FourCC number objects to the subtypes array to elect to receive that type as a CM-  
SampleBuffer instead of an NSAttributedString. Initializing an AVPlayerItemLegibleOutput using the Constructor method is equivalent to calling Constructor with an empty array, which means that all legible data,  
regardless of media subtype, will be delivered using NSAttributedString in a common format.

If a media subtype for which there is no legible data in the current player item is included in the media  
subtypes array, no error will occur. AVPlayerItemLegibleOutput will not vend closed caption data as CM-  
SampleBuffers, so it is an error to include ‘c608’ in the media subtypes array.  
See also:  
- 17.72.6 Constructor

17.72.8 Properties

17.72.9 advanceIntervalForDelegateInvocation as Double

**Function:** Permits advance invocation of the associated delegate, if any.  
**Notes:**  
If it is possible, an AVPlayerItemLegibleOutput will message its delegate advanceIntervalForDelegateInvocation seconds earlier than otherwise. If the value you provide is large, effectively requesting provision of  
samples earlier than the AVPlayerItemLegibleOutput is prepared to act on them, the delegate will be invoked  
as soon as possible.  
(Read and Write property)
17.72.10 textStylingResolution as String

**Function:** A string identifier indicating the degree of text styling to be applied to attributed strings vended by the receiver.

**Notes:**
Valid values are AVPlayerItemLegibleOutputTextStylingResolutionDefault and AVPlayerItemLegibleOutputTextStylingResolutionSourceAndRulesOnly. An NSInvalidArgumentException is raised if this property is set to any other value. The default value is AVPlayerItemLegibleOutputTextStylingResolutionDefault, which indicates that attributed strings vended by the receiver will include the same level of styling information that would be used if AVFoundation were rendering the text via AVPlayerLayer.

(Read and Write property)
17.73 class AVPlayerItemMBS

17.73.1 class AVPlayerItemMBS

**Function:** An AVPlayerItem represents the presentation state of an asset that’s played by an AVPlayer object, and lets you observe that state.

**Notes:**

A object carries a reference to an AVAsset object and presentation settings for that asset, including track enabled state. If you need to inspect the media assets themselves, you should message the AVAsset object itself.

You can initialize a player item using an URL (playerItemWithURL and Constructor); the resource types referenced by the URL may include, but aren’t necessarily limited to, those with the following corresponding UTIs:

- kUTTypeQuickTimeMovie, (.mov, .qt)
- kUTTypeMPEG4 (.mp4)
- "public.3gpp" (.3gp, .3gpp)
- kUTTypeMPEG4Audio (.m4a)
- "com.apple.coreaudio-format" (.caf)
- "com.microsoft.waveform-audio" (.wav)
- "public.aiff-audio" (.aif)
- "public.aifc-audio” (also .aif)
- "org.3gpp.adaptive-multi-rate-audio” (.amr)

If you want to play an asset more than once within a sequence of items, you must create independent instances of AVPlayerItem for each placement in the player’s queue.

17.73.2 Methods

17.73.3 accessLog as AVPlayerItemAccessLogMBS

**Function:** Returns an object that represents a snapshot of the network access log.

**Notes:**

An object that represents a snapshot of the network access log. The returned value can be nil. If the method returns nil, there is no logging information currently available for the player item.
17.73. **CLASS AVPLAYERITEMMBS**

17.73.4 **addOutput(output as AVPlayerItemOutputMBS)**

Function: Adds the specified player item output object to the receiver.
Notes:

output: The player item output object to associate with the item.

When you add an AVPlayerItemOutput object to an item, the samples associated with that output object are processed according to the rules for mixing, composing, or excluding content that the AVPlayer object honors for the specific media type. For example, video media is composed according to the instructions provided by the player item’s video composition object and audio media is mixed according to the parameters of its audio mix object.
Available in OS X v10.8 and later.

17.73.5 **automaticallyLoadedAssetKeys as String()**

Function: An array of property keys defined by the asset property. (read-only)
Notes:
The value of each key in automaticallyLoadedAssetKeys will be automatically be loaded by the asset before the receiver achieves the status AVPlayerItemStatusReadyToPlay; i.e. when the item is ready to play, the value of invoking statusOfValueForKey on the asset property value will be AVKeyValueStatusLoaded. If loading of any of the values fails, the status property of the receiver will change to AVPlayerItemStatusFailed.
Available in OS X v10.9 and later.

17.73.6 **available as boolean**

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

17.73.7 **cancelContentAuthorizationRequest**

Function: Causes the currently outstanding content authorization request to be cancelled.
Notes:

Calling this method while a content authorization request is pending will cause that request to be cancelled and its completion handler to be invoked with a status of AVContentAuthorizationCancelled.
This method does not block.

17.73.8 cancelPendingSeeks

Function: Cancel any pending seek requests and invoke the corresponding completion handlers if present.
Notes: Use this method to cancel and release the completion handlers of pending seeks.
The finished parameter of the completion handlers will be set to false.

17.73.9 Constructor(asset as AVAssetMBS)

Function: Initializes a new player item for a given asset.
See also:
• 17.73.10 Constructor(asset as AVAssetMBS, automaticallyLoadedAssetKeys() as string) 3456
• 17.73.11 Constructor(file as folderitem) 3457
• 17.73.12 Constructor(URL as string) 3457

17.73.10 Constructor(asset as AVAssetMBS, automaticallyLoadedAssetKeys() as string)

Function: Initializes a player item with an array of AVAsset keys.
Notes:
asset: An instance of AVAsset.
éautomaticallyLoadedAssetKeys: An array of strings, each representing a property defined by AVAsset.
Returns an initialized instance of AVPlayerItem.

The value of each key in automaticallyLoadedAssetKeys will be automatically be loaded by the underlying
AVAsset before the receiver achieves the status AVPlayerItemStatusReadyToPlay; i.e. when the item is
ready to play, the value returned by invoking the asset property’s statusOfValueForKey method will be one
of the terminal status values, either AVKeyValueStatusLoaded, AVKeyValueStatusFailed, or AVKeyValueS-
tatusCancelled.
17.73. CLASS AVPLAYERITEMMBS

Important: The asset property keys "playable" and "compatibleWithSavedPhotosAlbum" are not eligible for automatic loading by AVPlayerItem. You must use the AVAsset method loadValuesAsynchronously-ForKeys:completionHandler: to load the values of those properties asynchronously.

Available in OS X v10.9 and later.
See also:

- 17.73.9 Constructor(asset as AVAssetMBS) 3456
- 17.73.11 Constructor(file as folderitem) 3457
- 17.73.12 Constructor(URL as string) 3457

17.73.11 Constructor(file as folderitem)

Function: Prepares a player item with a given file.

Notes:

file: A folderitem.

This method immediately returns the item, but with the status AVPlayerItemStatusUnknown.
If the URL contains valid data that can be used by the player item, the status later changes to AVPlayerItem-StatusReadyToPlay.
If the URL contains no valid data or otherwise can’t be used by the player item, the status later changes to AVPlayerItemStatusFailed.
See also:

- 17.73.9 Constructor(asset as AVAssetMBS) 3456
- 17.73.10 Constructor(asset as AVAssetMBS, automaticallyLoadedAssetKeys() as string) 3456
- 17.73.12 Constructor(URL as string) 3457

17.73.12 Constructor(URL as string)

Function: Prepares a player item with a given URL.

Notes:

URL: An URL.

This method immediately returns the item, but with the status AVPlayerItemStatusUnknown.
If the URL contains valid data that can be used by the player item, the status later changes to AVPlayerItem-StatusReadyToPlay.
If the URL contains no valid data or otherwise can’t be used by the player item, the status later changes to
AVPlayerItemStatusFailed.
See also:

- 17.73.9 Constructor(asset as AVAssetMBS)
  - 17.73.10 Constructor(asset as AVAssetMBS, automaticallyLoadedAssetKeys() as string)
  - 17.73.11 Constructor(file as folderitem)

17.73.13 copy as AVPlayerItemMBS

**Function:** Creates a copy of the object.

17.73.14 errorLog as AVPlayerItemErrorLogMBS

**Function:** Returns an object that represents a snapshot of the error log.
**Notes:**
An object that represents a snapshot of the error log. The returned value can be nil.
If the method returns nil, there is no logging information currently available for the player item.

17.73.15 loadedTimeRanges as CMTimeRangeMBS()

**Function:** The time ranges of the item that have been loaded. (read-only)

17.73.16 outputs as AVPlayerItemOutputMBS()

**Function:** The outputs associated with the item. (read-only)
**Notes:**
This property contains the collection of AVPlayerItemOutput objects used to transfer media data to the
player object.
Available in OS X v10.8 and later.
17.73. **CLASS AVPLAYERITEMMBS**

17.73.17 **playerItemWithAsset(asset as AVAssetMBS) as AVPlayerItemMBS**

**Function:** Returns a new player item for a given asset.

See also:

- 17.73.18 playerItemWithAsset(asset as AVAssetMBS, automaticallyLoadedAssetKeys() as string) as AVPlayerItemMBS

17.73.18 **playerItemWithAsset(asset as AVAssetMBS, automaticallyLoadedAssetKeys() as string) as AVPlayerItemMBS**

**Function:** Creates and initializes a player item with an array of AVAsset keys.

**Notes:**

- asset: An instance of AVAsset.
- automaticallyLoadedAssetKeys: An array of strings, each representing a property key defined by AVAsset.

Returns an initialized instance of AVPlayerItem.

The value of each key in automaticallyLoadedAssetKeys will be automatically be loaded by the underlying AVAsset before the receiver achieves the status AVPlayerItemStatusReadyToPlay; i.e. when the item is ready to play, the value returned by invoking the asset property’s statusOfValueForKey:error: method will be one of the terminal status values, either AVKeyValueStatusLoaded, AVKeyValueStatusFailed, or AVKeyValueStatusCancelled.

Important: The asset property keys "playable" and "compatibleWithSavedPhotosAlbum" are not eligible for automatic loading by AVPlayerItem. You must use the AVAsset method loadValuesAsynchronouslyForKeys:completionHandler: to load the values of those properties asynchronously.

Available in OS X v10.9 and later.

See also:

- 17.73.17 playerItemWithAsset(asset as AVAssetMBS) as AVPlayerItemMBS

17.73.19 **playerItemWithFile(file as folderitem) as AVPlayerItemMBS**

**Function:** Returns a new player item, prepared to use a given folderitem.

**Notes:**

- File: A folderitem.

Returns a new player item, prepared to use folderitem.
This method immediately returns the item, but with the status AVPlayerItemStatusUnknown.
If the URL contains valid data that can be used by the player item, the status later changes to AVPlayerItemStatusReadyToPlay.
If the URL contains no valid data or otherwise can’t be used by the player item, the status later changes to AVPlayerItemStatusFailed.

### 17.73.20 playerItemWithURL(URL as string) as AVPlayerItemMBS

**Function:** Returns a new player item, prepared to use a given URL.
**Notes:**
- **URL:** An URL.
- Returns a new player item, prepared to use URL.

This method immediately returns the item, but with the status AVPlayerItemStatusUnknown.
If the URL contains valid data that can be used by the player item, the status later changes to AVPlayerItemStatusReadyToPlay.
If the URL contains no valid data or otherwise can’t be used by the player item, the status later changes to AVPlayerItemStatusFailed.

### 17.73.21 removeOutput(output as AVPlayerItemOutputMBS)

**Function:** Removes the specified player item output object from the receiver.
**Notes:**
- **output:** The player item output object to remove.
- Available in OS X v10.8 and later.

### 17.73.22 requestContentAuthorizationAsynchronously(timeoutInterval as Double, tag as Variant = nil)

**Function:** Causes appropriate action to be taken to allow the user to authorize the content for playback.
**Notes:**
- **timeoutInterval:** The maximum amount of time in seconds to wait for the user to authorize the content before calling the handler block with a timeout result.

Calling this method will present the user with the opportunity to authorize the content (for example, by launching iTunes and prompting the user to enter their Apple ID and password).
When the user has taken action (or the timeout has elapsed), the AVFoundationMBS.requestContentAuthorizationCompleted event is invoked. You determine the status of the authorization attempt by checking the value of the contentAuthorizationRequestStatus property.

Even if the status indicates a completed authorization, the content may still not be authorized (for example, if the user authorizes an Apple ID other than that associated with the content). You should re-check the value of contentAuthorizationRequestStatus to verify whether the content has actually been authorized before continuing. It is not necessary to call this method if the value of contentAuthorizationRequestStatus is already true.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

17.73.23 seekableTimeRanges as CMTimeRangeMBS()

Function: An array of time ranges within which it is possible to seek. (read-only)

17.73.24 seekToDate(date as date, fireEvent as boolean = false, tag as Variant = nil) as boolean

Function: Moves the playback cursor to the time given by the specified date object.
Notes:
date: The time to which to seek.

If fireEvent is true, the AVFoundationMBS.playerItemSeekToDateFinished event is called.

Use this method to seek to a specified time in the item item and be notified when the operation completes. If the seek request completes without being interrupted (either by another seek request or by any other operation), the completion handler you provide is executed with the finished parameter set to true.

If another seek request is already in progress when you call this method, the completion handler for the in-progress seek request is executed immediately with the finished parameter set to NO.
Available in OS X v10.9 and later.
CHAPTER 17. AVFOUNDATION

17.73.25 seekToTime(time as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil)

Function: Moves the playback cursor to a given time.

Notes:

time: The time to which to move the playback cursor.
If fireEvent is true, the AVFoundationMBS.playerItemSeekToTimeFinished event will be called later.

Use this method to seek to a specified time in the item item and be notified when the operation completes.
If the seek request completes without being interrupted (either by another seek request or by any other
operation), the event is executed with the finished parameter set to true.

If another seek request is already in progress when you call this method, the completion handler for the
in-progress seek request is executed immediately with the finished parameter set to false.

With tag you can pass any value you like to the event later. This can be for example an object reference or
a number in an array. Be aware that the reference to this tag value is kept until the event is called and can
cause memory reference cycles.
See also:

- 17.73.26 seekToTime(time as CMTimeMBS, toleranceBefore as CMTimeMBS, toleranceAfter as CM-TimeMBS, fireEvent as boolean = false, tag as Variant = nil)

17.73.26 seekToTime(time as CMTimeMBS, toleranceBefore as CMTimeMBS, toleranceAfter as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil)

Function: Moves the playback cursor within a specified time bound.

Notes:

time: The time to which you would like to move the playback cursor.
toleranceBefore: The tolerance allowed before time.
toleranceAfter: The tolerance allowed after time.

The time sought to will be within the range [ time-beforeTolerance, time+afterTolerance ] , and may differ
from the specified time for efficiency. If you pass kCMTimeZero for both toleranceBefore and toleranceAfter
(to request sample accurate seeking), you may incur additional decoding delay.

Passing kCMTimePositiveInfinity for both toleranceBefore and toleranceAfter is the same as messaging seek-
ToTime directly.
With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

See also:

- 17.73.25 seekToTime(time as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil)

### 17.73.27 selectedMediaOptionInMediaSelectionGroup(mediaSelectionGroup as AVMediaSelectionGroupMBS) as AVMediaSelectionOptionMBS

**Function:** Indicates the media selection option that’s currently selected from the specified group.

**Notes:**

mediaSelectionGroup: A media selection group obtained from the player item’s asset.

Returns an instance of AVMediaSelectionOption that describes the currently selection option in the group.

If the value of the allowsEmptySelection property of mediaSelectionGroup is true, the currently selected option in the group may be nil.

Available in OS X v10.8 and later.

### 17.73.28 selectMediaOption(mediaSelectionOption as AVMediaSelectionOptionMBS, mediaSelectionGroup as AVMediaSelectionGroupMBS)

**Function:** Selects the media option described by a specified instance of AVMediaSelectionOption in a given media selection group and deselects all other options in that group.

**Notes:**

mediaSelectionOption: The option to select.

If the value of the allowsEmptySelection property of mediaSelectionGroup is true, you can pass nil to deselect all media selection options in the group.

mediaSelectionGroup: The media selection group, obtained from the receiver’s asset, that contains mediaSelectionOption.

If mediaSelectionOption isn’t a member of the mediaSelectionGroup, no change in presentation state will result.

If multiple options within a group meet your criteria for selection according to locale or other considerations, and if these options are otherwise indistinguishable to you according to media characteristics that are meaningful for your application, content is typically authored so that the first available option that meets your criteria is appropriate for selection.
17.73.29 selectMediaOptionAutomaticallyInMediaSelectionGroup(mediaSelectionGroup as AVMediaSelectionGroupMBS)

**Function:** Selects the media option in the specified media selection group that best matches the receiver’s automatic selection criteria.
**Notes:**
mediaSelectionGroup: The media selection group, obtained from the receiver’s asset, that contains the specified option.

This method has no effect unless the appliesMediaSelectionCriteriaAutomatically property of the associated AVPlayer is true and unless automatic media selection has previously been overridden by invoking sselectMediaOption:inMediaSelectionGroup.
Available in OS X v10.9 and later.

17.73.30 setTextStyleRules(rules() as AVTextStyleRuleMBS)

**Function:** Sets the textStyleRules array.

17.73.31 stepByCount(stepCount as Integer)

**Function:** Moves the player’s current item’s current time forward or backward by a specified number of steps.
**Notes:**
stepCount: The number of steps by which to move.
A positive number steps forward, a negative number steps backward.

The size of each step depends on the receiver’s enabled AVPlayerItemTrack objects (see tracks).

17.73.32 textStyleRules as AVTextStyleRuleMBS()

**Function:** An array of text style rules to apply to subtitles and other legible text.
Notes:
You can use this property to assign an array of AVTextStyleRule objects to the item. Each rule specifies both the style information and the range of text to which that styling should apply. Available in OS X v10.9 and later.

17.73.33 timedMetadata as AVMetadataItemMBS()

Function: The timed metadata played most recently by the media stream. (read-only)
Notes: The array contains instances of AVMetadataItem.

17.73.34 tracks as AVPlayerItemTrackMBS()

Function: An array of AVPlayerItemTrack objects. (read-only)
Notes: This property can change dynamically during playback.
You can observe this property using key-value observing.

17.73.35 Properties

17.73.36 asset as AVAssetMBS

Function: The underlying asset provided during initialization. (read-only)
Notes: (Read only property)

17.73.37 audioMix as AVAudioMixMBS

Function: The audio mix parameters to be applied during playback.
Notes: (Read and Write property)
17.73.38 audioTimePitchAlgorithm as String

Function: The processing algorithm used to manage audio pitch for scaled audio edits.
Notes:
The supported constants are defined in Time Pitch Algorithm Settings.
An NSInvalidArgumentException will be raised if this property is set to a value other than the defined constants.
Available in OS X v10.9 and later.
(Read and Write property)

17.73.39 canPlayFastForward as boolean

Function: A Boolean value indicating whether the item can be played at rates greater than 1.0. (read-only)
Notes:
Available in OS X v10.8 and later.
(Read only property)

17.73.40 canPlayFastReverse as boolean

Function: A Boolean value indicating whether the item can be played at rates less than 1.0. (read-only)
Notes:
Available in OS X v10.8 and later.
(Read only property)

17.73.41 canPlayReverse as boolean

Function: A Boolean value indicating whether the item can be played with a rate of -1.0. (read-only)
Notes:
Available in OS X v10.8 and later.
(Read only property)
17.73.42 canPlaySlowForward as boolean

Function: A Boolean value indicating whether the item can be played at a rate between 0.0 and 1.0. (read-only)
Notes: Available in OS X v10.8 and later.
(Read only property)

17.73.43 canPlaySlowReverse as boolean

Function: A Boolean value indicating whether the item can be played at a rate between -1.0 and 0.0. (read-only)
Notes: Available in OS X v10.8 and later.
(Read only property)

17.73.44 canStepBackward as boolean

Function: A Boolean value indicating whether the item supports stepping backward. (read-only)
Notes: Once the item becomes ready to play, the value of this property does not change. This behavior applies even when boundary conditions, such as when the item’s current time is kCMTTimeZero, have been reached.
Available in OS X v10.8 and later.
(Read only property)

17.73.45 canStepForward as boolean

Function: A Boolean value indicating whether the item supports stepping forward. (read-only)
Notes: Once the item becomes ready to play, the value of this property does not change. This behavior applies even when boundary conditions, such as when the item’s current time is equal to its end time, have been reached.
Available in OS X v10.8 and later.
(Read only property)
17.73.46  contentAuthorizationRequestStatus as Integer

Function: Indicates the status of the most recent call to requestContentAuthorizationAsynchronouslyWith-TimeoutInterval. (read-only)
Notes:
This property reports the authorization status as determined by the most recent call to requestContentAuthorizationAsynchronouslyWithTimeoutInterval.

The value will be AVContentAuthorizationUnknown before the first call and between the time a request call is made and just prior to the completion handler being executed (thus it is safe to query this property from the event).

This value is not key-value observable.
(Read only property)

17.73.47  currentDate as date

Function: Returns the current time of the item as a date object.
Notes:
The current time of the item as a date object, or nil if playback is not mapped to any date.
(Read only property)

17.73.48  currentTime as CMTimeMBS

Function: Returns the current time of the item.
Notes: (Read only property)

17.73.49  customVideoCompositor as AVVideoCompositingMBS

Function: The custom video compositor, if any. (read-only)
Notes:
The custom video compositor instance that is used during image generation is accessible via this property after the value of AVPlayerItemStatusFailed is set to an AVVideoComposition instance that specifies a custom video compositor class. Any additional communication between the application and that instance of the custom video compositor, if any is required for configuration or other purposes, can only occur once that
If the value of AVPlayerItemStatusFailed is changed from an AVVideoComposition that specifies a custom video compositor class to another instance of AVVideoComposition that specifies the same custom video compositor class, the instance of the custom video compositor that was previously created will receive the renderContextChanged: message and remain in use for subsequent image generation.

This property is nil if there is no video compositor, or if the internal video compositor is in use. Available in OS X v10.9 and later. (Read only property)

17.73.50 duration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Indicates the duration of the item. (read-only)
Notes: Indicates the duration of the item, not considering either its forwardPlaybackEndTime or reversePlaybackEndTime. (Read only property)

17.73.51 error as NSErrorMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: If the receiver’s status is AVPlayerItemStatusFailed, this describes the error that caused the failure. (read-only)
Notes: The value of this property is an error that describes what caused the receiver to no longer be able to be played. If the receiver’s status is not AVPlayerItemStatusFailed, the value of this property is nil. (Read only property)

17.73.52 forwardPlaybackEndTime as CMTimeMBS

Notes: The value indicated the time at which playback should end when the playback rate is positive (see AVPlayer’s rate property).
The default value is kCMTimeInvalid, which indicates that no end time for forward playback is specified. In this case, the effective end time for forward playback is the item’s duration.

The value of this property has no effect on playback when the rate is negative.
(Read and Write property)

17.73.53  **Handle as Integer**

**Function:** The internal object reference.
**Notes:** (Read and Write property)

17.73.54  **isApplicationAuthorizedForPlayback as boolean**

**Function:** Indicates whether the application can be used to play the content. (read-only)
**Notes:**
This property reports whether or not the calling application is authorized to play the content associated with the item.

Application authorization is independent of content authorization (see contentAuthorizedForPlayback) and that both must be granted in order for an application to be allowed to play protected content. Also, unlike content authorization, application authorization is not dependent on user credentials (that is, if applicationAuthorizedForPlayback is false, there are no means to obtain authorization).

This property is not key-value observable.
(Read only property)

17.73.55  **isAuthorizationRequiredForPlayback as boolean**

**Function:** Indicates whether or not authorization is required to play the content. (read-only)
**Notes:**
This property reports whether authorization is required for the item's content to be played. If it does not require authorization, then none of the other authorization-related methods or properties apply (though they will return sensible values where possible).

This property is not key-value observable.
17.73. **CLASS AVPLAYERITEMMBS**

(Read only property)

17.73.56  **isContentAuthorizedForPlayback as boolean**

**Function:** Indicates whether the content has been authorized by the user (for example, by authorizing the content’s associated account in iTunes). (read-only)

**Notes:**

This property reports whether the user has provided the necessary credentials to the system in order for the content to be decrypted for playback.

Content authorization is independent of application authorization (see applicationAuthorizedForPlayback) and that both must be granted in order for an application to be allowed to play protected content.

This property is not key-value observable.

(Read only property)

17.73.57  **isPlaybackBufferEmpty as boolean**

**Function:** Indicates whether playback has consumed all buffered media and that playback will stall or end. (read-only)

**Notes:** (Read only property)

17.73.58  **isPlaybackBufferFull as boolean**

**Function:** Indicates whether the internal media buffer is full and that further I/O is suspended. (read-only)

**Notes:**

Despite the playback buffer reaching capacity there might not exist sufficient statistical data to support a playbackLikelyToKeepUp prediction of true.

(Read only property)

17.73.59  **isPlaybackLikelyToKeepUp as boolean**

**Function:** Indicates whether the item will likely play through without stalling (read-only)
Notes:
This property communicates a prediction of playability. Factors considered in this prediction include I/O throughput and media decode performance. It is possible for playbackLikelyToKeepUp to indicate false while the property playbackBufferFull indicates true. In this event the playback buffer has reached capacity but there isn’t the statistical data to support a prediction that playback is likely to keep up in the future. It is up to you to decide whether to continue media playback.
(Read only property)

17.73.60 presentationSize as CGSizeMBS

Function: The size at which the visual portion of the item is presented by the player. (read-only)
Notes:
You can scale the presentation size to fit within the bounds of a player layer using its videoGravity property. You can also scale the presentation size arbitrarily using the frame property of an AVPlayerLayer object.
(Read only property)

17.73.61 reversePlaybackEndTime as CMTimeMBS

Function: The time at which reverse playback ends.
Notes:
The value indicated the time at which playback should end when the playback rate is negative (see AV-Player’s rate property).

The default value is kCMTimeInvalid, which indicates that no end time for reverse playback is specified. In this case, the effective end time for reverse playback is kCMTimeZero.

The value of this property has no effect on playback when the rate is positive.
(Read and Write property)

17.73.62 seekingWaitsForVideoCompositionRendering as Boolean

Function: A Boolean value indicating whether the item’s timing follows the displayed video frame when seeking with a video composition.
Notes:
By default, item timing is updated as quickly as possible during seeking. Specifically, the item does not wait
for new frames to be rendered when seeking during normal playback. In most situations, the latency between
the completion of a seek operation and the display of a video frame at the new time is negligible. However,
when video compositions are in use, the processing of video may introduce noticeable latency. Setting the
value of this property to true causes the item’s timing to be updated only after the corresponding video
frame has been displayed. For example, this allows an AVSynchronizedLayer object associated with the item
to remain in sync with the displayed video.

This property has no effect on items whose videoComposition property is nil.
Available in OS X v10.9 and later.
(Read and Write property)

17.73.63 status as Integer

Function: The status of the player item. (read-only)
Notes:
For example, whether the item is playable. For values: AVPlayerItemStatusUnknown, AVPlayerItemStatus-
ReadyToPlay and AVPlayerItemStatusFailed.
(Read only property)

17.73.64 videoComposition as AVVideoCompositionMBS

Function: The video composition settings to be applied during playback.
Notes: (Read and Write property)

17.73.65 Constants

17.73.66 AVContentAuthorizationBusy = 4

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the authorization status constants.
Notes: The last call to request content authorization could not be completed because another asset is cur-
rently attempting authorization.

17.73.67 AVContentAuthorizationCancelled = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the authorization status constants.
Notes: The last call to request content authorization was cancelled by the user.
17.73.68  AVContentAuthorizationCompleted = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the authorization status constants. **Notes:** The last completed call to request content authorization completed.

17.73.69  AVContentAuthorizationNotAvailable = 5

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the authorization status constants. **Notes:** The last call to request content authorization could not be completed because there was no known mechanism by which to attempt authorization.

17.73.70  AVContentAuthorizationNotPossible = 6

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the authorization status constants. **Notes:** The last call to request content authorization could not be completed in a non-recoverable way (for example, a newer version of iTunes is required).

17.73.71  AVContentAuthorizationTimedOut = 3

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the authorization status constants. **Notes:** The last call to request content authorization was cancelled because the timeout interval was reached.

17.73.72  AVContentAuthorizationUnknown = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the authorization status constants. **Notes:** No call to request content authorization has completed yet.

17.73.73  AVPlayerItemStatusFailed = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the status values. **Notes:** The item cannot be played.
17.73. CLASS AVPLAYERITEMMBS

17.73.74 AVPlayerItemStatusReadyToPlay = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function**: One of the status values. **Notes**: The item is ready to play.

17.73.75 AVPlayerItemStatusUnknown = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function**: One of the status values. **Notes**: The item’s status is unknown.
17.74 class AVPlayerItemOutputMBS

17.74.1 class AVPlayerItemOutputMBS

Function: The AVPlayerItemOutput class is an abstract class that defines the common interface for moving
samples from an asset to an AVPlayer object.

Notes:
You do not create instances of this class directly but instead use one of the concrete subclasses that manage
specific types of assets.

This class provides basic methods for converting time values to the timebase of the item. It also provides an
option to suppress rendering of the output associated with the specific instance of this class.

Available in OS X v10.8 and later.

17.74.2 Methods

17.74.3 available as boolean

Function: Whether this class is available.

Notes: Returns true on Mac OS X 10.7 and newer.

17.74.4 Constructor

Function: The default constructor.

17.74.5 itemTimeForHostTime(hostTimeInSeconds as Double) as CMTimeMBS

Function: Converts a host time (specified in seconds) to the item’s timebase.

Notes:
hostTimeInSeconds: A host time value, specified in seconds. For example, you might specify the time value
returned by the CACurrentMediaTime function or the timestamp from a CADisplayLink object for this
parameter.
17.74. **CLASS AVPLAYERITEMOUTPUTMBS**

Returns the equivalent time in the item’s timebase.

The timestamp associated with a CADisplayLink object represents the time of the most recent screen refresh, which is usually a time in the past. If you want to find the time associated with the next screen refresh, you need to increment the timestamp by the value in the display link’s duration property.

### 17.74.6 `itemTimeForMachAbsoluteTime(machAbsoluteTime as Int64) as CMTimeMBS`

**Function:** Converts a Mach host time to the item’s timebase.

**Notes:**
- `machAbsoluteTime`: The Mach host time to convert. You typically retrieve this value using the mach_absolute_time function.

Returns the equivalent time in the item’s timebase.

Available in OS X v10.8 and later.

### 17.74.7 Properties

#### 17.74.8 Handle as Integer

**Function:** The internal object reference.

**Notes:** (Read and Write property)

#### 17.74.9 `suppressesPlayerRendering as boolean`

**Function:** A Boolean indicating whether the player object renders the receiver’s output.

**Notes:**
- When the value of this property is false (the default), the player object handles the rendering of the receiver's associated output. You can change the value of this property to true if you want to suppress the rendering of the media data associated with this object.

Available in OS X v10.8 and later.

(Read and Write property)
17.75 class AVPlayerItemTrackMBS

17.75.1 class AVPlayerItemTrackMBS

Function: The track of a player item.
Notes:
You use an AVPlayerItemTrack object to modify the presentation state of an asset track (AVAssetTrack) being presented by an AVPlayer object.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.75.2 Methods

17.75.3 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

17.75.4 Constructor

Function: The private constructor.

17.75.5 Properties

17.75.6 assetTrack as AVAssetTrackMBS

Function: The asset track for which the player item represents presentation state. (read-only)
Notes: (Read only property)

17.75.7 currentVideoFrameRate as Double

Function: For video media types, indicates the current frame rate of the track as it plays. (read-only)
Notes:
If the media type of the assetTrack is AVMediaTypeVideo, the property indicates the current frame rate of the track as it plays, in units of frames per second.

If the item is not playing, or if the media type of the track is not video, the value of this property is 0.0.

This property is not key-value observable.
Available in OS X v10.9 and later.
(Read only property)

17.75.8  Enabled as Boolean

**Function:** Indicates whether the track is enabled for presentation during playback.
**Notes:** (Read and Write property)

17.75.9  Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)
17.76 class AVPlayerItemVideoOutputMBS

17.76.1 class AVPlayerItemVideoOutputMBS

**Function:** The AVPlayerItemVideoOutput lets you coordinate the output of content associated with a Core Video pixel buffer.  
**Notes:**  
Available in OS X v10.8 and later.  
This class can call the outputSequenceWasFlushed and outputMediaDataWillChange events in the AVFoundationMBS class.  
Subclass of the AVPlayerItemOutputMBS class.

17.76.2 Methods

17.76.3 Constructor(pixelBufferAttributes as dictionary)

**Function:** Initializes and returns a video output object using the specified pixel buffer attributes.  
**Notes:** pixelBufferAttributes; The pixel buffer attributes required for video output. For a list of pixel buffer attributes you can include in this dictionary, see the CVPixelBuffer.h header file in the Core Video framework.

17.76.4 copyCIImageForItemTime(time as CMTimeMBS) as Variant

**Function:** Acquires and returns an image that is appropriate to display at the specified time.  
**Notes:**  
itemTime: The time at which you want to retrieve the image from the item.  
outItemTimeForDisplay: Optional, the time by which you intend to use the returned pixel buffer.  

Returns a pixel buffer containing the image data to display or nil if nothing should be displayed at the specified time. The caller is responsible for calling CVBufferRelease on the returned data when it is no longer needed.  

Typically, you call this method in response to a CVDisplayLink callback or a CADisplayLink delegate method call when the hasNewPixelBufferForItemTime method also returns true.

After calling this method, the video output object marks the pixel buffer data as having been acquired. This causes the hasNewPixelBufferForItemTime method to return false unless newer data becomes available.
17.76. **CLASS AVPLAYERITEMVIDEOOUTPUTMBS**

Returns CIImageMBS object.
Available in OS X v10.8 and later.
See also:

- 17.76.5 `copyCIImageForItemTime(time as CMTimeMBS, byref outItemTimeForDisplay as CMTimeMBS) as Variant` 3481

### 17.76.5 `copyCIImageForItemTime(time as CMTimeMBS, byref outItemTimeForDisplay as CMTimeMBS) as Variant`

**Function:** Acquires and returns an image that is appropriate to display at the specified time.
**Notes:**

itemTime: The time at which you want to retrieve the image from the item.
outItemTimeForDisplay: Optional, the time by which you intend to use the returned pixel buffer.

Returns a pixel buffer containing the image data to display or nil if nothing should be displayed at the specified time. The caller is responsible for calling CVBufferRelease on the returned data when it is no longer needed.

Typically, you call this method in response to a CVDisplayLink callback or a CADisplayLink delegate method call when the hasNewPixelBufferForItemTime method also returns true.

After calling this method, the video output object marks the pixel buffer data as having been acquired. This causes the hasNewPixelBufferForItemTime method to return false unless newer data becomes available.

Returns CIImageMBS object.
Available in OS X v10.8 and later.
See also:

- 17.76.4 `copyCIImageForItemTime(time as CMTimeMBS) as Variant` 3480

### 17.76.6 `copyPixelBufferForItemTime(time as CMTimeMBS) as CVPixelBufferMBS`

**Function:** Acquires and returns an image that is appropriate to display at the specified time.
**Notes:**

itemTime: The time at which you want to retrieve the image from the item.
outItemTimeForDisplay: Optional, the time by which you intend to use the returned pixel buffer.

Returns a pixel buffer containing the image data to display or nil if nothing should be displayed at the specified time. The caller is responsible for calling CVBufferRelease on the returned data when it is no
Typically, you call this method in response to a CVDisplayLink callback or a CADisplayLink delegate method call when the hasNewPixelBufferForItemTime method also returns true.

After calling this method, the video output object marks the pixel buffer data as having been acquired. This causes the hasNewPixelBufferForItemTime method to return false unless newer data becomes available.

Returns CVPixelBufferMBS object.
Available in OS X v10.8 and later.

See also:

- 17.76.6 copyPixelBufferForItemTime(time as CMTimeMBS) as CVPixelBufferMBS

17.76.7 copyPixelBufferForItemTime(time as CMTimeMBS, byref outItemTimeForDisplay as CMTimeMBS) as CVPixelBufferMBS

Function: Acquires and returns an image that is appropriate to display at the specified time.

Notes:

- itemTime: The time at which you want to retrieve the image from the item.
- outItemTimeForDisplay: Optional, the time by which you intend to use the returned pixel buffer.

Returns a pixel buffer containing the image data to display or nil if nothing should be displayed at the specified time. The caller is responsible for calling CVBufferRelease on the returned data when it is no longer needed.

Typically, you call this method in response to a CVDisplayLink callback or a CADisplayLink delegate method call when the hasNewPixelBufferForItemTime method also returns true.

After calling this method, the video output object marks the pixel buffer data as having been acquired. This causes the hasNewPixelBufferForItemTime method to return false unless newer data becomes available.

Available in OS X v10.8 and later.
See also:

- 17.76.6 copyPixelBufferForItemTime(time as CMTimeMBS) as CVPixelBufferMBS
17.76.8 hasNewPixelBufferForItemTime(time as CMTimeMBS) as boolean

**Function:** Returns a Boolean value indicating whether video output is available for the specified item time.

**Notes:**

itemTime: The item time to query. The time value is relative to the AVPlayerItem object with which the receiver is associated.

Returns true if there is available video output that has not been previously acquired or false if there is not.

This method returns true if the video data at the specified time has not yet been acquired or is different from the video that was acquired previously. If you require multiple objects to acquire video output from the same AVPlayerItem object, you should create separate AVPlayerItemVideoOutput objects for each. Available in OS X v10.8 and later.

17.76.9 requestNotificationOfMediaDataChangeWithAdvanceInterval(time as Double)

**Function:** Informs the receiver that the video output client is entering a quiescent state.

**Notes:**

interval: The amount of time to wait before notifying the delegate of the media change.

Call this method before you suspend your use of a CVDisplayLinkRef type or a CADisplayLink object. After the interval expires, the video output object notifies its delegate that it should resume the display link. If the interval value you specify is large, the delegate is notified as soon as possible rather than waiting.

Do not call this method repeatedly to force the delegate to be notified for each sample.

17.76.10 setDelegate

**Function:** Sets the delegate so the events are called for this instance.

**Notes:** The constructor (if used) sets this for you automatically.
17.77 class AVPlayerLayerMBS

17.77.1 class AVPlayerLayerMBS

Function: AVPlayerLayer is a subclass of CALayer to which an AVPlayer object can direct its visual output.
Notes:
The videoGravity property defines how the video content is displayed within the player layer’s bounds rect.

The value for the contents key of a player layer is opaque and effectively read-only.

During playback, AVPlayer may compensate for temporal drift between its visual output and its audible
output to one or more independently-clocked audio output devices by adjusting the timing of its associated
player layers. The effects of these adjustments are usually very small; however, clients that wish to remain
entirely unaffected by such adjustments may wish to place other layers for which timing is important into
independently timed subtrees of their layer trees.

You can create arbitrary numbers of player layers with the same AVPlayer object. Only the most-recently-
created player layer will actually display the video content on-screen.
Subclass of the CALayerMBS class.

17.77.2 Methods

17.77.3 Constructor(player as AVPlayerMBS)

Function: Creates a player layer to display the visual output of a specified player.
Notes: player: The player for which the player layer displays visual output.

17.77.4 isReadyForDisplay as boolean

Function: Indicates whether the first video frame has been made ready for display for the current item of
the associated player. (read-only)
Notes:
Use this property as an indicator of when best to show or animate-in a player layer into view. An player
layer may be displayed, or made visible, while this property is false, however the layer will not have any
user-visible content until the value becomes true.
This property remains false for a player’s currentItem whose asset contains no enabled video tracks.

17.77.5 \textbf{playerLayerWithPlayer(player as AVPlayerMBS) as AVPlayerLayerMBS}

\textit{MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.}
\textit{Function:} Returns a player layer to display the visual output of a specified player.
\textit{Notes:}
player: The player for which the player layer displays visual output.

Returns a player layer configured to display the visual output of player.

17.77.6 \textbf{videoRect as CGRectMBS}

\textit{MBS AVFoundation Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.}
\textit{Function:} The current size and position of the video image as displayed within the receiver’s bounds.
\textit{(read-only)}
\textit{Notes:} Available in OS X v10.9 and later.

17.77.7 \textbf{Properties}

17.77.8 \textbf{player as AVPlayerMBS}

\textit{MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.}
\textit{Function:} The player for which the player layer displays visual output.
\textit{Notes:} (Read and Write computed property)

17.77.9 \textbf{videoGravity as string}

\textit{MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.}
\textit{Function:} Specifies how the video is displayed within a player layer’s bounds.
\textit{Notes:}
Options are AVLayerVideoGravityResizeAspect, AVLayerVideoGravityResizeAspectFill, and AVLayerVideoGravityResize.
This property is animatable.
(Read and Write computed property)
17.78 class AVPlayerMBS

17.78.1 class AVPlayerMBS

Function: You use an AVPlayer object to implement controllers and user interfaces for single- or multiple-item playback.

Notes:
The multiple-item case supports advanced behaviors.

AVPlayer works equally well with local and remote media files, providing you with appropriate information about readiness to play or about the need to await additional data before continuing.

You can display the visual content of items played by an instance of AVPlayer in a CoreAnimation layer of class AVPlayerLayer; to synchronize real-time playback with other CoreAnimation layers, you can use AVSynchronizedLayer. You cannot use an instance of AVVideoCompositionCoreAnimationTool with an AVPlayer object; for offline rendering you should instead use AVAssetExportSession.

You can observe the status of a player using key-value observing. So that you can add and remove observers safely, AVPlayer serializes notifications of changes that occur dynamically during playback on a dispatch queue. By default, this queue is the main queue. To ensure safe access to a player’s nonatomic properties while dynamic changes in playback state may be reported, you must serialize access with the receiver’s notification queue. In the common case, such serialization is naturally achieved by invoking AVPlayer’s various methods on the main thread or queue.

17.78.2 Methods

17.78.3 addBoundaryTimeObserverForTimes(times() as CMTimeMBS, tag as Variant = nil) as AVPlayerTimeObserverMBS

Function: Requests invocation of a block when specified times are traversed during normal playback.

Notes:
times: An array of NSValue objects containing CMTime values representing the times at which to invoke block.
Returns an opaque object that you pass as the argument to removeTimeObserver to stop observation.

You must retain the returned value as long as you want the time observer to be invoked by the player. Each invocation of this method should be paired with a corresponding call to removeTimeObserver.
 Calls AVFoundationMBS.BoundaryTimeObserver event passing tag value.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

17.78.4 addPeriodicTimeObserverForInterval(interval as CMTimeMBS, tag as Variant = nil) as AVPlayerTimeObserverMBS

Function: Requests invocation of a given block during playback to report changing time.

Notes:

interval: The interval of invocation of the block during normal playback, according to progress of the current time of the player.
The block takes a single parameter:

Returns an opaque object that you pass as the argument to removeTimeObserver: to cancel observation.

You must retain the returned value as long as you want the time observer to be invoked by the player. Each invocation of this method should be paired with a corresponding call to removeTimeObserver.

The AVFoundationMBS.PeriodicTimeObserver event is invoked periodically at the interval specified, interpreted according to the timeline of the current item. The block is also invoked whenever time jumps and whenever playback starts or stops. If the interval corresponds to a very short interval in real time, the player may invoke the block less frequently than requested. Even so, the player will invoke the event sufficiently often for the client to update indications of the current time appropriately in its end-user interface.

Special Considerations
Releasing the observer object without invoking removeTimeObserver: will result in undefined behavior.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

17.78.5 available as boolean

Function: Whether this class is available.

Notes: Returns true on Mac OS X 10.7 and newer.
17.78.6  cancelPendingPrerolls

Function: Cancels the preloading of media data.
Notes: This method cancels any pending operations to prepare the render pipeline for the current item.
Available in OS X v10.8 and later.

17.78.7  Constructor

Function: The default constructor.
See also:
- 17.78.8 Constructor(File as folderitem)
- 17.78.9 Constructor(item as AVPlayerItemMBS)
- 17.78.10 Constructor(URL as string)

17.78.8  Constructor(File as folderitem)

Function: Initializes a new player to play a single audiovisual resource referenced by a given file.
Notes: File: A folderitem that identifies an audiovisual resource.
This method implicitly creates an AVPlayerItem object. You can get the player item using currentItem.
See also:
- 17.78.7 Constructor
- 17.78.9 Constructor(item as AVPlayerItemMBS)
- 17.78.10 Constructor(URL as string)

17.78.9  Constructor(item as AVPlayerItemMBS)

Function: Initializes a new player to play a given single audiovisual item.
Notes: You can use this method to play items for which you have an existing AVAsset object (see Constructor
17.78. CLASS AVPLAYERMBS

in AVPlayerItem).

See also:

- 17.78.7 Constructor
- 17.78.8 Constructor(File as folderitem)
- 17.78.10 Constructor(URL as string)

17.78.10 Constructor(URL as string)

Function: Initializes a new player to play a single audiovisual resource referenced by a given URL.

Notes:

URL: An URL that identifies an audiovisual resource.
This method implicitly creates an AVPlayerItem object. You can get the player item using currentItem.

See also:

- 17.78.7 Constructor
- 17.78.8 Constructor(File as folderitem)
- 17.78.9 Constructor(item as AVPlayerItemMBS)

17.78.11 mediaSelectionCriteriaForMediaCharacteristic(mediaCharacteristic as string) as AVPlayerMediaSelectionCriteriaMBS

Function: Returns the automatic selection criteria for media that has the specified media characteristic.

Notes:

mediaCharacteristic: The media characteristic for which the selection criteria is to be returned. Supported values include AVMediaCharacteristicAudible, AVMediaCharacteristicLegible, and AVMediaCharacteristicVisual.

Returns the automatic media selection criteria for mediaCharacteristic.

Available in OS X v10.9 and later.

17.78.12 pause

Function: Pauses playback.
Notes: This is the same as setting rate to 0.0.

17.78.13 play

**Function:** Begins playback of the current item.
**Notes:** This is the same as setting rate to 1.0.

17.78.14 playerWithFile(File as folderitem) as AVPlayerMBS

**Function:** Returns a new player to play a single audiovisual resource referenced by a given file.
**Notes:**
- File: A folderitem that identifies an audiovisual resource.
- Returns a new player initialized to play the audiovisual resource specified by folderitem.
- This method implicitly creates an AVPlayerItem object. You can get the player item using currentItem.

17.78.15 playerWithPlayerItem(item as AVPlayerItemMBS) as AVPlayerMBS

**Function:** Returns a new player initialized to play a given single audiovisual item
**Notes:**
- item: A player item.
- Returns a new player, initialized to play item.

You can use this method to play items for which an AVAsset object has previously been created (see Constructor in AVPlayerItem).

17.78.16 playerWithURL(URL as string) as AVPlayerMBS

**Function:** Returns a new player to play a single audiovisual resource referenced by a given URL.
**Notes:**
- URL: An URL that identifies an audiovisual resource.
- Returns a new player initialized to play the audiovisual resource specified by URL.
- This method implicitly creates an AVPlayerItem object. You can get the player item using currentItem.
17.78. **CLASS AVPLAYERMBS**

**17.78.17 prerollAtRate(rate as Double, tag as Variant)**

**Function:** Begins loading media data to prime the media pipelines for playback.

**Notes:**

rate: The playback rate to use when determining how much data to load.

Calls AVFoundationMBS.prerollAtRateFinished event when the player finishes the load attempt.

This method loads data starting at the item’s current playback time. The current rate for the playback item should always be 0 prior to calling this method. After the method calls the completion handler, you can change the item’s playback rate to begin playback.

If the player object is not ready to play (its status property is not AVPlayerStatusReadyToPlay), this method throws an exception.

Available in OS X v10.8 and later.

**17.78.18 removeTimeObserver(observer as AVPlayerTimeObserverMBS)**

**Function:** Cancels a previously registered time observer.

**Notes:**

observer: An object returned by a previous call to addPeriodicTimeObserverForInterval or addBoundaryTimeObserverForTimes.

Upon return, the caller is guaranteed that no new time observer event will begin executing. Depending on the calling thread and the queue used to add the time observer, an in-flight block may continue to execute after this method returns. You can guarantee synchronous time observer removal by enqueueing the call to removeTimeObserver on the main queue (do it in main event).

You should use this method to explicitly cancel each time observer added using addPeriodicTimeObserverForInterval and addBoundaryTimeObserverForTimes.

**17.78.19 replaceCurrentItemWithPlayerItem(item as AVPlayerItemMBS)**

**Function:** Replaces the player item with a new player item.

**Notes:**

item: A player item.
You can only use this method with players created without queues. If the player was not initialized with a single item and no queue, the method throws an exception.

The item replacement occurs asynchronously; observe the currentItem property to find out when the replacement will/did occur.

Special Considerations
The new item must have the same compositor as the item it replaces, or have no compositor.

17.78.20 seekToDate(date as date, fireEvent as boolean = false, tag as Variant = nil)

Function: Moves the playback cursor to the specified time.
Notes:
If FireEvent is true, the AVFoundationMBS.playerSeekToDateFinished event is called.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

17.78.21 seekToTime(time as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil)

Function: Moves the playback cursor to a given time.
Notes:
time: The time to which to move the playback cursor.

Use this method to seek to a specified time for the current player item and be notified when the operation completes. If the seek request completes without being interrupted (either by another seek request or by any other operation), the AVFoundationMBS.playerSeekToTimeFinished is executed with the finished parameter set to true.

If another seek request is already in progress when you call this method, the event for the in-progress seek request is executed immediately with the finished parameter set to false.
If fireevent is true, the AVFoundationMBS.playerSeekToTimeFinished event is run later.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

See also:

- 17.78.22 seekToTime(time as CMTimeMBS, toleranceBefore as CMTimeMBS, toleranceAfter as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil)

17.78.22 seekToTime(time as CMTimeMBS, toleranceBefore as CMTimeMBS, toleranceAfter as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil)

Function: Moves the playback cursor within a specified time bound and invokes the event when the seek operation has either been completed or been interrupted.

Notes:

If fireevent is true, the AVFoundationMBS.playerSeekToTimeFinished event is run later.

time: The time to which you would like to move the playback cursor.
toleranceBefore: The tolerance allowed before time.
toleranceAfter: The tolerance allowed after time.

Use this method to seek to a specified time for the current player item and to be notified when the seek operation is complete.

The time seeked to will be within the range \[ time-\text{beforeTolerance}, time+\text{afterTolerance} \], and may differ from the specified time for efficiency. If you pass kCMTimeZero for both toleranceBefore and toleranceAfter (to request sample accurate seeking), you may incur additional decoding delay.

Invoking this method with toleranceBefore set to kCMTimePositiveInfinity and toleranceAfter set to kCMTimePositiveInfinity is the same as invoking seekToTime:.

The completion handler for any prior seek request that is still in process will be invoked immediately with the finished parameter set to false. If the new request completes without being interrupted by another seek request or by any other operation the event will be invoked with the finished parameter set to true.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

See also:
• 17.78.21 seekToTime(time as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil)  

17.78.23 setMediaSelectionCriteria(criteria as AVPlayerMediaSelectionCriteriaMBS, mediaCharacteristic as string)

Function: Applies automatic selection criteria for media that has the specified media characteristic.
Notes:
criteria: An instance of AVPlayerMediaSelectionCriteria that specifies the selection criteria.
mediaCharacteristic: The media characteristic for which the selection criteria are to be applied. Supported values include AVMediaCharacteristicAudible, AVMediaCharacteristicLegible, and AVMediaCharacteristicVisual.
Criteria will be applied to an AVPlayerItem instance when:

• It is made ready to play.
• Specific media selections are made by the AVPlayerItem instance using the method selectMediaOption in a different group. The automatic choice in one group may be influenced by a specific selection in another group.
• Underlying system preferences change, e.g. system language, accessibility captions.

Specific selections made by the AVPlayerItem instance using the method selectMediaOption method within any group will override automatic selection in that group until the player item receives a selectMediaOptionAutomaticallyInMediaSelectionGroup message.

Available in OS X v10.9 and later.

17.78.24 setRate(rate as Double, time as CMTimeMBS, HostTime as CMTimeMBS)

Function: Synchronizes the playback rate and time of the current item with an external source.
Notes:
rate: The playback rate for the item.
itemTime: The precise time at which to match playback of the item. To use the current item’s current time, specify kCMTimeInvalid.
hostClockTime: The host time at which to synchronize playback. If you specify kCMTimeInvalid, the rate and time are set together without any external synchronization.
This method adjusts the current item’s timebase so that the time in itemTime is in sync with the time in hostClockTime. Thus, if hostClockTime specifies a time in the past, the item’s timebase is adjusted to make it appear as if the item has been running at the specified rate since itemTime. And if hostClockTime specifies a time in the future, playback is adjusted backward (if possible) so that the value in itemTime occurs at the precise moment the host’s clock reaches the value in hostClockTime. If there is no content to play before the time specified by itemTime, playback holds until the two times come into sync.

This method does not ensure that media data is loaded before the timebase starts moving. However, if you specify a host time in the near future, that would give you some time to load the media data and prepare for playback.

17.78.25 Properties

17.78.26 ActionAtItemEnd as Integer

Function: The action to perform when an item has finished playing.
Notes: (Read and Write property)

17.78.27 appliesMediaSelectionCriteriaAutomatically as Boolean

Function: Indicates whether the receiver should apply the current selection criteria automatically to AVPlayerItems.
Notes:
By default, AVPlayer applies selection criteria based on system preferences. To override the default criteria for any media selection group, use setMediaSelectionCriteria method.
(Read and Write property)

17.78.28 audioOutputDeviceUniqueID as String

Function: Specifies the unique ID of the Core Audio output device used to play audio.
Notes:
By default, the value of this property is nil, indicating that the default audio output device is used. Otherwise the value of this property is an NSString containing the unique ID of the Core Audio output device to be used for audio output.
Core Audio’s kAudioDevicePropertyDeviceUID is a suitable source of audio output device unique IDs.
(Read and Write property)
17.78.29 **ClosedCaptionDisplayEnabled as boolean**

**Function:** Indicates whether the player uses closed captioning.

**Notes:** (Read and Write property)

17.78.30 **currentItem as AVPlayerItemMBS**

**Function:** The player’s current item. (read-only)

**Notes:** (Read only property)

17.78.31 **currentTime as CMTimeMBS**

**Function:** Returns the current time of the current item.

**Notes:** (Read only property)

17.78.32 **error as NSErrorMBS**

**Function:** If the receiver’s status is AVPlayerStatusFailed, this describes the error that caused the failure. (read-only)

**Notes:**

The value of this property is an error object that describes what caused the receiver to no longer be able to play items. If the receiver’s status is not AVPlayerStatusFailed, the value of this property is nil. (Read only property)

17.78.33 **Handle as Integer**

**Function:** The internal object reference.

**Notes:** (Read and Write property)
17.78. **CLASS AVPLAYERMBS**

### 17.78.34 Muted as boolean

**Function:** Indicates whether the audio output of the player is muted.
**Notes:** (Read and Write property)

### 17.78.35 rate as Double

**Function:** The current rate of playback.
**Notes:**
0.0 means "stopped", 1.0 means "play at the natural rate of the current item".
(Read and Write property)

### 17.78.36 status as Integer

**Function:** Indicates whether the player can be used for playback. (read-only)
**Notes:**
When the value of this property is AVPlayerStatusFailed, you can no longer use the player for playback and you need to create a new instance to replace it. If this happens, you can check the value of the error property to determine the nature of the failure.
This property is key value observable using key-value observing.
(Read only property)

### 17.78.37 volume as Double

**Function:** Indicates the current audio volume of the player.
**Notes:**
0.0 means "silence all audio," 1.0 means "play at the full volume of the current item."
(Read and Write property)
17.78.38 Constants

17.78.39 AVPlayerActionAtItemEndAdvance = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants with actionAtItemEnd to indicate the action a player should take when it finishes playing.
Notes: Indicates that the player should advance to the next item, if there is one.

17.78.40 AVPlayerActionAtItemEndNone = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants with actionAtItemEnd to indicate the action a player should take when it finishes playing.
Notes: Indicates that the player should do nothing.

17.78.41 AVPlayerActionAtItemEndPause = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the constants with actionAtItemEnd to indicate the action a player should take when it finishes playing.
Notes: Indicates that the player should pause playing.

17.78.42 AVPlayerStatusFailed = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the possible values of the status property, to indicate whether it can successfully play items.
Notes:
Indicates that the player can no longer play AVPlayerItem instances because of an error.
The error is described by the value of the player’s error property.

17.78.43 AVPlayerStatusReadyToPlay = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the possible values of the status property, to indicate whether it can successfully play items.
Notes: Indicates that the player is ready to play AVPlayerItem instances.
17.78.44 AVPlayerStatusUnknown = 0

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the possible values of the status property, to indicate whether it can successfully play items. **Notes:** Indicates that the status of the player is not yet known because it has not tried to load new media resources for playback.

17.79 class AVPlayerMediaSelectionCriteriaMBS

17.79.1 class AVPlayerMediaSelectionCriteriaMBS

**Function:** The AVPlayerMediaSelectionCriteria class specifies the preferred languages and media characteristics for an AVPlayer instance.  
**Notes:** The languages and media characteristics of assets containing media selection options that an AVPlayer instance should attempt to select automatically when preparing and playing items. The languages and media characteristics are specified in the preferred order.

17.79.2 Methods

17.79.3 available as boolean

**Function:** Whether this class is available.

17.79.4 Constructor(preferredLanguages() as string, preferredMediaCharacteristics() as string)

**Function:** Returns an initialized media selection criteria instance with the specified settings.  
**Notes:**  
preferredLanguages: An array of strings containing language identifiers, in the preferred order. Can be nil.  
preferredMediaCharacteristics: An array of strings indicating additional media characteristics, the preferred order. Can be nil.  
Supported media characteristics are defined in AVMediaSelectionOption Constants and Media Characteristics.

Returns an initialized AVPlayerMediaSelectionCriteria instance.

When making selections, AVPlayer treats the preferredLanguages as the paramount criterion and the preference for preferredMediaCharacteristics as secondary.

The objects in the preferredLanguages array are indicated using BCP 47 language identifiers or ISO 639-2/T language codes.

If no option with any of the preferredLanguages is available, a selection is made according to the default enabling and disabling of media options as stored in the asset.
The preferredMediaCharacteristics are used when selecting media for the AVPlayer.

For example, desirable characteristics of legible media may include AVMediaCharacteristicTranscribesSpokenDialogForAccessibility and AVMediaCharacteristicDescribesMusicAndSoundForAccessibility.

Similarly, desirable characteristics of audible media may include AVMediaCharacteristicDescribesVideoForAccessibility.

If no option is found that possesses all of the desired characteristics, the option that best matches the desired characteristics will be selected.
Available in OS X v10.9 and later.

17.79.5 preferredLanguages as String()

**Function:** The array of preferred languages in the order of desirability. (read-only)
**Notes:** Available in OS X v10.9 and later.

17.79.6 preferredMediaCharacteristics as String()

**Function:** The array of preferred media characteristics in the order of desirability. (read-only)
**Notes:** Available in OS X v10.9 and later.

17.79.7 Properties

17.79.8 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)
17.80 class AVPlayerTimeObserverMBS

17.80.1 class AVPlayerTimeObserverMBS

Function: The class for an observer.
Notes: You keep reference to this class, so you can cancel time observer later.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.80.2 Methods

17.80.3 Constructor

Function: The private constructor.

17.80.4 Destructor

Function: The destructor.
Notes: Automatically cancels this observer if it was not cancelled.
17.81. CLASS AVQUEUEPLAYERMBS

17.81. class AVQueuePlayerMBS

17.81.1 class AVQueuePlayerMBS

Function: AVQueuePlayer is a subclass of AVPlayer you use to play a number of items in sequence.
Notes: Subclass of the AVPlayerMBS class.

17.81.2 Methods

17.81.3 advanceToNextItem

Function: Ends playback of the current item and initiates playback of the next item in the player’s queue.
Notes: This method also removes the current item from the play queue.

17.81.4 appendItem(item as AVPlayerItemMBS)

Function: Places given player item in the queue.
Notes: item: The item to be inserted.

17.81.5 canAppendItem(item as AVPlayerItemMBS) as boolean

Function: Returns a Boolean value that indicates whether a given player item can be appended into the player’s queue.
Notes:
item: The AVPlayerItem object to test.

Returns true if item can be appended to the queue, otherwise false.
Adding the same item to a player at more than one position in the queue is not supported.
17.81.6 canInsertItem(item as AVPlayerItemMBS, afterItem as AVPlayerItemMBS = nil) as boolean

Function: Returns a Boolean value that indicates whether a given player item can be inserted into the player's queue.
Notes:
item: The AVPlayerItem object to test.
afterItem: The item that item is to follow in the queue. Pass nil to test whether item can be appended to the queue.

Returns true if item can be appended to the queue, otherwise false.
Adding the same item to a player at more than one position in the queue is not supported.

17.81.7 Constructor(items() as AVPlayerItemMBS)

Function: Initializes an instance of AVQueuePlayer by enqueuing the player items from a given array.
Notes:
items: An array of AVPlayerItem objects with which initially to populate the player’s queue.
Creates an instance of AVQueuePlayer initialized to play the player items in items.

17.81.8 insertItem(item as AVPlayerItemMBS, afterItem as AVPlayerItemMBS = nil)

Function: Places given player item after a specified item in the queue.
Notes:
item: The item to be inserted.
afterItem: The item that the newly inserted item should follow in the queue. Pass nil to append the item to the queue.

17.81.9 items as AVPlayerItemMBS()

Function: Returns an array of the currently enqueued items.
Notes: The array contains AVPlayerItem objects.
17.81. **CLASS AVQUEUEPLAYERMBS**

17.81.10 **queuePlayerWithItems(items() as AVPlayerItemMBS) as AVQueuePlayerMBS**

**Function:** Returns an instance of AVQueuePlayer initialized to play items from a given array.

**Notes:**

items: An array of AVPlayerItem objects with which initially to populate the player’s queue.

Returns an instance of AVQueuePlayer initialized to play the player items in items.

17.81.11 **removeAllItems**

**Function:** Removes all the items from the queue.
**Notes:** This has the side-effect of stopping playback by the player.

17.81.12 **removeItem(item as AVPlayerItemMBS)**

**Function:** Removes a given player item from the queue.
**Notes:**

item: The item to be removed.

If item is currently playing, this has the same effect as advanceToNextItem.
17.82 class AVSampleBufferDisplayLayerMBS

17.82.1 class AVSampleBufferDisplayLayerMBS

Function: AVSampleBufferDisplayLayer is a subclass of CALayer that can decompress and display compressed or uncompressed video frames.
Notes: Subclass of the CALayerMBS class.

17.82.2 Methods

17.82.3 Constructor

Function: The default constructor.

17.82.4 enqueueSampleBuffer(sampleBuffer as CMSampleBufferMBS)

Function: Sends a sample buffer for display.
Notes: If sampleBuffer has the kCMSampleAttachmentKey_DoNotDisplay attachment set to True, the frame will be decoded but not displayed. Otherwise, if sampleBuffer has the kCMSampleAttachmentKey_DisplayImmediately attachment set to True, the decoded image will be displayed as soon as possible, replacing all previously enqueued images regardless of their timestamps. Otherwise, the decoded image will be displayed at sampleBuffer’s output presentation timestamp, as interpreted by the control timebase (or the mach_absolute_time timeline if there is no control timebase). To schedule the removal of previous images at a specific timestamp, enqueue a marker sample buffer containing no samples, with the kCMSampleBufferAttachmentKey_EmptyMedia attachment set to kCFBooleanTrue. IMPORTANT NOTE: attachments with the kCMSampleAttachmentKey_prefix must be set via CMSampleBufferGetSampleAttachmentsArray and CFDictionarySetValue. Attachments with the kCMSampleBufferAttachmentKey_prefix must be set via CMSetAttachment.

17.82.5 flush

Function: Instructs the layer to discard pending enqueued sample buffers.
Notes: It is not possible to determine which sample buffers have been decoded, so the next frame passed to enqueueSampleBuffer should be an IDR frame (also known as a key frame or sync sample).
### 17.82.6 flushAndRemoveImage

**Function:** Instructs the layer to discard pending enqueued sample buffers and remove any currently displayed image.  
**Notes:** It is not possible to determine which sample buffers have been decoded, so the next frame passed to enqueueSampleBuffer should be an IDR frame (also known as a key frame or sync sample).

### 17.82.7 requestMediaDataWhenReady(tag as Variant = nil)

**Function:** Instructs the target to invoke a client-supplied block repeatedly, at its convenience, in order to gather sample buffers for display.  
**Notes:**  
The block should enqueue sample buffers to the layer either until the layer’s readyForMoreMediaData property becomes false or until there is no more data to supply. When the layer has decoded enough of the media data it has received that it becomes ready for more media data again, it will invoke the block again in order to obtain more. If this function is called multiple times, only the last call is effective.  
Call stopRequestingMediaData to cancel this request.  
Each call to requestMediaDataWhenReady should be paired with a corresponding call to stopRequestingMediaData. Releasing the AVSampleBufferDisplayLayer without a call to stopRequestingMediaData will result in undefined behavior. 
Calls SampleBufferDisplayLayerMediaDataWhenReady event on AVFoundationMBS class.  

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

### 17.82.8 stopRequestingMediaData

**Function:** Cancels any current requestMediaDataWhenReady call.  
**Notes:** This method may be called from outside the block or from within the block.

### 17.82.9 Properties

#### 17.82.10 isReadyForMoreMediaData as boolean

**Function:** Indicates the readiness of the layer to accept more sample buffers.
Notes:

AVSampleBufferDisplayLayer keeps track of the occupancy levels of its internal queues for the benefit of clients that enqueue sample buffers from non-real-time sources—i.e., clients that can supply sample buffers faster than they are consumed, and so need to decide when to hold back. Clients enqueuing sample buffers from non-real-time sources may hold off from generating or obtaining more sample buffers to enqueue when the value of readyForMoreMediaData is false. It is safe to call enqueueSampleBuffer when readyForMoreMediaData is false, but it is a bad idea to enqueue sample buffers without bound. To help with control of the non-real-time supply of sample buffers, such clients can use requestMediaDataWhenReady in order to specify a block that the layer should invoke whenever it’s ready for sample buffers to be appended. The value of readyForMoreMediaData will often change from false to true asynchronously, as previously supplied sample buffers are decoded and displayed.

This property is not key value observable.
(Read only property)

17.82.11 videoGravity as string

Notes:

Options are AVLayerVideoGravityResizeAspect, AVLayerVideoGravityResizeAspectFill and AVLayerVideoGravityResize. AVLayerVideoGravityResizeAspectFill is default.

See AVFoundationMBS class for a description of these options.
(Read and Write property)
17.83. **CLASS AVSYNCHRONIZEDLAYERMBS**

### 17.83 class AVSynchronizedLayerMBS

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** AVSynchronizedLayer a subclass of CALayer with layer timing that synchronizes with a specific AVPlayerItem.

**Notes:**

You can create an arbitrary number of synchronized layers from the same AVPlayerItem object.

A synchronized layer is similar to a CATransformLayer object in that it doesn’t display anything itself, it just confers state upon its layer subtree. AVSynchronizedLayer confers is timing state, synchronizing the timing of layers in its subtree with that of a player item.

Subclass of the CALayerMBS class.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

### 17.83.2 Methods

#### 17.83.3 Constructor

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The private constructor.

### 17.83.4 synchronizedLayerWithPlayerItem(playerItem as AVPlayerItemMBS) as AVSynchronizedLayerMBS

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns a new synchronized layer with timing synchronized with a given player item.

**Notes:**

playerItem: A player item.

Returns a new synchronized layer with timing synchronized with playerItem.
17.83.5 Properties

17.83.6 `playerItem` as `AVPlayerItemMBS`

**Function:** The player item to which the timing of the layer is synchronized.  
**Notes:** (Read and Write computed property)
17.84. class AVTextStyleRuleMBS

17.84.1 class AVTextStyleRuleMBS

Function: AVTextStyleRule represents a set of text styling attributes that can be applied to some or all of
the text of legible media, such as subtitles and closed captions.

17.84.2 Methods

17.84.3 available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9.

17.84.4 Constructor(textMarkupAttributes as dictionary)

Function: Creates an instance of AVTextStyleRule with the specified text markup attributes.
Notes: textMarkupAttributes: A dictionary with keys representing text style attributes that are specifiable
in text markup. Eligible keys are defined in <CoreMedia/CMTextMarkup.h>.
See also:
• 17.84.5 Constructor(textMarkupAttributes as dictionary, textSelector as string)

17.84.5 Constructor(textMarkupAttributes as dictionary, textSelector as string)

Function: Creates an instance of AVTextStyleRule with the specified text markup attributes and an iden-
tifier for the range or ranges of text to which the attributes should be applied.
Notes:
textMarkupAttributes: A dictionary with keys representing text style attributes that are specifiable in text
markup. Eligible keys are defined in <CoreMedia/CMTextMarkup.h>.
textSelector: An identifier for the range or ranges of text to which the attributes should be applied. Eligible
identifiers are determined by the format and content of the legible media. A value of nil indicates that the
textMarkupAttributes should be applied as default styles for all text unless overridden by content markup
or other applicable text selectors.
Returns an instance of AVTextStyleRule
See also:
17.84.4 Constructor (textMarkupAttributes as dictionary)

17.84.6 copy as AVTextStyleRuleMBS

Function: Creates a copy of the style rule.

17.84.7 textStyleRuleWithTextMarkupAttributes (textMarkupAttributes as Dictionary) as AVTextStyleRuleMBS

Function: Creates an instance of AVTextStyleRule with the specified text markup attributes.
Notes:
textMarkupAttributes: A dictionary with keys representing text style attributes that are specifiable in text
markup. Eligible keys are defined in `<CoreMedia/CMTextMarkup.h>`.
Returns an instance of AVTextStyleRule
Equivalent to invoking textStyleRuleWithTextMarkupAttributes with a value of nil for textSelector.
See also:

- 17.84.8 textStyleRuleWithTextMarkupAttributes (textMarkupAttributes as Dictionary, textSelector as string) as AVTextStyleRuleMBS

17.84.8 textStyleRuleWithTextMarkupAttributes (textMarkupAttributes as Dictionary, textSelector as string) as AVTextStyleRuleMBS

Function: Creates an instance of AVTextStyleRule with the specified text markup attributes and an identifier for the range
or ranges of text to which the attributes should be applied.
Notes:
textMarkupAttributes: A dictionary with keys representing text style attributes that are specifiable in text
markup. Eligible keys are defined in `<CoreMedia/CMTextMarkup.h>`.
textSelector: An identifier for the range or ranges of text to which the attributes should be applied. Eligible
identifiers are determined by the format and content of the legible media. A value of nil indicates that the
textMarkupAttributes should be applied as default styles for all text unless overridden by content markup
or other applicable text selectors.
Returns an instance of AVTextStyleRule
See also:

- 17.84.7 textStyleRuleWithTextMarkupAttributes (textMarkupAttributes as Dictionary) as AVTextStyleRuleMBS
17.84.9 Properties

17.84.10 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.84.11 textMarkupAttributes as Dictionary

Function: A dictionary with keys representing text style attributes that are specifiable in text markup.
Notes: Eligible keys and the expected types of their corresponding values are defined in <CoreMedia/CMTextMarkup.h>.
(Read only property)

17.84.12 textSelector as String

Function: A string that identifies the range or ranges of text to which the attributes should be applied.
Notes: A value of nil indicates that the textMarkupAttributes should be applied as default styles for all text unless overridden by content markup or other applicable text selectors. The syntax of text selectors is determined by the format of the legible media. Eligible selectors may be determined by the content of the legible media (e.g. CSS selectors that are valid for a specific WebVTT document).
(Read only property)
17.85  class AVTimeCodeMBS

17.85.1  class AVTimeCodeMBS

Function: The class for a time code.
Notes:
The data class used by AVAssetMBS.readTimeCodeObjects to store details on time codes.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.85.2  Methods

17.85.3  Constructor

Function: Private constructor.

17.85.4  Properties

17.85.5  duration as CMTimeMBS

Function: The duration.
Notes: (Read only property)

17.85.6  frameNumber as Int64

Function: The frame number.
Notes: (Read only property)

17.85.7  frameQuanta as UInt32

Function: Returns the frames/sec for timecode (eg. 30) OR frames/tick for counter mode
Notes: (Read only property)
17.85. CLASS AVTIMECODEMBS

17.85.8 presentationTimeStamp as CMTimeMBS

Function: The earliest presentation timestamp.
Notes: (Read only property)

17.85.9 tcFlag as UInt32

Function: The time zone flags.
Notes: Can be combination of

- kDropFrame 1
- k24HourMax 2
- kNegTimesOK 4

(Read only property)

17.85.10 timecode as String

Function: The timecode as formatted number.
Notes: Format is 2 digit hours, double colon, 2 digit minutes, double colon, 2 digit seconds, double colon, 2 digit frames.
e.g. "01:02:03:04"
(Read only property)

17.85.11 type as String

Function: The type of timecode.
Notes: Can be tmcd for 32-bit time code or tc64 for 64-bit timecode.
(Read only property)
17.86 class AVTimedMetadataGroupMBS

17.86.1 class AVTimedMetadataGroupMBS

**Function:** You use an AVTimedMetadataGroup object to represent a collection of metadata items.
**Notes:** AV Foundation also provides a mutable subclass, AVMutableTimedMetadataGroup.

17.86.2 Methods

17.86.3 Constructor(items() as AVMetadataItemMBS, timeRange as CMTimeRangeMBS)

**Function:** Returns a metadata group initialized with given metadata items.
**Notes:**
- items: An array of AVMetadataItem objects.
- timeRange: The time range of the metadata contained in items.

17.86.4 copy as AVTimedMetadataGroupMBS

**Function:** Creates a copy of the object.

17.86.5 items as AVMetadataItemMBS()

**Function:** The metadata items in the group. (read-only)
**Notes:** The array contains instances of AVMetadataItem.

17.86.6 timeRange as CMTimeRangeMBS

**Function:** The time range of the metadata. (read-only)
17.86.7 Properties

17.86.8 Handle as Integer

Function: The internal object reference.

Notes: (Read and Write property)
17.87  class AVURLAssetMBS

17.87.1  class AVURLAssetMBS

**Function:** AVURLAsset is a concrete subclass of AVAsset that you use to initialize an asset from an URL.  
**Example:**

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child(”test.mov”)  
dim u as AVURLAssetMBS = AVURLAssetMBS.URLAssetWithFile(f)  
dim a() as AVAssetTrackMBS = u.tracks

MsgBox str(UBound(a)+1)+” tracks.”
```

**Notes:** Subclass of the AVAssetMBS class.

17.87.2  Methods

17.87.3  audiovisualMIMETypes as string()

**Function:** Returns an array of the MIME types the AVURLAsset class understands.  
**Example:**

```vba
MsgBox Join(AVURLAssetMBS.audiovisualMIMETypes, EndOfLine)
```

**Notes:** See also MimeTypeToFileExtensionMBS function.

17.87.4  audiovisualTypes as string()

**Function:** Returns an array of the file types the AVURLAsset class understands.  
**Example:**

```vba
MsgBox Join(AVURLAssetMBS.audiovisualTypes, EndOfLine)
```
17.87. **CLASS AVURLASSETMBS**

17.87.5 **compatibleTrackForCompositionTrack(compositionTrack as AVCompositionTrackMBS) as AVAssetTrackMBS**

**Function:** Returns an asset track from which any time range can be inserted into a given composition track.  
**Notes:**  
- compositionTrack: The composition track for which a compatible AVAssetTrack object is requested.  

Returns an asset track managed by the receiver from which any time range can be inserted into a given composition track.

You insert the track into using `insertTimeRange` (AVMutableCompositionTrack). This method is the logical complement of `mutableTrackCompatibleWithTrack`.

17.87.6 **Constructor(File as folderitem, options as dictionary = nil)**

**Function:** Initializes an asset for inspection of a resource referenced by a given file.  
**Example:**
```plaintext
dim f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
dim u as AVURLAssetMBS = new AVURLAssetMBS(f)
MsgBox str(U.duration.Seconds) + " seconds long"
```

**Notes:**  
- file: A folderitem that references the container file to be represented by the asset.  
- options: A dictionary that contains options for the initialization of the asset.  
See also:

  - 17.87.7 Constructor(URL as string, options as dictionary = nil)

17.87.7 **Constructor(URL as string, options as dictionary = nil)**

**Function:** Initializes an asset for inspection of a resource referenced by a given URL.  
**Notes:**  
- URL: An URL that references the container file to be represented by the asset.  
- options: A dictionary that contains options for the initialization of the asset.  
See also:
17.87.8 isPlayableExtendedMIMEType(extendedMIMEType as string) as boolean

Function: Returns a Boolean value indicating whether an asset is playable with the codec(s) and container type specified in a given extended MIME type.
Notes: Returns true if an asset is playable with the codec(s) and container type specified in extendedMIMEType, otherwise false.
See also FileExtensionToMimeTypeMBS function.

17.87.9 URLAssetWithFile(File as folderitem, options as dictionary = nil) as AVURLAssetMBS

Function: Returns an asset for inspection of a resource referenced by a given file.
Example:
```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
dim u as AVURLAssetMBS = AVURLAssetMBS.URLAssetWithFile(f)
MsgBox str(u.duration.Seconds)+" seconds video."
```
Notes:
File: A folderitem that references the container file to be represented by the asset.
options: A dictionary that contains options for the initialization of the asset.

Returns an asset initialized for inspection of a resource referenced by folderitem.

17.87.10 URLAssetWithURL(URL as string, options as dictionary = nil) as AVURLAssetMBS

Function: Returns an asset for inspection of a resource referenced by a given URL.
Notes:
URL: An URL that references the container file to be represented by the asset.
options: A dictionary that contains options for the initialization of the asset.
17.87. **CLASS AVURLASSETMBS**

Returns an asset initialized for inspection of a resource referenced by URL.

### 17.87.11 Properties

#### 17.87.12 resourceLoader as AVAssetResourceLoaderMBS

**Function:** The resource loader associated with the asset. (read-only)  
**Notes:**  
During loading, the resource loader object may be asked to assist in the loading of a resource. For example, a resource that requires decryption might result in the resource loader being asked to provide the appropriate decryption keys. You can assign a delegate object to the resource loader object and use your delegate to intercept these requests and provide an appropriate response.  
Available on Mac OS X 10.9 or later.  
(Read only property)

#### 17.87.13 URL as string

**Function:** The URL with which the asset was initialized. (read-only)  
**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
dim u as AVURLAssetMBS = new AVURLAssetMBS(f)
MsgBox u.URL
```

**Notes:** (Read only property)
17.88 **class AVVideoCompositingMBS**

17.88.1 **class AVVideoCompositingMBS**

**Function:** The AVVideoCompositing protocol defines properties and methods that custom video compositors must implement.  
**Notes:**

For each AV Foundation object of class AVPlayerItem, AVAssetExportSession, AVAssetImageGenerator, or AVAssetReaderVideoCompositionOutput that has a non-nil value for its videoComposition property, and the value of the customVideoCompositorClass property of the AVVideoComposition is not nil, AV Foundation creates and uses an instance of that custom video compositor class to process the instructions contained in the AVVideoComposition.

The custom video compositor instance will be created when you assign videoComposition an instance of AVVideoComposition that’s associated with a different custom video compositor class than the object was previously using.

When creating instances of custom video compositors, AV Foundation initializes them by calling init and then makes them available as the value of the customVideoCompositor property of the object to which it was assigned. You then can do any additional setup or configuration to the custom compositor.

Custom video compositor instances will then be retained by the AV Foundation object for as long as the value of its videoComposition property indicates that an instance of the same custom video compositor class should be used, even if the value is changed from one instance of AVVideoComposition to another instance that’s associated with the same custom video compositor class.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.88.2 **Methods**

17.88.3 **cancelAllPendingVideoCompositionRequests**

**Function:** Directs a custom video compositor object to cancel or finish all pending video composition requests.  
**Notes:**

Upon receiving this message, a custom video compositor must block until it has either cancelled all pending frame requests, and called the finishCancelledRequest method for each of them. If cancellation is not possible, the method must block until it has finished processing of all the frames and called the finishWithComposedVideoFrame method for each of them.

Available in OS X v10.9 and later.
17.88. CLASS AVVIDEOCOMPOSITINGMBS

17.88.4 Constructor

Function: The private constructor.
Notes:
Initializes an instance of the class that implements the video compositing protocol. (required)
This constructor is private to make sure you don’t create an object from this class by error. Please use
designated functions to create objects.

17.88.5 renderContextChanged(newRenderContext as AVVideoComposition-
RenderContextMBS)

Function: Invoked to notify the custom compositor that a composition will switch to a different render
context. (required)
Notes:
newRenderContext: The new render context that will be handling video composition.

Instances of classes implementing the AVVideoComposting protocol must implement this method to be noti-
fied when the AVVideoCompositionRenderContext instance handing a video composition changes. AVVideo-
CompositionRenderContext instances being immutable, such a change will occur every time there is a change
in the video composition parameters.
Available in OS X v10.9 and later.

17.88.6 startVideoCompositionRequest(asyncVideoCompositionRequest as AVAsyn-
chronousVideoCompositionRequestMBS)

Function: Directs a custom video compositor object to create a new pixel buffer composed asynchronously
from a collection of sources. (required)
Notes:
asyncVideoCompositionRequest: An instance of AVAsynchronousVideoCompositionRequest that provides
context for the requested composition.

The custom compositor is expected to invoke, either subsequently or immediately, the asyncVideoComposi-
tionRequest object’s finishWithComposedVideoFrame or finishWithError methods.

If you intend to finish rendering the frame after handling of this message returns, you must retain asyncVideo-
CompositionRequest until after composition is finished.
Note that if the custom compositor’s implementation of this method returns without finishing the composition immediately, it may be invoked again with another composition request before the prior request is finished; in such cases the custom compositor should be prepared to manage multiple composition requests.

If the rendered frame is exactly the same as one of the source frames, with no letterboxing, pillboxing or cropping needed, then the appropriate source pixel buffer may be returned, after CFRelease has been called on it.

Available in OS X v10.9 and later.

### 17.88.7 Properties

#### 17.88.8 Handle as Integer

**Function:** The internal object reference.

**Notes:** (Read and Write property)

#### 17.88.9 requiredPixelBufferAttributesForRenderContext as Dictionary

**Function:** Returns the pixel buffer attributes required by the video compositor for new buffers created for processing. (required) (read-only)

**Notes:**

The property is required to provide a `kCVPixelBufferPixelFormatTypeKey` key in the dictionary, along with attributes for which the compositor needs specific values to work properly. Omitted attributes will be supplied by the composition engine to allow for the best performance. If the attribute `kCVPixelBufferPixelFormatTypeKey` key is not in the dictionary an exception will be raised. The value of the `kCVPixelBufferPixelFormatTypeKey` is an array of `kCVPixelFormatType_*` constants as defined in `PixelFormat_Types`.

The value of `requiredPixelBufferAttributesForRenderContext` is retrieved prior to the creation of a new render context; the combination of the attributes in the returned value and the additional attributes supplied by the composition engine will be used in the creation of subsequent render context’s pixelBuffers.

This property is queried once before any composition request is sent to the compositor. Changing required buffer attributes afterwards is not supported.

Available in OS X v10.9 and later.

(Read only property)
17.88. CLASS AVVIDEOCOMPOSITINGMBS

17.88.10 sourcePixelBufferAttributes as Dictionary

**Function:** Returns the kinds of source frame pixel buffer attributes a video compositor can accept as input.

(required) (read-only)

**Notes:**

The property is required to provide a kCVPixelBufferPixelFormatTypeKey key in the dictionary, along with attributes for which the compositor needs specific values to work properly. Omitted attributes will be supplied by the composition engine to allow for the best performance. If the attribute kCVPixelBufferPixelFormatTypeKey key is not in the dictionary an exception will be raised. The value of the kCVPixelBufferPixelFormatTypeKey is an array of kCVPixelFormatType_* constants as defined in Pixel_Format_Types.

If the custom compositor is meant to be used with an AVVideoCompositionCoreAnimationTool created using the videoCompositionCoreAnimationToolWithAdditionalLayer:asTrackID: method, kCVPixelFormatType_32BGRA should be included as one of the supported pixel format types.

Missing attributes will be set by the composition engine to values allowing the best performance.

This property is queried once before any composition request is sent to the compositor. Changing source buffer attributes afterwards is not supported.

Available in OS X v10.9 and later.

(Read only property)
17.89 **class AVVideoCompositionCoreAnimationToolMBS**

17.89.1 **class AVVideoCompositionCoreAnimationToolMBS**

**Function:** You use an AVVideoCompositionCoreAnimationTool object to incorporate Core Animation in a video composition.  
**Notes:**  
Any animations will be interpreted on the video’s timeline, not real-time, so you should:

1. Set animations’ `beginTime` property to `1e-100` rather than `0` (which CoreAnimation replaces with `CACurrentMediaTime`);  
2. Set animations’ `removedOnCompletion` property to `false` so they are not automatically removed.

17.89.2 **Methods**

17.89.3 **available as boolean**

**Function:** Whether this class is available.  
**Notes:** Returns true on Mac OS X 10.7 and newer.

17.89.4 **Constructor**

**Function:** The default constructor.

17.89.5 **videoCompositionCoreAnimationToolWithAdditionalLayer(layer as CALayerMBS, trackID as Integer) as AVVideoCompositionCoreAnimationToolMBS**

**Function:** Add a Core Animation layer to the video composition.  
**Notes:**  
layer: The Core Animation layer to add.  
trackID: A track ID to identify the track.
trackID should not match any real trackID in the source.

Return a new animation tool for the layer.

You use this method to include a Core Animation layer as an individual track input in video composition. Video composition instructions should reference trackID where the rendered animation should be included.

17.89.6  videoCompositionCoreAnimationToolWithPostProcessingAsVideoLayer(videoLayer as CALayerMBS, animationLayer as CALayerMBS) as AVVideoCompositionCoreAnimationToolMBS

Function: Composes the composited video frames with a Core Animation layer.
Notes:
videoLayer: A video layer.
animationLayer: An animation layer.

Returns a new animation tool for the composition. Place composited video frames in videoLayer and render animationLayer to produce the final frame.

17.89.7  videoCompositionCoreAnimationToolWithPostProcessingAsVideoLayers(videoLayers() as CALayerMBS, animationLayer as CALayerMBS) as AVVideoCompositionCoreAnimationToolMBS

Function: Composes the composited video frames with the Core Animation layer.
Notes:
videoLayers: An array containing the video layers
animationLayer: The animation layer.

Returns a new AVVideoCompositionCoreAnimationTool instance with the composited video frames and the rendered animation layer.

Duplicates the composited video frames in each videoLayer and renders animationLayer to produce the final frame. The videoLayers should be in animationLayer’s sublayer tree.

The animationLayer should not come from, or be added to, another layer tree. Available in OS X v10.9 and later.
17.89.8 Properties

17.89.9 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
17.90. **CLASS AVVIDEOCOMPOSITIONINSTRUCTIONMBS**

17.90 **class AVVideoCompositionInstructionMBS**

17.90.1 **class AVVideoCompositionInstructionMBS**

**Function:** An AVVideoCompositionInstruction object represents an operation to be performed by a compositor.

**Notes:**

An AVVideoComposition object maintains an array of instructions to perform its composition.

The is a specialty with the AVFoundation framework: There is a class and an interface with same name. The plugin only has one class for both. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.90.2 **Methods**

17.90.3 **available as boolean**

**Function:** Whether this class is available.

**Notes:** Returns true on Mac OS X 10.7 and newer.

17.90.4 **Constructor**

**Function:** The private constructor.

17.90.5 **copy as AVVideoCompositionInstructionMBS**

**Function:** Creates a copy of the object.

17.90.6 **mutableCopy as AVMutableVideoCompositionInstructionMBS**

**Function:** Creates an editable copy of the object.
17.90.7 requiredSourceTrackIDs as Integer()

**Function:** An array of video track IDs required to compose frames for this instruction. (required) (read-only)
**Notes:** Available in OS X v10.9 and later.

17.90.8 Properties

17.90.9 containsTweening as Boolean

**Function:** A Boolean value that returns whether the composition contains tweening. (required) (read-only)
**Notes:**
If YES, rendering a frame from the same source buffers and the same composition instruction at two different compositionTime may yield different output frames. If NO, two such compositions will yield the same frame.

The media pipeline may be able to avoid some duplicate processing when this property is set to false. Available in OS X v10.9 and later.
(Read only property)

17.90.10 enablePostProcessing as boolean

**Function:** Indicates whether post processing is required for the video composition instruction. (read-only)
**Notes:**
A value of false indicates that no post processing is required for the whole duration of the video composition instruction. The composition process is more efficient if the value is false.

The value is true by default.
(Read only property)

17.90.11 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)
17.90. CLASS AVVIDEOCOMPOSITIONINSTRUCTIONMBS

17.90.12 passthroughTrackID as Integer

**Function:** Returns the track ID if a single source frame should be displayed for the duration of the instruction. (required) (read-only)

**Notes:**
If for the duration of the instruction, the video composition result is one of the source frames, this property returns the corresponding track ID. The compositor won’t be run for the duration of the instruction and the proper source frame is used instead.

The dimensions, clean aperture and pixel aspect ratio of the source buffer are matched to the required values automatically.
Available in OS X v10.9 and later.
(Read only property)

17.90.13 timeRange as CMTimeRangeMBS

**Function:** The time range during which the instruction is effective. (read-only)

**Notes:**
If the time range is invalid, the video compositor will ignore it.
(Read only property)
17.91 class AVVideoCompositionLayerInstructionMBS

17.91.1 class AVVideoCompositionLayerInstructionMBS

**Function:** An AVVideoCompositionLayerInstruction object represents the transform and opacity ramps to apply to a given track.

17.91.2 Methods

17.91.3 available as boolean

**Function:** Whether this class is available.
**Notes:** Returns true on Mac OS X 10.7 and newer.

17.91.4 Constructor

**Function:** The default constructor.

17.91.5 copy as AVVideoCompositionLayerInstructionMBS

**Function:** Creates a copy of the object.

17.91.6 getCropRectangleRampForTime(time as CMTimeMBS, byref startCropRectangle as CGRectMBS, byref endCropRectangle as CGRectMBS, byref timeRange as CMTimeRangeMBS) as Boolean

**Function:** Obtains the crop rectangle ramp that includes the specified time.
**Notes:**
- time: If a ramp with a time range that contains the specified time has been set, information about the effective ramp for that time is supplied. Otherwise, information about the first ramp that starts after the specified time is supplied.
- startCropRectangle: A CGRect to receive the starting crop rectangle value for the crop rectangle ramp.
- endCropRectangle: A CGRect to receive the ending crop rectangle value for the crop rectangle ramp.
timeRange: A CMTimeRange to receive the time range of the crop rectangle ramp.

Returns false will be returned if the specified time is beyond the duration of the last crop rectangle ramp that has been set.
Available in OS X v10.9 and later.

17.91.7 getOpacityRampForTime(time as CMTimeMBS, byref startOpacity as Double, byref endOpacity as Double, byref timeRange as CMTimeRangeMBS) as boolean

Function: Obtains the opacity ramp that includes a specified time.
Notes:
time: If a ramp with a time range that contains the specified time has been set, information about the effective ramp for that time is supplied. Otherwise, information about the first ramp that starts after the specified time is supplied.
startOpacity: a float to receive the starting opacity value for the opacity ramp.
endOpacity: a float to receive the ending opacity value for the opacity ramp.
timeRange: a CMTimeRange to receive the time range of the opacity ramp.

Returns true if values are returned successfully, otherwise false. False is returned if time is beyond the duration of the last opacity ramp that has been set.

17.91.8 getTransformRampForTime(time as CMTimeMBS, byref startTransform as CGAffineTransformMBS, byref endTransform as CGAffineTransformMBS, byref timeRange as CMTimeRangeMBS) as boolean

Function: Obtains the transform ramp that includes a specified time.
Notes:
time
If a ramp with a time range that contains the specified time has been set, information about the effective ramp for that time is supplied. Otherwise, information about the first ramp that starts after the specified time is supplied.
startTransform: A float to receive the starting transform value for the transform ramp.
endTransform: A float to receive the ending transform value for the transform ramp.
timeRange: A CMTimeRange to receive the time range of the transform ramp.
Returns true if values are returned successfully, otherwise false. False is returned if time is beyond the duration of the last transform ramp that has been set.
17.91.9  mutableCopy as AVMutableVideoCompositionLayerInstructionMBS

Function: Creates an editable copy of the object.

17.91.10  trackID as Integer

Function: The trackID of the source track to which the compositor will apply the instruction. (read-only)

17.91.11  Properties

17.91.12  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
17.92. Class AVVideoCompositionMBS

17.92.1. Class AVVideoCompositionMBS

**Function:** An AVVideoComposition object represents an immutable video composition.
**Notes:** The AVFoundation framework also provides a mutable subclass, AVMutableVideoComposition, that you can use to create new videos.

17.92.2. Methods

17.92.3. animationTool as AVVideoCompositionCoreAnimationToolMBS

**Function:** A video composition tool to use with Core Animation in offline rendering. (read-only)
**Notes:**
This attribute may be nil.

You set an animation tool if you are using the composition in conjunction with AVAssetExportSession for offline rendering, rather than with AVPlayer.

17.92.4. available as boolean

**Function:** Whether this class is available.
**Notes:** Returns true on Mac OS X 10.7 and newer.

17.92.5. Constructor

**Function:** The constructor.

17.92.6. copy as AVVideoCompositionMBS

**Function:** Creates a copy of the object.
17.92.7 frameDuration as CMTimeMBS

**Function:** The interval for which the video composition should render composed video frames. (read-only)
**Notes:** This property only applies when the composition is enabled.

17.92.8 instructions as AVVideoCompositionInstructionMBS()

**Function:** The video composition instructions. (read-only)
**Notes:**
The array contains of instances of AVVideoCompositionInstruction.

For the first instruction in the array, timeRange.start must be less than or equal to the earliest time for
which playback or other processing will be attempted (typically kCMTimeZero). For subsequent instruc-
tions, timeRange.start must be equal to the prior instruction’s end time. The end time of the last instruction
must be greater than or equal to the latest time for which playback or other processing will be attempted
(typically be the duration of the asset with which the instance of AVVideoComposition is associated).

17.92.9 isValidForAsset(asset as AVAssetMBS, timerange as CMTimeRangeMBS) as boolean

**Function:** Indicates whether the time ranges of the composition’s instructions conform to validation re-
quirements.
**Notes:**
asset: An AVAsset object, if you wish to validate the time ranges of the instructions against the duration
of the asset and the track IDs of the layer instructions against the asset’s tracks. Pass nil to skip that
validation.
timeRange: A time range.
Only those instructions with time ranges that overlap with this time range will be validated. To validate all
instructions that may be used for playback or other processing, regardless of time range, pass CMTimeRange-
Make(kCMTimeZero, kCMTimePositiveInfinity).

Returns true if the time ranges of the composition’s instructions conform to validation requirements, other-
wise false.

This method may call events videoCompositionShouldContinueValidatingAfterFindingInvalidValueForKey,
videoCompositionShouldContinueValidatingAfterFindingInvalidTrackIDInInstruction, videoCompositionShould-
ContinueValidatingAfterFindingInvalidTimeRangeInInstruction or videoCompositionShouldContinueValidatin-
In the course of validation, the receiver will invoke its events (if there is one) with reference to any trouble spots in the video composition.

This method raises an exception if the event modifies the receiver’s array of instructions or the array of layer instructions of any AVVideoCompositionInstruction object contained therein during validation.

17.92.10 mutableCopy as AVMutableVideoCompositionMBS

**Function:** Creates an editable copy of the object.

17.92.11 renderSize as CGSizeMBS

**Function:** The size at which the video composition should render. (read-only)
**Notes:** This property only applies when the composition is enabled.

17.92.12 videoCompositionWithPropertiesOfAsset(asset as AVAssetMBS) as AVVideoCompositionMBS

**Function:** Creates and returns a video composition object configured to present the video tracks of the specified asset.
**Notes:**

- asset: The asset whose configuration matches the intended use of the video composition.

Returns a new video composition object.

This method creates the video composition object and configures it with the values and instructions suitable for presenting the video tracks of the specified asset. The returned object contains instructions that respect the spatial properties and time ranges of the specified asset’s video tracks. It also configures the object properties in the following way:

- The value of the frameDuration property is set to a value short enough to accommodate the greatest nominal frame rate value among the asset’s video tracks, as indicated by the nominalFrameRate prop-
The property of each track. If all of the asset tracks have a nominal frame rate of 0, a frame rate of 30 frames per second is used, with the frame duration set accordingly.

- The value assigned to the renderSize property depends on whether the asset is an AVComposition object. If it is, the value is set to the value of the naturalSize property of the composition. If it is not, the value is set to a value that encompasses all of the asset’s video tracks.

- The value of the renderScale property is set to 1.0.

- The value of the animationTool property is set to nil.

Available in OS X v10.9 and later.

**17.92.13 Properties**

**17.92.14 Handle as Integer**

*Function:* The internal object reference.

*Notes:* (Read and Write property)
17.93. CLASS AVVIDEOCOMPOSITIONRENDERCONTEXTMBS

17.93 class AVVideoCompositionRenderContextMBS

17.93.1 class AVVideoCompositionRenderContextMBS

**Function:** The AVVideoCompositionRenderContext class defines the context within which custom com- positors render new output pixels buffers.
**Notes:**
An instance of AVVideoCompositionRenderContext provides size and scaling information and offers a service for efficiently providing pixel buffers from a managed pool of buffers.
Available in OS X v10.9 and later.

17.93.2 Methods

17.93.3 available as boolean

**Function:** Whether this class is available.
**Notes:** Returns true on Mac OS X 10.9 or later.

17.93.4 Constructor

**Function:** The constructor.

17.93.5 newPixelBuffer as CVPixelBufferMBS

**Function:** Returns a pixel buffer to use for rendering.
**Notes:**
The buffer’s kCVImageBufferCleanApertureKey and kCVImageBufferPixelAspectRatioKey attachments are set to match the current composition processor properties.
You are responsible for calling CVBufferRelease on the pixel buffer.
Available in OS X v10.9 and later.
17.93.6 Properties

17.93.7 edgeWidths as AVEdgeWidthsMBS

Function: The thickness of the edge processing region on the left, top, right and bottom edges, in pixels.
(readonly)
Notes:
Available in OS X v10.9 and later.
(Read only property)

17.93.8 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.93.9 highQualityRendering as Boolean

Function: The rendering quality to use. (readonly)
Notes:
Specifies that the custom compositor should use higher quality, potentially slower algorithms.
Generally this property is true for non-real-time use cases.
Available in OS X v10.9 and later.
(Read only property)

17.93.10 pixelAspectRatio as AVPixelAspectRatioMBS

Function: The pixel aspect ratio for rendered frames. (readonly)
Notes:
Available in OS X v10.9 and later.
(Read only property)
17.93.11  renderScale as Double

**Function:** A scaling ratio that is applied when rendering frames. (read-only)
**Notes:**
Available in OS X v10.9 and later.
(Read only property)

17.93.12  renderTransform as CGAffineTransformMBS

**Function:** Transform to apply to the source image (read-only)
**Notes:**
The transform to apply to the source image incorporating the renderScale, pixelAspectRatio, and edgeWidths.
The coordinate system origin is the top left corner of the buffer.
Available in OS X v10.9 and later.
(Read only property)

17.93.13  size as CGSizeMBS

**Function:** The width and height for rendering frames. (read-only)
**Notes:**
Available in OS X v10.9 and later.
(Read only property)

17.93.14  videoComposition as AVVideoCompositionMBS

**Function:** The video composition being rendered.
**Notes:**
Available in OS X v10.9 and later.
(Read only property)
17.94 class CMFormatDescriptionMBS

17.94.1 class CMFormatDescriptionMBS

**Function:** The class for a format description.
**Notes:**
CMFormatDescriptions are immutable Core Foundation objects that describe media data of various types, including audio, video, andmuxed media data. There are two types of API: media-type-agnostic APIs (supported by all CMFormatDescriptions) and media-type-specific APIs. The media-type-agnostic APIs are prefixed with CMFormatDescription, and the media-type-specific APIs are prefixed with CMAudioFormatDescription CMVideoFormatDescription, and so on.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

17.94.2 Methods

17.94.3 Constructor

**Function:** The private constructor.

17.94.4 Equal(other as CMFormatDescriptionMBS) as boolean

**Function:** Checks if two descriptions are equal.

17.94.5 Extensions as Dictionary

**Function:** Queries extensions to the description.

17.94.6 MediaSubType as string

**Function:** Queries media sub type.
17.94. **CLASS CMFORMATDESCRIPTIONMBS**

17.94.7 **MediaType as string**

**Function:** Queries media type.

17.94.8 **Name as string**

**Function:** Queries the name of this format description.

17.94.9 **Properties**

17.94.10 **Handle as Integer**

**Function:** The internal object reference.  
**Notes:** (Read and Write property)
17.95 class CMSampleBufferMBS

17.95.1 class CMSampleBufferMBS

**Function:** CMSampleBuffers are CF objects containing zero or more compressed (or uncompressed) samples of a particular media type (audio, video, muxed, etc), that are used to move media sample data through the media system.

**Notes:**

A CMSampleBuffer can contain a CMBlockBuffer of one or more media samples or a CVImageBuffer, a reference to the format description for the stream of CMSampleBuffers, size and timing information for each of the contained media samples, and both buffer-level and sample-level attachments. The buffer-level attachments of a CMSampleBuffer are distinct from the attachments of its contained CMBlockBuffer. An example of a sample-level attachment is an annotation about video frame dependencies (eg. "droppable", "other frames depend on me", "I depend on other frames", etc). Each sample (video frame) in the CMSampleBuffer would need its own attachment in this case. Another sample-level attachment example is SMPTE timecode acquired during capture. To get and set a CMSampleBuffer's buffer-level attachments, use the APIs in in CMAttachmentBearer.h (CMGetAttachment et al).

It is possible for a CMSampleBuffer to describe samples it does not yet contain. For example, some media services may have access to sample size, timing and format information before the data is read. Such services may create CMSampleBuffers with that information and insert them into queues early, and attach (or fill) the CMBlockBuffers of media data later, when the data becomes ready. To this end, CMSampleBuffers have the concept of data-readiness, which can be tested, set, forced to become ready "now", etc. It is also possible for a CMSampleBuffer to contain nothing but a special buffer-level attachment that describes a media stream event (eg. "discontinuity: drain and reset decoder before processing the next CMSampleBuffer"). Such a special attachment can also be attached to regular CMSampleBuffers (ie. that contain media sample data), and if so, the event it describes is defined to occur after the samples in that CMSampleBuffer.

The MBS Plugin implements a subset of what's available. If you need more, please do not hesitate to contact us.

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

17.95.2 Methods

17.95.3 Constructor

**Function:** The private constructor.
17.95.4  Copy as CMSampleBufferMBS

Function: Creates a copy of the object.

17.95.5  CopySampleBufferForRange(pos as Integer, len as Integer) as CMSampleBufferMBS

Function: Creates a CMSampleBuffer containing a range of samples from an existing CMSampleBuffer.
Notes: Samples containing non-interleaved audio are currently not supported.

17.95.6  Invalidate

Function: Makes the sample buffer invalid, calling any installed invalidation callback.
Notes: An invalid sample buffer cannot be used – all accessors will return kCMSampleBufferError_Invalidated.
It is not a good idea to do this to a sample buffer that another module may be accessing concurrently.
Example of use: the invalidation callback could cancel pending I/O.

17.95.7  MakeDataReady

Function: Makes a CMSampleBuffer's data ready, by calling the client’s MakeDataReadyCallback.
Notes: The CMSampleBufferMakeDataReadyCallback is passed in by the client during creation. It must return 0 if successful, and in that case, CMSampleBufferMakeDataReady will set the data readiness of the CMSampleBuffer to true. Example of usage: when it is time to actually use the data. Example of callback routine: a routine to force a scheduled read to complete. If the CMSampleBuffer is not ready, and there is no CMSampleBufferMakeDataReadyCallback to call, kCMSampleBufferError_BufferNotReady will be returned. Similarly, if the CMSampleBuffer is not ready, and the CMSampleBufferMakeDataReadyCallback fails and returns an error, kCMSampleBufferError_BufferNotReady will be returned.

17.95.8  SampleSize(index as Integer) as UInt64

MBS AVFoundation Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the size in bytes of a specified sample in a CMSampleBuffer.
Notes:
Size in bytes of the specified sample in the CMSampleBuffer. If the sample index is not in the range 0 .. numSamples-1, a size of 0 will be returned. If there are no sample sizes in this CMSampleBuffer, a size of 0 will be returned. This will be true, for example, if the samples in the buffer are non-contiguous (eg. non-interleaved audio, where the channel values for a single sample are scattered through the buffer), or if this CMSampleBuffer contains a CVImageBuffer.

17.95.9 SetDataReady

**Function:** Marks a CMSampleBuffer’s data as “ready”. 
**Notes:** There is no way to undo this operation. The only way to get an ”unready” CMSampleBuffer is to call CMSampleBufferCreate with the dataReady parameter set to false. Example of usage: in a read completion routine.

17.95.10 Properties

17.95.11 DataIsReady as boolean

**Function:** Returns whether or not a CMSampleBuffer’s data is ready. 
**Notes:** 
Whether or not the CMSampleBuffer’s data is ready. True is returned for special marker buffers, even though they have no data. False is returned if there is an error.  
(Read only property)

17.95.12 DecodeTimeStamp as CMTimeMBS

**Function:** Returns the numerically earliest decode timestamp of all the samples in a CMSampleBuffer. 
**Notes:** 
The returned decode timestamp is always the decode timestamp of the first sample in the buffer, since even out-of-presentation-order samples are expected to be in decode order in the buffer. Numerically earliest sample decode timestamp in the CMSampleBuffer. kCMTimeInvalid is returned if there is an error.  
(Read only property)
17.95.13  Duration as CMTimeMBS

Function: Returns the total duration of a CMSampleBuffer.
Notes:
If the buffer contains out-of-presentation-order samples, any gaps in the presentation timeline are not rep-
resented in the returned duration.
The returned duration is simply the sum of all the individual sample durations.
Returns the duration of the CMSampleBuffer. kCMTimeInvalid is returned if there is an error.
(Read only property)

17.95.14  FormatDescription as CMFormatDescriptionMBS

Function: Returns the format description of the samples in a CMSampleBuffer.
Notes:
Nil is returned if there is an error.
(Read only property)

17.95.15  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

17.95.16  ImageBuffer as CVImageBufferMBS

Function: Returns a CMSampleBuffer’s CVImageBuffer of media data.
Notes:
The result will be nil if the CMSampleBuffer does not contain a CVImageBuffer, if the CMSampleBuffer
contains a CMBlockBuffer, or if there is some other error.
(Read only property)

17.95.17  IsValid as boolean

Function: Queries whether a sample buffer is still valid.
Notes:
Returns false if buffer is nil or Invalidate was called, true otherwise.
Does not perform any kind of exhaustive validation of the sample buffer.
(Read only property)

17.95.18 Lasterror as Integer

MBS AVFoundation Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The last error code.
Notes:
See error code constants.
Looking with debugger on properties of this class will change the lasterror code!
(Read and Write property)

17.95.19 NumberOfSamples as Integer

Function: Returns the number of media samples in a CMSampleBuffer.
Notes:
The number of media samples in the CMSampleBuffer. 0 is returned if there is an error.
(Read only property)

17.95.20 OutputDecodeTimeStamp as CMTimeMBS

Function: Returns the output decode timestamp of the CMSampleBuffer.
Notes:
For consistency with OutputPresentationTimeStamp, this is calculated as: OutputPresentationTimeStamp + ((DecodeTimeStamp - PresentationTimeStamp) / SpeedMultiplier).
CMInvalidTime is returned if there is an error.
(Read only property)

17.95.21 OutputDuration as CMTimeMBS

Function: Returns the output duration of a CMSampleBuffer.
Notes:
The OutputDuration is the duration minus any trimmed duration, all divided by the SpeedMultiplier: \((\text{Duration} - \text{TrimDurationAtStart} - \text{TrimDurationAtEnd}) / \text{SpeedMultiplier}\)

Returns the output duration of the CMSampleBuffer. kCMTimeInvalid is returned if there is an error.
(Read only property)

### 17.95.22 OutputPresentationTimeStamp as CMTimeMBS

**Function:** Returns the output presentation timestamp of the CMSampleBuffer.

**Notes:**

The output presentation timestamp is the time at which the decoded, trimmed, stretched and possibly reversed samples should commence being presented.

If CMSampleBufferSetOutputPresentationTimeStamp has been called to explicitly set the output PTS, CMSampleBufferGetOutputPresentationTimeStamps returns it.

If not, CMSampleBufferGetOutputPresentationTimeStamps calculates its result as \((\text{PresentationTimeStamp} + \text{TrimDurationAtStart})\) unless kCMSampleBufferAttachmentKey.Reverse is kCFBooleanTrue, in which case it calculates the result as \((\text{PresentationTimeStamp} + \text{Duration} - \text{TrimDurationAtEnd})\).

These are generally correct for un-stretched, un-shifted playback.

For general forward playback in a scaled edit, the OutputPresentationTimeStamp should be set to:
\(\left(\frac{\text{PresentationTimeStamp} + \text{TrimDurationAtStart} - \text{EditStartMediaTime}}{\text{EditSpeedMultiplier}}\right) + \text{EditStartTrackTime}\).

For general reversed playback:
\(\left(\frac{\text{PresentationTimeStamp} + \text{Duration} - \text{TrimDurationAtEnd} - \text{EditStartMediaTime}}{\text{EditSpeedMultiplier}}\right) + \text{EditStartTrackTime}\).

Returns kCMTimeInvalid is returned if there is an error.
(Read and Write property)

### 17.95.23 PresentationTimeStamp as CMTimeMBS

**Function:** Returns the numerically earliest presentation timestamp of all the samples in a CMSampleBuffer.

**Notes:**

For in-presentation-order samples, this is the presentation timestamp of the first sample.

For out-of-presentation-order samples, this is the presentation timestamp of the sample that will be presented first, which is not necessarily the first sample in the buffer.

Returns numerically earliest sample presentation timestamp in the CMSampleBuffer. kCMTimeInvalid is returned if there is an error.
(Read only property)
17.95.24  **Text as String**

MBS AVFoundation Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
**Function:** For text samples, provides the text.  
**Notes:** (Read only property)

17.95.25  **TotalSampleSize as UInt64**

**Function:** Returns the total size in bytes of sample data in a CMSampleBuffer.  
**Notes:**  
If there are no sample sizes in this CMSampleBuffer, a size of 0 will be returned.  
(Read only property)

17.95.26  **Constants**

17.95.27  **kAllocationFailed = -12730**

MBS AVFoundation Plugin, Plugin Version: 15.0.  
**Function:** One of the error code constants.  
**Notes:** An allocation failed.

17.95.28  **kAlreadyHasDataBuffer = -12732**

MBS AVFoundation Plugin, Plugin Version: 15.0.  
**Function:** One of the error code constants.  
**Notes:** Attempt was made to set a dataBuffer on a CMSampleBuffer that already has one.

17.95.29  **kArrayTooSmall = -12737**

MBS AVFoundation Plugin, Plugin Version: 15.0.  
**Function:** One of the error code constants.  
**Notes:** Output array was not large enough for the array being requested.

17.95.30  **kBufferHasNoSampleSizes = -12735**

MBS AVFoundation Plugin, Plugin Version: 15.0.  
**Function:** One of the error code constants.  
**Notes:** Attempt to get sample size information when there was none.
17.95.31  \text{kBufferHasNoSampleTimingInfo} = -12736

MBS AVFoundation Plugin, Plugin Version: 15.0. \textbf{Function}: One of the error code constants.  
\textbf{Notes}: Attempt to get sample timing information when there was none.

17.95.32  \text{kBufferNotReady} = -12733

MBS AVFoundation Plugin, Plugin Version: 15.0. \textbf{Function}: One of the error code constants.  
\textbf{Notes}: Buffer could not be made ready.

17.95.33  \text{kCannotSubdivide} = -12739

MBS AVFoundation Plugin, Plugin Version: 15.0. \textbf{Function}: One of the error code constants.  
\textbf{Notes}: Sample buffer does not contain sample sizes. This can happen when the samples in the buffer are non-contiguous (e.g. non-interleaved audio, where the channel values for a single sample are scattered through the buffer).

17.95.34  \text{kInvalidated} = -12744

MBS AVFoundation Plugin, Plugin Version: 15.0. \textbf{Function}: One of the error code constants.  
\textbf{Notes}: the sample buffer was invalidated.

17.95.35  \text{kInvalidEntryCount} = -12738

MBS AVFoundation Plugin, Plugin Version: 15.0. \textbf{Function}: One of the error code constants.  
\textbf{Notes}: Timing info or size array entry count was not 0, 1, or numSamples.

17.95.36  \text{kInvalidMediaFormat} = -12743

MBS AVFoundation Plugin, Plugin Version: 15.0. \textbf{Function}: One of the error code constants.  
\textbf{Notes}: The format of the given media does not match the given format description (e.g. a format description paired with a CVImageBuffer that fails CMVideoFormatDescriptionMatchesImageBuffer).
17.95.37 kInvalidMediaTypeForOperation = -12741

MBS AVFoundation Plugin, Plugin Version: 15.0. **Function:** One of the error code constants.  
**Notes:** The media type specified by a format description is not valid for the given operation (eg. a CMSampleBuffer with a non-audio format description passed to GetAudioStreamPacketDescriptions).

17.95.38 kInvalidSampleData = -12742

MBS AVFoundation Plugin, Plugin Version: 15.0. **Function:** One of the error code constants.  
**Notes:** Buffer contains bad data. Only returned by CMSampleBuffer functions that inspect its sample data.

17.95.39 kRequiredParameterMissing = -12731

MBS AVFoundation Plugin, Plugin Version: 15.0. **Function:** One of the error code constants.  
**Notes:** Nil or 0 was passed for a required parameter.

17.95.40 kSampleIndexOutOfRange = -12734

MBS AVFoundation Plugin, Plugin Version: 15.0. **Function:** One of the error code constants.  
**Notes:** Sample index was not between 0 and numSamples-1, inclusive.

17.95.41 kSampleTimingInfoInvalid = -12740

MBS AVFoundation Plugin, Plugin Version: 15.0. **Function:** One of the error code constants.  
**Notes:** Buffer unexpectedly contains a non-numeric sample timing info.
17.96. CLASS CMTimeMappingMBS

17.96. class CMTimeMappingMBS

Function: A class to specify the mapping of a segment of one time line into another.
Notes: A CMTimeMapping specifies the mapping of a segment of one time line (called the source) into another time line (called the target). When used for movie edit lists, the source time line is the media and the target time line is the track or movie.

17.96.2 Methods

17.96.3 Constructor(source as CMTimeRangeMBS, target as CMTimeRangeMBS)

Function: Initializes the time mapping object.

17.96.4 Properties

17.96.5 Source as CMTimeRangeMBS

Function: The time range on the source time line.
Notes:
For an empty edit, source.start is an invalid CMTime, in which case source.duration is ignored. Otherwise, source.start is the starting time within the source, and source.duration is the duration of the source timeline to be mapped to the target time range.
(Read and Write property)

17.96.6 Target as CMTimeRangeMBS

Function: The time range on the target time line.
Notes:
If target.duration and source.duration are different, then the source segment should be played at the rate source.duration /target.duration to fit.
(Read and Write property)
17.97  class CMTimeMBS

17.97.1  class CMTimeMBS

Function:  CMTime is a class representing times (either timestamps or durations).

Example:

dim t as new CMTimeMBS(1200, 600)
MsgBox t.Description

Notes:

A CMTime is represented as a rational number, with a numerator (an int64 value), and a denominator (an
int32 timescale). Conceptually, the timescale specifies the fraction of a second each unit in the numerator
occupies. Thus if the timescale is 4, each unit represents a quarter of a second; if the timescale is 10, each
unit represents a tenth of a second, and so on. In addition to a simple time value, a CMTime can represent
non-numeric values: +infinity, -infinity, and indefinite. Using a flag CMTime indicates whether the time
been rounded at some point.

CMTimes contain an epoch number, which is usually set to 0, but can be used to distinguish unrelated time-
lines: for example, it could be incremented each time through a presentation loop, to differentiate between
time N in loop 0 from time N in loop 1.

Additional functions for managing dates and times are described in Time Utilities Reference. Note that CM-
Time is designed for media timelines whereas functions in Time Utilities Reference are designed for working
with wall-clock time in Core Foundation framework; see also AV Foundation Constants Reference.

17.97.2  Methods

17.97.3  AbsoluteValue as CMTimeMBS

Function:  Returns the absolute value of a CMTime.

Notes:  Same as the argument time, with sign inverted if negative.

17.97.4  Add(other as CMTimeMBS) as CMTimeMBS

Function:  Returns the sum of two CMTimes.

Notes:
17.97. CLASS CMTIMEMBS

self: CMTime to be added.
other: Another CMTime to be added.
Returns the sum of the two CMTimes \((addend1 + addend2)\).

If the operands both have the same timescale, the timescale of the result will be the same as the operands' timescale. If the operands have different timescales, the timescale of the result will be the least common multiple of the operands' timescales. If that LCM timescale is greater than \(k\text{CMTimeMaxTimescale}\), the result timescale will be \(k\text{CMTimeMaxTimescale}\), and default rounding will be applied when converting the result to this timescale. If the result value overflows, the result timescale will be repeatedly halved until the result value no longer overflows. Again, default rounding will be applied when converting the result to this timescale. If the result value still overflows when timescale == 1, then the result will be either positive or negative infinity, depending on the direction of the overflow.

If any rounding occurs for any reason, the result’s kCMTimeFlagsHasBeenRounded flag will be set. This flag will also be set if either of the operands has kCMTimeFlagsHasBeenRounded set. If either of the operands is invalid, the result will be invalid. If the operands are valid, but just one operand is infinite, the result will be similarly infinite. If the operands are valid, and both are infinite, the results will be as follows:

\[
\begin{align*}
+\infty + +\infty &= +\infty \\
-\infty + -\infty &= -\infty \\
+\infty + -\infty &= \text{invalid} \\
-\infty + +\infty &= \text{invalid}
\end{align*}
\]

If the operands are valid, not infinite, and either or both is indefinite, the result will be indefinite. If the two operands are numeric (i.e., valid, not infinite, not indefinite), but have different nonzero epochs, the result will be invalid. If they have the same nonzero epoch, the result will have epoch zero (a duration). Times in different epochs cannot be added or subtracted, because epoch length is unknown. Times in epoch zero are considered to be durations and can be added to times in other epochs. Times in different epochs can be compared, however, because numerically greater epochs always occur after numerically lesser epochs.

17.97.5 Compare(other as CMTimeMBS) as Integer

Function: Returns the numerical relationship of two CMTimes.
Notes:
self: First CMTime in comparison.
other: Second CMTime in comparison.

Returns the numerical relationship of the two CMTimes.
-1 is returned if time1 is less than time2.
1 is returned if time1 is greater than time2.
0 is returned if time1 and time2 are equal.

If the two CMTimes are numeric (i.e., not invalid, infinite, or indefinite), and have different epochs, it is
considered that times in numerically larger epochs are always greater than times in numerically smaller
epochs. Since this routine will be used to sort lists by time, it needs to give all values (even invalid and
indefinite ones) a strict ordering to guarantee that sort algorithms terminate safely. The order chosen is
somewhat arbitrary: -infinity < all finite values < indefinite < +infinity < invalid

Invalid CMTimes are considered to be equal to other invalid CMTimes, and greater than any other CM-
Time. Positive infinity is considered to be less than any invalid CMTime, equal to itself, and greater than
any other CMTime. An indefinite CMTime is considered to be less than any invalid CMTime, less than
positive infinity, equal to itself, and greater than any other CMTime. Negative infinity is considered to be
equal to itself, and less than any other CMTime.

17.97.6 Constructor(Value as Int64, Timescale as Integer, Flags as Integer = 1, Epoch as Int64 = 0)

Function: Creates a new time object with the given field values.
Example:

    dim t as new CMTimeMBS(1200, 600)
    MsgBox t.Description

17.97.7 ConvertScale(newTimescale as Integer, RoundingMethod as Integer = 1) as CMTimeMBS

Function: Returns a new CMTime containing the source CMTime converted to a new timescale (rounding
as requested).
Example:

    dim t as CMTimeMBS = CMTimeMBS.MakeWithSeconds(123.4, 600)
    dim u as CMTimeMBS = t.ConvertScale(300, t.kCMTimeRoundingMethod_Default)
    MsgBox t.Description+EndOfLine+u.Description

Notes:
17.97. CLASS CMTIMEMBS

self: Source CMTime.
newTimescale: The timescale to which the source CMTime is converted.
RoundingMethod: The requested rounding method.

Returns the converted CMTime.
If the value needs to be rounded, the kCMTimeFlagsHasBeenRounded flag will be set. See constants for a discussion of the various rounding methods available. If the source time is non-numeric (i.e., infinite, indefinite, invalid), the result will be similarly non-numeric.

17.97.8 Description as string

Function: Creates a description of the time.
Example:

dim t as new CMTimeMBS(1200, 600)
MsgBox t.Description

17.97.9 kCMTimeIndefinite as CMTimeMBS

Function: Predefined time.
Notes:
Use this constant to initialize an indefinite CMTime (for example, the duration of a live broadcast).
Do not test against this using (time = kCMTimeIndefinite), there are many CMTimes other than this that are also indefinite. Use time.IsIndefinite instead.

17.97.10 kCMTimeInvalid as CMTimeMBS

Function: Predefined time.
Example:

dim t as CMTimeMBS = CMTimeMBS.kCMTimeInvalid
MsgBox "Invalid: " + str(t.IsInvalid)

Notes:
Use this constant to initialize an invalid CMTime.
All fields are 0. Do not test against this using \((\text{time} = \text{kCMTimeInvalid})\), there are many CMTimes other than this that are also invalid. Use \text{time.IsInvalid} instead.

17.97.11 \textbf{kCMTimeNegativeInfinity as CMTimeMBS}

\textbf{Function:} Predefined time.
\textbf{Notes:}
Use this constant to initialize a CMTime to -infinity.
Do not test against this using \((\text{time} = \text{kCMTimeNegativeInfinity})\), there are many CMTimes other than this that are also -infinity. Use \text{time.IsNegativeInfinity} instead.

17.97.12 \textbf{kCMTimePositiveInfinity as CMTimeMBS}

\textbf{Function:} Predefined time.
\textbf{Notes:}
Use this constant to initialize a CMTime to +infinity.
Do not test against this using \((\text{time} = \text{kCMTimePositiveInfinity})\), there are many CMTimes other than this that are also +infinity. Use \text{time.IsPositiveInfinity} instead.

17.97.13 \textbf{kCMTimeZero as CMTimeMBS}

\textbf{Function:} Predefined time.
\textbf{Notes:}
Use this constant to initialize a CMTime to 0.
Do not test against this using \((\text{time} = \text{kCMTimeZero})\), there are many CMTimes other than this that are also 0. Use \text{time.Compare(kCMTimeZero)} instead.

17.97.14 \textbf{Make(value as Int64, timescale as Integer) as CMTimeMBS}

\textbf{Function:} Makes a valid CMTime with value and timescale.
\textbf{Example:}
\begin{verbatim}
dim t as CMTimeMBS = CMTimeMBS.Make(1234, 600)
MsgBox t.Description
\end{verbatim}
Notes:
Epoch is implied to be 0.

value: Initializes the value field of the resulting CMTime.
timescale: Initializes the timescale field of the resulting CMTime.

Returns the resulting CMTime

17.97.15 MakeWithEpoch(value as Int64, timescale as Integer, Epoch as Int64)
as CMTimeMBS

Function: Makes a valid CMTime with value, scale and epoch.
Notes:
value: Initializes the value field of the resulting CMTime.
timescale: Initializes the scale field of the resulting CMTime.
epoch: Initializes the epoch field of the resulting CMTime.

Returns the resulting CMTime.

17.97.16 MakeWithSeconds(seconds as Double, preferredTimeScale as Int32 = 600)
as CMTimeMBS

Function: Makes a CMTime from a Float number of seconds, and a preferred timescale.
Example:
    dim t as CMTimeMBS = CMTimeMBS.MakeWithSeconds(123.4, 600)
    MsgBox t.Description

Notes:
seconds: Initializes the seconds field of the resulting CMTime.
preferredTimeScale: Initializes the preferredTimeScale field of the resulting CMTime.

Returns the resulting CMTime.
The epoch of the result will be zero. If preferredTimeScale is $\leq 0$, the result will be an invalid CMTime. If the preferred timescale will cause an overflow, the timescale will be halved repeatedly until the overflow goes away, or the timescale is 1. If it still overflows at that point, the result will be +/- infinity. The kCM-TimeFlagsHasBeenRounded flag will be set if the result, when converted back to seconds, is not exactly equal to the original seconds value.

### 17.97.17 Maximum(t1 as CMTimeMBS, t2 as CMTimeMBS) as CMTimeMBS

**Function**: Returns the greater of two CMTimes.

**Example**:

```vba
dim t1 as new CMTimeMBS(1200, 600)
dim t2 as new CMTimeMBS(70, 30)

dim mi as CMTimeMBS = CMTimeMBS.Minimum(t1,t2)
dim ma as CMTimeMBS = CMTimeMBS.Maximum(t1,t2)

MsgBox "with " +t1.Description+ 
" and " +t2.Description+ 
" the minimum is " +mi.Description+ 
" and maximum is " +ma.Description
```

### 17.97.18 Minimum(t1 as CMTimeMBS, t2 as CMTimeMBS) as CMTimeMBS

**Function**: Returns the lesser of two CMTimes.

**Example**:

```vba
dim t1 as new CMTimeMBS(1200, 600)
dim t2 as new CMTimeMBS(70, 30)

dim mi as CMTimeMBS = CMTimeMBS.Minimum(t1,t2)
dim ma as CMTimeMBS = CMTimeMBS.Maximum(t1,t2)

MsgBox "with " +t1.Description+ 
" and " +t2.Description+ 
" the minimum is " +mi.Description+ 
" and maximum is " +ma.Description
```
17.97. CLASS CMTIMEMBS

17.97.19 Multiply(multiplier as Integer) as CMTimeMBS

Function: Returns the product of a CMTime and a 32-bit integer.
Example:

```vbnet
dim t as new CMTimeMBS(1200, 600)
MsgBox str(T.Seconds)+" seconds"
t = t.Multiply(2)
MsgBox str(T.Seconds)+" seconds"
```

Notes:

- **self**: The CMTime that will be multiplied.
- **multiplier**: A 32-bit integer. CMTime time and multiplier will be multiplied.

Returns the product of the CMTime and the 32-bit integer.

The result will have the same timescale as the CMTime operand. If the result value overflows, the result timescale will be repeatedly halved until the result value no longer overflows. Again, default rounding will be applied when converting the result to this timescale. If the result value still overflows when timescale == 1, then the result will be either positive or negative infinity, depending on the direction of the overflow. If any rounding occurs for any reason, the result’s kCMTimeFlags_HasBeenRounded flag will be set. This flag will also be set if the CMTime operand has kCMTimeFlags_HasBeenRounded set. If the CMTime operand is invalid, the result will be invalid. If the CMTime operand is valid, but infinite, the result will be infinite, and of an appropriate sign, give the signs of both operands. If the CMTime operand is valid, but indefinite, the result will be indefinite.

17.97.20 MultiplyByFloat(multiplier as Double) as CMTimeMBS

Function: Returns the product of a CMTime and a 64-bit float.
Example:

```vbnet
dim t as new CMTimeMBS(1200, 600)
MsgBox str(T.Seconds)+" seconds"
t = t.MultiplyByFloat(2.0)
MsgBox str(T.Seconds)+" seconds"
```

Notes:

- **time**: The CMTime that will be multiplied.
- **multiplier**: A 64-bit float. CMTime time and multiplier will be multiplied.
CHAPTER 17. AVFOUNDATION

Returns the product of the CMTime and the 64-bit float.

The result will initially have the same timescale as the CMTime operand. If the result timescale is less than 65536, it will be repeatedly doubled until it is at least 65536. If the result value overflows, the result timescale will be repeatedly halved until the result value no longer overflows. Again, default rounding will be applied when converting the result to this timescale. If the result value still overflows when timescale == 1, then the result will be either positive or negative infinity, depending on the direction of the overflow. If any rounding occurs for any reason, the result’s kCMTimeFlagsHasBeenRounded flag will be set. This flag will also be set if the CMTime operand has kCMTimeFlagsHasBeenRounded set. If the CMTime operand is invalid, the result will be invalid. If the CMTime operand is valid, but infinite, the result will be infinite, and of an appropriate sign, given the signs of both operands. If the CMTime operand is valid, but indefinite, the result will be indefinite.

17.97.21 Show

Function: Prints a description of the CMTime.

Example:

dim t as new CMTimeMBS(1200, 600)
t.show

17.97.22 Subtract(other as CMTimeMBS) as CMTimeMBS

Function: Returns the difference of two CMTimes.

Notes:

self: The CMTime from which the subtrahend will be subtracted.
other: The CMTime that will be subtracted from the minuend.

Returns the difference of the two CMTimes (minuend - subtrahend).

If the operands both have the same timescale, the timescale of the result will be the same as the operands' timescale. If the operands have different timescales, the timescale of the result will be the least common multiple of the operands' timescales. If that LCM timescale is greater than kCMTimeMaxTimescale, the result timescale will be kCMTimeMaxTimescale, and default rounding will be applied when converting the result to this timescale.

If the result value overflows, the result timescale will be repeatedly halved until the result value no longer
overflows. Again, default rounding will be applied when converting the result to this timescale. If the result value still overflows when timescale = 1, then the result will be either positive or negative infinity, depending on the direction of the overflow.

If any rounding occurs for any reason, the result’s kCMTimeFlags_HasBeenRounded flag will be set. This flag will also be set if either of the operands has kCMTimeFlags_HasBeenRounded set. If either of the operands is invalid, the result will be invalid. If the operands are valid, but just one operand is infinite, the result will be similarly infinite. If the operands are valid, and both are infinite, the results will be as follows:

\[ +\infty - +\infty = \text{invalid} \]
\[ -\infty - -\infty = \text{invalid} \]
\[ +\infty - -\infty = +\infty \]
\[ -\infty - +\infty = -\infty \]

If the operands are valid, not infinite, and either or both is indefinite, the result will be indefinite. If the two operands are numeric (i.e., valid, not infinite, not indefinite), but have different nonzero epochs, the result will be invalid. If they have the same nonzero epoch, the result will have epoch zero (a duration). Times in different epochs cannot be added or subtracted, because epoch length is unknown. Times in epoch zero are considered to be durations and can be subtracted from times in other epochs. Times in different epochs can be compared, however, because numerically greater epochs always occur after numerically lesser epochs.

17.97.23 Properties

17.97.24 Epoch as Int64

Function: The epoch of the CMTime.

Notes:

You use the epoch to differentiate between equal timestamps that are actually different because of looping, multi-item sequencing, and so on.

The epoch is used during comparison: greater epochs happen after lesser ones. Addition or subtraction is only possible within a single epoch, however, since the epoch length may be unknown or variable.

The epoch is typically 0, but you might use a different value, for example, in a loop.
(Read and Write property)

17.97.25 Flags as Integer

Function: A bitfield representing the flags set for the CMTime.

Notes:
For example, kCMTimeFlags_Valid. See constants for possible values. (Read and Write property)

17.97.26  **HasBeenRounded as Boolean**

**Function:** Returns a Boolean value that indicates whether a given time has been rounded.
**Notes:**
Returns true if the CMTime has been rounded, otherwise false (the time is completely accurate).
(Read only property)

17.97.27  **IsIndefinite as Boolean**

**Function:** Returns whether a CMTime is indefinite.
**Notes:**
Returns true if the CMTime is indefinite, false if it is not.
(Read only property)

17.97.28  **IsInvalid as Boolean**

**Function:** Returns a Boolean value that indicates whether a given time is invalid.
**Example:**
```
    dim t as new CMTimeMBS(1200, 600)
    MsgBox "Invalid: " + str(t.IsInvalid)

    t = CMTimeMBS.kCMTimeInvalid
    MsgBox "Invalid: " + str(t.IsInvalid)
```
**Notes:**
Returns true if the CMTime is invalid, otherwise false.
(Read only property)
17.97. CLASS CMTIMEMBS

17.97.29  IsNegativeInfinity as Boolean

Function: Returns a Boolean value that indicates whether a given time is negative infinity.
Notes:
Returns true if the CMTime is negative infinity, otherwise false.
Use this instead of (myTime = kCMTimeNegativeInfinity), since there are many CMTime structs that represent positive infinity. This is because the non-flags fields are ignored, so they can contain anything.
(Read only property)

17.97.30  IsNumeric as Boolean

Function: Returns a Boolean value that indicates whether a given time is numeric.
Notes:
Returns true if the CMTime is numeric, otherwise false. Returns false if the CMTime is invalid, indefinite, or +/- infinity.
A numeric time contains a usable value/timescale/epoch.
(Read only property)

17.97.31  IsPositiveInfinity as Boolean

Function: Returns a Boolean value that indicates whether a given time is positive infinity.
Notes:
Returns true if the CMTime is positive infinity, otherwise false.
Use this instead of (myTime = kCMTimePositiveInfinity), since there are many CMTime structs that represent positive infinity. This is because the non-flags fields are ignored, so they can contain anything.
(Read only property)

17.97.32  IsValid as Boolean

Function: Returns a Boolean value that indicates whether a given time is valid.
Example:
```vba
dim t as new CMTimeMBS(1200, 600)
MsgBox "valid: " + str(t.IsValid)
```

**Notes:**
Return true if the CMTime is valid, otherwise false.
(Read only property)

### 17.97.33 Seconds as Double

**Function:** The number of seconds.
**Example:**
```vba
dim t as new CMTimeMBS(1200, 600)
t.show
```

**Notes:**
If the CMTime is invalid or indefinite, NaN is returned. If the CMTime is infinite, +/- infinity is returned. If the CMTime is numeric, epoch is ignored, and time.value / time.timescale is returned. The division is done in Float64, so the fraction is not lost in the returned result.
(Read only property)

### 17.97.34 Timescale as Integer

**Function:** The timescale of the CMTime.
**Notes:**
value/timescale = seconds.
(Read and Write property)

### 17.97.35 Value as Int64

**Function:** The value of the CMTime.
**Notes:**
value/timescale = seconds.
(Read and Write property)
17.97.36 Constants

17.97.37 kCMTimeFlags_HasBeenRounded = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function**: One of the flags for CMTime. **Notes**: Indicates that the time has been rounded.

17.97.38 kCMTimeFlags_ImpliedValueFlagsMask = 28

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function**: One of the flags for CMTime. **Notes**: Indicates that the time is +infinity, -infinity, or indefinite. Use this value with bitwiseAnd on the flags.

17.97.39 kCMTimeFlags_Indefinite = 16

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function**: One of the flags for CMTime. **Notes**: Indicates that the time is indefinite.

17.97.40 kCMTimeFlags_NegativeInfinity = 8

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function**: One of the flags for CMTime. **Notes**: Indicates that the time is -infinity.

17.97.41 kCMTimeFlags_PositiveInfinity = 4

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function**: One of the flags for CMTime. **Notes**: Indicates that the time is +infinity.

17.97.42 kCMTimeFlags_Valid = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function**: One of the flags for CMTime. **Notes**: Indicates that the time is valid.
17.97.43  kCMTimeMaxTimescale = & h7fffffff

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** A constant to define the maximum timescale.

17.97.44  kCMTimeRoundingMethod_Default = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of constants used to specify the rounding method to use when computing time.value during timescale conversions.  
**Notes:** Synonym for kCMTimeRoundingMethod_RoundHalfAwayFromZero.

17.97.45  kCMTimeRoundingMethod_QuickTime = 4

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of constants used to specify the rounding method to use when computing time.value during timescale conversions.  
**Notes:**  
Use kCMTimeRoundingMethod_RoundTowardZero if converting from larger to smaller scale (that is, from more precision to less precision), but use kCMTimeRoundingMethod_RoundAwayFromZero if converting from smaller to larger scale (i.e. from less precision to more precision).  
Also, never round a negative number down to 0; always return the smallest magnitude negative CMTime in this case (-1/newTimescale).

17.97.46  kCMTimeRoundingMethod_RoundAwayFromZero = 3

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of constants used to specify the rounding method to use when computing time.value during timescale conversions.  
**Notes:** Round away from zero if abs(fraction) is >0.

17.97.47  kCMTimeRoundingMethod_RoundHalfAwayFromZero = 1

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of constants used to specify the rounding method to use when computing time.value during timescale conversions.  
**Notes:** Round towards zero if abs(fraction) is <0.5, away from 0 if abs(fraction) is >= 0.5.

17.97.48  kCMTimeRoundingMethod_RoundTowardNegativeInfinity = 6

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of constants used to specify the rounding method to use when computing time.value during timescale conversions.
Notes: Round towards -infinity if fraction is not 0.

17.97.49  kCMTimeRoundingMethod_RoundTowardPositiveInfinity = 5

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of constants used to specify the rounding method to use when computing time.value during timescale conversions. Notes: Round towards +infinity if fraction is not 0.

17.97.50  kCMTimeRoundingMethod_RoundTowardZero = 2

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of constants used to specify the rounding method to use when computing time.value during timescale conversions. Notes: Round towards zero if fraction is not 0.
17.98 class CMTimeRangeMBS

17.98.1 class CMTimeRangeMBS

**Function:** The class that represent time ranges.

**Example:**

```dim t as CMTimeMBS = CMTimeMBS.MakeWithSeconds(5) // start at 5
dim d as CMTimeMBS = CMTimeMBS.MakeWithSeconds(10) // duration 10
dim r as CMTimeRangeMBS = CMTimeRangeMBS.Make(t,d)```

**Notes:** A CMTimeRange is represented as two CMTime structs, one that specifies the start time of the range and another that specifies the duration of the range. A time range does not include the end time that would be calculated by adding the duration to the start time.

17.98.2 Methods

17.98.3 AllTimeRange as CMTimeRangeMBS

**Function:** Creates a special timerange to cover all times.

**Notes:** From zero to infinity.

17.98.4 Constructor(start as CMTimeMBS, duration as CMTimeMBS)

**Function:** Creates a new range with given values.

**Example:**

```dim t as CMTimeMBS = new CMTimeMBS(5*600, 600, kCMTimeFlags_Valid) // start at 5
dim d as CMTimeMBS = new CMTimeMBS(10*600, 600, kCMTimeFlags_Valid) // duration 10
dim r as CMTimeRangeMBS = new CMTimeRangeMBS(t,d)```

17.98.5 ContainsTime(time as CMTimeMBS) as boolean

**Function:** Indicates whether a time is contained within a time range.

**Notes:**
time: CMTime to be tested for inclusion.
Returns true if the specified time is contained within the specified time range, false if it is not.

This function returns a Boolean value that indicates whether the time specified by the time parameter is
contained within the range specified by the range parameter.

17.98.6 ContainsTimeRange(timeRange as CMTimeRangeMBS) as boolean

Function: Returns a Boolean that indicates whether a given time range is contained within another time
range.
Notes:
range1: The CMTimeRange being interrogated.
range2: CMTimeRange to be tested for inclusion.

Returns true if the second time range is contained within the first time range, false if it is not.
This function returns a Boolean value that indicates whether the time range specified by the range1 param-
eter contains the range specified by the range2 parameter.

17.98.7 Description as string

Function: Creates a String with a description of a CMTimeRange.

17.98.8 Equal(range1 as CMTimeRangeMBS, range2 as CMTimeRangeMBS) as boolean

Function: Returns a Boolean value that indicates whether two CMTimeRanges are identical.
Notes:
range1: CMTimeRange to be compared for equality.
range2: Another CMTimeRange to be compared for equality.

Returns true if the two time ranges are identical, false if they differ.
This function returns a Boolean value that indicates whether the time ranges specified by the range1 and
range2 parameters are identical.
17.98.9 Intersection(range1 as CMTimeRangeMBS, range2 as CMTimeRangeMBS) as CMTimeRangeMBS

Function: Returns the intersection of two CMTimeRanges.
Notes:
range1: CMTimeRange to be intersected.
range2: Another CMTimeRange to be intersected.

Returns the intersection of the two CMTimeRanges.
This function returns a CMTimeRange structure that represents the intersection of the time ranges specified by the range1 and range2 parameters. This is the largest range that both ranges include.

17.98.10 kCMTimeRangeInvalid as CMTimeRangeMBS

Function: Use this constant to generate an invalid CMTimeRange.

17.98.11 kCMTimeRangeZero as CMTimeRangeMBS

Function: Use this constant to generate an empty CMTimeRange at 0.

17.98.12 Make(start as CMTimeMBS, duration as CMTimeMBS) as CMTimeRangeMBS

Function: Creates a valid CMTimeRange with the given start time and duration.
Example:
    dim t as CMTimeMBS = CMTimeMBS.MakeWithSeconds(5) // start at 5
    dim d as CMTimeMBS = CMTimeMBS.MakeWithSeconds(10) // duration 10
    dim r as CMTimeRangeMBS = CMTimeRangeMBS.Make(t,d)

Notes:
start: CMMTime for initializing the start field of the resulting CMTimeRange.
duration: CMMTime for initializing the duration field of the resulting CMTimeRange.

Returns the resulting CMTimeRange.
The duration parameter must have an epoch of 0; otherwise an invalid time range will be returned.

17.98.13  Show

Function: Prints a description of the CMTimeRange to stderr (similar to CFShow).

17.98.14  TimeRangeFromTimeToTime(start as CMTimeMBS, EndTime as CMTimeMBS) as CMTimeRangeMBS

Function: Creates a valid CMTimeRange from the given start and end time.
Notes:
start: CMTime structure representing start time for creating the range.
EndTime: CMTime structure representing end time for creating the range.
Returns the resulting CMTimeRange.

17.98.15  Union(range1 as CMTimeRangeMBS, range2 as CMTimeRangeMBS) as CMTimeRangeMBS

Function: Returns the union of two CMTimeRanges.
Notes:
range1: CMTimeRange to be unified.
range2: Another CMTimeRange to be unified.
Returns the union of the two CMTimeRanges.
This function returns a CMTimeRange that represents the union of the time ranges specified by the range1 and range2 parameters. This is the smallest range that includes all times that are in either range.

17.98.16  Properties

17.98.17  Duration as CMTimeMBS

Function: The duration.
17.98.18 EndTime as CMTimeMBS

Function: Returns a CMTime structure representing the end of a time range.
Notes:
range: The CMTimeRange from which to find the end of time range.
Returns a CMTime representing the end of the specified time range.

This function returns a CMTime structure that indicates the end of the time range specified by the range parameter. ContainsTime(range, range.EndTime) is always false.
(Read only property)

17.98.19 IsEmpty as Boolean

Function: Returns a Boolean value that indicates whether a given CMTimeRange has a duration of 0.
Notes:
Returns true if range has a duration of 0; otherwise, false.
(Read only property)

17.98.20 IsIndefinite as Boolean

Function: Returns a Boolean value that indicates whether a given CMTimeRange is indefinite.
Notes:
Returns true if range is indefinite; otherwise, false.
An indefinite time range has either an indefinite start or an indefinite duration, or both.
(Read only property)

17.98.21 IsInvalid as Boolean

Function: Returns a Boolean value that indicates whether a given CMTimeRange is invalid.
Notes:
Returns true if range is invalid; otherwise, false.
(Read only property)

17.98.22 IsValid as Boolean

Function: Returns a Boolean value that indicates whether a given CMTimeRange is valid.
Notes:
Returns true if range is valid; otherwise, false.
(Read only property)

17.98.23 Start as CMT imeMBS

Function: The start time.
Notes: (Read and Write property)
17.99 class CVImageBufferMBS

17.99.1 class CVImageBufferMBS

**Function:** Core Video image buffers provides a convenient interface for managing different types of image data.

**Example:**

```vbnet
Dim p As New Picture(300, 200)
Dim b As CVPixelBufferMBS = CVPixelBufferMBS.PixelBufferWithPicture(p)
MsgBox Str(b.Width) & " x " & Str(b.Height)
```

**Notes:**

Pixel buffers and Core Video OpenGL buffers derive from the Core Video image buffer.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

17.99.2 Methods

17.99.3 CIImage as Variant

**Function:** The CIImage object for drawing into picture.

**Notes:** Each time you call this function a new CIImage object is created, so cache it if possible.

17.99.4 Constructor

**Function:** The private constructor.

17.99.5 JPEG(CompressionFactor as Double = 0.8) as Memoryblock

MBS AVFoundation Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** Returns JPEG compressed image data.

**Notes:**

Compression Factor is in range from 0 to 1.0.
Returns memoryblock with jpeg data or nil in case of error.
17.99. **CLASS CVIMAGEBUFFERMBS**

### 17.99.6 NSImage as Variant

MBS AVFoundation Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
**Function:** Queries image buffer as NSImageMBS object.  
**Notes:** Result is NSImageMBS object or nil in case of error.

### 17.99.7 Properties

#### 17.99.8 Context as CGContextMBS

**Function:** The CGContext for this picture.  
**Notes:** (Read only property)

#### 17.99.9 Handle as Integer

**Function:** The internal object reference.  
**Notes:** (Read only property)

#### 17.99.10 IsFlipped as Boolean

**Function:** Returns whether the image is flipped vertically or not.  
**Notes:**  
True if 0,0 in the texture is upper left, false if 0,0 is lower left.  
(Read only property)

#### 17.99.11 Lasterror as Integer

**Function:** The last error.  
**Notes:** (Read and Write property)
17.99.12 Picture as Picture

Function: The picture this image buffer references to.
Notes: (Read only property)
17.100. CLASS CVPIXELBUFFERMBS

17.100 class CVPixelBufferMBS

17.100.1 class CVPixelBufferMBS

**Function:** A Core Video pixel buffer is an image buffer that holds pixels in main memory.
**Example:**

```vba
dim p as new Picture(300, 200)
dim b as CVPixelBufferMBS = CVPixelBufferMBS.PixelBufferWithPicture(p)
MsgBox str(b.Width) + " x " + str(b.Height)
```

**Notes:**
Applications generating frames, compressing or decompressing video, or using Core Image can all make use of Core Video pixel buffers.
Subclass of the CVImageBufferMBS class.

17.100.2 Methods

17.100.3 BaseAddress as Ptr

**Function:** Returns the base address of the pixel buffer.
**Notes:**
For chunky buffers, returns a pointer to the pixel at (0,0) in the buffer.
For planar buffers, returns a pointer to a PlanarComponentInfo structure (as defined by QuickTime in ImageCodec.h).

Retrieving the base address for a pixel buffer requires that the buffer base address be locked via a successful call to CVPixelBufferLockBaseAddress.

17.100.4 BaseAddressOfPlane(planeIndex as Integer) as Ptr

**Function:** Returns the base address of the plane at the specified plane index.
**Notes:**
planeIndex: The index of the plane.

Returns the base address of the plane, or NULL for nonplanar pixel buffers.
Retrieving the base address for a pixel buffer requires that the buffer base address be locked by a successful call to LockBaseAddress.

### 17.100.5 BytesPerRowOfPlane(planeIndex as Integer) as Integer

**Function:** Returns the number of bytes per row for a plane at the specified index in the pixel buffer.  
**Notes:**  
- `planeIndex`: The index of the plane whose bytes-per-row value you want to obtain.
  
Returns the number of row bytes of the plane, or nil for nonplanar pixel buffers.

### 17.100.6 Constructor(pic as picture)

**Function:** Creates a pixel buffer for a picture.  
**Example:**

```vba
dim p as new Picture(300, 200)
dim b as new CVPixelBufferMBS(p)
MsgBox str(b.Width)+” x ”+str(b.Height)
```

**Notes:**  
- Only for Cocoa target.  
- This function takes the existing picture and creates a pixelbuffer referencing it. Also we setup the CGContext object and stores it in Context property. Also picture property is set to the current picture.

### 17.100.7 FillExtendedPixels

**Function:** Fills the extended pixels of the pixel buffer.  
**Notes:** This function replicates edge pixels to fill the entire extended region of the image.

### 17.100.8 Flush

**Function:** Flushes output to the image buffer.
### 17.100.9 GetExtendedPixels(byref extraColumnsOnLeft as Integer, byref extraColumnsOnRight as Integer, byref extraRowsOnTop as Integer, byref extraRowsOnBottom as Integer)

**Function:** Returns the amount of extended pixel padding in the pixel buffer.
**Notes:**
- extraColumnsOnLeft: On output, the pixel row padding to the left.
- extraColumnsOnRight: On output, the pixel row padding to the right.
- extraRowsOnTop: On output, the pixel row padding to the top.
- extraRowsOnBottom: On output, the pixel row padding to the bottom.

### 17.100.10 HeightOfPlane(planeIndex as Integer) as Integer

**Function:** Returns the height of the plane at planeIndex in the pixel buffer.
**Notes:**
- planeIndex: The index of the plane.
  Returns the height of the buffer, in pixels, or 0 for nonplanar pixel buffers.

### 17.100.11 kCVPixelBufferBytesPerRowAlignmentKey as string

**Function:** One of the attribute keys.
**Notes:** Indicates the number of bytes per row in the pixel buffer (type Number).

### 17.100.12 kCVPixelBufferCGBitmapContextCompatibilityKey as string

**Function:** One of the attribute keys.
**Notes:** Indicates whether the pixel buffer is compatible with Core Graphics bitmap contexts (type Boolean).
17.100.13  kCVPixelBufferCGImageCompatibilityKey as string

Function: One of the attribute keys.
Notes: Indicates whether the pixel buffer is compatible with CGImage types (type Boolean).

17.100.14  kCVPixelBufferExtendedPixelsBottomKey as string

Function: One of the attribute keys.
Notes: The number of pixels padding the bottom of the image (type Number).

17.100.15  kCVPixelBufferExtendedPixelsLeftKey as string

Function: One of the attribute keys.
Notes: The number of pixels padding the left of the image (type Number).

17.100.16  kCVPixelBufferExtendedPixelsRightKey as string

Function: One of the attribute keys.
Notes: The number of pixels padding the right of the image (type Number).

17.100.17  kCVPixelBufferExtendedPixelsTopKey as string

Function: One of the attribute keys.
Notes: The number of pixels padding the top of the image (type Number).

17.100.18  kCVPixelBufferHeightKey as string

Function: One of the attribute keys.
Notes: The height of the pixel buffer (type Number).
17.100. **CLASS CVPIXELBUFFERMBS**

### 17.100.19  kCVPixelBufferIOSurfaceCoreAnimationCompatibilityKey as string

**Function:** One of the attribute keys.
**Notes:** A boolean value

### 17.100.20  kCVPixelBufferIOSurfaceOpenGLFBOCompatibilityKey as string

**Function:** One of the attribute keys.
**Notes:** Ensures that the CVPixelBuffer’s IOSurfaceRef can be displayed in an CoreAnimation CALayer.

### 17.100.21  kCVPixelBufferIOSurfaceOpenGLTextureCompatibilityKey as string

**Function:** One of the attribute keys.
**Notes:** Ensures that CGLTexImageIOSurface2D() will succeed in creating a valid texture object from the CVPixelBuffer’s IOSurface AND that the resulting texture may be used as a color buffer attachment to a OpenGL frame buffer object.

### 17.100.22  kCVPixelBufferIOSurfacePropertiesKey as string

**Function:** One of the attribute keys.
**Notes:**
- Indicates optional properties in the IOSurface framework (type Dictionary). An empty dictionary indicates default values.
- Presence of this key requests allocation via the IOSurface framework.

### 17.100.23  kCVPixelBufferMemoryAllocatorKey as string

**Function:** One of the attribute keys.
**Notes:** The allocator used with this buffer (type CFAllocatorRef).
17.100.24  kCVPixelBufferOpenGLCompatibilityKey as string

**Function:** One of the attribute keys.
**Notes:** Indicates whether the pixel buffer is compatible with Core Graphics bitmap contexts (type Boolean).

17.100.25  kCVPixelBufferPixelFormatTypeKey as string

**Function:** One of the attribute keys.
**Notes:** The pixel format for this buffer (type Number, or type Array containing an array of Number types (actually type OSType)). For a listing of common pixel formats, see the QuickTime Ice Floe Dispatch 20.

17.100.26  kCVPixelBufferPlaneAlignmentKey as string

**Function:** One of the attribute keys.
**Notes:** Specifies the alignment of the planes within the buffer. Planes will start on a byte number which is a multiple of this value. (type Number).

17.100.27  kCVPixelBufferWidthKey as string

**Function:** One of the attribute keys.
**Notes:** The width of the pixel buffer (type Number).

17.100.28  LockBaseAddress(flags as Integer)

**Function:** Locks the base address of the pixel buffer.
**Notes:** lockFlags: You can pass zero or kLockReadonly.

17.100.29  PixelBufferWithCGImage(CGImage as Variant) as CVPixelBufferMBS

**Function:** Creates a pixel buffer for a CGImage by making a copy of the picture.
**Notes:**
**17.100. CLASS CVPIXELBUFFERMBS**

Image parameter must be a CGImageMBS object.
For Carbon and Cocoa.
Returns nil on any error.

---

### 17.100.30 PixelBufferWithPicture(pic as picture) as CVPixelBufferMBS

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Creates a pixel buffer for a picture by making a copy of the picture.

**Example:**

```vbscript
dim p as new Picture(300, 200)
dim b as CVPixelBufferMBS = CVPixelBufferMBS.PixelBufferWithPicture(p)
MsgBox str(b.Width) + " x " + str(b.Height)
```

**Notes:**
For Carbon and Cocoa.
Returns nil on any error.

---

### 17.100.31 UnlockBaseAddress(flags as Integer)

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Unlocks the base address of the pixel buffer.

---

### 17.100.32 WidthOfPlane(planeIndex as Integer) as Integer

**MBS AVFoundation Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns the width of the plane at a given index in the pixel buffer.

**Notes:**
- `pixelBuffer`: The pixel buffer whose plane width you want to obtain.
- `planeIndex`: The plane index that contains the plane’s width value.

Returns the width of the plane, in pixels, or 0 for nonplanar pixel buffers.
17.100.33 Properties

17.100.34 BytesPerRow as Integer

Function: Returns the number of bytes per row of the pixel buffer.
Example:

```vba
dim p as new Picture(300, 200)
dim b as new CVPixelBufferMBS(p)
MsgBox str(b.BytesPerRow)
```

Notes:
The number of bytes per row of the image data. For planar buffers, this function returns a rowBytes value such that bytesPerRow * height covers the entire image, including all planes.
(Read only property)

17.100.35 DataSize as Integer

Function: Returns the data size for contiguous planes of the pixel buffer.
Example:

```vba
dim p as new Picture(300, 200)
dim b as new CVPixelBufferMBS(p)
MsgBox str(b.DataSize)
```

Notes: (Read only property)

17.100.36 Height as Integer

Function: Returns the height of the pixel buffer.
Example:

```vba
dim p as new Picture(300, 200)
dim b as CVPixelBufferMBS = CVPixelBufferMBS.PixelBufferWithPicture(p)
MsgBox str(b.Width)+" x "+str(b.Height)
```
17.100.37  IsPlanar as Boolean

Function: Determines whether the pixel buffer is planar.
Notes:

Returns true if the pixel buffer was created using CVPixelBufferCreateWithPlanarBytes; otherwise, false.
(Read only property)

17.100.38  PixelFormatType as String

Function: Returns the pixel format type of the pixel buffer.
Notes:

Returns a four-character code OSType identifier for the pixel format.
(Read only property)

17.100.39  PlaneCount as Integer

Function: Returns number of planes of the pixel buffer.
Notes:

Returns the number of planes. Returns 0 for nonplanar pixel buffers.
(Read only property)

17.100.40  Width as Integer

Function: Returns the width of the pixel buffer.
Example:

```
dim p as new Picture(300, 200)
dim b as CVPixelBufferMBS = CVPixelBufferMBS.PixelBufferWithPicture(p)
MsgBox str(b.Width)+" x "+str(b.Height)
```
17.100.41 Constants

17.100.42 kCVPixelFormatType_16BE555 = & h00000010

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the pixel formats for CVPixelBuffer. Notes:
16 bit BE RGB 555.
Available in OS X v10.5 and later.

17.100.43 kCVPixelFormatType_16BE565 = "B565"

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the pixel formats for CVPixelBuffer. Notes:
16 bit BE RGB 565.
Available in OS X v10.5 and later.

17.100.44 kCVPixelFormatType_16Gray = "b16g"

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the pixel formats for CVPixelBuffer. Notes:
16 bit Grayscale, 16-bit big-endian samples, black is zero.
Available in OS X v10.5 and later.

17.100.45 kCVPixelFormatType_16LE555 = "L555"

MBS AVFoundation Plugin, Plugin Version: 13.2. Function: One of the pixel formats for CVPixelBuffer. Notes:
16 bit LE RGB 555.
Available in OS X v10.5 and later.
17.100  CLASS CVPIXELBUFFERMBS

17.100.46  kCVPixelFormatType_16LE5551 = "5551"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. **Notes:**

16 bit LE RGB 5551. Available in OS X v10.5 and later.

17.100.47  kCVPixelFormatType_16LE565 = "L565"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. **Notes:**

16 bit LE RGB 565. Available in OS X v10.5 and later.

17.100.48  kCVPixelFormatType_1IndexedGray_WhiteIsZero = & h00000021

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. **Notes:**

1 bit indexed gray, white is zero. Available in OS X v10.5 and later.

17.100.49  kCVPixelFormatType_1Monochrome = & h00000001

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. **Notes:**

1 bit indexed. Available in OS X v10.5 and later.

17.100.50  kCVPixelFormatType_24BGR = "24BG"

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. **Notes:**

24 bit BGR. Available in OS X v10.5 and later.
17.100.51 kCVPixelFormatType_24RGB = & h00000018

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. **Notes:**

24 bit RGB.
Available in OS X v10.5 and later.

17.100.52 kCVPixelFormatType_2Indexed = & h00000002

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. **Notes:**

2 bit indexed.
Available in OS X v10.5 and later.

17.100.53 kCVPixelFormatType_2IndexedGray_WhiteIsZero = & h00000022

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. **Notes:**

2 bit indexed gray, white is zero.
Available in OS X v10.5 and later.

17.100.54 kCVPixelFormatType_32ABGR = ”ABGR”

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. **Notes:**

32 bit ABGR.
Available in OS X v10.5 and later.

17.100.55 kCVPixelFormatType_32AlphaGray = ”b32a”

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. **Notes:**

32 bit AlphaGray, 16-bit big-endian samples, black is zero.
Available in OS X v10.5 and later.
17.100.56  kCVPixelFormatType_32ARGB = & h00000020

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer.  
**Notes:**  
32 bit ARGB.  
Available in OS X v10.5 and later.

17.100.57  kCVPixelFormatType_32BGRA = ”BGRA”

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer.  
**Notes:**  
32 bit BGRA.  
Available in OS X v10.5 and later.

17.100.58  kCVPixelFormatType_32RGBA = ”RGBA”

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer.  
**Notes:**  
32 bit RGBA.  
Available in OS X v10.5 and later.

17.100.59  kCVPixelFormatType_420YpCbCr8Planar = ”y420”

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer.  
**Notes:**  
Planar Component Y’CbCr 8-bit 4:2:0.  baseAddr points to a big-endian CVPlanarPixelBufferInfo_YCbCrPlanar struct.  
Available in OS X v10.5 and later.

17.100.60  kCVPixelFormatType_422YpCbCr10 = ”v210”

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer.  
**Notes:**  
Component Y’CbCr 10-bit 4:2:2.  
Available in OS X v10.5 and later.
17.100.61  kCVPixelFormatType_422YpCbCr16 = ”v216”

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. 
**Notes:**
Component Y’CbCr 10,12,14,16-bit 4:2:2. 
Available in OS X v10.5 and later.

17.100.62  kCVPixelFormatType_422YpCbCr8 = ”2vuy”

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. 
**Notes:**
Component Y’CbCr 8-bit 4:2:2, ordered Cb Y’0 Cr Y’1. 
Available in OS X v10.5 and later.

17.100.63  kCVPixelFormatType_422YpCbCr_4A_8BiPlanar = ”a2vy”

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. 
**Notes:**
First plane: Video-range Component Y’CbCr 8-bit 4:2:2, ordered Cb Y’0 Cr Y’1; second plane: alpha 8-bit 0-255. 
Available in OS X v10.5 and later.

17.100.64  kCVPixelFormatType_4444YpCbCrA8 = ”v408”

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. 
**Notes:**
Component Y’CbCrA 8-bit 4:4:4:4, ordered Cb Y’ Cr A. 
Available in OS X v10.5 and later.

17.100.65  kCVPixelFormatType_4444YpCbCrA8R = ”r408”

MBS AVFoundation Plugin, Plugin Version: 13.2. **Function:** One of the pixel formats for CVPixelBuffer. 
**Notes:**
Component Y’CbCrA 8-bit 4:4:4:4, rendering format. Full range alpha, zero biased YUV, ordered A Y’ Cr Cb. 
Available in OS X v10.5 and later.
17.100.66  \texttt{kCVPixelFormatType\_444YpCbCr10 = ”v410”}

MBS AVFoundation Plugin, Plugin Version: 13.2. \textbf{Function:} One of the pixel formats for CVPixelBuffer. \textbf{Notes:}
Available in OS X v10.5 and later.

17.100.67  \texttt{kCVPixelFormatType\_444YpCbCr8 = ”v308”}

MBS AVFoundation Plugin, Plugin Version: 13.2. \textbf{Function:} One of the pixel formats for CVPixelBuffer. \textbf{Notes:}
Component Y’CbCr 8-bit 4:4:4.
Available in OS X v10.5 and later.

17.100.68  \texttt{kCVPixelFormatType\_48RGB = ”b48r”}

MBS AVFoundation Plugin, Plugin Version: 13.2. \textbf{Function:} One of the pixel formats for CVPixelBuffer. \textbf{Notes:}
48 bit RGB, 16-bit big-endian samples.
Available in OS X v10.5 and later.

17.100.69  \texttt{kCVPixelFormatType\_4Indexed = & h00000004}

MBS AVFoundation Plugin, Plugin Version: 13.2. \textbf{Function:} One of the pixel formats for CVPixelBuffer. \textbf{Notes:}
4 bit indexed.
Available in OS X v10.5 and later.

17.100.70  \texttt{kCVPixelFormatType\_4IndexedGray\_WhiteIsZero = & h00000024}

MBS AVFoundation Plugin, Plugin Version: 13.2. \textbf{Function:} One of the pixel formats for CVPixelBuffer. \textbf{Notes:}
4 bit indexed gray, white is zero.
Available in OS X v10.5 and later.
17.100.71  kCVPixelFormatType_64ARGB = "b64a"

MBS AVFoundation Plugin, Plugin Version: 13.2.  **Function:** One of the pixel formats for CVPixelBuffer.  
**Notes:**
64 bit ARGB, 16-bit big-endian samples.  
Available in OS X v10.5 and later.

17.100.72  kCVPixelFormatType_8Indexed = & h00000008

MBS AVFoundation Plugin, Plugin Version: 13.2.  **Function:** One of the pixel formats for CVPixelBuffer.  
**Notes:**
8 bit indexed.  
Available in OS X v10.5 and later.

17.100.73  kCVPixelFormatType_8IndexedGray_WhiteIsZero = & h00000028

MBS AVFoundation Plugin, Plugin Version: 13.2.  **Function:** One of the pixel formats for CVPixelBuffer.  
**Notes:**
8 bit indexed gray, white is zero.  
Available in OS X v10.5 and later.

17.100.74  kLockReadonly = 1

MBS AVFoundation Plugin, Plugin Version: 13.2.  **Function:** The flag for LockBaseAddress function.  
**Notes:**
If you are not going to modify the data while you hold the lock, you should set this flag to avoid potentially modifying any existing caches of the buffer contents.  This flag should be passed both to the lock and unlock functions.  Non-symmetrical usage of this flag will result in undefined behavior.
17.101. CLASS MOVIE

17.101  class Movie

17.101.1  class Movie

Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Extends the Movie class inside Xojo.

17.101.2  Methods

17.101.3  AVAssetMBS as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the AVAsset for this movie.

**Example:**

```plaintext
dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim m as movie = f.OpenAsMovie
dim asset as AVAssetMBS = m.AVAssetMBS
MsgBox str(asset.duration.Seconds) + " seconds"
```

**Notes:**

Useful in order to use plugin functions on a movie object, e.g. query meta data.
Only for Cocoa target in Xojo 2014.
17.102 class Movieplayer

17.102.1 class Movieplayer

Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Extends the Movieplayer class inside Xojo.

17.102.2 Methods

17.102.3 AVAssetMBS as AVAssetMBS

**Function:** Returns the AVAsset for this movieplayer.
**Example:**

```lisp
dim f as FolderItem = SpecialFolder.Desktop.Child("Der Hausbau.m4v")
dim m as movie = f.OpenAsMovie
MoviePlayer1.movie = m
MoviePlayer1.play

dim asset as AVAssetMBS = MoviePlayer1.AVAssetMBS
MsgBox str(asset.duration.Seconds)+" seconds"
```

**Notes:**
Useful in order to use plugin functions on a movieplayer, e.g. query meta data.
Only for Cocoa target in Xojo 2014.

17.102.4 AVPlayerLayerMBS as AVPlayerLayerMBS

**Function:** Returns the AVPlayerLayer for this movieplayer.
**Notes:** Only for Cocoa target in Xojo 2014.

17.102.5 AVPlayerMBS as AVPlayerMBS

**Function:** Returns the AVPlayer for this movieplayer.
**Notes:** Only for Cocoa target in Xojo 2014.
17.103. class Sound

17.103.1 class Sound

Example:

```vbs
dim f as FolderItem = SpecialFolder.Desktop.Child("test.mp4")
dim s as sound = f.OpenAsSound
dim a as AVAudioPlayerMBS = s.AVAudioPlayerMBS
MsgBox str(a.duration)+" seconds long"
call a.play
```

17.103.2 Methods

17.103.3 AVAudioPlayerMBS as AVAudioPlayerMBS

Example:

```vbs
dim f as FolderItem = SpecialFolder.Desktop.Child("test.mp4")
dim s as sound = f.OpenAsSound
dim a as AVAudioPlayerMBS = s.AVAudioPlayerMBS
MsgBox str(a.duration)+" seconds long"
call a.play
```

Notes:

Xojo uses AVAudioPlayer for playing sounds in version 2013r4 and newer. This function returns the player object, so you change more settings.
Chapter 18

AVFoundationNode

18.1 class AVAudio3DPointMBS

18.1.1 class AVAudio3DPointMBS

Function: Class representing a point in 3D space.

Notes: This class is used by classes dealing with 3D audio such as those that adopt the AVAudioMixing protocol and the AVAudioEnvironmentNode class and represents a point in 3D space, in meters.

18.1.2 Methods

18.1.3 Constructor(x as Double = 0.0, y as Double = 0.0, z as Double = 0.0)

Function: The constructor.

18.1.4 Properties

18.1.5 x as Double

Function: The location on the x-axis, in meters.

Notes: (Read and Write property)
18.1.6 y as Double

**Function:** The location on the y-axis, in meters.
**Notes:** (Read and Write property)

18.1.7 z as Double

**Function:** The location on the z-axis, in meters.
**Notes:** (Read and Write property)
18.2. CLASS AVAUDIOBUFFERMBS

18.2  class AVAudioBufferMBS

18.2.1  class AVAudioBufferMBS

Function: The AVAudioBuffer class represents a buffer of audio data and its format.
Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

18.2.2  Methods

18.2.3  available as boolean

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

18.2.4  Constructor

Function: The private constructor.

18.2.5  copy as AVAudioBufferMBS

Function: Creates a read only copy of the buffer.

18.2.6  mutableCopy as AVAudioBufferMBS

Function: Creates a mutable copy of the buffer.
18.2.7 Properties

18.2.8 format as AVAudioFormatMBS

Function: The format of the audio in the buffer.
Notes: (Read only property)

18.2.9 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
18.3.3 Methods

18.3.3 available as boolean

Function: Whether this class is available for use.

Notes: Should return true on OS X 10.10 and newer.
18.3.4 Constructor(Layout as QTAudioChannelLayoutMBS)

Function: Initialize an audio channel layout object using an existing one.
Example:

```vbscript
Function StereoFormat() As AVAudioFormatMBS
    // stereo format with standard layout tag
    dim qlayout as new QTAudioChannelLayoutMBS
    qlayout.ChannelLayoutTag = QTAudioChannelLayoutMBS.kAudioChannelLayoutTag_Stereo
    dim layout as new AVAudioChannelLayoutMBS(qlayout)
    dim pf as new AVAudioFormatMBS(44100, layout)
    Return pf
End Function
```

Notes: If the provided audio channel layout objects tag is kAudioChannelLayoutTag_UseChannelDescriptions, this initializer attempts to convert it to a more specific tag. See also:
- 18.3.5 Constructor(LayoutTag as Integer)

18.3.5 Constructor(LayoutTag as Integer)

Function: Initialize an audio channel layout object using a layout tag.
Example:

```vbscript
Function StereoFormat() As AVAudioFormatMBS
    // stereo format with standard layout tag
    dim layout as new AVAudioChannelLayoutMBS(QTAudioChannelLayoutMBS.kAudioChannelLayoutTag_Stereo)
    dim pf as new AVAudioFormatMBS(44100, layout)
    Return pf
End Function
```

Notes: See QTAudioChannelLayoutMBS class for constants. See also:
- 18.3.4 Constructor(Layout as QTAudioChannelLayoutMBS)
18.3. CLASS AVAUDIOCHANNELLAYOUTMBS

18.3.6 isEqual(other as AVAudioChannelLayoutMBS) as boolean

Function: Determines whether another audio channel layout is exactly equal to this layout.
Notes:
other: The AVAudioChannelLayout object to compare against.

Returns true if they are equal; otherwise false.

18.3.7 layoutWithLayout(Layout as QTAudioChannelLayoutMBS) as AVAudioChannelLayoutMBS

Function: Creates a new audio channel layout object from an existing one.

18.3.8 layoutWithLayoutTag(LayoutTag as Integer) as AVAudioChannelLayoutMBS

Function: Creates a new audio channel layout object using an audio channel layout tag.
Notes: If the provided audio channel layout objects tag is kAudioChannelLayoutTag.UseChannelDescriptions, this initializer attempts to convert it to a more specific tag.

18.3.9 Properties

18.3.10 channelCount as Integer

Function: The number of channels of audio data.
Notes: (Read only property)

18.3.11 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
18.3.12 layout as QTAudioChannelLayoutMBS

Function: The underlying audio channel layout.
Notes:
See QTAudioChannelLayoutMBS class for details.
(Read only property)

18.3.13 layoutTag as Integer

Function: The audio channels underlying layout tag.
Notes:
See QTAudioChannelLayoutMBS class for constants.
(Read only property)
18.4. class AVAudioComponentDescriptionMBS

18.4.1 class AVAudioComponentDescriptionMBS

**Function:** Identifying information for an audio component.

18.4.2 Methods

18.4.3 Constructor(componentType as string = "", componentSubType as string = "", componentManufacturer as string = "", componentFlags as UInt32 = 0, componentFlagsMask as UInt32 = 0)

**Function:** The constructor.

18.4.4 Properties

18.4.5 componentFlags as UInt32

**Function:** The flags.
**Notes:**
Set this value to zero.
(Read and Write property)

18.4.6 componentFlagsMask as UInt32

**Function:** The mask of flags set.
**Notes:**
Set this value to zero.
(Read and Write property)
18.4.7 componentManufacturer as String

Function: The unique vendor identifier, registered with Apple, for the audio component.
Notes: (Read and Write property)

18.4.8 componentSubType as String

Function: A 4-byte code that you can use to indicate the purpose of a component.
Notes: For example, you could use lpas or lowp as a mnemonic indication that an audio unit is a low-pass filter.
(Read and Write property)

18.4.9 componentType as String

Function: A unique 4-byte code identifying the interface for the component.
Notes: (Read and Write property)
18.5.  CLASS AVAUDIOENGINEMBS

18.5  class AVAudioEngineMBS

18.5.1  class AVAudioEngineMBS

Function: The AVAudioEngine class defines a group of connected AVAudioNode objects, known as audio
nodes.
Notes:
You use audio nodes to generate audio signals, process them, and perform audio input and output.
You create each audio node separately and attach it to the audio engine. You can perform all audio node op-
erations during runtime connecting them, disconnecting them, and removing them with only minor limitations:

- Reconnect audio nodes only when they are upstream of a mixer.
- If you remove an audio node that has differing input and output channel counts, or which is a mixer, the
  result will likely be a broken graph.

18.5.2  Methods

18.5.3  attachNode(node as AVAudioNodeMBS)

Function: Attaches a new audio node to the audio engine.
Notes:
node: The audio node to be attached to the audio engine.
To support the instantiation of arbitrary AVAudioNode subclasses, instances are created externally to the
audio engine but are unusable until attached to the audio engine using this method.

18.5.4  available as boolean

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.
18.5.5 AVAudioEngineConfigurationChangeNotification as String

Function: Posted when the audio engine configuration changes.
Notes: When the audio engine's I/O unit observes a change to the audio input or output hardware's channel count or sample rate, the audio engine stops, uninitializes itself, and issues this notification.

18.5.6 connect(node1 as AVAudioNodeMBS, node2 as AVAudioNodeMBS, bus1 as Integer, bus2 as Integer, format as AVAudioFormatMBS)

Function: Establish a connection between two audio nodes, specifying the input and output busses.
Notes:
node1: The source audio node.
node2: The destination audio node.
bush: The output bus of the source audio node.
bush2: The input bus of the destination audio node.
format: If not nil, the format of the source audio node's output bus is set to this AVAudioFormat object. In all cases, the format of the destination audio node's input bus is set to match that of the source audio node's output bus.

Audio nodes have input and output busses (AVAudioNodeBus). Use this method to establish connections between audio nodes. Connections are always one-to-one, never one-to-many or many-to-one.
See also:

- 18.5.7 connect(node1 as AVAudioNodeMBS, node2 as AVAudioNodeMBS, format as AVAudioFormatMBS)

18.5.7 connect(node1 as AVAudioNodeMBS, node2 as AVAudioNodeMBS, format as AVAudioFormatMBS)

Function: Establishes a connection between two audio nodes.
Notes:
node1: The source audio node.
node2: The destination audio node.

This method calls the connect method using bus 0 for the source audio node, and bus 0 for the destination audio node, except in the case of a destination which is a mixer, in which case the destination is the mixer's nextAvailableInputBus.
See also:
format: If not nil, the format of the source audio nodes output bus is set to this AVAudioFormat object. In all cases, the format of the destination audio nodes input bus is set to match that of the source audio nodes output bus.

- 18.5.6 connect(node1 as AVAudioNodeMBS, node2 as AVAudioNodeMBS, bus1 as Integer, bus2 as Integer, format as AVAudioFormatMBS)

18.5.8 Constructor

Function: The constructor.

18.5.9 Destructor

Function: The destructor.

18.5.10 detachNode(node as AVAudioNodeMBS)

Function: Detaches a audio node previously attached to the audio engine. 
Notes: 
node: The audio node to be detached from the audio engine. 

If necessary, the audio engine will safely disconnect the audio node before detaching it.

18.5.11 disconnectNodeInput(node as AVAudioNodeMBS)

Function: Removes all input connections of the audio node. 
Notes: 
node: The audio node whose inputs you want to disconnect. 

Connections are broken on each of the audio nodes input buses. 
See also:
18.5.12  **disconnectNodeInput(node as AVAudioNodeMBS, bus as Integer)**

**Function:** Removes the input connection of an audio node on the specified bus.
**Notes:**
node: The audio node whose input is to be disconnected.
bus: The destinations input bus to be disconnected.
See also:
- 18.5.11 disconnectNodeInput(node as AVAudioNodeMBS)

18.5.13  **disconnectNodeOutput(node as AVAudioNodeMBS)**

**Function:** Remove all output connections of an audio node.
**Notes:** node: The audio node whose outputs are to be disconnected.
See also:
- 18.5.14 disconnectNodeOutput(node as AVAudioNodeMBS, bus as Integer)

18.5.14  **disconnectNodeOutput(node as AVAudioNodeMBS, bus as Integer)**

**Function:** Remove the output connection of an audio node on the specified bus.
**Notes:**
node: The audio node whose output is to be disconnected.
bus: The destinations output bus to disconnect.
See also:
- 18.5.13 disconnectNodeOutput(node as AVAudioNodeMBS)

18.5.15  **pause**

**Function:** Pauses the audio engine.
**Notes:**
Stops the flow of audio through the audio engine but does not deallocate the resources allocated by prepare.
You resume the audio engine by invoking startAndReturnError again.
### 18.5.16 prepare

**Function:** Prepares the audio engine for starting.  
**Notes:** This method preallocates many of the resources that the audio engine requires in order to start. Use it in order to start audio input or output more responsively.

### 18.5.17 reset

**Function:** Resets all of the audio nodes in the audio engine.  
**Notes:** This method resets all of the audio nodes in the audio engine. Use it, for example, to silence reverb and delay tails.

### 18.5.18 startAndReturnError(byref error as NSErrorMBS) as Boolean

**Function:** Starts the audio engine.  
**Notes:**  
Error: Returns, by-reference, a description of the error.

Returns true if the audio engine started successfully; otherwise, false.  
This method invokes the prepare method if it has not already been called since stop was invoked.  
It then starts the audio hardware via the AVAudioInputNode and/or AVAudioOutputNode instances in the audio engine.  

Errors can occur when:

- There is problem in the structure of the graph. Input can’t be routed to output or to a recording tap through converter type nodes.  
- An AVAudioSession error occurred  
- The driver failed to start the hardware

### 18.5.19 stop

**Function:** Stop the audio engine.  
**Notes:** Releases the resources allocated by the prepare method.
18.5.20  Properties

18.5.21  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

18.5.22  inputNode as AVAudioInputNodeMBS

Function: The audio engines singleton input audio node.
Notes: The audio engine creates a singleton on demand when inputNode is first accessed. To receive input, connect
another audio node from the output of the input audio node, or create a recording tap on it.

The AVAudioSession instance and/or the availability of hardware features determine whether an app can
perform input. Check the input format of input node (specifically, the hardware format) for a non-zero
sample rate and channel count to see if input is enabled.
(Read only property)

18.5.23  mainMixerNode as AVAudioMixerNodeMBS

Function: The audio engines optional singleton main mixer node.
Notes: When the property is first accessed the audio engine constructs a singleton main mixer and connects it to
the outputNode on demand. You can then connect additional audio nodes to the mixer.

By default, the mixer’s output format (sample rate and channel count) will track the format of the output
node. It is possible to make the connection explicitly with a different format.
(Read only property)

18.5.24  outputNode as AVAudioOutputNodeMBS

Function: The audio engines singleton output audio node.
Notes:
When this property is first accessed the audio engine creates a singleton on demand. Connect another audio node to the input of the output audio node, or obtain a mixer that is connected by default, using the mainMixerNode property.

The AVAudioSession instance and/or the availability of hardware features determine whether an app can perform output. Check the output format of output node (specifically, the hardware format) for a non-zero sample rate and channel count to see if output is enabled.
(Read only property)

### 18.5.25 running as Boolean

**Function:** Returns the audio engines running state.
**Notes:**
The value is true if the audio engine is running, otherwise, false.
(Read only property)

### 18.5.26 Events

#### 18.5.27 ConfigurationChanged(notification as NSNotificationMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function:** Posted when the audio engine configuration changes.
**Notes:** When the audio engines I/O unit observes a change to the audio input or output hardwares channel count or sample rate, the audio engine stops, uninitializes itself, and issues this notification.
class AVAudioEnvironmentDistanceAttenuationParametersMBS

18.6.1 class AVAudioEnvironmentDistanceAttenuationParametersMBS

Function: The AVAudioEnvironmentDistanceAttenuationParameters class specifies the attenuation distance, the gradual loss in audio intensity, and characteristics.
Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

18.6.2 Methods

18.6.3 available as boolean

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

18.6.4 Constructor

Function: The private constructor.

18.6.5 Properties

18.6.6 distanceAttenuationModel as Integer

Function: The distance attenuation model describing the drop-off in gain as the source moves away from the listener.
Notes: The default value is the AVAudioEnvironmentDistanceAttenuationModelInverse attenuation model.
(Read and Write property)

18.6.7 Handle as Integer

Function: The internal object reference.
18.6.8 maximumDistance as Double

**Function:** The distance, in meters, beyond which no further attenuation is applied.  
**Notes:**  
The default value is 100000.0 meters.  
This property is relevant for the AVAudioEnvironmentDistanceAttenuationModelInverse attenuation model.  
(Read and Write property)

18.6.9 referenceDistance as Double

**Function:** The minimum distance, in meters, at which attenuation is applied.  
**Notes:**  
The default value is 1.0 meter.  
This property is relevant for the AVAudioEnvironmentDistanceAttenuationModelInverse and AVAudioEnvironmentDistanceAttenuationModelLinear attenuation models.  
(Read and Write property)

18.6.10 rolloffFactor as Double

**Function:** Determines the attenuation curve.  
**Notes:**  
A higher value results in a steeper attenuation curve. The default value is 1.0. The value must be greater than 0.0.  
This property is relevant for the AVAudioEnvironmentDistanceAttenuationModelExponential, AVAudioEnvironmentDistanceAttenuationModelInverse, and AVAudioEnvironmentDistanceAttenuationModelLinear attenuation models.  
(Read and Write property)
18.6.11 Constants

18.6.12 DistanceAttenuationModelExponential = 1

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the distance attenuation models. Notes: Calculated as distanceGain = (distance / referenceDistance) ^(-rolloffFactor).

18.6.13 DistanceAttenuationModelInverse = 2

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the distance attenuation models. Notes: Calculated as distanceGain = referenceDistance / (referenceDistance + rolloffFactor * (distance referenceDistance)).

18.6.14 DistanceAttenuationModelLinear = 3

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the distance attenuation models. Notes: Calculated as distanceGain = (1 rolloffFactor * (distance referenceDistance) / (maximumDistance referenceDistance)).
18.7. class AVAudioEnvironmentNodeMBS

18.7.1 class AVAudioEnvironmentNodeMBS

Function: The AVAudioEnvironmentNode class is a mixer node that simulates a 3D audio environment.

Notes:

Any node that conforms to the AVAudioMixing protocol (for example, AVAudioPlayerNode) can act as a source in this environment.

The environment has an implicit listener. By controlling the listeners position and orientation, the application controls the way the user experiences the virtual world. In addition, this node also defines properties for distance attenuation and reverberation that help characterize the environment.

It is important to note that only inputs with a mono channel connection format to the environment node are spatialized. If the input is stereo, the audio is passed through without being spatialized. Currently inputs with connection formats of more than 2 channels are not supported.

In order to set the environment nodes output to a multichannel format, use an AVAudioFormatMBS having one of the following Audio Channel Layout Tags.

- kAudioChannelLayoutTag_AudioUnit_4
- kAudioChannelLayoutTag_AudioUnit_5_0
- kAudioChannelLayoutTag_AudioUnit_6_0
- kAudioChannelLayoutTag_AudioUnit_7_0
- kAudioChannelLayoutTag_AudioUnit_7_0_Front
- kAudioChannelLayoutTag_AudioUnit_8

Subclass of the AVAudioNodeMBS class.

18.7.2 Methods

18.7.3 Constructor

Function: The constructor.
18.7.4 Properties

18.7.5 distanceAttenuationParameters as AVAudioEnvironmentDistanceAttenuationParametersMBS

Function: The distance attenuation parameters for the environment.
Notes: (Read only property)

18.7.6 nextAvailableInputBus as Integer

Function: Finds an unused input bus.
Notes: This method finds and returns the first input bus to which no other node is connected.
(Read only property)

18.7.7 obstruction as Double

Function: Simulates filtering of the direct path of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Only the direct path of sound between the source and listener are blocked.
The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.7.8 occlusion as Double

Function: Simulates filtering of the direct and reverb paths of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Both the direct and reverb paths of sound between the source and listener are blocked.
The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only
18.7. CLASS AVAUDIOENVIRONMENTNODEMBS

by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.7.9 outputVolume as Double

Function: The mixer’s output volume.
Notes:
This accesses the mixer’s output volume (0.0-1.0, inclusive).
(Read and Write property)

18.7.10 pan as Double

Function: The buss’s stereo pan.
Notes:
The default value is 0.0. A value in the range -1.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.7.11 position as AVAudio3DPointMBS

Function: The location of the source in the 3D environment.
Notes:
The coordinates are specified in meters. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.7.12 rate as Double

Function: Changes the playback rate of the input signal.
Notes:
A value of 2.0 results in the output audio playing one octave higher. A value of 0.5, results in the output audio playing one octave lower.
CHAPTER 18. AVFOUNDATIONNODE

The default value is 1.0. The range of valid values is 0.5 to 2.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.7.13 renderingAlgorithm as Integer

Function: Type of rendering algorithm used.
Notes:
Depending on the current output format of the AVAudioEnvironmentNode instance, only a subset of the rendering algorithms may be supported. An array of valid rendering algorithms is retrieved by calling the applicableRenderingAlgorithms function of the AVAudioEnvironmentNode instance.

The default rendering algorithm is AVAudio3DMixingRenderingAlgorithmEqualPowerPanning. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.7.14 reverbBlend as Double

Function: Controls the blend of dry and reverb processed audio.
Notes:
This property controls the amount of the sources audio that will be processed by the reverb by the AVAudioEnvironmentNode instance. A value of 0.5 will result in an equal blend of dry and processed (wet) audio.

The default is 0.0. The range of valid values is 0.0 (completely dry) to 1.0 (completely wet). This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.7.15 reverbParameters as AVAudioEnvironmentReverbParametersMBS

Function: The reverb parameters for the environment.
Notes: (Read only property)
18.7.16 volume as Double

**Function:** The buss’s input volume.

**Notes:**

The default value is 1.0. The range of valid values are 0.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode and AVAudioMixerNode class mixers.

(Read and Write property)
18.8  class AVAudioEnvironmentReverbParametersMBS

18.8.1  class AVAudioEnvironmentReverbParametersMBS

**Function:** The AVAudioEnvironmentReverbParameters class encapsulates the parameters that you use to control the reverb of the AVAudioEnvironmentNode class.

**Notes:**
Reverberation can be used to simulate the acoustic characteristics of an environment. The AVAudioEnvironmentNode class has a built-in reverb that describes the space that the listener is in.

The reverb also has a single filter that sits at the end of the chain. You can use this filter to shape the overall sound of the reverb. For instance, select one of the reverb presets to simulate the general space and then use the filter to brighten or darken the overall sound.

You cannot create a standalone instance of AVAudioEnvironmentReverbParameters. Only an instance vended by a source object, such as an AVAudioEnvironmentNode instance is valid.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

18.8.2  Methods

18.8.3  available as boolean

**Function:** Whether this class is available for use.
**Notes:** Should return true on OS X 10.10 and newer.

18.8.4  Constructor

**Function:** The private constructor.

18.8.5  loadFactoryReverbPreset(preset as Integer)

**Function:** Loads one of the reverbs factory presets.
**Notes:** Loading a factory reverb preset changes the sound of the reverb. This is independent of the filter which follows the reverb in the signal chain.
18.8.6 Properties

18.8.7 enable as Boolean

**Function:** Enables the reverberation.
**Notes:**
The default value is false.
(Read and Write property)

18.8.8 filterParameters as AVAudioUnitEQFilterParametersMBS

**Function:** The filter that applies to the output of the reverb.
**Notes:** (Read only property)

18.8.9 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

18.8.10 level as Double

**Function:** The master level, in decibels, of the reverb.
**Notes:**
The default value is 0.0. The values must be within the range of -40 to 40 dB.
(Read and Write property)
18.9 class AVAudioFileMBS

18.9.1 class AVAudioFileMBS

Function: The AVAudioFile class represents an audio file that can be opened for reading or writing.
Notes:
Regardless of the file's actual format, you read and write the file using AVAudioPCMBuffer objects, that contain samples in AVAudioCommonFormat, referred to as the file's processing format. Conversions are performed to and from the file's actual format.

Reads and writes are always sequential, but random access is possible by setting the framePosition property.

18.9.2 Methods

18.9.3 available as boolean

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

18.9.4 Constructor(File as FolderItem, byref error as NSErrorMBS)

Function: Opens a file for reading.
Notes:
file: The path of the file to read.
Error: Returns, by-reference, a description of the error, if an error occurs.
See also:

- 18.9.5 Constructor(File as FolderItem, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS) 3627
- 18.9.6 Constructor(File as FolderItem, settings as Dictionary, byref error as NSErrorMBS) 3627
- 18.9.7 Constructor(File as FolderItem, settings as Dictionary, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS) 3628
18.9. CLASS AV_AUDIOFILEMBS

18.9.5 Constructor(File as FolderItem, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS)

**Function:** Open a file for reading using a specified processing format.

**Notes:**
- file: The path of the file to read.
- format: The processing format to use when reading from the file.
- interleaved: Whether to use an interleaved processing format.
- Error: Returns, by-reference, a description of the error, if an error occurs.

Returns an initialized audio file object for reading.

The file format may be deinterleaved float, that is AVAudioPCMFormatFloat32. The processing format refers to the buffers read from the file. The content is read and converted from the file format to the processing format. The processing format must be at the same sample rate as the actual file contents and must be linear PCM, whether or not the processing buffer is interleaved float is determined by the interleaved parameter.

See also:
- 18.9.4 Constructor(File as FolderItem, byref error as NSErrorMBS) 3626
- 18.9.6 Constructor(File as FolderItem, settings as Dictionary, byref error as NSErrorMBS) 3627
- 18.9.7 Constructor(File as FolderItem, settings as Dictionary, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS) 3628

18.9.6 Constructor(File as FolderItem, settings as Dictionary, byref error as NSErrorMBS)

**Function:** Open a file for writing.

**Notes:**
- file: The path of the file to create for writing.
- settings: The format of the file to create. (See the settings property in the AVAudioRecorder class.)
- Error: Returns, by-reference, a description of the error, if an error occurs.

Returns an initialized audio file object for writing.

The file type to create is inferred from the file extension of fileURL. This method will overwrite a file at the specified URL if a file already exists.
The file is opened for writing using the standard format, AVAudioPCMFormatFloat32.

See also:
- 18.9.4 Constructor(File as FolderItem, byref error as NSErrorMBS) 3626
- 18.9.5 Constructor(File as FolderItem, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS) 3627
- 18.9.7 Constructor(File as FolderItem, settings as Dictionary, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS) 3628

18.9.7 Constructor(File as FolderItem, settings as Dictionary, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS)

Function: Open a file for writing using a specified processing format.
Notes:
file: The path to write the file.
settings: The format of the file to create.
format: The processing format to use when writing to the file.
interleaved: Whether to use an interleaved processing format.
Error: Returns, by-reference, a description of the error, if an error occurs.

Returns an initialized audio file object for writing.

The file type to create is inferred from the file extension of file.
This method will overwrite a file at the specified URL if a file already exists.
See also:
- 18.9.4 Constructor(File as FolderItem, byref error as NSErrorMBS) 3626
- 18.9.5 Constructor(File as FolderItem, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS) 3627
- 18.9.6 Constructor(File as FolderItem, settings as Dictionary, byref error as NSErrorMBS) 3627

18.9.8 fileDuration(file as folderItem) as Double

MBS AVFoundation Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Queries duration of an audio file.
Notes:
This uses different AVAudioFile API than rest of AVAudioFileMBS class.
We discovered a bug in Apples frameworks to report wrong length for some MP3 files and this function seems to be closer to the real duration of the file.
18.9. CLASS AVAUDIOFILEMBS

18.9.9 readIntoBuffer(buffer as AVAudioPCMBufferMBS, byref error as NSErrorMBS) as Boolean

**Function:** The buffer from which to read into the file.

**Notes:**

buffer: The buffer from which to read the file. Its format must match the files processing format.

Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true, if the read was successful; otherwise false.

Reading sequentially from the framePosition property, attempts to fill the buffer to its capacity. On return, the buffers length property indicates the number of sample frames successfully read.

See also:

- 18.9.10 readIntoBuffer(buffer as AVAudioPCMBufferMBS, frameCount as Integer, byref error as NSErrorMBS) as Boolean

18.9.10 readIntoBuffer(buffer as AVAudioPCMBufferMBS, frameCount as Integer, byref error as NSErrorMBS) as Boolean

**Function:** Read a portion of a buffer.

**Notes:**

buffer: The buffer from which to read the file. Its format must match the files processing format.

frames: The number of frames to read.

Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true, if the read was successful; otherwise false.

Like the read method, but can be used to read fewer frames than the buffer frameCapacity.

See also:

- 18.9.9 readIntoBuffer(buffer as AVAudioPCMBufferMBS, byref error as NSErrorMBS) as Boolean

18.9.11 writeFromBuffer(buffer as AVAudioPCMBufferMBS, byref error as NSErrorMBS) as Boolean

**Function:** Write a buffer.

**Notes:**
buffer: The buffer from which to write to the file. Its format must match the files processing format.
Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true, if the read was successful.

Writes sequentially. The buffer’s frameLength signifies how much of the buffer is to be written.

18.9.12 Properties

18.9.13 fileFormat as AVAudioFormatMBS

Function: The on-disk format of the file.
Notes: (Read only property)

18.9.14 FramePosition as Int64

Function: The position in the file at which the next read or write operation will occur.
Notes:
Set the framePosition property to perform a seek before a read or write. A read or write operation advances the frame position value by the number of frames read or written.
(Read and Write property)

18.9.15 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

18.9.16 Length as Int64

Function: The number of sample frames in the file.
Notes:
This can be computationally expensive to compute for the first time.
(Read only property)
18.9.17 processingFormat as AVAudioFormatMBS

**Function:** The processing format of the file.

**Notes:** (Read only property)

18.9.18 URL as String

**Function:** The URL the file is reading or writing.

**Notes:** (Read only property)
18.10 class AVAudioFormatMBS

18.10.1 class AVAudioFormatMBS

**Function:** The AVAudioFormat class wraps a Core Audio AudioStreamBasicDescription struct, with convenience initializers and accessors for common formats, including Core Audios standard deinterleaved 32-bit floating point format.
**Notes:** Instances of this class are immutable.

18.10.2 Methods

18.10.3 available as boolean

**Function:** Whether this class is available for use.
**Notes:** Should return true on OS X 10.10 and newer.

18.10.4 Constructor(format as Integer, sampleRate as Double, channels as Integer, interleaved as Boolean)

**Function:** Initializes a newly allocated audio format instance.
**Notes:**
- format: The audio format. See AVAudioCommonFormat for values.
- sampleRate: The sample rate, in hertz.
- channels: The channel count.
- interleaved: True if the audio format is interleaved; otherwise false.

See also:
- 18.10.5 Constructor(format as Integer, sampleRate as Double, interleaved as Boolean, layout as AVAudioChannelLayoutMBS)
- 18.10.6 Constructor(sampleRate as Double, channels as Integer)
- 18.10.7 Constructor(sampleRate as Double, layout as AVAudioChannelLayoutMBS)
- 18.10.8 Constructor(Settings as Dictionary)
18.10. **CLASS AVAUDIOFORMATMBS**

18.10.5 **Constructor(format as Integer, sampleRate as Double, interleaved as Boolean, layout as AVAudioChannelLayoutMBS)**

**Function:** Initializes a newly allocated audio format instance with the specified auto format, sample rate, interleaved format and channel layout.

**Notes:**

- format: The audio format. See AVAudioCommonFormat for values.
- sampleRate: The sample rate, in hertz.
- interleaved: True if the audio format is interleaved; otherwise false.
- layout: The channel layout. Must not be nil.

See also:

- 18.10.4 Constructor(format as Integer, sampleRate as Double, channels as Integer, interleaved as Boolean) 3632
- 18.10.6 Constructor(sampleRate as Double, channels as Integer) 3633
- 18.10.7 Constructor(sampleRate as Double, layout as AVAudioChannelLayoutMBS) 3634
- 18.10.8 Constructor(Settings as Dictionary) 3634

18.10.6 **Constructor(sampleRate as Double, channels as Integer)**

**Function:** Initializes a newly allocated audio format instance with the specified sample rate and channel count.

**Notes:**

- sampleRate: The sample rate, in hertz.
- channels: The channel count.

The returned AVAudioFormat instance uses the AVAudioPCMFormatFloat32 format.

See also:

- 18.10.4 Constructor(format as Integer, sampleRate as Double, channels as Integer, interleaved as Boolean) 3632
- 18.10.5 Constructor(format as Integer, sampleRate as Double, interleaved as Boolean, layout as AVAudioChannelLayoutMBS) 3633
- 18.10.7 Constructor(sampleRate as Double, layout as AVAudioChannelLayoutMBS) 3634
- 18.10.8 Constructor(Settings as Dictionary) 3634
18.10.7 Constructor(sampleRate as Double, layout as AVAudioChannelLayoutMBS)

**Function:** Initializes a newly allocated audio format instance as a deinterleaved float with the specified sample rate and channel layout.

**Example:**

```vbnet
Function StereoFormat() As AVAudioFormatMBS
    // stereo format with standard layout tag
    dim qlayout as new QTAudioChannelLayoutMBS
    qlayout.ChannelLayoutTag = QTAudioChannelLayoutMBS.kAudioChannelLayoutTag_Stereo

    dim layout as new AVAudioChannelLayoutMBS(qlayout)
    dim pf as new AVAudioFormatMBS(44100, layout)

    Return pf
End Function
```

**Notes:**

- sampleRate: The sample rate, in hertz.
- layout: The channel layout. Must not be nil.

The returned AVAudioFormat instance uses the AVAudioPCMFormatFloat32 format.

See also:

- 18.10.4 Constructor(format as Integer, sampleRate as Double, channels as Integer, interleaved as Boolean) 3632
- 18.10.5 Constructor(format as Integer, sampleRate as Double, interleaved as Boolean, layout as AVAudioChannelLayoutMBS) 3633
- 18.10.6 Constructor(sampleRate as Double, channels as Integer) 3633
- 18.10.8 Constructor(Settings as Dictionary) 3634

18.10.8 Constructor(Settings as Dictionary)

**Function:** Initializes a newly allocated audio format instance using a settings dictionary.

**Notes:**

- settings: The settings dictionary. See AV Foundation Audio Settings Constants for supported key/value pairs.
Many settings dictionary elements pertain to encoder settings, not the basic format, and will be ignored. See also:

- 18.10.4 Constructor(format as Integer, sampleRate as Double, channels as Integer, interleaved as Boolean) 3632
- 18.10.5 Constructor(format as Integer, sampleRate as Double, interleaved as Boolean, layout as AVAudioChannelLayoutMBS) 3633
- 18.10.6 Constructor(sampleRate as Double, channels as Integer) 3633
- 18.10.7 Constructor(sampleRate as Double, layout as AVAudioChannelLayoutMBS) 3634

18.10.9  isEqual(other as AVAudioFormatMBS) as boolean

Function: Returns a Boolean value that indicates whether the audio format instance and a given object have identical format settings.
Notes:
object: The object to be compared.

Returns true if the receiver and object are equal, otherwise false.

This method defines what it means for instances to be equal. The two objects are considered equal if and only if they return identical values for all the settings.

18.10.10  Properties

18.10.11  channelCount as Integer

Function: The number of channels of audio data.
Notes: (Read only property)

18.10.12  channelLayout as AVAudioChannelLayoutMBS

Function: The underlying audio channel layout.
Notes:
The value is the underlying AVAudioChannelLayout instance.
(Read only property)
18.10.13 commonFormat as Integer

Function: Returns the common format identifier.
Notes: (Read only property)

18.10.14 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

18.10.15 Interleaved as Boolean

Function: Describes whether the samples are interleaved.
Notes: For non-PCM formats, this value is undefined.
(Read only property)

18.10.16 sampleRate as Double

Function: The audio format sampling rate in hertz.
Notes: (Read only property)

18.10.17 settings as Dictionary

Function: The format represented as a dictionary with keys from AVAudioSettings.
Notes: Not all formats representable by an AudioStreamBasicDescription struct (the underlying implementation) can be represented in a settings dictionary; in that case, nil is returned.
(Read only property)
18.10. CLASS AVAUDIOFORMATMBS

18.10.18 Standard as Boolean

**Function:** Describes whether the format is deinterleaved native-endian float.
**Notes:**
True if the format is deinterleaved native-endian float (AVAudioPCMFormatFloat32), otherwise false.
(Read only property)

18.10.19 Constants

18.10.20 AVAudioOtherFormat = 0

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the common audio formats.
**Notes:** A format which is not 16/32bit integer or 32/64bit float.

18.10.21 AVAudioPCMFormatFloat32 = 1

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the common audio formats.
**Notes:** Native-endian floats. This is the standard format.

18.10.22 AVAudioPCMFormatFloat64 = 2

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the common audio formats.
**Notes:** Native-endian doubles.

18.10.23 AVAudioPCMFormatInt16 = 3

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the common audio formats.
**Notes:** Signed 16-bit native-endian integers.

18.10.24 AVAudioPCMFormatInt32 = 4

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the common audio formats.
**Notes:** Signed 32-bit native-endian integers.
18.11 class AVAudioInputNodeMBS

18.11.1 class AVAudioInputNodeMBS

Function: The AVAudioInputNode class represents a node that connects to the system’s audio input.
Notes:
This node has one element. The format of the input scope reflects the audio hardware sample rate and
channel count. The format of the output scope is initially the same as that of the input, but you may set it
to a different format, in which case the node will convert.
Subclass of the AVAudioIONodeMBS class.

18.11.2 Methods

18.11.3 Constructor

Function: The private constructor.

18.11.4 Properties

18.11.5 obstruction as Double

Function: Simulates filtering of the direct path of sound due to an obstacle.
Notes:
The value of obstruction is in decibels. Only the direct path of sound between the source and listener are
blocked.
The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only
by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.11.6 occlusion as Double

Function: Simulates filtering of the direct and reverb paths of sound due to an obstacle.
Notes:
The value of obstruction is in decibels. Both the direct and reverb paths of sound between the source and listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.11.7  pan as Double

Function: The buss’s stereo pan.
Notes:
The default value is 0.0. A value in the range -1.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.11.8  position as AVAudio3DPointMBS

Function: The location of the source in the 3D environment.
Notes:
The coordinates are specified in meters. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.11.9  rate as Double

Function: Changes the playback rate of the input signal.
Notes:
A value of 2.0 results in the output audio playing one octave higher. A value of 0.5, results in the output audio playing one octave lower.

The default value is 1.0. The range of valid values is 0.5 to 2.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)
CHAPTER 18. AVFOUNDATIONNODE

18.11.10 renderingAlgorithm as Integer

Function: Type of rendering algorithm used.

Notes:

Depending on the current output format of the AVAudioEnvironmentNode instance, only a subset of the rendering algorithms may be supported. An array of valid rendering algorithms is retrieved by calling the applicableRenderingAlgorithms function of the AVAudioEnvironmentNode instance.

The default rendering algorithm is AVAudio3DMixingRenderingAlgorithmEqualPowerPanning. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.

The rendering algorithms differ in terms of quality and cpu cost. AVAudio3DMixingRenderingAlgorithmEqualPowerPanning is the simplest panning algorithm and also the least expensive computationally.

If the AVAudioEnvironmentNode instance is set to a multichannel output format, only certain rendering algorithms know how to render to all of the output channels (currently AVAudio3DMixingRenderingAlgorithmSoundField). If any of the other rendering algorithms are selected, the AVAudioEnvironmentNode instance will render to only the first two output channels.

With the exception of AVAudio3DMixingRenderingAlgorithmSoundField, while the mixer is rendering to multi channel hardware, audio data will only be rendered to channels 1 & 2. (Read and Write property)

18.11.11 reverbBlend as Double

Function: Controls the blend of dry and reverb processed audio.

Notes:

This property controls the amount of the sources audio that will be processed by the reverb by the AVAudioEnvironmentNode instance. A value of 0.5 will result in an equal blend of dry and processed (wet) audio.

The default is 0.0. The range of valid values is 0.0 (completely dry) to 1.0 (completely wet). This property is currently implemented only by the AVAudioEnvironmentNode class mixer. (Read and Write property)
18.11. CLASS AVAUDIOINPUTNODEMBS

18.11.12 volume as Double

Function: The buss’s input volume.

Notes:
The default value is 1.0. The range of valid values are 0.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode and AVAudioMixerNode class mixers.
(Read and Write property)

18.11.13 Constants

18.11.14 RenderingAlgorithmEqualPowerPanning = 0

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the types of rendering algorithms available per input bus of the environment node.

Notes: Pans the data of the mixer bus into a stereo field. This algorithm is analogous to the pan knob found on a mixing board channel strip.

18.11.15 RenderingAlgorithmHRTF = 2

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the types of rendering algorithms available per input bus of the environment node.

Notes: The Head Related Transfer Function is a high quality algorithm using filtering to emulate 3 dimensional space in headphones. HRTF is a cpu intensive algorithm.

18.11.16 RenderingAlgorithmSoundField = 3

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the types of rendering algorithms available per input bus of the environment node.

Notes: Designed for rendering to multi channel hardware. The mixer takes data being rendered with SoundField and distributes it amongst all the output channels with a weighting toward the location in which the sound derives. It is very effective for ambient sounds, which may derive from a specific location in space, yet should be heard through the listeners entire space.

18.11.17 RenderingAlgorithmSphericalHead = 1

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the types of rendering algorithms available per input bus of the environment node.

Notes: Designed to emulate 3 dimensional space in headphones by simulating inter-aural time delays and
other spatial cues. This algorithm is slightly less CPU intensive than AVAudio3DMixingRenderingAlgorithmHRTF.

18.11.18 RenderingAlgorithmStereoPassThrough = 5

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the types of rendering algorithms available per input bus of the environment node. **Notes:** This algorithm should be used when no localization is desired for the source data. Setting this algorithm tells the mixer to take mono/stereo input and pass it directly to channels 1 & 2 without localization.
18.12. class AVAudioIONodeMBS

18.12.1. class AVAudioIONodeMBS

Function: The AVAudioIONode class is the base class for nodes that connects to the system’s audio input
or output.
Notes: Subclass of the AVAudioNodeMBS class.

18.12.2. Methods

18.12.3. Constructor

Function: The private constructor.

18.12.4. Properties

18.12.5. audioUnit as Integer

Function: The node’s underlying audio unit, if any.
Notes: Value is the handle.
(Read only property)

18.12.6. presentationLatency as Double

Function: The presentation, or hardware, latency.
Notes: (Read only property)
18.13 class AVAudioMixerNodeMBS

18.13.1 class AVAudioMixerNodeMBS

Function: The AVAudioMixerNode class represents a node that mixes its inputs to a single output.
Notes:
Mixers may have any number of inputs. The mixer node accepts input at any sample rate and efficiently combines sample rate conversions. It also accepts any channel count and will correctly upmix or downmix to the output channel count.
Subclass of the AVAudioNodeMBS class.

18.13.2 Methods

18.13.3 Constructor

Function: The constructor.

18.13.4 Properties

18.13.5 nextAvailableInputBus as Integer

Function: Returns an unused input bus.
Notes:
This method finds and returns the first input bus to which no other node is connected.
(Read only property)

18.13.6 obstruction as Double

Function: Simulates filtering of the direct path of sound due to an obstacle.
Notes:
The value of obstruction is in decibels. Only the direct path of sound between the source and listener are blocked.
The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only
18.13. CLASS AVAUDIOMIXERNODEMBS

by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.13.7 occlusion as Double

Function: Simulates filtering of the direct and reverb paths of sound due to an obstacle.
Notes:
The value of obstruction is in decibels. Both the direct and reverb paths of sound between the source and
listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only
by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.13.8 pan as Double

Function: The buss’s stereo pan.
Notes:
The default value is 0.0. A value in the range -1.0 to 1.0. This property is currently implemented only by
the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.13.9 position as AVAudio3DPointMBS

Function: The location of the source in the 3D environment.
Notes:
The coordinates are specified in meters. This property is currently implemented only by the AVAudioEnvi-
ronmentNode class mixer.
(Read and Write property)

18.13.10 rate as Double

Function: Changes the playback rate of the input signal.
Notes:

A value of 2.0 results in the output audio playing one octave higher. A value of 0.5, results in the output audio playing one octave lower.

The default value is 1.0. The range of valid values is 0.5 to 2.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.13.11 renderingAlgorithm as Integer

Function: Type of rendering algorithm used.
Notes:

Depending on the current output format of the AVAudioEnvironmentNode instance, only a subset of the rendering algorithms may be supported. An array of valid rendering algorithms is retrieved by calling the applicableRenderingAlgorithms function of the AVAudioEnvironmentNode instance.

The default rendering algorithm is AVAudio3DMixingRenderingAlgorithmEqualPowerPanning. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.13.12 reverbBlend as Double

Function: Controls the blend of dry and reverb processed audio.
Notes:

This property controls the amount of the sources audio that will be processed by the reverb by the AVAudioEnvironmentNode instance. A value of 0.5 will result in an equal blend of dry and processed (wet) audio.

The default is 0.0. The range of valid values is 0.0 (completely dry) to 1.0 (completely wet). This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.13.13 volume as Double

Function: The buss’s input volume.
Notes:
The default value is 1.0. The range of valid values are 0.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode and AVAudioMixerNode class mixers. (Read and Write property)
18.14 class AVAudioNodeMBS

18.14.1 class AVAudioNodeMBS

Function: The AVAudioNode class is an abstract class for an audio generation, processing, or I/O block.

Notes:

AVAudioEngine objects contain instances of various AVAudioNode subclasses. This base class provides certain common functionality.

Nodes have input and output busses, which can be thought of as connection points. For example, an effect typically has one input bus and one output bus. A mixer typically has multiple input busses and one output bus.

Busses have formats, expressed in terms of sample rate and channel count. When making connections between nodes, often the format must match exactly. However, there are exceptions such as the AVAudioMixerNode and AVAudioOutputNode classes.

Nodes do not currently provide useful functionality until attached to an engine. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

18.14.2 Methods

18.14.3 available as boolean

Function: Whether this class is available for use.

Notes: Should return true on OS X 10.10 and newer.

18.14.4 Constructor

Function: The private constructor.

18.14.5 inputFormatForBus(busIndex as Integer) as AVAudioFormatMBS

Function: Returns the input format for the specified bus.
18.14. CLASS AVAUDIONODEMBS

Notes: Returns an AVAudioFormatMBS object representing the input format of the bus.

18.14.6  installTapOnBus(busIndex as Integer, bufferSize as UInt32 = 0, format as AVAudioFormatMBS = nil, tag as Variant = nil)

Function: Installs an audio tap on the bus to record, monitor, and observe the output of the node.
Notes:
bus: The node output bus to which to attach the tap.
bufferSize: The requested size of the incoming buffers. The implementation may choose another size.
format: If non-nil, attempts to apply this as the format of the specified output bus.

This should only be done when attaching to an output bus which is not connected to another node; an error will result otherwise. The tap and connection formats (if non-nil) on the specified bus should be identical. Otherwise, the latter operation will override any previously set format.

For AVAudioOutputNode, tap format must be specified as nil.

The plugin calls the Tap event with the data periodically.

Only one tap may be installed on any bus. Taps may be safely installed and removed while the engine is running.

18.14.7  nameForInputBus(busIndex as Integer) as string

Function: The name of an input bus.

18.14.8  nameForOutputBus(busIndex as Integer) as string

Function: The name of the output bus.

18.14.9  outputFormatForBus(busIndex as Integer) as AVAudioFormatMBS

Function: Returns the output format for the specified bus.
CHAPTER 18. AVFOUNDATIONNODE

Notes: Returns an AVAudioFormatMBS object representing the input format of the bus.

18.14.10 removeTapOnBus(busIndex as Integer)

Function: Removes an audio tap on a bus.
Notes: bus: The node output bus whose tap is to be removed.

18.14.11 reset

Function: Clear a unit’s previous processing state.

18.14.12 Properties

18.14.13 engine as AVAudioEngineMBS

Function: The audio engine of the node.
Notes:
Returns nil if the node is not attached to an audio engine.
(Read only property)

18.14.14 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

18.14.15 lastRenderTime as AVAudioTimeMBS

Function: The time for which the node most recently rendered.
Notes:
Return nil if the engine is not running or if the node is not connected to an input or output node.
(Read only property)
18.14.16  **numberOfInputs** as Integer

**Function:** The number of input busses for the node.
**Notes:** (Read only property)

18.14.17  **numberOfOutputs** as Integer

**Function:** The number of output busses for the node.
**Notes:** (Read only property)

18.14.18  **Events**

18.14.19  **Tap**(bus as Integer, bufferSize as UInt32, format as AVAudioFormatMBS, buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, tag as Variant)

MBS AVFoundation Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function:** The tap event.
**Notes:** Called after using installTapOnBus periodically.
18.15 class AVAudioOutputNodeMBS

Function: The AVAudioOutputNode class represents a audio node that connects to the system’s audio output.
Notes:
This audio node has one element. The format of the output scope reflects the audio hardware sample rate and channel count. The format of the input scope is initially the same as that of the output, but you may set it to a different format, in which case the audio node will convert.
Subclass of the AVAudioIONodeMBS class.

18.15.2 Methods

18.15.3 Constructor

Function: The private constructor.

18.15.4 Properties

18.15.5 CurrentDeviceID as UInt32

Function: Get or set the current device.
Notes:
Please check OutputDevices dictionary for which devices are available.
(Read and Write property)

18.15.6 DefaultDeviceID as UInt32

Function: Queries the Core Audio ID of the default device.
Notes: (Read only property)
18.15.7 OutputDevices as Dictionary

Function: Queries a dictionary with output devices.
Notes:

Key is the ID and value is the name of the device.
(Read only property)
18.16 class AVAudioPCMBufferMBS

18.16.1 class AVAudioPCMBufferMBS

**Function:** The AVAudioPCMBuffer class is a subclass of AVAudioBuffer for use with PCM audio formats.

**Notes:**
The PCM buffer class also provides methods useful for manipulating buffers of audio in PCM format. Subclass of the AVAudioBufferMBS class.

18.16.2 Methods

18.16.3 Constructor(format as AVAudioFormatMBS, frameCapacity as Integer)

**Function:** Initializes a newly allocated PCM audio buffer instance for PCM audio data.

**Notes:**
- format: The format of the PCM audio to be contained in the buffer.
- frameCapacity: The capacity of the buffer in PCM sample frames.

18.16.4 floatChannelDataCopy(ChannelIndex as Integer) as Memoryblock

**Function:** Copies buffer’s audio samples as floating point values.

**Notes:** Returns memoryblock with samples only for the given channel.

18.16.5 int16ChannelDataCopy(ChannelIndex as Integer) as Memoryblock

**Function:** Copies buffer’s audio samples as 16-bit integer point values.

**Notes:** Returns memoryblock with samples only for the given channel.

18.16.6 int32ChannelDataCopy(ChannelIndex as Integer) as Memoryblock

**Function:** Copies buffer’s audio samples as 32-bit integer point values.
18.16. **CLASS AVAUDIOPCMBUFFERMBS**

**Notes:** Returns memoryblock with samples only for the given channel.

### 18.16.7 level(ChannelIndex as Integer) as Double

**Function:** Calculates level for a channel.

**Notes:**
Value returned is between around 0.0 (nothing) to 1.0 (maximum).
Negative values are for errors.

### 18.16.8 Properties

#### 18.16.9 floatChannelData as Ptr

**Function:** The buffer's audio samples as floating point values.

**Notes:**
The floatChannelData property returns pointers to the buffers audio samples, if the buffers format is 32-bit float. It returns nil if it is another format.

The returned pointer is to format.channelCount pointers to float. Each of these pointers is to frameLength valid samples, which are spaced by stride samples.

If the format is not interleaved, as with the standard deinterleaved float format, then the pointers will be to separate chunks of memory and the stride property value is 1.

If the format is interleaved, then the pointers will refer to the same buffer of interleaved samples, each offset by 1 frame, and the stride property value is the number of interleaved channels.  
(Read only property)

#### 18.16.10 frameCapacity as Integer

**Function:** The buffer's capacity, in audio sample frames.

**Notes:** (Read only property)
18.16.11  frameLength as Integer

**Function:** The current number of valid sample frames in the buffer.
**Notes:**
You may modify the length of the buffer as part of an operation that modifies its contents. The length must be less than or equal to the frameCapacity. Modifying frameLength will update the mDataByteSize field in each of the underlying AudioBufferList structs AudioBuffer struct correspondingly, and vice versa. Note that in the case of deinterleaved formats, the mDataByteSize field will refer the size of one channels worth of audio samples.

The length must be less than or equal to the frameCapacity. In the case of deinterleaved formats, frameCapacity will refer to the size of one channels worth of audio samples.

(Read and Write property)

18.16.12  int16ChannelData as Ptr

**Function:** Access the buffer’s 16bit integer audio samples.
**Notes:**
The int16ChannelData property returns the buffer’s audio samples if the buffer’s format has 2-byte integer samples, or nil if it is another format.

See floatChannelData for more information.

(Read only property)

18.16.13  int32ChannelData as Ptr

**Function:** Access the buffer’s 32-bit integer audio samples.
**Notes:**
The int32ChannelData property returns the buffer’s audio samples if the buffer’s format has 4-byte integer samples, or nil if it is another format.

See floatChannelData for more information.

(Read only property)
18.16.14 stride as Integer

**Function:** The buffer’s number of interleaved channels.
**Notes:** (Read only property)
18.17 class AVAudioPlayerNodeMBS

18.17.1 class AVAudioPlayerNodeMBS

**Function:** The AVAudioPlayerNode class plays buffers or segments of audio files.

**Notes:**

AVAudioPlayerNode supports scheduling the playback of AVAudioBuffer instances, or segments of audio files opened via AVAudioFile. Buffers and segments may be scheduled at specific points in time, or to play immediately following preceding segments.

Normally, you will want to configure the nodes output format with the same number of channels as are in the files and buffers to be played. Otherwise, channels will be dropped or added as required. It is usually better to use an AVAudioMixerNode to do this.

Similarly, when playing file segments, the node will sample rate convert if necessary, but it is often preferable to configure the nodes output sample rate to match that of the file(s) and use a mixer to perform the rate conversion.

When playing buffers, there is an implicit assumption that the buffers are at the same sample rate as the nodes output format.

This class overrides the AVAudioNode method reset and unschedules all previously scheduled buffers and file segments, and also returns the player timeline to sample time 0.

**Player Timeline**

The usual AVAudioNode sample times (as observed by lastRenderTime) have an arbitrary zero point. AVAudioPlayerNode superimposes a second player timeline on top of this, to reflect when the player was started, and intervals during which it was paused. The methods nodeTimeForPlayerTime and playerTimeForNodeTime convert between the two.

**Scheduling Playback Time**

The scheduleBuffer, scheduleFile, and scheduleSegment methods take an AVAudioTime when parameter. This is interpreted as follows:

- If the when parameter is nil:
  - If there have been previous commands, the new one is played immediately following the last one.
  - Otherwise, if the node is playing, the event is played in the very near future.
  - Otherwise, the command is played at sample time 0.
- If the when parameter is a sample time, the parameter is interpreted as such.
18.17. CLASS AVAUDIOPLAYERNODEMBS

- If the when parameter is a host time it is ignored unless sample time not valid.

The scheduling methods will fail if:

- A buffer’s channel count does not match that of the node’s output format.
- A file can’t be accessed.
- An AVAudioTime specifies neither a valid sample time or host time.
- A segment’s start frame or frame count is negative.

Subclass of the AVAudioNodeMBS class.

18.17.2 Methods

18.17.3 Constructor

Function: The constructor.

18.17.4 nodeTimeForPlayerTime(playerTime as AVAudioTimeMBS) as AVAudioTimeMBS

Function: Convert from player time to node time.
Notes:
playerTime: A time relative to the players start time.

Returns a node time.

This method and its inverse playerTimeForNodeTime are discussed in The Player Timeline. If the player is not playing when this method is called, nil is returned.

18.17.5 pause

Function: Pause playback.
Notes: The player’s sample time does not advance while the node is paused.
18.17.6  play

**Function:** Start or resume playback immediately.
**Notes:** This is equivalent to playAtTime with a value of nil.

18.17.7  playAtTime(time as AVAudioTimeMBS = nil)

**Function:** Start or resume playback at a specific time.
**Notes:**
when: The node time at which to start or resume playback. Passing nil starts playback immediately.

This node is initially paused. Requests to play buffers or file segments are enqueued, and any necessary decoding begins immediately. Playback does not begin, however, until the player has started playing, via this method.

18.17.8  playerTimeForNodeTime(nodeTime as AVAudioTimeMBS) as AVAudioTimeMBS

**Function:** Convert from node time to player time.
**Notes:**
nodeTime: The node time.

Returns a time relative to the players start time.

This method and its inverse nodeTimeForPlayerTime are discussed in The Player Timeline. If the player is not playing when this method is called, nil is returned.

18.17.9  prepareWithFrameCount(frameCount as UInt32)

**Function:** Prepares previously scheduled file regions or buffers for playback.
**Notes:** frameCount: The number of sample frames of data to be prepared before returning.
18.17.10  scheduleBuffer(buffer as AVAudioPCMBufferMBS, tag as Variant = nil)

Function: Schedule playing samples from an audio buffer.
Notes:

buffer: The buffer to play.

Calls scheduleBufferCompleted event later when playback is done.
time will be nil and options be zero in that case.

Schedules the buffer to be played following any previously scheduled commands.
See also:

• 18.17.11 scheduleBuffer(buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, options as Integer, tag as Variant = nil) 3661

18.17.11  scheduleBuffer(buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, options as Integer, tag as Variant = nil)

Function: Schedule playing samples from an audio buffer at the specified time and with the specified playback options.
Notes:

buffer: The buffer to play.
when: The time at which to play the buffer.
options: Playback options.

Calls later scheduleBufferCompleted event after the buffer has completely played or the player is stopped.
See also:

• 18.17.10 scheduleBuffer(buffer as AVAudioPCMBufferMBS, tag as Variant = nil) 3661

18.17.12  scheduleFile(file as AVAudioFileMBS, time as AVAudioTimeMBS, tag as Variant = nil)

Function: Schedule playing of an entire audio file.
Notes:

file: The file to play.
when: The time at which to play the buffer.
Calls later scheduleFileCompleted event when playback is done.

18.17.13  **scheduleSegment**(file as AVAudioFileMBS, time as AVAudioTimeMBS, startFrame as Int64, frameCount as Int64, tag as Variant = nil)

*Function*: Schedule playing a segment of an audio file.
*Notes*: 
file: The audio file of the file to play.
startFrame: The starting frame position in the stream.
frameCount: The number of frames to play.
when: The time at which to play the buffer.

Calls later scheduleSegmentCompleted event.

18.17.14  **stop**

*Function*: Clear all of the node's previously scheduled events and stop playback.
*Notes*: All of the nodes previously scheduled events are cleared, including any that are in the middle of playing. The nodes sample time (and therefore the times to which new events are to be scheduled) is reset to 0, and will not proceed until the node is started again by sending a play or playAtTime message.

18.17.15  **Properties**

18.17.16  **obstruction as Double**

*Function*: Simulates filtering of the direct path of sound due to an obstacle.
*Notes*: 
The value of obstruction is in decibels. Only the direct path of sound between the source and listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
*(Read and Write property)*
18.17.17  occlusion as Double

Function: Simulates filtering of the direct and reverb paths of sound due to an obstacle.
Notes:
The value of obstruction is in decibels. Both the direct and reverb paths of sound between the source and listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.17.18  pan as Double

Function: The buss's stereo pan.
Notes:
The default value is 0.0. A value in the range -1.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.17.19  Playing as Boolean

Function: Indicates whether or not the player is playing.
Notes: (Read only property)

18.17.20  position as AVAudio3DPointMBS

Function: The location of the source in the 3D environment.
Notes:
The coordinates are specified in meters. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)
18.17.21 rate as Double

Function: Changes the playback rate of the input signal.
Notes:
A value of 2.0 results in the output audio playing one octave higher. A value of 0.5, results in the output audio playing one octave lower.

The default value is 1.0. The range of valid values is 0.5 to 2.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.17.22 renderingAlgorithm as Integer

Function: Type of rendering algorithm used.
Notes:
Depending on the current output format of the AVAudioEnvironmentNode instance, only a subset of the rendering algorithms may be supported. An array of valid rendering algorithms is retrieved by calling the applicableRenderingAlgorithms function of the AVAudioEnvironmentNode instance.

The default rendering algorithm is AVAudio3DMixingRenderingAlgorithmEqualPowerPanning. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.17.23 reverbBlend as Double

Function: Controls the blend of dry and reverb processed audio.
Notes:
This property controls the amount of the sources audio that will be processed by the reverb by the AVAudioEnvironmentNode instance. A value of 0.5 will result in an equal blend of dry and processed (wet) audio.

The default is 0.0. The range of valid values is 0.0 (completely dry) to 1.0 (completely wet). This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)
18.17. **CLASS AVAUDIOPLAYERNODEMBS**

18.17.24 **volume as Double**

**Function:** The buss’s input volume.  
**Notes:**  
The default value is 1.0. The range of valid values are 0.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode and AVAudioMixerNode class mixers.  
(Read and Write property)

18.17.25 **Events**

18.17.26 **scheduleBufferCompleted(buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, options as Integer, tag as Variant)**

MBS AVFoundation Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Called after the buffer has completely played or the player is stopped.

18.17.27 **scheduleFileCompleted(file as AVAudioFileMBS, time as AVAudioTimeMBS, tag as Variant)**

MBS AVFoundation Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Called after the file has completely played or the player is stopped.

18.17.28 **scheduleSegmentCompleted(file as AVAudioFileMBS, startFrame as Int64, frameCount as Int64, time as AVAudioTimeMBS, tag as Variant)**

MBS AVFoundation Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Called after the segment has completely played or the player is stopped.

18.17.29 **Constants**

18.17.30 **AVAudioPlayerNodeBufferInterrupts = 2**

MBS AVFoundation Plugin, Plugin Version: 15.3.  
**Function:** One of the flags to control buffer scheduling.  
**Notes:** The buffer interrupts any buffer already playing.
18.17.31 AVAudioPlayerNodeBufferInterruptsAtLoop = 4

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the flags to control buffer scheduling. **Notes:** The buffer interrupts any buffer already playing, at its loop point.

18.17.32 AVAudioPlayerNodeBufferLoops = 1

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the flags to control buffer scheduling. **Notes:** The buffer loops indefinitely.
18.18. CLASS AVAUDIOTIMEMBS

18.18 class AVAudioTimeMBS

18.18.1 class AVAudioTimeMBS

Function: The AVAudioTime class is used by AVAudioEngine to represent time.
Notes: Instances of the class are immutable.
A single moment in time may be represented in two different ways:

- Using mach_absolute_time(), the system’s basic clock. Referred to as host time.
- Audio samples at a particular sample rate.

A single AVAudioTime instance may contain either or both representations; it might represent only a sample
time, only a host time, or both.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

18.18.2 Methods

18.18.3 available as boolean

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

18.18.4 Constructor

Function: The private constructor.

18.18.5 extrapolateTimeFromAnchor(anchorTime as AVAudioTimeMBS) as AVAudioTimeMBS

Function: Creates an audio time object by converting between host and sample time.
Notes:
anchorTime: An AVAudioTime instance with a more complete AudioTimeStamp than that of the receiver.
Returns a newly created and initialized AVAudioTime instance with the extrapolated time.

If anchorTime is an AVAudioTime instance where both host time and sample time are valid, and the receiver is another timestamp where only one of the two is valid, this method returns a new AVAudioTime instance copied from the receiver and where any additional valid fields provided by the anchor are also valid.

18.18.6  

**hostTimeForSeconds(Seconds as Double) as UInt64**

**Function:** Converts seconds to host time.

**Notes:**

seconds: The number of seconds.

Returns the seconds represented as host time.

18.18.7  

**secondsForHostTime(HostTime as UInt64) as Double**

**Function:** Converts host time to seconds.

**Notes:**

hostTime: The host time.

Returns the host time represented as seconds.

18.18.8  

**timeWithHostTime(HostTime as UInt64) as AVAudioTimeMBS**

**Function:** Creates an audio time object with the specified host time.

**Notes:**

hostTime: The host time.

Returns a newly created and initialized AVAudioTime instance with the extrapolated time.

See also:

- 18.18.9  

**timeWithHostTime(hostTime as UInt64, SampleTime as Int64, sampleRate as Double) as AVAudioTimeMBS**
18.18.9  timeWithHostTime(hostTime as UInt64, SampleTime as Int64, sampleRate as Double) as AVAudioTimeMBS

**Function:** Creates an audio time object with the specified host time, sample time, and sample rate.

**Notes:**
- hostTime: The host time.
- sampleTime: The sample time.
- sampleRate: The sample rate.

Returns a newly created and initialized AVAudioTime instance with the specified host time, sample time, and sample rate.

See also:
- 18.18.8 timeWithHostTime(HostTime as UInt64) as AVAudioTimeMBS

18.18.10  timeWithSampleTime(SampleTime as Int64, sampleRate as Double) as AVAudioTimeMBS

**Function:** Creates an audio time object with the specified sample time and sample rate.

**Notes:**
- sampleTime: The sample time.
- sampleRate: The sample rate.

Returns a newly created and initialized AVAudioTime instance with the specified sample time and sample rate.

18.18.11  Properties

18.18.12  Handle as Integer

**Function:** The internal object reference.

**Notes:** (Read and Write property)

18.18.13  hostTime as UInt64

**Function:** The host time.
CHAPTER 18. AVFOUNDATIONNODE

Notes: (Read only property)

18.18.14  hostTimeValid as Boolean

Function: Whether the host time value is valid.
Notes:
True if the hostTime property is valid, otherwise false.
(Read only property)

18.18.15  sampleRate as Double

Function: The sample rate at which the sample time is being expressed.
Notes: (Read only property)

18.18.16  sampleTime as Int64

Function: The time as a number of audio samples, as tracked by the current audio device.
Notes: (Read only property)

18.18.17  sampleTimeValid as Boolean

Function: Whether the sample time and sample rate properties are valid.
Notes: (Read only property)
18.19 class AVAudioUnitComponentManagerMBS

18.19.1 class AVAudioUnitComponentManagerMBS

**Function:** The AVAudioUnitComponentManager class is a singleton object that provides a way to find audio components that are registered with the system.

**Notes:**

It provides methods to search and query various information about the audio components without opening them. Currently, only audio components that are audio units can only be searched.

The class also supports predefined system tags and arbitrary user tags. Each audio unit can be tagged as part of its definition. AudioUnit Hosts such as Logic or GarageBand can present groupings of audio units based on the tags.

Searching for audio units can be done in various ways:

- Using a NSPredicate instance that contains search strings for tags or descriptions
- Using a block to match on a custom criteria.
- Using an AudioComponentDescription.

Available in OS X v10.10 and later.

18.19.2 Methods

18.19.3 allComponents as AVAudioUnitComponentMBS()

**Function:** Finds all components.

**Example:**

```plaintext
// Needs OS X 10.10 or newer
dim m as new AVAudioUnitComponentManagerMBS

dim a() as AVAudioUnitComponentMBS = m.allComponents

for each c as AVAudioUnitComponentMBS in a
    dim d as AVAudioComponentDescriptionMBS = c.audioComponentDescription
    'List.AddRow c.Name, c.ManufacturerName, c.LocalizedTypeName, c.VersionString, d.componentType+
    ""+d.componentSubType
```
// we look for the mixer
// AUMixer Apple Mixer 1.6.0 aumx smxr

if d.componentType = "aumx" and d.componentSubType = "smxr" then
dim aa as new AVAudioUnitMBS(d)
MsgBox aa.Name
end if

next

### 18.19.4 available as boolean

**Function:** Whether this class is available for use.
**Notes:** Should return true on OS X 10.10 and newer.

### 18.19.5 AVAudioUnitComponentTagsDidChangeNotification as String

**Function:** The notification name for the notification sent when tags changed.

### 18.19.6 componentsMatchingDescription(Description as AVAudioComponentDescriptionMBS) as AVAudioUnitComponentMBS()

**Function:** An array of audio component objects that matches the description.
**Notes:** description: The AudioComponentDescription struct to match. The type, subtype and manufacturer fields are used to search for matching audio units. A value of "" or 0 for any of these fields is a wildcard and returns the first match found.

### 18.19.7 componentsPassingTest(tag as Variant = nil) as AVAudioUnitComponentMBS()

**Function:** An array of audio components that pass the Test event.
**Notes:** For each AudioComponent found by the manager, the Test event will be called. If the block returns true then the AVAudioComponent instance is added to the array.
18.19. CLASS AVAUDIOUNITCOMPONENTMANAGERMBS

18.19.8 Constructor

Function: The constructor.

18.19.9 Destructor

Function: The destructor.

18.19.10 sharedAudioUnitComponentManager as AVAudioUnitComponentManagerMBS

Function: Returns the shared component manager.

18.19.11 standardLocalizedTagNames as string()

Function: An array of the the localized standard system tags defined by the audio units.

18.19.12 tagNames as string()

Function: An array of all tags associated with the current user, as well as all system tags defined by the audio units.

18.19.13 Properties

18.19.14 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
18.19.15 Events

18.19.16 TagsDidChange(notification as NSNotificationMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when tags changed.

18.19.17 Test(component as AVAudioUnitComponentMBS, byref stop as Boolean, tag as Variant) as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event to apply to the audio unit components.
Notes:
Component: The component to test.
stop: A reference to a Boolean value. The block can set the value to true to stop further processing of the search. The stop argument is an out-only argument. You should only ever set this Boolean to true within the event.

The event returns a Boolean value that indicates whether comp passed the test.
18.20. class AVAudioUnitComponentMBS

18.20.1 class AVAudioUnitComponentMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The AVAudioUnitComponent class provides details about an audio unit such as: type, subtype, manufacturer, and location. **Example:**

```cpp
// Needs OS X 10.10 or newer
dim m as new AVAudioUnitComponentManagerMBS

dim a() as AVAudioUnitComponentMBS = m.allComponents

for each c as AVAudioUnitComponentMBS in a
dim d as AVAudioComponentDescriptionMBS = c.audioComponentDescription
'List.AddRow c.Name, c.ManufacturerName, c.LocalizedTypeName, c.VersionString, d.componentType+
"+d.componentSubType

// we look for the mixer
// AUMixer Apple Mixer 1.6.0 aumx smxr

if d.componentType = "aumx" and d.componentSubType = "smxr" then
    dim aa as new AVAudioUnitMBS(d)
    MsgBox aa.Name
end if
next
```

**Notes:**

User tags can be added to the AVAudioUnitComponent which can be queried later for display.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

18.20.2 Methods

18.20.3 allTagNames as string()

MBS AVFoundation Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of tag names for the audio unit component.
18.20.4 available as boolean

**Function:** Whether this class is available for use.
**Notes:** Should return true on OS X 10.10 and newer.

18.20.5 Constructor

**Function:** The private constructor.

18.20.6 SetUserTagNames(tags() as string)

**Function:** Sets an array of tags created by the user.

18.20.7 supportsNumberOfChannels(numInputChannels as Integer, numOutputChannels as Integer) as boolean

**Function:** Returns whether the audio unit component supports the specified number of input and output channels.
**Notes:**
numInputChannels: The number of input channels.
numOutputChannels: The number of output channels.

Returns true if the audio unit component supports the specified number of input and output channels, otherwise false.

18.20.8 userTagNames as string()

**Function:** An array of tags created by the user.
18.20. CLASS AVAUDIOUNITCOMPONENTMBS

18.20.9  Properties

18.20.10  audioComponentDescription as AVAudioComponentDescriptionMBS

Function: The AudioComponentDescription of the audio unit component.
Notes: (Read only property)

18.20.11  componentFile as FolderItem

Function: The folderitem of the audio unit component.
Notes: (Read only property)

18.20.12  componentURL as String

Function: The URL of the audio unit component.
Notes: (Read only property)

18.20.13  configurationDictionary as Dictionary

Function: The audio unit components configuration dictionary.
Notes: (Read only property)

18.20.14  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

18.20.15  hasCustomView as Boolean

Function: Whether the audio unit component has a custom view.
Notes:
True if the component has a custom view, otherwise false.
(Read only property)

18.20.16 hasMIDIInput as Boolean

Function: Whether the audio unit component has midi input.
Notes: (Read only property)

18.20.17 hasMIDIOutput as Boolean

Function: Whether the audio unit component has midi output.
Notes: (Read only property)

18.20.18 iconFile as FolderItem

Function: The folderitem of an icon the represents the audio unit component.
Notes: (Read only property)

18.20.19 iconURL as String

Function: The URL of an icon the represents the audio unit component.
Notes: (Read only property)

18.20.20 LocalizedTypeName as String

Function: The localized type name of the component.
Notes: (Read only property)
18.20.21 ManufacturerName as String

**Function:** The name of the manufacturer of the audio unit component.
**Notes:** (Read only property)

18.20.22 Name as String

**Function:** The name of the audio unit component.
**Notes:** (Read only property)

18.20.23 passesAUVal as Boolean

**Function:** Whether the audio unit component passes the AUVal.
**Notes:**
True if the component passes the AUVal, otherwise false.
(Read only property)

18.20.24 SandboxSafe as Boolean

**Function:** Whether the audio unit component is safe for sandboxing.
**Notes:**
True if the component is safe for sandboxing, otherwise false. This only applies to the current process.
(Read only property)

18.20.25 TypeName as String

**Function:** The audio unit component type.
**Notes:** (Read only property)
**18.20.26 Version as Integer**

**Function:** The audio unit component version number.

**Notes:**

The version number is an NSNumber comprised of a hexadecimal number with major, minor, and a dot-release format: 0xMMMMmmDD.

(Read only property)

**18.20.27 VersionString as String**

**Function:** A string representing the audio unit component version number.

**Notes:** (Read only property)
18.21. CLASS AVAUDIOUNITDELAYMBS

18.21 class AVAudioUnitDelayMBS

18.21.1 class AVAudioUnitDelayMBS

Function: The AVAudioUnitDelay class is an AVAudioUnitEffect subclass that implements a delay effect.
Notes:
A delay unit delays the input signal by the specified time interval and then blends it with the input signal. The amount of high frequency roll-off can also be controlled in order to simulate the effect of a tape delay. Subclass of the AVAudioUnitEffectMBS class.

18.21.2 Methods

18.21.3 Constructor

Function: The constructor.

18.21.4 Properties

18.21.5 delayTime as Double

Function: The time taken by the delayed input signal to reach the output.
Notes:
The delay is specified in seconds. The default value is 1. The valid range of values is 0 to 2 seconds.
(Read and Write property)

18.21.6 feedback as Double

Function: The amount of the output signal fed back into the delay line.
Notes:
The feedback is specified as a percentage. The default value is 50%. The valid range of values is -100% to 100%.
(Read and Write property)
18.21.7 lowPassCutoff as Double

Function: The cutoff frequency, in Hz, above which high frequency content is rolled off.
Notes:
The default value is 15000 Hz. The valid range of values is 10 Hz through (sampleRate/2).
(Read and Write property)

18.21.8 wetDryMix as Double

Function: The blend of the wet and dry signals.
Notes:
The blend is specified as a percentage. The default value is 100%. The valid range of values is 0% (all dry) through 100% (all wet).
(Read and Write property)
18.22. class AVAudioUnitDistortionMBS

18.22.1 class AVAudioUnitDistortionMBS

Function: The AVAudioUnitDistortion class is an AVAudioUnitEffect subclass that implements a multi-stage distortion effect.
Notes: Subclass of the AVAudioUnitEffectMBS class.

18.22.2 Methods

18.22.3 Constructor

Function: The constructor.

18.22.4 loadFactoryPreset(preset as Integer)

Function: Configures the audio distortion unit by loading a distortion preset.
Notes: preset: The distortion preset. See AVAudioUnitDistortionPreset for possible values.

18.22.5 Properties

18.22.6 preGain as Double

Function: The gain, in decibels, applied to the signal before being distorted.
Notes:
The default value is -6 db. The valid range of values is -80 db to 20 db.
(Read and Write property)

18.22.7 wetDryMix as Double

Function: The blend of the distorted and dry signals.
Notes:
The blend is specified as a percentage. The default value is 50%. The range is 0% (all dry) through 100% (all wet).
(Read and Write property)

18.22.8 Constants

18.22.9 PresetDrumsBitBrush = 0

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the preset audio distortions. Notes: Preset that provides a DrumsBitBrush distortion.

18.22.10 PresetDrumsBufferBeats = 1

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the preset audio distortions. Notes: Preset that provides a DrumsBuffersBitBrush distortion.

18.22.11 PresetDrumsLoFi = 2

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the preset audio distortions. Notes: Preset that provides a DrumsLoFi distortion.

18.22.12 PresetMultiBrokenSpeaker = 3

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the preset audio distortions. Notes: Preset that provides a MultiBrokenSpeaker distortion.

18.22.13 PresetMultiCellphoneConcert = 4

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the preset audio distortions. Notes: Preset that provides a MultiCellphoneConcert distortion.

18.22.14 PresetMultiDecimated1 = 5

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the preset audio distortions. Notes: Preset that provides a MultiDecimated1 distortion.
18.22.15  PresetMultiDecimated2 = 6

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a MultiDecimated2 distortion.

18.22.16  PresetMultiDecimated3 = 7

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a MultiDecimated3 distortion.

18.22.17  PresetMultiDecimated4 = 8

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a MultiDecimated4 distortion.

18.22.18  PresetMultiDistortedCubed = 10

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a MultiDistortedCubed distortion.

18.22.19  PresetMultiDistortedFunk = 9

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a MultiDistortedFunk distortion.

18.22.20  PresetMultiDistortedSquared = 11

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a MultiDistortedSquared distortion.

18.22.21  PresetMultiEcho1 = 12

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a MultiEcho1 distortion.
18.22.22 PresetMultiEcho2 = 13

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a MultiEcho2 distortion.

18.22.23 PresetMultiEchoTight1 = 14

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a MultiEchoTight1 distortion.

18.22.24 PresetMultiEchoTight2 = 15

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a MultiEchoTight2 distortion.

18.22.25 PresetMultiEverythingIsBroken = 16

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a MultiEverythingIsBroken distortion.

18.22.26 PresetSpeechAlienChatter = 17

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a SpeechAlienChatter distortion.

18.22.27 PresetSpeechCosmicInterference = 18

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a SpeechCosmicInterference distortion.

18.22.28 PresetSpeechGoldenPi = 19

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions. **Notes:** Preset that provides a SpeechGoldenPi distortion.
18.22.29 PresetSpeechRadioTower = 20

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions.  
**Notes:** Preset that provides a SpeechRadioTower distortion.

18.22.30 PresetSpeechWaves = 21

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the preset audio distortions.  
**Notes:** Preset that provides a SpeechWaves distortion.
18.23 class AVAudioUnitEffectMBS

18.23.1 class AVAudioUnitEffectMBS

Function: An AVAudioUnitEffect class that processes audio in real-time using AudioUnits of type: effect, music effect, panner, remote effect or remote music effect.
Notes:
These effects run in real-time and process some number of audio input samples to produce number of audio output samples. A delay unit is an example of an effect unit.
Subclass of the AVAudioUnitMBS class.

18.23.2 Methods

18.23.3 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)

Function: Initializes an AVAudioUnitEffect object.
Notes:
audioComponentDescription: AudioComponentDescription of the AudioUnit to be instantiated.
The audioComponentDescription must be one of these types kAudioUnitType_Effect, kAudioUnitType_MusicEffect, kAudioUnitType_Panner, kAudioUnitType_RemoteEffect, or kAudioUnitType_RemoteMusicEffect.

18.23.4 Properties

18.23.5 bypass as Boolean

Function: Bypass state of the AudioUnit.
Notes: (Read and Write property)
18.24. class AVAudioUnitEQFilterParametersMBS

18.24.1 class AVAudioUnitEQFilterParametersMBS

**Function:** The AVAudioUnitEQFilterParameters class encapsulates the parameters used by an AVAudioUnitEQ instance.

**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

18.24.2 Methods

18.24.3 Constructor

**Function:** The private constructor.

18.24.4 Properties

18.24.5 bandwidth as Double

**Function:** The bandwidth of the EQ filter, in octaves.

**Notes:**
The value range of values is 0.05 to 5.0 octaves.
(Read and Write property)

18.24.6 bypass as Boolean

**Function:** The bypass state of the EQ filter band.

**Notes:**
True if the bypass is active, otherwise false.
(Read and Write property)
18.24.7  filterType as Integer

**Function:** The EQ filter type.
**Notes:**
The default value is AVAudioUnitEQFilterTypeParametric.
(Read and Write property)

18.24.8  frequency as Double

**Function:** The frequency of the EQ filter, in hertz.
**Notes:**
The valid range of values is 20 Hz through (SampleRate/2).
(Read and Write property)

18.24.9  gain as Double

**Function:** The gain of the EQ filter, in decibels.
**Notes:**
The default value is 0 db. The valid range of values is -96 db through 24 db.
(Read and Write property)

18.24.10  Constants

18.24.11  FilterTypeBandPass = 5

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the filter types available to use with the filterType property.
**Notes:** Band pass filter. The required parameters are: frequency (center) and bandwidth.

18.24.12  FilterTypeBandStop = 6

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the filter types available to use with the filterType property.
**Notes:** Band stop filter (notch filter). The required parameters are: frequency (center) and bandwidth.
18.24.13 FilterTypeHighPass = 2

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the filter types available to use with the filterType property.  
**Notes:** Simple Butterworth 2nd order high pass filter. The required parameters are: frequency (-3 dB cutoff at specified frequency).

18.24.14 FilterTypeHighShelf = 8

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the filter types available to use with the filterType property.  
**Notes:** High shelf filter. The required parameters are: frequency (center) and gain.

18.24.15 FilterTypeLowPass = 1

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the filter types available to use with the filterType property.  
**Notes:** Simple Butterworth 2nd order low pass filter. The required parameters are: frequency (-3 dB cutoff at specified frequency).

18.24.16 FilterTypeLowShelf = 7

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the filter types available to use with the filterType property.  
**Notes:** Low shelf filter. The required parameters are: frequency (center) and gain.

18.24.17 FilterTypeParametric = 0

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the filter types available to use with the filterType property.  
**Notes:** Parametric filter based on Butterworth analog prototype. The required parameters are: frequency (center), bandwidth, and gain.

18.24.18 FilterTypeResonantHighPass = 4

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the filter types available to use with the filterType property.
Notes: High pass filter with resonance support (using the bandwidth parameter). The required parameters are: frequency (-3 dB cutoff at specified frequency) and bandwidth.

18.24.19 FilterTypeResonantHighShelf = 10

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the filter types available to use with the filterType property. Notes: High shelf filter with resonance support (using the bandwidth parameter). The required parameters are: frequency (center), bandwidth, and gain.

18.24.20 FilterTypeResonantLowPass = 3

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the filter types available to use with the filterType property. Notes: Low pass filter with resonance support (using the bandwidth parameter). The required parameters are: frequency (-3 dB cutoff at specified frequency) and bandwidth.

18.24.21 FilterTypeResonantLowShelf = 9

MBS AVFoundation Plugin, Plugin Version: 15.3. Function: One of the filter types available to use with the filterType property. Notes: Low shelf filter with resonance support (using the bandwidth parameter). The required parameters are: frequency (center), bandwidth, and gain.
18.25. CLASS AVAUDIOUNITEQMBS

18.25 class AVAudioUnitEQMBS

18.25.1 class AVAudioUnitEQMBS

Function: The AVAudioUnitEQ class is an AVAudioUnitEffect subclass that implements a multi-band equalizer.
Notes: The AVAudioUnitEQFilterParameters class encapsulates the filter parameters that are returned in the bands property array. Subclass of the AVAudioUnitEffectMBS class.

18.25.2 Methods

18.25.3 bands as AVAudioUnitEQFilterParametersMBS()

Function: An array of AVAudioUnitEQFilterParameters objects.
Notes: The number of elements in the array is equal to the number of bands.

18.25.4 Constructor

Function: The private constructor.
See also:

• 18.25.5 Constructor(bands as Integer) 3693

18.25.5 Constructor(bands as Integer)

Function: Initializes a newly allocated AVAudioUnitEQ instance.
Notes: Bands: The number of bands created by the EQ.
See also:

• 18.25.4 Constructor 3693
18.25.6 Properties

18.25.7 globalGain as Double

Function: The overall gain adjustment applied to the signal, in decibels.
Notes: The default value is 0 db. The valid range of values is -96 db to 24 db.
(Read and Write property)
18.26. class AVAudioUnitGeneratorMBS

18.26.1 class AVAudioUnitGeneratorMBS

Function: The AVAudioUnitGenerator is an AVAudioUnit subclass that generates audio output.
Notes:
An AVAudioUnitGenerator represents an AudioUnit of type kAudioUnitType_Generator or kAudioUnitType_RemoteGenerator. A generator will have no audio input, but will produce audio output. An example is a tone generator.
Subclass of the AVAudioUnitMBS class.

18.26.2 Methods

18.26.3 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)

Function: Initializes a newly allocated AVAudioUnitGenerator instance.
Notes:
audioComponentDescription: The audio component description.

The AudioComponentDescription struct componentType field must be kAudioUnitType_Generator or kAudioUnitType_RemoteGenerator.

18.26.4 Properties

18.26.5 bypass as Boolean

Function: The bypass state of the audio unit.
Notes:
True if the bypass state is enabled, otherwise false.
(Read and Write property)
18.26.6 obstruction as Double

Function: Simulates filtering of the direct path of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Only the direct path of sound between the source and listener are blocked.
The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.26.7 occlusion as Double

Function: Simulates filtering of the direct and reverb paths of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Both the direct and reverb paths of sound between the source and listener are blocked.
The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.26.8 pan as Double

Function: The buss’s stereo pan.
Notes: The default value is 0.0. A value in the range -1.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.26.9 position as AVAudio3DPointMBS

Function: The location of the source in the 3D environment.
Notes:
18.26. CLASS AVAUDIOUNITGENERATORMBS

The coordinates are specified in meters. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.26.10 rate as Double

Function: Changes the playback rate of the input signal.
Notes:
A value of 2.0 results in the output audio playing one octave higher. A value of 0.5, results in the output audio playing one octave lower.

The default value is 1.0. The range of valid values is 0.5 to 2.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.26.11 renderingAlgorithm as Integer

Function: Type of rendering algorithm used.
Notes:
Depending on the current output format of the AVAudioEnvironmentNode instance, only a subset of the rendering algorithms may be supported. An array of valid rendering algorithms is retrieved by calling the applicableRenderingAlgorithms function of the AVAudioEnvironmentNode instance.

The default rendering algorithm is AVAudio3DMixingRenderingAlgorithmEqualPowerPanning. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.26.12 reverbBlend as Double

Function: Controls the blend of dry and reverb processed audio.
Notes:
This property controls the amount of the sources audio that will be processed by the reverb by the AVAudioEnvironmentNode instance. A value of 0.5 will result in an equal blend of dry and processed (wet) audio.

The default is 0.0. The range of valid values is 0.0 (completely dry) to 1.0 (completely wet). This property
is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

18.26.13 volume as Double

Function: The buss’s input volume.
Notes: The default value is 1.0. The range of valid values are 0.0 to 1.0. This property is currently implemented
only by the AVAudioEnvironmentNode and AVAudioMixerNode class mixers.
(Read and Write property)
18.27 class AVAudioUnitMBS

18.27.1 class AVAudioUnitMBS

**Function:** The AVAudioUnit class is a subclass of the AVAudioNode class that, depending on the type of
the audio unit, processes audio either in real-time or non real-time.
**Notes:** Subclass of the AVAudioNodeMBS class.

18.27.2 Methods

18.27.3 AddPropertyListener(ID as UInt32)

**Function:** Registers to receive notifications for when a property changes.
**Notes:**
When an audio unit property value changes, a PropertyListener event can be called by the audio unit to
inform interested parties that this event has occurred.

You must call RemovePropertyListener when you are done with the audio unit.

Lasterror is set.

18.27.4 Constructor

**Function:** The private constructor.
See also:

* 18.27.5 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)

18.27.5 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)

**Function:** Initializes a newly allocated audio component specified by the description.
**Example:**

// Needs OS X 10.10 or newer
dim m as new AVAudioUnitComponentManagerMBS
dim a() as AVAudioUnitComponentMBS = m.allComponents

for each c as AVAudioUnitComponentMBS in a
    dim d as AVAudioComponentDescriptionMBS = c.audioComponentDescription
    'List.AddRow c.Name, c.ManufacturerName, c.LocalizedTypeName, c.VersionString, d.componentType+
    "+d.componentSubType

    // we look for the mixer
    // AUMixer Apple Mixer 1.6.0 aumx smxr
    if d.componentType = "aumx" and d.componentSubType = "smxr" then
        dim aa as new AVAudioUnitMBS(d)
        MsgBox aa.Name
    end if
next

Notes: audioComponentDescription: The description of the audio unit to be initialized.
See also:
- 18.27.4 Constructor

18.27.6 CreateView(PreferredSize as NSSizeMBS) as NSViewMBS

Function: Creates view if possible for the audio unit.
Example:

    // audiounit is property of window
    dim audiounit as new AVAudioUnitTimePitchMBS

    dim preferredSize as new NSSizeMBS(200,100)
    // view is property of window
    dim view as NSViewMBS = audiounit.CreateView(preferredSize)

    dim w as new NSWindowMBS(self)

    // set position
    view setFrameOrigin(new NSPointMBS(100, 100))

    // add to window
    w.contentView.addSubview view
18.27. CLASS AVAUDIOUNITMBS

Notes:

Returns nil in case of error.
PreferredSize is the preferred size of the control.

18.27.7 Destructor

Function: The destructor.

18.27.8 GetParameter(ID as UInt32, Scope as UInt32, Element as UInt32) as Single

Function: Get the value of a parameter as specified by its ID, scope and element.
Notes:

LastError is set.
If no error occurs, the result is the parameter value.
Please check Apple's documentation for possible parameters.

18.27.9 GetProperty(ID as UInt32, Scope as UInt32, Element as UInt32) as Memoryblock

Function: Retrieves the value of a specified property.
Notes:

The plugin queries the data size, creates a memoryblock, queries the value and returns it.
LastError is set.

18.27.10 GetPropertyInfo(ID as UInt32, Scope as UInt32, Element as UInt32, byref WriteAble as Boolean) as UInt32

Function: Retrieves information about a specified property.
Notes:

The API can be used to retrieve both the size of the property, and whether it is writable or not. In order to
get a general answer on the capability of an audio unit, this function should be called before the audio unit
is initialized (as some properties are writable when the audio unit is initialized, and others not)
18.27.11  `installLevelMonitor(CallsPerSecond as Integer, tag as Variant = nil)`

**Function:** Installs the handler to call LevelMonitor event regularly.
**Notes:** CallsPerSecond can be between 5 and 50. Tag is stored and passed to the event.

18.27.12  `RemovePropertyListener(ID as UInt32)`

**Function:** Remove a previously registered property listener.

18.27.13  `setParameter(ID as UInt32, Scope as UInt32, Element as UInt32, Value as Single, inBufferOffsetInFrames as UInt32 = 0)`

**Function:** Set the value of a parameter as specified by its ID, scope and element.
**Notes:**
Parameter IDs are consistent across all of the elements in a scope - so for a mixer, the "input volume" parameter can be applied on any input, and the particular input is specified by the elementID.

Lasterror is set.
Please check Apple's documentation for possible parameters.

18.27.14  `setProperty(ID as UInt32, Scope as UInt32, Element as UInt32, data as Memoryblock)`

**Function:** Sets the value of a specified property.
**Notes:**
Some properties can be cleared by passing data = nil.
Lasterror is set.
18.27.15 Properties

18.27.16 audioComponentDescription as AVAudioComponentDescriptionMBS

Function: The audio compression description of the underlying Core Audio audio unit.
Notes: (Read only property)

18.27.17 audioUnitHandle as Integer

Function: The internal handle for the audio unit.
Notes: (Read only property)

18.27.18 lastError as Integer

Function: The last error code for the property/parameter functions.
Notes:
Zero means no error.
(Read and Write property)

18.27.19 ManufacturerName as String

Function: The name of the manufacturer of the audio unit.
Notes: (Read only property)

18.27.20 Name as String

Function: The name of the audio unit.
Notes: (Read only property)
18.27.21 Version as Integer

Function: The version number of the audio unit.
Notes: (Read only property)

18.27.22 Events

18.27.23 LevelMonitor(Level0 as Double, Level1 as Double, Level2 as Double,
Level3 as Double, Level4 as Double, Level5 as Double, Level6 as Double,
Level7 as Double, tag as Variant)

MBS AVFoundation Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Reports level values.
Notes: We pass 8 level parameters for up to 8 channels.

18.27.24 PropertyListener(ID as UInt32, Scope as UInt32, Element as UInt32)

MBS AVFoundation Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The property listener event.
Notes:
When you listen for changes on a property, this event can be called.
Either synchronous on main thread or when received on other threads, the plugin will run it asynchronously
on main thread.
18.28. **CLASS AVAUDIOUNITMIDIINSTRUMENTMBS**

18.28  **class AVAudioUnitMIDIInstrumentMBS**

**Function:** The AVAudioUnitMIDIInstrument class is an abstract class representing music devices or remote instruments.

**Notes:**

An AVAudioUnitMIDIInstrument subclass can be used in a chain that processes realtime input (live) and has general concept of music events, for example, notes.

Available in OS X v10.10 and later.
Subclass of the AVAudioUnitMBS class.

18.28.2  **Methods**

18.28.3  **Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)**

**Function:** Initializes a MIDI instrument audio unit with the specified component description.

**Notes:**

description: The AudioComponentDescription struct. The component of type must be kAudioUnitType_MusicDevice or kAudioUnitType_RemoteInstrument.

18.28.4  **sendController(Controller as Integer, Value as Integer, Channel as Integer)**

**Function:** Send a MIDI controller event to the instrument.

**Notes:**

ccontroller: Specifies a standard MIDI controller number. The valid range is 0 to 127.

cvalue: Value for the controller. The valid range is 0 to 127.

cchannel: The channel number to which the event is sent.

18.28.5  **sendMIDIEvent(midiStatus as Integer, data1 as Integer)**

**Function:** Sends a MIDI event which contains one data byte to the instrument.

**Notes:**
midiStatus: The STATUS value of the MIDI event.
data1: The data byte of the MIDI event.

See also:

- 18.28.6 sendMIDIEvent(midiStatus as Integer, data1 as Integer, data2 as Integer)

18.28.6 sendMIDIEvent(midiStatus as Integer, data1 as Integer, data2 as Integer)

Function: Sends a MIDI event which contains two data bytes to the instrument.
Notes:
midiStatus: The STATUS value of the MIDI event.
data1: The first data byte of the MIDI event.
data2: The first data byte of the MIDI event.
See also:

- 18.28.5 sendMIDIEvent(midiStatus as Integer, data1 as Integer)

18.28.7 sendMIDISysExEvent(data as MemoryBlock)

Function: Sends a MIDI System Exclusive event to the instrument.
Notes: midiData: A memoryblock object containing the complete SysEx data including start(F0) and termination(F7) bytes.

18.28.8 sendPitchBend(pitchbend as Integer, Channel as Integer)

Function: Sends MIDI Pitch Bend event to the instrument.
Notes:
pitchbend: Value of the pitch bend. The valid range of values is 0 to 16383.
channel: The channel number to which the event is sent.

If this method is not invoked, then the pitch bend is the default value of 8192 (no pitch).

18.28.9 sendPressure(pressure as Integer, Channel as Integer)

Function: Sends MIDI channel pressure event to the instrument.
Notes:

pressure: The value of the pressure. The valid range is 0 to 127.
channel: The channel number to which the event is sent.

18.28.10 `sendPressureForKey(Key as Integer, value as Integer, Channel as Integer)`

Function: Sends MIDI Polyphonic key pressure event to the instrument.
Notes:

key: The key (note) number to which the pressure event applies. The valid range is 0 to 127.
value: The value of the pressure. The valid range is 0 to 127.
channel: The channel number to which the event is sent.

18.28.11 `sendProgramChange(program as Integer, bankMSB as Integer, bankLSB as Integer, Channel as Integer)`

Function: Sends a MIDI Program Change and Bank Select events to the instrument.
Notes:

program: Specifies the program (preset) number within the bank to load. The valid range is 0 to 127.
bankMSB: Specifies the most significant byte value for the bank to select. The valid range is 0 to 127.
bankLSB: Specifies the least significant byte value for the bank to select. The valid range is 0 to 127.
channel: The channel number to which the event is sent.
See also:

- 18.28.12 `sendProgramChange(program as Integer, Channel as Integer)`

18.28.12 `sendProgramChange(program as Integer, Channel as Integer)`

Function: Sends a MIDI Program Change and Bank Select events to the instrument.
Notes:

program: Specifies the program. The valid range is 0 to 127.
channel: The channel number to which the event is sent.

The instrument will be loaded from the bank that has been previous set by MIDI Bank Select controller
messages (0 and 31). If none has been set, bank 0 will be used.
See also:
• 18.28.11 sendProgramChange(program as Integer, bankMSB as Integer, bankLSB as Integer, Channel as Integer)

18.28.13 startNote(note as Integer, Velocity as Integer, Channel as Integer)

Function: Sends a MIDI Note On event to the instrument.
Notes:

- note: The note number (key) to play. The valid range is 0 to 127.
- velocity: Specifies the volume at which the note is played. The valid range is 0 to 127.
- channel: The channel number to which the event is sent.

18.28.14 stopNote(note as Integer, Channel as Integer)

Function: Sends a MIDI Note Off event to the instrument
Notes:

- note: The note number (key) to stop. The valid range is 0 to 127.
- channel: The channel number to which the event is sent.
18.29 class AVAudioUnitReverbMBS

18.29.1 class AVAudioUnitReverbMBS

Function: The AVAudioUnitReverb class is an AVAudioUnitEffect subclass that implements a reverb effect.
Notes:
A reverb simulates the acoustic characteristics of a particular environment. Use the different presets to simulate a particular space and blend it in with the original signal using the wetDryMix property. Subclass of the AVAudioUnitEffectMBS class.

18.29.2 Methods

18.29.3 Constructor

Function: The constructor.

18.29.4 loadFactoryPreset(preset as Integer)

Function: Configures the audio unit a reverb preset.
Notes:
preset: The reverb preset. See AVAudioUnitReverbPreset for the supported values.
The default value is AVAudioUnitReverbPresetMediumHall.

18.29.5 Properties

18.29.6 wetDryMix as Double

Function: The blend of the wet and dry signals.
Notes:
The blend is specified as a percentage. The range is 0% (all dry) through 100% (all wet).
(Read and Write property)
18.29.7 Constants

18.29.8 PresetCathedral = 8

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets. **Notes:** The reverb preset with the acoustic characteristics of a cathedral environment.

18.29.9 PresetLargeChamber = 7

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets. **Notes:** The reverb preset with the acoustic characteristics of a large-sized chamber environment.

18.29.10 PresetLargeHall = 4

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets. **Notes:** The reverb preset with the acoustic characteristics of a large-sized hall environment.

18.29.11 PresetLargeHall2 = 12

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets. **Notes:** The reverb preset with the acoustic characteristics of an alternate large-sized hall environment.

18.29.12 PresetLargeRoom = 2

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets. **Notes:** The reverb preset with the acoustic characteristics of a large-sized room environment.

18.29.13 PresetLargeRoom2 = 9

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets. **Notes:** The reverb preset with the acoustic characteristics of an alternate large-sized room environment.
18.29.14 PresetMediumChamber = 6

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets.  
**Notes:** The reverb preset with the acoustic characteristics of a medium-sized chamber environment.

18.29.15 PresetMediumHall = 3

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets.  
**Notes:** The reverb preset with the acoustic characteristics of a medium-sized hall environment. This is the default value for the audio unit.

18.29.16 PresetMediumHall2 = 10

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets.  
**Notes:** The reverb preset with the acoustic characteristics of an alternate medium-sized hall environment.

18.29.17 PresetMediumHall3 = 11

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets.  
**Notes:** The reverb preset with the acoustic characteristics of an alternate medium-sized hall environment.

18.29.18 PresetMediumRoom = 1

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets.  
**Notes:** The reverb preset with the acoustic characteristics of a medium-sized room environment.

18.29.19 PresetPlate = 5

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets.  
**Notes:** The reverb preset with the acoustic characteristics of a plate environment.

18.29.20 PresetSmallRoom = 0

MBS AVFoundation Plugin, Plugin Version: 15.3. **Function:** One of the reverb presets.  
**Notes:** The reverb preset with the acoustic characteristics of a small-sized room environment.
18.30  class AVAudioUnitSamplerMBS

18.30.1  class AVAudioUnitSamplerMBS

Function: The AVAudioUnitSampler class encapsulates Apple’s Sampler Audio Unit.
Notes: The sampler audio unit can be configured by loading different types of instruments such as an .aupreset file, a DLS or SF2 sound bank, an EXS24 instrument, a single audio file or with an array of audio files. The output is a single stereo bus.
Subclass of the AVAudioUnitMIDIInstrumentMBS class.

18.30.2  Methods

18.30.3  Constructor

Function: The private constructor.
See also:

- 18.30.4 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS) 3712

18.30.4  Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)

Function: Initializes a MIDI instrument audio unit with the specified component description.
See also:

- 18.30.3 Constructor 3712

18.30.5  loadAudioFilesAtFiles(Files() as folderitem, byref error as NSErrorMBS) as boolean

Function: Configures the sampler by loading the specified audio files.
Notes: Files: An array of files for the audio files.
Error: Returns, by-reference, a description of the error, if an error occurs.
Returns true if the sampler was configured with the audio file(s); otherwise false.

The audio files are loaded into a new instrument with each audio file placed into its own sampler zone. Any information contained in the audio file regarding their placement in the instrument, for example, root key, key range, will be used.

### 18.30.6 loadAudioFilesAtURLs(URLs() as string, byref error as NSErrorMBS) as boolean

**Function:** Configures the sampler by loading the specified audio files.

**Notes:**
- URLs: An array of URLs for the audio files.
- Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true if the sampler was configured with the audio file(s); otherwise false.

The audio files are loaded into a new instrument with each audio file placed into its own sampler zone. Any information contained in the audio file regarding their placement in the instrument, for example, root key, key range, will be used.

### 18.30.7 loadInstrumentAtFile(File as folderitem, byref error as NSErrorMBS) as boolean

**Function:** Configures the sampler with the specified instrument file.

**Notes:**
- File: The file containing the instrument.
- Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true if the sampler was configured with the instrument file; otherwise false.

The instrument can be of one of the following types: Logic or GarageBand EXS24, samplers native .aupreset file or an audio file, for example, .caf, .aiff, .wav, or .mp3.

In the case of single audio file, it is loaded into a new default instrument and any information contained in the audio file regarding its placement in the instrument, for example, root key, key range, will be used.
18.30.8  loadInstrumentAtURL(URL as string, byref error as NSErrorMBS) as boolean

**Function:** Configures the sampler with the specified instrument file.

**Notes:**

URL: The URL of the file containing the instrument.
Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true if the sampler was configured with the instrument file; otherwise false.

The instrument can be of one of the following types: Logic or GarageBand EXS24, samplers native .aupreset file or an audio file, for example, .caf, .aiff, .wav, or .mp3.

In the case of single audio file, it is loaded into a new default instrument and any information contained in the audio file regarding its placement in the instrument, for example, root key, key range, will be used.

18.30.9  loadSoundBankInstrumentAtFile(bankFile as folderitem, program as Integer, bankMSB as Integer, bankLSB as Integer, byref error as NSErrorMBS) as boolean

**Function:** loads a specific instrument from the specified sound bank.

**Notes:**

bankFile: Soundbank file. The file can be either a DLS bank (.dls) or a SoundFont bank (.sf2).
program: program number for the instrument to load
bankMSB: MSB for the bank number for the instrument to load. This is usually 0x79 for melodic instruments and 0x78 for percussion instruments.
bankLSB: LSB for the bank number for the instrument to load. This is often 0, and represents the "bank variation".
Error: the status of the operation

This method reads from file and allocates memory, so it should not be called on a real time thread.
18.30. **CLASS AVAUDIOUNITSAMPLERMBS**

18.30.10 **loadSoundBankInstrumentAtURL**

```plaintext
loadSoundBankInstrumentAtURL(bankURL as string, program as Integer, bankMSB as Integer, bankLSB as Integer, byref error as NSErrorMBS) as boolean
```

**Function:** loads a specific instrument from the specified sound bank.  
**Notes:**  
- bankURL: URL for a Soundbank file. The file can be either a DLS bank (.dls) or a SoundFont bank (.sf2).  
- program: program number for the instrument to load  
- bankMSB: MSB for the bank number for the instrument to load. This is usually 0x79 for melodic instruments and 0x78 for percussion instruments.  
- bankLSB: LSB for the bank number for the instrument to load. This is often 0, and represents the "bank variation".  
- Error: the status of the operation  
This method reads from file and allocates memory, so it should not be called on a real time thread.

18.30.11 **Properties**

18.30.12 **globalTuning as Double**

**Function:** Adjusts the tuning of all the notes played.  
**Notes:**  
The tuning unit is cents. The default value is 0.0. The range of valid values is -2400 to 2400 cents.  
(Read and Write property)

18.30.13 **masterGain as Double**

**Function:** Adjusts the gain, in decibels, of all the notes played.  
**Notes:**  
The default value is 0.0 db. The range of valid values is -90.0 db to 12.0 db.  
(Read and Write property)

18.30.14 **stereoPan asDouble**

**Function:** Adjusts the stereo panning for all the notes played.
Notes:

The default value is 0.0. The range of valid values is -1.0 to 1.0.
(Read and Write property)
18.31  class AVAudioUnitTimeEffectMBS

18.31.1  class AVAudioUnitTimeEffectMBS

**Function:** The AVAudioUnitTimeEffect class is an AVAudioUnit subclass that processes audio in non-realtime.  
**Notes:**
An AVAudioUnitTimeEffect instance represents an AVAudioUnit of type aufc (kAudioUnitType_FormatConverter). These effects do not process audio in real-time. The AVAudioUnitVarispeed class is an example of a time effect unit. Subclass of the AVAudioUnitMBS class.

18.31.2  Methods

18.31.3  Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)

**Function:** Initializes a newly allocated audio component specified by the description.  
**Notes:**
audioComponentDescription: The description of the audio unit to be initialized. The componentType field of the description struct must be kAudioUnitType_FormatConverter (aufc).

If the componentType field of the audioComponentDescription struct is not kAudioUnitType_FormatConverter an exception is raised.

18.31.4  Properties

18.31.5  bypass as Boolean

**Function:** Returns the bypass state of the audio unit.  
**Notes:**
If true then the audio unit processing is being bypassed.  
(Read and Write property)
18.32 class AVAudioUnitTimePitchMBS

18.32.1 class AVAudioUnitTimePitchMBS

Function: The AVAudioUnitTimePitch class is an AVAudioUnitTimeEffect subclass that provides good
quality playback rate and pitch shifting independent of each other.
Notes: Subclass of the AVAudioUnitTimeEffectMBS class.

18.32.2 Methods

18.32.3 Constructor

Function: The constructor.

18.32.4 Properties

18.32.5 overlap as Double

Function: The amount of overlap between segments of the input audio signal.
Notes:
A higher value results in fewer artifacts in the output signal.
The default value is 8.0. The range of values is 3.0 to 32.0.
(Read and Write property)

18.32.6 pitch as Double

Function: The amount by which the input signal is pitch shifted.
Notes:
The pitch is measured in cents, a logarithmic value used for measuring musical intervals. One octave is equal
to 1200 cents. One musical semitone is equal to 100 cents.
The default value is 1.0. The range of values is -2400 to 2400.
(Read and Write property)
18.32.7 rate as Double

**Function:** The playback rate of the input signal.

**Notes:**

The default value is 1.0. The range of supported values is 1/32 to 32.0.

(Read and Write property)
18.33 class AVAudioUnitVarispeedMBS

18.33.1 class AVAudioUnitVarispeedMBS

Function: The AVAudioUnitVarispeed class is an AVAudioUnitTimeEffect subclass that allows control of
the playback rate.
Notes: Subclass of the AVAudioUnitTimeEffectMBS class.

18.33.2 Methods

18.33.3 Constructor

Function: The constructor.

18.33.4 Properties

18.33.5 Rate as Double

Function: The audio playback rate.
Notes:
The varispeed audio unit resamples the input signal, as a result changing the playback rate also changes the
pitch. For example, changing the rate to 2.0 results in the output audio playing one octave higher. Similarly
changing the rate to 0.5, results in the output audio playing one octave lower.

The pitch is measured in cents, a logarithmic value used for measuring musical intervals. One octave is equal
to 1200 cents. One musical semitone is equal to 100 cents.

Using the rate value you calculate the pitch (in cents) using the formula pitch = 1200.0 * log2(rate). Con-
versely, you calculate the appropriate rate for a desired pitch with the formula rate = pow(2, cents/1200.0).

The default value is 1.0. The range of values is 0.25 to 4.0. The unit of rate is unspecified.
(Read and Write property)
Chapter 19

AVMovie

19.1 class AVFragmentedMovieMBS

19.1.1 class AVFragmentedMovieMBS

Function: The movie class for fragmented movies.
Notes: A subclass of AVMovie for handling fragmented movie files. An AVFragmentedMovie is capable of changing
the values of certain of its properties and those of its tracks, if it’s associated with an instance of AVFragmentedMovieMinder when one or more movie fragments are appended to the movie file.
Subclass of the AVMovieMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

19.1.2 Methods

19.1.3 AVFragmentedMovieContainsMovieFragmentsDidChangeNotification as string

Function: One of the notification names.
Notes: Posted after the value of @”containsMovieFragments” has already been loaded and the AVFragmentedMovie is added to an AVFragmentedMovieMinder, either when 1) movie fragments are detected in
the movie file on disk after it had previously contained none or when 2) no movie fragments are detected in
the movie file on disk after it had previously contained one or more.

3721
19.1.4 AVFragmentedMovieDurationDidChangeNotification as string

Function: One of the notification names.
Notes: Posted when the duration of an AVFragmentedMovie changes while it’s being minded by an AVFragmentedMovieMinder, but only for changes that occur after the status of the value of @"duration" has reached AVKeyValueStatusLoaded.

19.1.5 AVFragmentedMovieWasDefragmentedNotification as string

Function: One of the notification names.
Notes: Posted when the movie file on disk is defragmented while an AVFragmentedMovie is being minded by an AVFragmentedMovieMinder, but only if the defragmentation occurs after the status of the value of @"canContainMovieFragments" has reached AVKeyValueStatusLoaded.

19.1.6 Constructor

Function: The private constructor.

19.1.7 fragmentedMovieTracks as AVFragmentedMovieTrackMBS()

Function: The tracks in a movie.
Notes: The value of this property is an array of tracks the movie contains; the tracks are of type AVFragmentedMovieTrack.

19.1.8 fragmentedMovieTracksWithMediaCharacteristic(mediaCharacteristic as string) as AVFragmentedMovieTrackMBS()

Function: Provides an array of AVFragmentedMovieTracks of the asset that present media with the specified characteristic.
Notes: mediaCharacteristic: The media characteristic according to which the receiver filters its AVFragmentedMovieTracks. (Media characteristics are defined in AVMediaFormat.h)
An array of AVFragmentedMovieTracks; may be empty if no tracks with the specified characteristic are available.
19.1. CLASS AVFRAGMENTEDMOVIEMBS

Becomes callable without blocking when the key "tracks" has been loaded

19.1.9 fragmentedMovieTracksWithMediaType(mediaType as string) as AVFragmentedMovieTrackMBS()

Function: Provides an array of AVFragmentedMovieTracks of the asset that present media of the specified media type.
Notes:

mediaType: The media type according to which the receiver filters its AVFragmentedMovieTracks. (Media types are defined in AVMediaFormat.h)
An array of AVFragmentedMovieTracks; may be empty if no tracks of the specified media type are available.
Becomes callable without blocking when the key "tracks" has been loaded

19.1.10 fragmentedMovieTrackWithTrackID(ID as Integer) as AVFragmentedMovieTrackMBS

Function: Provides an instance of AVFragmentedMovieTrack that represents the track of the specified trackID.
Notes:

ID: The trackID of the requested AVFragmentedMovieTrack.

An instance of AVFragmentedMovieTrack; may be nil if no track of the specified trackID is available.
Becomes callable without blocking when the key "tracks" has been loaded
19.2 class AVFragmentedMovieTrackMBS

19.2.1 class AVFragmentedMovieTrackMBS

Function: The class for a movie track from a fragmented movie.
Notes:
A subclass of AVMovieTrack for handling tracks of fragmented movie files. An AVFragmentedMovieTrack is capable of changing the values of certain of its properties, if its parent movie is associated with an instance of AVFragmentedMovieMinder when one or more movie fragments are appended to the movie file.
Subclass of the AVMovieTrackMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

19.2.2 Methods

19.2.3 AVFragmentedMovieTrackSegmentsDidChangeNotification as String

Function: One of the notification names for fragmented movies.
Notes: Posted when the array of segments of an AVFragmentedMovieTrack changes while the associated instance of AVFragmentedMovie is being minded by an AVFragmentedMovieMinder, but only for changes that occur after the status of the value of "segments" has reached AVKeyValueStatusLoaded.

19.2.4 AVFragmentedMovieTrackTimeRangeDidChangeNotification as String

Function: One of the notification names for fragmented movies.
Notes: Posted when the timeRange of an AVFragmentedMovieTrack changes while the associated instance of AVFragmentedMovie is being minded by an AVFragmentedMovieMinder, but only for changes that occur after the status of the value of "timeRange" has reached AVKeyValueStatusLoaded.

19.2.5 AVFragmentedMovieTrackTotalSampleDataLengthDidChangeNotification as String

Function: One of the notification names for fragmented movies.
Notes: This notification name has been deprecated. Use either AVFragmentedMovieTrackTimeRangeDidChangeNotification or AVFragmentedMovieTrackSegmentsDidChangeNotification instead; in either case, you can assume that timing changes to fragmented tracks result in changes to the total length of the sample.
19.2. CLASS AVFRAGMENTEDMOVIETRACKMBS

data used by the track.

19.2.6 Constructor

**Function:** The private constructor.
19.3 class AVMediaDataStorageMBS

19.3.1 class AVMediaDataStorageMBS

Function: The class for media storage.
Notes: Available on OS X 10.11 and newer.

19.3.2 Methods

19.3.3 available as boolean

Function: Whether this class is available.
Example:

```lisp
if not AVMediaDataStorageMBS.available then
    MsgBox "This application requires a newer OS X version."
end if
```

Notes: Returns true on OS X 10.11.

19.3.4 Constructor

Function: The private constructor.
See also:

- 19.3.5 Constructor(File as FolderItem, Options as Dictionary = nil)
- 19.3.6 Constructor(URL as String, Options as Dictionary = nil)

19.3.5 Constructor(File as FolderItem, Options as Dictionary = nil)

Function: Creates an AVMediaDataStorage object associated with a folderitem.
Notes:

File: A folderitem that specifies a file where sample data that is added to a movie or track should be written.
options: A dictionary object that contains keys for specifying options for the initialization of the AVMedia-
DataStorage object. Currently no keys are defined.
19.3. CLASS AVMEDIADATASTORAGEMBS

Raises exception if things go wrong.
See also:

- 19.3.4 Constructor
- 19.3.6 Constructor(URL as String, Options as Dictionary = nil)

19.3.6 Constructor(URL as String, Options as Dictionary = nil)

Function: Creates an AVMediaDataStorage object associated with a file URL.
Notes:

URL: An URL that specifies a file where sample data that is added to a movie or track should be written.
options: A dictionary object that contains keys for specifying options for the initialization of the AVMediaDataStorage object. Currently no keys are defined.

Raises exception if things go wrong.
See also:

- 19.3.4 Constructor
- 19.3.5 Constructor(File as FolderItem, Options as Dictionary = nil)

19.3.7 Properties

19.3.8 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

19.3.9 URL as String

Function: The URL from which the receiver was initialized; may be "".
Notes: (Read only property)
19.4 class AVMovieMBS

19.4.1 class AVMovieMBS

**Function:** AVMovie represents the audiovisual containers in a file that conforms to the QuickTime movie file format or to one of the related ISO base media file formats (such as MPEG-4).

**Example:**

```vbs
dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim m as new AVMovieMBS(f, nil)
MsgBox str(m.duration.Seconds)+" seconds."
```

**Notes:**

AVMovie supports operations involving the format-specific portions of the QuickTime Movie model that are not supported by AVAsset. For instance, you can retrieve the movie header from an existing QuickTime movie file. You can also use AVMovie to write a movie header into a new file, thereby creating a reference movie.

A mutable subclass of AVMovie, AVMutableMovie, provides methods that support the familiar Movie editing model; for instance, you can use AVMutableMovie to copy media data from one track and paste that data into another track. You can also use AVMutableMovie to establish track references from one track to another (for example, to set one track as a chapter track of another track). If you want to perform editing operations on individual tracks, you can use the associated classes AVMovieTrack and AVMutableMovieTrack.

You need to use AVMovie and AVMutableMovie only when operating on format-specific features of a QuickTime or ISO base media file. You generally do not need to use these classes just to open and play QuickTime movie files or ISO base media files. Instead, you can use the classes AVURLAsset and AVPlayerItem. If however you already have an AVMutableMovie and want to play it or inspect it, you can make an immutable snapshot of the AVMutableMovie.

Subclass of the AVAssetMBS class.

19.4.2 Methods

19.4.3 available as Boolean

**Function:** Whether this class is available.

**Example:**

```vbs
if not AVMovieMBS.available then
    MsgBox "This application requires a newer OS X version."
```
Notes: Returns true on OS X 10.10.

19.4.4 AVMovieReferenceRestrictionsKey as String

Function: Indicates the restrictions used by the movie when resolving references to external media data.
Notes:
The value of this key is an NSNumber wrapping an AVAssetReferenceRestrictions enum value or the logical combination of multiple such values. See AVAsset.h for the declaration of the AVAssetReferenceRestrictions enum.
Some movies can contain references to media data stored outside the movie’s container, for example in another file. This key can be used to specify a policy to use when these references are encountered. If a movie contains one or more references of a type that is forbidden by the reference restrictions, loading of movie properties will fail. In addition, such a movie cannot be used with other AVFoundation modules, such as AVPlayerItem or AVAssetExportSession.

19.4.5 Constructor

Function: The private constructor.
See also:

- 19.4.6 Constructor(Data as MemoryBlock, Options as Dictionary = nil) 3729
- 19.4.7 Constructor(File as FolderItem, Options as Dictionary = nil) 3730
- 19.4.8 Constructor(URL as String, Options as Dictionary = nil) 3731

19.4.6 Constructor(Data as MemoryBlock, Options as Dictionary = nil)

Function: Creates an AVMovie object from a movie header stored in an data parameter.
Notes:
data: An Memoryblock containing a movie header. We make a copy of that.
options: Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
CHAPTER 19. AVMOVIE

You can use this method to operate on movie headers that are not stored in files; this might include movie headers on the pasteboard (which do not contain media data). In general you should avoid loading an entire movie file with its media data into an instance of Memoryblock/String! By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack’s mediaDataStorage property will be nil. If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

In case of error raises an exception.

Available on OS X 10.11.
See also:

- 19.4.5 Constructor
- 19.4.7 Constructor(File as FolderItem, Options as Dictionary = nil)
- 19.4.8 Constructor(URL as String, Options as Dictionary = nil)

19.4.7 Constructor(File as FolderItem, Options as Dictionary = nil)

Function: Creates an AVMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
Example:

```dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim m as new AVMovieMBS(f, nil)
MsgBox str(m.duration.Seconds)+" seconds."
```

Notes:

File: A folderItem that specifies a file containing a movie header.
options: A Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.

By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack’s mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

Raises exception if something goes wrong.
See also:

- 19.4.5 Constructor
19.4. CLASS AVMOVIEMBS

- 19.4.6 Constructor(Data as MemoryBlock, Options as Dictionary = nil)
- 19.4.8 Constructor(URL as String, Options as Dictionary = nil)

19.4.8 Constructor(URL as String, Options as Dictionary = nil)

**Function:** Creates an AVMovie object from a movie header stored in a QuickTime movie file or ISO base media file.

**Notes:**

URL: An URL that specifies a file containing a movie header.
options: A Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.

Returns An AVMovie object or nil in case of error.
By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack’s mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

Raises exception if something goes wrong.
See also:

- 19.4.5 Constructor
- 19.4.6 Constructor(Data as MemoryBlock, Options as Dictionary = nil)
- 19.4.7 Constructor(File as FolderItem, Options as Dictionary = nil)

19.4.9 copy as AVMovieMBS

**Function:** Creates a copy of the movie.

**Example:**

```plaintext
dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim m as new AVMovieMBS(f, nil)

dim c as AVMutableMovieMBS = m.mutableCopy

Break // now edit

dim k as AVMovieMBS = c.copy

break // now we have k with snapshot and can still edit c
```
19.4.10  **movieHeaderWithFileType(fileType as String, byref error as NSErrorMBS) as MemoryBlock**

**Function:** Creates a memoryblock object containing the movie header of the AVMovie object.

**Notes:**

fileType: A UTI indicating the specific file format of the movie header (e.g. AVFileTypeQuickTimeMovie for a QuickTime movie).

Error: If an error occurs reading the movie header, describes the nature of the failure.

The movie header will be a pure reference movie, with no base URL, suitable for use on the pasteboard.

Returns memoryblock in case of success or nil in case of error.

Available on OS X 10.11 or newer.

19.4.11  **movieTracks as AVMovieTrackMBS()**

**Function:** The tracks in a movie.

**Notes:** The value of this property is an array of tracks the movie contains; the tracks are of type AVMovieTrack.

19.4.12  **movieTracksWithMediaCharacteristic(mediaCharacteristic as string) as AVMovieTrackMBS()**

**Function:** Provides an array of AVMovieTracks of the asset that present media with the specified characteristic.

**Example:**

```vba
    dim f as FolderItem = SpecialFolder.Desktop.Child(“test.m4v”)
dim m as new AVMovieMBS(f, nil)

dim videotracks() as AVMovieTrackMBS = m.movieTracksWithMediaCharacteristic(AVFoundationMBS.AVMediaCharacteristicVisual)

    MsgBox str(UBound(videotracks)+1)+” visual tracks”
```

**Notes:**

mediaCharacteristic: The media characteristic according to which the receiver filters its AVMovieTracks.
19.4. CLASS AVMOVIEMBS

(Media characteristics are defined in AVMediaFormat.h)
An array of AVMovieTracks; may be empty if no tracks with the specified characteristic are available. Becomes callable without blocking when the key "tracks" has been loaded.

19.4.13 movieTracksWithMediaType(mediaType as string) as AVMovieTrackMBS()

Function: Provides an array of AVMovieTracks of the asset that present media of the specified media type.
Example:
   dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
   dim m as new AVMovieMBS(f, nil)

   dim videotracks() as AVMovieTrackMBS = m.movieTracksWithMediaType(AVFoundationMBS.AV медиаTypeVideo)
   MsgBox str(UBound(videotracks)+1)+" video tracks"

Notes:
mediaType: The media type according to which the receiver filters its AVMovieTracks. (Media types are defined in AVMediaFormat.h)
An array of AVMovieTracks; may be empty if no tracks of the specified media type are available. Becomes callable without blocking when the key "tracks" has been loaded.

19.4.14 movieTrackWithTrackID(ID as Integer) as AVMovieTrackMBS

Function: Provides an instance of AVMovieTrack that represents the track of the specified trackID.
Notes:
ID: The trackID of the requested AVMovieTrack.

Returns n instance of AVMovieTrack; may be nil if no track of the specified trackID is available. Becomes callable without blocking when the key "tracks" has been loaded

19.4.15 movieTypes as String()

Function: Provides the file types the AVMovie class understands.
Example:
Notes: Returns an array of UTIs identifying the file types the AVMovie class understands.

19.4.16 movieWithData(Data as MemoryBlock, Options as Dictionary = nil) as AVMovieMBS

Function: Creates an AVMovie object from a movie header stored in an data parameter.
Notes:
- data: An Memoryblock/String containing a movie header. We make a copy of that.
- options: Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
- Returns An AVMovie object or nil in case of error.
You can use this method to operate on movie headers that are not stored in files; this might include movie headers on the pasteboard (which do not contain media data). In general you should avoid loading an entire movie file with its media data into an instance of Memoryblock/String! By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack’s mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.
See also:

- 19.4.17 movieWithData(Data as String, Options as Dictionary = nil) as AVMovieMBS

19.4.17 movieWithData(Data as String, Options as Dictionary = nil) as AVMovieMBS

Function: Creates an AVMovie object from a movie header stored in an data parameter.
Example:

```// load movie in memory```
```
dim f as FolderItem = SpecialFolder.Desktop.Child(”test.m4v”)
dim b as BinaryStream = BinaryStream.Open(f)
```

```// now open it from memory```
```
dim s as string = b.Read(b.Length)
dim m as AVMovieMBS = AVMovieMBS.movieWithData(s)
```

MsgBox str(m.duration.Seconds)+” seconds.”
19.4. CLASS AVMOVIEMBS

Notes:

data: An Memoryblock/String containing a movie header. We make a copy of that.
options: Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
Returns An AVMovie object or nil in case of error.
You can use this method to operate on movie headers that are not stored in files; this might include movie headers on the pasteboard (which do not contain media data). In general you should avoid loading an entire movie file with its media data into an instance of Memoryblock/String! By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack’s mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.
See also:

- 19.4.16 movieWithData(Data as MemoryBlock, Options as Dictionary = nil) as AVMovieMBS 3734

19.4.18 movieWithFile(File as FolderItem, Options as Dictionary = nil) as AVMovieMBS

Function: Creates an AVMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim m as AVMovieMBS = AVMovieMBS.movieWithFile(f)
MsgBox str(m.duration.Seconds)+" seconds."

Notes:
File: A folderitem that specifies a file containing a movie header.
options: A Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
Returns An AVMovie object or nil in case of error.
By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack’s mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.
19.4.19 **movieWithURL**(*URL* as String, *Options* as Dictionary = nil) as AVMovieMBS

**Function:** Creates an AVMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
**Notes:**
- **URL:** An URL that specifies a file containing a movie header.
- **options:** A Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
**Returns** An AVMovie object or nil in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack’s mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

19.4.20 **mutableCopy** as AVMutableMovieMBS

**Function:** Creates a mutable copy of the movie.
**Example:**
```plaintext
dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim m as new AVMovieMBS(f, nil)

dim c as AVMutableMovieMBS = m.mutableCopy

Break // now edit

dim k as AVMovieMBS = c.copy

break // now we have k with snapshot and can still edit c
```

19.4.21 **writeMovieHeaderToFile**(*File* as FolderItem, *fileType* as String, *options* as Integer, byref *error* as NSErrorMBS) as Boolean

**Function:** Writes the movie header to a destination file.
**Notes:**
- **File:** A folderitem indicating where to write the movie header.
- **fileType:** A UTI indicating the specific file format (e.g. AVFileTypeQuickTimeMovie for a QuickTime movie).
19.4. CLASS AVMOVIEMBS

options: An integer whose bits specify options for the writing of the movie header. Can be AVMovieWritingTruncateDestinationToMovieHeaderOnly.
Error: If an error occurs writing the movie header, describes the nature of the failure.

Data references in the output movie header are adjusted to be relative to the destination URL. Note that modifications to instances of AVMutableMovie, to their constituent AVMutableMovieTracks, or to their collections of metadata are committed to storage when their movie headers are written.

19.4.22 writeMovieHeaderToURL(URL as String, fileType as String, options as Integer, byref error as NSErrorMBS) as Boolean

Function: Writes the movie header to a destination URL.
Notes:
URL: An URL indicating where to write the movie header.
fileType: A UTI indicating the specific file format (e.g. AVFileTypeQuickTimeMovie for a QuickTime movie).
options: An integer whose bits specify options for the writing of the movie header. Can be AVMovieWritingTruncateDestinationToMovieHeaderOnly.
Error: If an error occurs writing the movie header, describes the nature of the failure.

Data references in the output movie header are adjusted to be relative to the destination URL. Note that modifications to instances of AVMutableMovie, to their constituent AVMutableMovieTracks, or to their collections of metadata are committed to storage when their movie headers are written.

19.4.23 Properties

19.4.24 canContainMovieFragments as Boolean

Function: Indicates whether the movie file is capable of being extended by fragments.
Notes:
The value of this property is true if an 'mvex' box is present in the 'moov' box. The 'mvex' box is necessary in order to signal the possible presence of later 'moof' boxes.
(Read only property)
19.4.25  containsMovieFragments as Boolean

Function: Indicates whether the movie file is extended by at least one movie fragment.
Notes:
The value of this property is YES if canContainMovieFragments is YES and at least one 'moof' box is present
after the 'moov' box.
Available on OS X 10.11 or newer.
(Read only property)

19.4.26  Data as MemoryBlock

Function: The data block with which the instance of AVMovie was initialized; may be nil.
Notes:
Available on OS X 10.11 or newer.
(Read only property)

19.4.27  defaultMediaDataStorage as AVMediaDataStorageMBS

Function: The default storage container for media data added to a movie.
Notes:
The value of this property is an AVMediaDataStorage object that indicates where sample data that is added
to a movie should be written by default.
(Read only property)

19.4.28  URL as String

Function: The URL with which the instance of AVMovie was initialized; may be ""
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim m as new AVMovieMBS(f, nil)
MsgBox m.URL
```
19.4.29 Constants

19.4.30 AVMovieWritingTruncateDestinationToMovieHeaderOnly = 1

MBS AVFoundation Plugin, Plugin Version: 16.0. **Function:** One of the options for writeMovieHeaderToURL.
**Notes:**
If set, writing the movie header will truncate all existing data in the destination file and write a new movie header, thereby creating a pure reference movie file.
A file type box will be written at the beginning of the file. If not set, writing the movie header will remove any existing movie header in the destination file and write a new movie header, preserving any other data in the file. If the destination file was empty, a file type box will be written at the beginning of the file.
You would not want to use the AVMovieWritingTruncateDestinationToMovieHeaderOnly option if you had written sample data to the destination file using (for example) insertTimeRange with copySampleData set to true, since that data would be lost.
19.5 class AVMovieTrackMBS

19.5.1 class AVMovieTrackMBS

Function: AVMovieTrack represents the tracks of audiovisual containers in a file that conforms to the
QuickTime movie file format or to one of the related ISO base media file formats (such as MPEG-4).
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
dim m as new AVMovieMBS(f, nil)

dim videotracks() as AVMovieTrackMBS = m.movieTracksWithMediaCharacteristic(AVFoundationMBS.AV-
MediaCharacteristicFrameBased)

for each videotrack as AVMovieTrackMBS in videotracks
dim s as CGSizeMBS = videotrack.naturalSize
MsgBox str(s.Width)+" x " + str(s.Height)
next

Notes:
Subclass of the AVAssetTrackMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

19.5.2 Methods

19.5.3 available as Boolean

Function: Whether this class is available.
Example:

if not AVMovieTrackMBS.available then
MsgBox "This application requires a newer OS X version."
end if

Notes: Returns true on OS X 10.10.
19.5.4 Constructor

Function: The private constructor.

19.5.5 Properties

19.5.6 alternateGroupID as Integer

Function: An integer indicating the track as a member of a particular alternate group.
Notes: (Read only property)

19.5.7 mediaDataStorage as AVMediaDataStorageMBS

Function: The storage container for media data added to a track.
Notes: The value of this property is an AVMediaDataStorage object that indicates the location at which media data
inserted or appended to the track will be written.
(Read only property)

19.5.8 mediaDecodeTimeRange as CMTimeRangeMBS

Function: A CMTimeRange indicating the range of decode times for the track’s media.
Notes: (Read only property)

19.5.9 mediaPresentationTimeRange as CMTimeRangeMBS

Function: A CMTimeRange indicating the range of presentation times for the track’s media.
Notes: (Read only property)
19.6 class AVMutableMovieMBS

19.6.1 class AVMutableMovieMBS

**Function:** AVMutableMovie adds to its immutable superclass, AVMovie, several categories of methods for editing QuickTime movie files, e.g. inserting and removing time ranges of media, adding and removing tracks, and modifying the metadata collections stored therein. 

**Notes:**

By default, after creating an AVMutableMovie the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack’s mediaDataStorage property will be nil. If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

Available in OS X 10.11. 
Subclass of the AVMovieMBS class.

19.6.2 Methods

19.6.3 addMutableTracksCopyingSettingsFromTracks(existingTracks() as AVMovieTrackMBS, options as Dictionary) as AVMutableMovieTrackMBS()

**Function:** Adds one or more empty tracks to the target movie, copying track settings from the source tracks. 

**Notes:**

existingTracks: An array of AVMovieTrack objects. 
options: An dictionary object that contains keys for specifying options for the initialization of the new AVMutableMovieTrack objects. Currently no keys are defined; pass nil for default initialization behavior. 
Returns An array of AVMutableMovieTrack objects; the index of a track in this array is the same as the index of its source track in the existingTracks array. 
This method creates one or more empty tracks in the target movie and configures those tracks with settings (such as track userdata and metadata, width, height, and preferred volume) copied from the source tracks in the existingTracks array. Also, properties involving pairs of tracks (such as track references) are copied from the source tracks to the target tracks.

19.6.4 addMutableTrackWithMediaType(mediaType as String, track as AVMovieTrackMBS, options as Dictionary) as AVMutableMovieTrackMBS

**Function:** Adds an empty track to the target movie.
19.6. CLASS AVMUTABLEMOVIEMBS 3743

Notes:

mediaType: The media type of the new track (e.g. AVMediaTypeVideo for a video track).
track: If you wish to transfer settings from an existing track, including trackuserdata
and metadata, width, height, preferred volume, etc., pass a reference to an
AVMovieTrack representing that track. Otherwise pass nil.

options: An Dictionary object that contains keys for specifying options for the initialization of the new
AVMutableMovieTrack object. Currently no keys are defined; pass nil for default initialization behavior.
Returns An AVMutableMovieTrack object or nil in case of error.
The trackID of the newly added track is a property of the returned instance of AVMutableMovieTrack.

19.6.5 Constructor

Function: The constructor to create blank new movie.
See also:
- 19.6.6 Constructor(Data as MemoryBlock, Options as Dictionary = nil) 3743
- 19.6.7 Constructor(Data as MemoryBlock, Options as Dictionary = nil, byref error as NSErrorMBS) 3744
- 19.6.8 Constructor(File as FolderItem, Options as Dictionary = nil) 3745

- 19.6.11 Constructor(URL as String, Options as Dictionary = nil) 3747
- 19.6.12 Constructor(URL as String, Options as Dictionary = nil, byref error as NSErrorMBS) 3748

19.6.6 Constructor(Data as MemoryBlock, Options as Dictionary = nil)

Function: Creates an AVMutableMovie object from a movie header stored in a Memoryblock/string.
Notes:
data: A memoryblock containing a movie header.
options: An dictionary object that contains keys for specifying options for the initialization of the AV-
MutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure.
CHAPTER 19. AVMOVIE

Raises exception in case of error.

You can use this method to operate on movie headers that are not stored in files. In general you should avoid loading an entire movie file with its media data into an instance of memoryblock!

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack’s mediaDataStorage property will be nil. If you want to create an AVMutableMovie from an memoryblock and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

- 19.6.12 Constructor(URL as String, Options as Dictionary = nil, byref error as NSErrorMBS)

19.6.8 Constructor(File as FolderItem, Options as Dictionary = nil)

Function: Creates an AVMutableMovie object from a movie header stored in a QuickTime movie file or
ISO base media file.

Notes:

File: An folderitem that specifies a file containing a movie header.
options: An Dictionary object that contains keys for specifying options for the initialization of the AV-
MutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure.

Returns An AVMutableMovie object or nil in case of error.

Raises exception in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's
mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks,
you must first set one of these properties to indicate where the sample data should be written.

19.6. CLASS AVMUTABLEMOVIEMBS

19.6.10 Constructor(Movie as AVMovieMBS = nil, Options as Dictionary = nil, byref error as NSErrorMBS)

**Function:** Creates an AVMutableMovie object without tracks (and therefore without media).
**Notes:**

movie: If you wish to transfer settings from an existing movie (including movie userdata and metadata, preferred rate, preferred volume, etc.), pass a reference to an AVMovie object representing that movie. Otherwise pass nil. The userdata and metadata from the source movie may need to be converted if the format of that movie differs from fileType; you may wish to inspect the userdata or metadata of the receiver to ensure that important data was copied.

options: A dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined; pass nil for default initialization behavior.

Error: If an error occurs creating a movie, describes the nature of the failure.

Raises exception in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack’s mediaDataStorage property will be nil. If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

- 19.6.12 Constructor(URL as String, Options as Dictionary = nil, byref error as NSErrorMBS)

19.6.11 Constructor(URL as String, Options as Dictionary = nil)

**Function:** Creates an AVMutableMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
**Notes:**

URL: An URL that specifies a file containing a movie header.

options: An Dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure. Optional.

Raises exception in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack’s mediaDataStorage property will be nil.

If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

See also:

- 19.6.10 Constructor(Movie as AVMovieMBS = nil, Options as Dictionary = nil, byref error as NSErrorMBS) 3747
- 19.6.12 Constructor(URL as String, Options as Dictionary = nil, byref error as NSErrorMBS) 3748

19.6.12 Constructor(URL as String, Options as Dictionary = nil, byref error as NSErrorMBS)

Function: Creates an AVMutableMovie object from a movie header stored in a QuickTime movie file or ISO base media file.

Notes:

URL: An URL that specifies a file containing a movie header.
options: An Dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure. Optional.

Raises exception in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack’s mediaDataStorage property will be nil.

If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

- 19.6.11 Constructor(URL as String, Options as Dictionary = nil)

19.6.13 insertEmptyTimeRange(timeRange as CMTimeRangeMBS)

Function: Adds an empty time range to the target movie.
Notes: timeRange: The time range to be made empty. Note that you cannot add empty time ranges to the end of a movie.

19.6.14 insertTimeRange(timeRange as CMTimeRangeMBS, asset as AVAssetMBS, atTime as CMTimeMBS, copySampleData as Boolean, byref Error as NSErrorMBS) as boolean

Function: Inserts all the tracks of a timeRange of an asset into a movie.
Notes:

- timeRange: The time range of the asset to be inserted.
- asset: An AVAsset object indicating the source of the inserted media. Only instances of AVURLAsset and AVComposition are supported. Must not be nil.
- startTime: The time in the target movie at which the media is to be inserted.
- copySampleData: A boolean value that indicates whether sample data is to be copied from the source to the destination during edits. If true, the sample data is written to the location specified by the track property mediaDataStorage if non-nil, or else by the movie property defaultMediaDataStorage if non-nil; if both are nil, the method will fail and return false. If false, sample data will not be written and sample references to the samples in their original container will be added as necessary.
- Note that in this case, this method will fail if the source AVAsset is not able to provide sample reference information for the original container.
- Error: If the insertion fails, an error object that describes the nature of the failure.
Returns a boolean value that indicates the success of the insertion.

This method may add new tracks to the target movie to ensure that all tracks of the asset are represented in the inserted timeRange.
Existing content at the specified startTime will be pushed out by the duration of timeRange.

19.6.15 metadata as AVMetadataItemMBS()

Function: A collection of metadata stored by the movie.
Notes: The value of this property is an array of AVMetadataItem objects representing the collection of metadata stored by the movie.

19.6.16 movieWithData(Data as MemoryBlock, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS

Function: Creates an AVMutableMovie object from a movie header stored in a Memoryblock/string.
Notes:
data: A memoryblock/string containing a movie header.
options: An dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure.

Returns an AVMutableMovie object or nil in case of error.

You can use this method to operate on movie headers that are not stored in files. In general you should avoid loading an entire movie file with its media data into an instance of memoryblock!

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's mediaDataStorage property will be nil. If you want to create an AVMutableMovie from an memoryblock and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.
See also:

- 19.6.17 movieWithData(Data as String, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS
19.6.17 movieWithData(Data as String, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS

**Function:** Creates an AVMutableMovie object from a movie header stored in a Memoryblock/string.

**Notes:**
- data: A memoryblock/string containing a movie header.
- options: An dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
- Error: If an error occurs creating a movie, describes the nature of the failure.

**Returns** An AVMutableMovie object or nil in case of error.

You can use this method to operate on movie headers that are not stored in files. In general you should avoid loading an entire movie file with its media data into an instance of memoryblock!

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack’s mediaDataStorage property will be nil. If you want to create an AVMutableMovie from an memoryblock and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

See also:
- 19.6.16 movieWithData(Data as MemoryBlock, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS

19.6.18 movieWithFile(File as FolderItem, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS

**Function:** Creates an AVMutableMovie object from a movie header stored in a QuickTime movie file or ISO base media file.

**Notes:**
- File: An folderitem that specifies a file containing a movie header.
- options: An Dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
- Error: If an error occurs creating a movie, describes the nature of the failure.

**Returns** An AVMutableMovie object or nil in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack’s mediaDataStorage property will be nil.

If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks,
you must first set one of these properties to indicate where the sample data should be written.

19.6.19 movieWithSettingsFromMovie(Movie as AVMovieMBS, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS

Function: Creates an AVMutableMovie object without tracks (and therefore without media).

Notes:

movie: If you wish to transfer settings from an existing movie (including movie userdata and metadata, preferred rate, preferred volume, etc.), pass a reference to an AVMovie object representing that movie. Otherwise pass nil. The userdata and metadata from the source movie may need to be converted if the format of that movie differs from fileType; you may wish to inspect the userdata or metadata of the receiver to ensure that important data was copied.

options: A dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined; pass nil for default initialization behavior.

Error: If an error occurs creating a movie, describes the nature of the failure.

Returns An AVMutableMovie object or nil in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack’s mediaDataStorage property will be nil. If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

19.6.20 movieWithURL(URL as String, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS

Function: Creates an AVMutableMovie object from a movie header stored in a QuickTime movie file or ISO base media file.

Notes:

URL: An URL that specifies a file containing a movie header.

options: A dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.

Error: If an error occurs creating a movie, describes the nature of the failure.

Returns An AVMutableMovie object or nil in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack’s mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

19.6.21 `mutableMovieTracks` as `AVMutableMovieTrackMBS()`

**Function:** The tracks in a mutable movie.

**Notes:** The value of this property is an array of tracks the mutable movie contains; the tracks are of type `AVMutableMovieTrack`.

19.6.22 `mutableMovieTracksWithMediaCharacteristic(mediaCharacteristic as string)` as `AVMutableMovieTrackMBS()`

**Function:** Provides an array of `AVMutableMovieTracks` of the asset that present media with the specified characteristic.

**Notes:**
- `mediaCharacteristic`: The media characteristic according to which the receiver filters its `AVMutableMovieTracks`. (Media characteristics are defined in `AVMediaFormat.h`)
- An array of `AVMutableMovieTracks`; may be empty if no tracks with the specified characteristic are available.
- Becomes callable without blocking when the key "tracks" has been loaded.

19.6.23 `mutableMovieTracksWithMediaType(mediaType as string)` as `AVMutableMovieTrackMBS()`

**Function:** Provides an array of `AVMutableMovieTracks` of the asset that present media of the specified media type.

**Notes:**
- `mediaType`: The media type according to which the receiver filters its `AVMutableMovieTracks`. (Media types are defined in `AVMediaFormat.h`)
- An array of `AVMutableMovieTracks`; may be empty if no tracks of the specified media type are available.
- Becomes callable without blocking when the key "tracks" has been loaded.
19.6.24 mutableMovieTrackWithTrackID(ID as Integer) as AVMutableMovieTrackMBS

**Function:** Provides an instance of AVMutableMovieTrack that represents the track of the specified trackID.  
**Notes:**  
ID: The trackID of the requested AVMutableMovieTrack.  

An instance of AVMutableMovieTrack; may be nil if no track of the specified trackID is available.  
Becomes callable without blocking when the key "tracks" has been loaded.

19.6.25 mutableTrackCompatibleWithTrack(track as AVAssetTrackMBS) as AVMutableMovieTrackMBS

**Function:** Provides a reference to a track of a mutable movie into which any time range of an AVAssetTrack can be inserted (via insertTimeRange:ofTrack).  
**Notes:**  
track: A reference to the AVAssetTrack from which a time range may be inserted.  
Returns An AVMutableMovieTrack that can accommodate the insertion.  
If no such track is available, the result is nil. A new track of the same media type as the AVAssetTrack can be created via addMutableTrackWithMediaType, and this new track will be compatible.  

For best performance, the number of tracks in a movie should be kept to a minimum, corresponding to the number for which media data must be presented in parallel. If media data of the same type is to be presented serially, even from multiple assets, a single track of that media type should be used. This method, mutableTrackCompatibleWithTrack, can help the client to identify an existing target track for an insertion.

19.6.26 removeTimeRange(timeRange as CMTimeRangeMBS)

**Function:** Removes a specified time range from a movie.  
**Notes:** timeRange: The time range to be removed.

19.6.27 removeTrack(track as AVMovieTrackMBS)

**Function:** Removes a track from the target movie.
19.6. CLASS AVMUTABLEMOVIE MBS

Notes: track: The track to be removed.

19.6.28 scaleTimeRange(timeRange as CMTTimeRangeMBS, duration as CMT-TimeMBS)

Function: Changes the duration of a time range of a movie.
Notes:
timeRange: The time range to be scaled.
duration: The new duration of the time range.

19.6.29 setMetadata(items() as AVMetadataItemMBS)

Function: Sets the metadata.

19.6.30 Properties

19.6.31 defaultMediaDataStorage as AVMediaDataStorageMBS

Function: The default storage container for media data added to a movie.
Notes:
The value of this property is an AVMediaDataStorage object that indicates where sample data that is added
to a movie should be written, for any track for whose mediaDataStorage property is nil.
(Read and Write property)

19.6.32 interleavingPeriod as CMTTimeMBS

Function: A CMTTime that indicates the duration for interleaving runs of samples of each track.
Notes:
The default interleaving period is 0.5 seconds.
(Read and Write property)
19.6.33 modified as Boolean

Function: Whether a movie has been modified.
Notes: The value of this property is a boolean that indicates whether the AVMutableMovie object has been modified since it was created, was last written, or had its modified state cleared via assignment Modified = false.
(Read and Write property)

19.6.34 preferredRate as Double

Function: The natural rate at which the movie is to be played; often but not always 1.0.
Notes: (Read and Write property)

19.6.35 preferredTransform as CMTimeMBS

Function: A CGAffineTransform indicating the transform specified in the movie’s storage container as the preferred transformation of the visual media data for display purposes; the value is often but not always CGAffineTransformIdentity.
Notes: (Read and Write property)

19.6.36 preferredVolume as Double

Function: The preferred volume of the audible media data of the movie; often but not always 1.0.
Notes: (Read and Write property)

19.6.37 timescale as Integer

Function: For file types that contain a 'moov' atom, such as QuickTime Movie files, specifies the time scale of the movie.
Notes: The default movie time scale is 600. In certain cases, you may want to set this to a different value. For instance, a movie that contains a single audio track should typically have the movie time scale set to the
19.6. **CLASS AVMUTABLEMOVIEMBS**

media time scale of that track.

This property should be set on a new empty movie before any edits are performed on the movie. (Read and Write property)
19.7 class AVMutableMovieTrackMBS

19.7.1 class AVMutableMovieTrackMBS

Function: AVMutableMovieTrack provides the track-level editing interface of an AVMutableMovie.  
Notes:  
Media can be inserted into a movie track and other editing operations performed via an instance of this class.  
Available on OS X 10.11.  
Subclass of the AVMovieTrackMBS class.  
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

19.7.2 Methods

19.7.3 addTrackAssociationToTrack(movieTrack as AVMovieTrackMBS, trackAssociationType as String)

Function: Establishes a track association of a specific type between two tracks.  
Notes:  
movieTrack: An AVMovieTrack object that is to be associated with the receiver.  
trackAssociationType: The type of track association to add between the receiver and the specified movieTrack (for instance, AVTrackAssociationTypeChapterList).

19.7.4 Constructor

Function: The private constructor.

19.7.5 insertEmptyTimeRange(timeRange as CMTimeRangeMBS)

Function: Adds an empty time range to the target track.  
Notes: timeRange: The time range to be made empty. Note that you cannot add empty time ranges to the end of a track.
19.7.6 **insertTimeRange(**timeRange as CMTimeRangeMBS, assetTrack as AVAssetTrackMBS, atTime as CMTimeMBS, copySampleData as Boolean, byref Error as NSErrorMBS) as boolean

**Function:** Inserts a portion of an AVAssetTrack object into the target movie.

**Notes:**
- **timeRange:** The time range from the track from which media is to be inserted.
- **track:** An AVAssetTrack object indicating the source of the inserted media. Only AVAssetTracks of AVURLAssets and AVCompositions are supported. Must not be nil.
- **startTime:** The time in the target track at which the media is to be inserted.
- **copySampleData:** A boolean value that indicates whether sample data is to be copied from the source to the destination during edits.

If true, the sample data is written to the file specified by the track property mediaDataStorage if non-nil, or else by the movie property defaultMediaDataStorage if non-nil; if both are nil, the method will fail and return NO.

If false, sample data will not be written and sample references to the samples in their original container will be added as necessary. Note that in this case, this method will fail if the original samples are fragmented.

**Error:** If the insertion fails, describes the nature of the failure.

Returns a boolean value that indicates the success of the insertion.

19.7.7 **metadata as AVMetadataItemMBS()**

**Function:** A collection of metadata stored by the track.

**Notes:** The value of this property is an array of AVMetadataItem objects representing the collection of metadata stored by the track.

19.7.8 **removeTimeRange(**timeRange as CMTimeRangeMBS) **

**Function:** Removes a specified time range from a track.

**Notes:** timeRange: The time range to be removed.
CHAPTER 19. AVMOVIE

19.7.9  removeTrackAssociationToTrack(movieTrack as AVMovieTrackMBS, trackAssociationType as String)

Function: Removes a track association of a specific type between two tracks.
Notes:
movieTrack: An AVMovieTrack object that is associated with the receiver.
trackAssociationType: The type of track association to remove between the receiver and the specified movieTrack (for instance, AVTrackAssociationTypeChapterList).

19.7.10 scaleTimeRange(timeRange as CMTimeRangeMBS, duration as CMTimeMBS)

Function: Changes the duration of a time range of a track.
Notes:
timeRange: The time range to be scaled.
duration: The new duration of the time range.

19.7.11 setMetadata(items() as AVMetadataItemMBS)

Function: Sets the metadata items.

19.7.12 Properties

19.7.13 alternateGroupID as Integer

Function: An integer indicating the track as a member of a particular alternate group.
Notes: (Read and Write property)

19.7.14 cleanApertureDimensions as CGSizeMBS

Function: A CGSize indicating the clean aperture dimensions of the track.
Notes: (Read and Write property)
19.7.15 Enabled as Boolean

Function: A boolean value indicating whether the track is enabled by default for presentation.
Notes: (Read and Write property)

19.7.16 encodedPixelsDimensions as CGSize

Function: A CGSize indicating the dimensions encoded pixels dimensions of the track.
Notes: (Read and Write property)

19.7.17 extendedLanguageTag as String

Function: The language tag associated with the track.
Notes:
The value of this property is an IETF BCP 47 (RFC 4646) language identifier indicating the language tag associated with the track; may be "" if no language tag is indicated.
(Read and Write property)

19.7.18 hasProtectedContent as Boolean

Function: Whether a track contains protected content.
Notes:
The value of this property is a boolean that indicates whether the track contains protected content.
(Read only property)

19.7.19 languageCode as String

Function: The language associated with the track.
Notes:
The value of this property is an ISO 639-2/T language code indicating the language associated with the track; may be "" if no language is indicated.
(Read and Write property)
19.7.20 layer as Integer

Function: The layer level of the visual media data of the track.
Notes: (Read and Write property)

19.7.21 mediaDataStorage as AVMediaDataStorageMBS

Function: The storage container for media data added to a track.
Notes: The value of this property is an AVMediaDataStorage object that indicates the location at which media data
inserted or appended to the track will be written.
(Read and Write property)

19.7.22 Modified as Boolean

Function: Whether a track has been modified.
Notes: The value of this property is a boolean that indicates whether the AVMutableMovieTrack object has been
modified since it was created, was last written, or had its modified state cleared via an assignment: Modified
= false.
(Read and Write property)

19.7.23 naturalSize as CGSizeMBS

Function: A CGSize indicating the dimensions at which the visual media data of the track should be dis-
played.
Notes: (Read and Write property)

19.7.24 preferredMediaChunkAlignment as Integer

Function: For file types that support media chunk alignment, the boundary for media chunk alignment (in
bytes).
Notes:
The default value is 0, which means that the receiver will choose an appropriate default value.
A value of 1 implies that no padding should be used to achieve a particular chunk alignment. It is an error to set a negative value for chunk alignment.
(Read and Write property)

### 19.7.25 preferredMediaChunkDuration as CMTimeMBS

**Function:** For file types that support media chunk durations, the maximum duration to be used for each chunk of sample data written to the file.
**Notes:**
The total duration of the samples in a chunk will be no greater than this preferred chunk duration, or the duration of a single sample if the sample’s duration is greater than this preferred chunk duration.

The default value is kCMTimeInvalid, which means that the receiver will choose an appropriate default chunk duration. It is an error to set a chunk duration that is negative or non-numeric.

This property and preferredMediaChunkSize, which also specifies the size of a chunk, are mutually exclusive. Thus, if both properties are set, the last setting is honored.
(Read and Write property)

### 19.7.26 preferredMediaChunkSize as Integer

**Function:** For file types that support media chunk sizes, the maximum size (in bytes) to be used for each chunk of sample data written to the file.
**Notes:**
The total size of the samples in a chunk will be no larger than this preferred chunk size, or the size of a single sample if the sample is larger than this preferred chunk size.

The default value is 0, which means that the receiver will choose an appropriate default chunk size. It is an error to set a negative chunk size.

This property and preferredMediaChunkDuration, which also specifies the size of a chunk, are mutually exclusive.
Thus, if both properties are set, the last setting is honored.
(Read and Write property)
19.7.27 preferredTransform as CGAffineTransformMBS

Function: A CGAffineTransform indicating the transform specified in the track’s storage container as the preferred transformation of the visual media data for display purposes; the value is often but not always CGAffineTransformIdentity.
Notes: (Read and Write property)

19.7.28 preferredVolume as Double

Function: The preferred volume of the audible media data of the track; often but not always 1.0.
Notes: (Read and Write property)

19.7.29 productionApertureDimensions as CGSizeMBS

Function: A CGSize indicating the production aperture dimensions of the track.
Notes: (Read and Write property)

19.7.30 sampleReferenceBaseURL as String

Function: For file types that support writing sample references, such as QuickTime Movie files, specifies the base URL that sample references are relative to; may be nil.
Notes:
If the value of this property can be resolved as an absolute URL, the sample locations written to the file when appending sample references to this track will be relative to this URL. The URL must point to a location contained by any common parent directory of the locations that will be referenced. For example, setting the sampleReferenceBaseURL property to "file:///Users/johnappleseed/Movies/" and appending sample buffers that refer to "file:///Users/johnappleseed/Movies/data/movie1.mov" will cause the sample reference "data/movie1.mov" to be written to the movie file.

If the value of the property cannot be resolved as an absolute URL or if it points to a location that is not contained by any common parent directory of the locations that will be referenced, the location will be written unmodified.

The default value is ",", which means that the location will be written unmodified.
(Read and Write property)
19.7. **CLASS AVMUTABLEMOVIETRACKMBS**

19.7.31 **timescale as Integer**

**Function:** For file types that contain a ‘moov’ atom, such as QuickTime Movie files, specifies the time scale of the track’s media.

**Notes:**

The default media time scale is 0.

This property should be set on a new empty track before any edits are performed on the track.

(Read and Write property)
Chapter 20

Barcode

20.1  class BarcodeGeneratorMBS

20.1.1  class BarcodeGeneratorMBS

**Function:** The class to generate barcodes.  
**Example:**  
```vbnet
dim b as new BarcodeGeneratorMBS  
b.Symbology = b.BarcodeQrcode  
b.Scale = 2  
b.BorderWidth = 4  
b.Encode "Hello Xojo Developer!"  
Backdrop = b.Picture
```

**Notes:**  
The MBS Plugin uses the zint library (BSD license).  
Please also see the manual for Zint (included in examples) for special options for individual barcodes.

20.1.2  Methods

20.1.3  Constructor

**Function:** The constructor.
20.1.4 Destructor

20.1.5 EANChecksum(text as string) as string

MBS Barcode Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Calculates checksums for EAN.  
**Example:**
```
// returns "3" for 12 digit EAN:
MsgBox BarcodeGeneratorMBS.EANChecksum("425098421626")
```

**Notes:**
Returns checksum character.

For EAN 8, please use UPCChecksum function.

20.1.6 Encode(text as string, width as single = 0, height as single = 0, RotationAngle as Integer = 0)

**Example:**
```
dim b as new BarcodeGeneratorMBS
b.Symbology = b.BarcodeQrcode
b.Scale = 2
b.BorderWidth = 4
b.Encode "Hello Xojo Developer!"
Backdrop = b.Picture
```

**Notes:**
If width is zero, we use automatic width.
If height is zero, we use automatic height. Default height for some 2D bars is 30 units.  
RotationAngle can be 0, 90, 180 or 270.  
You can set options before calling and query other properties (like picture after this)
20.1.7 ISBNChecksum(text as string) as string

MBS Barcode Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Example:

// returns 6 for 9 digit ISBN:
MsgBox BarcodeGeneratorMBS.ISBNChecksum("074755100")

Notes: Returns checksum character.

20.1.8 SVG as String

Function: Creates SVG as text.
Example:

dim z as new BarcodeGeneratorMBS

// try QR Code
z.Symbology = BarcodeGeneratorMBS.BarcodeQrcode
z.Encode ”Hello World”

dim s1 as string = z.SVG

// try SVG
z.Symbology = BarcodeGeneratorMBS.BarcodeEanX
z.Encode ”123456789012”

dim s2 as string = z.SVG

break // check SVG

Notes: Lasterror and ErrorText are set.

20.1.9 UPCChecksum(text as string) as string

Function: Calculates UPC checksum.
Example:
dim s as string = "24796"
MsgBox BarcodeGeneratorMBS.UPCChecksum(s)

Notes: String must contain numbers.

20.1.10 ValidSymbologyID(ID as Integer) as Boolean

20.1.11 WritePS(path as string) as Integer

dim z as new BarcodeGeneratorMBS
z.Symbology = BarcodeGeneratorMBS.BarcodeUpca
z.Encode "72527270270"
dim f as FolderItem = SpecialFolder.Desktop.Child("barcode.eps")
dim e as Integer = z.WritePS(f.UnixpathMBS)
if z.ErrorText.len >0 then
  MsgBox z.ErrorText
else
  MsgBox "OK"
end if

Notes:
Returns error code. Lasterror and ErrorText is also set.
File path should be ASCII only (other characters not guaranteed) and maybe point to temp file somewhere.

20.1.12 WriteSVG(path as string) as Integer

Example:

```
Dim z As New BarcodeGeneratorMBS

z.Symbology = BarcodeGeneratorMBS.BarcodeUpca
z.Encode "72527270270"

Dim f As FolderItem = SpecialFolder.Desktop.Child("barcode.svg")
Dim e As Integer = z.WriteSVG(f.UnixpathMBS)
If z.ErrorText.len > 0 Then
    MsgBox z.ErrorText
Else
    MsgBox "OK"
End If
```

Notes:
Returns error code. Lasterror is set.
ErrorText is also set.
File path should be ASCII only (other characters not guaranteed) and maybe point to temp file somewhere.

20.1.13 Properties

20.1.14 BackColor as Color

**Function:** The background color.
**Notes:**
By default white.
Please set before Encode to take effect while encoding barcode.
(Read and Write property)

20.1.15 BitmapByteLength as Integer

**Function:** The byte length of a bitmap.
**Notes:** (Read only property)
20.1.16 BitmapHeight as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Height of stored bitmap image (in pixels). **Notes:** (Read only property)

20.1.17 BitmapWidth as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Width of stored bitmap image (in pixels). **Notes:** (Read only property)

20.1.18 BorderWidth as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Border width. **Notes:**
Default 0.
Please set before Encode to take effect while encoding barcode. (Read and Write property)

20.1.19 DotSize as Single

MBS Barcode Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The dot size. **Notes:** (Read and Write property)

20.1.20 ECI as Integer

MBS Barcode Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** ECI field. **Notes:** (Read and Write property)

20.1.21 ErrorText as String

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Error message in the event that an error occurred.
20.1.22 ForeColor as Color

**Function:** The foreground color.
**Notes:**
- By default black.
- Please set before Encode to take effect while encoding barcode.
- (Read and Write property)

20.1.23 Height as Integer

**Function:** Symbol height.
**Notes:**
- Default 50.
- (Read and Write property)

20.1.24 InputMode as Integer

**Function:** Set encoding of input data.
**Notes:**
- Default binary mode.
- Please set before Encode to take effect while encoding barcode.
- (Read and Write property)

20.1.25 LastError as Integer

**Function:** The last error code.
**Notes:** (Read and Write property)
20.1.26 Option1 as Integer

**Function:** Symbology specific options.
**Notes:**
Please set before Encode to take effect while encoding barcode.
(Read and Write property)

20.1.27 Option2 as Integer

**Function:** Symbology specific options.
**Notes:**
Please set before Encode to take effect while encoding barcode.
(Read and Write property)

20.1.28 Option3 as Integer

**Function:** Symbology specific options.
**Notes:**
Please set before Encode to take effect while encoding barcode.
(Read and Write property)

20.1.29 OutputOptions as Integer

**Function:** Binding or box parameters.
**Notes:**
Use OutputOptionBind, OutputOptionBox or OutputOptionNone.
Please set before Encode to take effect while encoding barcode.
(Read and Write property)

20.1.30 Picture as Picture

**Function:** The barcode picture.
20.1.1. Render as ZintRenderMBS

Function: The render information.
Notes: 
You can check this classes and draw the barcode yourself. 
For Example with DynaPDF as vector graphics. 

Only available after you called Encode method. 
(Read and Write property)

20.1.32 Rows as Integer

Function: Number of rows used by the symbol or, if using barcode stacking, the row to be used by the next symbol. 
Notes: (Read only property)

20.1.33 Scale as Single

Function: Scale factor for adjusting size of image. 
Example: 

```pascal
dim b as new BarcodeGeneratorMBS 
b.Symbology = b.BarcodeQrcode 
b.Scale = 4 
b.BorderWidth = 4 
b.Encode "Hello Xojo Developer!" 
Backdrop = b.Picture
```

Notes: 
Default is 1.0 
Please set before Encode to take effect while encoding barcode. 
(Read and Write property)
20.1.34  **ShowText as Boolean**

**Function:** Whether to show the text below the barcode.

**Notes:**

Please set before Encode to take effect while encoding barcode.
(Read and Write property)

20.1.35  **Symbology as Integer**

**Function:** Symbology to use.

**Notes:**

e.g. BarcodeEANX.

Please set before Encode to take effect while encoding barcode.
(Read and Write property)

20.1.36  **Text as String**

**Function:** Human readable text, which usually consists of the input data plus one or more check digits.

**Notes:**

Uses UTF-8 formatting.
(Read only property)

20.1.37  **WhitespaceWidth as Integer**

**Function:** The width of the whitespace.

**Notes:**

Please set before Encode to take effect while encoding barcode.
(Read and Write property)

20.1.38  **Width as Integer**

**Function:** Width of the generated symbol.
20.1.39 Constants

20.1.40 BarcodeAuspost = 63

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the barcode symbology constants  
**Notes:** Australia Post Standard Customer

20.1.41 BarcodeAusredirect = 68

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the barcode symbology constants  
**Notes:** Australia Post Redirection

20.1.42 BarcodeAusreply = 66

20.1.121 **BarcodeRssLtd = 30**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the barcode symbology constants  
**Notes:** GS1 DataBar Limited

20.1.122 **BarcodeRssLtdCc = 133**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the barcode symbology constants  
**Notes:** Composite Symbol with GS1 DataBar Limited component

20.1.123 **BarcodeTelepen = 32**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the barcode symbology constants  
**Notes:** Telepen Alpha

20.1.124 **BarcodeTelepenNum = 87**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the barcode symbology constants  
**Notes:** Telepen Numeric

20.1.125 **BarcodeUpca = 34**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the barcode symbology constants  
**Notes:** UPC A
20.1.126  BarcodeUpcaCc = 135

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the barcode symbology constants
**Notes:** Composite Symbol with UPC A linear component

20.1.127  BarcodeUPCACheck = 35

MBS Barcode Plugin, Plugin Version: 16.5. **Function:** One of the barcode symbology constants
**Notes:** UPCA Check

20.1.128  BarcodeUpce = 37

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the barcode symbology constants
**Notes:** UPC E

20.1.129  BarcodeUpceCc = 136

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the barcode symbology constants
**Notes:** Composite Symbol with UPC E linear component

20.1.130  BarcodeUPCECheck = 38

MBS Barcode Plugin, Plugin Version: 16.5. **Function:** One of the barcode symbology constants
**Notes:** UPCE Check

20.1.131  ErrorEncodingProblem = 9

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
**Notes:** A problem has occurred during encoding of the data. This should never happen. Please contact the developer if you encounter this error.

20.1.132  ErrorFileAccess = 10

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the error constants.
**Notes:** Zint was unable to open the requested output file. This is usually a file permissions problem.
20.1.133  **ErrorInvalidCheck = 7**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** An ISBN with an incorrect check digit has been entered. No symbol has been generated.

20.1.134  **ErrorInvalidData = 6**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** The data to be encoded includes characters which are not permitted by the selected symbology (e.g. alphabetic characters in an EAN symbol). No symbol has been generated.

20.1.135  **ErrorInvalidOption = 8**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** One of the values in zint_struct was set incorrectly and Zint was unable to guess what it should have been. No symbol has been generated.

20.1.136  **ErrorMemory = 11**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** Zint ran out of memory. This should only be a problem with legacy systems.

20.1.137  **ErrorTooLong = 5**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** The input data is too long or too short for the selected symbology. No symbol has been generated.

20.1.138  **InputModeData = 0**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the input mode constants.  
**Notes:** Uses full ASCII range interpreted as Latin-1 or binary data.

20.1.139  **InputModeGS1 = 2**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the input mode constants.  
**Notes:** Encodes GS1 data using FNC1 characters.
20.1.140  **InputModeKanji = 3**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the input mode constants.  
**Notes:** Kanji

20.1.141  **InputModeSJIS = 4**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the input mode constants.  
**Notes:** SJJS

20.1.142  **InputModeUnicode = 1**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the input mode constants.  
**Notes:** Uses pre-formatted UTF-8 input.

20.1.143  **OptionDMRE = 101**

MBS Barcode Plugin, Plugin Version: 16.5. **Function:** One of the output options.

20.1.144  **OptionSquare = 100**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the options.  
**Notes:** An extra feature is available for Data Matrix symbols which allows Zint to automatically resize the symbol as required but also prevents Zint from using rectangular symbols. To set this mode set the value `Option3 = OptionSquare`.

20.1.145  **OutputOptionBind = 2**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the output options.  
**Notes:** Boundary bars above and below the symbol and between rows if stacking multiple symbols.
20.1. CLASS BARCODEGENERATORMBS

20.1.146 OutputOptionBoldText = 64

MBS Barcode Plugin, Plugin Version: 16.5. **Function:** One of the output options.  
**Notes:** Use bold text.

20.1.147 OutputOptionBox = 4

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the output options.  
**Notes:** Add a box surrounding the symbol and whitespace.

20.1.148 OutputOptionCMYKColors = 128

MBS Barcode Plugin, Plugin Version: 16.5. **Function:** One of the output options.  
**Example:**
```csharp
dim z as new BarcodeGeneratorMBS
// enable CMYK
z.OutputOptions = z.OutputOptionCMYKColors
```

**Notes:**
use CMYK colors for Postscript output.  
For images, you can use plugin functions to convert RGB to CMYK if needed.

20.1.149 OutputOptionDottyMode = 256

MBS Barcode Plugin, Plugin Version: 16.5. **Function:** One of the output options.

20.1.150 OutputOptionNoASCII = 1

MBS Barcode Plugin, Plugin Version: 16.5. **Function:** One of the output options.

20.1.151 OutputOptionNone = 0

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the output options.  
**Notes:** No box or boundary bars.
20.1.152  **OutputOptionReaderInit = 16**

MBS Barcode Plugin, Plugin Version: 16.5. **Function:** One of the output options.

20.1.153  **OutputOptionSmallText = 32**

MBS Barcode Plugin, Plugin Version: 16.5. **Function:** One of the output options.  
**Notes:** Use small text.

20.1.154  **OutputOptionStdOut = 8**

MBS Barcode Plugin, Plugin Version: 16.5. **Function:** One of the output options.  
**Notes:** Write to stdout.

20.1.155  **WarnInvalidOption = 2**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** One of the values was set incorrectly but Zint has made a guess at what it should have been and generated a barcode accordingly.

20.1.156  **WarnUseECI = 3**

MBS Barcode Plugin, Plugin Version: 16.5. **Function:** One of the error constants.  
**Notes:** The warning to use ECI.
20.2. CLASS BARCODESCANNERMBS

20.2 class BarcodeScannerMBS

20.2.1 class BarcodeScannerMBS

MBS Picture Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
A class to read a barcode from a given picture.
Deprecated: This item is deprecated and should no longer be used. You can use zxing classes instead.
Notes: Deprecated in favor of new zxing classes.

20.2.2 Methods

20.2.3 Scan(p as picture) as boolean

Function:
Scans for a barcode on the picture.
Notes:
The barcode is searched on the middle vertical line from the left to right.
So the picture you pass can be as small as just one pixel height.
The barcode should be horizontal centered in that picture for best results.
Returns true on success and false on failure.
See also:

- 20.2.4 Scan(p as picture, lines() as Integer) as boolean

20.2.4 Scan(p as picture, lines() as Integer) as boolean

Function:
Scans for a barcode on the picture.
Example:

```dim i as Integer
dim lines(-1) as Integer
dim b as BarcodeScannerMBS
dim p as Picture
// set b to your scanner and p to your picture
for i=0 to 99
    lines.append i*10 // search every 10th line on a 1000 pixel high image.
next```
if b.scan(p,lines) then
// ok
end if

Notes:
The barcode is searched on the lines with the given offsets from the left to right.

The lines array must have at least one entry specifying the lines to search on.
If the values in the lines array are out of bounds, they are ignored. The first line has the value 0.

So the picture you pass can be as small as just one pixel height.
The barcode should be horizontal centered in that picture for best results.

Returns true on success and false on failure.
See also:

• 20.2.3 Scan(p as picture) as boolean

20.2.5 Properties

20.2.6 Barcode as String

MBS Picture Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
The barcode result of the last scan.
Notes:
If the last scan was successful, this property has a value.
If the last scan failed, this property is empty.
(Read and Write property)

20.2.7 CheckDigits as Boolean

MBS Picture Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Whether to calculate the checksum.
Notes:
Normal 12 or 13 digit barcodes have the last number being a checksum.
If it does not match, the barcode is declined.

Default is false.
(Read and Write property)
20.2.8 LastBarcode as String

MBS Picture Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The barcode result of the last successful scan.

**Notes:**
If a scan fails, this value still has the value of the last successful scan.
(Read and Write property)

20.2.9 LastPicture as Picture

MBS Picture Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last picture used for the scan.

**Notes:** (Read and Write property)

20.2.10 MinimumLength as Integer

MBS Picture Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The minimum length of barcodes.

**Notes:**
Set to 0 to disable.

To avoid false barcodes, any barcode is rejected which does not have the sufficient length.

Default is 13.
(Read and Write property)

20.2.11 Mode as Integer

MBS Picture Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The mode of the scanner.

**Notes:**
Mode 0 is to scan EANs.
Mode 1 is to scan 2/5 family barcodes.
(Read and Write property)
20.3 class ZintRenderHexagonMBS

20.3.1 class ZintRenderHexagonMBS

Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

20.3.2 Methods

20.3.3 Constructor

20.3.4 Properties

20.3.5 NextObject as ZintRenderHexagonMBS

Notes: This is nil on the last object in the chain. (Read and Write property)

20.3.6 X as Single

Notes: (Read only property)

20.3.7 Y as Single

Notes: (Read only property)
20.4. CLASS ZINTRENDERLINEMBS

20.4 class ZintRenderLineMBS

20.4.1 class ZintRenderLineMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a line to draw.  
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

20.4.2 Methods

20.4.3 Constructor

20.4.4 Properties

20.4.5 Length as Single

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The length of the line.  
**Notes:** (Read only property)

20.4.6 NextObject as ZintRenderLineMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The next line object in the chain.  
**Notes:**  
This is nil on the last object in the chain.  
(Read and Write property)

20.4.7 Width as Single

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of the line.  
**Notes:**
You need to know the orientation of the barcode to know how to draw it
(Read only property)

**20.4.8 X as Single**

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The X coordinate.  
**Notes:** (Read only property)

**20.4.9 Y as Single**

**Notes:** (Read only property)
20.5. class ZintRenderMBS

20.5.1 class ZintRenderMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for render information. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

20.5.2 Methods

20.5.3 Constructor

20.5.4 hexagons as ZintRenderHexagonMBS()

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns array with all the hexagon objects.

20.5.5 lines as ZintRenderLineMBS()

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns array with all the line objects.

20.5.6 rings as ZintRenderRingMBS()

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns array with all the ring objects.

20.5.7 strings as ZintRenderStringMBS()

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns array with all the string objects.
20.5.8 Properties

20.5.9 FirstHexagon as ZintRenderHexagonMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The first hexagon object in the chain of string objects. Notes: (Read and Write property)

20.5.10 FirstLine as ZintRenderLineMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The first line object in the chain of string objects. Notes: (Read and Write property)

20.5.11 FirstRing as ZintRenderRingMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The first ring object in the chain of string objects. Notes: (Read and Write property)

20.5.12 FirstString as ZintRenderStringMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The first string object in the chain of string objects. Notes: (Read and Write property)

20.5.13 Height as Single

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The height of the barcode. Notes: (Read only property)

20.5.14 Width as Single

20.5. **CLASS ZINTRENDERMBS**

**Notes:** (Read only property)
20.6 class ZintRenderRingMBS

20.6.1 class ZintRenderRingMBS

**Function:** The class for a ring to draw.  
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

20.6.2 Methods

20.6.3 Constructor

**Function:** The private constructor.

20.6.4 Properties

20.6.5 LineWidth as Single

**Function:** The width of the line.  
**Notes:** (Read only property)

20.6.6 NextObject as ZintRenderRingMBS

**Function:** The next ring object in the chain.  
**Notes:** This is nil on the last object in the chain.  
(Read and Write property)

20.6.7 Radius as Single

**Function:** The radius for this ring.  
**Notes:** (Read only property)
20.6.8  X as Single

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The X coordinate.  
**Notes:** (Read only property)

20.6.9  Y as Single

**Notes:** (Read only property)
20.7  class ZintRenderStringMBS

20.7.1  class ZintRenderStringMBS

Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

20.7.2  Methods

20.7.3  Constructor

20.7.4  Properties

20.7.5  FontSize as Single

Notes: (Read only property)

20.7.6  Length as Integer

Notes: (Read and Write property)

20.7.7  NextObject as ZintRenderStringMBS

Notes:
This is nil on the last object in the chain.
(Read and Write property)
20.7. **CLASS ZINTRENDERSTRINGMBS**

### 20.7.8 Text as String

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The text.

**Notes:**
Plugin assumes string is in UTF-8.
(Read and Write property)

### 20.7.9 Width as Single

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of the string.

**Notes:** (Read only property)

### 20.7.10 X as Single

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The X coordinate.

**Notes:** (Read only property)

### 20.7.11 Y as Single

**Notes:** (Read only property)
20.8  class zxingAztecReaderMBS

20.8.1  class zxingAztecReaderMBS

Notes: Subclass of the zxingReaderMBS class.

20.8.2  Methods

20.8.3  Constructor

20.9. **CLASS ZXINGBARCODEFORMATMBS**

20.9  class zxingBarcodeFormatMBS

20.9.1  class zxingBarcodeFormatMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a barcode format.

20.9.2  Methods

20.9.3  Constructor(value as Integer)

20.9.4  Properties

20.9.5  Name as String

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The name of the barcode for display. **Notes:** (Read only property)

20.9.6  Value as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The numeric value for this barcode. **Notes:** (Read and Write property)

20.9.7  Constants

20.9.8  kFormatAzTec = 1

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible barcode format constants. **Notes:** Aztec
20.9.9 \texttt{kFormatCoda128} = 5

MBS Barcode Plugin, Plugin Version: 13.5. \textbf{Function:} One of the possible barcode format constants. 
\textbf{Notes:} Code 128 1D format.

20.9.10 \texttt{kFormatCoda39} = 3

MBS Barcode Plugin, Plugin Version: 13.5. \textbf{Function:} One of the possible barcode format constants. 
\textbf{Notes:} Coda 39

20.9.11 \texttt{kFormatCoda93} = 4

MBS Barcode Plugin, Plugin Version: 13.5. \textbf{Function:} One of the possible barcode format constants. 
\textbf{Notes:} Code 39 1D format.

20.9.12 \texttt{kFormatCodaBar} = 2

MBS Barcode Plugin, Plugin Version: 13.5. \textbf{Function:} One of the possible barcode format constants. 
\textbf{Notes:} Coabar

20.9.13 \texttt{kFormatCodaEAN13} = 8

MBS Barcode Plugin, Plugin Version: 13.5. \textbf{Function:} One of the possible barcode format constants. 
\textbf{Notes:} EAN-13 1D format.

20.9.14 \texttt{kFormatCodaEAN8} = 7

MBS Barcode Plugin, Plugin Version: 13.5. \textbf{Function:} One of the possible barcode format constants. 
\textbf{Notes:} EAN-8 1D format

20.9.15 \texttt{kFormatCodaITF} = 9

MBS Barcode Plugin, Plugin Version: 13.5. \textbf{Function:} One of the possible barcode format constants. 
\textbf{Notes:} ITF (Interleaved Two of Five) 1D format.
20.9.16 kFormatCodaPDF417 = 11

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible barcode format constants.  
**Notes:** PDF417 format.

20.9.17 kFormatCodaQRCode = 12

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible barcode format constants.  
**Notes:** QR Code 2D barcode format.

20.9.18 kFormatCodaRSSExpanded = 14

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible barcode format constants.  
**Notes:** Coda RSS Expanded

20.9.19 kFormatCodaUPCA = 15

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible barcode format constants.  
**Notes:** UPC-A 1D format.

20.9.20 kFormatCodaUPCE = 16

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible barcode format constants.  
**Notes:** UPC-E 1D format.

20.9.21 kFormatCodaUPCEANExtension = 17

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible barcode format constants.  
**Notes:** UPC EAN Extension

20.9.22 kFormatCodeRSS14 = 13

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible barcode format constants.  
**Notes:** RSS 14
20.9.23 kFormatDataMatrix = 6

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible barcode format constants. **Notes:** DataMatrix 2D barcode format.
20.10. CLASS ZXINGBINARIZERMBS

20.10 class zxingBinarizerMBS

20.10.1 class zxingBinarizerMBS

**Function:** The binarazer class.

**Notes:**
This class provides binary values for luminance values.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

20.10.2 Methods

20.10.3 Constructor

**Function:** The private constructor.

20.10.4 createBinarizer(source as zxingLuminanceSourceMBS) as zxingBinarizerMBS

**Function:** Creates a new binarizer for the given luminance source.

20.10.5 Properties

20.10.6 Handle as Integer

**Function:** The internal object reference.

**Notes:** (Read only property)

20.10.7 Height as Integer

**Function:** Queries height of the image.

**Notes:** (Read only property)
20.10.8 LuminanceSource as zxingLuminanceSourceMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The luminance source used.  
**Notes:** (Read only property)

20.10.9 Width as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries width of the image.  
**Notes:** (Read only property)
20.11.  CLASS ZXINGBINARYBITMAPMBS

20.11  class zxingBinaryBitmapMBS

20.11.1  class zxingBinaryBitmapMBS

Function:  This class is the core bitmap class used by ZXing to represent 1 bit data.
Notes:  Reader objects accept a BinaryBitmap and attempt to decode it.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

20.11.2  Methods

20.11.3  Constructor

20.11.4  CreateWithPicture(pic as picture, hybrid as boolean = false) as zxingBinaryBitmapMBS

Notes:  if hybrid is true, we use internally the HybridBinarizer, else the GlobalHistogramBinarizer.

20.11.5  crop(left as Integer, top as Integer, width as Integer, height as Integer) as zxingBinaryBitmapMBS

20.11.6  rotateCounterClockwise as zxingBinaryBitmapMBS

20.11.7 string as string

20.11.8 Properties

20.11.9 Handle as Integer

20.11.10 Height as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Queries height of the image. Notes: (Read only property)

20.11.11 isCropSupported as Boolean

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Whether this bitmap can be cropped. Notes: (Read only property)

20.11.12 isRotateSupported as Boolean

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Whether this bitmap supports counter-clockwise rotation. Notes: (Read only property)

20.11.13 LuminanceSource as zxingLuminanceSourceMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Queries the luminance source for this bitmap. Notes: (Read only property)
20.11.14 Width as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries width of the image.  
**Notes:** (Read only property)
20.12 class zxingBitArrayMBS

20.12.1 class zxingBitArrayMBS

20.12.2 Methods

20.12.3 clear

Example:

dim b as new zxingBitArrayMBS(10)
b.set(2)
// show
MsgBox b.Text
// clear the bits
b.clear
// and show again
MsgBox b.Text

20.12.4 Constructor(size as Integer)

20.12.5 get(index as Integer) as boolean

20.12.6 getNextSet(fromIndex as Integer) as Integer

20.12.7  getNextUnset(fromIndex as Integer) as Integer

20.12.8  isRange(start as Integer, ende as Integer, value as boolean) as boolean

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Efficient method to check if a range of bits is set, or not set.

20.12.9  PictureColumn(pic as picture, Column as Integer) as zxingBitArrayMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries a column of a picture as bit array.

20.12.10  PictureRow(pic as picture, row as Integer) as zxingBitArrayMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries a row of a picture as bit array.

20.12.11  reverse

**Example:**

```vba
dim b as new zxingBitArrayMBS(10)
b.set(2)
// show
MsgBox b.Text
// reverse the bits
b.reverse
// and show again
MsgBox b.Text
```
Notes: This does reverse order, not inverse the values.

20.12.12 set(index as Integer)

```vba
dim b as new zxingBitArrayMBS(10)
// show
MsgBox b.Text
// set a bit
b.set(5)
// and show again
MsgBox b.Text
```

20.12.13 setBulk(index as Integer, newBits as Integer)

```vba
dim b as new zxingBitArrayMBS(10)
// show
MsgBox b.Text
// set the bits
b.setBulk(2, & b101010101 )
// and show again
MsgBox b.Text
```

20.12.14 Properties

20.12.15 Handle as Integer

20.12. CLASS ZXINGBITARRAYMBS

20.12.16 Size as Integer

**Function:** Returns size of the array.
**Example:**

```vbnet
dim b as new zxingBitArrayMBS(10)
MsgBox str(b.size)
```

**Notes:** (Read only property)

20.12.17 Text as String

**Function:** Returns text representation.
**Example:**

```vbnet
dim b as new zxingBitArrayMBS(10)
// show
MsgBox b.Text
// set a bit
b.set(5)
// and show again
MsgBox b.Text
```

**Notes:** (Read only property)
20.13 class zxingChecksumExceptionMBS

20.13.1 class zxingChecksumExceptionMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the exceptions from zxing. **Notes:** Subclass of the zxingReaderExceptionMBS class.
20.14 class zxingCodaBarReaderMBS

20.14.1 class zxingCodaBarReaderMBS

20.14.2 Methods

20.14.3 Constructor

20.14.4 decodeRow(rowNumber as Integer, row as zxingBitArrayMBS) as zxingResultMBS

20.14.5 validatePattern(start as Integer)

20.15  class zxingCode128ReaderMBS

20.15.1  class zxingCode128ReaderMBS

Notes: Subclass of the zxingOneDReaderMBS class.

20.15.2  Methods

20.15.3  BarcodeFormat as zxingBarcodeFormatMBS

20.15.4  Constructor

Notes: Was private until version 17.5.

20.15.5  decodeRow(rowNumber as Integer, row as zxingBitArrayMBS) as zxingResultMBS

20.16. class zxingCode39ReaderMBS

20.16.1. class zxingCode39ReaderMBS

20.16.2. Methods

20.16.3. Constructor(usingCheckDigit as boolean = false, extendedMode as boolean = false)

20.16.4. decodeRow(rowNumber as Integer, row as zxingBitArrayMBS) as zxingResultMBS

20.17  class zxingCode93ReaderMBS

20.17.1  class zxingCode93ReaderMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decodes Code 93 barcodes. **Notes:** Subclass of the zxingOneDReaderMBS class.

20.17.2  Methods

20.17.3  Constructor

20.17.4  decodeRow(rowNumber as Integer, row as zxingBitArrayMBS) as zxingResultMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Trys to decode a barcode from one row of pixels.
20.18. CLASS ZXINGDATAMATRIXREADERMBS

20.18  class zxingDataMatrixReaderMBS

20.18.1  class zxingDataMatrixReaderMBS

**Notes:** Subclass of the zxingReaderMBS class.

20.18.2  Methods

20.18.3  Constructor

CHAPTER 20. BARCODE

20.19  class zxingDecodeHintsMBS

20.19.1  class zxingDecodeHintsMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for hints to the scanner. **Notes:** This gives an idea to decoder on what you may expect.

20.19.2  Methods

20.19.3  addFormat(format as zxingBarcodeFormatMBS)

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a barcode format. **Notes:** The class will set the corresponding hint for this format.

20.19.4  clear

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clears the hints.

20.19.5  Constructor

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor. **See also:**

- 20.19.6 Constructor(other as zxingDecodeHintsMBS)
- 20.19.7 Constructor(value as Integer)

20.19.6  Constructor(other as zxingDecodeHintsMBS)

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The copy constructor. **See also:**

- 20.19.5 Constructor
- 20.19.7 Constructor(value as Integer)
20.19. CLASS ZXINGDECODEHINTSMBS

20.19.7 Constructor(value as Integer)

Function: The constructor to use a given hint.
See also:

- 20.19.5 Constructor
- 20.19.6 Constructor(other as zxingDecodeHintsMBS)

20.19.8 containsFormat(format as zxingBarcodeFormatMBS) as boolean

Function: Whether a given hint is set in this hints set.

20.19.9 DefaultHint as zxingDecodeHintsMBS

Function: The default hint set.
Notes: This is combination: ONED_HINT, QR_CODE_HINT, DATA_MATRIX_HINT, AZTEC_HINT and PDF_417_HINT.

20.19.10 Destructor

Function: The destructor.

20.19.11 OneDHint as zxingDecodeHintsMBS

Function: The 1D hint set.
Notes: This is combination: CODE_39_HINT, CODE_93_HINT, CODE_128_HINT, ITF_HINT, CODABAR_HINT and PRODUCT_HINT.

20.19.12 ProductHint as zxingDecodeHintsMBS

Function: The product barcode hint set.
Notes: This is combination: UPC_A_HINT, UPC_E_HINT, EAN_13_HINT, EAN_8_HINT and RSS_14_HINT.

20.19.13 Properties

20.19.14 Handle as Integer

**Notes:** (Read and Write property)

20.19.15 isEmpty as Boolean

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether this hints set is empty.  
**Notes:** (Read only property)

20.19.16 TryHarder as Boolean

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether try harder flag is set.  
**Notes:** (Read and Write property)

20.19.17 Constants

20.19.18 ASSUME_GS1 = & h0800000

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** Assume GS1

20.19.19 AZTEC_HINT = 2

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** Aztec
20.19.20 CHARACTER_SET = &h4000000

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** Character Set

20.19.21 CODABAR_HINT = 4

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** Codabar

20.19.22 CODE_128_HINT = &h020

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** Code 128

20.19.23 CODE_39_HINT = 8

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** Code 39

20.19.24 CODE_93_HINT = &h010

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** Code 93

20.19.25 DATA_MATRIX_HINT = &h0040

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** Data Matrix

20.19.26 EAN_13_HINT = &h000100

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** EAN 13
20.19.27  **EAN_8_HINT = \& h000080**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** EAN 8

20.19.28  **ITF_HINT = \& h000200**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** ITF

20.19.29  **PDF_417_HINT = \& h000800**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** PDF 317

20.19.30  **QR_CODE_HINT = \& h001000**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** QR Code

20.19.31  **RSS_14_HINT = \& h002000**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** RSS 14

20.19.32  **RSS_EXPANDED_HINT = \& h004000**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** RSS Expanded

20.19.33  **TRYHARDER_HINT = \& h8000000**

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** Whether to spend more CPU time to get better result.
20.19.34  UPC_A_HINT = & h008000

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** UPC A

20.19.35  UPC_EAN_EXTENSION_HINT = & h020000

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** UPC EAN with extension

20.19.36  UPC_E_HINT = & h010000

MBS Barcode Plugin, Plugin Version: 13.5. **Function:** One of the possible hint constants.  
**Notes:** UPC E
20.20 class zxingDetectorExceptionMBS

20.20.1 class zxingDetectorExceptionMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the exceptions from zxing. **Notes:** Subclass of the zxingExceptionMBS class.
20.21. CLASS ZXINGEAN13READERMBS

20.21 class zxingEAN13ReaderMBS

20.21.1 class zxingEAN13ReaderMBS

**Function:** Decodes of the EAN-13 format.

**Example:**

```vbscript
dim g as new BarcodeGeneratorMBS
    g.Symbology = g.BarcodeEanx
    g.BorderWidth = 5
    g.Scale = 2
    g.Encode "036000291452"
    g.Height = 100
dim p as Picture = g.Picture

    window1.Backdrop = p

dim b as zxingBinaryBitmapMBS = zxingBinaryBitmapMBS.CreateWithPicture(p)
dim x as new zxingEAN13ReaderMBS
    dim result as zxingResultMBS = x.decode(b)
dim bf as zxingBarcodeFormatMBS = result.BarcodeFormat

    MsgBox bf.Name+": " +result.Text

    Exception r as zxingExceptionMBS
    MsgBox r.message
```

**Notes:** Subclass of the zxingUPCEANReaderMBS class.

20.21.2 Methods

20.21.3 BarcodeFormat as zxingBarcodeFormatMBS

**Function:** The barcode format.

20.21.4 Constructor

**Function:** The constructor.
20.21.5 decodeMiddle(row as zxingBitArrayMBS, start as Integer, byref resultString as string) as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Trys to decode a barcode from one row of pixels.
20.22. class zxingEAN8ReaderMBS

20.22.1. class zxingEAN8ReaderMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decoding of the EAN-8 format. **Notes:** Subclass of the zxingUPCEANReaderMBS class.

20.22.2. Methods

20.22.3. BarcodeFormat as zxingBarcodeFormatMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The barcode format.

20.22.4. Constructor

20.22.5. decodeMiddle(row as zxingBitArrayMBS, start as Integer, byref resultString as string) as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Trys to decode a barcode from one row of pixels.
20.23 class zxingExceptionMBS

20.23.1 class zxingExceptionMBS

20.24. class zxingFormatExceptionMBS

20.24.1 class zxingFormatExceptionMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the exceptions from zxing. **Notes:** Subclass of the zxingReaderExceptionMBS class.
20.25 class zxingGlobalHistogramBinarizerMBS

20.25.1 class zxingGlobalHistogramBinarizerMBS

**Function:** One of the binarizer.

**Notes:**

This Binarizer implementation uses the old ZXing global histogram approach. It is suitable for low-end mobile devices which don’t have enough CPU or memory to use a local thresholding algorithm. However, because it picks a global black point, it cannot handle difficult shadows and gradients.

Faster mobile devices and all desktop applications should probably use HybridBinarizer instead. Subclass of the zxingBinarizerMBS class.

20.25.2 Methods

20.25.3 Constructor(LuminanceSource as zxingLuminanceSourceMBS)

20.26. class zxingHybridBinarizerMBS

20.26.1. class zxingHybridBinarizerMBS

Function: One of the binarizer.

Notes:

This class implements a local thresholding algorithm, which while slower than the GlobalHistogramBinarizer, is fairly efficient for what it does. It is designed for high frequency images of barcodes with black data on white backgrounds. For this application, it does a much better job than a global blackpoint with severe shadows and gradients. However it tends to produce artifacts on lower frequency images and is therefore not a good general purpose binarizer for uses outside ZXing.

This class extends GlobalHistogramBinarizer, using the older histogram approach for 1D readers, and the newer local approach for 2D readers. 1D decoding using a per-row histogram is already inherently local, and only fails for horizontal gradients. We can revisit that problem later, but for now it was not a win to use local blocks for 1D.

This Binarizer is the default for the unit tests and the recommended class for library users. Subclass of the zxingGlobalHistogramBinarizerMBS class.

20.26.2 Methods

20.26.3 Constructor(LuminanceSource as zxingLuminanceSourceMBS)

Function: The constructor.
20.27 class zxingIllegalArgumentExceptionMBS

20.27.1 class zxingIllegalArgumentExceptionMBS

20.28. **CLASS ZXINGILLEGALSTATEEXCEPTIONMBS**

### 20.28 class zxingIllegalStateExceptionMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the exceptions from zxing. **Notes:** Subclass of the zxingReaderExceptionMBS class.
20.29  class zxingITFReaderMBS

20.29.1  class zxingITFReaderMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decodes an ITF barcode. **Notes:** Subclass of the zxingOneDReaderMBS class.

20.29.2  Methods

20.29.3  Constructor

20.29.4  decodeRow(rowNumber as Integer, row as zxingBitArrayMBS) as zxingResultMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Tries to decode a barcode from one row of pixels.
20.30 class zxingLuminanceSourceMBS

20.30.1 class zxingLuminanceSourceMBS

Function: The class for an image source.
Notes: The purpose of this class hierarchy is to abstract different bitmap implementations across platforms into a standard interface for requesting greyscale luminance values. The interface only provides immutable methods; therefore crop and rotation create copies. This is to ensure that one Reader does not modify the original luminance source and leave it in an unknown state for other Readers in the chain.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

20.30.2 Methods

20.30.3 Constructor

Function: The private constructor.

20.30.4 CreateWithPicture(pic as picture) as zxingLuminanceSourceMBS

Function: Creates a new luminance source for this picture.
Notes: Returns nil on error like low memory.

20.30.5 crop(left as Integer, top as Integer, width as Integer, height as Integer) as zxingLuminanceSourceMBS

Function: Returns a new object with cropped image data.
Notes: Implementations may keep a reference to the original data rather than a copy. Only callable if isCropSupported() is true.

left: The left coordinate, 0 <= left < Width.
top: The top coordinate, 0 <= top <= Height.
width: The width of the rectangle to crop.
height: The height of the rectangle to crop.
Returns A cropped version of this object.

20.30.6  invert as zxingLuminanceSourceMBS

20.30.7  rotateCounterClockwise as zxingLuminanceSourceMBS

20.30.8  string as string

20.30.9  Properties

20.30.10  Handle as Integer

Notes: (Read only property)

20.30.11  Height as Integer

Notes: (Read only property)

20.30.12  isCropSupported as Boolean

20.30.13 isRotateSupported as Boolean

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether this bitmap supports counter-clockwise rotation. **Notes:** (Read only property)

20.30.14 Width as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of the bitmap. **Notes:** (Read only property)
20.31 class zxingMultiFormatOneDReaderMBS

20.31.1 class zxingMultiFormatOneDReaderMBS

20.31.2 Methods

20.31.3 Constructor(hints as zxingDecodeHintsMBS)

20.31.4 decodeRow(rowNumber as Integer, row as zxingBitArrayMBS) as zxingResultMBS

20.32  class zxingMultiFormatReaderMBS

20.32.1  class zxingMultiFormatReaderMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This interface attempt to read several barcodes from one image. **Notes:** Subclass of the zxingReaderMBS class.

20.32.2  Methods

20.32.3  Constructor

20.32.4  decodeWithState(image as zxingBinaryBitmapMBS) as zxingResultMBS

20.32.5  setHints(hints as zxingDecodeHintsMBS)

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the hint to use for decoding.
20.33 class zxingMultiFormatUPCEANReaderMBS

20.33.1 class zxingMultiFormatUPCEANReaderMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A reader that can read all available UPC/EAN formats. **Notes:** If a caller wants to try to read all such formats, it is most efficient to use this implementation rather than invoke individual readers. Subclass of the zxingOneDReaderMBS class.

20.33.2 Methods

20.33.3 Constructor(hints as zxingDecodeHintsMBS)

20.33.4 decodeRow(rowNumber as Integer, row as zxingBitArrayMBS) as zxingResultMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Tries to decode a barcode from one row of pixels.
20.34  class zxingNotFoundExceptionMBS

20.34.1  class zxingNotFoundExceptionMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the exceptions from zxing.  **Notes:** Subclass of the zxingExceptionMBS class.
20.35  class zxingOneDReaderMBS

20.35.1  class zxingOneDReaderMBS

**Function:** Encapsulates functionality and implementation that is common to all families of one-dimensional  
barcodes.  
**Notes:**  
Subclass of the zxingReaderMBS class.  
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

20.35.2  Methods

20.35.3  Constructor

**Function:** The private constructor.

20.35.4  decodeRow(rowNumber as Integer, row as zxingBitArrayMBS) as zxingResultMBS

**Function:** Trys to decode a barcode from one row of pixels.
20.36. **CLASS ZXINGPDF417READERMBS**

20.36 **class zxingPDF417ReaderMBS**

20.36.1 **class zxingPDF417ReaderMBS**

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This class can detect and decode PDF417 codes in an image. **Notes:** Subclass of the zxingReaderMBS class.

20.36.2 **Methods**

20.36.3 **Constructor**

20.36.4 **reset**

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Resets the decoder.
20.37 class zxingQRCodeReaderMBS

20.37.1 class zxingQRCodeReaderMBS

**Function:** This class can detect and decode QR Codes in an image.

**Example:**

```vbnet
dim g as new BarcodeGeneratorMBS
    g.Symbology = g.BarcodeQrcode
    g.BorderWidth = 5
    g.Scale = 2
    g.Encode "Hello World"

dim p as Picture = g.Picture
    window1.Backdrop = p

dim b as zxingBinaryBitmapMBS = zxingBinaryBitmapMBS.CreateWithPicture(p)
dim x as new zxingQRCodeReaderMBS
    dim result as zxingResultMBS = x.decode(b)
    dim bf as zxingBarcodeFormatMBS = result.BarcodeFormat
    MsgBox bf.Name + ": " + result.Text

Exception r as zxingExceptionMBS
    MsgBox r.message
```

**Notes:** Subclass of the zxingReaderMBS class.

20.37.2 Methods

20.37.3 Constructor

**Function:** The constructor.
20.38 class zxingReaderExceptionMBS

20.38.1 class zxingReaderExceptionMBS

**Function:** The general exception class throw when something goes wrong during decoding of a barcode.

**Notes:**

This includes, but is not limited to, failing checksums / error correction algorithms, being unable to locate finder timing patterns, and so on.

Subclass of the zxingExceptionMBS class.
20.39 class zxingReaderMBS

20.39.1 class zxingReaderMBS

Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

20.39.2 Methods

20.39.3 Constructor

20.39.4 decode(image as zxingBinaryBitmapMBS) as zxingResultMBS

See also:

- 20.39.5 decode(image as zxingBinaryBitmapMBS, hints as zxingDecodeHintsMBS) as zxingResultMBS 3856

20.39.5 decode(image as zxingBinaryBitmapMBS, hints as zxingDecodeHintsMBS) as zxingResultMBS

Notes: Hints may help to limit what to expect and makes it faster.
See also:

- 28.18.43 decode(image as zxingBinaryBitmapMBS) as zxingResultMBS 4697
20.39.6 Properties

20.39.7 Handle as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference. **Notes:** (Read only property)
20.40 class zxingReedSolomonExceptionMBS

20.40.1 class zxingReedSolomonExceptionMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the exceptions from zxing. **Notes:** Subclass of the zxingExceptionMBS class.
20.41. **CLASS ZXINGRESULTMBS**

20.41  **class zxingResultMBS**

20.41.1  **class zxingResultMBS**

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Encapsulates the result of decoding a barcode within an image.<br><br>**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

20.41.2  **Methods**

20.41.3  **BarcodeFormat as zxingBarcodeFormatMBS**

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Representing the format of the barcode that was decoded.

20.41.4  **Constructor**

20.41.5  **Data as Memoryblock**

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Raw text encoded by the barcode, if applicable, otherwise nil.

20.41.6  **ResultPoint(index as integer) as zxingResultPointMBS**

MBS Barcode Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries point with given index.<br><br>**Notes:** Index from 0 to PointCount-1.

20.41.7  **ResultPoints as zxingResultPointMBS()**

MBS Barcode Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries list of points.
20.41.8  **Text as string**

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function**: Raw text encoded by the barcode, if applicable, otherwise "".

20.41.9  **Properties**

20.41.10  **Handle as Integer**

**Notes**: (Read only property)

20.41.11  **PointCount as Integer**

MBS Barcode Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function**: Queries number of points.
**Notes**: (Read only property)
20.42. CLASS ZXINGRESULTPOINTMBS

20.42 class zxingResultPointMBS

20.42.1 class zxingResultPointMBS

Notes: Typically, this would be the location of a finder pattern or the corner of the barcode, for example.

20.42.2 Methods

20.42.3 Constructor

See also:

• 20.42.4 Constructor(x as single, y as single)

20.42.4 Constructor(x as single, y as single)

See also:

• 20.42.3 Constructor

20.42.5 distance(p1 as zxingResultPointMBS, p2 as zxingResultPointMBS) as single

See also:

• 20.42.6 distance(x1 as single, y1 as single, x2 as single, y2 as single) as single

20.42.6 distance(x1 as single, y1 as single, x2 as single, y2 as single) as single

See also:

• 20.42.5 distance(p1 as zxingResultPointMBS, p2 as zxingResultPointMBS) as single
20.42.7 equals(other as zxingResultPointMBS) as boolean

20.42.8 Properties

20.42.9 Handle as Integer

20.42.10 X as Single

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The x value. Notes: (Read only property)

20.42.11 Y as Single

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The y value. Notes: (Read only property)
20.43. class zxingUPCARReaderMBS

20.43.1 class zxingUPCARReaderMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decodes of the UPC-A format. **Notes:** Subclass of the zxingUPCEANReaderMBS class.

20.43.2 Methods

20.43.3 BarcodeFormat as zxingBarcodeFormatMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The barcode format.

20.43.4 Constructor

20.43.5 decodeMiddle(row as zxingBitArrayMBS, start as Integer, byref resultString as string) as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Tries to decode a barcode from one row of pixels.

20.43.6 decodeRow(rowNumber as Integer, row as zxingBitArrayMBS) as zxingResultMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Tries to decode a barcode from one row of pixels. **See also:**

- 20.43.7 decodeRow(rowNumber as Integer, row as zxingBitArrayMBS, startGuardBegin as Integer, startGuardEnd as Integer) as zxingResultMBS
20.43.7  decodeRow(rowNumber as Integer, row as zxingBitArrayMBS, startGuardBegin as Integer, startGuardEnd as Integer) as zxingResultMBS

**Function:**  Tries to decode a barcode from one row of pixels.

See also:

- 20.43.6 decodeRow(rowNumber as Integer, row as zxingBitArrayMBS) as zxingResultMBS
20.44 class zxingUPCEANReaderMBS

20.44.1 class zxingUPCEANReaderMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Encapsulates functionality and implementation that is common to UPC and EAN families of one-dimensional barcodes. **Notes:** Subclass of the zxingOneDReaderMBS class. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

20.44.2 Methods

20.44.3 BarcodeFormat as zxingBarcodeFormatMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The barcode format.

20.44.4 BarcodeFormatName(BarcodeFormat as Integer) as string

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries the barcode format name for a number.

20.44.5 checkChecksum(s as string) as boolean

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks the checksum of a barcode. **Example:**
```
dim s as string = "036000291452"
dim r as new zxingUPCAReaderMBS

dim testOK as Boolean = r.checkChecksum("036000291452")
dim testFail as Boolean = r.checkChecksum("036000291453")
break // see values in debugger
```

**Notes:** Computes the UPC/EAN checksum on a string of digits, and reports whether the checksum is correct or not.
20.44.6 Constructor

20.44.7 `decodeMiddle(row as zxingBitArrayMBS, start as Integer, byref resultString as string) as Integer`

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Trys to decode a barcode from one row of pixels.

20.44.8 `decodeRow(rowNumber as Integer, row as zxingBitArrayMBS) as zxingResultMBS`

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Trys to decode a barcode from one row of pixels. See also:

- 20.44.9 `decodeRow(rowNumber as Integer, row as zxingBitArrayMBS, rangeStart as Integer, rangeLength as Integer) as zxingResultMBS`

20.44.9 `decodeRow(rowNumber as Integer, row as zxingBitArrayMBS, rangeStart as Integer, rangeLength as Integer) as zxingResultMBS`

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Trys to decode a barcode from one row of pixels. See also:

- 20.44.8 `decodeRow(rowNumber as Integer, row as zxingBitArrayMBS) as zxingResultMBS`
20.45.1 class zxingUPCEReaderMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decodes of the UPC-E format. **Notes:** Subclass of the zxingUPCEANReaderMBS class.

20.45.2 Methods

20.45.3 BarcodeFormat as zxingBarcodeFormatMBS

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The barcode format.

20.45.4 Constructor

20.45.5 convertUPCEtoUPCA(upce as string) as string

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Expands a UPC-E value back into its full, equivalent UPC-A code value. **Notes:** upce: UPC-E code as string of digits. Returns equivalent UPC-A code as string of digits.

20.45.6 decodeMiddle(row as zxingBitArrayMBS, start as Integer, byref resultString as string) as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Trys to decode a barcode from one row of pixels.
Chapter 21

Base 64

21.1 Globals

21.1.1 DecodeBase64MBS(s as string) as string

MBS Encryption Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decodes the base 64 text string into its original binary data. **Notes:** Improved in MBS Plugin 2.7. Memory needed is around lenb(s)*2.

21.1.2 EncodeBase64MBS(s as string, breakposition as Integer, breakstring as string) as string

MBS Encryption Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Encodes the binary data in the string into a base64 text string. **Notes:** Improved in MBS Plugin 2.7 to support breakposition and breakstring. If you don’t need them, just pass 0 and “”. Memory needed is around lenb(s)*2.8.

21.1.3 uuDecodeMBS(data as string, byref name as string, byref mode as Integer) as string

MBS Encryption Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** UU Decoding. **Example:**

```vbs
    dim f as FolderItem = SpecialFolder.Desktop.Child("test.uu")
    dim b as BinaryStream = BinaryStream.Open(f)
```
dim name as string
dim mode as Integer

dim s as String = b.Read(b.Length)
dim d as string = uuDecodeMBS(s, name, mode)

dim p as Picture = Picture.FromData(d)

Backdrop = p

Notes:
Decodes UU encoded data. name and mode properties are filled.
Returns empty text if something goes wrong.
Raises out of memory exception in case of low memory situation.

21.1.4  uuEncodeMBS(data as string, name as string, mode as Integer = & 0755) as string

Function: UU Encoding.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child(“test.jpg”)
dim b as BinaryStream = BinaryStream.Open(f)
dim s as string = b.Read(b.Length)

dim d as string = uuEncodeMBS(s, “test”)"

f = SpecialFolder.Desktop.Child(“test.txt”)
b = BinaryStream.Create(f, true)

b.Write d

Notes:
Encodes binary data as text similar to Base64.
The data is prefixed with file name and mode.

Returns empty text if something goes wrong.
Raises out of memory exception in case of low memory situation.
21.2 class Base64MBS

21.2.1 class Base64MBS

MBS Encryption Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Encodes and decodes Base64 with events. **Notes:** The global functions may be faster as they don’t use events.

21.2.2 Methods

21.2.3 DecodeBase64(s as string) as string

MBS Encryption Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decodes the base 64 text string into its original binary data. **Notes:** Memory needed is around lenb(s)*2.

21.2.4 EncodeBase64(s as string, breakposition as Integer, breakstring as string) as string

MBS Encryption Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Encodes the binary data in the string into a base64 text string. **Notes:** Improved in MBS Plugin 2.7 to support breakposition and breakstring. If you don’t need them, just pass 0 and “”. Memory needed is around lenb(s)*2.8.

21.2.5 Properties

21.2.6 Yield as Boolean

MBS Encryption Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the class should give CPU time to Realbasic so windows can be updated and other threads go on. **Notes:** Default is false. (Read and Write property)
21.2.7 Events

21.2.8 Finished(wascanceled as boolean)

MBS Encryption Plugin, Plugin Version: 3.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: Called when the encoding function returns.
Notes: wascanceled is true if the Working Event got a true returned.

21.2.9 Start

MBS Encryption Plugin, Plugin Version: 3.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: Called when encoding or decoding is started.

21.2.10 Working(percent as Double) as boolean

MBS Encryption Plugin, Plugin Version: 3.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: Called after each 4 KB chunk.
Notes: You can return true to cancel the process.
Chapter 22

Basic

22.1 Globals

22.1.1  DifferenceMBS(extends StartDate as date, EndDate as date) as DateDifferenceMBS

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Calculates the difference between two dates.  
**Example:**

```
    dim d as date
    dim e as date
    dim r as DateDifferenceMBS
    dim s as string

    d=new date
    d.Year=2008
    d.Month=7
    d.Day=2
    d.Hour=10
    d.Minute=48
    d.Second=22

    e=new date
    e.Year=2010
    e.Month=7
    e.Day=1
    e.Hour=10
    e.Minute=36
    e.Second=0
```
r=d.DifferenceMBS(e)

s=  "Years: " +str(r.Year)+EndOfLine
s=s+"Months: " +str(r.month)+EndOfLine
s=s+"Days: " +str(r.day)+EndOfLine
s=s+"Hours: " +str(r.hour)+EndOfLine
s=s+"Minutes: " +str(r.Minute)+EndOfLine
s=s+"Seconds: " +str(r.Second)+EndOfLine

MsgBox s

// shows: "Years: 1 Months: 11 Days: 29 Hours: 22 Minutes: 47 Seconds: 38"

Notes:

Returns nil on any errors. (one of the dates is nil or property getter don’t work)
Valid only for dates from the gregorian calendar.

Calculates the difference between the older and newer date. The dates are sorted, so the difference is always a positive.
You can see Swap property to see if first date is after second date.

22.1.2 ReturnErrPtrMBS as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A callback to use for GS8.

22.1.3 ReturnInPtrMBS as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A callback to use for GS8.

22.1.4 ReturnOutPtrMBS as Integer

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A callback to use for GS8.
22.1.5 HideCursorMBS

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Hides the mouse Cursor.

**Example:**

HideCursorMBS

22.1.6 ShowCursorMBS

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Shows the mouse Cursor.

**Example:**

ShowCursorMBS

22.1.7 cloneMemoryBlockMBS(s as memoryblock) as memoryblock

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clones the memory-block.

**Example:**

```vbnet
dim m as MemoryBlock = "Hello"
dim n as MemoryBlock = cloneMemoryBlockMBS(m)
m.Byte(1)=asc("a")
n.Byte(1)=asc("u")

dim a as string = m
dim b as string = n
MsgBox a+" " +b
```

**Notes:** May return nil on low memory conditions.
22.1.8  cloneMemoryBlockWithLengthMBS(s as memoryblock, len as Integer) as memoryblock

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clones the memory-block.

**Example:**
```basic
    dim m as MemoryBlock = "Hello"
    dim n as MemoryBlock = cloneMemoryBlockWithLengthMBS(m, 5)
    m.Byte(1) = asc("a")
    n.Byte(1) = asc("u")
    dim a as string = m
    dim b as string = n
    MsgBox a + " " + b
```

**Notes:** May return nil on low memory conditions.

22.1.9  cloneStringMBS(s as string) as string

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clones the string.

**Notes:**
May return "" on low memory conditions.
The encoding of the string is copied in RB 4.5 or newer.

22.1.10  GetEncodingOfStringMBS(s as string) as UInt32

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the internal value for the encoding.

**Example:**
```basic
    dim s as string = "Hello"
    MsgBox hex(GetEncodingOfStringMBS(s)) // shows 8000100 for UTF8
```

**Notes:**
Only useful on Realbasic 4.5 and newer.
Some example values for encoding:
### 22.1. GLOBALS

<table>
<thead>
<tr>
<th>Encoding</th>
<th>Codepage/Character Set</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MacRoman</td>
<td>0</td>
<td>Also for ASCII or binary data used.</td>
</tr>
<tr>
<td>WindowsLatin1</td>
<td>&amp; h0500</td>
<td>ANSI codepage 1252</td>
</tr>
<tr>
<td>ISOLatin1</td>
<td>&amp; h0201</td>
<td>ISO 8859-1</td>
</tr>
<tr>
<td>NextStepLatin</td>
<td>&amp; h0B01</td>
<td>NextStep encoding</td>
</tr>
<tr>
<td>Unicode</td>
<td>&amp; h0100</td>
<td>16 bit Unicode</td>

<tr>
<td>UTF8</td>
<td>&amp; h08000100</td>
<td>8 bit Unicode</td>
</tr>
<tr>
<td>Invalid</td>
<td>&amp; hFFFFFFFF</td>
<td>(Binary)</td>
</tr>
<tr>
<td>Invalid</td>
<td>&amp; hFFFFF</td>
<td>(Binary)</td>
</tr>
</tbody>
</table>

Renamed from `GetStringEncoding` to `GetEncodingOfString` in MBS Plugin 3.1.

#### 22.1.11 MemoryBlockToStringMBS(s as memoryblock) as string

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a copy of the content of the memoryblock as a string.

**Example:**

```vba
dim m as MemoryBlock = NewMemoryBlock(6)
m.CString(0) = "Hello"
MsgBox MemoryBlockToStringMBS(m)
```

**Notes:**

- May return "" on low memory conditions.
- As some memoryblocks don’t have a known length, you can provide one as a second parameter.

#### 22.1.12 MemoryBlockToStringWithLengthMBS(s as memoryblock,len as Integer) as string

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a copy of the content of the memoryblock as a string.

**Example:**

```vba
dim m as MemoryBlock = NewMemoryBlock(6)
m.CString(0) = "Hello"
MsgBox MemoryBlockToStringWithLengthMBS(m,5)
```
Notes:
May return "" on low memory conditions.
As some memory blocks don't have a known length, you can provide one as a second parameter.

22.1.13 OSTypeFromStringMBS (str as string) as Integer

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns an integer representing a 4 byte String.
**Example:**
MsgBox str(OSTypeFromStringMBS("MBSP"))

Notes:
This OSType datatype is used on Mac OS for 4 letter codes.
e.g. the type and creator code for a file.

22.1.14 SetEncodingOfStringMBS (s as string, encoding as UINT32)

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the internal value
for the encoding of this string.
**Example:**
dim s as string = ""
dim t as string = ConvertEncoding(s, encodings.UTF16)
dim m as MemoryBlock = t // memory block has bytes from UTF16 string without knowing the encoding
dim u as string = m // convert back to a string without encoding
MsgBox u // shows wrong characters
SetEncodingOfStringMBS u, 256 // set to UTF-16
MsgBox u

Notes:
Only useful on Realbasic 4.5 and newer.
Some example values for encoding:

Renamed from SetStringEncoding to SetEncodingOfString in MBS Plugin 3.1.
22.1.15  **StringFromOSTypeMBS(value as Integer) as string**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a 4 byte string for the given integer.  
**Example:**

```vbs
MsgBox StringFromOSTypeMBS(1296192336) // shows MBSP
```

**Notes:**

This OSType datatype is used on Mac OS for 4 letter codes. e.g. the type and creator code for a file.

22.1.16  **StringToMemoryBlockMBS(s as string) as memoryblock**

MBS Util Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a copy of the content of the string as a memoryblock.  
**Example:**

```vbs
dim m as MemoryBlock = StringToMemoryBlockMBS("Hello")
MsgBox m.StringValue(0,5)
```

**Notes:** May return nil on low memory conditions.

22.1.17  **BitwiseXORStringBytesMBS(s as string, v as Integer) as string**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Bitwise XOR with a string’s bytes.  
**Example:**
dim a as string = "Hello"
dim b as string = BitwiseXORStringBytesMBS(a,1) // encode
dim c as string = BitwiseXORStringBytesMBS(b,1) // decode
MsgBox b
MsgBox c

Notes:
Memory usage is around lenb(s)*2.
Returns nil on low memory.
v should be in range of 0 to 255.
If you use this function two times on a string, you get the original back.
Any encoding information is lost.

22.1.18 Color2IntegerMBS(colorValue as Color) as UInt32

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: Returns the RGB value of the color as an integer.
Example:
dim c as color
dim i as UInt32

c=rgb(255,255,255)
i=Color2IntegerMBS(c)

MsgBox hex(i) // FFFFFF
c=rgb(& h12 ,& H34 ,& h56)
i=Color2IntegerMBS(c)

MsgBox hex(i) // 123456

Notes:
Same as:
i=c.red*65536+c.green*256+c.blue

22.1.19 Integer2ColorMBS(intValue as UInt32) as Color

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: Returns the integer as if it is a color.
Example:

dim c as color
dim i as UInt32
c=Integer2ColorMBS(i)

Notes:
Same as:
c=rgb(i\65536 mod 256, i\256 mod 256, i mod 256)

22.2 class DateDifferenceMBS

22.2.1 class DateDifferenceMBS

Example:

// calculate difference between now and a date in 2008.

dim d as date
dim r as DateDifferenceMBS
dim s as string
dim c as Clipboard
d=new date
d.Year=2008
d.Month=7
d.Day=2
d.Hour=10
d.Minute=48
d.Second=22
dim e as new date // today
r=new DateDifferenceMBS(d, e)

s= "Years: "+str(r.Year)+EndOfLine
s=s+"Months: "+str(r.month)+EndOfLine
s=s+"Days: "+str(r.day)+EndOfLine
s=s+"Hours: "+str(r.Hour)+EndOfLine
s=s+"Minutes: "+str(r.Minute)+EndOfLine
s=s+"Seconds: "+str(r.Second)+EndOfLine
CHAPTER 22. BASIC

MsgBox s

Notes:
Calculates the difference between the older and newer date. The dates are sorted, so the difference is always a positive.
You can see Swap property to see if first date is after second date.

This class allows you to know exactly how many months/years are between two dates. Something that TotalSeconds calculations will not give you!

22.2.2 Methods

22.2.3 Calc(StartDate as date, EndDate as date) as boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Calculates the difference between two dates.
Example:

    dim d as date
    dim e as date
    dim r as DateDifferenceMBS
    dim s as string
    dim c as Clipboard

    d=new date
    d.Year=2008
    d.Month=7
    d.Day=2
    d.Hour=10
    d.Minute=48
    d.Second=22

    e=new date
    e.Year=2010
    e.Month=7
    e.Day=1
    e.Hour=10
    e.Minute=36
    e.Second=0

    r=new DateDifferenceMBS
if r.Calc(d,e) then

s= "Years:  "+str(r.Year)+EndOfLine
s=s+"Months:  "+str(r.month)+EndOfLine
s=s+"Days:  "+str(r.day)+EndOfLine
s=s+"Hours:  "+str(r.hour)+EndOfLine
s=s+"Minutes:  "+str(r.Minute)+EndOfLine
s=s+"Seconds:  "+str(r.Second)+EndOfLine

MsgBox s

// shows: "Years: 1 Months: 11 Days: 29 Hours: 22 Minutes: 47 Seconds: 38"
end if

Notes:

Returns false on any errors and true on success.
Valid only for dates from the gregorian calendar.
Sets ready property.

Calculates the difference between the older and newer date. The dates are sorted, so the difference is always a positive.
You can see Swap property to see if first date is after second date.

22.2.4 Constructor

See also:

• 22.2.5 Constructor(StartDate as date, EndDate as date)

22.2.5 Constructor(StartDate as date, EndDate as date)

Notes: Internally calls Calc and sets ready property.
See also:

• 22.2.4 Constructor
22.2.6  isLeapYear(year as Integer) as boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks whether a year is a leap year.

**Example:**

```basic
if DateDifferenceMBS.isLeapYear(2004) then
    messagebox "2004 is a leap year"
else
    messagebox "2004 is not a leap year"
end if
```

**Notes:** Valid only for dates from the gregorian calendar.

22.2.7  Properties

22.2.8  Day as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The day of the date difference.

**Notes:** (Read only property)

22.2.9  EndDate as Date

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The end date used to do the calculation.

**Notes:** (Read only property)

22.2.10  EndDay as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The day of the end date.

**Notes:** (Read only property)

22.2.11  EndHour as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The hour of the end date.
22.2. CLASS DATEDIFFERENCEMBS

Notes: (Read only property)

22.2.12 EndMinute as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The minute of the end date.
*Notes: (Read only property)*

22.2.13 EndMonth as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The month of the end date.
*Notes: (Read only property)*

22.2.14 EndSecond as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The second of the end date.
*Notes: (Read only property)*

22.2.15 EndTotalSeconds as Double

MBS Util Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The total seconds value of the end date.
*Notes: (Read and Write property)*

22.2.16 EndYear as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The year of the end date.
*Notes: (Read only property)*

22.2.17 Hour as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The hour of the date difference.
22.2.18 Minute as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The minute of the date difference. **Notes:** (Read only property)

22.2.19 Month as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The month of the date difference. **Notes:** (Read only property)

22.2.20 Ready as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the date calculation has been performed. **Notes:** Using the constructor with nil dates can lead into an invalid state in which ready is false. (Read only property)

22.2.21 Second as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The second of the date difference. **Notes:** (Read only property)

22.2.22 StartDate as Date

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The start date of the date used. **Notes:** (Read only property)
22.2. CLASS DATEDIFFERENCEMBS

22.2.23 StartDay as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The day of the start date.
**Notes:** (Read only property)

22.2.24 StartHour as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The hour of the start date.
**Notes:** (Read only property)

22.2.25 StartMinute as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The minute of the start date.
**Notes:** (Read only property)

22.2.26 StartMonth as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The month of the start date.
**Notes:** (Read only property)

22.2.27 StartSecond as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The second of the start date.
**Notes:** (Read only property)

22.2.28 StartTotalSeconds as Double

MBS Util Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The total seconds value of the start date.
**Notes:** (Read and Write property)
22.2.29  StartYear as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The year of the start date. Notes: (Read only property)

22.2.30  Swap as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Whether dates have been swapped. Notes:
Dates are swapped if enddate is before startdate. (Read only property)

22.2.31  TotalDay as Integer

MBS Util Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The number of days between Example:

```vbnet
dim d as new date(2011, 9, 25)
dim e as new date(2012, 1, 1)

dim diff as new DateDifferenceMBS

if diff.Calc(d, e) then
    MsgBox str(diff.TotalDay) + ” days between dates.” // should be 98
end if
```

Notes:
Our day, month and year properties are about how many days, months and years are between start and end dates. This property gives you the total number of days. So day may be 6 and month be 3 and totaldays could be 98 if there are two months with 31 days included and one with 30 days. (Read only property)
22.2. CLASS DATEDIFFERENCEMBS

22.2.32  TotalSeconds as Double

MBS Util Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The total seconds value of the difference between the dates.
**Notes:** (Read and Write property)

22.2.33  Year as Integer

MBS Util Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The year of the date difference.
**Notes:** (Read only property)
22.3 class UniversalCharacterDetectionMBS

22.3.1 class UniversalCharacterDetectionMBS

MBS Util Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for universal character encoding detection.

**Notes:**
Based on the Mozilla project.

You can pass a string with bytes to this class and receive an encoding as answer. Similar to the Guess-JapaneseEncoding function built into REALbasic.

Possible encoding names used by this class: Big5, EUC-JP, EUC-KR, x-euc-tw, gb18030, windows-1252, UTF-8, UTF-16BE, X-ISO-10646-UCS-4-3412, UTF-32BE, X-ISO-10646-UCS-4-2143, UTF-32LE, UTF-16LE.

22.3.2 Methods

22.3.3 AddData(data as string)

MBS Util Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Passes more data to the engine for analysis.

**Notes:** The string encoding from REALbasic is ignored. Only the raw data bytes are examined.

22.3.4 Constructor(filter as Integer)

MBS Util Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor.

**Notes:** filter: which languages to detect or ignore. Use the filter* constants.

22.3.5 Finish

MBS Util Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Notify the engine that data no more data will come.

**Notes:** This method can fire the Report event.
22.3.6 Properties

22.3.7 LastCharSet as String

MBS Util Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last character set reported in the report event. **Notes:** (Read and Write property)

22.3.8 Events

22.3.9 Report(Charset as string)

MBS Util Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when an encoding was detected. **Notes:** This event allows you to pass more and more data and as soon as the event fires you can decide to stop probing.

22.3.10 Constants

22.3.11 FilterAll = 31

MBS Util Plugin, Plugin Version: 10.0. **Function:** One of the language filter constants. **Notes:** All languages.

22.3.12 FilterChinese = 3

MBS Util Plugin, Plugin Version: 10.0. **Function:** One of the language filter constants. **Notes:** Traditional and Simplified Chinese together.

22.3.13 FilterChineseSimplified = 1

MBS Util Plugin, Plugin Version: 10.0. **Function:** One of the language filter constants. **Notes:** Simplified Chinese.
22.3.14  FilterChineseTraditional = 2

MBS Util Plugin, Plugin Version: 10.0. **Function:** One of the language filter constants.  
**Notes:** Traditional Chinese.

22.3.15  FilterCJK = 15

MBS Util Plugin, Plugin Version: 10.0. **Function:** One of the language filter constants.  
**Notes:** Chinese, Japanese and Korean together.

22.3.16  FilterJapanese = 4

MBS Util Plugin, Plugin Version: 10.0. **Function:** One of the language filter constants.  
**Notes:** Japanese

22.3.17  FilterKorean = 8

MBS Util Plugin, Plugin Version: 10.0. **Function:** One of the language filter constants.  
**Notes:** Korean

22.3.18  FilterNonCJK = 16

MBS Util Plugin, Plugin Version: 10.0. **Function:** One of the language filter constants.  
**Notes:** Non Chinese/Japanese/Korean languages.
Chapter 23

Bluetooth

23.1 class CBATTRequestMBS

23.1.1 class CBATTRequestMBS

Function: The CBATTRequest class represents Attribute Protocol (ATT) read and write requests from remote central devices (represented by CBCentral objects).

Notes:

Remote centrals use these ATT requests to read and write characteristic values on local peripherals (represented by CBPeripheralManager objects). Local peripherals, on the other hand, use the properties of CBATTRequest objects to respond to the read and write requests appropriately, using the respondToRequest:withResult: method of the CBPeripheralManager class.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

23.1.2 Methods

23.1.3 Available as boolean

Function: Whether this class is available.

Notes: Returns true on macOS 10.9 or newer.
23.1.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

23.1.5 Properties

23.1.6 central as CBCentralMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The remote central device that originated the request. **Notes:** (Read only property)

23.1.7 characteristic as CBCharacteristicMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The characteristic whose value is to be read or written. **Notes:** (Read only property)

23.1.8 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

23.1.9 offset as UInt64

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The zero-based index of the first byte for the read or write request. **Notes:**

You can use the value of this property to ensure that the ATT request is attempting to read or write within the proper bounds of the characteristics value. For an example of how to take a requests offset property into account when responding to a read or write request, see Responding to Read and Write Requests from a Central in Apple documentation. (Read only property)
23.1. CLASS CBATTREQUESTMBS

23.1.10 value as MemoryBlock

Function: The data being read or written.

Notes:

The value of this property differs according to the type of request. For read requests, the property of this value is nil and should be set before responding to the remote central through the respondToRequest method. For write requests, the value of this property is the data that is to be written to the characteristics value. (Read and Write property)
CHAPTER 23. BLUETOOTH

23.2 class CBAttributeMBS

23.2.1 class CBAttributeMBS

**Function:** CBAtribute is an abstract base class that defines behavior common to the collection of objects that represent aspects of services offered by a peripheral.

**Notes:**

Concrete subclasses of CBAtribute (and their mutable counterparts) are used to represent the services a peripheral offers, the characteristics of those services, and the descriptors attached to those characteristics. The concrete subclasses are:

- CBService
- CBCharacteristic
- CBDescriptor

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

23.2.2 Methods

23.2.3 Available as boolean

**Function:** Whether this class is available.

**Notes:** Returns true on macOS 10.13 or newer.

23.2.4 Constructor

**Function:** The private constructor.

23.2.5 Properties

23.2.6 Handle as Integer

**Function:** The internal object reference.
23.2. **CLASS CBATTRIBUTEMBS**

**Notes:** (Read and Write property)

### 23.2.7 UUID as CBUUIDMBS

**Function:** The Bluetooth-specific UUID of the attribute.  
**Notes:**  
This property is a 128-bit UUID that identifies the attribute.  
(Read only property)
23.3 class CBCentralManagerMBS

23.3.1 class CBCentralManagerMBS

Function: CBCentralManager objects are used to manage discovered or connected remote peripheral devices (represented by CBPeripheral objects), including scanning for, discovering, and connecting to advertising peripherals.

Notes:
Before you call CBCentralManager methods, the state of the central manager object must be powered on, as indicated by the CBCentralManagerStatePoweredOn constant. This state indicates that the central device (your iPhone or iPad, for instance) supports Bluetooth low energy and that Bluetooth is on and available to use.
Subclass of the CBManagerMBS class.

23.3.2 Methods

23.3.3 Available as boolean

Function: Whether this class is available.
Notes: Returns true on MacOS 10.7 or later.

23.3.4 cancelPeripheralConnection(Peripheral as CBPeripheralMBS)

Function: Cancels an active or pending local connection to a peripheral.
Notes:
peripheral: The peripheral to which the central manager is either trying to connect or has already connected.

This method is nonblocking, and any CBPeripheral class commands that are still pending to peripheral may or may not complete. Because other apps may still have a connection to the peripheral, canceling a local connection does not guarantee that the underlying physical link is immediately disconnected. From the apps perspective, however, the peripheral is considered disconnected, and the central manager object calls the didDisconnectPeripheral event.
23.3. CLASS CBCENTRALMANAGERMBS

23.3.5 CBATTErrorDomain as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The domain for Core Bluetooth ATT errors. **Notes:** This value is used in the NSError class.

23.3.6 CBCentralManagerOptionRestoreIdentifierKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used to pass options to the CBCentralManager method. **Notes:**

A string containing a unique identifier (UID) for the central manager that is being instantiated. The system uses this UID to identify a specific central manager. As a result, the UID must remain the same for subsequent executions of the app in order for the central manager to be successfully restored.

23.3.7 CBCentralManagerOptionShowPowerAlertKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used to pass options to the CBCentralManager method. **Notes:**

A Boolean value that specifies whether the system should display a warning dialog to the user if Bluetooth is powered off when the central manager is instantiated. The value for this key is a number. If the key is not specified, the default value is false.

23.3.8 CBCentralManagerRestoredStatePeripheralsKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the options keys. **Notes:**

See connectPeripheral method. An array of CBPeripheral objects containing all peripherals that were connected or pending connection at the time the application was terminated by the system. When possible, all known information for each peripheral will be restored, including any discovered services, characteristics and descriptors, as well as characteristic notification states.
23.3.9 CBCentralManagerRestoredStateScanOptionsKey as String

Function: One of the options keys.
Notes:
A dictionary containing the scan options at the time the application was terminated by the system.
See also scanForPeripheralsWithServices method.

23.3.10 CBCentralManagerRestoredStateScanServicesKey as String

Function: One of the options keys.
Notes:
An array of CBUUID objects containing the service(s) being scanned for at the time the application was terminated by the system.
See also scanForPeripheralsWithServices method.

23.3.11 CBCentralManagerScanOptionAllowDuplicatesKey as String

Function: One of the keys used to pass options to the scanForPeripheralsWithServices method.
Notes:
A Boolean value that specifies whether the scan should run without duplicate filtering.
The value for this key is a number. If true, filtering is disabled and a discovery event is generated each time the central receives an advertising packet from the peripheral. Disabling this filtering can have an adverse effect on battery life and should be used only if necessary. If false, multiple discoveries of the same peripheral are coalesced into a single discovery event. If the key is not specified, the default value is false.

23.3.12 CBCentralManagerScanOptionSolicitedServiceUUIDsKey as String

Function: One of the keys used to pass options to the scanForPeripheralsWithServices method.
Notes:
An array of service UUIDs (represented by CBUUID objects) that you want to scan for.
Specifying this scan option causes the central manager to also scan for peripherals soliciting any of the services contained in the array.
23.3.13 CBConnectPeripheralOptionNotifyOnConnectionKey as String

Function: One of the keys used to pass options to the connectPeripheral method.

Notes:
A Boolean value that specifies whether the system should display an alert for a given peripheral if the app is suspended when a successful connection is made.
The value for this key is a number. This key is useful for apps that have not specified the bluetooth-central background mode and cannot display their own alert. If more than one app has requested notification for a given peripheral, the one that was most recently in the foreground receives the alert. If the key is not specified, the default value is false.

23.3.14 CBConnectPeripheralOptionNotifyOnDisconnectionKey as String

Function: One of the keys used to pass options to the connectPeripheral method.

Notes:
A Boolean value that specifies whether the system should display a disconnection alert for a given peripheral if the app is suspended at the time of the disconnection.
The value for this key is a number. This key is useful for apps that have not specified the bluetooth-central background mode and cannot display their own alert. If more than one app has requested notification for a given peripheral, the one that was most recently in the foreground receives the alert. If the key is not specified, the default value is false.

23.3.15 CBConnectPeripheralOptionNotifyOnNotificationKey as String

Function: One of the keys used to pass options to the connectPeripheral method.

Notes:
A Boolean value that specifies whether the system should display an alert for all notifications received from a given peripheral if the app is suspended at the time.
The value for this key is a number. This key is useful for apps that have not specified the bluetooth-central background mode and cannot display their own alert. If more than one app has requested notification for a given peripheral, the one that was most recently in the foreground receives the alert. If the key is not specified, the default value is false.

23.3.16 CBEErrorDomain as String

Function: The domain for Core Bluetooth errors.
CHAPTER 23. BLUETOOTH

Notes: This value is used in the NSError class.

23.3.17 connectPeripheral(peripheral as CBPeripheralMBS, options as Dictionary = nil)

Notes:
peripheral: The peripheral to which the central is attempting to connect.
options: A dictionary to customize the behavior of the connection. For available options, see Peripheral Connection Options.

If a local connection to a peripheral is successfully established, the central manager object calls the centralManager:didConnectPeripheral: method of its delegate object. If the connection attempt fails, the central manager object calls the didFailToConnectPeripheral event. Attempts to connect to a peripheral do not time out. To explicitly cancel a pending connection to a peripheral, call the cancelPeripheralConnection method. The cancelPeripheralConnection method is implicitly called when peripheral is deallocated.

23.3.18 Constructor(options as dictionary = nil)

Notes: options: An optional dictionary containing initialization options for a central manager.

23.3.19 Destructor

23.3.20 retrieveConnectedPeripheralsWithServices(serviceUUIDs() as CBUUIDMBS) as CBPeripheralMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a list of the peripherals (containing any of the specified services) currently connected to the system.
Notes:
serviceUUIDs: A list of service UUIDs (represented by CBUUID objects).
Returns a list of the peripherals that are currently connected to the system and that contain any of the
services specified in the serviceUUID parameter.

The list of connected peripherals can include those that are connected by other apps and that will need to
be connected locally using the connectPeripheral method before they can be used.

23.3.21 retrievePeripheralsWithIdentifiers(identifiers() as NSUUIDMBS) as CBPeripheralMBS()

Function: Returns a list of known peripherals by their identifiers.
Notes:
identifiers: A list of peripheral identifiers (represented by NSUUID objects) from which CBPeripheral objects
can be retrieved.

Returns a list of peripherals that the central manager is able to match to the provided identifiers.

23.3.22 scanForPeripheralsWithServices(serviceUUIDs() as CBUUIDMBS = nil, options as Dictionary = nil)

Function: Scans for peripherals that are advertising services.
Notes:
serviceUUIDs: An array of CBUUID objects that the app is interested in. In this case, each CBUUID object
represents the UUID of a service that a peripheral is advertising.
options: An optional dictionary specifying options to customize the scan. For available options, see Peripheral Scanning Options.

You can provide an array of CBUUID objects representing service UUIDs in the serviceUUIDs parameter.
When you do, the central manager returns only peripherals that advertise the services you specify (recom-
mended). If the serviceUUIDs parameter is nil, all discovered peripherals are returned regardless of their
supported services (not recommended). If the central manager is already scanning with different parameters,
the provided parameters replace them. When the central manager object discovers a peripheral, it calls the
didDiscoverPeripheral event.
Apps that have specified the bluetooth-central background mode are allowed to scan while in the background.
That said, they must explicitly scan for one or more services by specifying them in the serviceUUIDs pa-
parameter. The CBCentralManager scan option is ignored while scanning in the background.
23.3.23 stopScan

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Asks the central manager to stop scanning for peripherals.

23.3.24 Properties

23.3.25 isScanning as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether or not the central is currently scanning. **Notes:** (Read only property)

23.3.26 Events

23.3.27 DidConnectPeripheral(peripheral as CBPeripheralMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a connection is successfully created with a peripheral. **Notes:**

peripheral: The peripheral that has been connected to the system.

This method is invoked when a call to connectPeripheral is successful. You typically implement this method to set the peripherals delegate and to discover its services.

23.3.28 DidDisconnectPeripheral(peripheral as CBPeripheralMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when an existing connection with a peripheral is torn down. **Notes:**

peripheral: The peripheral that has been disconnected.

error: If an error occurred, the cause of the failure.

This method is invoked when a peripheral connected via the connectPeripheral method is disconnected. If the disconnection was not initiated by cancelPeripheralConnection, the cause is detailed in error. After this method is called, no more methods are invoked on the peripheral devices CBPeripheralDelegate object. Note that when a peripheral is disconnected, all of its services, characteristics, and characteristic descriptors
are invalidated.

**23.3.29 DidDiscoverPeripheral**(peripheral as CBPeripheralMBS, advertisementData as Dictionary, RSSI as String)

**Function:** Invoked when the central manager discovers a peripheral while scanning.  
**Notes:**

peripheral: The discovered peripheral.  
advertisementData: A dictionary containing any advertisement data.  
RSSI: The current received signal strength indicator (RSSI) of the peripheral, in decibels.

The advertisement data can be accessed through the keys listed in Advertisement Data Retrieval Keys. You must retain a local copy of the peripheral if any command is to be performed on it. In use cases where it makes sense for your app to automatically connect to a peripheral that is located within a certain range, you can use RSSI data to determine the proximity of a discovered peripheral device.

**23.3.30 DidFailToConnectPeripheral**(peripheral as CBPeripheralMBS, error as NSErrorMBS)

**Function:** Invoked when the central manager fails to create a connection with a peripheral.  
**Notes:**

peripheral: The peripheral that failed to connect.  
error: The cause of the failure.

This method is invoked when a connection initiated via the connectPeripheral method fails to complete. Because connection attempts do not time out, a failed connection usually indicates a transient issue, in which case you may attempt to connect to the peripheral again.

**23.3.31 DidUpdateState**

**Function:** Invoked when the central managers state is updated.  
**Notes:** You implement this required method to ensure that Bluetooth low energy is supported and available to use on the central device. You should issue commands to the central manager only when the state of the central manager is powered on, as indicated by the CBCentralManagerStatePoweredOn constant. A state with a value lower than CBCentralManagerStatePoweredOn implies that scanning has stopped and that any connected peripherals have been disconnected. If the state moves below CBCentralManagerStatePow-
CHAPTER 23. BLUETOOTH

eredOff, all CBPeripheral objects obtained from this central manager become invalid and must be retrieved or discovered again. For a complete list and discussion of the possible values representing the state of the central manager, see the CBCentralManagerState enumeration in CBCentralManager.

23.3.32   WillRestoreState(dict as dictionary)

**Function:** Invoked when the central manager is about to be restored by the system.  
**Notes:**

dict: A dictionary containing information about the central manager that was preserved by the system at the time the app was terminated. For the available keys to this dictionary, see Central Manager State Restoration Options.

For apps that opt in to the state preservation and restoration feature of Core Bluetooth, this is the first method invoked when your app is relaunched into the background to complete some Bluetooth-related task. Use this method to synchronize the state of your app with the state of the Bluetooth system.

23.3.33   Constants

23.3.34   CBATTErrorAttributeNotFound = & h0A

**Function:** One of the att error codes.  
**Notes:** The attribute is not found within the specified attribute handle range.

23.3.35   CBATTErrorAttributeNotLong = & h0B

**Function:** One of the att error codes.  
**Notes:** The attribute cannot be read or written using the ATT read blob request.

23.3.36   CBATTErrorInsufficientAuthentication = 5

**Function:** One of the att error codes.  
**Notes:** The attribute requires authentication before its value can be read or written.
23.3. CBCENTRALMANAGERMBS

23.3.37 CBATTErrorInsufficientAuthorization = 8

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes. **Notes:** The attribute requires authorization before its value can be read or written.

23.3.38 CBATTErrorInsufficientEncryption = &h0F

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes. **Notes:** The attribute requires encryption before its value can be read or written.

23.3.39 CBATTErrorInsufficientEncryptionKeySize = &h0C

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes. **Notes:** The encryption key size used for encrypting this link is insufficient.

23.3.40 CBATTErrorInsufficientResources = &h11

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes. **Notes:** Resources are insufficient to complete the ATT request.

23.3.41 CBATTErrorInvalidAttributeValueLength = &h0D

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes. **Notes:** The length of the attributes value is invalid for the intended operation.

23.3.42 CBATTErrorInvalidHandle = 1

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes. **Notes:** The attribute handle is invalid on this peripheral.

23.3.43 CBATTErrorInvalidOffset = 7

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes. **Notes:** The specified offset value was past the end of the attributes value.
23.3.44  CBATTErrorInvalidPdu = 4

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes.  
**Notes:** The attribute Protocol Data Unit (PDU) or message is invalid.

23.3.45  CBATTErrorPrepareQueueFull = 9

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes.  
**Notes:** The prepare queue is full, because too many prepare write requests have been queued.

23.3.46  CBATTErrorReadNotPermitted = 2

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes.  
**Notes:** The attributes value cannot be read.

23.3.47  CBATTErrorRequestNotSupported = 6

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes.  
**Notes:** The attribute server does not support the request received by the client.

23.3.48  CBATTErrorSuccess = 0

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes.  
**Notes:** The ATT command or request successfully completed.

23.3.49  CBATTErrorUnlikelyError = & h0E

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes.  
**Notes:** The ATT request has encountered an unlikely error and therefore could not be completed.

23.3.50  CBATTErrorUnsupportedGroupType = & h10

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes.  
**Notes:** The attribute type is not a supported grouping attribute as defined by a higher-layer specification.
23.3.51 CBATTErrorWriteNotPermitted = 3

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the att error codes. 
**Notes:** The attributes value cannot be written.

23.3.52 CBCentralManagerStatePoweredOff = 4

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the states. 
**Notes:** Bluetooth is currently powered off.

23.3.53 CBCentralManagerStatePoweredOn = 5

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the states. 
**Notes:** Bluetooth is currently powered on and is available to use.

23.3.54 CBCentralManagerStateResetting = 1

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the states. 
**Notes:** The connection with the system service was momentarily lost; an update is imminent.

23.3.55 CBCentralManagerStateUnauthorized = 3

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the states. 
**Notes:** The app is not authorized to use the Bluetooth low energy peripheral/server role.

23.3.56 CBCentralManagerStateUnknown = 0

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the states. 
**Notes:** The current state of the peripheral manager is unknown; an update is imminent.

23.3.57 CBCentralManagerStateUnsupported = 2

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the states. 
**Notes:** The platform doesn’t support the Bluetooth low energy peripheral/server role.
23.3.58  CBErrorAlreadyAdvertising = 9

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes.  
**Notes:** The peripheral is already advertising.

23.3.59  CBErrorConnectionFailed = 10

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes.  
**Notes:** The connection failed.

23.3.60  CBErrorConnectionLimitReached = 11

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes.  
**Notes:** The device already has the maximum number of connections.

23.3.61  CBErrorConnectionTimeout = 6

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes.  
**Notes:** The connection timed out.

23.3.62  CBErrorInvalidHandle = 2

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes.  
**Notes:** The specified attribute handle is invalid.

23.3.63  CBErrorInvalidParameters = 1

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes.  
**Notes:** The specified parameters are invalid.

23.3.64  CBErrorNotConnected = 3

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes.  
**Notes:** The device is not currently connected.
23.3. CLASS CBCENTRALMANAGERMBS

23.3.65 CBErrorOperationCancelled = 5

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes. **Notes:** The operation is canceled.

23.3.66 CBErrorOutOfSpace = 4

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes. **Notes:** The device has run out of space to complete the intended operation.

23.3.67 CBErrorPeripheralDisconnected = 7

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes. **Notes:** The peripheral disconnected.

23.3.68 CBErrorUnknown = 0

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes. **Notes:** An unknown error occurred.

23.3.69 CBErrorUnknownDevice = 12

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes. **Notes:** Unknown device.

23.3.70 CBErrorUUIDNotAllowed = 8

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the error codes. **Notes:** The specified UUID is not permitted.
23.4  class CBCentralMBS

23.4.1  class CBCentralMBS

Function: The central CoreBluetooth class.
Notes:
The CBCentral class represents remote central devices that have connected to an app implementing the
peripheral role on a local device. That is, when you are implementing the peripheral role using the CBPeripheralManager class, centrals that connect to your local peripheral are represented as CBCentral objects.
Remote centrals are identified by universally unique identifiers (UUIDs), represented by NSUUID objects.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

23.4.2  Methods

23.4.3  Available as boolean

Function: Whether this class is available.
Notes: Returns true on MacOS 10.9 or newer.

23.4.4  Constructor

Function: The private constructor.

23.4.5  Properties

23.4.6  maximumUpdateValueLength as Integer

Function: The maximum amount of data, in bytes, that the central can receive in a single notification or
indication.
Notes: (Read only property)
23.5. CLASS CBCHARACTERISTICMBS

23.5 class CBCharacteristicMBS

23.5.1 class CBCharacteristicMBS

Function: The class for a service characteristic. 
Notes:
CBCharacteristic and its subclass CBMutableCharacteristic represent further information about a peripher-
als service. CBCharacteristic objects in particular represent the characteristics of a remote peripherals 
service (remote peripheral devices are represented by CBPeripheral objects). A characteristic contains a sin-
gle value and any number of descriptors describing that value. The properties of a characteristic determine 
how the value of the characteristic can be used and how the descriptors can be accessed. 
Subclass of the CBAttributeMBS class. 
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

23.5.2 Methods

23.5.3 Constructor

Function: The private constructor.

23.5.4 descriptors as CBDescriptorMBS()

Function: A list of the descriptors that have been discovered in this characteristic. 
Notes: The value of this property is an array of CBDescriptor objects that represent a characteristics de-
scriptors. Characteristic descriptors provide more information about a characteristics value. For example, 
they may describe the value in human-readable form and describe how the value should be formatted for 
presentation purposes. For more information about characteristic descriptors, see CBDescriptor.

23.5.5 Properties

23.5.6 isBroadcasted as Boolean

Function: Whether the characteristic is currently broadcasted or not. 
Notes: 
Available in MacOS 10.9 or newer.
23.5.7 isNotifying as Boolean

Function: A Boolean value indicating whether the characteristic is currently notifying a subscribed central of its value.
Notes:
True if you have enabled notifications or indications for the characteristic by successfully calling the setNotifyValue method of the CBPeripheral class. If the value of this property is true, the peripheral updates the subscribed central that it is connected to whenever the characteristics value has changed. If the value of the property is false, notifications (or indications) have not been enabled for the characteristic, and the peripheral does not update the central that it is connected to whenever the characteristics value has changed. (Read only property)

23.5.8 properties as Integer

Function: The properties of the characteristic.
Notes:
The properties of a characteristic determine how the characteristics value and descriptors can be used and accessed. For a list of the possible values representing the properties of a characteristic, see constants. (Read only property)

23.5.9 service as CBServiceMBS

Function: The service that this characteristic belongs to.
Notes: (Read only property)

23.5.10 value as MemoryBlock

Function: The value of the characteristic.
Notes:
This property contains the value of the characteristic. For example, a temperature measurement characteristic of a health thermometer service may have a value that indicates a temperature in Celsius.
23.5. CLASS CBCHARACTERISTICMBS

(Read only property)

23.5.11 Constants

23.5.12 kPropertyAuthenticatedSignedWrites = & h40

Notes: Signed writes of the characteristics value are permitted, without a response from the peripheral to indicate that the write was successful.

23.5.13 kPropertyBroadcast = 1

Notes: The characteristics value can be broadcast using a characteristic configuration descriptor.

23.5.14 kPropertyExtendedProperties = & h80

Notes: Additional characteristic properties are defined in the characteristic extended properties descriptor.

23.5.15 kPropertyIndicate = & h20

Notes: Indications of the characteristics value are permitted, with a response from the central to indicate that the indication was received.

23.5.16 kPropertyIndicateEncryptionRequired = & h200

Notes: Only trusted devices can enable indications of the characteristics value.

23.5.17 kPropertyNotify = & h10

Notes: Notifications of the characteristics value are permitted, without a response from the central to indi-
cate that the notification was received.

23.5.18  kPropertyNotifyEncryptionRequired = & h100

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function**: One of the property constants.  
**Notes**: Only trusted devices can enable notifications of the characteristics value.

23.5.19  kPropertyRead = 2

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function**: One of the property constants.  
**Notes**: The characteristics value can be read.

23.5.20  kPropertyWrite = 8

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function**: One of the property constants.  
**Notes**: The characteristics value can be written, with a response from the peripheral to indicate that the write was successful.

23.5.21  kPropertyWriteWithoutResponse = 4

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function**: One of the property constants.  
**Notes**: The characteristics value can be written, without a response from the peripheral to indicate that the write was successful.
23.6. **CLASS CBDESCRIPTORMBS**

23.6  **class CBDescriptorMBS**

**Function:** The CoreBluetooth class for a characteristic description.  
**Notes:**

CBDescriptor and its subclass CBMutableDescriptor represent a descriptor of a peripherals characteristic.  
CBDescriptor objects in particular represent the descriptors of a remote peripherals characteristic (remote peripheral devices are represented by CBPeripheral objects). Descriptors provide further information about a characteristics value. For example, they may describe the value in human-readable form and describe how the value should be formatted for presentation purposes. Characteristic descriptors also indicate whether a characteristics value is configured on a server (a peripheral) to indicate or notify a client (a central) when the value of the characteristic changes.

There are six predefined types of descriptors that along with their corresponding value types are detailed in CBUUID. CBDescriptor lists the predefined types of descriptors and the CBUUIDMBS constants that are used to represent them.

<table>
<thead>
<tr>
<th>Descriptor type</th>
<th>Descriptor constant</th>
</tr>
</thead>
<tbody>
<tr>
<td>Characteristic extended properties</td>
<td>CBUUIDMBS.CBUUIDCharacteristicExtendedPropertiesString</td>
</tr>
<tr>
<td>Characteristic user description</td>
<td>CBUUIDMBS.CBUUIDCharacteristicUserDescriptionString</td>
</tr>
<tr>
<td>Client characteristic configuration</td>
<td>CBUUIDMBS.CBUUIDClientCharacteristicConfigurationString</td>
</tr>
<tr>
<td>Server characteristic configuration</td>
<td>CBUUIDMBS.CBUUIDServerCharacteristicConfigurationString</td>
</tr>
<tr>
<td>Characteristic format</td>
<td>CBUUIDMBS.CBUUIDCharacteristicFormatString</td>
</tr>
<tr>
<td>Characteristic aggregate format</td>
<td>CBUUIDMBS.CBUUIDCharacteristicAggregateFormatString</td>
</tr>
</tbody>
</table>

Subclass of the CBAAttributeMBS class.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

23.6.2  **Methods**

23.6.3  **Available as boolean**

**Function:** Whether this class is available.  
**Notes:** Returns true on MacOS 10.7 or newer.
23.6.4 Constructor

23.6.5 Properties

23.6.6 Characteristic as CBCharacteristicMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The characteristic that this descriptor belongs to. Notes: (Read only property)

23.6.7 Value as Variant

The value types for the various types of descriptors are detailed in CBUUID. You can read the value of a descriptor by calling the readValueForDescriptor: method of the CBPeripheral class. You can write the value of a descriptor by calling the writeValue method of the CBPeripheral class. That said, you cannot use the writeValue method to write the value of a client configuration descriptor (CBUUIDClientCharacteristicConfigurationString); instead, you should use the setNotifyValue method of the CBPeripheral class to configure client indications or notifications of a characteristics value on a server. (Read only property)
23.7. class CBL2CAPChannelMBS

23.7.1 class CBL2CAPChannelMBS

23.7.2 Methods

23.7.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function: Whether the class is available.
Notes: Returns true on MacOS 10.13.

23.7.4 Constructor

23.7.5 Properties

23.7.6 Handle as Integer

Notes: (Read and Write property)

23.7.7 inputStream as NSInputStreamMBS

Notes: (Read only property)
23.7.8 outputStream as NSOutputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: An NSStream used for writing data to the peer. Notes: (Read only property)

23.7.9 peer as CBPeerMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The peer connected to the channel. Notes: (Read only property)

23.7.10 PSM as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The PSM (Protocol/Service Multiplexer) of the channel. Notes: (Read only property)
23.8. class CBManagerMBS

23.8.1 class CBManagerMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The abstract base class for Core Bluetooth manager objects (central and peripheral). **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

23.8.2 Methods

23.8.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the class is available. **Notes:** Returns true on MacOS 10.13 or newer.

23.8.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

23.8.5 Properties

23.8.6 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** (Read and Write property)

23.8.7 State as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The state of the manager. **Notes:** (Read only property)
23.8.8 Constants

23.8.9 `kStatePoweredOff = 4`

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the state constants.  
**Notes:** Bluetooth is currently powered off.

23.8.10 `kStatePoweredOn = 5`

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the state constants.  
**Notes:** Bluetooth is currently powered on and available to use.

23.8.11 `kStateResetting = 1`

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the state constants.  
**Notes:** The connection with the system service was momentarily lost, update imminent.

23.8.12 `kStateUnauthorized = 3`

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the state constants.  
**Notes:** The application is not authorized to use the Bluetooth Low Energy role.

23.8.13 `kStateUnknown = 0`

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the state constants.  
**Notes:** State unknown, update imminent.

23.8.14 `kStateUnsupported = 2`

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the state constants.  
**Notes:** The platform doesn’t support the Bluetooth Low Energy Central/Client role.
23.9. **CLASS CBMUTABLECHARACTERISTICMBS**

23.9  **class CBMutableCharacteristicMBS**

**Function:** CBMutableCharacteristic objects represent the characteristics of a local peripherals service (local peripheral devices are represented by CBPeripheralManager objects).

**Notes:**

This class adds write access to many of the properties in the CBCharacteristic class it inherits from.

You use this class to create a characteristic and to set its properties and permissions as desired. After you create a characteristic and add it to a local service, you can publish it (and the service) to the peripherals local database using the addService method of the CBPeripheralManager class. After you publish a characteristic, the characteristic is cached and you can no longer make changes to it.

Subclass of the CBCharacteristicMBS class.

23.9.2  **Methods**

23.9.3  **Available as boolean**

**Function:** Whether the class is available.

**Notes:** Returns true on MacOS 10.9 or later.

23.9.4  **Constructor(UUID as CBUUIDMBS, properties as Integer, value as MemoryBlock, permissions as Integer)**

**Function:** Returns a newly initialized mutable characteristic with specified permissions, properties, and value.

**Notes:**

UUID: A 128-bit UUID that identifies the characteristic.
properties: The properties of the characteristic.
value: The characteristic value to be cached. If nil, the value is dynamic and will be requested on demand.
permissions: The permissions of the characteristic value.

Returns a newly initialized mutable characteristic.

If you specify a value for the characteristic, the value is cached and its properties and permissions are set to CBCharacteristicPropertyRead and CBAtributePermissionsReadable, respectively. Therefore, if you need
the value of a characteristic to be writeable, or if you expect the value to change during the lifetime of the published service to which the characteristic belongs, you must specify the value to be nil. So doing ensures that the value is treated dynamically and requested by the peripheral manager whenever the peripheral manager receives a read or write request from a central. When the peripheral manager receives a read or write request from a central, it calls the didReceiveReadRequest or the didReceiveWriteRequests event, respectively.

23.9.5 setDescriptors(Descriptors() as CBDescriptorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Set the list of descriptors that describe the characteristic. **Notes:** The value of this property is an array of CBDescriptor objects that represent a characteristics descriptors. Characteristic descriptors provide more information about a characteristics value. For example, they may describe the value in human-readable form and describe how the value should be formatted for presentation purposes. For more information about characteristic descriptors, see CBDescriptor.

23.9.6 subscribedCentrals as CBDescriptorMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A list of centrals currently subscribed to the characteristics value. **Notes:** The value of this property is an array of CBCentral objects that are currently subscribed to the characteristics value. The array is empty if the characteristic is not configured to support notifications or indications. Even if the characteristic is configured to support notifications or indications, the array is empty if no centrals are currently subscribing to the characteristics value.

23.9.7 Properties

23.9.8 permissions as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The permissions of the characteristic value. **Notes:** Characteristic permissions represent the read, write, and encryption permissions for a characteristics value. For a complete list and discussion of the characteristic permissions that may be set, see constants. (Read and Write property)

23.9.9 properties as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The properties of the characteristic.
The properties of a characteristic determine how the characteristics value and descriptors can be used and accessed. The characteristic properties CBCharacteristicPropertyBroadcast and CBCharacteristicPropertyExtendedProperties are not allowed for mutable characteristics. That is, you cannot set these properties when you initialize a CBMutableCharacteristic object using the Constructor method. For a list of the possible values representing the properties of a characteristic, see the CBCharacteristicProperties enumeration in CBCharacteristic.

(Read and Write property)

23.9.10 value as MemoryBlock

**Function:** The value of the characteristic.

**Notes:**

This property contains the value of the characteristic. For example, a temperature measurement characteristic of a health thermometer service may have a value that indicates a temperature in Celsius.

(Read and Write property)

23.9.11 Constants

23.9.12 kReadable = 1

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the permission flags.

**Notes:** The characteristics value has read-only permission.

23.9.13 kReadEncryptionRequired = 4

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the permission flags.

**Notes:** The characteristics value is readable only by trusted devices.

23.9.14 kWriteable = 2

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the permission flags.

**Notes:** The characteristics value has write-only permission.
23.9.15  \texttt{kWriteEncryptionRequired} = 8

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function:} One of the permission flags. 
\textbf{Notes:} The characteristics value is writeable only by trusted devices.
23.10. **CLASS CBMUTABLEDESCRIPTORMBS**

### 23.10.1 class CBMutableDescriptorMBS

**Function:** CBMutableDescriptor objects represent the descriptors of a local peripherals characteristic (local peripheral devices are represented by CBPeripheralManager objects).

**Notes:**

You use the CBMutableDescriptor class to create a local characteristic descriptor. After you create a descriptor and associate it with a local characteristic, you can publish it (along with the characteristic and local service to which it belongs) to the peripherals local database via the addService: method of the CBPeripheralManager class. After you publish a local descriptor, the descriptor is cached and you can no longer make changes to it.

There are six predefined types of descriptors that along with their corresponding value types are detailed in CBUUID. That said, only two of these are currently supported when creating local, mutable descriptors: the characteristic user description descriptor and the characteristic format descriptor, represented by the CBUUID constants CBUUIDCharacteristicUserDescriptionString and CBUUIDCharacteristicFormatString, respectively. The system automatically creates the characteristic extended properties descriptor and the client characteristic configuration descriptor, depending on the properties of the characteristic to which the descriptor belongs.

Subclass of the CBDescriptorMBS class.

### 23.10.2 Methods

#### 23.10.3 Constructor(UUID as CBUUIDMBS, value as variant)

**Function:** Returns a newly initialized mutable descriptor with a specified value.

**Notes:**

UUID: A 128-bit UUID that identifies the characteristic. You must use only one of the two currently supported descriptor types: CBUUIDCharacteristicUserDescriptionString or CBUUIDCharacteristicFormatString. For more details about these descriptor types, see CBUUID.

value: The descriptor value to be cached. This value is required (that is, it must not be nil) and cannot be updated dynamically after the descriptor has been published.

Returns a newly initialized mutable descriptor.

The value type of value depends on the type of descriptor.

- The value type of a characteristic user description descriptor (CBUUIDCharacteristicUserDescription-
String) is a string that can be used to provide a human-readable description of the characteristics value.

- The value type of a characteristic format descriptor (CUUIDCharacteristicFormatString) is a memory block that can be used to specify how the characteristics value should be formatted for presentation purposes.

If you want to create a local characteristic format descriptor, the descriptors value must conform to the attribute value of the characteristic format descriptor as defined in the Bluetooth 4.0 specification, Volume 3, Part G, Section 3.3.3.5 (for more information, see Bluetooth 4.0 Characteristic Presentation Format).
23.11. CLASS CBMUTABLESERVICEMBS

23.11 class CBMutableServiceMBS

23.11.1 class CBMutableServiceMBS

Function: The CBMutableService class adds write access to all of the properties in the CBService class it inherits from.

Notes:

You use this class to create a service or an included service on a local peripheral device (represented by a CBPeripheralManager object). After you create a service, you can add it to the peripherals local database using the addService method of the CBPeripheralManager class. After you add a service to the peripherals local database, the service is cached and you can no longer make changes to it.

Subclass of the CBServiceMBS class.

23.11.2 Methods

23.11.3 Constructor(UUID as CBUUIDMBS, isPrimary as Boolean)

Function: Returns a newly initialized mutable service specified by UUID and service type.

Notes:

UUID: A 128-bit UUID that identifies the service.

isPrimary: A Boolean value indicating whether the type of service is primary or secondary. If the value is true, the type of service is primary. If the value is false, the type of service is secondary.

23.11.4 setCharacteristics(characteristics() as CBCharacteristicMBS)

Function: Sets list of characteristics of a service.

Notes: An array containing CBCharacteristic objects that represent a services characteristics. Characteristics provide further details about a peripherals service. For example, a heart rate service may contain one characteristic that describes the intended body location of the devices heart rate sensor and another characteristic that transmits heart rate measurement data.

23.11.5 setIncludedServices(includedServices() as CBServiceMBS)

Function: Sets the list of included services.

Notes: A service of a peripheral may contain a reference to other services that are available on the periph-
eral. These other services are the included services of the service.
23.12. class CBPeerMBS

23.12.1 class CBPeerMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CBPeer class is an abstract base class that defines common behavior for objects representing remote devices. **Notes:**
You typically do not create instances of either CBPeer or its concrete subclasses. Instead, the system creates them for you during the process of peer discovery.

Your app running on the local device takes the role of either a central (by creating an instance of CBCentralManager) or a peripheral (by creating an instance of CBPeripheralManager), and interacts through the manager with remote devices in the opposite role. During the process of peer discovery, where a central device scans for peripherals advertising services, the system creates objects from the concrete subclasses of CBPeer to represent discovered remote devices.

The concrete subclasses of CBPeer are:

- CBPeripheralMBS
- CBCentralMBS

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

23.12.2 Methods

23.12.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available. **Notes:** Returns true on Mac OS 10.13 or newer.

23.12.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
23.12.5 copy as CBPeerMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy.

23.12.6 Properties

23.12.7 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

23.12.8 identifier as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The UUID associated with the peer.  
**Notes:**  
The value of this property represents the unique identifier of the peer. The first time a local manager encounters a peer, the system assigns the peer a UUID, represented by a new NSUUID object. Peers are identified by NSUUID UUIDs instead of by the CBUUID objects that identify a peripherals services, characteristics, and characteristic descriptors.  
(Read only property)
23.13. **CLASS CBPERIPHERALMANAGERMBS**

23.13 class CBPeripheralManagerMBS

23.13.1 class CBPeripheralManagerMBS

**Function:** The CoreBluetooth peripheral manager class.

**Notes:**

CBPeripheralManager objects are used to manage published services within the local peripheral devices Generic Attribute Profile (GATT) database and to advertise these services to central devices (represented by CBCentral objects). While a service is in the database, it is visible to, and can be accessed by, any connected central. That said, if your app has not specified the bluetooth-peripheral background mode, the contents of its services become disabled when it is in the background or in a suspended state; any remote central trying to access the services characteristic value or characteristic descriptors receives an error.

Before you call CBPeripheralManager methods, the state of the peripheral manager object must be powered on, as indicated by the kStatePoweredOn. This state indicates that the peripheral device (your iPhone or iPad, for instance) supports Bluetooth low energy and that its Bluetooth is on and available to use. Subclass of the CBManagerMBS class.

23.13.2 Methods

23.13.3 addService(service as CBMutableServiceMBS)

**Function:** Publishes a service and any of its associated characteristics and characteristic descriptors to the local GATT database.

**Notes:**

service: The service you want to publish.

When you add a service to the database, the peripheral manager calls the didAddService:error event. If the service contains any included services, you must publish them first.

23.13.4 authorizationStatus as integer

**Function:** Returns the apps authorization status for sharing data while in the background state.

**Notes:**

A value indicating whether the app is authorized to share data using Bluetooth services while in the background. For a list of the possible values, see constants.
The authorization status of a given app is managed by the system and determined by several factors. Apps must be explicitly authorized to share data using Bluetooth services while in the background state. The system automatically displays a request for user authorization when your app first attempts to use Bluetooth services to share data.

Calling this method does not prompt the user for access. Instead, you use this method to detect restricted access and simply hide any affected UI features from the user.

### 23.13.5 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Checks whether this class is available.  
**Notes:** Returns true for MacOS 10.9 or newer.

### 23.13.6 CBPeripheralManagerOptionRestoreIdentifierKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used to pass options to the Constructor.  
**Notes:**  
A string containing a unique identifier (UID) for the peripheral manager that is being instantiated. The system uses this UID to identify a specific peripheral manager. As a result, the UID must remain the same for subsequent executions of the app in order for the peripheral manager to be successfully restored.

### 23.13.7 CBPeripheralManagerOptionShowPowerAlertKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used to pass options to the Constructor.  
**Notes:**  
A Boolean value that specifies whether the system should display a warning dialog to the user if Bluetooth is powered off when the peripheral manager is instantiated. The value for this key is a boolean. If the key is not specified, the default value is false.

### 23.13.8 CBPeripheralManagerRestoredStateAdvertisementDataKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used to pass options to the constructor.  
**Notes:** A dictionary containing the data that the peripheral manager was advertising at the time the app was terminated by the system.
23.13. CLASS CBPERIPHERALMANAGERMBS

23.13.9 CBPeripheralManagerRestoredStateServicesKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used to pass options to the constructor. **Notes:** An array of CBMutableService objects that contains all of the services that were published to the local peripherals database at the time the app was terminated by the system.

23.13.10 Constructor(options as Dictionary = nil)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the peripheral manager.

23.13.11 Destructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

23.13.12 removeAllServices

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all published services from the local GATT database. **Notes:** Because the GATT database is shared among apps on the local peripheral device, this method removes only the services that you have added using the addService method. Any services that have been published by other apps on the local peripheral device are not removed from the GATT database.

23.13.13 removeService(service as CBMutableServiceMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes a specified published service from the local GATT database. **Notes:**

service: The service you want to remove.

Because the GATT database is shared among apps on the local peripheral device, more than one instance of a service may exist in the database. As a result, this method removes only the instance of the service that your app added to the database (using the addService method). If the service is included by any other services, you must remove them first.
CHAPTER 23. BLUETOOTH

23.13.14 respondToRequest(request as CBATTRequestMBS, error as integer)

Function: Responds to a read or write request from a connected central.
Notes:
request: The read or write request that was received from the connected central. For more information
about read and write requests, see CBATTRequest.
result: The result of attempting to fulfill the request. For a list of possible results, see Core Bluetooth
Constants.

When the peripheral manager receives a request (represented as a CBATTRequest object) from a connected
central to read or write a characteristics value, it calls the didReceiveReadRequest or didReceiveWriteRequests
event. Each time one of these events is called, you call this method to respond to the corresponding read or
write request.

23.13.15 setDesiredConnectionLatency(latency as integer, central as CBCentralMBS)

Function: Sets the desired connection latency for an existing connection to a central device.
Notes:
latency: The desired connection latency. For a list of the possible connection latency values that you may
set for the peripheral manager, see CBPeripheralManagerConnectionLatency.
central: The central that the peripheral manager is currently connected to.

The latency of a peripheral-central connection controls how frequently messages can be exchanged between
the peripheral and the central to which the peripheral is connected. By setting a desired connection latency,
you manage the relationship between the frequency with which data is exchanged and the resulting bat-
tery performance of the peripheral device. When you call this method to set the connection latency, note
that connection latency changes are not guaranteed. And so, the resultant latency may vary. If you do
not explicitly set a latency, the connection latency is set to the latency that was chosen by the central de-
vice when the connection was first established. Typically, it is not necessary to change the connection latency.

23.13.16 startAdvertising(advertisementData as Dictionary)

Function: Invoked when you start advertising the local peripheral devices data.
Notes:
error: If an error occurred, the cause of the failure.
This event is invoked when your app calls the `startAdvertising` method to begin advertising the local peripheral devices data. If successful, the error parameter is nil. If there is a problem advertising the data, the error parameter returns the cause of the failure.

### 23.13.17 stopAdvertising

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops advertising peripheral manager data. **Notes:** Call this method when you no longer want to advertise peripheral manager data.

### 23.13.18 updateValue(value as MemoryBlock, characteristic as CBMutableCharacteristicMBS, onSubscribedCentrals() as CBCentralMBS = nil) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends an updated characteristic value to one or more subscribed centrals, via a notification or indication. **Notes:**

- value: The characteristic value you want to send via a notification or indication.
- characteristic: The characteristic whose value has changed.
- centrals: A list of centrals (represented by CBCentral objects) that have subscribed to receive updates of the characteristics value. If nil, all subscribed centrals are updated. Centrals that have not subscribed to a characteristics value are ignored.

Returns true if the update is successfully sent to the subscribed central or centrals. false if the update is not successfully sent because the underlying transmit queue is full.

You use this method to send updates of a characteristics valuethrough a notification or indicationto selected centrals that have subscribed to that characteristics value. If the method returns false because the underlying transmit queue is full, the peripheral manager calls the peripheralManagerIsReadyToUpdateSubscribers event when more space in the transmit queue becomes available. After this delegate method is called, you may resend the update.

If the length of the value parameter exceeds the length of the maximumUpdateValueLength property of a subscribed CBCentral, the value parameter is truncated accordingly.
23.13.19 Properties

23.13.20 isAdvertising as Boolean

Function: A Boolean value indicating whether the peripheral is currently advertising data.
Notes:
true if the peripheral is currently advertising data as a result of you successfully calling the startAdvertising method. false if the peripheral is not currently advertising data.
(Read only property)

23.13.21 Events

23.13.22 DidAddService(service as CBServiceMBS, error as NSErrorMBS)

Function: Invoked when you publish a service, and any of its associated characteristics and characteristic descriptors, to the local Generic Attribute Profile (GATT) database.
Notes:
service: The service that was added to the local GATT database.
error: If an error occurred, the cause of the failure.
This event is invoked when your app calls the addService method to publish a service to the local peripherals GATT database. If the service is successfully published to the local database, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

23.13.23 DidOpenL2CAPChannel(channel as CBL2CAPChannelMBS, error as NSErrorMBS)

23.13.24 DidPublishL2CAPChannel(PSM as Integer, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: This event is the response to a publishL2CAPChannel call.
Notes:
PSM: The PSM of the channel that was published.
error: If an error occurred, the cause of the failure.
The PSM will contain the PSM that was assigned for the published channel

### 23.13.25 DidReceiveReadRequest(Request as CBATTRequestMBS)

**Function:** Invoked when a local peripheral device receives an Attribute Protocol (ATT) read request for a characteristic that has a dynamic value.
**Notes:**
request: A CBATTRequest object that represents a request to read a characteristics value.

Each time this method is invoked, you call the respondToRequest method of the CBPeripheralManager class exactly once to respond to the read request.

### 23.13.26 DidReceiveWriteRequests(requests() as CBATTRequestMBS)

**Function:** Invoked when a local peripheral device receives an Attribute Protocol (ATT) write request for a characteristic that has a dynamic value.
**Notes:**
requests: A list of one or more CBATTRequest objects, each representing a request to write the value of a characteristic.

In the same way that you respond to a read request, each time this method is invoked, you call the respondToRequest:withResult: method of the CBPeripheralManager class exactly once. If the requests parameter contains multiple requests, treat them as you would a single request if any individual request cannot be fulfilled, you should not fulfill any of them. Instead, call the respondToRequest method immediately, and provide a result that indicates the cause of the failure.

When you respond to a write request, note that the first parameter of the respondToRequest method expects a single CBATTRequest object, even though you received an array of them from the didReceiveWriteRequests event. To respond properly, pass in the first request of the requests array.

### 23.13.27 DidStartAdvertising(error as NSErrorMBS)

**Function:** Advertising did start.
**Notes:**
error: If an error occurred, the cause of the failure.

This event returns the result of a startAdvertising call. If advertisement could not be started, the cause will be detailed in the error parameter.

### 23.13.28 DidSubscribeToCharacteristic(central as CBCentralMBS, characteristic as CBCharacteristicMBS)

**Function:** Invoked when a remote central device subscribes to a characteristics value.

**Notes:**
- central: The remote central device that subscribed to the characteristics value.
- characteristic: The characteristic whose value has been subscribed to.

This method is invoked when a remote central device subscribes to the value of one of the local peripherals characteristics, by enabling notifications or indications on the characteristics value. You should use the invocation of this method as a cue to start sending the subscribed central updates as the characteristics value changes. To send updated characteristic values to subscribed centrals, use the updateValue method of the CBPeripheralManager class.

### 23.13.29 DidUnpublishL2CAPChannel(PSM as Integer, error as NSErrorMBS)

**Function:** This event is the response to a unpublishL2CAPChannel call.

**Notes:**
- PSM: The PSM of the channel that was published.
- error: If an error occurred, the cause of the failure.

### 23.13.30 DidUnsubscribeFromCharacteristic(central as CBCentralMBS, characteristic as CBCharacteristicMBS)

**Function:** Invoked when a remote central device unsubscribes from a characteristics value.

**Notes:**
- central: The remote central device that subscribed to the characteristics value.
- characteristic: The characteristic whose value has been unsubscribed from.

This method is invoked when a remote central device unsubscribes from the value of one of the local periph-
erals characteristics, by disabling notifications or indications on the characteristics value. You should use
the invocation of this method as a cue to stop sending the subscribed central updates as the characteristics
value changes.

23.13.31  DidUpdateState

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Func-

tion: Invoked when the peripheral manager’s state is updated.

Notes: You implement this required method to ensure that Bluetooth low energy is supported and available
to use on the local peripheral device. Issue commands to the peripheral manager only when the state of the
peripheral manager is powered on, as indicated by the kStatePoweredOn constant. A state with a value lower
than CBPeripheralManagerStatePoweredOn implies that advertising has stopped and that any connected
centrals have been disconnected. If the state moves below CBPeripheralManagerStatePoweredOff, advertis-
ing has stopped and must be explicitly restarted. In addition, the local database is cleared and all services
must be explicitly added again. For a complete list and discussion of the possible values representing the
state of the peripheral manager, see the CBPeripheralManagerState enumeration in CBPeripheralManager.

23.13.32  IsReadyToUpdateSubscribers

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Func-

tion: Invoked when a local peripheral device is again ready to send characteristic value updates.

Notes: When a call to the updateValue method fails because the underlying queue used to transmit the
updated characteristic value is full, the peripheralManagerIsReadyToUpdateSubscribers: method is invoked
when more space in the transmit queue becomes available. You can then implement this event to resend the
value.

23.13.33  WillRestoreState(dic as dictionary)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Func-

tion: Invoked when the peripheral manager is about to be restored by the system.

Notes:

dict: A dictionary containing information about the peripheral manager that was preserved by the system
at the time the app was terminated. For the available keys to this dictionary, see Peripheral Manager State
Restoration Options.

For apps that opt in to the state preservation and restoration feature of Core Bluetooth, this is the first
method invoked when your app is relaunched into the background to complete some Bluetooth-related task.
Use this method to synchronize the state of your app with the state of the Bluetooth system.
23.13.34 Constants

23.13.35 \texttt{kAuthorizationStatusAuthorized} = 3

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function}: One of the values representing the current authorization state of the peripheral manager.
\textbf{Notes}: This app is authorized to share data using Bluetooth services while in the background state.

23.13.36 \texttt{kAuthorizationStatusDenied} = 2

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function}: One of the values representing the current authorization state of the peripheral manager.
\textbf{Notes}: The user explicitly denied this app from sharing data using Bluetooth services while in the background state.

23.13.37 \texttt{kAuthorizationStatusNotDetermined} = 0

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function}: One of the values representing the current authorization state of the peripheral manager.
\textbf{Notes}: The user has not yet made a choice regarding whether this app can share data using Bluetooth services while in the background state.

23.13.38 \texttt{kAuthorizationStatusRestricted} = 1

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function}: One of the values representing the current authorization state of the peripheral manager.
\textbf{Notes}: This app is not authorized to share data using Bluetooth services while in the background state. The user cannot change this app's status, possibly due to active restrictions such as parental controls being in place.

23.13.39 \texttt{kConnectionLatencyHigh} = 2

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function}: One of the values representing the connection latency of the peripheral manager.
\textbf{Notes}: Extending battery life has priority over rapid communication.
23.13.40  \textit{kConnectionLatencyLow} = 0

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function:} One of the values representing the connection latency of the peripheral manager. 
\textbf{Notes:} Rapid communication has priority over battery life.

23.13.41  \textit{kConnectionLatencyMedium} = 1

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function:} One of the values representing the connection latency of the peripheral manager. 
\textbf{Notes:} A balance exits between communication frequency and battery life.

23.13.42  \textit{kStatePoweredOff} = 4

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function:} One of the state constants. 
\textbf{Notes:} Bluetooth is currently powered off.

23.13.43  \textit{kStatePoweredOn} = 5

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function:} One of the state constants. 
\textbf{Notes:} Bluetooth is currently powered on and is available to use.

23.13.44  \textit{kStateResetting} = 1

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function:} One of the state constants. 
\textbf{Notes:} The connection with the system service was momentarily lost; an update is imminent.

23.13.45  \textit{kStateUnauthorized} = 3

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function:} One of the state constants. 
\textbf{Notes:} The app is not authorized to use the Bluetooth low energy peripheral/server role.

23.13.46  \textit{kStateUnknown} = 0

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function:} One of the state constants. 
\textbf{Notes:} The current state of the peripheral manager is unknown; an update is imminent.
23.13.47 \texttt{kStateUnsupported} = 2

MBS Bluetooth Plugin, Plugin Version: 18.1. \textbf{Function:} One of the state constants. 
\textbf{Notes:} The platform doesn’t support the Bluetooth low energy peripheral/server role.
23.14. **CLASS CBPERIPHERALMBS**

23.14 class CBPeripheralMBS

23.14.1 class CBPeripheralMBS

**Function:** The CBPeripheral class represents remote peripheral devices that your app by means of a central manager (an instance of CBCentralManager) has discovered advertising or is currently connected to.

**Notes:**

Peripherals are identified by universally unique identifiers (UUIDs), represented by NSUUID objects. Peripherals may contain one or more services or provide useful information about their connected signal strength.

You use this class to discover, explore, and interact with the services available on a remote peripheral that supports Bluetooth low energy. A service encapsulates the way part of the device behaves. For example, one service of a heart rate monitor may be to expose heart rate data from the monitor's heart rate sensor. Services themselves are made up of characteristics or included services (references to other services). Characteristics provide further details about a peripherals service. For example, the heart rate service just described may contain one characteristic that describes the intended body location of the device's heart rate sensor and another characteristic that transmits heart rate measurement data. Finally, characteristics contain any number of descriptors that provide more information about the characteristics value, such as a human-readable description and a way to format the value.

Subclass of the CBPeerMBS class.

23.14.2 Methods

23.14.3 Available as boolean

**Function:** Whether this class is available.

**Notes:** Returns true on Mac OS 10.7 and newer.

23.14.4 Constructor(Peripheral as CBPeripheralMBS)

**Function:** The constructor.

**Notes:** You can subclass this class and fill events. Than when you get a Peripheral, you can call this constructor to make a new object of your subclass with the given Peripheral and connect the event.
23.14.5 Destructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

23.14.6 discoverCharacteristics(characteristicUUIDs() as CBUUIDMBS = nil, service as CBServiceMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Discovers the specified characteristics of a service. **Notes:** characteristicUUIDs: An array of CBUUID objects that you are interested in. Here, each CBUUID object represents a UUID that identifies the type of a characteristic you want to discover. service: The service whose characteristics you want to discover.

An array of CBUUID objects representing characteristic UUIDs can be provided in the characteristicUUIDs parameter. As a result, the peripheral returns only the characteristics of the service that your app is interested in (recommended). If the characteristicUUIDs parameter is nil, all the characteristics of the service are returned; setting the parameter to nil is considerably slower and is not recommended. When the peripheral discovers one or more characteristics of the specified service, it calls the didDiscoverCharacteristicsForService event. If the characteristics of a service are successfully discovered, you can access them through the services characteristics property.

23.14.7 discoverDescriptorsForCharacteristic(Characteristic as CBCharacteristicMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Discovers the descriptors of a characteristic. **Notes:** characteristic: The characteristic whose descriptors you want to discover.

When the peripheral discovers one or more descriptors of the specified characteristic, it calls the didDiscoverDescriptorsForCharacteristic event. If the descriptors of a characteristic are successfully discovered, you can access them through the characteristics descriptors property.
23.14.8  discoverIncludedServices(includedServiceUUIDs() as CBUUIDMBS = nil, service as CBServiceMBS)

**Function:** Discovers the specified included services of a service.  
**Notes:**

- includedServiceUUIDs: An array of CBUUID objects that you are interested in. Here, each CBUUID object represents a UUID that identifies the type of included service you want to discover.
- service: The service whose included services you want to discover.

You can provide an array of CBUUID objects representing included service UUIDs in the includedServiceUUIDs parameter. When you do, the peripheral returns only the included services of the service that your app is interested in (recommended). If the includedServiceUUIDs parameter is nil, all the included services of the service are returned; setting the parameter to nil is considerably slower and is not recommended. When the peripheral discovers one or more included services of the specified service, it calls the didDiscoverIncludedServicesForService event. If the included services of a service are successfully discovered, you can access them through the service’s includedServices property.

23.14.9  discoverServices(serviceUUIDs() as CBUUIDMBS = nil)

**Function:** Discovers the specified services of the peripheral.  
**Notes:**

- serviceUUIDs: An array of CBUUID objects that you are interested in. Here, each CBUUID object represents a UUID that identifies the type of service you want to discover.

You can provide an array of CBUUID objects representing service UUIDs in the serviceUUIDs parameter. When you do, the peripheral returns only the services of the peripheral that your app is interested in (recommended). If the serviceUUIDs parameter is nil, all the available services of the peripheral are returned; setting the parameter to nil is considerably slower and is not recommended. When the peripheral discovers one or more services, it calls the didDiscoverServices event. If the services of the peripheral are successfully discovered, you can access them through the peripheral’s services property.

23.14.10  maximumWriteValueLengthForType(Type as Integer) as Integer

**Function:** The maximum amount of data, in bytes, that can be sent to a characteristic in a single write type.  
**Notes:** Type can be kWriteWithResponse or kWriteWithoutResponse.
23.14.11 readRSSI

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieves the current RSSI value for the peripheral while it is connected to the central manager.

**Notes:** In macOS, when you call this method to retrieve the RSSI of the peripheral while it is currently connected to the central manager, the peripheral calls the peripheralDidUpdateRSSI event. If the RSSI value of the peripheral is successfully retrieved, you can access it through the peripherals RSSI property.

23.14.12 readValueForCharacteristic(Characteristic as CBCharacteristicMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieves the value of a specified characteristic.

**Notes:**

characteristic: The characteristic whose value you want to read.

When you call this method to read the value of a characteristic, the peripheral calls the peripheral:didUpdateValueForCharacteristic:method of its delegate object. If the value of the characteristic is successfully retrieved, you can access it through the characteristics value property.

Not all characteristics are guaranteed to have a readable value. You can determine whether a characteristics value is readable by accessing the relevant properties of the CBCharacteristicProperties enumeration, which are detailed in CBCharacteristic.

23.14.13 readValueForDescriptor(descriptor as CBDescriptorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Retrieves the value of a specified characteristic descriptor.

**Notes:**

descriptor: The characteristic descriptor whose value you want to read.

When you call this method to read the value of a characteristic descriptor, the peripheral calls the didUpdateValueForDescriptor event. If the value of the characteristic descriptor is successfully retrieved, you can access it through the characteristic descriptors value property.

23.14.14 services as CBServiceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A list of services on the peripheral that have been discovered.

**Notes:** Returns an array of services (represented by CBService objects) that were discovered on the peripheral through a successful call to the discoverServices method. If you have yet to call the discoverServices
method to discover the services of the peripheral, or if there was an error in doing so, the value of this property is nil.

### 23.14.15 setNotifyValue(enabled as Boolean, Characteristic as CBCharacteristicMBS)

**Function:** Sets notifications or indications for the value of a specified characteristic.

**Notes:**

- **enabled**: A Boolean value indicating whether you wish to receive notifications or indications whenever the characteristics value changes. true if you want to enable notifications or indications for the characteristics value. false if you do not want to receive notifications or indications whenever the characteristics value changes.

- **characteristic**: The specified characteristic.

When you enable notifications for the characteristics value, the peripheral calls the didUpdateNotificationStateForCharacteristic event to indicate whether or not the action succeeded. If successful, the peripheral then calls the didUpdateValueForCharacteristic event whenever the characteristic value changes. Because it is the peripheral that chooses when to send an update, your app should be prepared to handle them as long as notifications or indications remain enabled. If the specified characteristic is configured to allow both notifications and indications, calling this method enables notifications only. You can disable notifications and indications for a characteristics value by calling this method with the enabled parameter set to false.

### 23.14.16 writeValue(data as MemoryBlock, Characteristic as CBCharacteristicMBS, Type as Integer)

**Function:** Writes the value of a characteristic.

**Notes:**

- **data**: The value to be written.
- **characteristic**: The characteristic whose value is to be written.
- **type**: The type of write to be executed. For a list of the possible types of writes to a characteristics value, see CBCharacteristicWriteType.

When you call this method to write the value of a characteristic, the peripheral calls the didWriteValueForCharacteristic event only if you specified the write type as CBCharacteristicMBS.kWriteWithResponse. The response you receive through the didWriteValueForCharacteristic event indicates whether the write was successful; if the write failed, it details the cause of the failure in an error. If you specify the write type as CBCharacteristicWriteWithoutResponse, the write is best-effort and not guaranteed. If the write does not
succeed in this case, you are not notified nor do you receive an error indicating the cause of the failure. The data passed into the data parameter is copied, and you can dispose of it after the method returns. Characteristics may allow only certain type of writes to be performed on their value. To determine which types of writes are permitted to a characteristics value, you access the relevant properties of the CBCharacteristicProperties enumeration, which are detailed in CBCharacteristic.

See also:

- 23.14.17 writeValue(data as MemoryBlock, Descriptor as CBDescriptorMBS)

### 23.14.17 writeValue(data as MemoryBlock, Descriptor as CBDescriptorMBS)

**Function:** Writes the value of a characteristic descriptor.

**Notes:**

data: The value to be written.
descriptor: The descriptor whose value is to be written.

When you call this method to write the value of a characteristic descriptor, the peripheral calls the peripheral:didWriteValueForDescriptor:error: method of its delegate object. The data passed into the data parameter is copied, and you can dispose of it after the method returns. You cannot use this method to write the value of a client configuration descriptor (represented by the CBUIDClientCharacteristicConfigurationString constant), which describes how notification or indications are configured for a characteristics value with respect to a client. If you want to manage notifications or indications for a characteristics value, you must use the setNotifyValue method instead.

See also:

- 23.14.16 writeValue(data as MemoryBlock, Characteristic as CBCharacteristicMBS, Type as Integer)

### 23.14.18 Properties

#### 23.14.19 CanSendWriteWithoutResponse as Boolean

**Function:** True if the remote device has space to send a write without response.

**Notes:**

If this value is false, the value will be set to true after the current writes have been flushed, and IsReadyToSendWriteWithoutResponse event will be called.

(Read only property)
23.14. Class CBPeripheralMBS

23.14.20 Name as String

**Function:** The name of the peripheral.
**Notes:**
The value of this property is a string containing the device name of the peripheral. You can access this property to retrieve a human-readable name of the peripheral. There may be two types of names associated with a peripheral: one that the device advertises and another that the device publishes in its database as its Bluetooth low energy Generic Access Profile (GAP) device name. Although this property may contain either type of name, the GAP device name takes priority. This means that if a peripheral has both types of names associated with it, this property returns its GAP device name.
(Read only property)

23.14.21 RSSI as String

**Function:** The RSSI, in decibels, of the peripheral.
**Notes:**
Returns a number, in decibels, that indicates the RSSI of the peripheral while it is currently connected to the central manager. You can use a connected peripherals RSSI property to determine the peripherals proximity. The default value of this property is nil and is set the first time you successfully call the readRSSI method.
(Read only property)

23.14.22 State as Integer

**Function:** The current connection state of the peripheral.
**Notes:**
The value of this property represents the current connection state of the peripheral. For a list of the possible values of this property, see CBPeripheralState.
(Read only property)

23.14.23 Events

23.14.24 DidDiscoverCharacteristicsForService(service as CBServiceMBS, error as NSErrorMBS)

**Function:** Invoked when you discover the characteristics of a specified service.
Notes:
peripheral: The peripheral providing this information.
service: The service that the characteristics belong to.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the discoverCharacteristics method. If the characteristics of the specified service are successfully discovered, you can access them through the service’s characteristics property. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

23.14.25 DidDiscoverDescriptorsForCharacteristic(characteristic as CBCharacteristicMBS, error as NSErrorMBS)

Function: Invoked when you discover the descriptors of a specified characteristic.
Notes:
peripheral: The peripheral providing this information.
characteristic: The characteristic that the characteristic descriptors belong to.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the discoverDescriptorsForCharacteristic method. If the characteristic descriptors of the specified characteristic are successfully discovered, you can access them through the characteristics descriptors property. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

23.14.26 DidDiscoverIncludedServicesForService(service as CBServiceMBS, error as NSErrorMBS)

Function: Invoked when you discover the included services of a specified service.
Notes:
peripheral: The peripheral providing this information.
service: The CBService object containing the included service.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the discoverIncludedServices method. If the included services of the specified service are successfully discovered, you can access them through the services includedServices property. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.
23.14.27  DidDiscoverServices(error as NSErrorMBS)

Function: Invoked when you discover the peripherals available services.
Notes:

peripheral: The peripheral that the services belong to.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the discoverServices method. If the services of the peripheral are successfully discovered, you can access them through the peripherals services property. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

23.14.28  DidModifyServices(invalidatedServices() as CBServiceMBS)

Function: Invoked when a peripherals services have changed.
Notes:

invalidatedServices: A list of services that have been invalidated.

This method is invoked whenever one or more services of a peripheral have changed. A peripherals services have changed if:

- A service is removed from the peripherals database
- A new service is added to the peripherals database
- A service that was previously removed from the peripherals database is readded to the database at a different location

If you previously discovered any of the services that have changed, they are provided in the invalidated-Services parameter and can no longer be used. You can use the discoverServices method to discover any new services that have been added to the peripherals database or to find out whether any of the invalidated services that you were using (and want to continue using) have been added back to a different location in the peripherals database.

23.14.29  DidOpenL2CAPChannel(channel as CBL2CAPChannelMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Called when channel is opened.
23.14.30 DidReadRSSI(RSSI as String, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked after you call readRSSI to retrieve the value of the peripherals current RSSI while it is connected to the central manager. **Notes:**

peripheral: The peripheral providing this information.
RSSI: The RSSI, in decibels, of the peripheral.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the readRSSI method. If successful, the error parameter is nil and the parameter RSSI reports the receivers signal strength, in decibels. If unsuccessful, the error parameter returns the cause of the failure.

23.14.31 DidUpdateName

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a peripherals name changes. **Notes:** The event is invoked whenever the peripheral devices Generic Access Profile (GAP) device name has changed. Since a peripheral device can change its GAP device name, you can implement this method if your app needs to display the current name of the peripheral device.

23.14.32 DidUpdateNotificationStateForCharacteristic(characteristic as CBCharacteristicMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when the peripheral receives a request to start or stop providing notifications for a specified characteristics value. **Notes:**

characteristic: The characteristic for which notifications of its value are to be configured.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the setNotifyValue method. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

23.14.33 DidUpdateRSSI(error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when you retrieve the value of the peripherals current RSSI while it is connected to the
central manager.

**Notes:**

error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the readRSSI method. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

### 23.14.34 DidUpdateValueForCharacteristic(characteristic as CBCharacteristicMBS, error as NSErrorMBS)

**Function:** Invoked when you retrieve a specified characteristics value, or when the peripheral device notifies your app that the characteristics value has changed.

**Notes:**

peripheral: The peripheral providing this information.
characteristic: The characteristic whose value has been retrieved.
error: If an error occurred, the cause of the failure.

This method is invoked when your app calls the readValueForCharacteristic method, or when the peripheral notifies your app that the value of the characteristic for which notifications and indications are enabled (via a successful call to setNotifyValue for Characteristic) has changed. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

### 23.14.35 DidUpdateValueForDescriptor(descriptor as CBDescriptorMBS, error as NSErrorMBS)

**Function:** Invoked when you retrieve a specified characteristic descriptors value.

**Notes:**

peripheral: The peripheral providing this information.
descriptor: The characteristic descriptor whose value has been retrieved.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the readValueForDescriptor method. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.
23.14.36 DidWriteValueForCharacteristic(characteristic as CBCharacteristicMBS, error as NSErrorMBS)

**Function:** Invoked when you write data to a characteristics value.
**Notes:**

- peripheral: The peripheral providing this information.
- characteristic: The characteristic whose value has been written.
- error: If an error occurred, the cause of the failure.

This event is invoked only when your app calls the writeValue for Characteristic method with the CBCharacteristicWriteWithResponse constant specified as the write type. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

23.14.37 DidWriteValueForDescriptor(descriptor as CBDescriptorMBS, error as NSErrorMBS)

**Function:** Invoked when you write data to a characteristic descriptors value.
**Notes:**

- descriptor: The characteristic descriptor whose value has been written.
- error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the writeValue for Descriptor method. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

23.14.38 IsReadyToSendWriteWithoutResponse

**Function:** The peripheral providing this update.
**Notes:** This event is invoked after a failed call to writeValue for Characteristic, when peripheral is again ready to send characteristic value updates.

23.14.39 Constants

23.14.40 kStateConnected = 2

MBS Bluetooth Plugin, Plugin Version: 18.1. **Function:** One of the values representing the current connection state of the peripheral.
23.14. CLASS CBPERIPHERALMBS

Notes: The peripheral is currently connected to the central manager.

23.14.41 kStateConnecting = 1

MBS Bluetooth Plugin, Plugin Version: 18.1. Function: One of the values representing the current connection state of the peripheral.
Notes: The peripheral is currently in the process of connecting to the central manager.

23.14.42 kStateDisconnected = 0

MBS Bluetooth Plugin, Plugin Version: 18.1. Function: One of the values representing the current connection state of the peripheral.
Notes: The peripheral is currently not connected to the central manager.

23.14.43 kStateDisconnecting = 3

MBS Bluetooth Plugin, Plugin Version: 18.1. Function: One of the values representing the current connection state of the peripheral.
Notes: The peripheral is currently in the process of disconnecting from the central manager.

23.14.44 kWriteWithoutResponse = 1

MBS Bluetooth Plugin, Plugin Version: 18.1. Function: One of the constants to specify which type of write is to be performed on a CBCharacteristic.
Notes: Writes without response.

23.14.45 kWriteWithResponse = 0

MBS Bluetooth Plugin, Plugin Version: 18.1. Function: One of the constants to specify which type of write is to be performed on a CBCharacteristic.
Notes: Write with Response.
23.15 class CBServiceMBS

23.15.1 class CBServiceMBS

Notes:
CBService and its subclass CBMutableService represent a peripherals servicea collection of data and associated behaviors for accomplishing a function or feature of a device (or portions of that device). CBService objects in particular represent services of a remote peripheral device (represented by a CBPeripheral object). Services are either primary or secondary and may contain a number of characteristics or included services (references to other services).
Subclass of the CBAAttributeMBS class.

23.15.2 Methods

23.15.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether this class is available.
Notes: Returns true on MacOS 10.7 or newer.

23.15.4 characteristics as CBCharacteristicMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A list of characteristics that have been discovered in this service.
Notes: This array contains CBCharacteristic objects that represent a services characteristics. Characteristics provide further details about a peripherals service. For example, a heart rate service may contain one characteristic that describes the intended body location of the devices heart rate sensor and another characteristic that transmits heart rate measurement data.

23.15.5 Constructor

23.15.6 includedServices as CBServiceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A list of included services that have been discovered in this service. Notes: This array contains CBService objects that represent the included services of a service. A service of a peripheral may contain a reference to other services that are available on the peripheral. These other services are the included services of the service and can be discovered using the discoverIncludedServices method of the CBPeripheral class.

23.15.7 Properties

23.15.8 isPrimary as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A Boolean value indicating whether the type of service is primary or secondary. Notes: A peripherals service is either primary or secondary. A primary service describes the primary function of a device and can be included by another service. A secondary service describes a service that is relevant only in the context of another service that has referenced it. For example, the primary service of a heart rate monitor may be to expose heart rate data from the monitors heart rate sensor, whereas a secondary service may be to expose the sensors battery data. If the value of this property is true, the type of service is primary. If the value of this property is false, the type of service is secondary. (Read only property)

23.15.9 peripheral as CBPeripheralMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The peripheral to which this service belongs. Notes: (Read only property)
23.16 class CBUUIDMBS

Function: The class for UUIDs in CoreBluetooth.
Notes: 
Instances of the CBUUID class represent the 128-bit universally unique identifiers (UUIDs) of attributes used in Bluetooth low energy communication, such as a peripherals services, characteristics, and characteristic descriptors. This class provides a number of factory methods for dealing with long UUIDs when developing your app. For example, instead of passing around the string representation of a 128-bit Bluetooth low energy attribute in your code, you can create a CBUUID object that represents it, and pass that around instead.

Though not all UUIDs that identify Bluetooth-specific attributes are predefined by the Bluetooth Special Interest Group (SIG), Bluetooth SIG has defined and published a number of commonly used UUIDs that have been shortened to 16-bits or 32-bits for convenience. The CBUUID class provides methods that automatically transform these predefined shorter UUIDs into their 128-bit equivalent UUIDs. When you create a CBUUID object from a predefined 16-bit or 32-bit UUID, Core Bluetooth pre-fills the rest of the 128-bit UUID with the Bluetooth base UUID, which is defined in the Bluetooth 4.0 specification, Volume 3, Part F, Section 3.2.1.

In addition to providing methods for creating CBUUID objects, this class defines constants that represent the UUIDs of the Bluetooth-defined characteristic descriptors, which are defined in the Bluetooth 4.0 specification, Volume 3, Part G, Section 3.3.3.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

23.16.2 Methods

23.16.3 Available as boolean

Function: Whether this class is available.
Notes: Returns true on macOS 10.7 or newer.

23.16.4 CBAdvertisementDataIsConnectable as String

Function: One of the keys used in an advertisementData dictionary.
Notes: 
A Boolean value that indicates whether the advertising event type is connectable.
The value for this key is a boolean. You can use this value to determine whether a peripheral is connectable at a particular moment.
23.16.5 CBAdvertisementDataLocalNameKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used in an advertisementData dictionary. **Notes:** A string containing the local name of a peripheral.

23.16.6 CBAdvertisementDataManufacturerDataKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used in an advertisementData dictionary. **Notes:** A memoryblock containing the manufacturer data of a peripheral.

23.16.7 CBAdvertisementDataOverflowServiceUUIDsKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used in an advertisementData dictionary. **Notes:** An array of one or more CBUUID objects, representing CBService UUIDs that were found in the overflow area of the advertisement data. Due to the nature of the data stored in this area, UUIDs listed here are best effort and may not always be accurate. For details about the overflow area of advertisement data, see the startAdvertising: method in CBPeripheralManager.

23.16.8 CBAdvertisementDataServiceDataKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used in an advertisementData dictionary. **Notes:** A dictionary containing service-specific advertisement data. The keys are CBUUID objects, representing CBService UUIDs. The values are NSData objects, representing service-specific data.

23.16.9 CBAdvertisementDataServiceUUIDsKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used in an advertisementData dictionary.
Notes: An array of service UUIDs.

23.16.10 CBAdvertisementDataSolicitedServiceUUIDsKey as String

Notes: An array of one or more CBUUID objects, representing CBService UUIDs.

23.16.11 CBAdvertisementDataTxPowerLevelKey as String

Notes: A number containing the transmit power of a peripheral.
This key and value are available if the broadcaster (peripheral) provides its Tx power level in its advertising packet. Using the RSSI value and the Tx power level, it is possible to calculate path loss.

23.16.12 CBUUIDCharacteristicAggregateFormatString as String

23.16.13 CBUUIDCharacteristicExtendedPropertiesString as String

Notes: The corresponding value for this descriptor is a number.

23.16.14 CBUUIDCharacteristicFormatString as String

Notes: The corresponding value for this descriptor is a memoryblock.
23.16. **CLASS CBUUIDMBS**

23.16.15 **CBUUIDCharacteristicUserDescriptionString as String**

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The string representation of the UUID for the user description descriptor. **Notes:** The corresponding value for this descriptor is a string.

23.16.16 **CBUUIDCharacteristicValidRangeString as String**

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The string representation of the UUID for the valid range descriptor.

23.16.17 **CBUUIDClientCharacteristicConfigurationString as String**

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The string representation of the UUID for the client configuration descriptor. **Notes:** The corresponding value for this descriptor is a number.

23.16.18 **CBUUIDL2CAPPSMCharacteristicString as String**

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the characteristics keys. **Notes:** The PSM (a little endian uint16_t) of an L2CAP Channel associated with the GATT service containing this characteristic. Servers can publish this characteristic with the UUID ABDD3056-28FA-441D-A470-55A75A52553A

23.16.19 **CBUUIDServerCharacteristicConfigurationString as String**

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The string representation of the UUID for the server configuration descriptor. **Notes:** The corresponding value for this descriptor is a number.

23.16.20 **Constructor**

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
23.16.21 copy as CBUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the object.

23.16.22 isEqual(other as CBUUIDMBS) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Checks whether two UUIDs are equal. **Notes:** Returns true if both are equal.

23.16.23 Operator Compare(other as CBUUIDMBS) as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compares two objects for Xojo's comparison operators.

23.16.24 UUIDWithData(mem as MemoryBlock) as CBUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a CBUUID object from a 16-bit, 32-bit, or 128-bit UUID data container. **Notes:** This method is useful when the UUID of a Bluetooth attribute is formatted in raw bytes.

23.16.25 UUIDWithNSUUID(uuid as NSUUIDMBS) as CBUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a CBUUID object from an NSUUID object.

23.16.26 UUIDWithString(s as string) as CBUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a CBUUID object from a 16-bit, 32-bit, or 128-bit UUID string. **Notes:** Specify 128-bit UUIDs as a string of hexadecimal digits punctuated by hyphens, for example, 68753A44-4D6F-1226-9C60-0050E4C00067. Specify 16-bit or 32-bit UUIDs as a string of 4 or 8 hexadecimal digits, respectively.
23.16.27 Properties

23.16.28 data as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The data of the UUID.  
**Notes:** (Read only property)

23.16.29 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

23.16.30 UUIDString as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The UUID represented as a string.  
**Notes:** (Read only property)
Chapter 24

Calendar

24.1  class CalAlarmMBS

24.1.1  class CalAlarmMBS

Function: The class for an Alarm in iCal.
Example:

// start a connection to the calendar database
dim s as new CalCalendarStoreMBS

// needed for the error details
dim e as NSErrorMBS

// create a new calendar
dim c as new CalEventMBS

dim StartDate as date = new date
StartDate.day = StartDate.day + 1 // start tomorrow

dim calendars() as CalCalendarMBS = s.calendars

// set properties
c.Title="new Event"
c.startDate=StartDate
c.calendar=calendars(0) // add to first calendar

dim EndDate as new date(StartDate) // one hour after start
EndDate.hour = EndDate.hour + 1

c.endDate=EndDate

3967
```vbscript
dim a as new CalAlarmMBS // Send email one hour earlier
a.action = a.CalAlarmActionEmail
a.relativeTrigger = -3600
a.emailAddress="some@email.address"
c.addAlarm a // attach an alarm

// save event
call s.saveEvent(c.s.CalSpanAllEvents, e)
if e<>nil then
    MsgBox e.localizedDescription
else
    MsgBox "New event was created."
end if
```

**Notes:** Requires Mac OS X 10.5 to work.

### 24.1.2 Methods

#### 24.1.3 Constructor

**Function:** This constructor creates a new empty alarm object.

**Example:**
```
dim a as new CalAlarmMBS // add alarm
a.action = a.CalAlarmActionDisplay
a.relativeTrigger = -3600*24 // 24 Hours before
```

### 24.1.4 triggerDateRelativeTo(currentdate as date) as date

**Function:** Returns the date of the trigger relative to the given date.
24.1.6 absoluteTrigger as date

Function: The absolute trigger value.
Notes: The time that an alarm goes off is referred to as the trigger. Alarms have either a relative trigger, which means the alarm fires a certain number of seconds before an alarm occurs, or an absolute trigger, which specifies the exact time the alarm will trigger off.

Setting an absoluteTrigger will also set the relativeTrigger to 0.
(Read and Write property)

24.1.7 acknowledged as date

Function: The acknowledged date for the alarm.
Notes: (Read and Write property)

24.1.8 action as String

Function: The action used for this alarm.
Notes: See the CalAlarmAction* constants.
(Read and Write property)

24.1.9 emailAddress as String

Function: The email address to notify.
Notes: Setting an emailAddress will also set the action to CalAlarmEmail as well as set the sound and URL to nil.
(Read and Write property)
24.1.10  relatedTo as String

Function: Related to text.
Notes: (Read and Write property)

24.1.11  relativeTrigger as Double

Function: The absolute relative value.
Notes: The time that an alarm goes off is referred to as the trigger. Alarms have either a relative trigger, which means the alarm fires a certain number of seconds before an alarm occurs, or an absolute trigger, which specifies the exact time the alarm will trigger off.

Setting a relativeTrigger will also set the absoluteTrigger to 0.
(Read and Write property)

24.1.12  sound as String

Function: The sound file to play.
Notes: Setting a sound will also set the action to CalAlarmSound as well as set the emailAddress and URL to nil. Expects the name of a system alert. See NSSound.
(Read and Write property)

24.1.13  url as string

Function: The URL to launch when the alarm comes.
Notes: Setting a URL will also set the action to CalAlarmProcedure as well as set the emailAddress and sound to nil. The URL must be a file URL.
(Read and Write property)
24.1.14 Constants

24.1.15 CalAlarmActionDisplay=”DISPLAY”
MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the alarm action constants. **Notes:** Display the event.

24.1.16 CalAlarmActionEmail=”EMAIL”
MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the alarm action constants. **Notes:** Send an email.

24.1.17 CalAlarmActionProcedure=”PROCEDURE”
MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the alarm action constants.

24.1.18 CalAlarmActionSound=”AUDIO”
MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the alarm action constants. **Notes:** Play a sound.
24.2  class CalAttendeeMBS

24.2.1  class CalAttendeeMBS

**Function:** The class for an Attendee.  
**Notes:**  
Requires Mac OS X 10.5 to work.  
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

24.2.2  Methods

24.2.3  Constructor

**Function:** The private constructor.

24.2.4  Properties

24.2.5  address as String

**Function:** The address of this attendee.  
**Notes:** (Read only property)

24.2.6  commonName as String

**Function:** The user-entered name of the attendee.  
**Notes:** (Read only property)

24.2.7  Handle as Integer

**Function:** The internal used CalAttendee reference.  
**Notes:** (Read and Write property)
24.2. Class CalAttendeeEMBS

24.2.8 status as String

Function: The attendee status.

Notes:
Use the CalAttendeeStatus* constants.

For now (Mac OS X 10.5), it is not possible to modify an event’s attendees or the attendees themselves. (Read only property)

24.2.9 Constants

24.2.10 CalAttendeeStatusAccepted="ACCEPTED"

MBS MacFrameworks Plugin, Plugin Version: 7.7. Function: These constants are used to describe the user’s confirmation status for an attendee.

24.2.11 CalAttendeeStatusDeclined="DECLINED"

MBS MacFrameworks Plugin, Plugin Version: 7.7. Function: These constants are used to describe the user’s confirmation status for an attendee.

24.2.12 CalAttendeeStatusNeedsAction="NEEDS-ACTION"

MBS MacFrameworks Plugin, Plugin Version: 7.7. Function: These constants are used to describe the user’s confirmation status for an attendee.

Notes: This is the default status for an attendee.

24.2.13 CalAttendeeStatusTentative="TENTATIVE"

MBS MacFrameworks Plugin, Plugin Version: 7.7. Function: These constants are used to describe the user’s confirmation status for an attendee.
24.3 class CalCalendarItemMBS

24.3.1 class CalCalendarItemMBS

_FUNCTION_ The class for a calendar item in iCal.

_Notes:_
This class and its subclasses should be used to get information about CalEvent and CalTasks. Accessors for
properties common to both of these classes are included here.

Requires Mac OS X 10.5 to work.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

24.3.2 _Methods_

24.3.3 _addAlarm(alarm as CalAlarmMBS)_

_FUNCTION_ Adds one alarm.

24.3.4 _addAlarms(alarms() as CalAlarmMBS)_

_FUNCTION_ Adds an array of alarms.

24.3.5 _alarms as CalAlarmMBS()_

_FUNCTION_ An array of CalAlarms associated with the calendar item.

24.3.6 _Constructor_

_FUNCTION_ The private constructor.
24.3. CLASS CALCALENDARITEMMBS

24.3.7 hasAlarm as Boolean

Function: Whether this item has an alarm associated.

24.3.8 nextAlarmDate as date

Function: Returns the next alarm date.

24.3.9 removeAlarm(alarm as CalAlarmMBS)

Function: Removes one alarm.

24.3.10 removeAlarms(alarms() as CalAlarmMBS)

Function: Removes the alarms.

24.3.11 setalarms(alarms() as CalAlarmMBS)

Function: Sets the alarms for this item.

24.3.12 Show

Function: Shows the item in iCal.
Example:

dim c as new CalCalendarStoreMBS

// search for some events within last year
dim d as new date
dim e as new date
d.Year = d.Year -1
dim events() as CalEventMBS = c.events(d, e)

// pick one, show title and show in iCal
MsgBox Events(30).Title
events(30).show

24.3.13 Properties

24.3.14 calendar as CalCalendarMBS

Function: The calendar of this item.
Notes: (Read and Write property)

24.3.15 dateStamp as date

Function: The datestamp of this calendar item.
Notes:
This value is read only.
(Read only property)

24.3.16 Handle as Integer

Function: The internal used CalCalendarItem reference.
Notes: (Read and Write property)

24.3.17 notes as String

Function: The notes text for this item.
Example:

dim c as new CalCalendarStoreMBS

// set the date range where we look for event
24.3. **CLASS CALCALENDARITEMMBS**

```vba
dim sd as new date(2016,6,7,0,0,0)
dim ed as new date(2016,6,7,23,59,59)

// look for an event on that date
dim a() as CalEventMBS = c.events(sd,ed, c.calendars)
dim e as CalEventMBS = a(1)

// show notes
MsgBox e.notes

// change it
e.notes = "Just a test"

// check again
MsgBox e.notes

// Save
dim error as NSErrorMBS
dim ok as Boolean = c.saveEvent(e, c.CalSpanThisEvent, error)

if ok then
    MsgBox "OK"
else if error <> nil then
    MsgBox error.localizedDescription
else
    MsgBox "Failed."
end if
```

**Notes:** (Read and Write property)

### 24.3.18 title as String

**Function:** The title for this calendar item.

**Example:**

```vba
// init
dim s as new CalCalendarStoreMBS

// Get date range for today
dim Startdate as new date
dim Enddate as new date

Startdate.hour = 0
Startdate.Minute = 0
```
Startdate.Second = 0
Enddate.hour = 23
Enddate.minute = 59
Enddate.second = 59

// Query events on all calendars
dim events() as CalEventMBS = s.events(Startdate,Enddate)

// Display result
dim lines(-1) as string
for each e as CalEventMBS in events
    lines.Append e.Title
next
eMsgBox Join(lines,EndOfLine)

Notes: (Read and Write property)

24.3.19  uid as String

Function: The unique ID for this item.
Example:

// start a connection to the calendar database
dim s as new CalCalendarStoreMBS

// needed for the error details
dim e as NSErrorMBS

// create a new calendar event
dim c as new CalEventMBS

dim calendars() as CalCalendarMBS = s.calendars

// set properties
c>Title="new Event"
c.startDate=new date
c.calendar=calendars(0) // add to first calendar

dim d as new date
d.hour=d.hour+1
c.endDate=d
24.3. **CLASS CALCALENDARITEMMBS**

```objectivec
// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
    MsgBox e.localizedDescription
else
    // show the UID
    MsgBox "New event was created with UID: " + c.uid
end if
```

**Notes:**

This value is read only.
(Read only property)

### 24.3.20 URL as String

**Function:** The URL for this calendar item.
**Notes:** (Read and Write property)
24.4 class CalCalendarMBS

24.4.1 class CalCalendarMBS

**Function:** A class for the iCal calendars.
**Example:**

```vbnet
// start a connection to the calendar database
dim s as new CalCalendarStoreMBS

// needed for the error details
dim e as NSErrorMBS

// create a new calendar
dim c as new CalCalendarMBS

// set properties
c.Title="New Calendar"
c.notes="Just a test"

// save calendar
call s.saveCalendar(c,e)
if e<>nil then
    MsgBox e.localizedDescription
else
    MsgBox "New calendar was created."
end if
```

**Notes:**
Requires Mac OS X 10.5 to work.
This class can be used to get attributes of a calendar, but cannot be used to get the list of events or tasks in a calendar.

24.4.2 Methods

24.4.3 Constructor
24.4. CLASS CALCALENDARMBS

// start a connection to the calendar database
dim s as new CalCalendarStoreMBS

// needed for the error details
dim e as NSErrorMBS

// create a new calendar
dim c as new CalCalendarMBS

// set properties
c.Title="New Calendar"
c.notes="Just a test"

// save calendar
call s.saveCalendar(c,e)
if e<>nil then
  MsgBox e.localizedDescription
else
  MsgBox "New calendar was created."
end if

Notes: All calendars created with this API will be of type CalCalendarTypeLocal.

24.4.4 Properties

24.4.5 Color as NSColorMBS

Function: The color for this calendar.
Notes: (Read and Write property)

24.4.6 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

**24.4.7 isEditable as Boolean**

**Function:** Whether this calendar is editable.

**Notes:**
This property is read only.
(Read only property)

**24.4.8 notes as String**

**Function:** The notes for this calendar.

**Notes:** (Read and Write property)

**24.4.9 title as String**

**Function:** The title of this calendar.

**Example:**
```
dim c as new CalCalendarStoreMBS
dim ca() as CalCalendarMBS = c.calendars
for each cc as CalCalendarMBS in ca
    MsgBox cc.Title+EndOfLine+cc.type+EndOfLine+cc.notes
next
```

**Notes:** (Read and Write property)

**24.4.10 type as String**

**Function:** The type of this calendar.

**Notes:**
This property is read only.

use the CalCalendarType* constants.
(Read only property)
24.4.11  uid as String

**Function:** The unique ID for this calendar.
**Notes:**
This property is read only.
(Read only property)

24.4.12  Constants

24.4.13  CalCalendarTypeBirthday="Birthday"

MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the calendar types.
**Example:**
// searches for the birthday calendar and than lists all birthdays in the next month

dim cals(-1) as CalCalendarMBS
dim a() as CalCalendarMBS
dim i as Integer
dim cal as CalCalendarMBS
dim sd, ed as date
dim ea() as CalEventMBS
dim e as CalEventMBS

dim c as new CalCalendarStoreMBS

a=c.calendars
for each cal in a
MsgBox "Calendar: " +cal.Title
if cal.type=cal.CalCalendarTypeBirthday then
cals.Append cal
end if
next

sd=new date
ed=new date
ed.Month=sd.Month+1

ea=c.events(sd,ed,cals)

for each e in ea
MsgBox "Event: " +e.Title
next
24.4.14 CalCalendarTypeCalDAV="CalDAV"
MBS MacFrameworks Plugin, Plugin Version: 7.7. Function: One of the calendar types.

24.4.15 CalCalendarTypeExchange="Exchange"

24.4.16 CalCalendarTypeIMAP="IMAP"
MBS MacFrameworks Plugin, Plugin Version: 7.7. Function: One of the calendar types.

24.4.17 CalCalendarTypeLocal="Local"
MBS MacFrameworks Plugin, Plugin Version: 7.7. Function: One of the calendar types.

24.4.18 CalCalendarTypeSubscription="Subscription"
MBS MacFrameworks Plugin, Plugin Version: 7.7. Function: One of the calendar types.
24.5. CLASS CALCALENDARSTOREMBS

24.5 class CalCalendarStoreMBS

24.5.1 class CalCalendarStoreMBS

Function: The class for the calendar storage.

Example:

// init
dim s as new CalCalendarStoreMBS

// find calendar by name
dim myCalendar as CalCalendarMBS
dim calendars() as CalCalendarMBS = s.calendars

for each ca as CalCalendarMBS in calendars
if ca.Title = "Private Events" then
myCalendar=ca
exit
end if
next

// Get date range for today

dim Startdate as new date

dim Enddate as new date

Startdate.hour = 0
Startdate.Minute = 0
Startdate.Second = 0

Enddate.hour = 23
Enddate.minute = 59
Enddate.second = 59

// Query events on this calendar
dim events() as CalEventMBS = s.events(Startdate,Enddate, myCalendar)

// Display result
dim lines(-1) as string

for each e as CalEventMBS in events
lines.Append e.Title
next

MsgBox Join(lines,EndOfLine)

Notes:
CHAPTER 24. CALENDAR

Requires Mac OS X 10.5 to work.

Calendar saving and modification errors:

CalCalendarNotEditableError = 1025 Events and tasks cannot be added to an uneditable calendar
CalDateInvalidError = 1026 The start date of an event must be earlier than its end date
CalCalendarNotInRepository = 1027 Events' and tasks' calendar property must be a calendar in the user's calendar store
CalCalendarTitleNotUniqueError = 1028 Calendar titles must be unique

And the domain for the errors is: CalCalendarStoreErrorDomain

24.5.2 Methods

24.5.3 calendars as CalCalendarMBS()

Function: An array of all the user's calendars, represented as CalCalendars.
Example:

dim c as new CalCalendarStoreMBS
dim ca() as CalCalendarMBS
ca=c.calendars
for each cc as CalCalendarMBS in ca
MsgBox cc.Title+EndOfLine+cc.type+EndOfLine+cc.notes
next

Notes:
If the user has iCal data from a previous version of Mac OS X, but has not launched iCal in 10.5, this will return an array of empty calendars. iCal needs to be launched at least once in order to migrate the user's calendar data.

If no calendar data from any version of Mac OS X exists, then this method will create and return two default calendars, named Home and Work.

24.5.4 calendarWithTitle(Title as string) as CalCalendarMBS

Function: Queries all calendars and searches for one with the given title.
24.5. **CLASS CALCALENDARSTOREMBS**

Example:

```vba
dim cs as new CalCalendarStoreMBS

// delete one
dim c as CalCalendarMBS = cs.calendarWithTitle("Just Testing")
dim e as NSErrorMBS
if cs.removeCalendar(c, e) then
    MsgBox "deleted"
else
    MsgBox "Failed to remove: " + e.LocalizedDescription
end if
```

Notes:
Title comparison is case insensitive.
Returns nil on any error.

### 24.5.5 calendarWithUID(UID as string) as CalCalendarMBS

**Function:** The calendar associated with the specific UID.
**Notes:** If no record with this UID exists, nil is returned.

### 24.5.6 Constructor

**Function:** The class for the calendar storage.
**Notes:** This is the main class. Keep an object of it around as long as you use the calendar classes.

### 24.5.7 events(StartDate as date, EndDate as date) as CalEventMBS()

**Function:** This method returns an array of all the CalEvents which match the condition.
**Example:**

```vba
dim c as new CalCalendarStoreMBS

dim i, count as Integer
dim ta() as CalEventMBS
dim ct as CalEventMBS
```
dim sd as new date
dim ed as new date

ed.day=ed.day+1
// events within the next 24 hours

ta=c.events(sd,ed)
for each ct in ta
    msgbox ct.Title+EndOfLine+ct.location+EndOfLine+ct.startDate.LongDate+” ”+ct.startDate.LongTime
next

Notes:

This is the function which uses all calendars.

For performance reasons, this method will only return occurrences of repeating events that fall within a
specific four year timespan. If the date range between the startDate and endDate is greater than four years,
then the timespan containing recurrences is always the first four years of date range.

See also:

- 24.5.8 events(StartDate as date, EndDate as date, calendar as CalCalendarMBS) as CalEventMBS() 3988
- 24.5.9 events(StartDate as date, EndDate as date, calendars() as CalCalendarMBS) as CalEventMBS() 3990
- 24.5.10 events(StartDate as date, EndDate as date, eventUID as string) as CalEventMBS() 3990
- 24.5.11 events(StartDate as date, EndDate as date, eventUID as string, calendar as CalCalendarMBS) as CalEventMBS() 3991
- 24.5.12 events(StartDate as date, EndDate as date, eventUID as string, calendars() as CalCalendarMBS) as CalEventMBS() 3991

24.5.8 events(StartDate as date, EndDate as date, calendar as CalCalendarMBS) as CalEventMBS()

Function: This method returns an array of all the CalEvents which match the condition.
Example:

// init
dim s as new CalCalendarStoreMBS

// find calendar by name
dim myCalendar as CalCalendarMBS
24.5. *CLASS CALCALENDARSTOREMBS*

```vba
Dim calendars() As CalCalendarMBS = s.calendars

For Each ca As CalCalendarMBS In calendars
    If ca.Title = "Private Events" Then
        MyCalendar = ca
        Exit
    End If
Next

' Get date range for today
Dim StartDate As New Date
Dim EndDate As New Date

StartDate.Hour = 0
StartDate.Minute = 0
StartDate.Second = 0

EndDate.Hour = 23
EndDate.Minute = 59
EndDate.Second = 59

' Query events on this calendar
Dim events() As CalEventMBS = s.events(StartDate, EndDate, MyCalendar)

' Display result
Dim lines(-1) As String
For Each e As CalEventMBS In events
    lines.Append e.Title
Next

MsgBox Join(lines, vbCrLf)
```

**Notes:** For performance reasons, this method will only return occurrences of repeating events that fall within a specific four year timespan. If the date range between the startDate and endDate is greater than four years, then the timespan containing recurrences is always the first four years of date range.

24.5.9  **events(StartDate as date, EndDate as date, calendars() as CalCalendarMBS) as CalEventMBS()**

**Function:** This method returns an array of all the CalEvents which match the condition.

**Notes:** For performance reasons, this method will only return occurrences of repeating events that fall within a specific four year timespan. If the date range between the startDate and endDate is greater than four years, then the timespan containing recurrences is always the first four years of date range.

See also:

24.5.10  **events(StartDate as date, EndDate as date, eventUID as string) as CalEventMBS()**

**Function:** This method returns an array of all the CalEvents which match the condition.

**Notes:**

This is the function which uses all calendars.

For performance reasons, this method will only return occurrences of repeating events that fall within a specific four year timespan. If the date range between the startDate and endDate is greater than four years, then the timespan containing recurrences is always the first four years of date range.

24.5.11 events(StartDate as date, EndDate as date, eventUID as string, calendar as CalCalendarMBS) as CalEventMBS()

24.5.13 eventsMT(StartDate as date, EndDate as date, calendars() as CalCalendarMBS = nil) as CalEventMBS()

Function:  This method returns an array of all the CalEvents which match the condition.

Notes:
For performance reasons, this method will only return occurrences of repeating events that fall within a specific four year timespan. If the date range between the startDate and endDate is greater than four years, then the timespan containing recurrences is always the first four years of date range.

If calendars array is nil, we use all calendars.

The work is performed on an extra thread, so this function can yield time to other Xojo (Real Studio) threads. For best user experience run this command on a Xojo (Real Studio) thread, so your GUI stays responsive.

24.5.14 eventWithUID(UID as string, occurrence as date) as CalEventMBS

Function:  Searches the event with the given unique ID.

Example:

```xojo
// connect to calendar storage
dim c as new CalCalendarStoreMBS

// find event with given UID
dim e as CalEventMBS = c.eventWithUID(“M2CD-6-1-EEB42862-8BD6-4880-AF91-4AEEADD900B6”, nil)

// and display title
MsgBox e.Title
```

Notes:
Returns nil on any error.

uid: The unique identifier of an event.
date: The date of a recurring event. Pass nil if the event is not recurring.
24.5. **CLASS CALCALENDARSTOREMBS**

Returns a CalEvent object that matches the specified unique identifier and date. Returns nil if the event is not found, or the event is recurring and date is not specified.

Available in Mac OS X v10.5 and later.

24.5.15 **removeCalendar(calendar as CalCalendarMBS, byref error as NSErrorMBS) as boolean**

**Function:** Deletes a calendar.

**Example:**

```vba
dim cs as new CalCalendarStoreMBS

// before

dim calendars1() as CalCalendarMBS = cs.calendars
dim list1() as string

for each c1 as CalCalendarMBS in calendars1
    list1.Append c1.Title
next

MsgBox Join(list1, EndOfLine)

// delete one

dim c as CalCalendarMBS = cs.calendarWithTitle("Just Testing")
dim e as NSErrorMBS
if cs.removeCalendar(c, e) then
    MsgBox "deleted"
else
    MsgBox "Failed to remove: " + e.localizedDescription
end if

// after

dim calendars2() as CalCalendarMBS = cs.calendars
dim list2() as string

for each c2 as CalCalendarMBS in calendars2
    list2.Append c2.Title
next

MsgBox Join(list2, EndOfLine)
```
24.5.16 removeEvent(theEvent as CalEventMBS, span as Integer, byref error as NSErrorMBS) as boolean

**Function:** Removes the event from the calendar.

**Example:**

```plaintext
// start a connection to the calendar database
dim s as new CalCalendarStoreMBS

// needed for the error details
dim e as NSErrorMBS

// create a new calendar event
dim c as new CalEventMBS

dim calendars() as CalCalendarMBS = s.calendars

// set properties
c.Title="new Event"
c.startDate=new date
c.calendar=calendars(0) // add to first calendar

dim d as new date
d.hour=d.hour+1
c.endDate=d

// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
    MsgBox e.localizedDescription
else
    MsgBox "New event was created with UID: " +c.uid

    e = nil

// and delete it
if s.removeEvent(c, s.CalSpanAllEvents, e) then
    MsgBox "Event deleted."
else
    MsgBox e.localizedDescription
end if
end if
```
24.5. CLASS CALCALENDARSTOREMBS

Notes:
Returns true on success and false on failure.
Error is stored in the error object.

24.5.17 removeTask(task as CalTaskMBS, byref error as NSErrorMBS) as boolean

Function: Removes the task from the calendar.
Notes:
Returns true on success and false on failure.
Error is stored in the error object.

24.5.18 saveCalendar(calendar as CalCalendarMBS, byref error as NSErrorMBS) as boolean

Function: Writes changes to calendar.
Example:

```vbnet
dim cs as new CalCalendarStoreMBS
dim c as new CalCalendarMBS
c.Title = "Just Testing"

dim e as NSErrorMBS
if cs.saveCalendar(c, e) then
    MsgBox "OK"
else
    MsgBox "Failed "+e.localizedDescription
end if
```

Notes:
The saveCalendar and the removeCalendar calendars allow the client to add, modify, and remove calendars in the user’s calendar store. saveCalendar should be used both to add a new calendar to the calendar store, and to modify a calendar already in the store.

The only calendars that can be added with this API are local calendars; it is not possible to add subscribed
or CalDAV calendars, or the birthday calendar.

Changes made to a CalCalendar are not persisted until that calendar has been passed to saveCalendar. If saveCalendar is not called, the changes will be lost.

24.5.19   saveEvent(theEvent as CalEventMBS, span as Integer, byref error as NSErrorMBS) as boolean

Function: This method allows the client to add or modify events in the user’s calendar store.
Notes:
This method should be used both to add a new event to the calendar store, and to modify an event already in the calendar store.
If the event being saved is a repeating event, the second argument is used to describe whether the change being made should apply to future occurrences of that event, all occurrences, or only this instance. This is analogous to options on the dialog iCal presents when a user modifies a recurring event (though iCal’s UI does not provide a way to change all events, past and present).

Changes made to a CalEvent are not persisted until that event has been passed to saveEvent. If saveEvent is not called, the changes will be lost.

Applying changes to all events or all future events may cause the UID or the occurrence date of the event to change.

24.5.20   saveTask(task as CalTaskMBS, byref error as NSErrorMBS) as boolean

Function: Saves the specified task to the calendar store.
Example:

```vba
dim s as new CalCalendarStoreMBS
dim t as new CalTaskMBS
dim a() as CalCalendarMBS = s.calendars
dim d as new date
d.Month = d.Month + 1

t.calendar = a(0)
t.Title = "Test"
t.URL = "http://www.mbsplugins.de/"
t.priority = t.CalPriorityMedium
t.dueDate = d
```
24.5. CLASS CALCALENDARSTOREMBS

```vbnet
t.notes = "just a test"
t.isCompleted = false

dim e as NSErrorMBS
if s.saveTask(t, e) then
  MsgBox "saved"
else
  MsgBox "failed to save"
end if
```

**Notes:**

- **task:** The task to save.
- **error:** If this method returns false, an NSError object describing the error.

Returns true on success; otherwise, returns false and sets the error argument to an NSError object describing the error.

Use this method to save new task objects and modifications to existing task objects. Changes to task objects are not persistent until this method is invoked. The calendar property needs to be set before attempting to save a task.

Available in Mac OS X v10.5 and later.

### 24.5.21 tasks as CalTaskMBS()

**Function:** This method returns an array of all the CalTasks.

**Notes:** This is the function which uses all calendars.

See also:

- 24.5.22 tasks(calendar as CalCalendarMBS) as CalTaskMBS() 3997
- 24.5.23 tasks(calendars() as CalCalendarMBS) as CalTaskMBS() 3998

### 24.5.22 tasks(calendar as CalCalendarMBS) as CalTaskMBS()

**Function:** This method returns an array of all the CalTasks which match the condition.

See also:

- 24.5.21 tasks as CalTaskMBS() 3997
24.5.23 tasks(calendars() as CalCalendarMBS) as CalTaskMBS()

Function: This method returns an array of all the CalTasks which match the condition.

See also:

- 24.5.21 tasks as CalTaskMBS()

- 24.5.22 tasks(calendar as CalCalendarMBS) as CalTaskMBS()

24.5.24 TasksCompletedSince(completedSince as date) as CalTaskMBS()

Function: This method returns an array of all the CalTasks which match the condition.

Notes: This is the function which uses all calendars.

See also:

- 124.11.18 TasksCompletedSince(completedSince as date, calendar as CalCalendarMBS) as CalTaskMBS() 17365

- 24.5.26 TasksCompletedSince(completedSince as date, calendars() as CalCalendarMBS) as CalTaskMBS() 3998

24.5.25 TasksCompletedSince(completedSince as date, calendar as CalCalendarMBS) as CalTaskMBS()

Function: This method returns an array of all the CalTasks which match the condition.

See also:

- 24.5.24 TasksCompletedSince(completedSince as date) as CalTaskMBS() 3998

- 24.5.26 TasksCompletedSince(completedSince as date, calendars() as CalCalendarMBS) as CalTaskMBS() 3998

24.5.26 TasksCompletedSince(completedSince as date, calendars() as CalCalendarMBS) as CalTaskMBS()

Function: This method returns an array of all the CalTasks which match the condition.

See also:
24.5. **CLASS CALCALENDARSTOREMBS**

- 24.5.24 `TasksCompletedSince(completedSince as date) as CalTaskMBS()` 3998
- 24.11.18 `TasksCompletedSince(completedSince as date, calendar as CalCalendarMBS) as CalTaskMBS()` 17365

24.5.27 **taskWithUID(UID as string) as CalTaskMBS**

**Function:** Searches the task with the given unique ID.
**Notes:** Returns nil on any error.

24.5.28 **UncompletedTasks as CalTaskMBS()**

**Function:** This method returns an array of all the CalTasks which match the condition.
**Example:**
```vbscript
dim c as new CalCalendarStoreMBS
dim ta() as CalTaskMBS = c.UncompletedTasks
for each ct as CalTaskMBS in ta
    msgbox ct.Title+EndOfLine+str(ct.priority)+EndOfLine+ct.dueDate.LongDate
next
```

**Notes:** This is the function which uses all calendars.
See also:
- 24.5.29 `UncompletedTasks(calendar as CalCalendarMBS) as CalTaskMBS()` 3999
- 24.5.30 `UncompletedTasks(calendars() as CalCalendarMBS) as CalTaskMBS()` 4000

24.5.29 **UncompletedTasks(calendar as CalCalendarMBS) as CalTaskMBS()**

**Function:** This method returns an array of all the CalTasks which match the condition.
See also:
- 24.5.28 `UncompletedTasks as CalTaskMBS()` 3999
- 24.5.30 `UncompletedTasks(calendars() as CalCalendarMBS) as CalTaskMBS()` 4000
24.5.30 UncompletedTasks(calendars() as CalCalendarMBS) as CalTaskMBS()

Function: This method returns an array of all the CalTasks which match the condition.
See also:
- 24.5.28 UncompletedTasks as CalTaskMBS()
- 24.5.29 UncompletedTasks(calendar as CalCalendarMBS) as CalTaskMBS()

24.5.31 UncompletedTasksDueBefore(dueDate as date) as CalTaskMBS()

Function: This method returns an array of all the CalTasks which match the condition.
Notes: This is the function which uses all calendars.
See also:
- 24.5.32 UncompletedTasksDueBefore(dueDate as date, calendar as CalCalendarMBS) as CalTaskMBS()
- 24.5.33 UncompletedTasksDueBefore(dueDate as date, calendars() as CalCalendarMBS) as CalTaskMBS()

24.5.32 UncompletedTasksDueBefore(dueDate as date, calendar as CalCalendarMBS) as CalTaskMBS()

Function: This method returns an array of all the CalTasks which match the condition.
See also:
- 24.5.31 UncompletedTasksDueBefore(dueDate as date) as CalTaskMBS()
- 24.5.33 UncompletedTasksDueBefore(dueDate as date, calendars() as CalCalendarMBS) as CalTaskMBS()

24.5.33 UncompletedTasksDueBefore(dueDate as date, calendars() as CalCalendarMBS) as CalTaskMBS()

Function: This method returns an array of all the CalTasks which match the condition.
See also:
- 24.5.31 UncompletedTasksDueBefore(dueDate as date) as CalTaskMBS()
- 24.5.32 UncompletedTasksDueBefore(dueDate as date, calendar as CalCalendarMBS) as CalTaskMBS()
24.5. CLASS CALCALENDARSTOREMBS

24.5.34 Properties

24.5.35 Handle as Integer

Function: The internal used CalCalendarStore reference.  
Notes: (Read and Write property)

24.5.36 Events

24.5.37 CalendarsChanged(Externally as boolean, InsertedRecords() as string, UpdatedRecords() as string, DeletedRecords() as string)

Function: The event being called when some calendars changed.  
Notes: 
The Calendar Store frameworks posts notifications when any application, including yours, makes changes to the user’s calendar data.

Externally is true if this changes are not made by your application.

The three events give you the unique IDs of the calendars which have been inserted, updated or modified.

If all three arrays are nil/empty, that indicates everything has changed, and the client should refresh the calendar, event, and task information currently being used. Since this tends to be an expensive and inconvenient operation, it will only occur under unusual circumstances, such as when restoring from backup.

24.5.38 EventsChanged(Externally as boolean, InsertedRecords() as string, UpdatedRecords() as string, DeletedRecords() as string)

Function: The event being called when some events changed.  
Notes: 
The Calendar Store frameworks posts notifications when any application, including yours, makes changes to the user’s calendar data.

Externally is true if this changes are not made by your application.
The three events give you the unique IDs of the events which have been inserted, updated or modified.

If all three arrays are nil/empty, that indicates everything has changed, and the client should refresh the calendar, event, and task information currently being used. Since this tends to be an expensive and inconvenient operation, it will only occur under unusual circumstances, such as when restoring from backup.

24.5.39 TasksChanged(Externally as boolean, InsertedRecords() as string, UpdatedRecords() as string, DeletedRecords() as string)

Function: The event being called when some tasks changed.  
Notes: The Calendar Store frameworks posts notifications when any application, including yours, makes changes to the user's calendar data.

Externally is true if this changes are not made by your application.

The three events give you the unique IDs of the tasks which have been inserted, updated or modified.

If all three arrays are nil/empty, that indicates everything has changed, and the client should refresh the calendar, event, and task information currently being used. Since this tends to be an expensive and inconvenient operation, it will only occur under unusual circumstances, such as when restoring from backup.

24.5.40 Constants

24.5.41 CalSpanAllEvents=2

MBS MacFrameworks Plugin, Plugin Version: 7.7. Function: One of the Calendar Span constants.

24.5.42 CalSpanFutureEvents=1

MBS MacFrameworks Plugin, Plugin Version: 7.7. Function: One of the Calendar Span constants.
24.5. **CLASS CALCALENDARSTOREMBS**

24.5.43 **CalSpanThisEvent=0**

MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the Calendar Span constants.
24.6  class CalEventMBS

24.6.1  class CalEventMBS

Function: The class to handle events in iCal.

Example:

// start a connection to the calendar database
dim s as new CalCalendarStoreMBS

// needed for the error details
dim e as NSErrorMBS

// create a new event
dim c as new CalEventMBS

// set properties
dim calendars() as CalCalendarMBS = s.calendars
c.Title="new Event"
c.startDate=new date
c.calendar=calendars(0) // add to first calendar

dim d as new date
d.hour=d.hour+1
c.endDate=d

// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
    MsgBox e.localizedDescription
else
    MsgBox "New event was created."
end if

Notes:

Requires Mac OS X 10.5 to work.
Subclass of the CalCalendarItemMBS class.
24.6. CLASS CALEVENTMBS

24.6.2 Methods

24.6.3 attendees as CalAttendeeMBS()

Function: The attendees for this event.
Notes: It is not possible to modify an event’s attendees in Mac OS X 10.5.

24.6.4 Constructor

Function: The constructor to which creates a new event.
Example:

// start a connection to the calendar database
Dim s As New CalCalendarStoreMBS

// needed for the error details
Dim e As NSErrorMBS

// create a new event
Dim c As New CalEventMBS

// set properties
Dim calendars() As CalCalendarMBS = s.calendars
C.Title = "new Event"
C.startDate = New Date
C.calendar = calendars(0) // add to first calendar

Dim d As New Date
D.Hour = D.Hour + 1
C.endDate = d

// save event
Call s.saveEvent(c, s.CalSpanAllEvents, e)
If e <> nil Then
MsgBox e.localizedDescription
Else
MsgBox "New event was created."
End If

Notes: The calendar property must be set before calling saveTask on a new task.
24.6.5 Properties

24.6.6 endDate as date

Function: The end date.
Example:

```basic
dim e as CalEventMBS
msgbox e.endDate.longdate+ ” ”+e.endDate.longtime
```

Notes:
The client is responsible for making sure they never attempt to save an event with a start date that occurs after the endDate, or an endDate that occurs before the startDate. Calling saveEvent: on an improperly configured event will fail.
(Read and Write property)

24.6.7 isAllDay as boolean

Function: Whether this event is all day.
Notes:
True for all day events.
(Read and Write property)

24.6.8 isDetached as boolean

Function: Whether this event is detached.
Notes:
These properties are only meaningful for CalEvents which are instances of a repeating event.

If this CalEvent is an instance of a repeating event, and an attribute of this CalEvent has been changed to from the default value generated by the repeating event, isDetached will return true. If the CalEvent is unchanged from its default state, or is not a repeating event, isDetached returns false.
(Read only property)
24.6.9 location as string

Function: The location of this event.

Example:

```vbnet
dim c as new CalCalendarStoreMBS

// set the date range where we look for event
dim sd as new date(2016,6,7,0,0,0)
dim ed as new date(2016,6,7,23,59,59)

// look for an event on that date
dim a() as CalEventMBS = c.events(sd, ed, c.calendars)
dim e as CalEventMBS = a(1)

// show location
MsgBox e.location

// change it
e.location = "Hamburg"

// check again
MsgBox e.location

// Save
dim error as NSErrorMBS
dim ok as Boolean = c.saveEvent(e, c.CalSpanThisEvent, error)

if ok then
    MsgBox "OK"
else if error <> nil then
    MsgBox error.localizedDescription
else
    MsgBox "Failed."
end if
```

Notes: (Read and Write property)

24.6.10 occurrence as date

Function: The occurrences of this event.

Notes:
These properties are only meaningful for CalEvents which are instances of a repeating event.

Returns the occurrence date of a CalEvent. Since all instances of a repeating event have the same UID, we need another way to differentiate between those CalEvents. This method returns the NSDate on which this event was originally scheduled to occur. This value will remain the same even if the event has been detached and its start date has changed. For CalEvents not part of a repeating pattern, this method will return the same value as startDate.
(Read only property)

### 24.6.11 recurrenceRule as CalRecurrenceRuleMBS

**Function:** The recurrence rule for this event.
**Example:**

```// create a recurrence event:

dim c as new CalCalendarStoreMBS
    dim e as new CalEventMBS
    dim error as NSErrorMBS
    dim s as string
    dim ed as new date
    dim rule as CalRecurrenceRuleMBS
    dim rend as CalRecurrenceEndMBS

ed.day=21
    ed.Month=7
    ed.Year=2008

e.endDate=ed

    dim sd as new date

        sd.day=18
        sd.Month=7
        sd.Year=2008

e.startDate=sd
    e.isAllDay=true
    e.location="Example Location"

    rule=CalRecurrenceRuleMBS.initYearlyRecurrence(1,nil)

    dim calendars() as CalCalendarMBS = c.calendars
    e.Title="Example Title"
    e.calendar=calendars(0) // pick first calendar
```
24.6. CLASS CALEVENTMBS

e.notes="Example Notes"
e.URL="http://www.monkeybreadsoftware.de"
e.recurrenceRule=rule

if c.saveEvent(e, c.CalSpanAllEvents, error) then
if error<>Nil then s=error.localizedDescription
MsgBox "OK"+EndOfLine+s
else
if error<>Nil then s=error.localizedDescription
MsgBox "Failed"+EndOfLine+s
end if

Notes:
Set to nil to remove recurrence rule.
(Read and Write property)

24.6.12 startDate as date

Function: The start date.
Example:

dim e as CalEventMBS
msgbox e.startDate.longdate+" "+e.startDate.longtime

Notes:
The client is responsible for making sure they never attempt to save an event with a start date that occurs
after the endDate, or an endDate that occurs before the startDate. Calling saveEvent: on an improperly
configured event will fail.
(Read and Write property)
24.7 class CalNthWeekDayMBS

24.7.1 class CalNthWeekDayMBS

**Function:** CalNthWeekDay specifies the nth instance of a particular day of the week, such as the third Tuesday of every month.
**Notes:**
Requires Mac OS X 10.5 to work.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

24.7.2 Methods

24.7.3 Constructor

**Function:** The private constructor.

24.7.4 Properties

24.7.5 dayOfTheWeek as Integer

**Function:** The day of the week.
**Notes:**
Valid values for dayOfTheWeek are integers 1-7, which correspond to days of the week with Sunday = 1.
(Read only property)

24.7.6 weekNumber as Integer

**Function:** The week number.
**Notes:**
Valid values for weekNumber portion are 1, 2, 3, 4, or -1, where a value of -1 indicates the last week.
(Read only property)
24.8. **CLASS CALRECURRENCEENDMBS**

24.8  **class CalRecurrenceEndMBS**

24.8.1  **class CalRecurrenceEndMBS**

**Function:** The class to specify the end of a recurring calendar event.

**Notes:**

CalRecurrenceEnd is an attribute of CalRecurrenceRule that defines how long the recurrence is scheduled to repeat.

The recurrence can be defined either with an integer that indicates the total number times it repeats, or with a date, after which it no longer repeats. An event which is set to never end should have its CalRecurrenceEnd set to nil.

If the end of the pattern is defines with a date, the client must pass a valid date, nil cannot be passed. If the end of the pattern is defined as terms of a number of occurrences, the occurrenceCount passed to the initializer must be positive, it cannot be 0. If the client attempts to initialize a CalRecurrenceEnd with a nil date or OccurrenceCount of 0, an exception is raised.

A CalRecurrenceEnd initialized with an end date will return 0 for occurrenceCount. One initialized with a number of occurrences will return nil for its endDate.

Requires Mac OS X 10.5 to work.

24.8.2  **Methods**

24.8.3  **Constructor(endDate as date)**

**Function:** The constructor for a new recurrence end based on an end date.

See also:

- 24.8.4  **Constructor(occurrenceCount as Integer)**

24.8.4  **Constructor(occurrenceCount as Integer)**

**Function:** The constructor for a new recurrence end based on an occurrence count.

See also:

- 24.8.3  **Constructor(endDate as date)**
CHAPTER 24. CALENDAR

24.8.5 Properties

24.8.6 endDate as date

Function: The end date.
Notes:
This property is read only.
(Read only property)

24.8.7 occurrenceCount as Integer

Function: The occurrence count.
Notes:
This property is read only.
(Read only property)

24.8.8 usesEndDate as boolean

Function: Whether the end date is used.
Notes:
This property is read only.
(Read only property)
24.9. **CLASS CALRECURRENCERULEMBS**

24.9  **class CalRecurrenceRuleMBS**

24.9.1  **class CalRecurrenceRuleMBS**

**Function:** The class for the recurrence rules.

**Example:**

```plaintext
// start a connection to the calendar database
dim s as new CalCalendarStoreMBS

// needed for the error details
dim e as NSErrorMBS

dim r as CalRecurrenceRuleMBS = CalRecurrenceRuleMBS.initYearlyRecurrence(1, nil) // repeat every year without end

  dim a as new CalAlarmMBS // add alarm
  a.action = a.CalAlarmActionDisplay
  a.relativeTrigger = -3600*24 // 24 Hours before

  // create a new calendar
dim c as new CalEventMBS

dim d as new date(2011, 04, 20) // the date

  // set properties
dim calendars() as CalCalendarMBS = s.calendars
c.Title="Test Birthday"
c.startDate=d
c.recurrenceRule = r
c.calendar=calendars(1) // add to second calendar
c.addAlarm(a)
c.endDate = d
c.isAllDay = true

  // save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
  if e<>nil then
    MsgBox e.localizedDescription
  else
    MsgBox "New event was created."
  end if
```

**Notes:**
CHAPTER 24. CALENDAR

Requires Mac OS X 10.5 to work.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

24.9.2 Methods

24.9.3 Constructor

Function: The private constructor.

24.9.4 daysOfMonth as Integer()

Function: This property can be accessed as an array containing one or more integers corresponding to the
days of the month the event recurs.
Notes:
This property is valid for rules whose CalRecurrenceType is CalMonthlyRecurrence, and that were initialized
with one or more specific days of the month (not with a day of the week and week of the month).
For all other CalRecurrenceRules, this property is empty.

24.9.5 daysOfWeek as Integer()

Function: This property can be accessed as an array containing one or more integers corresponding to the
days of the week the event recurs.
Notes: This property is valid for rules whose CalRecurrenceType is CalWeeklyRecurrence. For all other
CalRecurrenceRules, this property is empty.

24.9.6 initDailyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

Function: Daily Recurrence initializer.
Notes: Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which
is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every
week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple
initializers for each CalRecurrenceType which take only these two parameters.

### 24.9.7 initMonthlyRecurrence(interval as Integer, DayOfTheWeek as Integer, WeekOfTheMonth as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

**Function:** Monthly Recurrence initializer.
**Notes:**
This initializer allows the client to specify a repeating monthly pattern in terms of a day of the week and a week of the month that the event repeats. An example is an event that recurs the first Monday of every month.

Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters.

Valid values for days of the week are integers 1-7, which correspond to days of the week with Sunday = 1. Valid values for weeks of the month are integers 1-4 and -1, which is used to indicate the last week of the month.

See also:

- 24.9.8 initMonthlyRecurrence(interval as Integer, DaysOfTheMonth() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS
- 24.9.9 initMonthlyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

### 24.9.8 initMonthlyRecurrence(interval as Integer, DaysOfTheMonth() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

**Function:** Monthly Recurrence initializer.
**Notes:**
This initializer allows the client to specify multiple days of the month that an event will recur. This method should be used to initialize events that occur more than once a month, in a set monthly pattern.

Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple
initializers for each CalRecurrenceType which take only these two parameters.

Valid values for days of the month are integers 1-31.

See also:

- 24.9.7 initMonthlyRecurrence(interval as Integer, DayOfTheWeek as Integer, WeekOfTheMonth as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS
- 24.9.9 initMonthlyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

**24.9.9 initMonthlyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS**

**Function:** Monthly Recurrence initializer.

**Notes:** Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters.

See also:

- 24.9.7 initMonthlyRecurrence(interval as Integer, DayOfTheWeek as Integer, WeekOfTheMonth as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS
- 24.9.8 initMonthlyRecurrence(interval as Integer, DaysOfTheMonth() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

**24.9.10 initWeeklyRecurrence(interval as Integer, DaysOfTheWeek() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS**

**Function:** Weekly Recurrence initializers.

**Notes:**

This initializer allows the client to specify multiple days of the week that an event will recur. This initializer should be used to initialize events that occur more than once a week, in a set weekly pattern.

Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters.
Valid values for days of the week are integers 1-7, which correspond to days of the week with Sunday = 1. See also:

- 24.9.11 initWeeklyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

24.9.11 initWeeklyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

Function: Weekly Recurrence initializers.

Notes: Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters. See also:

- 24.9.10 initWeeklyRecurrence(interval as Integer, DaysOfTheWeek() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

24.9.12 initYearlyRecurrence(interval as Integer, DayOfTheWeek as Integer, WeekOfTheMonth as Integer, MonthsOfTheYear() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

Function: Yearly Recurrence initializer.

Notes:

This initializer allows the client to specify multiple months of the year that an event will recur. This method should be used to initialize events that recur on the same day of the week, in the same week of a month, of possibly more than one month a year, in a set yearly pattern. An example is an event that occurs every year on the last Friday of sixth and twelfth months.

Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters.

Valid values for days of the week are integers 1-7, which correspond to days of the week with Sunday = 1. Valid values for weeks of the month are integers 1-4 and -1, which is used to indicate the last week of the month.

Valid values for months of the year are integers 1-12, which correspond to months of the year with January
CHAPTER 24. CALENDAR

= 1.

See also:

- 24.9.13 initYearlyRecurrence(interval as Integer, MonthsOfTheYear() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

- 24.9.14 initYearlyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

24.9.13 initYearlyRecurrence(interval as Integer, MonthsOfTheYear() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

Function: Yearly Recurrence initializer.

Notes:

This initializer allows the client to specify multiple months of the year that an event will recur. This method should be used to initialize events that occur on the same date, in more than month a year, in a set monthly pattern. An example is an event that occurs every year on the first day of the first and seventh months.

Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters.

Valid values for months of the year are integers 1-12, which correspond to months of the year with January = 1.

See also:

- 24.9.12 initYearlyRecurrence(interval as Integer, DayOfTheWeek as Integer, WeekOfTheMonth as Integer, MonthsOfTheYear() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

- 24.9.14 initYearlyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

24.9.14 initYearlyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

Function: Yearly Recurrence initializer.

Example:

// create a recurrence event:
dim c as new CalCalendarStoreMBS
dim e as new CalEventMBS
dim error as NSErrorMBS
dim s as string
dim ed as new date
dim rule as CalRecurrenceRuleMBS
dim rend as CalRecurrenceEndMBS

ed.day=21
ed.Month=7
ed.Year=2008

e.endDate=ed

dim sd as new date

sd.day=18
sd.Month=7
sd.Year=2008

e.startDate=sd
e.isAllDay=true
e.location="Example Location"

rule=CalRecurrenceRuleMBS.initYearlyRecurrence(1,nil)

dim calendars() as CalCalendarMBS = c.calendars
e.Title="Example Title"
e.calendar=calendars(0) // pick first calendar
e.notes="Example Notes"
e.URL="http://www.monkeybreadsoftware.de"
e.recurrenceRule=rule

if c.saveEvent(e, c.CalSpanAllEvents, error) then
  if error<>Nil then s=error.localizedDescription
  MsgBox "OK”+EndOfLine+s
else
  if error<>Nil then s=error.localizedDescription
  MsgBox "Failed”+EndOfLine+s
end if

Notes: Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple
initializers for each CalRecurrenceType which take only these two parameters.

See also:

- 24.9.12 initYearlyRecurrence(interval as Integer, DayOfTheWeek as Integer, WeekOfTheMonth as Integer, MonthsOfTheYear() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS
- 24.9.13 initYearlyRecurrence(interval as Integer, MonthsOfTheYear() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

24.9.15 monthsOfTheYear as Integer()

Function: This property can be accessed as an array containing one or more integer corresponding to the months of the year the event recurs.

Notes: This property is valid for rules whose CalRecurrenceType is CalYearlyRecurrence. For all other CalRecurrenceRules, this property is empty.

24.9.16 nthWeekDaysOfTheMonth as CalNthWeekDayMBS()

Function: This property can be accessed as an array containing exactly one CalNthWeekDay corresponding to the week of the month the event recurs.

Notes: This property is valid for rules whose CalRecurrenceType is CalMonthlyRecurrence or CalYearlyRecurrence, and that were initialized with a day of the week and week of the month. For all other CalRecurrenceRules, this property is empty.

24.9.17 Properties

24.9.18 firstDayOfTheWeek as Integer

Function: The first day of the week.

Notes:

Recurrence patterns can specify which day of the week should be treated as the first day. Possible values for this property are integers 0 and 1-7, which correspond to days of the week with Sunday = 1. Zero indicates that the property is not set for this recurrence. The first day of the week only affects the way the recurrence is expanded for weekly recurrence patterns with an interval greater than 1. For those types of recurrence patterns, the CalendarStore framework will set firstDayOfTheWeek to be 2 (Monday). In all other cases, this property will be set to zero. The iCalendar spec stipulates that the default value is Monday if this property is not set.
24.9. **CLASS CALRECURRENCERULEMBS**

(Read only property)

### 24.9.19 Handle as Integer

**Function:** The internal used CalRecurrenceRule reference.
**Notes:** (Read and Write property)

### 24.9.20 recurrenceEnd as CalRecurrenceEndMBS

**Function:** This property defines when the repeating event is scheduled to end.
**Notes:**
- The end date can be specified by a number of occurrences, or with an end date.
- Value can be nil.
- This is a read only property.
(Read only property)

### 24.9.21 recurrenceInterval as Integer

**Function:** Specifies how often the rule repeats over the given recurrence type.
**Notes:**
- An interval of 1 indicates that the event repeats every time unit, while an interval of 2 indicates that the repetition occurs in every other unit, etc.
- This is a read only property.
(Read only property)

### 24.9.22 recurrenceType as Integer

**Function:** This property designates the unit of time used to describe the recurrence pattern.
**Notes:**
- CalRecurrenceType designates the unit of time used to describe the recurrence. It has four possible values, which correspond to recurrence rules that are defined in terms of days, weeks, months, and years.
The interval of a CalRecurrenceRule is an Integer which specifies how often the recurrence rule repeats over the unit of time described by the CalRecurrenceType. For example, if the CalRecurrenceType is CalWeeklyRecurrence, then an interval of 1 means the pattern is repeated every week. A NSUInteger of 2 indicates it is repeated every other week, 3 means every third week, and so on. The Integer must be a positive integer; 0 is not a valid value, and nil will be returned if the client attempts to initialize a rule with a negative or zero interval.

Together, CalRecurrenceType and interval define how often the CalRecurrenceRule’s pattern repeats. This is a read only property.  
(Read only property)

### 24.9.23 Constants

### 24.9.24 CalRecurrenceDaily=0

MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the recurrence type constants.

### 24.9.25 CalRecurrenceMonthly=2

MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the recurrence type constants.

### 24.9.26 CalRecurrenceWeekly=1

MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the recurrence type constants.

### 24.9.27 CalRecurrenceYearly=3

MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the recurrence type constants.
24.10.1 class CalTaskMBS

**Function:** The class for tasks in iCal.

**Example:**

```vba
dim calStore as new CalCalendarStoreMBS
dim err as NSErrorMBS ' needed for the error details
dim newTask as new CalTaskMBS ' create a new reminder

// find existign tasks
dim tasks() as CalTaskMBS = calStore.tasks

// set properties
newTask.Title="new reminder"
newTask.Priority=9
newTask.DueDate=new date

//

newTask.calendar = tasks(0).calendar ' add to first List of reminders

call calStore.saveTask(newTask,err) ' save reminder
if err<>nil then
    MsgBox err.localizedDescription
else
    MsgBox "New reminder was created."
end if
```

**Notes:**
Requires Mac OS X 10.5 to work.
Subclass of the CalCalendarItemMBS class.

24.10.2 Methods

24.10.3 Constructor

**Function:** The constructor to create a new empty task.

**Example:**
dim s as new CalCalendarStoreMBS
dim t as new CalTaskMBS
dim a() as CalCalendarMBS = s.calendars
dim d as new date
d.Month = d.Month + 1

t.calendar = a(0)
t.Title = "Test"
t.URL = "http://www.mbsplugins.de/"
t.priority = t.CalPriorityMedium
t.dueDate = d
t.notes = "just a test"
t.isCompleted = false

dim e as NSErrorMBS
if s.saveTask(t, e) then
    MsgBox "saved"
else
    MsgBox "failed to save"
end if

Notes: The calendar property must be set before calling saveTask on a new task.

24.10.4 Properties

24.10.5 completedDate as date

Function: The date the task was completed.
Notes: The properties isCompleted and CompletedDate are inextricably linked. Setting isCompleted to be true, will set the completedDate to be now, and setting any completedDate will change isCompleted to be true. Similarly, setting isCompleted to be false will set the completedDate to be nil, and setting the completedDate changes isCompleted to false.
(Read and Write property)

24.10.6 dueDate as date

Function: The date the task is due.
Example:

```vbnet
dim c as new CalCalendarStoreMBS

dim i, count as Integer
dim ta() as CalTaskMBS
dim ct as CalTaskMBS

ta = c.UncompletedTasks
for each ct in ta
    msgbox ct.Title + vbCrLf + str(ct.priority) + vbCrLf + ct.dueDate.LongDate
next
```

Notes: (Read and Write property)

24.10.7 isCompleted as Boolean

**Function:** Whether the task has been completed.

**Notes:**

The properties isCompleted and CompletedDate are inextricably linked. Setting isCompleted to be true,
will set the completedDate to be now, and setting any completedDate will change isCompleted to be true.
Similarly, setting isCompleted to be false will set the completedDate to be nil, and setting the completedDate
changes isCompleted to false.
(Read and Write property)

24.10.8 priority as Integer

**Function:** The priority of this task.

**Notes:**

The iCalendar specification allows priority to be specified with an integer in the range of 0-9, with 0 repre-
senting an undefined priority, 1 the highest priority, and 9 the lowest priority. When a user sets the priority
to high, medium or low in iCal saves the priority as 1, 5, or 9 respectively. Clients are encouraged to use
these values when setting a task’s priority, but is is possible to specify any integer value from 0 to 9. In iCal,
a task with a priority in the range of 1-4 will show up as high priority, a task with a priority of 5 will be
displayed as having medium priority, and 6-9 will be displayed as having a low priority.
(Read and Write property)
24.10.9 Constants

24.10.10 CalPriorityHigh=1
MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the constants for the priority property.

24.10.11 CalPriorityLow=9
MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the constants for the priority property.

24.10.12 CalPriorityMedium=5
MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the constants for the priority property.

24.10.13 CalPriorityNone=0
MBS MacFrameworks Plugin, Plugin Version: 7.7. **Function:** One of the constants for the priority property.
24.11. CLASS EKALARMMBS

24.11 class EKAlarmMBS

24.11.1 class EKAlarmMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: An EKAlarm object represents an alarm in Event Kit.

Notes:
Use the alarmWithAbsoluteDate: and alarmWithRelativeOffset class methods to create an alarm and use the properties to set information about an alarm. In OS X Mountain Lion, you can specify an action to trigger when the alarm fires via the emailAddress, soundName, or url property.

Subclass of the EKObjectMBS class.

24.11.2 Methods

24.11.3 alarmWithAbsoluteDate(d as date) as EKAlarmMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.

Function: Creates and returns an alarm with an absolute date.

24.11.4 alarmWithRelativeOffset(offset as Double) as EKAlarmMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.

Function: Creates and returns an alarm with a relative offset.

Notes:
offset: The offset from the start of an event, at which the alarm fires.

Negative offset values fire before the start of the event, while positive values fire after the start.

24.11.5 Constructor(date as date)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: Creates and returns an alarm with an absolute date.

See also:

• 24.11.6 Constructor(offset as Double)
24.11.6 Constructor(offset as Double)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
**Function:** Creates and returns an alarm with a relative offset.  
**Notes:**  
offset: The offset from the start of an event, at which the alarm fires.  
Negative offset values fire before the start of the event, while positive values fire after the start.  
See also:  
- 24.11.5 Constructor(date as date)

24.11.7 copy as EKAlarmMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
**Function:** Creates a copy of an alarm.

24.11.8 Properties

24.11.9 absoluteDate as date

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
**Function:** The absolute date for the alarm.  
**Notes:**  
If you set this property for a relative offset alarm, it loses the relative offset and becomes an absolute alarm.  
(Read and Write property)

24.11.10 emailAddress as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
**Function:** The recipient of an email to send when the alarm triggers.  
**Notes:**  
Assigning this property a value will set the soundName and url properties to nil.  
(Read and Write property)
24.11. CLASS EKALARMMBS

24.11.11 proximity as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** A value indicating how a location-based alarm is triggered.
**Notes:**
Alarms can be set to trigger when entering or exiting a location specified by structuredLocation. By default, alarms are not affected by location.
(Read and Write property)

24.11.12 relativeOffset as Double

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** The offset from the start of an event, at which the alarm fires.
**Notes:**
If you set this value for an absolute alarm, it loses its absolute date and becomes a relative offset alarm.
(Read and Write property)

24.11.13 soundName as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** The name of the sound to play when the alarm triggers.
**Notes:**
The value of this property is the name of a system sound that can be used with the soundNamed class method to create an NSSound object. Assigning this property a value will set the emailAddress and url properties to nil.
(Read and Write property)

24.11.14 structuredLocation as EKStructuredLocationMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** The location to trigger an alarm.
**Notes:**
This property is used in conjunction with proximity to perform geofence-based triggering of reminders.
(Read and Write property)
24.11.15  type as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The type of action to trigger when the alarm fires.
Notes:
To set the type of alarm, define one of emailAddress, soundName, or url.
(Read only property)

24.11.16  url as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The URL to open when the alarm triggers.
Notes:
Assigning this property a value will set the emailAddress and soundName properties to nil.
Available in OS X v10.8 and later.
Deprecated in OS X v10.9.
(Read and Write property)

24.11.17  Constants

24.11.18  kProximityEnter = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. Function: A value indicating whether an alarm is triggered
by entering or exiting a region.
Notes: The alarm is set to fire when entering a region.

24.11.19  kProximityLeave = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. Function: A value indicating whether an alarm is triggered
by entering or exiting a region.
Notes: The alarm is set to fire when leaving a region.

24.11.20  kProximityNone = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. Function: A value indicating whether an alarm is triggered
by entering or exiting a region.
Notes: The alarm has no proximity trigger.

24.11.21 kTypeAudio = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the possible values that can be read from the type property.
**Notes:** Play audio

24.11.22 kTypeDisplay = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the possible values that can be read from the type property.
**Notes:** Display alert

24.11.23 kTypeEmail = 3

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the possible values that can be read from the type property.
**Notes:** Email

24.11.24 kTypeProcedure = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the possible values that can be read from the type property.
**Notes:** Procedure
24.12 class EKCalendarItemMBS

24.12.1 class EKCalendarItemMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The class for a calendar item. Notes:
The EKCalendarItem class is an abstract superclass for calendar events and reminders. This class provides common properties and methods for accessing properties of calendar items such as the ability to set the calendar, title, and location as well as support for attaching notes, displaying attendees, setting multiple alarms, and specifying recurrence rules. Subclass of the EKObjectMBS class. This is a subclass of an abstract class. You can’t create an instance, but you can get one from various plugin functions.

24.12.2 Methods

24.12.3 addAlarm(alarm as EKAlarmMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Adds an alarm to the receiver. Notes:

24.12.4 addRecurrenceRule(rule as EKRecurrenceRuleMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Adds a recurrence rule to the recurrence rule array. Notes: The implementation only supports a single recurrence rule. Adding a recurrence rule replaces the single recurrence rule.

24.12.5 alarms as EKAlarmMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The alarms associated with the calendar item, as an array of EKAlarm objects. Notes: This property is empty if the calendar item has no alarms.
24.12.6 attendees as EKParticipantMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The attendees associated with the calendar item, as an array of EKParticipant objects. **Notes:** This property is read-only; it is not possible to add attendees with Event Kit. This property is nil if the calendar item has no attendees.

24.12.7 recurrenceRules as EKRecurrenceRuleMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The recurrence rules for the calendar item. **Notes:** The implementation only supports a single recurrence rule.

24.12.8 removeAlarm(alarm as EKAlarmMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes an alarm from the calendar item.

24.12.9 removeRecurrenceRule(rule as EKRecurrenceRuleMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes a recurrence rule from the recurrence rule array. **Notes:** The implementation only supports a single recurrence rule.

24.12.10 setAlarms(alarms() as EKAlarmMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the alarms array.

24.12.11 setRecurrenceRules(rules() as EKRecurrenceRuleMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the recurrences rules array.
CHAPTER 24. CALENDAR

24.12.12 Properties

24.12.13 calendar as EKCalendarMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The calendar for the calendar item. Notes: (Read and Write property)

24.12.14 calendarItemExternalIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The calendar items external identifier as provided by the calendar server. Notes: This identifier allows you to access the same event or reminder across multiple devices.

There are some cases where duplicate copies of a calendar item can exist in the same database:

- A calendar item was imported from an ICS file into multiple calendars
- An event was created in a calendar shared with the user and the user was also invited to the event
- The user is a delegate of a calendar that also has this event
- A subscribed calendar was added to multiple accounts

In such cases, you should choose between calendar items based on other factors, such as the calendar or source.

Recurring event identifiers are the same for all occurrences. If you wish to differentiate between occurrences, you may want to use the start date.

For Exchange servers, the identifier is different between iOS and OS X and different between devices for reminders. (Read only property)

24.12.15 calendarItemIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The calendar items unique identifier. Notes:
This property is set when the calendar item is created and can be used as a local identifier. Use calendarItemWithIdentifier to look up the item by this value.

A full sync with the calendar will lose this identifier. You should have a plan for dealing with a calendar whose identifier is no longer fetch-able by caching its other properties.
(Read only property)

### 24.12.16 creationDate as Date

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The date that this calendar item was created.

**Notes:**
If nil, this property was not set or was synced in this state.
(Read only property)

### 24.12.17 hasAlarms as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** A Boolean value that indicates whether the calendar item has alarms.

**Notes:**
If true, the calendar item has alarms; otherwise it does not.
(Read only property)

### 24.12.18 hasAttendees as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** A Boolean value that indicates whether the calendar item has attendees.

**Notes:**
If true, the calendar item has attendees; otherwise it does not.
(Read only property)

### 24.12.19 hasNotes as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** A Boolean value that indicates whether the calendar item has notes.

**Notes:**
If true, the calendar item has notes; otherwise it does not.
(Read only property)

### 24.12.20 hasRecurrenceRules as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** A Boolean value that indicates whether the calendar item has recurrence rules.
**Notes:**
If true, the calendar item has recurrence rules; otherwise it does not.
The implementation only supports a single recurrence rule. Adding a recurrence rule replaces the single recurrence rule.
(Read only property)

### 24.12.21 lastModifiedDate as Date

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** The date that the calendar item was last modified.
**Notes:** (Read only property)

### 24.12.22 location as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** The location associated with the calendar item.
**Notes:**
This property is "" if the calendar item has no location.
(Read and Write property)

### 24.12.23 notes as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** The notes associated with the calendar item.
**Notes:** (Read and Write property)
**24.12.24 timeZone as NSTimeZoneMBS**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
**Function:** The time zone for the calendar item. 
**Notes:**
If nil, the calendar item is a floating event. A floating event is not tied to a particular time zone. It occurs at a given time regardless of the time zone, for example, lunch at noon. The start and end times of a floating event should be set as if they were in the system time zone. 
(Read and Write property)

**24.12.25 title as String**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
**Function:** The title for the calendar item. 
**Notes:** (Read and Write property)

**24.12.26 URL as String**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
**Function:** The URL for the calendar item. 
**Notes:** (Read and Write property)
24.13 class EKCalendarMBS

24.13.1 class EKCalendarMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: An instance of the EKCalendar class represents a calendar in Event Kit.
Notes:
Use the properties in this class to get attributes about a calendar, such as its title and type. Use the calendarForEntityType method to create a calendar object.
Subclass of the EKObjectMBS class.

24.13.2 Methods

24.13.3 calendarForEntityType(entityType as Integer, eventStore as EKEventStoreMBS) as EKCalendarMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Creates a new calendar that can contain the given entity type.
Notes:
entityType: The entity type that this calendar may support.
eventStore: The event store in which to create this calendar.

Returns the created calendar.

You can only create calendars that accept either reminders or events. Some servers might allow mixing the two, although it is not common.

24.13.4 Constructor(entityType as Integer, eventStore as EKEventStoreMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Creates a new calendar that can contain the given entity type.
Notes:
entityType: The entity type that this calendar may support.
eventStore: The event store in which to create this calendar.

Returns the created calendar.

You can only create calendars that accept either reminders or events. Some servers might allow mixing the
two, although it is not common.

### 24.13.5 Properties

#### 24.13.6 allowedEntityTypes as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** The entity types this calendar can contain.
**Notes:**
While Event Kit only allows creation of single-entity calendars, other servers might allow mixed-entity calendars.
(Read only property)

#### 24.13.7 allowsContentModifications as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** A Boolean value that indicates whether you can add, edit, and delete items in the calendar.
**Notes:** (Read only property)

#### 24.13.8 calendarIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** A unique identifier for the calendar.
**Notes:**
This property is set when the calendar is created and can be used as a local identifier. Use calendarWithIdentifier to get a calendar with the specified identifier.

A full sync with the calendar will lose this identifier. You should have a plan for dealing with a calendar whose identifier is no longer fetch-able by caching its other properties.
(Read only property)

#### 24.13.9 color as NSColorMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** The calendars color.
**Notes:** (Read and Write property)
24.13.10  Immutable as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** A Boolean value indicating whether the calendars properties can be edited or deleted.

**Notes:**
If true, the calendar is immutable; otherwise it is not. Events and reminders can still be added to an immutable calendar.
(Read only property)

24.13.11  source as EKSourceMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The source object representing the account to which this calendar belongs.

**Notes:**
This property can only be set for newly created calendar objects. This property is read-only after the first time it is set; setting a value to this property after the first time it is set will result in an error. Therefore, moving a calendar from one source to another is not supported.
(Read and Write property)

24.13.12  Subscribed as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** A Boolean value indicating whether the calendar is a subscribed calendar.

**Notes:**
If true, the calendar is a subscribed calendar; otherwise it is not.
(Read only property)

24.13.13  supportedEventAvailabilities as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The event availability settings supported by this calendar, as indicated by a bitmask.

**Notes:**
If the calendar does not support event availability settings, this value is EKCalendarEventAvailabilityNone.
(Read only property)
24.13. CLASS EKCALENDAR.MBS

24.13.14 title as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The calendars title.
**Notes:** (Read and Write property)

24.13.15 type as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The calendars type.
**Notes:**
CalDAV-subscribed calendars are of type EKCalendarTypeCalDAV with Subscribed set to true. (Read only property)

24.13.16 Constants

24.13.17 kEntityMaskEvent = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the entity types.
**Notes:** Event

24.13.18 kEntityMaskReminder = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the entity types.
**Notes:** Reminder

24.13.19 kEntityTypeEvent = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the entity types.
**Notes:** Entity Event

24.13.20 kEntityTypeReminder = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the entity types.
**Notes:** Entity Reminder
24.13.21 kEventAvailabilityBusy = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event availabilities constants. **Notes:** Busy

24.13.22 kEventAvailabilityFree = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event availabilities constants. **Notes:** Free

24.13.23 kEventAvailabilityNone = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event availabilities constants. **Notes:** Not available

24.13.24 kEventAvailabilityTentative = 4

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event availabilities constants. **Notes:** Tentative

24.13.25 kEventAvailabilityUnavailable = 8

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event availabilities constants. **Notes:** Unavailable

24.13.26 kTypeBirthday = 4

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the possible calendar types. **Notes:** A birthday calendar.

24.13.27 kTypeCalDAV = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the possible calendar types. **Notes:** A CalDAV or iCloud calendar.
24.13.28  kTypeExchange = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the possible calendar types.  
**Notes:** An Exchange calendar.

24.13.29  kTypeLocal = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the possible calendar types.  
**Notes:** A local calendar.

24.13.30  kTypeSubscription = 3

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the possible calendar types.  
**Notes:** A locally subscribed calendar.
24.14 class EKEventMBS

24.14.1 class EKEventMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** An instance of the EKEvent class represents an event added to a calendar in the Event Kit framework.

**Notes:**

Use the eventWithEventStore method to create a new event. Use the properties in the class to get and modify certain information about an event. Other properties, such as the events title and calendar, are inherited from the parent class EKCalendarItem.

Subclass of the EKCalendarItemMBS class.

24.14.2 Methods

24.14.3 compareStartDateWithEvent(other as EKEventMBS) as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Compares the start date of the receiving event with the start date of another event.

**Notes:**

other: The event to compare against.

NSOrderedAscending -1 if the start date of the receiver precedes the start date of other.
NSOrderedSame 0 if the start dates of the two events are identical.
NSOrderedDescending 1 if the start date of the receiver comes after the start date of other.

24.14.4 Constructor(eventStore as EKEventStoreMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Creates and returns a new event belonging to a specified event store.

**Notes:** eventStore: The event store to which the event belongs.

24.14.5 eventWithEventStore(eventStore as EKEventStoreMBS) as EKEventMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Creates and returns a new event belonging to a specified event store.

**Notes:** eventStore: The event store to which the event belongs.
24.14.6 refresh as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Updates the events data with the current information in the Calendar database.

**Notes:**
If the event was successfully refreshed, true; otherwise, false.

You should call this method only on events that your application is editing, and only when your application receives the EKEventStoreChangedNotification notification. If this method returns false, the event has been deleted or otherwise invalidated, and you should not continue to use it.

This method does not replace the values of any properties that you have modified.

24.14.7 Properties

24.14.8 AllDay as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** A Boolean value that indicates whether the event is an all-day event.

**Notes:** (Read and Write property)

24.14.9 availability as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The availability setting for the event.

**Notes:**
This setting is used by CalDAV and Exchange servers to indicate how the event should be treated for scheduling purposes.

If the events calendar does not support availability settings, this property’s value is EKEventAvailabilityNotSupported.
(Read and Write property)

24.14.10 birthdayPersonUniqueID as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The Address Book framework record identifier of the person for this birthday event.

**Notes:**
This property is only set if this is a birthday event; otherwise the property is "."
(Read only property)

24.14.11  

**endDate as Date**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The end date for the event.
**Notes:** (Read and Write property)

24.14.12  

**eventIdentifier as String**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A unique identifier for the event.
**Notes:**
You can use this identifier to look up an event with the EKEventStore method eventWithIdentifier. If the calendar of an event changes, its identifier most likely changes as well.
(Read only property)

24.14.13  

**isDetached as Boolean**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether an event is a detached instance of a repeating event.
**Notes:**
This value is true if and only if the event is part of a repeating event and one or more of its attributes have been modified from the repeating events default attributes.
(Read only property)

24.14.14  

**occurrenceDate as Date**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The original occurrence date of an event if it is part of a recurring series.
**Notes:**
This value will remain the same even if the event has been detached and its start date has changed. Floating events (such as all-day events) are returned in the default time zone.
(Read only property)
24.14. CLASS EKEVENTMBS

24.14.15 organizer as EKParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The organizer associated with the event.
Notes:
This property is nil if the event has no organizer.
(Read only property)

24.14.16 startDate as Date

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The start date of the event.
Notes:
Floating events such as all-day events are returned in the default time zone.
(Read and Write property)

24.14.17 status as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The status of the event.
Notes:
You should act based on an events status only if the status is EKEventStatusCanceled, which indicates that the event has been canceled. Other statuses should be considered informational.
(Read only property)

24.14.18 Constants

24.14.19 kAvailabilityBusy = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the event availability.
Notes: The event has a busy availability setting.

24.14.20 kAvailabilityFree = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the event availability.
Notes: The event has a free availability setting.
24.14.21 kAvailabilityNotSupported = -1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event availability. **Notes:** Availability settings are not supported by the events calendar.

24.14.22 kAvailabilityTentative = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event availability. **Notes:** The event has a tentative availability setting.

24.14.23 kAvailabilityUnavailable = 3

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event availability. **Notes:** The event has an unavailable availability setting.

24.14.24 kStatusCanceled = 3

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event status constants. **Notes:** The event has no status.

24.14.25 kStatusConfirmed = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event status constants. **Notes:** The event has no status.

24.14.26 kStatusNone = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event status constants. **Notes:** The event has no status.

24.14.27 kStatusTentative = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event status constants. **Notes:** The event has no status.
24.15. class EKEventStoreMBS

24.15.1 class EKEventStoreMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An instance of the EKEventStore class represents the Calendar database. **Notes:** It is an applications point of contact for accessing calendar and reminder data.

You must request access to an entity type after the event store is initialized with requestAccessToEntityType for data to return.

Acceptable entity types are EKEntityMaskEvent for events and EKEntityMaskReminder for reminders. Create a predicate, or a search query for events, with the predicateForEventsWithStartDate method. Fetch and process events that match a given predicate with the eventsMatchingPredicate: and enumerateEventsMatchingPredicate methods. Save and delete events from the event store with the saveEvent and removeEvent methods. Subclass of the EKObjectMBS class.

24.15.2 Methods

24.15.3 authorizationStatusForEntityType(entityType as Integer) as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the authorization status for the given entity type. **Notes:** Available in OS X v10.9 and later.

24.15.4 Available as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available. **Notes:** Returns true on Mac OS X 10.8 and newer with 64-bit.

24.15.5 calendarItemsWithExternalIdentifier(identifier as string) as EKCalendarItemMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns either the events first occurrences or the reminders with the specified external identifier. **Notes:**
externalIdentifier: The calendar items external identifier.

Returns an array of calendar items with the specified identifier.

The external identifier can be obtained from the calendarItemExternalIdentifier property. There may be more than one matching calendar item due to reasons discussed in calendarItemExternalIdentifier.

24.15.6 calendarItemWithIdentifier(identifier as string) as EKCalendarItemMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns either the events first occurrence or the reminder with the specified identifier. **Notes:** Returns the reminder or the first occurrence of an event with the specified identifier.

24.15.7 calendarsForEntityType(types as Integer) as EKCalendarMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns calendars that support a given entity type, such as reminders or events.

24.15.8 calendarWithIdentifier(identifier as string) as EKCalendarMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the calendar with the specified identifier.

24.15.9 cancelFetchRequest(request as EKFetchRequestMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Cancels the request to fetch reminders. **Notes:**

Pass the request you got from fetchRemindersMatchingPredicate method.
The fetchRemindersMatchingPredicateCompleted event will not fire.

24.15.10 commit(byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Commits all unsaved changes to the event store. **Notes:**
24.15. **CLASS EKEVENTSTOREMBS**

error: The error variable to be filled with an error object.

If the commit operation succeeded, true is returned; otherwise, false. Returns true even when there are no changes to commit.

This method allows you to save batched changes to the event store. For example, if you pass false as the commit parameter to the saveCalendar, removeCalendar, saveEvent, or removeEvent methods, the changes are not saved until this method is invoked. Likewise, if you pass true as the commit parameter to the aforementioned methods, there is no need to call this method.

### 24.15.11 Constructor

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The default constructor.

See also:
- 24.15.12 Constructor(types as Integer)

### 24.15.12 Constructor(types as Integer)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Initializes access to the event store with support for the given entity type.

**Notes:**
Available in OS X v10.8 and later.
Deprecated in OS X v10.9.

See also:
- 24.15.11 Constructor

### 24.15.13 Destructor

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The destructor.

### 24.15.14 EKErrorDomain as string

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The EventKit error domain.
24.15.15 EKEventStoreChangedNotification as string

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The changed notification name.  
**Notes:** Posted whenever changes are made to the Calendar database, including adding, removing, and changing events or reminders. Individual changes are not described. When you receive this notification, you should refetch all EKEvent and EKReminder objects you have accessed, as they are considered stale. If you are actively editing an event and do not wish to refetch it unless it is absolutely necessary to do so, you can call the refresh method on it. If the method returns true, you do not need to refetch the event.

24.15.16 enumerateEventsMatchingPredicate(predicate as NSPredicateMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Finds all events that match a given predicate and calls enumerateEventsMatchingPredicateUpdate event for each event found.  
**Notes:**  
predicate: The search predicate. Must be created with the predicateForEventsWithStartDate:endDate:calendars method.  
Only events that have been committed are included in enumeration. Events saved using saveEvent:span:commit:error: with the commit parameter set to NO must call commit beforehand to be included.  
This method is synchronous.

24.15.17 eventsMatchingPredicate(predicate as NSPredicateMBS) as EKEventMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns all events that match a given predicate.  
**Notes:**  
Returns all events that match predicate, as an array of EKEvent objects.  
Only events that have been committed are included in the results. Events saved using saveEvent with the commit parameter set to false must call commit beforehand to be included.  
This method is synchronous.
24.15. **CLASS EKEVENTSTOREMBS**

24.15.18 *eventsMatchingPredicateAsync*(predicate as NSPredicateMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Returns all events that match a given predicate.

**Notes:**
Calls later eventsMatchingPredicateAsyncCompleted event with all events that match predicate, as an array of EKEvent objects.

Only events that have been committed are included in the results. Events saved using saveEvent with the commit parameter set to false must call commit beforehand to be included.

This method is asynchronous.

24.15.19 *eventsWithExternalIdentifier*(identifier as string) as EKCalendarItemMBS()

MBS Mac64bit Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Returns events with the specified external identifier.

**Notes:** Same as calendarItemsWithExternalIdentifier, but only returning events.

24.15.20 *eventWithIdentifier*(identifier as string) as EKEventMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Returns the first occurrence of an event with a given identifier.

**Notes:** The event corresponding to identifier, or nil if no event is found.

24.15.21 *fetchRemindersMatchingPredicate*(predicate as NSPredicateMBS, tag as Variant = nil) as EKFetchRequestMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Fetches reminders matching a given predicate asynchronously.

**Notes:**

predicate: The search predicate.

Returns a value to be used in cancelFetchRequest to cancel the request later if desired.

Only reminders that have been committed are included in the results. Reminders saved using saveReminder with the commit parameter set to NO must call commit beforehand to be included.
This method fetches reminders asynchronously. Calls FetchedReminders event later on success.

**24.15.22** fetchRemindersMatchingPredicateSync(predicate as NSPredicateMBS) as EKReminderMBS()

MBS Mac64bit Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Fetches reminders matching a given predicate synchronously.

**Notes:**
Same as fetchRemindersMatchingPredicate, except that we wait for result and return it without calling an event.

Only reminders that have been committed are included in the results. Reminders saved using saveReminder with the commit parameter set to NO must call commit beforehand to be included.

**24.15.23** predicateForCompletedRemindersWithCompletionDate(startDate as date, endDate as date) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Fetches completed reminders in a set of calendars within an optional range.

**Notes:**
startDate: The starting bound of the range to search.
endDate: The ending bound of the range to search.
calendars: Optional. An array of calendars to search.

The created predicate to be used for fetchRemindersMatchingPredicate methods.

Pass nil for startDate to find all reminders completed before endDate. Similarly, pass nil for both startDate and endDate to get all complete reminders in the specified calendars.

See also:

- **24.15.24** predicateForCompletedRemindersWithCompletionDate(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS
24.15.24 predicateForCompletedRemindersWithCompletionDate(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: Fetches completed reminders in a set of calendars within an optional range.

Notes:

startDate: The starting bound of the range to search.
endDate: The ending bound of the range to search.
calendars: Optional. An array of calendars to search.

The created predicate to be used for fetchRemindersMatchingPredicate methods.

Pass nil for startDate to find all reminders completed before endDate. Similarly, pass nil for both startDate and endDate to get all complete reminders in the specified calendars.

See also:

- 24.15.23 predicateForCompletedRemindersWithCompletionDate(startDate as date, endDate as date) as NSPredicateMBS

24.15.25 predicateForEvents(startDate as date, endDate as date) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: Creates and returns a predicate for finding events in the event store that fall within a given date range.

Notes:

startDate: The start date of the range of events fetched.
endDate: The end date of the range of events fetched.
calendars: Optional. The calendars to search, as an array of EKCalendarMBS objects. Passing nil indicates to search all calendars.

See also:

- 24.15.26 predicateForEvents(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS

24.15.26 predicateForEvents(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: Creates and returns a predicate for finding events in the event store that fall within a given date range.

Notes:
startDate: The start date of the range of events fetched.
endDate: The end date of the range of events fetched.
calendar: Optional. The calendars to search, as an array of EKCalendarMBS objects. Passing nil indicates to search all calendars.

See also:

- 24.15.25 predicateForEvents(startDate as date, endDate as date) as NSPredicateMBS

24.15.27 predicateForIncompleteRemindersWithDueDate(startDate as date, endDate as date) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: Fetches incomplete reminders in a set of calendars within an optional range.

Notes:

startDate: The starting bound of the range to search.
endDate: The ending bound of the range to search.
calendar: Optional. An array of calendars to search.

The created predicate to be used for fetchRemindersMatchingPredicate:completion:.

Pass nil for startDate to find all reminders due before endDate. Similarly, pass nil for both startDate and endDate to get all incomplete reminders in the specified calendars.

See also:

- 24.15.28 predicateForIncompleteRemindersWithDueDate(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS

24.15.28 predicateForIncompleteRemindersWithDueDate(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: Fetches incomplete reminders in a set of calendars within an optional range.

Notes:

startDate: The starting bound of the range to search.
endDate: The ending bound of the range to search.
calendar: Optional. An array of calendars to search.

The created predicate to be used for fetchRemindersMatchingPredicate:completion:.

Pass nil for startDate to find all reminders due before endDate. Similarly, pass nil for both startDate and endDate to get all incomplete reminders in the specified calendars.

See also:
• 24.15.27 predicateForIncompleteRemindersWithDueDate(startDate as date, endDate as date) as NSPredicateMBS

24.15.29 predicateForRemindersInCalendar(calendar as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fetches all reminders in a calendar. **Notes:** The created predicate to be used for fetchRemindersMatchingPredicate methods.

24.15.30 predicateForRemindersInCalendars(calendars() as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fetches all reminders in a set of calendars. **Notes:** The created predicate to be used for fetchRemindersMatchingPredicate methods.

24.15.31 refreshSourcesIfNecessary

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Pulls new data from remote sources if necessary. **Notes:** Use this method to pull new data from remote sources if the local data is out of date.

24.15.32 remindersWithExternalIdentifier(identifier as string) as EKCalendarItemMBS()

MBS Mac64bit Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns reminders with the specified external identifier. **Notes:** Same as calendarItemsWithExternalIdentifier, but only returning reminders.

24.15.33 reminderWithIdentifier(identifier as string) as EKCalendarItemMBS

MBS Mac64bit Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the reminder with the specified identifier. **Notes:** Same as calendarItemWithIdentifier, but for reminders only.
24.15.34 removeCalendar(calendar as EKCalendarMBS, commit as boolean, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes a calendar from the event store by either batching or committing the changes.
Notes:
- calendar: The calendar to be removed.
- commit: True to remove the calendar immediately; otherwise, the change is batched until the commit: method is invoked.
- error: The error that occurred, if any; otherwise, nil.

Returns true if successful; otherwise, false.
This method raises an exception if calendar belongs to another event store.

24.15.35 removeEvent(event as EKEventMBS, span as Integer, commit as boolean, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes an event or recurring events from the event store by either batching or committing the changes.
Notes:
- event: The event to remove.
- span: The span to use. Indicates whether the remove affects future instances of the event in the case of a recurring event.
- commit: True to remove the event immediately; otherwise, the change is batched until the commit: method is invoked.
- error: The error that occurred, if any did. Otherwise, nil.

If the event has successfully removed, true; otherwise, false. Also returns false if event cannot be removed because it is not in the event store.

This method raises an exception if it is passed an event from another event store.

24.15.36 removeReminder(reminder as EKReminderMBS, commit as boolean, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Removes a reminder from the event store by either committing or batching the changes.
Notes:
- reminder: The reminder to be removed.
commit: A Boolean value indicating whether to remove the reminder immediately or to batch the removals; passing NO will not commit the removal from the event store until the commit: method is invoked.
error: The error that occurred, if any; otherwise, nil.

If successful, true; otherwise, false.
This method raises an exception if reminder belongs to another event store.

24.15.37 requestAccessToEntityType(entityType as Integer, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Prompts the user to grant or deny access to event or reminder data.
Notes:
entityType: The event or reminder entity type.

Requesting access to an event store asynchronously prompts your users for permission to use their data. The user is only prompted the first time your app requests access to an entity type; any subsequent instantiations of EKEventStore uses existing permissions. When the user taps to grant or deny access, the requestAccessToEntityTypeCompleted event will be called on an arbitrary queue. Your app is not blocked while the user decides to grant or deny permission.

After users choose their permission level, the event store either calls the event. Available in OS X v10.9 and later.

24.15.38 reset

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Returns the event store to its saved state.
Notes: This method updates all the properties of all the objects with their corresponding values in the event store. Any local changes that were not saved before invoking this method will be lost. All objects that were created or retrieved using this store are disassociated from it and should be considered invalid.

24.15.39 saveCalendar(calendar as EKCalendarMBS, commit as boolean, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Saves a calendar to the event store by either committing or batching the changes.
Notes:
calendar: The calendar to be saved.
commit: True to save the calendar immediately; otherwise, the change is batched until the commit method is invoked.
error: The error that occurred, if any; otherwise, nil.

Returns true if successful; otherwise, false.

This method raises an exception if calendar belongs to another event store.

24.15.40  saveEvent(event as EKEventMBS, span as Integer, commit as boolean, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Saves an event or recurring events to the event store by either batching or committing the changes.
Notes:

   event: The event to be saved.
   span: The span to use. Indicates whether the save affects future instances of the event in the case of a recurring event.
   commit: To save the event immediately, pass true; otherwise, the change is batched until the commit method is invoked.
   error: The error that occurred, if any; otherwise, nil.

Returns if successful, true; otherwise, false. Also returns false if event does not need to be saved because it has not been modified.

This method raises an exception if it is passed an event from another event store.

When an event is saved, it is updated in the Calendar database. Any fields you did not modify are updated to reflect the most recent value in the database. If the event has been deleted from the database, it is re-created as a new event.

24.15.41  saveReminder(reminder as EKReminderMBS, commit as boolean, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Saves changes to a reminder by either committing or batching the changes.
Notes:

   reminder: The reminder to be saved.
24.15. CLASS EKEVENTSTOREMBS

commit: A Boolean value indicating whether to save the reminder immediately or to batch the changes; passing NO will not commit changes to the event store until the commit: method is invoked.
error: The error that occurred, if any; otherwise, nil.

If successful, true; otherwise, false.
This method raises an exception if reminder belongs to another event store.

24.15.42 sources as EKSourceMBS()

Notes: An EKSource object represents an account that contains calendars.

24.15.43 sourceWithIdentifier(identifier as string) as EKSourceMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a source with the specified identifier.

24.15.44 Properties

24.15.45 defaultCalendarForNewEvents as EKCalendarMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The calendar that events are added to by default, as specified by user settings.
Notes: (Read only property)

24.15.46 defaultCalendarForNewReminders as EKCalendarMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The calendar that events are added to by default, as specified by user settings.
Notes: (Read only property)

24.15.47 eventStoreIdentifier as String

Notes:
If the store is damaged, it is re-created and given a new identifier. If this value is different from a fetched value, you should take the appropriate action. 
(Read only property)

24.15.48 Events

24.15.49 Changed

Notes: Posted whenever changes are made to the Calendar database, including adding, removing, and changing events or reminders. Individual changes are not described. When you receive this notification, you should refetch all EKEvent and EKReminder objects you have accessed, as they are considered stale. If you are actively editing an event and do not wish to refetch it unless it is absolutely necessary to do so, you can call the refresh method on it. If the method returns true, you do not need to refetch the event.

24.15.50 enumerateEventsMatchingPredicateUpdate(e as EKEventMBS, byref stop as boolean, predicate as NSPredicateMBS, tag as Variant)

24.15.51 eventsMatchingPredicateAsyncCompleted(events() as EKEventMBS, predicate as NSPredicateMBS, tag as Variant)

24.15.52 fetchRemindersMatchingPredicateCompleted(reminders() as EKReminderMBS, predicate as NSPredicateMBS, tag as Variant)

24.15.53 requestAccessToEntityTypeCompleted(entityType as Integer, granted as Boolean, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called by requestAccessToEntityType once decision is made.

24.15.54 Constants

24.15.55 kAuthorizationStatusAuthorized = 3

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the constants to indicates the current authorization status for a specific entity type. 
**Notes:** The app is authorized to access the service.

24.15.56 kAuthorizationStatusDenied = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the constants to indicates the current authorization status for a specific entity type. 
**Notes:** The user explicitly denied access to the service for the app.

24.15.57 kAuthorizationStatusNotDetermined = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the constants to indicates the current authorization status for a specific entity type. 
**Notes:** The user has not yet made a choice regarding whether the app may access the service.

24.15.58 kAuthorizationStatusRestricted = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the constants to indicates the current authorization status for a specific entity type. 
**Notes:** The app is not authorized to access the service. The user cannot change this apps authorization status, possibly due to active restrictions such as parental controls being in place.

24.15.59 kEntityMaskEvent = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the entity types. 
**Notes:** Event
24.15.60  \textbf{kEntityMaskReminder} = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. \textbf{Function}: One of the entity types.  
\textbf{Notes}: Reminder

24.15.61  \textbf{kEntityTypeEvent} = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. \textbf{Function}: One of the entity types.  
\textbf{Notes}: Entity Event

24.15.62  \textbf{kEntityTypeReminder} = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. \textbf{Function}: One of the entity types.  
\textbf{Notes}: Entity Reminder

24.15.63  \textbf{kErrorAlarmGreaterThanRecurrence} = 8

MBS Mac64bit Plugin, Plugin Version: 15.3. \textbf{Function}: One of the error constants.  
\textbf{Notes}: The alarm interval is greater than the recurrence interval.

24.15.64  \textbf{kErrorAlarmProximityNotSupported} = 21

MBS Mac64bit Plugin, Plugin Version: 15.3. \textbf{Function}: One of the error constants.  
\textbf{Notes}: The source does not allow geofences on alarms.

24.15.65  \textbf{kErrorCalendarDoesNotAllowEvents} = 22

MBS Mac64bit Plugin, Plugin Version: 15.3. \textbf{Function}: One of the error constants.  
\textbf{Notes}: The calendar does not allow events to be added.
24.15.66 kErrorCalendarDoesNotAllowReminders = 23
MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the error constants. Notes: The calendar does not allow reminders to be added.

24.15.67 kErrorCalendarHasNoSource = 14
MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the error constants. Notes: The calendar cannot be saved with no source set.

24.15.68 kErrorCalendarIsImmutable = 16
MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the error constants. Notes: The calendar is immutable and cannot be modified or deleted.

24.15.69 kErrorCalendarReadOnly = 6
MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the error constants. Notes: The calendar is read-only and cannot have events added to it.

24.15.70 kErrorCalendarSourceCannotBeModified = 15
MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the error constants. Notes: The calendar cannot be moved to another source.

24.15.71 kErrorDatesInverted = 4
MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the error constants. Notes: The events end date occurs before its start date.

24.15.72 kErrorDurationGreaterThanRecurrence = 7
MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the error constants. Notes: The duration of an event is greater than its recurrence interval.
24.15.73  kErrorEventNotMutable = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants.
**Notes:** The event is not mutable and cannot be saved or deleted.

24.15.74  kErrorInternalFailure = 5

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants.
**Notes:** An internal error occurred.

24.15.75  kErrorInvalidSpan = 13

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants.
**Notes:** An invalid span was passed when saving or deleting.

24.15.76  kErrorInvitesCannotBeMoved = 12

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants.
**Notes:** The event cannot be moved because it is an invite.

24.15.77  kErrorNoCalendar = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants.
**Notes:** The event is not associated with a calendar.

24.15.78  kErrorNoEndDate = 3

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants.
**Notes:** The event has no end date set.

24.15.79  kErrorNoStartDate = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants.
**Notes:** The event has no start date set.
24.15. **CLASS EKEVENTSTOREMBS**

24.15.80  **kErrorObjectBelongsToDifferentStore = 11**

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants. **Notes:** The object belongs to a different calendar store.

24.15.81  **kErrorRecurringReminderRequiresDueDate = 18**

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants. **Notes:** The recurring reminder requires a due date.

24.15.82  **kErrorReminderLocationsNotSupported = 20**

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants. **Notes:** The source doesn’t support locations on reminders.

24.15.83  **kErrorSourceDoesNotAllowCalendarAddDelete = 17**

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants. **Notes:** The source doesn’t allow calendars to be added or deleted.

24.15.84  **kErrorSourceDoesNotAllowEvents = 25**

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants. **Notes:** The source does not allow calendars supporting event entity types.

24.15.85  **kErrorSourceDoesNotAllowReminders = 24**

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants. **Notes:** The source does not allow calendars supporting reminder entity types.

24.15.86  **kErrorStartDateCollidesWithOtherOccurrence = 10**

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants. **Notes:** The events start date collides with another occurrence of the event.
24.15.87  kErrorStartDateTooFarInFuture = 9

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants.  
**Notes:** The start date is further into the future than the calendar can display.

24.15.88  kErrorStructuredLocationsNotSupported = 19

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the error constants.  
**Notes:** The source to which this calendar belongs does not support structured locations.

24.15.89  kSpanFutureEvents = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event span constants.  
**Notes:** Modifications to this event instance should also affect future instances of this event.

24.15.90  kSpanThisEvent = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the event span constants.  
**Notes:** Modifications to this event instance should affect only this instance.

24.15.91  kWeekDayFriday = 6

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the weekday constants.  
**Notes:** Friday

24.15.92  kWeekDayMonday = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the weekday constants.  
**Notes:** Monday

24.15.93  kWeekDaySaturday = 7

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the weekday constants.  
**Notes:** Saturday
24.15.94 kWeekDaySunday = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the weekday constants. **Notes:** Sunday

24.15.95 kWeekDayThursday = 5

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the weekday constants. **Notes:** Thursday

24.15.96 kWeekDayTuesday = 3

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the weekday constants. **Notes:** Tuesday

24.15.97 kWeekDayWednesday = 4

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the weekday constants. **Notes:** Wednesday
24.16 class EKFetchRequestMBS

24.16.1 class EKFetchRequestMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The class for an ongoing fetch report.
Notes:
If request object is destroyed, the request is cancelled, if it is not yet finished.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

24.16.2 Methods

24.16.3 Constructor

24.16.4 Properties

24.16.5 Handle as Integer

Notes: (Read and Write property)
24.17. CLASS EKOBJECTMBS

24.17  class EKObjectMBS

24.17.1  class EKObjectMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
Function: The EKObject class is an abstract superclass for all Event Kit classes whose instances are persistent.
Notes: It provides fine control when saving and restoring property settings. For example, you can find out if a persistent object was modified locally and whether it needs to be saved. If the object has changed in the event store since it was fetched, you can refresh the local copy by keeping local changes or by removing local changes. You can also roll back the object to the state when it was first fetched.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

24.17.2  Methods

24.17.3  Constructor

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
Function: The private constructor.

24.17.4  hasChanges as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
Function: Returns whether this object or any of the objects it contains has uncommitted changes.
Notes: Returns true if there are uncommitted changes; otherwise, false.

24.17.5  isNew as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
Function: Returns whether this object has ever been saved.
Notes: Returns true if the object has not been saved; otherwise, false.

24.17.6  refresh as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
Function: Merges changes to this object with the latest saved values.
Notes:
If the operation is successful, YES; if the object was deleted in the event store, false. If this method returns false, the object should be released.

This method merges the local changes to properties of this object with the latest values in the event store. This method updates only properties that have not been modified locally, so you do not lose any changes by invoking this method. You can also use this method to see whether an object was deleted from the event store.

**24.17.7 reset**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns this object to its saved state. **Notes:** This method updates all the properties of this object with the corresponding values in the event store. Any local changes that were not saved before invoking this method are lost. This method does nothing if the object was never saved.

**24.17.8 rollback**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Rolls back the property values of this object to its original state when it was first fetched. **Notes:** Any local changes to this object are lost when invoking this method. This method does not refetch property values from the event store. This method does nothing if the object was never changed.

**24.17.9 Properties**

**24.17.10 Handle as Integer**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Internal object reference. **Notes:** (Read and Write property)
24.18. CLASS EKPARTICIPANTMBS

24.18 class EKParticipantMBS

24.18.1 class EKParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: An EKParticipant object represents a participant in a calendar event.

Notes:
A participant can be a person, group, room, or other resource.

Do not create EKParticipant objects directly. Instead, use the property attendees on EKCalendarItem to return an array of EKParticipant objects.

Event Kit cannot add participants to an event nor change participant information. Use the properties in this class to get information about a participant.
Subclass of the EKObjectMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

24.18.2 Methods

24.18.3 ABPersonInAddressBook(addressBook as Variant) as Variant

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: Returns the address book record that represents the participant.

Notes:
Please pass a ABAddressbookMBS object for the addressBook parameter. You get back a ABPersonMBS object.
The address book record for the participant, or nil if the record is not found.
This method searches for a record match based on the participants email address.

24.18.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: The private constructor.

24.18.5 copy as EKParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: Creates a copy of the participant.
24.18.6 Properties

24.18.7 isCurrentUser as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: A Boolean value indicating whether this participant represents the owner of this account.  
**Notes**: (Read only property)

24.18.8 name as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: The participants name.  
**Notes**: (Read only property)

24.18.9 participantRole as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: The participants role in the event.  
**Notes**: (Read only property)

24.18.10 participantStatus as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: The participants attendance status.  
**Notes**: (Read only property)

24.18.11 participantType as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: The participants type.  
**Notes**: (Read only property)
24.18. **CLASS EKPARTICIPANTMBS**

### 24.18.12 person as Variant

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The person in the shared addressbook instance.

**Notes:**
Value is an ABPersonMBS object.
(Read only property)

### 24.18.13 URL as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The URL representing this participant.

**Notes:** (Read only property)

### 24.18.14 Constants

#### 24.18.15 kRoleChair = 3

MBS Mac64bit Plugin, Plugin Version: 15.3.

**Function:** Represents a participants role for an event.

**Notes:** The participant is the chair of the event.

#### 24.18.16 kRoleNonParticipant = 4

MBS Mac64bit Plugin, Plugin Version: 15.3.

**Function:** Represents a participants role for an event.

**Notes:** The participant does not have an active role in the event.

#### 24.18.17 kRoleOptional = 2

MBS Mac64bit Plugin, Plugin Version: 15.3.

**Function:** Represents a participants role for an event.

**Notes:** The participants attendance is optional.

#### 24.18.18 kRoleRequired = 1

MBS Mac64bit Plugin, Plugin Version: 15.3.

**Function:** Represents a participants role for an event.

**Notes:** The participants attendance is required.
24.18.19 $k\text{RoleUnknown} = 0$

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Represents a participant’s role for an event. **Notes:** The participant’s role is unknown.

24.18.20 $k\text{StatusAccepted} = 2$

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the status constants. **Notes:** The participant has accepted the event.

24.18.21 $k\text{StatusCompleted} = 6$

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the status constants. **Notes:** The participant’s event has completed.

24.18.22 $k\text{StatusDeclined} = 3$

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the status constants. **Notes:** The participant has declined the event.

24.18.23 $k\text{StatusDelegated} = 5$

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the status constants. **Notes:** The participant has delegated attendance to another participant.

24.18.24 $k\text{StatusInProcess} = 7$

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the status constants. **Notes:** The participant’s event is currently in process.

24.18.25 $k\text{StatusPending} = 1$

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the status constants. **Notes:** The participant has yet to respond to the event.
24.18.26  kStatusTentative = 4

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the status constants.
**Notes:** The participants attendance status is tentative.

24.18.27  kStatusUnknown = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the status constants.
**Notes:** The participants attendance status is unknown.

24.18.28  kTypeGroup = 4

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Represents a participants type.
**Notes:** The participant is a group.

24.18.29  kTypePerson = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Represents a participants type.
**Notes:** The participant is a person.

24.18.30  kTypeResource = 3

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Represents a participants type.
**Notes:** The participant is a resource.

24.18.31  kTypeRoom = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Represents a participants type.
**Notes:** The participant is a room.

24.18.32  kTypeUnknown = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Represents a participants type.
**Notes:** The participants type is unknown.
24.19 class EKRecurrenceDayOfWeekMBS

24.19.1 class EKRecurrenceDayOfWeekMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The EKRecurrenceDayOfWeek class represents a day of the week for use with an EKRecurrenceRule object.

**Notes:** A day of the week can optionally have a week number, indicating a specific day in the recurrence rules frequency. For example, a day of the week with a day value of Tuesday and a week number of 2 would represent the second Tuesday of every month in a monthly recurrence rule, and the second Tuesday of every year in a yearly recurrence rule. A day of the week with a week number of 0 ignores its week number.

24.19.2 Methods

24.19.3 Constructor(dayOfTheWeek as Integer)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a day of the week with a given day and week number.

**Notes:**

dayOfTheWeek: The day of the week. Values range from 1 to 7, with Sunday being 1.
weekNumber: Optional, the week number.

See also:

- 24.19.4 Constructor(dayOfTheWeek as Integer, weekNumber as Integer)

24.19.4 Constructor(dayOfTheWeek as Integer, weekNumber as Integer)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a day of the week with a given day and week number.

**Notes:**

dayOfTheWeek: The day of the week. Values range from 1 to 7, with Sunday being 1.
weekNumber: Optional, the week number.

See also:

- 24.19.3 Constructor(dayOfTheWeek as Integer)

24.19.5 copy as EKRecurrenceDayOfWeekMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of this object.
24.19. **CLASS EKRECURRENCEDAYOFWEEKMBS**

### 24.19.6 dayOfWeek(dayOfTheWeek as Integer) as EKRecurrenceDayOfWeekMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a day of the week with a given day.
**Notes:**
The week number of the returned day of the week is 0.
Values range from 1 to 7, with Sunday being 1.
See also:
- 24.19.7 dayOfWeek(dayOfTheWeek as Integer, weekNumber as Integer) as EKRecurrenceDayOfWeekMBS

### 24.19.7 dayOfWeek(dayOfTheWeek as Integer, weekNumber as Integer) as EKRecurrenceDayOfWeekMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an autoreleased day of the week with a given day and week number.
**Notes:**
dayOfTheWeek: The day of the week. Values range from 1 to 7, with Sunday being 1.
weekNumber: The week number.
See also:
- 24.19.6 dayOfWeek(dayOfTheWeek as Integer) as EKRecurrenceDayOfWeekMBS

### 24.19.8 Properties

#### 24.19.9 dayOfTheWeek as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The day of the week.
**Notes:**
Values are from 1 to 7, with Sunday being 1.
(Read only property)

#### 24.19.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Internal object reference.
**Notes:** (Read and Write property)
24.19.11 weekNumber as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The week number of the day of the week.

**Notes:**
Values range from 53 to 53. A negative value indicates a value from the end of the range. 0 indicates the week number is irrelevant.
(Read only property)

24.19.12 Constants

24.19.13 kFriday = 6

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Day constant for Friday.

**Notes:** Friday

24.19.14 kMonday = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Day constant for Monday.

**Notes:** Monday

24.19.15 kSaturday = 7

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Day constant for Saturday.

**Notes:** Saturday

24.19.16 kSunday = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Day constant for Sunday.

**Notes:** Sunday

24.19.17 kThursday = 5

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Day constant for Thursday.

**Notes:** Thursday
24.19. CLASS EKRECURRENCE\DAYOFWEEKMBS

24.19.18 kTuesday = 3

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Day constant for Tuesday.
**Notes:** Tuesday

24.19.19 kWednesday = 4

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** Day constant for Wednesday.
**Notes:** Wednesday
24.20 class EKRecurrenceEndMBS

24.20.1 class EKRecurrenceEndMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The EKRecurrenceEnd class defines the end of a recurrence rule defined by an EKRecurrenceRule object.

**Notes:** The recurrence end can be specified by a date (date-based) or by a maximum count of occurrences (count-based). An event which is set to never end should have its EKRecurrenceEnd set to nil.

24.20.2 Methods

24.20.3 Constructor(endDate as date)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a date-based recurrence end with a given end date.

**Notes:** The end date argument must be a valid NSDate and not nil; otherwise an exception will be raised.

See also:

- 24.20.4 Constructor(occurrenceCount as Integer)

24.20.4 Constructor(occurrenceCount as Integer)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a count-based recurrence end with a given maximum occurrence count.

**Notes:** The maximum occurrence count argument must be a positive integer and not 0; otherwise an exception will be raised.

See also:

- 24.20.3 Constructor(endDate as date)

24.20.5 copy as EKRecurrenceEndMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the object.

24.20.6 recurrenceEndWithEndDate(endDate as date) as EKRecurrenceEndMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns a date-based recurrence end with a given end date.
24.20. CLASS EKRECURRENCEENDMBS

Notes: The end date argument must be a valid NSDate and not nil; otherwise an exception will be raised.

24.20.7 recurrenceEndWithOccurrenceCount(occurrenceCount as Integer) as EKRecurrenceEndMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Initializes and returns a count-based recurrence end with a given maximum occurrence count. Notes: The maximum occurrence count argument must be a positive integer and not 0; otherwise an exception will be raised.

24.20.8 Properties

24.20.9 endDate as Date

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The end date of the recurrence end, or nil if the recurrence end is count-based. Notes: (Read only property)

24.20.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Internal object reference. Notes: (Read and Write property)

24.20.11 occurrenceCount as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The occurrence count of the recurrence end, or 0 if the recurrence end is date-based. Notes: (Read only property)
24.21 class EKRecurrenceRuleMBS

24.21.1 class EKRecurrenceRuleMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
**Function:** The EKRecurrenceRule class is used to describe the recurrence pattern for a recurring event.  
**Notes:**  
After you create a recurrence rule, assign it to an event with the recurrenceRule method of EKEvent.  
Recurrence rules can have an end, represented by an EKRecurrenceEnd object. The end can be based on a specific date or a maximum number of occurrences.  
Subclass of the EKObjectMBS class.

24.21.2 Methods

24.21.3 Constructor(type as Integer, interval as Integer, days() as EKRecurrenceDayOfWeekMBS, monthDays() as Integer, months() as Integer, weeksOfTheYear() as Integer, daysOfTheYear() as Integer, setPositions() as Integer, end as EKRecurrenceEndMBS = nil)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
**Function:** Initializes and returns a recurrence rule with a given frequency and additional scheduling information.  
**Notes:**  
type: The frequency of the recurrence rule. Can be daily, weekly, monthly, or yearly.  
interval: The interval between instances of this recurrence. For example, a weekly recurrence rule with an interval of 2 occurs every other week. Must be greater than 0.  
days: The days of the week that the event occurs, as an array of EKRecurrenceDayOfWeek objects.  
monthDays: The days of the month that the event occurs, as an array of integers. Values can be from 1 to 31 and from -1 to -31. This parameter is only valid for recurrence rules of type EKRecurrenceFrequency-Monthly.  
months: the months of the year that the event occurs, as an array of integers. Values can be from 1 to 12. This parameter is only valid for recurrence rules of type EKRecurrenceFrequencyYearly.  
weeksOfTheYear: The weeks of the year that the event occurs, as an array of integers. Values can be from 1 to 53 and from -1 to -53. This parameter is only valid for recurrence rules of type EKRecurrenceFrequencyYearly.  
daysOfTheYear: The days of the year that the event occurs, as an array of integers. Values can be from 1 to 366 and from -1 to -366. This parameter is only valid for recurrence rules of type EKRecurrenceFrequencyYearly.  
setPositions: An array of ordinal numbers that filters which recurrences to include in the recurrence rules frequency. See setPositions for more information.  
end: The end of the recurrence rule.
Handle is zero if invalid values are provided.

Negative values indicate counting backwards from the end of the recurrence rules frequency.

See also:

- 24.21.4 Constructor(type as Integer, interval as Integer, end as EKRecurrenceEndMBS = nil)

### 24.21.4 Constructor(type as Integer, interval as Integer, end as EKRecurrenceEndMBS = nil)

**MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Initializes and returns a simple recurrence rule with a given frequency, interval, and end.

**Notes:**

type: The frequency of the recurrence rule. Can be daily, weekly, monthly, or yearly.

interval: The interval between instances of this recurrence. For example, a weekly recurrence rule with an interval of 2 occurs every other week. Must be greater than 0.

end: The end of the recurrence rule.

Handle is zero if invalid values are provided.

See also:

- 24.21.3 Constructor(type as Integer, interval as Integer, days() as EKRecurrenceDayOfWeekMBS, monthDays() as Integer, months() as Integer, weeksOfTheYear() as Integer, daysOfTheYear() as Integer, setPositions() as Integer, end as EKRecurrenceEndMBS = nil)

### 24.21.5 copy as EKRecurrenceRuleMBS

**MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Creates a copy of the recurrence rule.

### 24.21.6 daysOfTheMonth as Integer()

**MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The days of the month associated with the recurrence rule, as an array of integers.

**Notes:**

Values can be from 1 to 31 and from -1 to -31. This property value is valid only for recurrence rules that were initialized with specific days of the month and a frequency type of EKRecurrenceFrequencyMonthly. Negative values indicate counting backwards from the end of the month.
24.21.7 **daysOfWeek as Integer()**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The days of the week associated with the recurrence rule, as an array of EKRecurrenceDayOfWeek objects.

**Notes:** This property value is valid only for recurrence rules that were initialized with specific days of the week and a frequency type of EKRecurrenceFrequencyWeekly, EKRecurrenceFrequencyMonthly, or EKRecurrenceFrequencyYearly.

24.21.8 **daysOfYear as Integer()**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The days of the year associated with the recurrence rule, as an array of integers.

**Notes:**

Values can be from 1 to 366 and from -1 to -366. This property value is valid only for recurrence rules initialized with a frequency type of EKRecurrenceFrequencyYearly.

Negative values indicate counting backwards from the end of the year.

24.21.9 **monthsOfYear as Integer()**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The months of the year associated with the recurrence rule, as an array of integers.

**Notes:** Values can be from 1 to 12. This property value is valid only for recurrence rules initialized with specific months of the year and a frequency type of EKRecurrenceFrequencyYearly.

24.21.10 **setPositions as Integer()**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of ordinal numbers that filters which recurrences to include in the recurrence rules frequency.

**Notes:**

For example, a yearly recurrence rule that has a daysOfWeek value that specifies Monday through Friday, and a setPositions array containing 2 and -1, occurs only on the second weekday and last weekday of every year.

Values can be from 1 to 366 and from -1 to -366.

Negative values indicate counting backwards from the end of the recurrence rules frequency (week, month,
24.21.11 weeksOfTheYear as Integer()

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The weeks of the year associated with the recurrence rule, as an array of integers.
Notes:
Values can be from 1 to 53 and from -1 to -53. This property value is valid only for recurrence rules initialized with specific weeks of the year and a frequency type of EKRecurrenceFrequencyYearly. Negative values indicate counting backwards from the end of the year.

24.21.12 Properties

24.21.13 calendarIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The identifier for the recurrence rules calendar.
Notes: (Read only property)

24.21.14 firstDayOfTheWeek as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Indicates which day of the week the recurrence rule treats as the first day of the week.
Notes:
Values of 1 to 7 correspond to Sunday through Saturday. A value of 0 indicates that this property is not set for the recurrence rule.
(Read only property)

24.21.15 frequency as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The frequency of the recurrence rule.
Notes: (Read only property)
24.21.16  interval as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Specifies how often the recurrence rule repeats over the unit of time indicated by its frequency.
Notes: For example, a recurrence rule with a frequency type of EKRecurrenceFrequencyWeekly and an interval of 2 repeats every two weeks.
(Read only property)

24.21.17  recurrenceEnd as EKRecurrenceEndMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Indicates when the recurrence rule ends.
Notes: This can be represented by an end date or a number of occurrences.
(Read and Write property)

24.21.18  Constants

24.21.19  kRecurrenceFrequencyDaily = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the frequencies for recurrence rules.
Notes: Indicates a daily recurrence rule.

24.21.20  kRecurrenceFrequencyMonthly = 2

MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the frequencies for recurrence rules.
Notes: Indicates a monthly recurrence rule.

24.21.21  kRecurrenceFrequencyWeekly = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the frequencies for recurrence rules.
Notes: Indicates a weekly recurrence rule.
24.21.22  kRecurrenceFrequencyYearly = 3

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the frequencies for recurrence rules. **Notes:** Indicates a yearly recurrence rule.
24.22  class EKReminderMBS

24.22.1  class EKReminderMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** An instance of the EKReminder class represents a reminder added to a calendar in the Event
Kit framework.

**Notes:**
Use the reminderWithEventStore: method to create a new reminder. Use the properties in the class to get
and modify certain information about a reminder.
Subclass of the EKCalendarItemMBS class.

24.22.2  Methods

24.22.3  Constructor(eventStore as EKEventStoreMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Creates and returns a new reminder in the given event store.

24.22.4  reminderWithEventStore(eventStore as EKEventStoreMBS) as EKReminderMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** Creates and returns a new reminder in the given event store.

24.22.5  Properties

24.22.6  completed as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** A Boolean value determining whether or not the reminder is marked completed.

**Notes:**
Setting this property to true will set completionDate to the current date; setting this property to false will
set completionDate to nil.

If the reminder was completed using a different client, you may encounter the case where this property is
true, but completionDate is nil.
(Read and Write property)
24.22.7 completionDate as date

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The completion date as a date.  
**Notes:** (Read and Write property)

24.22.8 dueDate as date

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The due date.  
**Notes:** (Read only property)

24.22.9 dueDateComponents as NSDateComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The date by which the reminder should be completed.  
**Notes:**

The use of date components allows the due date and its time zone to be represented in a single property. A nil time zone represents a floating date. Setting a date component without an hour, minute and second component will set the reminder to be an all-day reminder. If this property is set, the calendar must be set to NSGregorianCalendar; otherwise an exception is raised.

This componentss timeZone property is independent of time zone properties on startDateComponents and its super EKCalendarItem object. By default, the due date is set to the system time zone.

On iOS, Event Kit requires that a start date is set if the due date is set, however this is not a requirement on OS X.  
(Read and Write property)

24.22.10 priority as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The priority of the reminder.  
**Notes:**

Priorities run from 1 (highest) to 9 (lowest). A priority of 0 means no priority. Saving a reminder with any other priority will fail. Per RFC 5545, priorities of 1-4 are considered "high," a priority of 5 is "medium," and priorities of 6-9 are "low."
24.22.11 startDateComponents as NSDateComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: The start date of the task.

Notes:

The use of date components allows the start date and its time zone to be represented in a single property. A nil time zone represents a floating date. Setting a date component without an hour, minute and second component will set the reminder to be an all-day reminder. If this property is set, the calendar must be set to NSGregorianCalendar; otherwise an exception is raised.

The start date component's timeZone property corresponds to the timeZone property on EKCalendarItem. A change in one value will cause a change in the other. Setting the time zone directly on the components does not guarantee that your changes will be saved; instead, pull this property from the reminder, set the time zone on it, and assign it back to the reminder:

(Read and Write property)

24.22.12 Constants

24.22.13 kPriorityHigh = 1

MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the priority constants.

Notes: High

24.22.14 kPriorityLow = 9

MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the priority constants.

Notes: Low

24.22.15 kPriorityMedium = 5

MBS Mac64bit Plugin, Plugin Version: 15.3. Function: One of the priority constants.

Notes: Medium
24.22. CLASS EKREMINDERMBS

24.22.16 kPriorityNone = 0

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the priority constants. **Notes:** No priority
24.23 class EKSourceMBS

24.23.1 class EKSourceMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** An instance of the EKSource class represents the account that a calendar belongs to.

**Notes:**
You do not create instances of this class. You retrieve EKSource objects from an EKEventStore object. Use the sources property to get all the EKSource objects for an event store, and use the methods in this class to access properties of the source object.

Subclass of the EKObjectMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

24.23.2 Methods

24.23.3 calendarsForEntityType(types as Integer) as EKCalendarMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** Returns the calendars that belong to this source object that support a particular entity type.

**Notes:** entityType: The entity type of either an event or a reminder.

24.23.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The private constructor.

24.23.5 Properties

24.23.6 sourceIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** A unique identifier for the source object.

**Notes:** (Read only property)

24.23.7 sourceType as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The type of this source object.
24.23. **CLASS EKSOURCEMBS**

**Notes:** (Read only property)

24.23.8 **title as String**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of this source object.  
**Notes:** (Read only property)

24.23.9 **Constants**

24.23.10 **kTypeBirthdays = 5**

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the source types.  
**Notes:** Represents a birthday source.

24.23.11 **kTypeCalDAV = 2**

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the source types.  
**Notes:** Represents a CalDAV or iCloud source.

24.23.12 **kTypeExchange = 1**

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the source types.  
**Notes:** Represents an Exchange source.

24.23.13 **kTypeLocal = 0**

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the source types.  
**Notes:** Represents a local source.

24.23.14 **kTypeMobileMe = 3**

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the source types.  
**Notes:** Represents a MobileMe source.
24.23.15  kTypeSubscribed = 4

MBS Mac64bit Plugin, Plugin Version: 15.3. **Function:** One of the source types.  
**Notes:** Represents a subscribed source.
24.24. **CLASS EKSTRUCTUREDLLOCATIONMBS**

24.24 **class EKStructuredLocationMBS**

24.24.1 **class EKStructuredLocationMBS**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The EKStructuredLocation class specifies a geofence that can be used to trigger the alarm of a calendar item. **Notes:**

Use `locationWithTitle` to create a new structured location, then set it to the `structuredLocation` property of an `EKAlarm` object.

Subclass of the `EKObjectMBS` class.

24.24.2 **Methods**

24.24.3 **Constructor(title as string)**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new structured location. **Notes:** `title`: The title of the location.

24.24.4 **copy as EKObjectMBS**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the location.

24.24.5 **locationWithTitle(title as string) as EKStructuredLocationMBS**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new structured location. **Notes:** `title`: The title of the location.

24.24.6 **Properties**

24.24.7 **geoLocation as Variant**

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The core location. **Notes:**
Value is a CLLocationMBS object.
(Read and Write property)

### 24.24.8 radius as Double

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A minimum distance from the core location that would trigger the alarm or reminder.
**Notes:**
To use the default radius, set this property to 0.
(Read and Write property)

### 24.24.9 title as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The title of the location.
**Notes:** (Read and Write property)
Chapter 25

Canon EOS Digital

25.1 class EdsBaseMBS

25.1.1 class EdsBaseMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The base object class.

25.1.2 Methods

25.1.3 ChildCount as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the number of child objects of the designated object. **Notes:** Example: Number of files in a directory. Lasterror is set.

25.1.4 GetPropertyData(PropertyID as UInt32, Param as Int32 = 0) as Memoryblock

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets property information from the object. **Notes:** PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. Values that can be designated for each property are as follows.

LastError is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred. Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

25.1.5 GetPropertyDataBool(PropertyID as UInt32, Param as Int32 = 0) as Boolean

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Gets property information from the object. Notes:

PropertyID: Designate the property ID. Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. Values that can be designated for each property are as follows.

LastError is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred. Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

25.1.6 GetPropertyDataInt32(PropertyID as UInt32, Param as Int32 = 0) as Int32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Gets property information from the object. Notes:
25.1. CLASS EDSBASEMBS

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

25.1.7 GetPropertyDataInt32Array(PropertyID as UInt32, Param as Int32 = 0) as Integer()

Function: Gets property information from the object.
Notes:
PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

25.1.8 GetPropertyDataPoint(PropertyID as UInt32, Param as Int32 = 0) as EdsPointMBS

Function: Gets property information from the object.
Notes:

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

LastError is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

25.1.9 GetPropertyDataRational(PropertyID as UInt32, Param as Int32 = 0) as EdsRationalMBS

Function: Gets property information from the object.
Notes:

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

LastError is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.
25.1. CLASS EDSBASEMBS

25.1.10 GetPropertyDataRationalArray(PropertyID as UInt32, Param as Int32 = 0) as EdsRationalMBS()

Function: Gets property information from the object.

Notes:

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

25.1.11 GetPropertyDataRect(PropertyID as UInt32, Param as Int32 = 0) as EdsRectMBS

Function: Gets property information from the object.

Notes:

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.
25.1.12 GetPropertyDataSize(PropertyID as UInt32, Param as Int32 = 0) as EdsSizeMBS

**Function:** Gets property information from the object.

**Notes:**

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

LastError is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.

Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

25.1.13 GetPropertyDataString(PropertyID as UInt32, Param as Int32 = 0) as String

**Function:** Gets property information from the object.

**Notes:**

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

LastError is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.

Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.
25.1.14  **GetPropertyDataType(PropertyID as UInt32, Param as Int32 = 0) as UInt32**

**Function:** Gets property information from the object.
**Notes:**
PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

25.1.15  **GetPropertyDataUInt32(PropertyID as UInt32, Param as Int32 = 0) as UInt32**

**Function:** Gets property information from the object.
**Example:**
```plaintext
// we set bit for redirecting output to PC, leave other bits as they are.
dim device as UInt32 = camera.GetPropertyDataUInt32(camera.kEdsPropID_Evf_OutputDevice)
if camera.lasterror = EDSModuleMBS.EDS_ERR_OK then

device = Bitwise.BitOr(device, EDSModuleMBS.kEdsEvfOutputDevice_PC)
camera.SetPropertyDataUInt32 camera.kEdsPropID_Evf_OutputDevice, 0, device
end if
```

**Notes:**
PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.
Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred. Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

25.1.16 GetPropertyDataUInt32Array(PropertyID as UInt32, Param as Int32 = 0) as UInt32()

Function: Gets property information from the object.
Notes:
PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

25.1.17 GetPropertyDataUInt8(PropertyID as UInt32, Param as Int32 = 0) as UInt8

Function: Gets property information from the object.
Notes:
PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.
Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred. Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

25.1.18  GetPropertyDesc(PropertyID as UInt32) as Memoryblock

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets a list of property data that can be set for the object, as well as maximum and minimum values. **Notes:** PropertyID: Designate a property ID.

LastError is set. Returns a memoryblock with EdsPropertyDesc structure data. This structure has:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>form</td>
<td>Int32(0)</td>
<td>Reserved (currently, always 0)</td>
</tr>
<tr>
<td>access</td>
<td>Int32(4)</td>
<td>Reserved (currently, always 0)</td>
</tr>
<tr>
<td>numElements</td>
<td>Int32(8)</td>
<td>Indicates the number of property data list elements stored in the PropDesc array.</td>
</tr>
<tr>
<td>propDesc</td>
<td>Int32(12+n*4)</td>
<td>A property data array. The meaning of PropDesc array elements varies depending on the property type.</td>
</tr>
</tbody>
</table>

For details on properties and the meaning of array elements that can be set in the data list, see the Properties section in SDK manual.

25.1.19  GetPropertyElementCount(PropertyID as UInt32) as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries property description and returns the number of items for a property.
25.1.20 GetPropertySize(PropertyID as UInt32, Param as Int32 = 0) as UInt32

Function: Gets the byte size and data type of a designated property from a camera object or image object.

Notes:
PropertyID: Designate the property ID.
Param: Additional information of the property. Used to designate multiple additional items of information, if the property has such information that can be set or retrieved. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData.

Returns the property size. The data type and value returned varies depending on the property ID. See "Property Details" for further information in the SDK manual.
Lasterror is set.

25.1.21 SetProgress(progress as EdsProgressMBS, options as Integer)

Function: Sets progress events.

Notes: An event is received as notification of progress during processing that takes a relatively long time, such as downloading files from a remote camera. If you register the callback function, the EDSDK calls the callback function during execution or on completion of the following APIs. This timing can be used in updating on-screen progress bars, for example.

25.1.22 SetPropertyData(PropertyID as UInt32, Param as Int32, data as Memoryblock)

Function: Sets property data for the object.

Notes:
PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically taken from data.size by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.
25.1. **CLASS EDSBASEMBS**

25.1.23 **SetPropertyDataBool(PropertyID as UInt32, Param as Int32, data as Boolean)**

**Function:** Sets property data for the object.

**Notes:**

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
LastError is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

25.1.24 **SetPropertyDataInt32(PropertyID as UInt32, Param as Int32, data as Int32)**

**Function:** Sets property data for the object.

**Notes:**

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
LastError is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

25.1.25 **SetPropertyDataInt32Array(PropertyID as UInt32, Param as Int32, data() as Integer)**

**Function:** Sets property data for the object.

**Notes:**

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you. Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

25.1.26 SetPropertyDataPoint(PropertyID as UInt32, Param as Int32, data as EdsPointMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Sets property data for the object. Notes:

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you. Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

25.1.27 SetPropertyDataRational(PropertyID as UInt32, Param as Int32, data as EdsRationalMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Sets property data for the object. Notes:

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you. Lasterror is set.
25.1. CLASS EDSBASEMBS

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

25.1.28 SetPropertyDataRationalArray(PropertyID as U32, Param as I32, data() as EdsRationalMBS)

Function: Sets property data for the object.

Notes:

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

25.1.29 SetPropertyDataRect(PropertyID as U32, Param as I32, data as EdsRectMBS)

Function: Sets property data for the object.

Notes:

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.
25.1.30 **SetPropertyDataSize(PropertyID as UInt32, Param as Int32, data as EdsSizeMBS)**

**Function:** Sets property data for the object.

**Notes:**

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

25.1.31 **SetPropertyDataString(PropertyID as UInt32, Param as Int32, data as String)**

**Function:** Sets property data for the object.

**Notes:**

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

25.1.32 **SetPropertyDataUInt32(PropertyID as UInt32, Param as Int32, data as UInt32)**

**Function:** Sets property data for the object.

**Example:**
/ we set bit for redirecting output to PC, leave other bits as they are.

```pascal
dim device as UInt32 = camera.GetPropertyDataUInt32(camera.kEdsPropID_Evf_OutputDevice)
if camera.lasterror = EDSModuleMBS.EDS_ERR_OK then

device = Bitwise.BitOr(device, EDSModuleMBS.kEdsEvfOutputDevice_PC)
camera.SetPropertyDataUInt32 camera.kEdsPropID_Evf_OutputDevice, 0, device
end if
```

Notes:

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

25.1.33 SetPropertyDataUInt32Array(PropertyID as UInt32, Param as Int32, data() as UInt32)

Function: Sets property data for the object.
Notes:

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.
25.1.34 SetPropertyDataUInt8(PropertyID as UInt32, Param as Int32, data as UInt8)

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets property data for the object. 
**Notes:**

PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you. 
LastError is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

25.1.35 Properties

25.1.36 DataRef as String

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to stream data. 
**Notes:** (Read only property)

25.1.37 Handle as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference. 
**Notes:** (Read and Write property)

25.1.38 Lasterror as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The last error code of last command. 
**Notes:**

See EDS_ERR_* constants in EDSModuleMBS.
(Read and Write property)
25.1. CLASS EDSBASEMBS

25.1.39 MemoryRef as Memoryblock

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to stream data.  
**Notes:** (Read only property)

25.1.40 Progress as EdsProgressMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Register a progress event.  
**Notes:** (Read only property)

25.1.41 Constants

25.1.42 kEdsDataType_Bool = 1

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the data type constants.  
**Notes:** Boolean

25.1.43 kEdsDataType_Bool_Array = 30

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the data type constants.  
**Notes:** Array of Boolean

25.1.44 kEdsDataType_ByteBlock = 14

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the data type constants.  
**Notes:** Bytes (use memoryblock)

25.1.45 kEdsDataType_Double = 13

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the data type constants.  
**Notes:** Double
25.1.46  \texttt{kEdsDataType\_Float} = 12

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the data type constants.

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants.  
**Notes:** Please check the ESDK API Programming Reference for details.

25.1.128  kEdsPropID_FocusInfo = & h00000104

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants.  
**Notes:** Please check the ESDK API Programming Reference for details.
25.1.129 kEdsPropID_GPSAltitude = & h00000806

25.1.130 kEdsPropID_GPSAltitudeRef = & h00000805

25.1.131 kEdsPropID_GPSDateStamp = & h0000081D

25.1.132 kEdsPropID_GPSLatitude = & h00000802

25.1.133 kEdsPropID_GPSLatitudeRef = & h00000801

25.1.134 kEdsPropID_GPSLongitude = & h00000804

25.1.135 kEdsPropID_GPSLongitudeRef = & h00000803

25.1.136  \textit{kEdsPropID_GPSMapDatum} = \& h00000812

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.

25.1.137  \textit{kEdsPropID_GPSSatellites} = \& h00000808

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.

25.1.138  \textit{kEdsPropID_GPSStatus} = \& h00000809

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.

25.1.139  \textit{kEdsPropID_GPSTimeStamp} = \& h00000807

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.

25.1.140  \textit{kEdsPropID_GPSVersionID} = \& h00000800

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.

25.1.141  \textit{kEdsPropID_HDDirectoryStructure} = \& h00000020

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.

25.1.142  \textit{kEdsPropID_ICCProfile} = \& h00000103

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.
25.1.143  kEdsPropID_ImageQuality = & h00000100

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants. 
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.144  kEdsPropID_ISOBracket = & h00000410

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants. 
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.145  kEdsPropID_ISOSpeed = & h00000402

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants. 
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.146  kEdsPropID_JpegQuality = & h00000101

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants. 
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.147  kEdsPropID_LensName = & h0000040d

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants. 
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.148  kEdsPropID_LensStatus = & h00000416

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants. 
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.149  kEdsPropID_LINEAR = & h00000300

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants. 
**Notes:** Please check the EDSDK API Programming Reference for details.
25.1.150 \texttt{kEdsPropID_MakerName} = \& \texttt{h00000005}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.

25.1.151 \texttt{kEdsPropID_MeteringMode} = \& \texttt{h00000403}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.

25.1.152 \texttt{kEdsPropID_MyMenu} = \& \texttt{h000000e}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.

25.1.153 \texttt{kEdsPropID_NoiseReduction} = \& \texttt{h00000411}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.

25.1.154 \texttt{kEdsPropID_Orientation} = \& \texttt{h00000102}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.

25.1.155 \texttt{kEdsPropID_OwnerName} = \& \texttt{h0000004}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.

25.1.156 \texttt{kEdsPropID_ParameterSet} = \& \texttt{h00000112}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function}: One of the property constants.  
\textbf{Notes}: Please check the EDSDK API Programming Reference for details.
25.1.157  kEdsPropID_PhotoEffect = & h0000010f

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants.  
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.158  kEdsPropID_PictureStyle = & h00000114

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants.  
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.159  kEdsPropID_PictureStyleCaption = & h00000200

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants.  
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.160  kEdsPropID_PictureStyleDesc = & h00000115

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants.  
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.161  kEdsPropID_ProductName = & h00000002

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants.  
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.162  kEdsPropID_Record = & h00000510

MBS Cameras Plugin, Plugin Version: 12.5. **Function:** One of the property constants.  
**Notes:** Please check the EDSDK API Programming Reference for details.  
New in 2.11 SDK.
25.1.163 \texttt{kEdsPropID\_RedEye} = \& \texttt{h00000413}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function:} One of the proeprty constants. \textbf{Notes:} Please check the EDSDK API Programming Reference for details.

25.1.164 \texttt{kEdsPropID\_SaveTo} = \& \texttt{h0000000b}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function:} One of the proeprty constants. \textbf{Notes:} Please check the EDSDK API Programming Reference for details.

25.1.165 \texttt{kEdsPropID\_Sharpness} = \& \texttt{h0000010c}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function:} One of the proeprty constants. \textbf{Notes:} Please check the EDSDK API Programming Reference for details.

25.1.166 \texttt{kEdsPropID\_ToneCurve} = \& \texttt{h0000010e}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function:} One of the proeprty constants. \textbf{Notes:} Please check the EDSDK API Programming Reference for details.

25.1.167 \texttt{kEdsPropID\_ToningEffect} = \& \texttt{h00000111}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function:} One of the proeprty constants. \textbf{Notes:} Please check the EDSDK API Programming Reference for details.

25.1.168 \texttt{kEdsPropID\_Tv} = \& \texttt{h00000406}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function:} One of the proeprty constants. \textbf{Notes:} Please check the EDSDK API Programming Reference for details.

25.1.169 \texttt{kEdsPropID\_Unknown} = \& \texttt{h0000ffff}

MBS Cameras Plugin, Plugin Version: 12.1. \textbf{Function:} One of the proeprty constants. \textbf{Notes:} Please check the EDSDK API Programming Reference for details.
25.1.170 kEdsPropID_WBCoeffs = & h00000302

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants.  
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.171 kEdsPropID_WhiteBalance = & h00000106

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants.  
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.172 kEdsPropID_WhiteBalanceBracket = & h0000040c

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants.  
**Notes:** Please check the EDSDK API Programming Reference for details.

25.1.173 kEdsPropID_WhiteBalanceShift = & h00000108

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the property constants.  
**Notes:** Please check the EDSDK API Programming Reference for details.
25.2 class EdsCameraAddedHandlerMBS

25.2.1 class EdsCameraAddedHandlerMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: This class is to monitor for cameras being added. Notes: Constructor registers callback for event and sets lasterror code.

25.2.2 Events

25.2.3 CameraAdded as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: This event is called when a new camera is added. Notes: Returns EDS_ERR_OK if successful. Otherwise, ensure the implementation returns an appropriate error code.
25.3.  **CLASS EDSCAMERALISTMBS**

25.3  **class EdsCameraListMBS**

25.3.1  **class EdsCameraListMBS**

**Function:** The object for a list of cameras.

**Notes:**

This object represents an enumeration of the cameras remotely connected to the host PC by USB interface. This object can be used to select the camera to be controlled from among the cameras currently connected with EDSDK client application. This object can also be used when getting an EdsCameraMBS child object. Subclass of the EdsBaseMBS class.

25.3.2  **Methods**

25.3.3  **Child(index as UInt32) as EdsCameraMBS**

**Function:** Gets an indexed child object of the designated object.

**Notes:**

Index is 0 based and range from 0 to ChildCount-1. Lasterror is set.
25.4  class EdsCameraMBS

25.4.1  class EdsCameraMBS

Function: This object represents a remotely connected camera.
Notes:
This object is used to control the camera or to get an EdsVolumeMBS object when accessing the memory
card, which is a child object of the camera.
Subclass of the EdsBaseMBS class.

25.4.2  Methods

25.4.3  Child(index as UInt32) as EdsVolumeMBS

Function: Gets an indexed child object of the designated object.
Notes:
Index is 0 based and range from 0 to ChildCount-1.
Lasterror is set.

25.4.4  CloseSession

Notes: Lasterror is set.

25.4.5  DateTime as EdsTimeMBS

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Convenience function to query date and time values.
Notes:
Calls GetPropertyData for you with kEdsPropID_DateTime.
Lasterror is set.
25.4. CLASS EDSCAMERAMBS

25.4.6 DeviceInfo as EdsDeviceInfoMBS

Function: Gets device information, such as the device name.
Notes: Because device information of remote cameras is stored on the host computer, you can use this API before
the camera object initiates communication (that is, before a session is opened).
LastError is set.
Returns nil on any error.

25.4.7 DownloadEvfImage(image as EdsEvfImageMBS, OldSDK as boolean)

Function: Downloads the live view image data set for a camera currently in live view mode.
Notes: Live view can be started by using the property ID:kEdsPropertyID_Evf_OutputDevice and data:EdsOutputDevice_PC to call SetPropertyData.
In addition to image data, information such as zoom, focus position, and histogram data is included in the
image data set. Image data is saved in a stream maintained by EdsEvfImageMBS. GetPropertyData can be
used to get information such as the zoom, focus position, etc.
Although the information of the zoom and focus position can be obtained from EdsEvfImageMBS, settings
are applied to EdsCameraMBS.
LastError is set.
If you use 2.11 SDK, please pass OldSDK=false. If you use 2.10 SDK, please pass OldSDK=true. The two
SDKs handle this function differently, so you need to tell the plugin which SDK you use. Using wrong value
will likely lead to a crash.

25.4.8 FocusInfo as EdsFocusInfoMBS

Function: Convenience function to query focus information.
Notes: Lasterror is set.
This queries kEdsPropID_FocusInfo with GetPropertyData for you and returns an EdsFocusInfoMBS object.
25.4.9 **OpenSession**

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Establishes a logical connection with a remote camera.

**Notes:**
Use this API after getting the camera’s EdsCamera object. Lasterror is set.

25.4.10 **Parent as EdsCameraListMBS**

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the parent object of the designated object.

**Notes:** Lasterror is set.

25.4.11 **PictureStyleDesc as EdsPictureStyleDescMBS**

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convenience function to query Picture Style Description information.

**Notes:**
Calls GetPropertyData for you with kEdsPropID_PictureStyleDesc and returns object with values. Lasterror is set.

25.4.12 **SendCommand(command as Integer, param as Integer = 0)**

MBS Cameras Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sends a command such as "Shoot" to a remote camera.

**Example:**

```vba
dim camera as EdsCameraMBS // your camera object

camera.SendCommand camera.kEdsCameraCommand_TakePicture
```

**Notes:**
Command: The command ID to send to the object. See kEdsCameraCommand* constants.
Param: Specify the x-coordinate in the upper 16 bit and the y-coordinate in the lower 16 bit for kEdsCameraCommand_DoClickWBEvf only. Lasterror is set.
25.4. SendStatusCommand(command as Integer, param as Integer = 0)

Function: Sets the remote camera state or mode.

Notes:

command: Designate the particular mode ID to set the camera to. See kEdsCameraStatusCommand* constants.
Param: Currently unused. Designate 0.
LastError is set.

Please check SDK manual for details.

25.4.14 SetCapacity(numberOfFreeClusters as Integer, bytesPerSector as Integer, reset as boolean)

Function: Sets the remaining HDD capacity on the host computer (excluding the portion from image transfer), as calculated by subtracting the portion from the previous time.

Notes:

Set a reset flag initially and designate the cluster length and number of free clusters.
Some cameras can display the number of shots left on the camera based on the available disk capacity of the host computer.
For these cameras, after the storage destination is set to the computer, use this API to notify the camera of the available disk capacity of the host computer.

LastError is set.

25.4.15 Constants

25.4.16 kEdsCameraCommand_BulbEnd = 3

Notes:

Lock the UI before bulb shooting.
An exposure time event is generated at the start of bulb shooting. (kEdsStateEvent_BulbExposureTime)
25.4.17  kEdsCameraCommand_BulbStart = 2

MBS Cameras Plugin, Plugin Version: 12.1. **Function:** One of the camera command constants.  
**Notes:** Starts bulb shooting/ Ends bulb shooting

25.4.18  kEdsCameraCommand_DoClickWBEvf = & h00000104
