### 33.62.30 tokenFieldTextShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** The event called to decide whether text editing should be allowed.

**Notes:** Return true to allow text editing.

### 33.62.31 tokenFieldTextShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** The event called to decide whether ending text editing should be allowed.

**Notes:** Return true to allow text editing.

### 33.62.32 writeRepresentedObjects(objects() as Variant, pboard as NSPasteboardMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** Sent so the delegate can write represented objects to the pasteboard corresponding to a given array of display strings.

**Notes:**

- **objects:** An array of represented objects associated with the token field.
- **pboard:** The pasteboard to which to write the represented objects.

Return true if you writes the represented objects to the pasteboard, false otherwise. If false, the token field writes the display strings to the NSStringPboardType pasteboard.
33.63 control NSViewControlMBS

33.63.1 control NSViewControlMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The control to host a generic NSView.

33.63.2 Properties

33.63.3 View as NSViewMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The view used in the control.
Notes:
Use this object to set more options on the control.
(Read only property)

33.63.4 Events

33.63.5 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an
initial mouse-down event, false if not.
Notes:
The receiver can either return a value unconditionally or use the location of event e to determine whether
or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to
click on a view in an inactive window, activating the view with one click, instead of clicking first to make the
window active and then clicking the view. Most view objects refuse a click-through attempt, so the event
simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do
accept them, so the user can immediately manipulate the control without having to release the mouse button.

33.63.6 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Whether to accept first responder.
33.63. CONTROL NSVIEWCONTROLMBS

Notes: Return true if your control can have the focus and false if not.

33.63.7 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Called when the object gets focus.
Notes: Return true to accept.

33.63.8 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a touch gesture.
Notes:
e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.63.9 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

33.63.10 Close

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom view is destroyed.

33.63.11 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes:
sender: The object sending the message; use it to get details about the dragging operation.
For this method to be invoked, the previous `performDragOperation` must have returned `true`.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object’s `animatesToDestination` property was set to `true` in `prepareForDragOperation`, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed from the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

### 33.63.12 `draggingEnded(sender as NSDraggingInfoMBS)`

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** Implement this event to be notified when a drag operation ends in some other destination.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

### 33.63.13 `draggingEntered(sender as NSDraggingInfoMBS) as Integer`

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.

**Notes:**

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in `NSDragOperation` in the `NSDraggingInfo` reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous `draggingEntered` message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination’s bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the drag-
gingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

33.63.14 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

33.63.15 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging session has completed.
Notes:
session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

33.63.16 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the drag moves on the screen.
Notes:
session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.
33.63.17  draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Declares the types of operations the source allows to be performed. (required)  
**Notes:**  
session: The dragging session.  
context: The dragging context. See NSDraggingContext constants for the supported values.  

Return the appropriate dragging operation as defined in constants.  

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

33.63.18  draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Invoked when the drag will begin.  
**Notes:**  
session: The dragging session.  
screenPoint: The point where the drag will begin, in screen coordinates.  

Available in OS X v10.7 and later.

33.63.19  draggingSourceOperationMaskForLocal(flag as boolean) as Integer

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.  
**Function:** Returns an integer bit mask indicating the types of dragging operations the source object will allow to be performed on the dragged image’s data.  
**Notes:**  
(flag as boolean) as Integer  
(isLocal: True indicates that the candidate destination object (the window or view over which the dragged image is currently poised) is in the same application as the source, while a false value indicates that the destination object is in a different application.  

( Deprecated in OS X v10.7. This method is informally deprecated. It is only called if the source does not implement the NSDraggingSource protocol methods. This method will be formally deprecated in a future OS release.)
A mask, created by combining the dragging operations listed in the NSDragOperation section of NSDraggingInfo protocol reference using the C bitwise OR operator. If the source does not permit any dragging operations, it should return NSDragOperationNone.

If not implemented, the default value is NSDragOperationCopy | NSDragOperationLink | NSDragOperationGeneric | NSDragOperationPrivate.

Available in OS X v10.0 and later. Deprecated in OS X v10.7.

**33.63.20 draggingUpdated(sender as NSDraggingInfoMBS) as Integer**

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.

Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.
33.63.21 drawFocusRingMask(g as NSGraphicsMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Draw the focus ring mask for the view.
Notes:
If false is returned, the default method from NSView class runs.

This method provides the shape of the focus ring mask by drawing the focus ring mask. An implementation of this method should draw in the view's interior (bounds) coordinate space, that the focus ring style has been set (it will be set it to NSFocusRingOnly to capture the focus ring itself), and that the fill and stroke colors have been set to an arbitrary fully opaque color.

Subclasses that find the default behavior insufficient should only draw the focus ring shape.

The NSView default implementation of this method simply fills self.bounds.
Available in Mac OS X v10.7 and later.

Please use NSGraphicsMBS class for drawing.

33.63.22 DrawRect(g as NSGraphicsMBS, left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The paint event with the rectangle which needs to be redrawn.

33.63.23 EnableMenuItems

Function: The event where you can enable menu items.

33.63.24 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has ended a touch gesture.
Notes:
e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

### 33.63.25 focusRingMaskBounds as NSRectMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** Returns the focus ring mask bounds.

**Notes:**

Return nil to run default NSView method.

Return a rectangle containing the mask in the view’s interior (bounds) coordinate space.

The mask bounds allows the focus ring’s overall size and position to be determined before it is drawn. Subclasses must override this method if they require the display of a focus ring. The NSView default implementation of this method simply returns NSRectMBS.Zero.

Note: The information provided by focusRingMaskBounds will enable Accessibility to identify selected subelements for zoom tracking, so it is important that this method provide a reasonably tight bounding box and that noteFocusRingMaskChanged is invoked as described.

### 33.63.26 ignoreModifierKeysForDraggingSession(session as NSDraggingSessionMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** Returns whether the modifier keys will be ignored for this dragging session.

**Notes:**

session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise. Available in OS X v10.7 and later.

### 33.63.27 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.

**Function:** Whether this view is opaque.
### 33.63.28 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function:** One of the key events.
**Notes:**
Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

### 33.63.29 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function:** One of the key events.
**Notes:**
Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

### 33.63.30 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function:** Informs the receiver that the user has begun a pinch gesture.
**Notes:**
e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

### 33.63.31 MenuAction(HitItem as MenuItem) As Boolean

**Function:** Called when a menuitem is choosen.
**Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.
33.63.32  menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes: theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

33.63.33  mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

33.63.34  mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: This event is called so you can decide what happens with mouse down.
Notes: Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

33.63.35  mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
CHAPTER 33. COCOA CONTROLS

Notes: Return true if you handled this event.

33.63.36  mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

33.63.37  mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

33.63.38  mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

33.63.39  mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes: Return true if you handled this event.

33.63.40  Open

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the custom NSView is created.

33.63.41  otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
33.63. CONTROL NSVIEWCONTROLMBS

Notes:

Return true if you handled this event.
Third mouse button.

33.63.42 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

33.63.43 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

33.63.44 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object’s animatesToDestination was set to true in prepareForDragOperation, then setup any
animation to arrange space for the drag items to animate to. Also at this time, enumerate through the
dragging items to set their destination frames and destination images.

### 33.63.45 `prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean`

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function:** Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
**Notes:**
- `sender`: The object sending the message; use it to get details about the dragging operation.
- Returns true if the receiver agrees to perform the drag operation and false if not.
- This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an
acceptable drag-operation value.
- If you want the drag items to animate from their current location on screen to their final location in your
view, set the sender object's animatesToDestination property to true in your implementation of this method.

### 33.63.46 `pressureChange(e as NSEventMBS) as boolean`

MBS MacControls Plugin, Plugin Version: 15.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Informs the current object that a pressure change occurred on a system that supports pressure
sensitivity.
**Notes:**
- This method is invoked automatically in response to user actions. `event` is the event that initiated the change
in pressure.
- Available in OS X v10.10.3 and later.

### 33.63.47 `resignFirstResponder as boolean`

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function:** Focus is going away.
**Notes:** Return true to accept.

### 33.63.48 `rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean`

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function:** One of the mouse events.
**Notes:** Return true if you handled this event.
**33.63. CONTROL NSVIEWCONTROLMBS**

33.63.49  **rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean**

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function**: One of the mouse events.
**Notes**: Return true if you handled this event.

33.63.50  **rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean**

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function**: One of the mouse events.
**Notes**: Return true if you handled this event.

33.63.51  **rotateWithEvent(e as NSEventMBS) as boolean**

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function**: Informs the receiver that the user has begun a rotation gesture.
**Notes**: 
- e: An event object representing the rotate gesture.
- The event will be sent to the view under the touch in the key window.
- Available in Mac OS X v10.6 and later.
- Return true if you handled this event.

33.63.52  **ScaleFactorChanged(NewFactor as Double)**

**Function**: The backing store scale factor has changed.
**Notes**: Please invalidate any cached bitmaps or other relevant state.

33.63.53  **scrollWheel(e as NSEventMBS) as boolean**

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function**: Informs the subclass that the mouse’s scroll wheel has moved.
**Notes**: 
- e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.
33.63.54  swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that the user has begun a swipe gesture.
Notes:
e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

33.63.55  updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Invoked when the dragging images should be changed.
Notes:
sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this
method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on
this destination. Otherwise, the dragging images will change too often during the drag which would be
distracting to the user.

33.63.56  viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Informs the receiver that it has been added to a new view hierarchy.
Notes:
The default implementation does nothing; subclasses can implement this event to perform whatever actions
are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in
any window. This occurs when the receiver has just been removed from its superview or when the receiver
has just been added to a superview that does not itself have a window. Overrides of this method may choose
to ignore such cases if they are not of interest.
33.63.57  wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.

Notes:

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.
33.64 class ProgressBar

33.64.1 class ProgressBar

Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in progress-bar class in REALbasic.

33.64.2 Methods

33.64.3 NSProgressIndicatorMBS as NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSProgressIndicatorMBS object for the given control.

**Example:**

MsgBox ProgressBar1.NSProgressIndicatorMBS.className

**Notes:** This way you can manipulate Cocoa controls directly.

33.64.4 SetMaximumThreadSafeMBS(maximum as Integer)

MBS Util Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets maximum property on main thread.

**Notes:**

This method is to allow you to set the maximum property of a progressbar in a thread without a problem.

If called on main thread, the plugin will simply set maximum property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

33.64.5 SetMinimumThreadSafeMBS(minimum as Integer)

MBS Util Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets minimum property on main thread.

**Notes:**
This method is to allow you to set the minimum property of a progressbar in a thread without a problem.

If called on main thread, the plugin will simply set minimum property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

**33.64.6 SetValueThreadSafeMBS(value as Integer)**

MBS Util Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets value property on main thread.
**Notes:**
This method is to allow you to set the value property of a progressbar in a thread without a problem.

If called on main thread, the plugin will simply set value property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.
33.65  class ProgressWheel

33.65.1  class ProgressWheel

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in ProgressWheel class in REALbasic.

33.65.2  Methods

33.65.3  NSProgressIndicatorMBS as NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSProgressIndicatorMBS object for the given control. 
**Notes:** This way you can manipulate Cocoa controls directly.
33.66 class PushButton

33.66.1 class PushButton

Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in pushbutton class in REALbasic.

33.66.2 Methods

33.66.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSButtonMBS object for the given control.

**Example:**

```plaintext
MsgBox PushButton1.NSButtonMBS.className
```

**Notes:** This way you can manipulate Cocoa controls directly.
33.67 class ScrollBar

33.67.1 class ScrollBar

33.67.2 Methods

33.67.3 NSScrollerMBS as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Creates a NSScrollerMBS object for the given control. Example:

MsgBox ScrollBar1.NSScrollerMBS.className

Notes: This way you can manipulate Cocoa controls directly.
33.68.  **CLASS SEGMENTEDCONTROL**

### 33.68  class SegmentedControl

#### 33.68.1  class SegmentedControl

Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Build in Segmented Control class in Real Studio.

#### 33.68.2  Methods

##### 33.68.3  NSSegmentedControlMBS as NSSegmentedControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSSegmentedControlMBS object for the given control.

**Example:**

```ruby
SegmentedControl1.NSSegmentedControlMBS.selectedSegment = 0
```

**Notes:** This way you can manipulate Cocoa controls directly.
33.69 class Separator

33.69.1 class Separator

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in Separator class in REALbasic.

33.69.2 Methods

33.69.3 NSBoxMBS as NSBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSBoxMBS object for the given control. **Notes:** This way you can manipulate Cocoa controls directly.
33.70.  CLASS SLIDER

33.70  class Slider

33.70.1  class Slider

Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in slider class in REALbasic.

33.70.2  Methods

33.70.3  NSSliderMBS as NSSliderMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSSliderMBS object for the given control.

**Example:**

MsgBox Slider1.NSSliderMBS.className

**Notes:** This way you can manipulate Cocoa controls directly.
33.71 class SpinningProgressIndicatorMBS

33.71.1 class SpinningProgressIndicatorMBS

Function: A resizable, recolorable clone of the spinning NSProgressIndicator.
Notes:
Based on YRKSpinningProgressIndicator from Kelan Champagne.
See also https://github.com/kelan/yrk-spinning-progress-indicator
Subclass of the NSViewMBS class.

33.71.2 Methods

33.71.3 Constructor

Function: Creates a new progress indicator with size 100/100 and position 0/0
Example:
```vbnet
dim t as new SpinningProgressIndicatorMBS
```

Notes: On success the handle property is not zero.
See also:
- 33.71.4 Constructor(Handle as Integer) 6788
- 33.71.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6789

33.71.4 Constructor(Handle as Integer)

Function: Creates an object based on the given SpinningProgressIndicator handle.
Example:
```vbnet
dim t as new SpinningProgressIndicatorMBS(0, 0, 100, 100)
dim v as new SpinningProgressIndicatorMBS(t.handle)
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a SpinningProgressIndicator and the plugin retains this handle.
See also:
33.71. CLASS SPINNINGPROGRESSINDICATORMBS

- 33.71.3 Constructor
- 33.71.5 Constructor(left as Double, top as Double, width as Double, height as Double)

33.71.5 Constructor(left as Double, top as Double, width as Double, height as Double)

**Function:** Creates a new progress indicator with the given size and position.
**Example:**
```
Dim x As New SpinningProgressIndicatorMBS(0, 0, 100, 100)
```

**Notes:** On success the handle property is not zero.
See also:
- 33.71.3 Constructor
- 33.71.4 Constructor(Handle as Integer)

33.71.6 startAnimation

**Function:** Starts animation.
**Notes:** If you see no animation, you can maybe add a timer with short period (50ms) and set needsDisplay to true.

33.71.7 stopAnimation

**Function:** Stops the animation.

33.71.8 Properties

33.71.9 backgroundColor as NSColorMBS

**Function:** The background color.
**Notes:**
Default color is NSColorMBS.clearColor.
(Read and Write computed property)

### 33.71.10 colorValue as NSColorMBS

**Function:** The color for drawing.
**Notes:**
Default color is NSColorMBS.blackColor.
(Read and Write computed property)

### 33.71.11 doubleValue as Double

**Function:** The current value.
**Notes:**
Default is 0.0.
(Read and Write computed property)

### 33.71.12 drawsBackground as boolean

**Function:** Whether to draw background.
**Notes:**
Default is false.
(Read and Write computed property)

### 33.71.13 isDisplayedWhenStopped as boolean

**Function:** Whether this control is visible without animation turned on.
**Notes:**
Default is true.
(Read and Write computed property)
### 33.71.14 `isIndeterminate` as boolean

**MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Whether progress is indeterminate.

**Notes:**

Default is true.

(Read and Write computed property)

### 33.71.15 `maxValue` as Double

**MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The maximum value.

**Notes:**

Default is 100.0.

(Read and Write computed property)

### 33.71.16 `usesThreadedAnimation` as boolean

**MBS MacExtras Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Whether to use a thread for the animation.

**Notes:**

Default is true.

(Read and Write computed property)
33.72  class Statictext

33.72.1  class Statictext

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in Statictext class in REALbasic.

33.72.2  Methods

33.72.3  NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSTextFieldMBS object for the given control. **Notes:** This way you can manipulate Cocoa controls directly.
33.73. CLASS TEXTAREA

33.73  class TextArea

33.73.1  class TextArea

Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The built in textarea class in REALbasic.

**Example:**

```REALbasic
// make a PDF from a textarea in Cocoa REALbasic target:

// find view
dim n as NSViewMBS = TextArea1.NSViewMBS
if n = nil then
    MsgBox "Only in Cocoa!"
    Return
end if

// make pdf data
dim s as string = n.dataWithPDFInsideRect(0,0,n.frame.Width, n.frame.Height)

// save
dim f as FolderItem = GetSaveFolderItem("", "test.pdf")
if f <> Nil then
    dim b as BinaryStream = BinaryStream.Create(f, true)
    b.Write s
end if
```

**Notes:** Requires RB 2009r4 or newer.

33.73.2  Methods

33.73.3  NSScrollViewMBS as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSScrollViewMBS object for the given control.

**Example:**

```REALbasic
MsgBox TextArea1.NSScrollViewMBS.className
```
CHAPTER 33. COCOA CONTROLS

Notes: This way you can manipulate Cocoa controls directly.

### 33.73.4 NSTextFieldMBS as NSTextFieldMBS

**Function:** Creates a NSTextFieldMBS object for the given control.

**Notes:**
This way you can manipulate Cocoa controls directly.
Real Studio 2012 uses a NSTextField for text areas without style and without multiline.

### 33.73.5 NSTextViewMBS as NSTextViewMBS

**Function:** Creates a NSTextViewMBS object for the given control.

**Example:**

```plaintext
// load rtf file into textarea
dim file as FolderItem = SpecialFolder.Desktop.Child(“test.rtf”)
dim n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
t.textStorage.setAttributedString(n)
```

**Notes:** This way you can manipulate Cocoa controls directly.

### 33.73.6 SetTextThreadSafeMBS(text as string)

**Function:** Sets text property on main thread.

**Notes:**
This method is to allow you to set the text property of a label in a thread without a problem.

If called on main thread, the plugin will simply set text property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.
33.73.7 WinInsertImageMBS(data as string, Width as Integer, Height as Integer)

**Notes:**
- Specify size in pixels and image data.
- Image data works with JPEG and other data types.
- Requires Windows 8 or newer.

33.73.8 Properties

33.73.9 RTFDataMBS as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get or set the textview content as RTF data.

**Example:**
```
dim rtf as MemoryBlock = TextArea1.RTFDataMBS
TextArea2.RTFDataMBS = rtf
```

**Notes:**
- Works only for Cocoa and uses RTF parser/generator from Apple.
- (Read and Write computed property)

33.73.10 WinRTFDataMBS(SelectionOnly as boolean = false) as string

MBS Win Plugin, Plugin Version: 14.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Get or set the RTF data for the text area.

**Notes:**
- Including images and probably faster as StyledText.RTFData.
- (Read and Write computed property)

33.73.11 WinSelStrikeThroughMBS as Boolean

MBS Win Plugin, Plugin Version: 17.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Get or set StrikeThrough text style.

**Notes:**
See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

### 33.73.12 WinSelSubScriptMBS as Boolean

MBS Win Plugin, Plugin Version: 17.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Get or set subscript text style.

**Notes:**
Subscript text has a lower base line and is smaller.
See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

### 33.73.13 WinSelSuperScriptMBS as Boolean

MBS Win Plugin, Plugin Version: 17.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Get or set superscript text style.

**Notes:**
Superscript text has a higher base line and is smaller.
See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

### 33.73.14 WinSpellcheckingMBS as Boolean

**Notes:**
Only for Windows 8 and newer.
Uses current language from user.

See [AutomaticSpellingCorrectionEnabled](#) and [ContinuousSpellCheckingEnabled](#) properties in NSTextViewMBS for MacOS.
(Read and Write computed property)
33.74  class TextField

33.74.1  class TextField

33.74.2  Methods

33.74.3  NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Creates a NSTextFieldMBS object for the given control. Notes: This way you can manipulate Cocoa controls directly. Seems like RS 2011r1 uses a NSTextField, so this method should return an object on Cocoa targets.

33.74.4  NSTextViewMBS as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Creates a NSTextViewMBS object for the given control. Notes: This way you can manipulate Cocoa controls directly. Seems like RS 2011r1 uses a NSTextField, so this method should return nil on Cocoa targets. Please use NSTextFieldMBS method in this case.

33.74.5  SetTextThreadSafeMBS(text as string)

MBS Util Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: Sets text property on main thread. Notes: This method is to allow you to set the text property of a label in a thread without a problem.

If called on main thread, the plugin will simply set text property directly. If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.
class UpDownArrows

Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The build in control class in REALbasic.

Methods

**NSStepperMBS as NSStepperMBS**

MBS MacControls Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSStepperMBS object for the given control. **Notes:** This way you can manipulate Cocoa controls directly.
Chapter 34

Cocoa Drawing

34.1 class NSBezierPathMBS

34.1.1 class NSBezierPathMBS

Notes:

An NSBezierPath object allows you to create paths using PostScript-style commands. Paths consist of straight and curved line segments joined together. Paths can form recognizable shapes such as rectangles, ovals, arcs, and glyphs; they can also form complex polygons using either straight or curved line segments. A single path can be closed by connecting its two endpoints, or it can be left open.

An NSBezierPath object can contain multiple disconnected paths, whether they are closed or open. Each of these paths is referred to as a subpath. The subpaths of an NSBezierPath object must be manipulated as a group. The only way to manipulate subpaths individually is to create separate NSBezierPath objects for each.

For a given NSBezierPath object, you can stroke the path’s outline or fill the region occupied by the path. You can also use the path as a clipping region for views or other regions. Using methods of NSBezierPath, you can also perform hit detection on the filled or stroked path. Hit detection is needed to implement interactive graphics, as in rubberbanding and dragging operations.

The current graphics context is automatically saved and restored for all drawing operations involving NSBezierPath objects, so your application does not need to worry about the graphics settings changing across invocations.
34.1.2 Methods

34.1.3 appendBezierPath(path as NSBezierPathMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends the contents of the specified path object to the receiver’s path.

**Notes:**

Path: The path to add to the receiver.

This method adds the commands used to create aPath to the end of the receiver’s path. This method does not explicitly try to connect the subpaths in the two objects, although the operations in Path may still cause that effect.

34.1.4 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends an arc of a circle to the receiver’s path.

**Notes:**

center: Specifies the center point of the circle used to define the arc.
radius: Specifies the radius of the circle used to define the arc.
startAngle: Specifies the starting angle of the arc, measured in degrees counterclockwise from the x-axis.
endAngle: Specifies the end angle of the arc, measured in degrees counterclockwise from the x-axis.

The created arc lies on the perimeter of the circle, between the angles specified by the startAngle and endAngle parameters. The arc is drawn in a counterclockwise direction. If the receiver’s path is empty, this method sets the current point to the beginning of the arc before adding the arc segment. If the receiver’s path is not empty, a line is drawn from the current point to the starting point of the arc.

Depending on the length of the arc, this method may add multiple connected curve segments to the path. See also:

- 34.1.5 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean)

- 34.1.6 appendBezierPathWithArc(point1 as NSPointMBS, point2 as NSPointMBS, radius as Double)
34.1. CLASS NSBEZIERPATHMBS

34.1.5 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends an arc of a circle to the receiver’s path.

**Notes:**
- center: Specifies the center point of the circle used to define the arc.
- radius: Specifies the radius of the circle used to define the arc.
- startAngle: Specifies the starting angle of the arc, measured in degrees counterclockwise from the x-axis.
- endAngle: Specifies the end angle of the arc, measured in degrees counterclockwise from the x-axis.
- clockwise: true if you want the arc to be drawn in a clockwise direction; otherwise false to draw the arc in a counterclockwise direction.

The created arc lies on the perimeter of the circle, between the angles specified by the startAngle and endAngle parameters. The arc is drawn in the direction indicated by the clockwise parameter. If the receiver’s path is empty, this method sets the current point to the beginning of the arc before adding the arc segment. If the receiver’s path is not empty, a line is drawn from the current point to the starting point of the arc.

Depending on the length of the arc, this method may add multiple connected curve segments to the path. See also:

- 34.1.4 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double)
- 34.1.6 appendBezierPathWithArc(point1 as NSPointMBS, point2 as NSPointMBS, radius as Double)

34.1.6 appendBezierPathWithArc(point1 as NSPointMBS, point2 as NSPointMBS, radius as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends an arc to the receiver’s path.

**Notes:**
- point1: The middle point of the angle.
- point2: The end point of the angle.
- radius: The radius of the circle inscribed in the angle.

The created arc is defined by a circle inscribed inside the angle specified by three points: the current point, the fromPoint parameter, and the toPoint parameter (in that order). The arc itself lies on the perimeter of the circle, whose radius is specified by the radius parameter. The arc is drawn between the two points of the circle that are tangent to the two legs of the angle.

The arc usually does not contain the points in the fromPoint and toPoint parameters. If the starting point
of the arc does not coincide with the current point, a line is drawn between the two points. The starting point of the arc lies on the line defined by the current point and the fromPoint parameter.

You must set the path’s current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

Depending on the length of the arc, this method may add multiple connected curve segments to the path. See also:

- 34.1.4 `appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double)` 6802
- 34.1.5 `appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean)` 6803

### 34.1.7 `appendBezierPathWithGlyph(glyph as Integer, font as NSFontMBS)`

Notes:

Glyph: The glyph to add to the path.
font: The font in which the glyph is encoded.

If the glyph is not encoded in the font specified by the font parameter that is, the font does not have an entry for the specified glyph then no path is appended to the receiver.

You must set the path’s current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

### 34.1.8 `appendBezierPathWithGlyphs(glyphs() as Integer, font as NSFontMBS)`

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Appends the outlines of the specified glyphs to the receiver’s path.

Notes:

glyphs: An array of glyphs to add to the path.
count: The number of glyphs in the glyphs parameter.
font: The font in which the glyphs are encoded.

If the glyphs are not encoded in the font specified by the font parameter that is, the font does not have an
entry for one of the specified glyphs; then no path is appended to the receiver.

You must set the path’s current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

### 34.1.9 appendBezierPathWithOvalInRect(rect as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends an oval path to the receiver, inscribing the oval in the specified rectangle.

**Notes:**

rect: The rectangle in which to inscribe the oval.

Before adding the oval, this method moves the current point, which implicitly closes the current subpath. If the aRect parameter specifies a square, the inscribed path is a circle. The path is constructed by starting in the lower-right quadrant of the rectangle and adding arc segments counterclockwise to complete the oval.

### 34.1.10 appendBezierPathWithPoints(points() as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends a series of line segments to the receiver’s path.

**Notes:**

points: An array of NSPoint data types, each of which contains the end point of the next line segment.

count: The number of points in the points parameter.

This method interprets the points as a set of connected line segments. If the current path contains an open subpath, a line is created from the last point in that subpath to the first point in the points array. If the current path is empty, the first point in the points array is used to set the starting point of the line segments. Subsequent line segments are added using the remaining points in the array.

This method does not close the path that is created. If you wish to create a closed path, you must do so by explicitly invoking the receiver’s closePath method.

### 34.1.11 appendBezierPathWithRect(rect as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends a rectangular path to the receiver’s path.

**Notes:**
rect: The rectangle describing the path to create.

Before adding the rectangle, this method moves the current point to the origin of the rectangle, which implicitly closes the current subpath (if any). The path is constructed by starting at the origin of aRect and adding line segments in a counterclockwise direction. The final segment is added using a closePath message.

34.1.12 appendBezierPathWithRoundedRect(rect as NSRectMBS, xRadius as Double, yRadius as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends a rounded rectangular path to the receiver’s path.
**Notes:**
rect: The rectangle that defines the basic shape of the path.

xRadius: The radius of each corner oval along the x-axis. Values larger than half the rectangle’s width are clamped to half the width.

yRadius: The radius of each corner oval along the y-axis. Values larger than half the rectangle’s height are clamped to half the height.

The path is constructed in a counter-clockwise direction, starting at the top-left corner of the rectangle. If either one of the radius parameters contains the value 0.0, the returned path is a plain rectangle without rounded corners.

34.1.13 bezierPath as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new NSBezierPath object.

34.1.14 bezierPathByFlatteningPath as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a “flattened” copy of the receiver.
**Notes:**

Returns a new path object whose contents are a flattened version of the receiver’s path.

Flattening a path converts all curved line segments into straight line approximations. The granularity of the approximations is controlled by the path’s current flatness value, which is set using the DefaultFlatness property.
34.1.15 **bezierPathByReversingPath** as **NSBezierPathMBS**

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new NSBezierPath object with the reversed contents of the receiver’s path. **Notes:**

Returns a new path object whose contents are a reversed version of the receiver’s path.

Reversing a path does not necessarily change the appearance of the path when rendered. Instead, it changes the direction in which path segments are drawn. For example, reversing the path of a rectangle (whose line segments are normally drawn starting at the origin and proceeding in a counterclockwise direction) causes its line segments to be drawn in a clockwise direction instead. Drawing a reversed path could affect the appearance of a filled pattern, depending on the pattern and the fill rule in use.

This method reverses each whole or partial subpath in the path object individually.

34.1.16 **bezierPathWithOvalInRect(r as NSRectMBS)** as **NSBezierPathMBS**

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new NSBezierPath object initialized with an oval path inscribed in the specified rectangle. **Notes:**

r: The rectangle in which to inscribe an oval.

Returns an NSBezierPath new path object with the oval path.

If the rect parameter specifies a square, the inscribed path is a circle. The path is constructed by starting in the lower-right quadrant of the rectangle and adding arc segments counterclockwise to complete the oval.

34.1.17 **bezierPathWithRect(r as NSRectMBS)** as **NSBezierPathMBS**

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new NSBezierPath object initialized with a rectangular path. **Notes:**

r: The rectangle describing the path to create.

Returns a new path object with the rectangular path. The path is constructed by starting at the origin of aRect and adding line segments in a counterclockwise direction.
34.1.18  bezierPathWithRoundedRect(r as NSRectMBS, xRadius as Double, yRadius as Double) as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new NSBezierPath object initialized with a rounded rectangular path. **Notes:**
- **r:** The rectangle that defines the basic shape of the path.
- **xRadius:** The radius of each corner oval along the x-axis. Values larger than half the rectangle’s width are clamped to half the width.
- **yRadius:** The radius of each corner oval along the y-axis. Values larger than half the rectangle’s height are clamped to half the height.

Returns a new path object with the rounded rectangular path.

The path is constructed in a counter-clockwise direction, starting at the top-left corner of the rectangle. If either one of the radius parameters contains the value 0.0, the returned path is a plain rectangle without rounded corners.

34.1.19  closePath

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the most recently added subpath. **Notes:** This method closes the current subpath by creating a line segment between the first and last points in the subpath. This method subsequently updates the current point to the end of the newly created line segment, which is also the first point in the now closed subpath.

34.1.20  Constructor

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a new empty NSBezierPath object.

34.1.21  containsPoint(p as NSPointMBS) as boolean

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver contains the specified point. **Example:**

```dim r as new NSRectMBS(10, 10, 50, 50)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
dim p as new NSPointMBS(20,20)```
MsgBox str(b.containsPoint(p))

Notes:

p: The point to test against the path, specified in the path object’s coordinate system.

Returns true if the path’s enclosed area contains the specified point; otherwise, false.

This method checks the point against the path itself and the area it encloses. When determining hits in the enclosed area, this method uses the non-zero winding rule (NSNonZeroWindingRule). It does not take into account the line width used to stroke the path.

34.1.22 copy as NSBezierPathMBS

34.1.23 curveToPoint(endPoint as NSPointMBS, controlPoint1 as NSPointMBS, controlPoint2 as NSPointMBS)

Notes:

endPoint: The destination point of the curve segment, specified in the current coordinate system
controlPoint1: The point that determines the shape of the curve near the current point.
controlPoint2: The point that determines the shape of the curve near the destination point.

You must set the path’s current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

34.1.24 elementAtIndex(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the type of path element at the specified index.

Notes:
index: The index of the desired path element.

Returns the type of the path element.
Path elements describe the commands used to define a path and include basic commands such as moving to a specific point, creating a line segment, creating a curve, or closing the path. The elements are stored in the order of their execution.

See also:

- 34.1.25 elementAtIndex(index as Integer, byref associatedPoints() as NSPointMBS) as Integer

### 34.1.25 elementAtIndex(index as Integer, byref associatedPoints() as NSPointMBS) as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets the element type and (and optionally) the associated points for the path element at the specified index.

**Notes:**

index: The index of the desired path element.
associatedPoints: On output, the data points associated with the specified path element.

Returns the type of the path element.

For curve operations, the order of the points is controlPoint1 (associatedPoints(0)), controlPoint2 (associatedPoints(1)), endPoint (associatedPoints(2)).

See also:

- 34.1.24 elementAtIndex(index as Integer) as Integer

### 34.1.26 elementCount as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the total number of path elements in the receiver’s path.

**Example:**

```dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)
MsgBox str(b.elementCount) // 2

b.removeAllPoints
MsgBox str(b.elementCount) // 0```

34.1. CLASS NSBEZIERPATHMBS

Notes: Each element type corresponds to one of the operations described in constants.

34.1.27 getLineDash(byref pattern() as Double, byref count as Integer, byref phase as Double)

Notes:

pattern: On output, this array contains the lengths (measured in points) of the line segments and gaps in the pattern. The values in the array alternate, starting with the first line segment length, followed by the first gap length, followed by the second line segment length, and so on.

count: On output, the number of entries written to pattern.

phase: On output, this value contains the offset at which to start drawing the pattern, measured in points along the dashed-line pattern. For example, a phase of 6 in the pattern 5-2-3-2 would cause drawing to begin in the middle of the first gap.

34.1.28 isEmpty as boolean

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a Boolean value indicating whether the receiver is empty.

Example:

dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath
MsgBox "isEmpty: " +str(b.isEmpty)

Notes: True if the receiver contains no path elements; otherwise, false.

34.1.29 lineToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Appends a straight line to the receiver’s path.

Notes:

p: The destination point of the line segment, specified in the current coordinate system.

This method creates a straight line segment starting at the current point and ending at the point specified by the aPoint parameter. The current point is the last point in the receiver’s most recently added segment.

You must set the path’s current point (using the moveToPoint method or through the creation of a pre-
ceding line or curve segment) before you invoke this method. If the path is empty, this method raises an
NSGenericException exception.

34.1.30  moveToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves the receiver’s current point to the specified location.
**Notes:**

p: A point in the current coordinate system.

This method implicitly closes the current subpath (if any) and sets the current point to the value in p. When
closing the previous subpath, this method does not cause a line to be created from the first and last points
in the subpath.

For many path operations, you must invoke this method before issuing any commands that cause a line or
curve segment to be drawn.

34.1.31  relativeCurveToPoint(endPoint as NSPointMBS, controlPoint1 as NS-
PointMBS, controlPoint2 as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a Bezier cubic curve to the receiver’s path from the current point to a new location, which is
specified as a relative distance from the current point.
**Notes:**

endPoint: The destination point of the curve segment, interpreted as a relative offset from the current point.
controlPoint1: The point that determines the shape of the curve near the current point, interpreted as a
relative offset from the current point.
controlPoint2: The point that determines the shape of the curve near the destination point, interpreted as
a relative offset from the current point.

You must set the path’s current point (using the moveToPoint method or through the creation of a pre-
ceding line or curve segment) before you invoke this method. If the path is empty, this method raises an
NSGenericException exception.

34.1.32  relativeLineToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends a straight line segment to the receiver’s path starting at the current point and moving towards
34.1. CLASS NSBEZIERPATHMBS

the specified point, relative to the current location.

Notes:

p: A point whose coordinates are interpreted as a relative offset from the current point.

The destination point is relative to the current point. For example, if the current point is (1, 1) and aPoint contains the value (1, 2), a line segment is created between the points (1, 1) and (2, 3).

You must set the path’s current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

34.1.33 relativeMoveToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Moves the receiver’s current point to a new point whose location is the specified distance from the current point. Notes:

p: A point whose coordinates are interpreted as a relative offset from the current point.

This method implicitly closes the current subpath (if any) and updates the location of the current point. For example, if the current point is (1, 1) and aPoint contains the value (1, 2), the previous subpath would be closed and the current point would become (2, 3). When closing the previous subpath, this method does not cause a line to be created from the first and last points in the subpath.

You must set the path’s current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

34.1.34 removeAllPoints

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Removes all path elements from the receiver, effectively clearing the path.

Example:

```vba
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath
b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)
MsgBox str(b.elementCount) // 2
b.removeAllPoints
```
34.1.35  setAssociatedPoints(points() as NSPointMBS, index as Integer)

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Changes the points associated with the specified path element.

Notes:

points: An array containing up to three NSPointMBS data types. This parameter must contain the correct number of points for the path element at the specified index. Move, close path, and line segment commands require one point. Curve operations require three points.
index: The index of the path element you want to modify.

You can use this method to change the points associated with a path quickly and without recreating the path. You cannot use this method to change the type of the path element.

The following example shows you how you would modify the point associated with a line path element. The path created by this example results in a path with two elements. The first path element specifies a move to point (0, 0) while the second creates a line to point (100, 100). It then changes the line to go only to the point (50,50) using this method:

Note: If you specify too few points for a path element of type NSCurveToBeziersPathElement, the behavior of this method is undefined.

34.1.36  setLineDash(pattern() as Double, phase as Double)

Example:

dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setFillColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)

dim pattern() as Double
34.1. CLASS NSBEZIERPATHMBS

pattern.Append 5
pattern.Append 2
b.setLineDashPattern, 6

g.stroke(b)
g = nil

window1Backdrop = n.CopyPicture // red line with dash pattern

Notes:

pattern: An array of floating point values that contains the lengths (measured in points) of the line segments and gaps in the pattern. The values in the array alternate, starting with the first line segment length, followed by the first gap length, followed by the second line segment length, and so on.
count: The number of values in pattern.
phase: The offset at which to start drawing the pattern, measured in points along the dashed-line pattern. For example, a phase of 6 in the pattern 5-2-3-2 would cause drawing to begin in the middle of the first gap.

34.1.37 transformUsingAffineTransform(transform as Variant)

Example:

dim bezierPath as NSBezierPathMBS = NSBezierPathMBS.bezierPath
dim transform as NSAffineTransformMBS = NSAffineTransformMBS.transform

bezierPath.moveToPoint NSMakePointMBS(0.0, 0.0)
bezierPath.lineToPoint NSMakePointMBS(100.0, 100.0)
transform.translate(10,10)
bezierPath.transformUsingAffineTransform(transform)

Break // bezierPath.bounds starts now at 10/10

Notes:

Transform: The transform to apply to the path.

This method applies the transform to the path’s points immediately. The following code translates a line from 0.0 to 100,100 to a line from 10,10 to 110,110.
transform must be a NSAffineTransformMBS object.

34.1.38 Properties

34.1.39 Bounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bounding box of the receiver’s path.

**Example:**

```dim r as new NSRectMBS(10, 10, 50, 50)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
dim rr as NSRectMBS = b.Bounds
MsgBox rr.String```

**Notes:**

The rectangle that encloses the path of the receiver. If the path contains curve segments, the bounding box encloses the curve but may not enclose the control points used to calculate the curve.

(Read only property)

34.1.40 ControlPointBounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bounding box of the receiver’s path, including any control points.

**Notes:**

The rectangle that encloses the receiver’s path. If the path contains curve segments, the bounding box encloses the control points of the curves as well as the curves themselves.

(Read only property)

34.1.41 CurrentPoint as NSPointMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s current point (the trailing point or ending point in the most recently added segment).

**Example:**

```dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath
b.moveToPoint NSMakePointMBS(10,10)```
34.1. **CLASS NSBEZIERNPATHMBS**

MsgBox b.CurrentPoint.String

**Notes:**
The point from which the next drawn line or curve segment begins.
If the receiver is empty, this method raises NSGenericException.
(Read only property)

### 34.1.42 defaultFlatness as Double

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default flatness value for all paths.

**Notes:**
The flatness value specifies the accuracy (or smoothness) with which curves are rendered. It is also the maximum error tolerance (measured in pixels) for rendering curves, where smaller numbers give smoother curves at the expense of more computation. The exact interpretation may vary slightly on different rendering devices.

The default flatness value is 0.6, which yields smooth curves.
(Read and Write property)

### 34.1.43 defaultLineCapStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default line cap style for all paths.

**Notes:**
The default line cap style or NSButtLineCapStyle if no other style has been set. For a list of values, see Constants.

The default line cap style can be overridden for individual paths by setting a custom style for that path using the LineCapStyle property.
(Read and Write property)

### 34.1.44 defaultLineJoinStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default line join style for all paths.

**Notes:**
CHAPTER 34. COCOA DRAWING

The default line join style or NSMiterLineJoinStyle if no other value has been set. For a list of values, see Constants.
(Read and Write property)

34.1.45  defaultLineWidth as Double

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the default line width for the all paths.
Notes:
The line width defines the thickness of stroked paths. A width of 0 is interpreted as the thinnest line that can be rendered on a particular device. The actual rendered line width may vary from the specified width by as much as 2 device pixels, depending on the position of the line with respect to the pixel grid and the current anti-aliasing settings. The width of the line may also be affected by scaling factors specified in the current transformation matrix of the active graphics context.
(Read and Write property)

34.1.46  defaultMiterLimit as Double

Notes:
The miter limit helps you avoid spikes at the junction of two line segments connected by a miter join (NSMiterLineJoinStyle). If the ratio of the miter lengththe diagonal length of the miter jointo the line thickness exceeds the miter limit, the joint is converted to a bevel join. The default miter limit value is 10, which converts miters whose angle at the joint is less than 11 degrees.
(Read and Write property)

34.1.47  defaultWindingRule as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the default winding rule used to fill all paths.
Notes:
The current default winding rule or NSNonZeroWindingRule if no default rule has been set. This value may be either NSNonZeroWindingRule or NSEvenOddWindingRule.
Winding rules determine how to paint (or fill) the region enclosed by a path. You use this method to set the default rule that is applied to paths that do not have a custom winding rule assigned.
(Read and Write property)
34.1. CLASS NSBEZIERPATHMBS

34.1.48 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

34.1.49 flatness as Double

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The flatness value of the path.  
**Notes:**  
If no value is set, this method returns the default flatness value.  
(Read and Write computed property)

34.1.50 lineCapStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The line cap style for the receiver’s path.  
**Notes:**  
If this value is not set for the receiver, the default line cap style is returned.  
(Read and Write computed property)

34.1.51 lineJoinStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver’s line join style.  
**Notes:**  
If this value is not set for the receiver, the default line join style is returned.  
(Read and Write computed property)

34.1.52 lineWidth as Double

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The line width of the receiver’s path.  
**Example:**

```plaintext
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)
```
g.setFillColor(NSColorMBS.redColor)

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint(NSMakePointMBS(10, 10))
b.lineToPoint(NSMakePointMBS(290, 290))

dim pattern() as Double
pattern.Append(10)
pattern.Append(4)

b.lineWidth = 5
b.setLineDash(pattern, 12)

g.stroke(b)

g = nil

window1.Backdrop = n.CopyPicture // red line with dash pattern

Notes:
The line width of the receiver, measured in points in the user coordinate space.
If no value was set explicitly for the receiver, this method returns the default line width.
(Read and Write computed property)

34.1.53 miterLimit as Double

Notes:
If no value is set, this method returns the default miter limit.
(Read and Write computed property)

34.1.54 windingRule as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the winding rule used to fill the receiver’s path.

Notes:
34.1. CLASS NSBEZIERPATHMBS

Returns the winding rule for the path. This value may be either NSNonZeroWindingRule or NSEvenOddWindingRule.

This value overrides the default value returned by defaultWindingRule.
For more information on how winding rules affect the appearance of filled paths, see Constants.
(Read and Write computed property)

34.1.55 Constants

34.1.56 NSBevelLineJoinStyle = 2

MBS MacBase Plugin, Plugin Version: 12.5. Function: One of the constants to specify the shape of the joints between connected segments of a stroked path.
Notes:
Specifies a bevel line shape of the joints between connected segments of a stroked path.
See the setDefaultLineJoinStyle method for an example of the appearance.

34.1.57 NS ButtLineCapStyle = 0

MBS MacBase Plugin, Plugin Version: 12.5. Function: One of the constants to specify the shape of endpoints for an open path when stroked.
Notes:
Specifies a butt line cap style for endpoints for an open path when stroked.
See the setDefaultLineCapStyle method for an example of the appearance.

34.1.58 NS ClosePathBezierPathElement = 3

MBS MacBase Plugin, Plugin Version: 12.5. Function: Basic path element command constants.
Notes:
Marks the end of the current subpath at the specified point.
Note that the point specified for the Close Path element is essentially the same as the current point.

34.1.59 NS CurveToBezierPathElement = 2

MBS MacBase Plugin, Plugin Version: 12.5. Function: Basic path element command constants.
Notes:
CHAPTER 34. COCOA DRAWING

Creates a curved line segment from the current point to the specified endpoint using two control points to define the curve. The points are stored in the following order: controlPoint1, controlPoint2, endPoint. Ovals, arcs, and Bezier curves all use curve elements to specify their geometry. Contains 3 points.

34.1.60  NSEvenOddWindingRule = 1

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants used to specify the winding rule a Bezier path should use. **Notes:**

Specifies the even-odd winding rule. Count the total number of path crossings. If the number of crossings is even, the point is outside the path. If the number of crossings is odd, the point is inside the path and the region containing it should be filled.

34.1.61  NSLineToBezierPathElement = 1

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** Basic path element command constants. **Notes:**

Creates a straight line from the current drawing point to the specified point. Lines and rectangles are specified using this path element. Contains 1 point.

34.1.62  NSMiterLineJoinStyle = 0

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants to specify the shape of the joints between connected segments of a stroked path. **Notes:**

Specifies a miter line shape of the joints between connected segments of a stroked path. See the setDefaultLineJoinStyle method for an example of the appearance.

34.1.63  NSMoveToBezierPathElement = 0

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** Basic path element command constants. **Notes:**

Moves the path object’s current drawing point to the specified point. This path element does not result in any drawing. Using this command in the middle of a path results in a
**34.1.64 NSNonZeroWindingRule = 0**

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants used to specify the winding rule a Bezier path should use.

**Notes:**

Specifies the non-zero winding rule. Count each left-to-right path as +1 and each right-to-left path as -1. If the sum of all crossings is 0, the point is outside the path. If the sum is nonzero, the point is inside the path and the region containing it is filled. This is the default winding rule.

**34.1.65 NSRoundLineCapStyle = 1**

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants to specify the shape of endpoints for an open path when stroked.

**Notes:**

Specifies a round line cap style for endpoints for an open path when stroked. See the setDefaultLineCapStyle method for an example of the appearance.

**34.1.66 NSRoundLineJoinStyle = 1**

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants to specify the shape of the joints between connected segments of a stroked path.

**Notes:**

Specifies a round line shape of the joints between connected segments of a stroked path. See the setDefaultLineJoinStyle method for an example of the appearance.

**34.1.67 NSSquareLineCapStyle = 2**

MBS MacBase Plugin, Plugin Version: 12.5. **Function:** One of the constants to specify the shape of endpoints for an open path when stroked.

**Notes:**

Specifies a square line cap style for endpoints for an open path when stroked. See the setDefaultLineCapStyle method for an example of the appearance.
34.2 class NSBitmapImageRepMBS

34.2.1 class NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The NSBitmapImageRep class renders an image from bitmap data. Notes: Bitmap data formats supported include GIF, JPEG, TIFF, PNG, and various permutations of raw bitmap data.

Alpha Premultiplication

If a coverage (alpha) plane exists, a bitmap’s color components are premultiplied with it. If you modify the contents of the bitmap, you are therefore responsible for premultiplying the data. For this reason, though, if you want to manipulate the actual data, an NSBitmapImageRep object is not recommended for storage. If you need to work with data that is not premultiplied, you should use Quartz, specifically CGImageCreate with kCGImageAlphaLast.

Note that premultiplying does not affect the output quality. Given source bitmap pixel \( s \), destination pixel \( d \), and alpha value \( a \), a blend is basically

\[
d' = a \times s + (1 - a) \times d
\]

All premultiplication does is precalculate \( a \times s \).

Subclass of the NSImageRepMBS class.

34.2.2 Methods

34.2.3 bitmapImageRepByConvertingToColorSpace(colorSpace as NSColorSpaceMBS, renderingIntent as Integer) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Converts the image rep to the specified colorspace. Notes: targetSpace: The new colorSpace renderingIntent: The rendering intent specifies how to handle colors that are not located within the target color space. The supported values are NSColorRenderingIntent.

An NSBitmapImageRep, or nil, if the conversion fails. If the original NSBitmapImageRep already uses that colorSpace, it is returned as is.
34.2. CLASS NSBITMAPIMAGEREPMBS

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>0</td>
</tr>
<tr>
<td>AbsoluteColorimetric</td>
<td>1</td>
</tr>
<tr>
<td>RelativeColorimetric</td>
<td>2</td>
</tr>
<tr>
<td>Perceptual</td>
<td>3</td>
</tr>
<tr>
<td>Saturation</td>
<td>4</td>
</tr>
</tbody>
</table>

34.2.4 bitmapImageRepByRetaggingWithColorSpace(newSpace as NSColorSpaceMBS) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the colorSpace tag of the receiver. **Notes:**

newSpace: The desired colorSpace.

Returns an NSBitmapImageRep, or nil, if the conversion fails. If the original NSBitmapImageRep already uses that colorSpace, it is returned as is.

This method will definitely fail if you pass a colorSpace that has a different color space model than the receiver. That is, if your original image is sRGB, you can only retag with some other RGB colorspace. Available in Mac OS X v10.6 and later.

34.2.5 BMPRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap as bmp data.

34.2.6 canBeCompressedUsing(compression as Integer) as Boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tests whether the receiver can be compressed by the specified compression scheme. **Notes:**

Returns true if the receiver’s data matches compression with this type, false if the data doesn’t match compression or if compression is unsupported.

Legal values for compression can be found in NSBitmapImageRep.h and are described in TIFF Compression
in NSBitmapImageReps. This method returns true if the receiver’s data matches compression; for example, if compression is NSTIFFCompressionCCITTFA3, then the data must be 1 bit per sample and 1 sample per pixel.

### 34.2.7 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a newly allocated NSBitmapImageRep from the provided data.

**Notes:**

- data: A data object containing image data. The contents of bitmapData can be any supported bitmap format. For TIFF data, the NSBitmapImageRep is initialized from the first header and image data found in bitmapData.

On success the handle property is not zero.

See also:

- 34.2.8 Constructor(pic as Picture)
- 34.2.9 Constructor(pixelsWide as Integer, pixelsHigh as Integer, bitsPerSample as Integer, samplesPerPixel as Integer, hasAlpha as boolean, colorSpaceName as string, bytesPerRow as Integer, bitsPerPixel as Integer)

### 34.2.8 Constructor(pic as Picture)

MBS MacBase Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSBitmapImageRep object created from a Core Graphics image object.

**Notes:**

- pic: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn’t be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the cgImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

See also:

- 34.2.7 Constructor(data as Memoryblock)
34.2. Constructor(pixelsWide as Integer, pixelsHigh as Integer, bitsPerSample as Integer, samplesPerPixel as Integer, hasAlpha as boolean, colorSpaceName as string, bytesPerRow as Integer, bitsPerPixel as Integer)

34.2.9 Constructor(pixelsWide as Integer, pixelsHigh as Integer, bitsPerSample as Integer, samplesPerPixel as Integer, hasAlpha as boolean, colorSpaceName as string, bytesPerRow as Integer, bitsPerPixel as Integer)

Example:

```pascal
dim n as new NSImageMBS(300,300)
dim r as new NSBitmapImageRepMBS(300, 300, 8, 4, true, NSColorSpaceMBS.NSCalibratedRGBColorSpace, 4*300, 32)

dim g as new NSGraphicsMBS(r)
g.setColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
```

g = nil // flush
n.addRepresentation r

Backdrop = n.CopyPictureWithMask

Notes:

The image bitmap data is allocated for you.

pixelsWide: The width of the image in pixels. This value must be greater than 0.
pixelsHigh: The height of the image in pixels. This value must be greater than 0.
bitsPerSample: The number of bits used to specify one pixel in a single component of the data. All components are assumed to have the same bits per sample. bps should be one of these values: 1, 2, 4, 8, 12, or 16.
samplesPerPixel: The number of data components, or samples per pixel. This value includes both color components and the coverage component (alpha), if present. Meaningful values range from 1 through 5. An image with cyan, magenta, yellow, and black (CMYK) color components plus a coverage component would have an spp of 5; a grayscale image that lacks a coverage component would have an spp of 1.
hasAlpha: True if one of the components counted in the number of samples per pixel (spp) is a coverage (alpha) component, and false if there is no coverage component. If true, the color components in the bitmap data must be premultiplied with their coverage component.
colorSpaceName: A string constant that indicates how data values are to be interpreted. It should be one of the following values: NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSCalibratedRGBColorSpace, NSDeviceWhiteColorSpace, NSDeviceBlackColorSpace, NSDeviceRGBColorSpace, NSDeviceCMYKColorSpace, NSNamedColorSpace or NSCustomColorSpace. (see NSColorSpaceMBS)

If bps is 12, you cannot specify the monochrome color space.
CHAPTER 34. COCOA DRAWING

bytesPerRow: The number of bytes that are allocated for each scan line in each plane of data. A scan line is a single row of pixels spanning the width of the image. Normally, rowBytes can be figured from the width of the image, the number of bits per pixel in each sample (bps), and, if the data is in a meshed configuration, the number of samples per pixel (spp). However, if the data for each row is aligned on word or other boundaries, it may have been necessary to allocate more memory for each row than there is data to fill it. rowBytes lets the object know whether that’s the case. If you pass in a rowBytes value of 0, the bitmap data allocated may be padded to fall on long word or larger boundaries for performance. If your code wants to advance row by row, use bytesPerRow and do not assume the data is packed. Passing in a non-zero value allows you to specify exact row advances.

bitsPerPixel: This integer value informs NSBitmapImageRep how many bits are actually allocated per pixel in each plane of data. If the data is in planar configuration, this normally equals bps (bits per sample). If the data is in meshed configuration, it normally equals bps times spp (samples per pixel). However, it’s possible for a pixel specification to be followed by some meaningless bits (empty space), as may happen, for example, if pixel data is aligned on byte boundaries. NSBitmapImageRep supports only a limited number of pixelBits values (other than the default): for RGB images with 4 bps, pixelBits may be 16; for RGB images with 8 bps, pixelBits may be 32. The legal values for pixelBits are system dependent. If you specify 0 for this parameter, the object interprets the number of bits per pixel using the values in the bps and spp parameters, as described in the preceding paragraph, without any meaningless bits.

On success the handle property is not zero.

You can add several NSBitmapImageRepMBS to NSImage to make a multi page tiff file. To make a 300 dpi image, the size of the NSImage must be smaller than the size of the bitmap inside by factor 72/300.

See also:
- 34.2.7 Constructor(data as Memoryblock)
- 34.2.8 Constructor(pic as Picture)

34.2.10 GIFRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap as gif data.

34.2.11 imageRepWithCGImage(CGImage as Variant) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSBitmapImageRep object created from a Core Graphics image object. **Notes:**
cgimage: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.
34.2. **CLASS NSBITMAPIMAGEREPMBS**

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn’t be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the cgImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

### 34.2.12 `imageRepWithCGImageRef(CGImageHandle as Integer) as NSBitmapImageRepMBS`

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSBitmapImageRep object created from a Core Graphics image reference. **Notes:**

CGImageHandle: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn’t be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the cgImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

### 34.2.13 `imageRepWithCIImage(CIImage as variant) as NSBitmapImageRepMBS`

MBS MacBase Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSBitmapImageRep object created from a CoreImage object. **Notes:**

CIImage: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn’t be created.
If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the CIImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

34.2.14 imageRepWithCIImageRef(CIImageHandle as Integer) as NSBitmapImageRepMBS

Notes:
CIImageHandle: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn’t be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the CIImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

34.2.15 imageRepWithData(data as Memoryblock) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and returns an NSBitmapImageRep object initialized with the first image in the supplied data.

Notes:

data: A data object containing one or more bitmapped images. The bitmapData parameter can contain data in any supported bitmap format.

Returns an NSBitmapImageRep instance or nil if the class is unable to create an image representation.
34.2. CLASS NSBITMAPIMAGEREPMBS

34.2.16 JPEGRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap as jpeg data.

34.2.17 NSImageColorSyncProfileData as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.

**Notes:**
Identifies a memoryblock containing the ColorSync profile data.
It can be used for TIFF, JPEG, GIF, and PNG files. This value is set when reading in and used when writing out image data. You can get the profile data for a particular color space from the corresponding NSColorSpace object or from the ColorSync Manager.

34.2.18 NSImageCompressionFactor as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.

**Notes:**
Identifies a number containing the compression factor of the image.
Used only for JPEG files. JPEG compression in TIFF files is not supported, and the factor is ignored. The value is a float between 0.0 and 1.0, with 1.0 resulting in no compression and 0.0 resulting in the maximum compression possible. It’s set when reading in and used when writing out the image.

34.2.19 NSImageCompressionMethod as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.

**Notes:**
Identifies a number identifying the compression method of the image.
Used only for TIFF files. The value corresponds to one of the NSTIFFCompression constants, described below. It’s set when reading in and used when writing out.

34.2.20 NSImageCurrentFrame as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.
CHAPTER 34. COCOA DRAWING

Notes:
Identifies a number containing the current frame for an animated GIF file.
The first frame is 0.

34.2.21 NSImageCurrentFrameDuration as string

Notes:
Identifies a number containing the duration (in seconds) of the current frame for an animated GIF image. The frame duration can be a floating-point value. It is used when reading in, but not when writing out.

34.2.22 NSImageDitherTransparency as string

Notes:
Identifies a number containing a boolean that indicates whether the image is dithered. Used only when writing GIF files.

34.2.23 NSImageEXIFData as string

Notes:
Identifies an dictionary containing the EXIF data for the image. This property is used only when reading or writing JPEG files. The dictionary contains the EXIF keys and values. Th standard dictionary keys (that is, those that are not specific to camera vendors) are identical to those for kCGImagePropertyExifDictionary declared in the CGImageSource API. See kCGImagePropertyExifDictionary Keys for details.

34.2.24 NSImageFallbackBackgroundColor as string

Notes:
34.2. CLASS NSBITMAPIMAGEREPMBS

Specifies the background color to use when writing to an image format (such as JPEG) that doesn’t support alpha. The color’s alpha value is ignored. The default background color, when this property is not specified, is white. The value of the property should be an NSColorMBS object. This constant corresponds to the kCGImageDestinationBackgroundColor constant in Quartz.
Available in Mac OS X v10.5 and later.

34.2.25 NSImageFrameCount as string

Notes:
Identifies a number containing the number of frames in an animated GIF file. This value is used when reading in data.

34.2.26 NSImageGamma as string

Notes:
Identifies a number containing the gamma value for the image. Used only for PNG files. The gamma values is a floating-point number between 0.0 and 1.0, with 0.0 being black and 1.0 being the maximum color. It’s set when reading in and used when writing out.

34.2.27 NSImageInterlaced as string

Notes:
Identifies a number containing a Boolean value that indicates whether the image is interlaced. Used only when writing out PNG files.

34.2.28 NSImageLoopCount as string

Notes:
Identifies a number containing the number of loops to make when animating a GIF image.
A value of 0 indicates the animation should loop indefinitely. Values should be specified as Integer numbers. It is used when reading in but not when writing out the image.

### 34.2.29 NSImageProgressive as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.

**Notes:**
Identifies a number containing a boolean that indicates whether the image uses progressive encoding. Used only for JPEG files. It’s set when reading in and used when writing out.

### 34.2.30 NSImageRGBColorTable as string

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys.

**Notes:**
Identifies an Memoryblock containing the RGB color table. Used only for GIF files. It’s stored as packed RGB. It’s set when reading in and used when writing out.

### 34.2.31 PNGRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap as PNG data.

### 34.2.32 TIFFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a TIFF representation of the receiver.

**Notes:**
This method invokes TIFFRepresentationUsingCompression using the stored compression type and factor retrieved from the initial image data or changed using setCompression. If the stored compression type isn’t supported for writing TIFF data (for example, NSTIFFCompressionNEXT), the stored compression is changed to NSTIFFCompressionNone before invoking TIFFRepresentationUsingCompression. receiver, using the compression that’s returned by getCompression (if applicable).

If a problem is encountered during generation of the TIFF, TIFFRepresentation raises an NSTIFFException or an NSBadBitmapParametersException.
34.2. CLASS NSBITMAPIMAGEREPMBS

See also:

- 34.2.33 TIFFRepresentation(properties as dictionary = nil) as Memoryblock

34.2.33 TIFFRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap as tiff data.

See also:

- 34.2.32 TIFFRepresentation as Memoryblock 6834

34.2.34 Properties

34.2.35 bitmapData as Ptr

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a pointer to the bitmap data.

**Notes:**

If the data is planar, returns a pointer to the first plane.
(Read only property)

34.2.36 bitmapFormat as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap format of the receiver.

**Notes:**

Returns 0 by default. The return value can indicate several different attributes, which are described in Constants.
(Read only property)

34.2.37 bitsPerPixel as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of bits allocated for each pixel in each plane of data.

**Notes:**

This number is normally equal to the number of bits per sample or, if the data is in meshed configuration, the number of bits per sample times the number of samples per pixel. It can be explicitly set to another value (in initWithBitmapDataPlanes) in case extra memory is allocated for each pixel. This may be the
case, for example, if pixel data is aligned on byte boundaries.
(Read only property)

34.2.38 bytesPerPlane as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the number of bytes in each plane or channel of data.
Notes:
This number is calculated from the number of bytes per row and the height of the image.
(Read only property)

34.2.39 bytesPerRow as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the minimum number of bytes required to specify a scan line (a single row of pixels spanning the width of the image) in each data plane.
Notes:
If not explicitly set to another value (in initWithBitmapDataPlanes), this number will be figured from the width of the image, the number of bits per sample, and, if the data is in a meshed configuration, the number of samples per pixel. It can be set to another value to indicate that each row of data is aligned on word or other boundaries.
(Read only property)

34.2.40 CGImage as Variant

Notes:
If the image was created using a CGImage, you can get it back. Else a new CGImage may be created for you.
(Read only property)

34.2.41 colorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the image rep's colorSpace
Notes:
34.2. CLASS NSBITMAPIMAGEREPMBSE

Available in Mac OS X v10.6 and later.
(Read only property)

34.2.42 isPlanar as Boolean

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if image data is a planar configuration and false if its in a meshed configuration. **Notes:**
In a planar configuration, the image data is segregated into a separate plane for each color and coverage component. In a meshed configuration, the data is integrated into a single plane.  
(Read only property)

34.2.43 numberOfPlanes as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of separate planes image data is organized into. **Notes:**
This number is the number of samples per pixel if the data has a separate plane for each component (isPlanar returns true) and 1 if the data is meshed (isPlanar returns false).  
(Read only property)

34.2.44 samplesPerPixel as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of components in the data. **Notes:**
The returned value includes both color components and the coverage component, if present.  
(Read only property)

34.2.45 valueForProperty(key as string) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value for the specified property. **Notes:**
Value can be nil.  
(Read and Write computed property)
34.2.46 Constants

34.2.47 NSAlphaFirstBitmapFormat = 1

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the bitmap format constants.

**Notes:**
If 0, alpha values are the last component.
For example, CMYKA and RGBA.
Available in Mac OS X v10.4 and later.

34.2.48 NSAlphaNonpremultipliedBitmapFormat = 2

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the bitmap format constants.

**Notes:**
If 0, alpha values are premultiplied.
Available in Mac OS X v10.4 and later.

34.2.49 NSBMPFileType = 1

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Image format file type constants.

**Notes:** Windows bitmap image (BMP) format

34.2.50 NSFloatingPointSamplesBitmapFormat = 4

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the bitmap format constants.

**Notes:**
If 0, samples are integer values.
Available in Mac OS X v10.4 and later.

34.2.51 NSGIFFileType = 2

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Image format file type constants.

**Notes:** Graphics Image Format (GIF), originally created by CompuServe for online downloads
34.2.52  **NSImageRepLoadStatusCompleted = -6**

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the image loading state constants. 
**Notes:** Enough data has been provided to successfully decompress the image (regardless of the complete flag).

34.2.53  **NSImageRepLoadStatusInvalidData = -4**

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the image loading state constants. 
**Notes:** An error occurred during image decompression. The image contains the portions of the data that have already been successfully decompressed, if any.

34.2.54  **NSImageRepLoadStatusReadingHeader = -2**

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the image loading state constants. 
**Notes:** The image format is known, but not enough data has been read to determine the size, depth, etc., of the image. You should continue to provide more data.

34.2.55  **NSImageRepLoadStatusUnexpectedEOF = -5**

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the image loading state constants. 
**Notes:** incrementalLoadFromData was called with true, but not enough data was available for decompression. The image contains the portions of the data that have already been successfully decompressed, if any.

34.2.56  **NSImageRepLoadStatusUnknownType = -1**

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the image loading state constants. 
**Notes:** Not enough data to determine image format. You should continue to provide more data.

34.2.57  **NSImageRepLoadStatusWillNeedAllData = -3**

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the image loading state constants. 
**Notes:** Incremental loading cannot be supported. Until you call incrementalLoadFromData with true, this status will be returned. You can continue to call the method but no decompression will take place. Once you do call the method with true, then the image will be decompressed and one of the final three status messages will be returned.
34.2.58  **NSJPEG2000FileType = 5**

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Image format file type constants. 
**Notes:** JPEG 2000 file format.

34.2.59  **NSJPEGFileType = 3**

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Image format file type constants. 
**Notes:** JPEG format.

34.2.60  **NSPNGFileType = 4**

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Image format file type constants. 
**Notes:** Portable Network Graphics (PNG) format.

34.2.61  **NSTIFFCompressionCCITTFAX3 = 3**

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants 
**Notes:**
CCITT Fax Group 3 compression. 
Used for 1-bit fax images sent over telephone lines.

34.2.62  **NSTIFFCompressionCCITTFAX4 = 4**

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants 
**Notes:**
CCITT Fax Group 4 compression. 
Used for 1-bit fax images sent over ISDN lines.

34.2.63  **NSTIFFCompressionJPEG = 6**

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants 
**Notes:** JPEG compression. No longer supported for input or output.
34.2. CLASS NSBITMAPIMAGEREPMBS

34.2.64 NSTIFFCompressionLZW = 5

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants  
**Notes:** LZW compression.

34.2.65 NSTIFFCompressionNEXT = 32766

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants  
**Notes:** NeXT compressed. Supported for input only.

34.2.66 NSTIFFCompressionNone = 1

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants  
**Notes:** No compression.

34.2.67 NSTIFFCompressionOldJPEG = 32865

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants  
**Notes:** Old JPEG compression. No longer supported for input or output.

34.2.68 NSTIFFCompressionPackBits = 32773

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Tiff Compression constants  
**Notes:** PackBits compression.

34.2.69 NSTIFFFileType = 0

MBS MacBase Plugin, Plugin Version: 12.0. **Function:** One of the Image format file type constants.  
**Notes:** Tagged Image File Format (TIFF)
34.3 class NSColorListMBS

34.3.1 class NSColorListMBS

34.3.2 Methods

34.3.3 colorWithKey(key as string) as NSColorMBS

34.3.4 Create(name as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates a color list; specify "" if you don’t want a name. Notes: Note that this does not add the color list to availableColorLists until the color list is saved into the user’s path with writeToFile("").
See also:
- 34.3.5 Create(name as string, path as string) as boolean

34.3.5 Create(name as string, path as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates a color list; specify "" if you don’t want a name. Notes: Note that this does not add the color list to availableColorLists until the color list is saved into the user’s path with writeToFile("").
See also:
- 34.3.4 Create(name as string) as boolean

34.3.6 insertColor(theColor as NSColorMBS, key as string, index as Integer)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Inserts color at the specified location. Notes: If a color by the same key is already in the list but at a different location it is removed from there.
34.3.7 isEditable as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this color list is editable.
**Notes:** True if it is editable.

34.3.8 Load(name as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Loads the named color list from availableColorLists.
**Notes:** Returns true on success.

34.3.9 name as string

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Name of the color list.

34.3.10 removeColorWithKey(key as string)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the color with the given key.
**Notes:** Does nothing if the key does not exist.

34.3.11 removeFile

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the color list is in the user’s path, removes the corresponding file in user’s colorlists directory.
**Notes:** Also removes the color list from availableColorLists. If there are no outstanding references to the color list this might deallocate the object as well.

34.3.12 setColor(theColor as NSColorMBS, key as string)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If key already exists, sets the corresponding color; otherwise inserts the color at the end.
34.3.13  writeToFile(path as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Writes the color list to the given path.
**Notes:**
Use "" to save to the user’s private colorlists directory. If the color list is named, this method will also insert
the color list into availableColorLists.
Returns true for success.
34.4. CLASS NSCOLORMBS

34.4 class NSColorMBS

34.4.1 class NSColorMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The class for a Cocoa color.
**Example:**
```vba
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.blueComponent)
```

34.4.2 Methods

34.4.3 alternateSelectedControlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the system color used for the face of a selected control.
**Example:**
```vba
dim c as NSColorMBS = NSColorMBS.alternateSelectedControlColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

**Notes:** The system color used for the face of a selected controla control being clicked or dragged. This color can be used where iApp-like highlighting is desired.

34.4.4 alternateSelectedControlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the system color used for text in a selected control.
**Example:**
```vba
dim c as NSColorMBS = NSColorMBS.alternateSelectedControlTextColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```
Notes: The system color used for text in a selected controla control being clicked or dragged. This color can be used where iApp-like highlighting is desired.

### 34.4.5 blackColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose grayscale value is 0.0 and whose alpha value is 1.0.  
**Example:**

```pascal
Dim c As NSColorMBS = NSColorMBS.blackColor

Window1.Title = c.Description
Window1.HasBackColor = True
Window1.BackColor = c.ColorValue
```

### 34.4.6 blendedColorWithFraction(alpha as Double, c as NSColorMBS) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object whose component values are a weighted sum of the receiver’s and the specified color object’s.  
**Example:**

```pascal
Dim b As NSColorMBS = NSColorMBS.blueColor
Dim r As NSColorMBS = NSColorMBS.redColor
Dim c As NSColorMBS = b.blendedColorWithFraction(0.5, r)

MsgBox c.Description
```

**Notes:**

fraction: The amount of the color to blend with the receiver’s color. The method converts color and a copy of the receiver to RGB, and then sets each component of the returned color to fraction of color’s value plus 1 fraction of the receiver’s.  
color: The color to blend with the receiver’s color.

The resulting color object or nil if the colors can’t be converted.
34.4. Class NSColorMBS

34.4.7  blueColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 0.0, 0.0, 1.0 and whose alpha value is 1.0.

**Example:**
```vbscript
dim c as NSColorMBS = NSColorMBS.blueColor
window1.Title = c.description
window1.HasBackColor = true
window1.backcolor = c.colorValue
```

34.4.8  brownColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 0.6, 0.4, 0.2 and whose alpha value is 1.0.

**Notes:**
```vbscript
dim c as NSColorMBS = NSColorMBS.brownColor
```
```vbscript
window1.Title = c.description
window1.HasBackColor = true
window1.backcolor = c.colorValue
```

34.4.9  CGColorHandle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts NSColor to CGColor.

**Notes:**
Return value may be an approximation in some cases, so there isn’t guaranteed round-trip fidelity. Available on Mac OS X 10.8.

34.4.10  clearColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose grayscale and alpha values are both 0.0.

**Example:**
```vbscript
dim c as NSColorMBS = NSColorMBS.clearColor
window1.Title = c.description
```

34.4.11 colorFromPasteboard as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns the NSColor currently on the given pasteboard.

**Notes:** The color currently on the pasteboard or nil if pasteBoard doesn’t contain color data.

34.4.12 colorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns an object representing the color space of the receiver.

**Example:**

```vba
dim b as NSColorMBS = NSColorMBS.blueColor
MsgBox b.colorSpace.localizedDescriptionedName
```

**Notes:**

An object representing a color space. The returned NSColorSpace object may represent a custom color space.

Calling this method raises an exception if the receiver is not based on a color space represented by an NSColorSpace object specifically, colors designated by NSNamedColorSpace and NSPatternColorSpace. If you are unsure about a color object, convert it to an equivalent NSColorSpace-based object before calling this method. Color objects created with color-space names NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSCalibratedRGBColorSpace, NSDeviceWhiteColorSpace, NSDeviceBlackColorSpace, NSDeviceRGBColorSpace, NSDeviceCMYKColorSpace, or NSCustomColorSpace with the NSColorSpace class methods corresponding to these names are safe to use with this method. See "About Color Spaces" in Color Programming Topics for Cocoa for a list of these corresponding methods.

34.4.13 colorUsingColorSpace(colorSpace as NSColorSpaceMBS) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns a new color object representing the color of the receiver in the specified color space.

**Example:**

```vba
dim b as NSColorMBS = NSColorMBS.blueColor
dim c as NSColorMBS = b.colorUsingColorSpace(NSColorSpaceMBS.deviceRGBColorSpace)
```
34.4. CLASS NSCOLORMBS

MsgBox b.description

Notes:

space: The color space of the new NSColor object.

Returns the new NSColor object. This method converts the receiver’s color to an equivalent one in the new color space. Although the new color might have different component values, it looks the same as the original. Returns nil if conversion is not possible.

If the receiver’s color space is the same as that specified in space, this method returns the same NSColor object.

34.4.14 colorUsingColorSpaceName(colorSpace as string) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and returns an NSColor whose color is the same as the receiver’s, except that the new NSColor is in the specified color space.

Notes:

colorSpace: The name of the color space containing the new NSColor object. If colorSpace is “”, the most appropriate color space is used.

The new NSColor object or nil if the specified conversion cannot be done.

34.4.15 colorWithAlphaComponent(alpha as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and returns an NSColor object that has the same color space and component values as the receiver, but the specified alpha component.

Example:

dim b as NSColorMBS = NSColorMBS.blueColor.colorWithAlphaComponent(0.5)
MsgBox b.description // shows ”NSCalibratedRGBColorSpace 0 0 1 0.5”

Notes:

alpha: The opacity value of the new NSColor object.
Returns a new NSColor object. If the receiver’s color space doesn’t include an alpha component, the receiver is returned.

A subclass with explicit opacity components should override this method to return a color with the specified alpha.

34.4.16  colorWithCalibratedHSV(hue as Double, saturation as Double, brightness as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and returns an NSColor object using the given opacity and HSB color space components.

Example:

```dim b as NSColorMBS = NSColorMBS.colorWithCalibratedHSV(1.0, 0.5, 0.2, 1.0)MsgBox b.description // shows "NSCalibratedRGBColorSpace 0.2 0.1 0.1 1"
```

Notes:

hue: The hue component of the color object in the HSB color space.
saturation: The saturation component of the color object in the HSB color space.
brightness: The brightness (or value) component of the color object in the HSB color space.
alpha: The opacity value of the color object,

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

34.4.17  colorWithCalibratedRGB(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

Example:

```dim b as NSColorMBS = NSColorMBS.colorWithCalibratedRGB(1.0, 0.5, 0.2, 1.0)MsgBox b.description // shows "NSCalibratedRGBColorSpace 1 0.5 0.2 1"
```

Notes:

red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.
Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

### 34.4.18 colorWithCalibratedWhite(white as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object using the given opacity and grayscale value.

**Example:**

```lisp
dim b as NSColorMBS = NSColorMBS.colorWithCalibratedWhite(1.0, 1.0)
MsgBox b.description // shows "NSCalibratedWhiteColorSpace 1 1"
```

**Notes:**
- white: The grayscale value of the color object.
- alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

### 34.4.19 colorWithCGColor(CGColorHandle as Integer) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts CGColor to NSColor.

**Notes:**
- Return value may be an approximation in some cases, so there isn’t guaranteed round-trip fidelity.
- Available on Mac OS X 10.8.

### 34.4.20 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, components() as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object created from the specified components of the given color space.

**Example:**

```lisp
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.localizedName

dim co as NSColorMBS = NSColorMBS.colorWithColorSpace(n, 1.0, 0, 0, 1.0)
```
CHAPTER 34. COCOA DRAWING

MsgBox co.description

Notes:

space: An NSColorSpace object representing a color space. The method raises an exception if this is nil.
components: An array of the components in the specified color space to use to create the NSColor object.
The order of these components is determined by the color-space profile, with the alpha component always last. (If you want the created color to be opaque, specify 1.0 for the alpha component.)

Returns the color object. If space represents a color space that cannot be used with NSColor objects (for example, a "pattern" color space) the method returns nil. Raises anNSExceptionMBS if the number of components does not match.

See also:

- 34.4.21 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, paramarray components as Double) as NSColorMBS

34.4.21 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, paramarray components as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns an NSColor object created from the specified components of the given color space.

Example:

dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.localizedDescription

dim co as NSColorMBS = NSColorMBS.colorWithColorSpace(n, 1.0, 0, 0, 1.0)
MsgBox co.localizedDescription

Notes:

space: An NSColorSpace object representing a color space. The method raises an exception if this is nil.
components: An array of the components in the specified color space to use to create the NSColor object.
The order of these components is determined by the color-space profile, with the alpha component always last. (If you want the created color to be opaque, specify 1.0 for the alpha component.)

Returns the color object. If space represents a color space that cannot be used with NSColor objects (for example, a "pattern" color space) the method returns nil. Raises anNSExceptionMBS if the number of components does not match.

See also:

- 34.4.20 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, components() as Double) as NSColorMBS
34.4. CLASS NSCOLORMBS

34.4.22 colorWithColorSpaceHSV(ColorSpace as NSColorSpaceMBS, hue as Double, saturation as Double, brightness as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object with the specified color space, hue, saturation, brightness, and alpha channel values.

**Notes:**

ColorSpace: An NSColorSpace object representing a color space. An exception is raised if the color model of the provided color space is not RGB.

hue: The hue (color) component, expressed as a floating-point value in the range 0.0 to 1.0.

saturation: The color saturation component, expressed as a floating-point value in the range 0.0 to 1.0.

brightness: The brightness component, expressed as a floating-point value in the range 0.0 to 1.0.

alpha: The alpha (opacity), expressed as a floating-point value in the range 0.0 (transparent) to 1.0 (opaque).

Returns the color object.

34.4.23 colorWithDeviceCMYK(cyan as Double, magenta as Double, yellow as Double, black as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object using the given opacity value and CMYK components.

**Example:**

```plaintext
dim b as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.5, 1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSDeviceCMYKColorSpace 0.5 1 0.5 0.2 1"
```

**Notes:**

cyan: The cyan component of the color object.

magenta: The magenta component of the color object.

yellow: The yellow component of the color object.

black: The black component of the color object.

alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setcmykcolor.
34.4.24 colorWithDeviceHSV(hue as Double, saturation as Double, brightness as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object using the given opacity value and HSB color space components.

**Example:**
```dim b as NSColorMBS = NSColorMBS.colorWithDeviceHSV(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSDeviceRGBColorSpace 0.2 0.1 0.1 1"
```

**Notes:**
- hue: The hue component of the color object.
- saturation: The saturation component of the color object.
- brightness: The brightness component of the color object.
- alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setrgbcolor.

34.4.25 colorWithDeviceRGB(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object using the given opacity value and RGB components.

**Example:**
```dim b as NSColorMBS = NSColorMBS.colorWithDeviceRGB(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSDeviceRGBColorSpace 1 0.5 0.2 1"
```

**Notes:**
- red: The red component of the color object.
- green: The green component of the color object.
- blue: The blue component of the color object.
- alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setrgbcolor.
34.4. **CLASS NSCOLORMBS**

34.4.26 **colorWithDeviceWhite(white as Double, alpha as Double=1.0) as NSColorMBS**

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSColor object using the given opacity and grayscale values. **Example:**

```vbnet
dim b as NSColorMBS = NSColorMBS.colorWithDeviceWhite(1.0, 1.0)
MsgBox b.description // shows "NSDeviceWhiteColorSpace 1 1"
```

**Notes:**

- `white`: The grayscale value of the color object.
- `alpha`: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setgray.

34.4.27 **colorWithDisplayP3(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a color created from the specified components in the Display P3 colorspace. **Notes:**

- `red`: The red component of the color object.
- `green`: The green component of the color object.
- `blue`: The blue component of the color object.
- `alpha`: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

34.4.28 **colorWithGenericGamma22White(white as Double, alpha as Double=1.0) as NSColorMBS**

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an color created with the specified white and alpha values in the GenericGamma22 colorspace. **Notes:**

- `white`: The white value of the color object.
- `alpha`: The opacity value of the color object.
CHAPTER 34. COCOA DRAWING

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.
Available in OS X v10.7 and later.

34.4.29  colorWithPatternImage(image as Variant) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Creates and returns an NSColor object that uses the specified image pattern.

Example:

dim p as Picture = LogoMBS(100)
dim n as new NSImageMBS(p)
dim c as NSColorMBS = NSColorMBS.colorWithPatternImage(n)
dim x as NSImageMBS = c.patternImage
Backdrop=x.CopyPictureWithMask

Notes:
The image is tiled starting at the bottom of the window. The image is not scaled.

Parameter is a NSImageMBS object. We declare it as a variant to reduce plugin dependencies.

34.4.30  colorWithSRGB(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns a color created from the specified components in the sRGB colorspace.

Notes:
red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.
Available in OS X v10.7 and later.
34.4. CLASS NSCOLORMBS

34.4.31 Components as Double()

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns the components of the receiver as an array.

**Example:**

```vba
dim b as NSColorMBS = NSColorMBS.blueColor
dim c(-1) as Double = b.Components
dim lines(-1) as string

for each d as Double in c
    lines.Append str(d)
next

MsgBox Join(lines) // shows 0 0 1 1
```

**Notes:** You can invoke this method on NSColor objects created from custom color spaces to get the individual floating point components, including alpha. Raises an exception if the receiver doesn’t have floating-point components. To find out how many components are in the components array, send the receiver a numberOfComponents message.

34.4.32 Constructor(c as color)

MBS MacBase Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Initializes the color with generic colorspace.

**Example:**

```vba
dim r as NSColorMBS = NSColorMBS.redColor
dim c as color = & c FF0000
dim n as new NSColorMBS(c)

Break // check debugger
```

See also:

- 34.4.33 Constructor(red as Double, green as Double, blue as Double, alpha as Double = 1.0)

34.4.33 Constructor(red as Double, green as Double, blue as Double, alpha as Double = 1.0)

MBS MacBase Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Initializes the color with generic colorspace.
Notes: Pass values in range from 0.0 to 1.0.
See also:

- 34.4.32 Constructor(c as color)

34.4.34 controlBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the system color used for the background of large controls.
**Example:**
dim c as NSColorMBS = NSColorMBS.controlBackgroundColor

window1.Title = c.description
window1.HasBackColor = true
window1.backcolor = c.colorValue

Notes: The system color used for the background of large controls such as browsers, table views, and clip views.

34.4.35 controlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the system color used for the flat surfaces of a control.
**Example:**
dim c as NSColorMBS = NSColorMBS.controlColor

window1.Title = c.description
window1.HasBackColor = true
window1.backcolor = c.colorValue

Notes: The system color used for the flat surfaces of a control. By default, the control color is a pattern color that will draw the ruled lines for the window background, which is the same as returned by windowBackgroundColor.

If you use controlColor assuming that it is a solid, you may have an incorrect appearance. You should use lightGrayColor in its place.
34.4. **CLASS NSCOLORMBS**

### 34.4.36 controlDarkShadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the dark edge of the shadow dropped from controls.

**Example:**

```vba
dim c as NSColorMBS = NSColorMBS.controlDarkShadowColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

**Notes:** Of the two dark borders that run along the bottom and right of controls, representing shadows, the color of the outer, darker border.

### 34.4.37 controlHighlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the highlighted bezels of controls.

**Example:**

```vba
dim c as NSColorMBS = NSColorMBS.controlHighlightColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

**Notes:** Of the two light borders that run along the top and left of controls, representing reflections from a light source in the upper left, the color of the inner, duller border.

### 34.4.38 controlLightHighlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for light highlights in controls.

**Example:**

```vba
dim c as NSColorMBS = NSColorMBS.controlLightHighlightColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```
Notes: Of the two light borders that run along the top and left of controls, representing reflections from a light source in the upper left, the color of the outer, brighter border.

34.4.39  controlShadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the system color used for the shadows dropped from controls.

Example:

```vba
dim c as NSColorMBS = NSColorMBS.controlShadowColor

window1.Title = c.description
window1.HasBackColor = true
window1.backcolor = c.colorValue
```

Notes: Of the two dark borders that run along the bottom and right of controls, representing shadows, the color of the inner, lighter border.

34.4.40  controlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the system color used for text on controls that aren’t disabled.

Example:

```vba
dim c as NSColorMBS = NSColorMBS.controlTextColor

window1.Title = c.description
window1.HasBackColor = true
window1.backcolor = c.colorValue
```

34.4.41  cyanColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns an NSColor object whose RGB value is 0.0, 1.0, 1.0 and whose alpha value is 1.0.

Example:

```vba
dim c as NSColorMBS = NSColorMBS.cyanColor
```
34.4. CLASS NSCOLORMBS

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue

### 34.4.42 darkGrayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose grayscale value is 1/3 and whose alpha value is 1.0.

**Example:**

```没人
dim c as NSColorMBS = NSColorMBS.darkGrayColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

### 34.4.43 disabledControlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for text on disabled controls.

**Example:**

```没人
dim c as NSColorMBS = NSColorMBS.disabledControlTextColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

### 34.4.44 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s CMYK and opacity values.

**Example:**

```没人
dim co as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(1.0, 0.5, 1.0, 0.8)
dim c,m,y,k as Double
co.getCMYK(c,m,y,k)
```
…. 6862

CHAPTER 34. COCOA DRAWING

MsgBox str(c) + “ ” + str(m) + “ ” + str(y) + “ ” + str(k)

Notes:

cyan: Upon return, contains the cyan component of the color object.
magenta: Upon return, contains the magenta component of the color object.
yellow: Upon return, contains the yellow component of the color object.
black: Upon return, contains the black component of the color object.
alpha: Upon return, contains opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSDeviceCMYKColorSpace. Sending it to other objects raises an exception.
See also:

• 34.4.45 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double, byref alpha as Double)

34.4.45  getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns the receiver’s CMYK and opacity values.

**Example:**

dim co as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(1.0, 0.5, 1.0, 0.8, 0.4)
dim c,m,y,k,a as Double

c.getCMYK(c,m,y,k,a)

MsgBox str(c) + “ ” + str(m) + “ ” + str(y) + “ ” + str(k) + “ ” + str(a)

Notes:

cyan: Upon return, contains the cyan component of the color object.
magenta: Upon return, contains the magenta component of the color object.
yellow: Upon return, contains the yellow component of the color object.
black: Upon return, contains the black component of the color object.
alpha: Upon return, contains opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSDeviceCMYKColorSpace. Sending it to other objects raises an exception.
See also:

• 34.4.44 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black
34.4.46 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the receiver’s HSB component and opacity values in the respective arguments.

Example:

dim c as NSColorMBS = NSColorMBS.colorWithCalibratedHSV(1.0, 0.5, 1.0, 0.4)
dim h,s,v,a as Double

c.getHSV(h,s,v,a)

MsgBox str(h) + ” ” + str(s) + ” ” + str(v) + ” ” + str(a)

Notes:

hue: Upon return, contains the hue component of the color object.
saturation: Upon return, contains the saturation component of the color object.
brightness: Upon return, contains the brightness component of the color object.
a: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.

See also:

• 34.4.47 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double, byref a as Double)

34.4.47 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double, byref a as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the receiver’s HSB component and opacity values in the respective arguments.

Notes:

hue: Upon return, contains the hue component of the color object.
saturation: Upon return, contains the saturation component of the color object.
brightness: Upon return, contains the brightness component of the color object.
a: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.
See also:

- 34.4.46 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double)

34.4.48 getRGB(byref red as Double, byref green as Double, byref blue as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the receiver’s RGB component and opacity values in the respective arguments.

**Example:**
```vba
dim c as NSColorMBS = NSColorMBS.blueColor
dim r,g,b as Double
c.getRGB(r,g,b)
MsgBox str(r)+" "+str(g)+" "+str(b) // shows "0 0 1"
```

**Notes:**
red: Upon return, contains the red component of the color object.
green: Upon return, contains the green component of the color object.
blue: Upon return, contains the blue component of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.

Plugin converts color to calibrated RGB if needed.

See also:

- 34.4.49 getRGB(byref red as Double, byref green as Double, byref blue as Double, byref alpha as Double)
34.4. CLASS NSCOLORMBS

c.getRGB(r, g, b, a)

MsgBox str(r) + " " + str(g) + " " + str(b) + " " + str(a) // shows "0 0 1 1"

Notes:
red: Upon return, contains the red component of the color object.
green: Upon return, contains the green component of the color object.
blue: Upon return, contains the blue component of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.

Plugin converts color to calibrated RGB if needed.
See also:
• 34.4.48 getRGB(byref red as Double, byref green as Double, byref blue as Double)

34.4.50 getWhite(byref white as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s grayscale value and alpha values.

**Example:**

dim c as NSColorMBS = NSColorMBS.colorWithDeviceWhite(1.0, 1.0)
dim w as Double

c.getWhite(w)

MsgBox str(w)

Notes:
white: Upon return, contains the grayscale value of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSDeviceBlackColorSpace, or NSDeviceWhiteColorSpace color space. Sending it to other objects raises an exception.
See also:
• 34.4.51 getWhite(byref white as Double, byref alpha as Double)
34.4.51  **getWhite(byref white as Double, byref alpha as Double)**

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s grayscale value and alpha values.

**Example:**

```vbs
dim c as NSColorMBS = NSColorMBS.colorWithDeviceWhite(1.0, 1.0)
dim w,a as Double
c.getWhite(w,a)
MsgBox str(w)+” ”+str(a)
```

**Notes:**

- **white:** Upon return, contains the grayscale value of the color object.
- **alpha:** Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSDeviceBlackColorSpace, or NSDeviceWhiteColorSpace color space. Sending it to other objects raises an exception.

**See also:**

- 34.4.50 getWhite(byref white as Double)

34.4.52  **grayColor as NSColorMBS**

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose grayscale value is 0.5 and whose alpha value is 1.0.

**Example:**

```vbs
dim c as NSColorMBS = NSColorMBS.grayColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

34.4.53  **greenColor as NSColorMBS**

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 0.0, 1.0, 0.0 and whose alpha value is 1.0.

**Example:**
34.4. CLASS NSCOLORMBS

```vba
Dim c As NSColorMBS = NSColorMBS.greenColor

Window1.Title = c.Description
Window1.HasBackColor = True
Window1.BackgroundColor = c.ColorValue
```

34.4.54 gridColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the optional gridlines in, for example, a table view.

**Example:**

```vba
Dim c As NSColorMBS = NSColorMBS.gridColor

Window1.Title = c.Description
Window1.HasBackColor = True
Window1.BackgroundColor = c.ColorValue
```

34.4.55 headerColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used as the background color for header cells in table views and outline views.

**Example:**

```vba
Dim c As NSColorMBS = NSColorMBS.headerColor

Window1.Title = c.Description
Window1.HasBackColor = True
Window1.BackgroundColor = c.ColorValue
```

**Notes:** The system color used as the background for header cells in table and outline views.

34.4.56 headerTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for text in header cells in table views and outline views.

**Example:**
dim c as NSColorMBS = NSColorMBS.headerTextColor

window1.Title = c.description
window1.HasBackColor = true
window1.backcolor = c.colorValue

### 34.4.57 `highlightColor` as `NSColorMBS`

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color that represents the virtual light source on the screen.

**Example:**

```vb
dim c as NSColorMBS = NSColorMBS.highlightColor

window1.Title = c.description
window1.HasBackColor = true
window1.backcolor = c.colorValue
```

### 34.4.58 `highlightWithLevel(level as Double)` as `NSColorMBS`

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object that represents a blend between the receiver and the highlight color returned by `highlightColor`.

**Example:**

```vb
dim c as NSColorMBS = NSColorMBS.blueColor
dim h as NSColorMBS = c.highlightWithLevel(0.5)
MsgBox h.description
```

**Notes:**

level: The amount of the highlight color that is blended with the receiver’s color. This should be a number from 0.0 through 1.0. A highlightLevel below 0.0 is interpreted as 0.0; a highlightLevel above 1.0 is interpreted as 1.0.

Returns the new NSColor object. Returns nil if the colors can’t be converted.

Invoke this method when you want to brighten the receiving NSColor for use in highlights.
34.4. CLASS NSCOLORMBS

34.4.59 keyboardFocusIndicatorColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color that represents the keyboard focus ring around controls.

**Example:**
```
dim c as NSColorMBS = NSColorMBS.keyboardFocusIndicatorColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

34.4.60 knobColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the flat surface of a slider knob that hasn’t been selected.

**Example:**
```
dim c as NSColorMBS = NSColorMBS.knobColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

**Notes:** The knob’s beveled edges, which set it in relief, are drawn in highlighted and shadowed versions of the face color. When a knob is selected, its color changes to selectedKnobColor.

34.4.61 lightGrayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose grayscale value is 2/3 and whose alpha value is 1.0.

**Example:**
```
dim c as NSColorMBS = NSColorMBS.lightGrayColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```
34.4.62  magentaColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 1.0, 0.0, 1.0 and whose alpha value is 1.0.

**Example:**

```
dim c as NSColorMBS = NSColorMBS.magentaColor

window1.Title = c.description
window1.HasBackColor = true
window1.backcolor = c.colorValue
```

34.4.63  orangeColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 1.0, 0.5, 0.0 and whose alpha value is 1.0.

**Example:**

```
dim c as NSColorMBS = NSColorMBS.orangeColor

window1.Title = c.description
window1.HasBackColor = true
window1.backcolor = c.colorValue
```

34.4.64  patternImage as Variant

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the image that the receiver is using as a pattern.

**Example:**

```
dim p as Picture = LogoMBS(100)
dim n as new NSImageMBS(p)
dim c as NSColorMBS = NSColorMBS.colorWithPatternImage(n)
dim x as NSImageMBS = c.patternImage

Backdrop = x.CopyPictureWithMask
```

**Notes:**

The image used by the color object. If the receiver doesn’t have an image, this method raises an exception.
Declared a variant instead of NSImageMBS to reduce plugin dependencies.

### 34.4.65 purpleColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 0.5, 0.0, 0.5 and whose alpha value is 1.0. **Example:**

```vba
dim c as NSColorMBS = NSColorMBS.purpleColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

### 34.4.66 redColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 1.0, 0.0, 0.0 and whose alpha value is 1.0. **Example:**

```vba
dim c as NSColorMBS = NSColorMBS.redColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

### 34.4.67 scrollBarColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for scroll "bars" that is, for the groove in which a scroller’s knob moves. **Example:**

```vba
dim c as NSColorMBS = NSColorMBS.scrollBarColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

**Notes:** The system color used for scroll bars.
34.4.68  **scrubberTexturedBackgroundColor** as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The scrubber texture background color.

34.4.69  **secondarySelectedControlColor** as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used in non-key views.

**Example:**
```vbnet
dim c as NSColorMBS = NSColorMBS.secondarySelectedControlColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

34.4.70  **selectedControlColor** as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the face of a selected control.

**Example:**
```vbnet
dim c as NSColorMBS = NSColorMBS.selectedControlColor
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

**Notes:** The system color used for the face of a selected control for a control being dragged or clicked.

34.4.71  **selectedControlTextColor** as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for text in a selected control for a control being clicked or dragged.

**Example:**
```vbnet
34.4. **CLASS NSCOLORMBS**

```plaintext
dim c as NSColorMBS = NSColorMBS.selectedControlTextColor
Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

### 34.4.72 selectedKnobColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the slider knob when it is selected.  
**Example:**

```plaintext
dim c as NSColorMBS = NSColorMBS.selectedKnobColor
Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

**Notes:** The system color used for a slider knob that is selected that is, dragged.

### 34.4.73 selectedMenuItemColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the face of selected menu items.  
**Example:**

```plaintext
dim c as NSColorMBS = NSColorMBS.selectedMenuItemColor
Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

**Notes:** The system color used for selected menu items.
34.4.74 selectedMenuItemTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the text in menu items.  
**Example:**

```vbs
dim c as NSColorMBS = NSColorMBS.selectedMenuItemTextColor
Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

**Notes:** The system color used for text in selected menu items.

--

34.4.75 selectedTextBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the background of selected text.  
**Example:**

```vbs
dim c as NSColorMBS = NSColorMBS.selectedTextBackgroundColor
Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

--

34.4.76 selectedTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for selected text.  
**Example:**

```vbs
dim c as NSColorMBS = NSColorMBS.selectedTextColor
Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```
34.4. **CLASS NSCOLORMBS**

### 34.4.77 shadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color that represents the virtual shadows cast by raised objects on the screen. **Example:**

```vbnet
dim c as NSColorMBS = NSColorMBS.shadowColor
Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

### 34.4.78 shadowWithLevel(level as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object that represents a blend between the receiver and the shadow color returned by shadowColor. **Example:**

```vbnet
dim c as NSColorMBS = NSColorMBS.blueColor
dim h as NSColorMBS = c.shadowWithLevel(0.5)
MsgBox h.description
```

**Notes:**

- **level:** The amount of the shadow color used for the blend. This should be a number from 0.0 through 1.0. A shadowLevel below 0.0 is interpreted as 0.0; a shadowLevel above 1.0 is interpreted as 1.0.

Returns the new NSColor object. Returns nil if the colors can’t be converted.

Invoke this method when you want to darken the receiving NSColor for use in shadows.

### 34.4.79 textBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the system color used for the text background. **Example:**

```vbnet
dim c as NSColorMBS = NSColorMBS.textBackgroundColor
```
34.4.80  **textColor as NSColorMBS**

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the system color used for text.  
**Example:**

```
dim c as NSColorMBS = NSColorMBS.textColor
```

**Notes:** The system color used for text. When text is selected, its color changes to the return value of selectedTextColor.

34.4.81  **whiteColor as NSColorMBS**

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns an NSColor object whose grayscale and alpha values are both 1.0.  
**Example:**

```
dim c as NSColorMBS = NSColorMBS.whiteColor
```

**Notes:** The system color used for text. When text is selected, its color changes to the return value of selectedTextColor.
34.4. CLASS NSCOLORMBS

34.4.82  windowBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a pattern color that will draw the ruled lines for the window background.

**Example:**

```vba
Dim c As NSColorMBS = NSColorMBS.windowBackgroundColor
Title = c.description

window1.HasBackColor = true
window1.backcolor = c.colorValue
```

34.4.83  windowFrameColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the system color used for window frames, except for their text.

**Example:**

```vba
Dim c As NSColorMBS = NSColorMBS.windowFrameColor
Title = c.description

window1.HasBackColor = true
window1.backcolor = c.colorValue
```

34.4.84  windowFrameTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the system color used for the text in window frames.

**Example:**

```vba
Dim c As NSColorMBS = NSColorMBS.windowFrameTextColor

// convert to Calibrated RGB ColorSpace
c = c.colorUsingColorSpaceName("NSCalibratedRGBColorSpace")

Title = c.description

window1.HasBackColor = true
window1.backcolor = c.colorValue
```
34.4.85  **writeToPasteboard**

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the receiver’s data to the specified pasteboard.

34.4.86  **yellowColor as NSColorMBS**

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColor object whose RGB value is 1.0, 1.0, 0.0 and whose alpha value is 1.0. **Example:**

```vbnet
dim c as NSColorMBS = NSColorMBS.yellowColor
Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

34.4.87  **Properties**

34.4.88  **alphaComponent as Double**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The alpha value of the color. **Example:**

```vbnet
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.alphaComponent)
```

**Notes:**

Value is from 0.0 to 1.0. (Read only property)

34.4.89  **blackComponent as Double**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a CMYK color. **Example:**
34.4. CLASS NSCOLORMBS

dim c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.blackComponent)

Notes:
Value is from 0.0 to 1.0.
(Read only property)

34.4.90 blueComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a RGB color.

**Example:**
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.blueComponent)

Notes:
Value is from 0.0 to 1.0.
(Read only property)

34.4.91 brightnessComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a HSV color.

**Example:**
dim c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)
MsgBox str(c.brightnessComponent)

Notes:
Value is from 0.0 to 1.0.
(Read only property)
34.4.92  catalogNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the name of the catalog containing the receiver’s name.
**Notes:**
This method raises an exception if the receiver’s color space isn’t NSNamedColorSpace.
(Read only property)

34.4.93  colorNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the receiver’s name.
**Notes:**
This method raises an exception if the receiver’s color space isn’t NSNamedColorSpace.
(Read only property)

34.4.94  colorSpaceName as string

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Get the color space of the color.
**Example:**
```dim c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)```
MsgBox c.colorSpaceName

**Notes:** (Read only property)

34.4.95  colorValue as color

MBS MacBase Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the color value of this color (ignoring color space).
**Notes:**
The alphaComponent is ignored.
Returns RGB(RedComponent*255, GreenComponent*255, BlueComponent*255).
Plugin converts color to calibrated RGB if needed.
(Read only property)
34.4.96 cyanComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a CMYK color.

**Example:**

```vbnet
dim c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.cyanComponent)
```

**Notes:**

Value is from 0.0 to 1.0.
(Read only property)

34.4.97 description as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The description of the color object.

**Example:**

```vbnet
dim n as NSColorMBS = NSColorMBS.blueColor
MsgBox n.description // shows "NSCalibratedRGBColorSpace 0 0 1 1"
```

**Notes:** (Read only property)

34.4.98 greenComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a RGB color.

**Example:**

```vbnet
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.greenComponent)
```

**Notes:**

Value is from 0.0 to 1.0.
34.4.99  Handle as Integer

MBS MacBase Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.  
**Notes:**  
Useful for declares. Value is a NSColor pointer.  
(Read and Write property)

34.4.100  hueComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color value from a HSV color.  
**Example:**
```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)
MsgBox str(c.hueComponent)
```

**Notes:**  
Value is from 0.0 to 1.0.  
(Read only property)

34.4.101  localizedCatalogNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name of the catalog containing the receiver’s name as a localized string.  
**Notes:**  
This string may be displayed in user interface items like color pickers.  
(Read only property)

34.4.102  localizedColorNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name of the receiver as a localized string.  
**Notes:**
The name of color object as a localized string. This string may be displayed in user interface items like color pickers.
(Read only property)

34.4.103 magentaComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The color value from a CMYK color.
**Example:**
```vba
dim c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.magentaComponent)
```

**Notes:**
Value is from 0.0 to 1.0.
(Read only property)
34.4.104   numberOfComponents as Integer

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Returns the number of components in the receiver.
**Example:**

```csharp
dim n as NSColorMBS = NSColorMBS.blueColor
MsgBox str(n.numberOfComponents) // shows 4
```

**Notes:**
The number of components in the color object. The floating-point components counted include alpha. This method raises an exception if the receiver doesn’t have floating-point components.

Available in Mac OS X v10.4 and later.
(Read only property)

34.4.105   redComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
The color value from a RGB color.
**Example:**

```csharp
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.redComponent)
```

**Notes:**
Value is from 0.0 to 1.0.
(Read only property)

34.4.106   saturationComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
The color value from a HSV color.
**Example:**

```csharp
dim c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)
MsgBox str(c.saturationComponent)
```
34.4. CLASS NSCOLORMBS

Notes:
Value is from 0.0 to 1.0.
(Read only property)

34.4.107 whiteComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The color value from a Gray color.
**Example:**
```vba
dim c as NSColorMBS = NSColorMBS.colorWithDeviceWhite(0.1)
MsgBox str(c.whiteComponent)
```

Notes:
Value is from 0.0 to 1.0.
(Read only property)

34.4.108 yellowComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The color value from a CMYK color.
**Example:**
```vba
dim c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.yellowComponent)
```

Notes:
Value is from 0.0 to 1.0.
(Read only property)
34.5 class NSColorPanelMBS

34.5.1 class NSColorPanelMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to control a Color Panel (floating window).
**Notes:**
If you use SelectColor in your application, this color panel will be converted in a dialog which makes this class useless.

You should only have one instance of this class in your application.

If you compile for Cocoa, a TextField/TextArea automatically registers for color panel. So in order to avoid them updating text color with color panel selection, clear the focus by calling window.clearfocus method.

This class does only work on desktop computers, not in a webbrowser. Subclass of the NSPanelMBS class.

34.5.2 Methods

34.5.3 attachColorList(list as NSColorListMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attaches the given color list to the panel.
**Notes:** An application should use this method to add an NSColorList saved with a document in its file package or in a directory other than NSColorList’s standard search directories.

34.5.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to create a new color panel.

34.5.5 detachColorList(list as NSColorListMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Detaches the color list from the panel.
34.5. **CLASS NSCOLORPANELMBS**

34.5.6 **GetColor(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean**

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current color in the RGB color model.  
**Notes:**  
Values from 0.0 to 1.0.  
Returns true if the values are valid.  
See also:  
- 34.5.21 getColor as NSColorMBS

34.5.7 **GetColorFromDrag as color**

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns color values from the drag.  
**Notes:**  
If you receive a drag flavor which can’t be handled, it may be a NSColor.  
In this case only this method will be successfull.  
See also:  
- 34.5.8 GetColorFromDrag(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean

34.5.8 **GetColorFromDrag(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean**

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns color values from the drag.  
**Notes:**  
If you receive a drag flavor which can’t be handled, it may be a NSColor.  
In this case only this method will be successfull.  
See also:  
- 34.5.7 GetColorFromDrag as color

34.5.9 **orderFrontColorPanel**

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Brings up the color panel, an instance of NSColorPanel.  
**Notes:** If the NSColorPanel object does not exist yet, this method creates one. This method is typically invoked when the user chooses Colors from a menu.
### 34.5.10 SetColor(red as single, green as single, blue as single, alpha as single)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color.  
**Notes:** Values from 0.0 to 1.0.  
See also:

- 34.5.11 setColor(value as NSColorMBS)

### 34.5.11 setColor(value as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color.  
See also:

- 34.5.10 SetColor(red as single, green as single, blue as single, alpha as single)

### 34.5.12 setContinuous(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether you want to receive Changed events while the user chooses the color.  
**Notes:** Set value to true to have the receiver calls the Changed event continuously as the color of the NSColorPanel is set by the user; otherwise false.

### 34.5.13 setMode(value as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the mode of the panel the mode is one of the modes allowed by the color mask.  
**Notes:**

Constants:

- `const NSGrayModeColorPanel = 0`
- `const NSRGBModeColorPanel = 1`
- `const NSCMYKModeColorPanel = 2`
- `const NSHSBModeColorPanel = 3`
- `const NSCustomPaletteModeColorPanel = 4`
- `const NSColorListmodeColorPanel = 5`
- `const NSWheelModeColorPanel = 6`
- `const NSCrayonModeColorPanel = 7`
34.5.14  SetPickerMode(value as Integer)

*Notes:* 

**Constants:**

- `NSColorPanelGrayModeMask` = &h00000001
- `NSColorPanelRGBModeMask` = &h00000002
- `NSColorPanelCMYKModeMask` = &h00000004
- `NSColorPanelHSBModeMask` = &h00000008
- `NSColorPanelCustomPaletteModeMask` = &h00000010
- `NSColorPanelColorListModeMask` = &h00000020
- `NSColorPanelWheelModeMask` = &h00000040
- `NSColorPanelCrayonModeMask` = &h00000080
- `NSColorPanelAllModesMask` = &h00000fff

34.5.15  setShowsAlpha(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. *Function:* Tells the panel whether or not to show alpha values and an opacity slider.
*Notes:* Note that calling the NSColor method setIgnoresAlpha with a value of true overrides any value set with this method.

34.5.16  SharedColorPanelExists as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. *Function:* Returns a Boolean value indicating whether the NSColorPanel has been created already.
*Notes:* True if the NSColorPanel has been created already; otherwise false.

34.5.17  Properties

34.5.18  accessoryView as NSViewMBS

*Notes:* 

The accessory view can be any custom view you want to display with NSColorPanel, such as a view offering color blends in a drawing program. The accessory view is displayed below the color picker and above the color swatches in the NSColorPanel. The NSColorPanel automatically resizes to accommodate the accessory view.
34.5.19  alpha as Double

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s current alpha value based on its opacity slider.

**Notes:**
Value is in the range between 0.0 and 1.0.
This is 1.0 (opaque) if the panel has no opacity slider.
(Read only property)

34.5.20  ColorValue as Color

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current color as a Realbasic color in the RGB model.

**Notes:** (Read and Write property)

34.5.21  getColor as NSColorMBS

**Notes:**
The color returned can be RGB or something else.
(Read and Write property)
See also:
- 34.5.6 GetColor(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean

34.5.22  getColorAsRGB as NSColorMBS

**Notes:**
Returned NSColorMBS object is in RGB color mode.
(Read only property)
34.5. **CLASS NSCOLORPANELMBS**

### 34.5.23 isContinuous as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the class continuously calls the Changed event. **Notes:**

Returns true if the receiver continuously calls the Changed event as the user manipulates the color picker; otherwise false. (Read and Write property)

### 34.5.24 mode as Integer

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the color picker mode. **Notes:**

**Constants:**

```plaintext
const NSGrayModeColorPanel = 0
const NSRGBModeColorPanel = 1
const NSCMYKModeColorPanel = 2
const NSHSBModeColorPanel = 3
const NSCustomPaletteModeColorPanel = 4
const NSColorListModeColorPanel = 5
const NSWheelModeColorPanel = 6
const NSCrayonModeColorPanel = 7
```

(Read and Write property)

### 34.5.25 showsAlpha as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether or not the panel shows alpha values and an opacity slider. **Notes:**

Note that calling the NSColor method setIgnoresAlpha with a value of true overrides any value set with setShowsAlpha. (Read and Write property)
34.5.26  Events

34.5.27  Changed

MBS MacCocoa Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color changed.  
**Notes:** May not fire in the RB IDE.

34.5.28  DidMove

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color panel did move.

34.5.29  GotFocus

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color panel got focus.

34.5.30  Hidden

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color panel is hidden.

34.5.31  LostFocus

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color panel lost focus.

34.5.32  Shown

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The color panel shows.
34.5. CLASS NSCOLORPANELMBS

34.5.33 WillClose

34.5.34 Constants

34.5.35 NSCMYKModeColorPanel = 2

MBS MacCocoa Plugin, Plugin Version: 14.2. Function: On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Cyan-yellow-magenta-black

34.5.36 NSColorListModeColorPanel = 5

MBS MacCocoa Plugin, Plugin Version: 14.2. Function: On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Custom color list

34.5.37 NSColorPanelAllModesMask = & h0000ffff

MBS MacCocoa Plugin, Plugin Version: 14.2. Function: On of the masks to specify the which modes the panel allows.
Notes: All of the above.

34.5.38 NSColorPanelCMYKModeMask = & h00000004

MBS MacCocoa Plugin, Plugin Version: 14.2. Function: On of the masks to specify the which modes the panel allows.
Notes: Cyan-yellow-magenta-black.

34.5.39 NSColorPanelColorListModeMask = & h00000020

MBS MacCocoa Plugin, Plugin Version: 14.2. Function: On of the masks to specify the which modes the panel allows.
Notes: Custom color list.
34.5.40 NSColorPanelCrayonModeMask = & h00000080

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.  
**Notes:** Crayons.

34.5.41 NSColorPanelCustomPaletteModeMask = & h00000010

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.  
**Notes:** Custom palette.

34.5.42 NSColorPanelGrayModeMask = & h00000001

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.  
**Notes:** Grayscale-alpha.

34.5.43 NSColorPanelHSBModeMask = & h00000008

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.  
**Notes:** Hue-saturation-brightness.

34.5.44 NSColorPanelRGBModeMask = & h00000002

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.  
**Notes:** Red-green-blue.

34.5.45 NSColorPanelWheelModeMask = & h00000040

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the masks to specify the which modes the panel allows.  
**Notes:** Color wheel.
34.5. **CLASS NSCOLORPANELMBS**

### 34.5.46 NSCrayonModeColorPanel = 7

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.

**Notes:** Crayons.

### 34.5.47 NSCustomPaletteModeColorPanel = 4

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.

**Notes:** Custom palette

### 34.5.48 NSGrayModeColorPanel = 0

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.

**Notes:** Grayscale-alpha

### 34.5.49 NSHSBModeColorPanel = 3

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.

**Notes:** Hue-saturation-brightness

### 34.5.50 NSNoModeColorPanel = -1

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.

**Notes:**
Indicates no color panel mode.
Available in OS X version 10.5 and later.

### 34.5.51 NSRGBModeColorPanel = 1

MBS MacCocoa Plugin, Plugin Version: 14.2. **Function:** On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
CHAPTER 34. COCOA DRAWING

Notes: Red-green-blue

34.5.52 NSWheelModeColorPanel = 6

MBS MacCocoa Plugin, Plugin Version: 14.2. Function: One of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Color wheel
34.5. CLASS NSCOLORPANELMBS

34.5.53 Screenshots

34.5.54 NSColorPanel.jpg

Function: The NSColorPanel running in a REALbasic application.
34.6. **CLASS NSCOLORSPACEMBS**

### 34.6 class NSColorSpaceMBS

#### 34.6.1 class NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSColorSpace class enables the creation of objects representing custom color spaces. **Notes:** You can make custom color spaces from ColorSync profiles or from ICC profiles. NSColorSpace also has factory methods that return objects representing the system color spaces.

#### 34.6.2 Methods

##### 34.6.3 adobeRGB1998ColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing an Adobe RGB (1998) color space. **Example:**

```vbnet
dim n as NSColorSpaceMBS = NSColorSpaceMBS.adobeRGB1998ColorSpace
MsgBox n.localizedDescription
```

**Notes:**

The NSColorSpace object. This color-additive color space has red, green, blue, and alpha components.

The Adobe RGB (1998) color space was designed to encompass most of the colors achievable on CMYK color printers, but by using RGB primary colors on a device such as the computer display. For more information on this color space, go to this website:

http://www.adobe.com/digitalimag/adobergb.html

##### 34.6.4 availableColorSpacesWithModel(Model as Integer) as NSColorSpaceMBS()

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the list of color spaces available on the system that are displayed in the color panel, in the order they are displayed in the color panel. **Example:**

```vbnet
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSRGBColorSpaceModel
a = NSColorSpaceMBS.availableColorSpacesWithModel(m)
```
dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedNome
next

MsgBox Join(names,EndOfLine)

Notes:
This method doesn’t return color spaces created on the fly or spaces without user-displayable names. Pass
NSUnknownColorSpaceModel as model to get all available color spaces.

Available in Mac OS X v10.6 and later.

34.6.5 CGColorSpaceHandle as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns a Core Graphics color-space object that represents a color space equivalent to the receiver’s.
Example:
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox hex(n.CGColorSpaceHandle)

Notes:
A reference to an Core Graphics color-space object (CGColorSpaceRef) or 0if the type of color space repre-
sented by the receiver cannot be represented by a CGColorSpace object.

Available in Mac OS X version 10.5.

34.6.6 colorSpaceForColorSpaceName(name as string) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The colorspace for this color space name.
Example:
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NS-
DeviceWhiteColorSpace)
MsgBox n.localizedDescriptionedNome
34.6. **CLASS NSCOLORSPACEMBS**

Notes:
This plugin function uses an undocumented method from Apple's AppKit framework. Seems like they use it only internally.

Works well on Mac OS X 10.6.

### 34.6.7 ColorSpaceWithCGColorSpace(CGColorSpaceHandle as Integer) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object initialized from a Core Graphics color-space object. **Notes:**
The initialized NSColorSpace object or nil if initialization was not successful, which might happen if the color space represented by the CGColorSpace object is not supported by NSColorSpace.

Because NSColorSpace might retain or copy the CGColorSpace object depending on circumstances, you should not assume pointer equality of the provided object with that returned by CGColorSpace. And even if the pointer equality is preserved during runtime, it may not be after the NSColorSpace object is archived and unarchived.

Available in Mac OS X version 10.5 and later.

### 34.6.8 ColorSpaceWithColorSyncProfile(ColorSyncProfileHandle as Integer) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object given a ColorSync profile. **Notes:**
The initialized NSColorSpace object or nil if initialization was not successful.

Available in Mac OS X v10.4 and later.
34.6.9 ColorSpaceWithICCProfileData(File as FolderItem) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object given an ICC profile.

**Notes:**

file: The path to the ICC profile to use when initializing the NSColorSpace object. For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

Returns the initialized NSColorSpace object or nil if initialization was not successful.
Available in Mac OS X v10.4 and later.
See also:

- 34.6.10 ColorSpaceWithICCProfileData(ICCProfileData as Memoryblock) as NSColorSpaceMBS

34.6.10 ColorSpaceWithICCProfileData(ICCProfileData as Memoryblock) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object given an ICC profile.

**Notes:**

ICCProfileData:
The ICC profile to use when initializing the NSColorSpace object. For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

Returns the initialized NSColorSpace object or nil if initialization was not successful.
Available in Mac OS X v10.4 and later.
See also:

- 34.6.9 ColorSpaceWithICCProfileData(File as FolderItem) as NSColorSpaceMBS

34.6.11 colorSyncProfileHandle as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ColorSync profile from which the receiver was created.

**Example:**

```haskell
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox hex(n.colorSyncProfileHandle)
```

**Notes:**
The ColorSync profile on which the receiver is based. You need to cast this value to an object of opaque type.
34.6. CLASS NSCOLORSPACEMBS

CMProfileRef. Returns NULL if the receiver was created from a ICC-profile data instead. See ColorSync Manager Reference for further information on CMProfileRef.

Available in Mac OS X v10.4 and later.

34.6.12 Constructor(ICCProfileData as Memoryblock)

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object given an ICC profile.

**Notes:**

ICCProfileData:
The ICC profile to use when initializing the NSColorSpace object. For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

The initialized NSColorSpace object or nil if initialization was not successful.

Available in Mac OS X v10.4 and later.

34.6.13 deviceCMYKColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a calibrated or device-dependent CMYK color space.

**Example:**

```dim n as NSColorSpaceMBS = NSColorSpaceMBS.deviceCMYKColorSpace
MsgBox n.localizedDescription```

**Notes:**
The NSColorSpace object. This color space has cyan, magenta, yellow, black, and alpha components. Typical devices that use the color-subtractive CMYK color space are color printers. This object corresponds to the Cocoa color space name NSDeviceCMYKColorSpace.

Available in Mac OS X v10.4 and later.
34.6.14 deviceGrayColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a calibrated or device-dependent gray color space.

**Example:**

```plaintext
dim n as NSColorSpaceMBS = NSColorSpaceMBS.deviceGrayColorSpace
MsgBox n.localizedDescription
```

**Notes:**
The NSColorSpace object. The color space also includes an alpha component. Typical devices that use this color space are grayscale printers and displays. This object corresponds to the Cocoa color space name NSDeviceWhiteColorSpace.

Available in Mac OS X v10.4 and later.

34.6.15 deviceRGBColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a calibrated or device-dependent RGB color space.

**Example:**

```plaintext
dim n as NSColorSpaceMBS = NSColorSpaceMBS.deviceRGBColorSpace
MsgBox n.localizedDescription
```

**Notes:** The NSColorSpace object. This color space has red, green, blue, and alpha components. Typical devices that use the color-additive RGB color space are displays and scanners. This object corresponds to the Cocoa color space name NSDeviceRGBColorSpace.

34.6.16 genericCMYKColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a device-independent CMYK color space.

**Example:**

```plaintext
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericCMYKColorSpace
MsgBox n.localizedDescription
```

**Notes:** The NSColorSpace object. This color space has red, green, blue, and alpha components. Typical devices that use the color-additive RGB color space are displays and scanners. This object corresponds to the Cocoa color space name NSDeviceRGBColorSpace.
The NSColorSpace object. This color space has cyan, magenta, yellow, black and alpha component. Available in Mac OS X v10.4 and later.

### 34.6.17 genericGamma22GrayColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a gray color space with a gamma value of 2.2. **Example:**

```vbnet
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericGamma22GrayColorSpace
MsgBox n.localizedDescription
```

**Notes:** Available in Mac OS X v10.6 and later.

### 34.6.18 genericGrayColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a device-independent gray color space. **Example:**

```vbnet
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericGrayColorSpace
MsgBox n.localizedDescription
```

**Notes:**
The NSColorSpace object. The color space also includes an alpha component. This object corresponds to the Cocoa color space name NSCalibratedWhiteColorSpace. Available in Mac OS X v10.4 and later.

### 34.6.19 genericRGBColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing a device-independent RGB color space. **Example:**

```vbnet
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.localizedDescription
```
Notes:
The NSColorSpace object. This color-additive color space has red, green, blue, and alpha components. This object corresponds to the Cocoa color space name NSCalibratedRGBColorSpace.

Available in Mac OS X v10.4 and later.

34.6.20 ICCProfileData as Memoryblock

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the ICC profile data from which the receiver was created.

**Notes:**
The ICC profile from which the receiver was created. This method attempts to compute the profile data from a CMProfileRef object and returns nil if it is unable to.

For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

Available in Mac OS X v10.4 and later.

34.6.21 initWithCGColorSpace(CGColorSpaceHandle as Integer)

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Initializes and returns an NSColorSpace object initialized from a Core Graphics color-space object.

**Notes:**
The initialized NSColorSpace object or nil if initialization was not successful, which might happen if the color space represented by the CGColorSpace object is not supported by NSColorSpace.

Because NSColorSpace might retain or copy the CGColorSpace object depending on circumstances, you should not assume pointer equality of the provided object with that returned by CGColorSpace. And even if the pointer equality is preserved during runtime, it may not be after the NSColorSpace object is archived and unarchived.

Available in Mac OS X version 10.5 and later.
34.6. CLASS NSCOLORSPACEMBS

34.6.22 initWithColorSyncProfile(ColorSyncProfileHandle as Integer)

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSColorSpace object given a ColorSync profile.

**Notes:**
The initialized NSColorSpace object or nil if initialization was not successful.

Available in Mac OS X v10.4 and later.

34.6.23 sRGBColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSColorSpace object representing an sRGB color space.

**Example:**
```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox n.localizedIdentifier
```

**Notes:**
The NSColorSpace object. This color-additive color space has red, green, blue, and alpha components.

The sRGB color space is a standard color space for use on monitors, printers, and the Internet. For further information on sRGB, see this website:

http://www.color.org/srgb.html

Available in Mac OS X version 10.5.

34.6.24 Properties

34.6.25 colorSpaceModel as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the model on which the color space of the receiver is based.

**Example:**
```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox str(n.colorSpaceModel)
```
Notes:
Available in Mac OS X v10.4 and later.
(Read only property)

34.6.26 colorSpaceName as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The name of the colorspace.
**Example:**
```vb
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.colorSpaceName
```

Notes:
This plugin function uses an undocumented method from Apple's AppKit framework. Seems like they use it only internally.
Works well on Mac OS X 10.6.
Returns an empty string for some color spaces.
(Read only property)

34.6.27 description as string

MBS MacBase Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the description of the color space.
**Notes:** (Read only property)

34.6.28 Handle as Integer

MBS MacBase Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The internal object reference.
**Notes:** (Read and Write property)
34.6. CLASS NSCOLORSPACEMBS

34.6.29 localizedName as string

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the localized name of the receiver.

**Example:**
```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox n.localizedDescription
```

**Notes:**
The name of the color space as a localized string or nil if no localized name exists.

Available in Mac OS X v10.4 and later.
(Read only property)

34.6.30 numberOfColorComponents as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of components supported by the receiver.

**Example:**
```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox str(n.numberOfColorComponents) // shows 3
```

**Notes:**
The number of components (excluding alpha) the receiver supports or zero if the receiver is not based on float components.

Available in Mac OS X v10.4 and later.
(Read only property)

34.6.31 Constants

34.6.32 NSCalibratedBlackColorSpace = ”NSCalibratedBlackColorSpace”

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Calibrated color space with black and alpha components (pure black is 1.0)

**Example:**
CHAPTER 34. COCOA DRAWING

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSCalibratedBlackColorSpace)
MsgBox n.localizedDescription
```

**Notes:** Deprecated in Mac OS X v10.6.

### 34.6.33 NSCalibratedRGBColorSpace = "NSCalibratedRGBColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Calibrated color space with red, green, blue, and alpha components.

**Example:**
```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSCalibratedRGBColorSpace)
MsgBox n.localizedDescription
```

**Notes:** You can also create a color with HSB (hue, saturation, brightness) and alpha components and can extract these components.

### 34.6.34 NSCalibratedWhiteColorSpace = "NSCalibratedWhiteColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Calibrated color space with white and alpha components (pure white is 1.0)

**Example:**
```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSCalibratedWhiteColorSpace)
MsgBox n.localizedDescription
```

### 34.6.35 NSCMYKColorSpaceModel=2

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** The CYMK (cyan, yellow, magenta, black) color-space model.

**Example:**
```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSCMYKColorSpaceModel
a = NSColorSpaceMBS.availableColorSpacesWithModel(m)
```
34.6. CLASS NSCOLORSPACEMBS

```vbnet
dim names(-1) As string

for each c as NSColorSpaceMBS in a
    names.Append c.localized_name
next
MsgBox Join(names, EndOfLine)
```

Notes:
Can refer to both device-dependent and generic color space variants.
Available in Mac OS X v10.4 and later.

34.6.36 NSCustomColorSpace = ”NSCustomColorSpace”

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Custom NSColorSpace object and floating-point components describing a color in that space.
**Notes:** A custom color-space object represents a color space that is not necessarily predefined by the Application Kit. See ”Working With Color Spaces” for information on creating custom color-space objects.

34.6.37 NSDeviceBlackColorSpace = ”NSDeviceBlackColorSpace”

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Device-dependent color space with black and alpha components (pure black is 1.0)
**Example:**
```vbnet
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSDeviceBlackColorSpace)
MsgBox n.localized_name
```

34.6.38 NSDeviceCMYKColorSpace = ”NSDeviceCMYKColorSpace”

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Device-dependent color space with cyan, magenta, yellow, black, and alpha components.
**Example:**
```vbnet
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSDeviceCMYKColorSpace)
MsgBox n.localized_name
```
34.6.39  **NSDeviceNColorSpaceModel=4**

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** DeviceN is a color-space model from Adobe Systems, Inc. used in PostScript and PDF color specification. 

**Example:**

```vba
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSDeviceNColorSpaceModel
a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
    names.Append c.localizedDescription
next

MsgBox Join(names, vbCrLf)
```

**Notes:** Available in Mac OS X v10.4 and later.

34.6.40  **NSDeviceRGBColorSpace = "NSDeviceRGBColorSpace"**

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Device-dependent color space with red, green, blue, and alpha components.

**Example:**

```vba
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSDeviceRGBColorSpace)
MsgBox n.localizedDescription
```

**Notes:** You can also create a color with HSB (hue, saturation, brightness) and alpha components and can extract these components.
34.6.41  NSDeviceWhiteColorSpace = ”NSDeviceWhiteColorSpace”

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Device-dependent color space with white and alpha components (pure white is 1.0)
**Example:**
```vba
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSDeviceWhiteColorSpace)
MsgBox n.localizedDescription
```

34.6.42  NSGrayColorSpaceModel=0

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** The grayscale color-space model. Can refer to both device-dependent and generic color space variants.
**Example:**
```vba
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSGrayColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
    names.Append c.localizedDescription
next

MsgBox Join(names,EndOfLine)
```

**Notes:** Available in Mac OS X v10.4 and later.

34.6.43  NSIndexedColorSpaceModel=5

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** An indexed color space, which identifies specified discrete colors in a color list by index number.
**Example:**
```vba
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSIndexedColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)
```
 CHAPTER 34. COCOA DRAWING

       dim names(-1) As string

       for each c as NSColorSpaceMBS in a
           names.Append c.localized Name
       next

       MsgBox Join(names,EndOfLine)

   Notes:
   An indexed color value (a color specification in indexed color space) consists of an index value that refers to
   a color in a color list.

   Available in Mac OS X version 10.5 and later.

34.6.44  NSLABColorSpaceModel=3

   MBS MacBase Plugin, Plugin Version: 8.6. Function: The L*a*b* device-independent color-space model,
   which represents colors relative to a reference white point.
   Example:
     dim a(-1) as NSColorSpaceMBS
     dim m as Integer = NSColorSpaceMBS.NSLABColorSpaceModel
     a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

     dim names(-1) As string

     for each c as NSColorSpaceMBS in a
         names.Append c.localized Name
     next

     MsgBox Join(names,EndOfLine)

   Notes: Available in Mac OS X v10.4 and later.

34.6.45  NSNamedColorSpace = “NSNamedColorSpace”

   Notes: The components of this color space are indexes into lists or catalogs of prepared colors. The catalogs
   of named colors come with lookup tables that are able to generate the correct color on a given device.
34.6.46 **NSPatternColorSpace = ”NSPatternColorSpace”**

MBS MacBase Plugin, Plugin Version: 9.8. **Function:** Pattern image (tiled)
**Notes:** Identifies a pattern color space, which is simply an image that is repeated over and over again in a tiled pattern.

34.6.47 **NSPatternColorSpaceModel=6**

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** Identifies a pattern color space, which is simply an image that is repeated over and over again in a tiled pattern.
**Example:**
```vba
Dim a(-1) As NSColorSpaceMBS
Dim m As Integer = NSColorSpaceMBS.NSPatternColorSpaceModel
a = NSColorSpaceMBS.availableColorSpacesWithModel(m)
Dim names(-1) As String
For Each c As NSColorSpaceMBS In a
    names.Append c.localizedName
Next
MsgBox Join(names, vbCrLf)
```

**Notes:** Available in Mac OS X version 10.5 and later.

34.6.48 **NSRGBColorSpaceModel=1**

MBS MacBase Plugin, Plugin Version: 8.6. **Function:** The RGB (red green blue) color-space model.
**Example:**
```vba
Dim a(-1) As NSColorSpaceMBS
Dim m As Integer = NSColorSpaceMBS.NSRGBColorSpaceModel
a = NSColorSpaceMBS.availableColorSpacesWithModel(m)
Dim names(-1) As String
For Each c As NSColorSpaceMBS In a
    names.Append c.localizedName
Next
MsgBox Join(names, vbCrLf)
```
names.Append c.localizedName
next

MsgBox Join(names, EndOfLine)

Notes:
Can refer to both device-dependent and generic color space variants. Available in Mac OS X v10.4 and later.

34.6.49 NSUnknownColorSpaceModel=-1

MBS MacBase Plugin, Plugin Version: 8.6. Function: This model is not known to NSColorSpace. Notes: Available in Mac OS X v10.4 and later.
34.7. CLASS NSEPSIMAGEREPMBS

34.7 class NSEPSImageRepMBS

34.7.1 class NSEPSImageRepMBS

34.7.2 Methods

34.7.3 boundingBox as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the rectangle that bounds the receiver. Notes: This rectangle is obtained from the "% % BoundingBox:" comment in the EPS header when the NSEPSImageRep object is initialized.

34.7.4 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes an NSEPSImageRep object initialized with the specified EPS data. Notes: The size of the receiver is set using the bounding box information specified in the EPS header comments. On success the handle property is not zero.

34.7.5 EPSRepresentation as Memoryblock

34.7.6 imageRepWithData(data as Memoryblock) as NSEPSImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and returns an NSEPSImageRep object initialized with the specified EPS data. Notes: Returns a new, initialized NSEPSImageRep object or nil if the object could not be initialized. The size of the receiver is set using the bounding box information specified in the EPS header comments.
34.7.7  prepareGState

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: Implemented by subclasses to configure the graphics state prior to drawing. **Notes**: The draw method of NSEPSImageRep sends this message to itself just before rendering the EPS code. The default implementation of this method does nothing. You can override it in your subclass to prepare the graphics state as needed.

34.7.8  Properties

34.7.9  pdfImage as NSPDFImageRepMBS

MBS MacBase Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: The PDF representation of the image. **Example**:

```plaintext
// read in as image
dim f as FolderItem = SpecialFolder.Desktop.Child("logo_new.eps")

// read in as image
dim image as new nsimageMBS(f)

// get representations
dim reps() as NSImageRepMBS = image.representations

// get EPS representation
dim rep as NSEPSImageRepMBS = NSEPSImageRepMBS(Reps(0))

// get PDF representation
dim pdf as NSPDFImageRepMBS = rep.pdfImage

Break
```

**Notes**: When you load an EPS file, a PDF file is automatically created. (Read only property)
34.8. CLASS NSGRAPHICSMBS

34.8 class NSGraphicsMBS

34.8.1 class NSGraphicsMBS

**Example:**

```plaintext
// make new image
dim myImage as new NSImageMBS(500,500)
dim myGraphics as new NSGraphicsMBS(myImage)

// make logo image
dim myPicture as Picture = LogoMBS(500)
dim anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width, anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush drawing

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

**Notes:**

The plugin often provides in events such objects for drawing. In that case please only use the object in the event and don’t store it for later use. It is only valid with in a draw event.

Internally this is a NSGraphicsContext object.

If you create objects on your own, make sure you only use the methods while the object is valid.
34.8.2 Methods

34.8.3 addClip(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Intersects the area enclosed by the receiver’s path with the clipping path of the current graphics context and makes the resulting shape the current clipping path. **Notes:** This method uses the current winding rule to determine the clipping shape of the receiver. This method does not affect the receiver’s path.

34.8.4 boundingRectWithSize(text as NSAttributedStringMBS, size as NSSizeMBS, options as Integer = 0) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Calculates and returns bounding rectangle for the receiver drawn using the options specified, within the given rectangle in the current graphics context. **Example:**

```plaintext
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy
m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// query size
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)
dim r as NSRectMBS = g.boundingRectWithSize(m, new NSSizeMBS(canvas1.Width, canvas1.Height), g.NSStringDrawingUsesLineFragmentOrigin)

MsgBox r.String
```

**Notes:**

- size: The size of the rectangle to draw in.
- options: The string drawing options.

Returns the bounding rectangle in the current graphics context.
The origin of the rectangle returned from this method is the first glyph origin. **See also:**

- 34.8.5 boundingRectWithSize(text as string, size as NSSizeMBS, options as Integer = 0, DictAttributes as dictionary = nil) as NSRectMBS
34.8. CLASS NSGRAPHICSMBS

34.8.5 boundingRectWithSize(text as string, size as NSSizeMBS, options as Integer = 0, DicAttributes as dictionary = nil) as NSRectMBS

**Function:** Calculates and returns the bounding rect for the text drawn using the given options and display characteristics, within the specified rectangle in the current graphics context.

**Example:**

```vbnet
Dim NSGraphics as New NSGraphicsMBS()
dim size as NSSizeMBS = new NSSizeMBS(100,100)
dim text as string = "Hello World. How are you? I'm fine. This is just a test string."
dim options as Integer = NSGraphics.NSStringDrawingUsesLineFragmentOrigin
Dim rect as NSRectMBS = NSGraphics.boundingRectWithSize(text, size, options)
MsgBox str(Rect.Width)+" "+str(Rect.Height)
```

**Notes:**

text: the text to use for calculation.
size: The size of the rectangle to draw in.
options: String drawing options.
attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of Strings, the attributes apply to the entire string, rather than ranges within the string.

Returns the bounding rect for the receiver drawn using the given options and display characteristics. The rect origin returned from this method is the first glyph origin.

Available in Mac OS X v10.4 and later.

See NSStringDrawing* constants. Use NSStringDrawingUsesLineFragmentOrigin to switch to multiline mode.

See also:

- 34.8.4 boundingRectWithSize(text as NSAttributedStringMBS, size as NSSizeMBS, options as Integer = 0) as NSRectMBS

34.8.6 clipRect(r as NSRectMBS)

**Function:** Intersects the specified rectangle with the clipping path of the current graphics context and makes the resulting shape the current clipping path

**Notes:** r: The rectangle to intersect with the current clipping path.
34.8.7 concat(transform as NSAffineTransformMBS)

MBS MacCocoa Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Concats this transform to the current transform of the graphics environment.

34.8.8 ConcatTransform(NSAffineTransform as Variant)

MBS MacCocoa Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends the receiver’s matrix to the current transformation matrix stored in the current graphics context, replacing the current transformation matrix with the result. 

**Notes:**
Please use saveGraphicsState so you can restore the state before applying matrix for other drawings.

Concatenation is performed by matrix multiplication.

If this method is invoked from within an NSView drawRect method, then the current transformation matrix is an accumulation of the screen, window, and any superview’s transformation matrices. Invoking this method defines a new user coordinate system whose coordinates are mapped into the former coordinate system according to the receiver’s transformation matrix. To undo the concatenation, you must invert the receiver’s matrix and invoke this method again.

NSAffineTransform must be a NSAffineTransformMBS object.

34.8.9 Constructor

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the current graphics context of the current thread. 

See also:

- 34.8.10 Constructor(targetImage as NSBitmapImageRepMBS)
- 34.8.11 Constructor(targetImage as NSImageMBS)
- 34.8.12 Constructor(targetView as NSViewMBS)
- 34.8.13 Constructor(targetWindow as NSWindowMBS)
- 34.8.14 Constructor(targetWindow as window)
34.8. CLASS NSGRAPHICS

34.8.10 Constructor(targetImage as NSBitmapImageRepMBS)

Function: Creates a new graphics context for drawing into a bitmap image representation.

Example:

```plaintext
dim n as new NSImageMBS(300,300)
dim r as new NSBitmapImageRepMBS(300, 300, 8, 4, true, NSColorSpaceMBS.NSCalibratedRGBColorSpace, 4*300, 32)

dim g as new NSGraphicsMBS(r)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
n.addRepresentation r

Backdrop = n.CopyPictureWithMask
```

Notes:

Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.

Returns nil on any error.

See also:

- 34.8.9 Constructor
- 34.8.11 Constructor(targetImage as NSImageMBS)
- 34.8.12 Constructor(targetView as NSViewMBS)
- 34.8.13 Constructor(targetWindow as NSWindowMBS)
- 34.8.14 Constructor(targetWindow as window)

34.8.11 Constructor(targetImage as NSImageMBS)

Function: Creates a new graphics context for drawing into an image.

Example:

```plaintext
// make new image
dim myImage as new NSImageMBS(500,500)
dim myGraphics as new NSGraphicsMBS(myImage)

// make logo image
dim myPicture as Picture = LogoMBS(500)
dim anotherImage as new NSImageMBS(myPicture)
```
// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width, anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush drawing

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
    b.Write myImage.JPEGRepresentation
    b.Close
end if

Notes: Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image. See also:

- 34.8.9 Constructor 6922
- 34.8.10 Constructor(targetImage as NSBitmapImageRepMBS) 6923

- 34.8.13 Constructor(targetWindow as NSWindowMBS) 6924
- 34.8.14 Constructor(targetWindow as window) 6925

34.8.13 Constructor(targetWindow as NSWindowMBS)

Function: Creates a new graphics context for drawing into a window.
See also:
34.8. **CLASS NSGRAPHICSMBS**

- 34.8.9 Constructor
- 34.8.10 Constructor(targetImage as NSBitmapImageRepMBS)
- 34.8.11 Constructor(targetImage as NSImageMBS)
- 34.8.12 Constructor(targetView as NSViewMBS)
- 34.8.14 Constructor(targetWindow as window)

### 34.8.14 Constructor(targetWindow as window)

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new graphics context for drawing into a window. **See also:**

- 34.8.9 Constructor
- 34.8.10 Constructor(targetImage as NSBitmapImageRepMBS)
- 34.8.11 Constructor(targetImage as NSImageMBS)
- 34.8.12 Constructor(targetView as NSViewMBS)

### 34.8.15 drawAtPoint(image as NSImageMBS, x as Double, y as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws all or part of the image at the specified point in the current coordinate system. **Notes:**

- x/y: The location in the current coordinate system at which to draw the image.
- sx/sy/sw/sh: The source rectangle specifying the portion of the image you want to draw. The coordinates of this rectangle are specified in the image’s own coordinate system. If you pass in zeros, the entire image is drawn.
- operation: The compositing operation to use when drawing the image. See the NSCompositingOperation constants.
- fraction: The opacity of the image, specified as a value from 0.0 to 1.0. Specifying a value of 0.0 draws the image as fully transparent while a value of 1.0 draws the image as fully opaque. Values greater than 1.0 are interpreted as 1.0.

The image content is drawn at its current resolution and is not scaled unless the CTM of the current coordinate system itself contains a scaling factor. The image is otherwise positioned and oriented using the current coordinate system.
For Operation you use the Composite constants in this class.
In the Cocoa world the y axis is reversed. y=0 is on the bottom.
See also:

- 34.8.16 drawAtPoint(text as NSAttributedStringMBS, point as NSPointMBS) 6926
- 34.8.17 drawAtPoint(text as string, point as NSPointMBS, DicAttributes as dictionary = nil) 6927

### 34.8.16 drawAtPoint(text as NSAttributedStringMBS, point as NSPointMBS)

**Function:** Draws the receiver with its font and other display attributes at the given point in the currently focused view.
**Example:**
```plaintext
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy
m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))
// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)
g.drawAtPoint m, new NSPointMBS(20,20)
```

**Notes:**
point: The point in the current view to draw the text.

The width (height for vertical layout) of the rendering area is unlimited, unlike drawInRect, which uses a bounding rectangle. As a result, this method renders the text in a single line.

Don’t invoke this method when no NSView is focused.
See also:

- 34.8.15 drawAtPoint(image as NSImageMBS, x as Double, y as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 6925
- 34.8.17 drawAtPoint(text as string, point as NSPointMBS, DicAttributes as dictionary = nil) 6927
34.8.17 drawAtPoint(text as string, point as NSPointMBS, DicAttributes as dictionary = nil)

**Function:** Draws the text with the font and other display characteristics of the given attributes, at the specified point in the currently focused view.

**Notes:**
- **Point:** The origin for the bounding box for drawing the string. If the focused view is flipped, the origin is the upper-left corner of the drawing bounding box; otherwise, the origin is the lower-left corner.
- **attributes:** A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of strings, the attributes apply to the entire string, rather than ranges within the string.

The width (height for vertical layout) of the rendering area is unlimited, unlike drawInRect, which uses a bounding rectangle. As a result, this method renders the text in a single line.

You should only invoke this method when an NSView object has focus.

See also:
- 34.8.15 drawAtPoint(image as NSImageMBS, x as Double, y as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 6925
- 34.8.16 drawAtPoint(text as NSAttributedStringMBS, point as NSPointMBS) 6926

34.8.18 drawInRect(image as NSImageMBS, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** draws the image into the given rectangle with the given source rectangle and the given mode.

**Example:**
```javascript
// make new image
dim myImage as new NSImageMBS(500,500)
dim myGraphics as new NSGraphicsMBS(myImage)

// make logo image
dim myPicture as Picture = LogoMBS(500)
dim anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width, anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush
```
CHAPTER 34. COCOA DRAWING

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
    b.Write myImage.JPEGRepresentation
    b.Close
end if

Notes:
For Operation you use the Composite constants in this class.
In the Cocoa world the y axis is reversed. y=0 is on the bottom.
See also:
- 34.8.19 drawInRect(text as NSAttributedStringMBS, rect as NSRectMBS) 6928
- 34.8.20 drawInRect(text as string, rect as NSRectMBS, DicAttributes as dictionary = nil) 6929

34.8.19  drawInRect(text as NSAttributedStringMBS, rect as NSRectMBS)

Function: Draws the attributed string within the given rectangle in the currently view, clipping the text layout to this rectangle.
Example:
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy
m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)
g.drawRect m, new NSRectMBS(20,20, 100, 100)

Notes:
rect: The rectangle in which to draw.

Text is drawn within rect according to its line sweep direction; for example, Arabic text will begin at the right edge and potentially be clipped on the left.
The rect parameter determines how many glyphs are typeset within the width of a line, but it’s possible for a portion of a glyph to appear outside the area of rect if the image bounding box of the particular glyph exceeds its typographic bounding box.

If the focus view is flipped, the text origin is set at the upper-left corner of the drawing bounding box; otherwise the origin is set at the lower-left corner. For text rendering, whether the view coordinates are flipped or not doesn’t affect the flow of line layout, which goes from top to bottom. However, it affects the interpretation of the text origin. So, for example, if the rect argument is `{ 0.0, 0.0, 100.0, 100.0 }`, the text origin is `{ 0.0, 0.0 }` when the view coordinates are flipped and `{ 0.0, 100.0 }` when not.

Don’t invoke this method when no NSView is focused.

See also:

- 34.8.18 drawInRect(image as NSImageMBS, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 6927
- 34.8.20 drawInRect(text as string, rect as NSRectMBS, DicAttributes as dictionary = nil) 6929

34.8.20 drawInRect(text as string, rect as NSRectMBS, DicAttributes as dictionary = nil)

Function: Draws the text with the font and other display characteristics of the given attributes, within the specified rectangle in the currently focused NSView.

Notes:

text: The text to draw.

Rect: The rectangle in which to draw the string.

attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of strings, the attributes apply to the entire string, rather than ranges within the string.

The rendering area is bounded by rect, unlike drawAtPoint, which has an unlimited width. As a result, this method renders the text in multiple lines.

You should only invoke this method when an NSView has focus.

See also:

- 34.8.18 drawInRect(image as NSImageMBS, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 6927
- 34.8.19 drawInRect(text as NSAttributedStringMBS, rect as NSRectMBS) 6928
34.8.21 drawPicture(image as Picture, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Draws a picture. **Notes:** Same as drawInRect with NSImageMBS, but using picture.

34.8.22 drawRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws a rectangle with the current color. **Notes:** In the Cocoa world the y axis is reversed. y=0 is on the bottom.

34.8.23 DrawWindowBackground(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws the window’s default background pattern into the specified rectangle of the currently focused view. **Notes:** Pass the rectangle (in the current coordinate system) in which to draw the window’s background pattern.

34.8.24 drawWithRect(text as NSAttributedStringMBS, rect as NSRectMBS, options as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws the receiver with the specified options, within the given rectangle in the current graphics context. **Example:**

```plaintext
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
```
34.8. **CLASS NSGRAPHICSMB\$**

```
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)
g.drawRect m, new NSRectMBS(20,20, 100, 100), g.NSStringDrawingUsesLineFragmentOrigin
```

**Notes:**
- rect: The rectangle specifies the rendering origin in the current graphics context.
- options: The string drawing options. See NSStringDrawingOptions for the available options.

The rect argument's origin field specifies the rendering origin. The point is interpreted as the baseline origin by default. With NSStringDrawingUsesLineFragmentOrigin, it is interpreted as the upper left corner of the line fragment rect. The size field specifies the text container size. The width part of the size field specifies the maximum line fragment width if larger than 0.0. The height defines the maximum size that can be occupied with text if larger than 0.0 and NSStringDrawingUsesLineFragmentOrigin is specified. If NSStringDrawingUsesLineFragmentOrigin is not specified, height is ignored and considered to be single-line rendering (NSLineBreakByWordWrapping and NSLineBreakByCharWrapping are treated as NSLineBreakByClipping).

You should only invoke this method when there is a current graphics context. Available in OS X v10.4 and later.

**34.8.25 eraseRect(x as Double, y as Double, w as Double, h as Double)**

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Erases a rectangle with the current color. **Notes:** In the Cocoa world the y axis is reversed. y=0 is on the bottom.

**34.8.26 fill(path as NSBezierPathMBS)**

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Paints the region enclosed by the receiver's path. **Example:**

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)
g.fillColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
g.fill(b)
```
CHAPTER 34. COCOA DRAWING

6932

g = nil

window1.Backdrop = n.CopyPicture // black image with red color rect

Notes:
This method fills the path using the current fill color and the receiver’s current winding rule. If the path contains any open subpaths, this method implicitly closes them before painting the fill region.

The painted region includes the pixels right up to, but not including, the path line itself. For paths with large line widths, this can result in overlap between the fill region and the stroked path (which is itself centered on the path line).

34.8.27 fillRect(r as NSRectMBS)

Function: Fills the specified rectangular path with the current fill color.
Example:

dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setFillColor NSColorMBS.redColor

dim r as new NSRectMBS(10,10,200,200)
g.fillRectMBS(r)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color rectangle

Notes:

r: A rectangle in the current coordinate system.

This method fills the specified region immediately. This method uses the compositing operation returned by the compositingOperation method of NSGraphicsContext.
See also:

• 34.8.28 fillRect(x as Double, y as Double, w as Double, h as Double) 6933

• 34.8.29 fillRect(x as Double, y as Double, w as Double, h as Double, operation as Integer) 6933
34.8. **CLASS NSGRAPHICSMBS**

### 34.8.28 fillRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fills a rectangle with the current color. **Notes:** In the Cocoa world the y axis is reversed. y=0 is on the bottom. See also:

- 34.8.27 fillRect(r as NSRectMBS)
- 34.8.29 fillRect(x as Double, y as Double, w as Double, h as Double, operation as Integer)

### 34.8.29 fillRect(x as Double, y as Double, w as Double, h as Double, operation as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fills a rectangle using the current fill color and the specified compositing operation. **Notes:** See NSComposite* constants. See also:

- 34.8.27 fillRect(r as NSRectMBS)
- 34.8.28 fillRect(x as Double, y as Double, w as Double, h as Double)

### 34.8.30 flushGraphics

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Forces any buffered operations or data to be sent to the receiver’s destination. **Notes:** Graphics contexts use buffers to queue pending operations but for efficiency reasons may not always empty those buffers immediately. This method forces the buffers to be emptied.

### 34.8.31 graphicsContext as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSGraphicsMBS object with the current graphics context of the current thread. **Example:**

```vba
Sub Paint(g As Graphics)
    // Canvas Paint event in a Mac Cocoa application
    dim ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContext
    ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)
End Sub
```
Notes: Returns nil on any error.

34.8.32 graphicsContextWithCGContext(targetCGContext as Variant, initialFlipped-State as boolean = false) as NSGraphicsMBS

Function: Creates a new graphics context pointing to the given CGContextMBS object.
Example:

Sub Paint(g As Graphics)
    // get current context
dim cg as CGContextMBS = GetCurrentCGContextMBS

    // get graphics context
dim ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithCGContext(cg)

    // and draw inside
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)
End Sub

Notes: Returns nil on any error.

34.8.33 graphicsContextWithCGContextHandle(targetCGContextRef as Integer, initialFlippedState as boolean = false) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: Creates a new graphics context pointing to the given CGContext reference.
Example:

Sub Paint(g As Graphics)
    // get current context
    dim cg as CGContextMBS = GetCurrentCGContextMBS

    // get graphics context
    dim ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithCGContextHandle(cg.Handle)

    // and draw inside
    ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)
End Sub

Notes: Returns nil on any error.
34.8.34  graphicsContextWithNSBitmapImageRep(targetImage as NSBitmapImageRepMBS) as NSGraphicsMBS

Function: Creates a new graphics context for drawing into a bitmap image representation.
Example:

    dim n as new NSImageMBS(300,300)
    dim r as new NSBitmapImageRepMBS(300, 300, 8, 4, true, NSColorSpaceMBS.NSCalibratedRGBColorSpace, 4*300, 32)
    dim g as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSBitmapImageRep(r)
    g.SetColorRGB 1.0,0,0,0.5
    g.fillRect 0, 0, 100, 100
    g = nil // flush
    n.addRepresentation r

Backdrop = n.CopyPictureWithMask

Notes:
Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.
Returns nil on any error.

34.8.35  graphicsContextWithNSImage(targetImage as NSImageMBS) as NSGraphicsMBS

Function: Creates a new graphics context for drawing into an image.
Example:

    // make new image
    dim myImage as new NSImageMBS(500,500)
    dim myGraphics as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSImage(myImage)

    // make logo image
    dim myPicture as Picture = LogoMBS(500)
    dim anotherImage as new NSImageMBS(myPicture)

    // draw logo image to new image
    myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width, anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush drawing

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
  b.Write myImage.JPEGRepresentation
  b.Close
end if

Notes:
Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.
Returns nil on any error.

34.8.36 graphicsContextWithNSView(targetView as NSViewMBS) as NSGraphicsMBS

Function: Creates a new graphics context for drawing into a Cocoa view.
Example:
// draws in a Cocoa view
dim gg as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSView(canvas1.NSViewMBS)
  gg.SetColorRGB 1.0,0,0,0.5
  gg.fillRect 0, 0, 100, 100
  gg = nil // flush

Notes:
Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the window.
Returns nil on any error.

34.8.37 graphicsContextWithNSWindow(targetNSWindow as NSWindowMBS) as NSGraphicsMBS

Function: Creates a new graphics context for drawing into a window.
Example:
// draw in a Cocoa window
dim g as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSWindow(window1.NSWindowMBS)
34.8. **CLASS NSGRAPHICSMBS**

```plaintext
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
```

**Notes**: Returns nil on any error.

### 34.8.38 `graphicsContextWithWindow(targetWindow as window) as NSGraphicsMBS`

**Function**: Creates a new graphics context for drawing into a window.

**Example**:

```plaintext
// draws in a Cocoa window
dim g as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithWindow(window1)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
```

**Notes**: Returns nil on any error.

### 34.8.39 `graphicsPort as Variant`

**Function**: Returns the low-level, platform-specific graphics context represented by the receiver.

**Notes**: In Mac OS X, this is the Core Graphics context, a CGContextMBS object.

### 34.8.40 `highlightRect(x as Double, y as Double, w as Double, h as Double)`

**Function**: Highlights the rectangle.

**Notes**: In the Cocoa world the y axis is reversed. y=0 is on the bottom.

### 34.8.41 `invalidate`

**Function**: Invalidates the graphics object.
34.8.42 isDrawingToScreen as boolean

Function: Returns a Boolean value that indicates whether the drawing destination is the screen.
Notes: True if the drawing destination is the screen, otherwise false.

A return value of false may mean that the drawing destination is a printer, but the destination may also be a PDF or EPS file. If this method returns false, you can call attributes to see if additional information is available about the drawing destination.

34.8.43 isFlipped as boolean

Function: Returns a Boolean value that indicates the receiver’s flipped state.
Notes: True if the receiver is flipped, otherwise false.

The state is determined by sending isFlipped to the receiver’s view that has focus. If no view has focus, returns false unless the receiver is instantiated using graphicsContextWithGraphicsPort:flipped: specifying true as the flipped parameter.

Available in Mac OS X v10.4 and later.

34.8.44 restoreGraphicsState

Function: Removes the receiver’s graphics state from the top of the graphics state stack and makes the next graphics state the current graphics state.
Notes: This method must have been preceded with a saveGraphicsState message to add the graphics state to the stack. Invocations of saveGraphicsState and restoreGraphicsState methods may be nested.

Restoring the graphics state restores such attributes as the current drawing style, transformation matrix, color, and font of the original graphics state.
34.8. **CLASS NSGRAPHICSMBS**

### 34.8.45 **saveGraphicsState**

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Saves the graphics state of the current graphics context.  
**Notes:** This method pushes the context onto the per-thread stack.

### 34.8.46 **ScaleCoordinates(x as Double, y as Double)**

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scales coordinate system so the next drawing commands will use different scaling.  
**Notes:** Use saveGraphicsState and restoreGraphicsState so you can restore the old state.

### 34.8.47 **set(transform as NSAffineTransformMBS)**

MBS MacCocoa Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the current transform of the graphics environment.

### 34.8.48 **setClip(path as NSBezierPathMBS)**

MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the clipping path of the current graphics context with the area inside the receiver’s path.  
**Notes:** You should avoid using this method as a way of adjusting the clipping path, as it may expand the clipping path beyond the bounds set by the enclosing view. If you do use this method, be sure to save the graphics state prior to modifying the clipping path and restore the graphics state when you are done.  

This method uses the current winding rule to determine the clipping shape of the receiver. This method does not affect the receiver’s path.

### 34.8.49 **setColor(c as NSColorMBS)**

MBS MacCocoa Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color of subsequent drawing to the color that the receiver represents.
34.8.50 **SetColorBW(white as Double, alpha as Double = 1.0)**

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color to a BW color.

**Notes:**
Values range is from 0.0 to 1.0.
Alpha 0.0 is invisible and alpha 1.0 is visible.

34.8.51 **SetColorCMYK(cyan as Double, magenta as Double, yellow as Double, black as Double, alpha as Double = 1.0)**

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color to a CMYK color.

**Notes:**
Values range is from 0.0 to 1.0.
Alpha 0.0 is invisible and alpha 1.0 is visible.

34.8.52 **SetColorHSV(hue as Double, saturation as Double, brightness as Double, alpha as Double = 1.0)**

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color to an HSV color.

**Notes:** Values range is from 0.0 to 1.0.

34.8.53 **SetColorRGB(red as Double, green as Double, blue as Double, alpha as Double = 1.0)**

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the color to a RGB color.

**Notes:**
Values range is from 0.0 to 1.0.
Alpha 0.0 is invisible and alpha 1.0 is visible.

34.8.54 **setCurrentContext**

MBS MacCocoa Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets this context to be the current.
34.8.55  setFillColor(c as NSColorMBS)

34.8.56  setStrokeColor(c as NSColorMBS)

34.8.57  SetTransform(NSAffineTransform as Variant)

Notes:
Please use saveGraphicsState so you can restore the state before applying matrix for other drawings.

The current transformation is stored in the current graphics context and is applied to subsequent drawing operations. You should use this method sparingly because it removes the existing transformation matrix, which is an accumulation of transformation matrices for the screen, window, and any superviews. Instead use the concat method to add this transformation matrix to the current transformation matrix.

NSAffineTransform must be a NSAffineTransformMBS object.

34.8.58  sizeWithAttributes(text as string, DicAttributes as dictionary = nil) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the bounding box size the text occupies when drawn with the given attributes.

Example:
Dim NSGraphics as New NSGraphicsMBS()
Dim NSStringWidth as Double = NSGraphics.sizeWithAttributes("Hello World").Width

MsgBox("StringWidth from NSGraphicsMBS: " + Str(NSStringWidth))

Dim REALGraphics as Graphics = window1.Graphics
Dim REALStringWidth as Double = REALGraphics.StringWidth("Hello World")
MsgBox("StringWidth from REAL Graphics: ") + Str(REALStringWidth)

Notes:
attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of strings, the attributes apply to the entire string, rather than ranges within the string.

Returns the bounding box size the receiver occupies when drawn with attributes.

34.8.59 stroke(path as NSBezierPathMBS)

Function: Draws a line along the receiver’s path using the current stroke color and drawing attributes.
Example:
  dim n as new NSImageMBS(300, 300)
  dim g as new NSGraphicsMBS(n)
  g.setStrokeColor NSColorMBS.redColor
  dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
  dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
  b.lineWidth = 5
  g.stroke(b)
  g = nil
  window1.Backdrop = n.CopyPicture // black image with red color rect

Notes: The drawn line is centered on the path with its sides parallel to the path segment. This method uses the current drawing attributes associated with the receiver. If a particular attribute is not set for the receiver, this method uses the corresponding default attribute.

34.8.60 strokeLine(point1 as NSPointMBS, point2 as NSPointMBS)

Function: Strokes a line between two points using the current stroke color and the default drawing attributes.
Example:
34.8. **CLASS NSGRAPHICS**

```plaintext
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setStrokeColor NSColorMBS.redColor

dim p1 as new NSPointMBS(10,10)
dim p2 as new NSPointMBS(50,50)
g.strokeLine(p1,p2)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color line
```

**Notes:**

- **point1**: The starting point of the line.
- **point2**: The ending point of the line.

This method strokes the specified path immediately.

See also:

- 34.8.61 strokeLine(x1 as Double, y1 as Double, x2 as Double, y2 as Double)

### 34.8.61 `strokeLine(x1 as Double, y1 as Double, x2 as Double, y2 as Double)`

**MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function**: Strokes a line.

See also:

- 34.8.60 strokeLine(point1 as NSPointMBS, point2 as NSPointMBS)

### 34.8.62 `strokeRect(r as NSRectMBS)`

**MBS MacCocoa Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function**: Strokes the path of the specified rectangle using the current stroke color and the default drawing attributes.

**Example:**

```plaintext
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setStrokeColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
```
g.strokeRect(r)

g = nil

window1.Backdrop = n.CopyPicture  // black image with red color rect

Notes:

r: A rectangle in the current coordinate system.

The path is drawn beginning at the rectangle’s origin and proceeding in a counterclockwise direction. This method strokes the specified path immediately.

34.8.63 TranslateCoordinates(x as Double, y as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Moves coordinate system so the next drawing commands will use different starting point. Notes: Use saveGraphicsState and restoreGraphicsState so you can restore the old state.

34.8.64 Properties

34.8.65 Handle as Integer

Reference to NSGraphicsContext object.
(Read and Write property)

34.8.66 Owner as Variant

When you have a graphics object based on a window, view or image, this property points to the original object to keep it alive while drawing.
(Read and Write property)
34.8. CLASS NSGRAPHICS

34.8.67 Valid as Boolean

MBS MacCocoa Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Wheter this graphics object is still valid.

**Notes:**
Set to true when the plugin creates an object and false when the object is no longer needed.
(Read and Write property)

34.8.68 imageInterpolation as Integer

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The interpolation behavior.

**Notes:**
Note that this value is not part of the graphics state, so it cannot be reset using restoreGraphicsState.
(Read and Write computed property)

34.8.69 shouldAntialias as boolean

MBS MacCocoa Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver should use antialiasing.

**Notes:**
This value is part of the graphics state and is restored by restoreGraphicsState.
(Read and Write computed property)

34.8.70 Constants

34.8.71 NSCompositeClear=0

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Transparent. (R = 0)

34.8.72 NSCompositeCopy=1

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Source image. (R = S)
**34.8.73 NSCompositeDestinationAtop=9**

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Destination image wherever both images are opaque, source image wherever source image is opaque but destination image is transparent, and transparent elsewhere. \( R = S^*(1 - Da) + D^*Sa \)

**34.8.74 NSCompositeDestinationIn=7**

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Destination image wherever both images are opaque, and transparent elsewhere. \( R = D^*Sa \)

**34.8.75 NSCompositeDestinationOut=8**

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere. \( R = D^*(1 - Sa) \)

**34.8.76 NSCompositeDestinationOver=6**

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Destination image wherever destination image is opaque, and source image elsewhere. \( R = S^*(1 - Da) + D \)

**34.8.77 NSCompositeHighlight=12**

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Source image wherever source image is opaque, and destination image elsewhere. (Deprecated. Mapped to NSCompositeSourceOver.)

**34.8.78 NSCompositePlusDarker=11**

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Sum of source and destination images, with color values approaching 0 as a limit. \( R = \text{MAX}(0, (1 - D) + (1 - S)) \)

**34.8.79 NSCompositePlusLighter=13**

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Sum of source and destination images, with color values approaching 1 as a limit. \( R = \text{MIN}(1, S + D) \)
34.8. CLASS NSGRAPHICSMBS

34.8.80 NSCompositeSourceAtop=5

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Source image wherever both images are opaque, destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere. \( R = S^*Da + D^*(1 - Sa) \)

34.8.81 NSCompositeSourceIn=3

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Source image wherever both images are opaque, and transparent elsewhere. \( R = S^*Da \)

34.8.82 NSCompositeSourceOut=4

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Source image wherever source image is opaque but destination image is transparent, and transparent elsewhere. \( R = S^*(1 - Da) \)

34.8.83 NSCompositeSourceOver=2

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Source image wherever source image is opaque, and destination image elsewhere. \( R = S + D^*(1 - Sa) \)

34.8.84 NSCompositeXOR=10

MBS MacCocoa Plugin, Plugin Version: 7.7. **Function:** Exclusive OR of source and destination images. \( R = S^*(1 - Da) + D^*(1 - Sa) \)
**Notes:** Works only with black and white images and is not recommended for color contexts.

34.8.85 NSImageInterpolationDefault=0

MBS MacCocoa Plugin, Plugin Version: 10.3. **Function:** One of the interpolation contants. **Notes:** Use the context’s default interpolation.

34.8.86 NSImageInterpolationHigh=3

MBS MacCocoa Plugin, Plugin Version: 10.3. **Function:** One of the interpolation contants. **Notes:** Slower, higher-quality interpolation.
34.8.87  **NSImageInterpolationLow=2**

MBS MacCocoa Plugin, Plugin Version: 10.3. **Function:** One of the interpolation constants.  
**Notes:** Fast, low-quality interpolation.

34.8.88  **NSImageInterpolationMedium=4**

MBS MacCocoa Plugin, Plugin Version: 10.3. **Function:** One of the interpolation constants.  
**Notes:**  
Medium quality, slower than NSImageInterpolationLow.  
Available in Mac OS X v10.6 and later.

34.8.89  **NSImageInterpolationNone=1**

MBS MacCocoa Plugin, Plugin Version: 10.3. **Function:** One of the interpolation constants.  
**Notes:** No interpolation.

34.8.90  **NSStringDrawingDisableScreenFontSubstitution = 4**

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the drawing option constants.  
**Notes:** Disable screen font substitution (equivalent to NSLayoutManager.setUsesScreenFonts(false)).

34.8.91  **NSStringDrawingOneShot = 16**

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the drawing option constants.  
**Notes:** Suppresses caching layout information.

34.8.92  **NSStringDrawingTruncatesLastVisibleLine = 32**

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the drawing option constants.  
**Notes:**  
Truncates and adds the ellipsis character to the last visible line if the text doesn’t fit into the bounds specified.
This option is ignored if NSStringDrawingUsesLineFragmentOrigin is not also set. In addition, the line break mode must be either NSLineBreakByWordWrapping or NSLineBreakByCharWrapping for this option to take effect. The line break mode can be specified in a paragraph style passed in the attributes dictionary argument of the drawing methods. Available in Mac OS X v10.5 and later.

### 34.8.93 NSStringDrawingUsesDeviceMetrics = 8

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the drawing option constants. **Notes:** Uses image glyph bounds instead of typographic bounds.

### 34.8.94 NSStringDrawingUsesFontLeading = 2

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the drawing option constants. **Notes:** Uses the font leading for calculating line heights.

### 34.8.95 NSStringDrawingUsesLineFragmentOrigin = 1

MBS MacCocoa Plugin, Plugin Version: 11.3. **Function:** One of the drawing option constants. **Example:**

```plaintext
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)

g.drawWithRect m, new NSRectMBS(20, 20, 100, 100), g.NSStringDrawingUsesLineFragmentOrigin
```

**Notes:** The specified origin is the line fragment origin, not the baseline origin.
34.9 class NSImageMBS

34.9.1 class NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
An NSImage object is a high-level class for manipulating image data.
**Notes:**
You use this class to load existing images or create new ones and composite them into a view or other image. This class works in conjunction with one or more image representation objects (subclasses of NSImageRep), which manage the actual image data.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

34.9.2 Methods

34.9.3 addRepresentation(img as NSImageRepMBS)

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Adds the specified image representation object to to the receiver.
**Notes:**
After invoking this method, you may need to explicitly set features of the new image representation, such as the size, number of colors, and so on. This is true particularly when the NSImage object has multiple image representations to choose from. See NSImageRep and its subclasses for the methods you use to complete initialization.

Any representation added by this method is retained by the receiver. Image representations cannot be shared among multiple NSImage objects.

34.9.4 BMPRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The image as the binary data in a BMP file.
**Example:**
```pascal
dim img as NSImageMBS  
dim p as Picture  
dim f as FolderItem  
dim b as BinaryStream
```
34.9. CLASS NSIMagemBS

```plaintext
p=NewPicture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p,p.Mask)

f=SpecialFolder.Desktop.Child("test.bmp")
b=f.CreateBinaryFile("")
b.Write img.BMPRepresentation
b.Close
f.Launch
```

Notes: BMP does not support masks.

34.9.5 BMPRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a BMP file. **Notes:** BMP does not support masks. Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

34.9.6 cancelIncrementalLoad

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Cancels the current download operation immediately, if the image is being incrementally loaded. **Notes:** This call has no effect if the image is not loading.

34.9.7 canInitWithPasteboard as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tests whether the receiver can create an instance of itself using pasteboard data. **Notes:** This method uses the NSImageRep class method imageUnfilteredPasteboardTypes to find a class that can handle the data in the specified pasteboard. If you create your own NSImageRep subclasses, override the imageUnfilteredPasteboardTypes method to notify NSImage of the pasteboard types your class supports.
34.9.8 Constructor

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default constructor creating a dummy NSImage object.

See also:

- 34.9.9 Constructor(data as Memoryblock)
- 34.9.10 Constructor(file as folderitem)
- 34.9.11 Constructor(image as Picture, mask as picture = nil)
- 34.9.12 Constructor(width as Double, height as Double)

34.9.9 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The data constructor calling initWithData internally.

**Notes:**

Calls initWithData.
On success the image is valid and the handle is not zero.

See also:

- 34.9.8 Constructor
- 34.9.10 Constructor(file as folderitem)
- 34.9.11 Constructor(image as Picture, mask as picture = nil)
- 34.9.12 Constructor(width as Double, height as Double)

34.9.10 Constructor(file as folderitem)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The file constructor calling initWithContentsOfURL(file) internally.

**Notes:**

Calls initWithContentsOfURL.
On success the image is valid and the handle is not zero.

See also:

- 34.9.8 Constructor
- 34.9.9 Constructor(data as Memoryblock)
- 34.9.11 Constructor(image as Picture, mask as picture = nil)
- 34.9.12 Constructor(width as Double, height as Double)
34.9. CLASS NSIMAGEMBS

34.9.11 Constructor(image as Picture, mask as picture = nil)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new NSImageMBS object based on the image data in a Realbasic picture.

**Example:**

```realbasic
dim img as new NSImageMBS(pict)
```

**Notes:**

Optional you can pass a picture with the mask. It is valid to use the mask property of the image for the second parameter.

With 11.3 plugins we are deprecating to pass a mask. The plugin prefers to simply take the mask or alpha channel of the picture itself.

On success the image is valid and the handle is not zero.

Calls initWithPicture.

See also:

- 34.9.8 Constructor
- 34.9.9 Constructor(data as Memoryblock)
- 34.9.10 Constructor(file as folderitem)
- 34.9.12 Constructor(width as Double, height as Double)

34.9.12 Constructor(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The size constructor calling initWithSize internally.

**Notes:**

Calls initWithSize.

On success the image is valid and the handle is not zero.

See also:

- 34.9.8 Constructor
- 34.9.9 Constructor(data as Memoryblock)
- 34.9.10 Constructor(file as folderitem)
- 34.9.11 Constructor(image as Picture, mask as picture = nil)
34.9.13 CopyMask as picture

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the content of the NSImage in current size.  
**Example:**

```vba
dim f as FolderItem
dim n as NSImageMBS
f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyMask
```

**Notes:**
Copies only the alpha channel as mask.

A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

34.9.14 CopyPicture(CGColorSpace as Variant = nil, BackgroundColor as NSColorMBS = nil) as picture

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the content of the NSImage in current size.  
**Example:**

```vba
dim f as FolderItem
dim n as NSImageMBS
f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyPicture // background is black
```

**Notes:**
A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

With Colorspace parameter you can pass a RGB CGColorsace to define which colorspace is used. Default
is DeviceRGB, but you could also pass generic RGB or other.

If BackgroundColor is not nil, the image is filled in background with this color and NSImage rendered on top of it.

### 34.9.15 CopyPictureRect

MBS MacBase Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the content of the NSImage from the given rectangle.

**Example:**

```vbnet
dim f as FolderItem
dim n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyPicture // background is black
```

**Notes:**

A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

With Colorspace parameter you can pass a RGB CGColorspace to define which colorspace is used. Default is DeviceRGB, but you could also pass generic RGB or other.

If BackgroundColor is not nil, the image is filled in background with this color and NSImage rendered on top of it.

### 34.9.16 CopyPictureWithAlpha

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the content of the NSImage in current size.

**Notes:**

This is a function for Cocoa target which returns picture with alpha channel.

Returns nil on any error.
34.9.17 CopyPictureWithAlphaRect(x as Integer, y as Integer, w as Integer, h as Integer) as picture

MBS MacBase Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the content of the NSImage in given rectangle. **Notes:**
This is a function for Cocoa target which returns picture with alpha channel. Returns nil on any error.

34.9.18 CopyPictureWithMask(CGColorSpace as Variant = nil) as picture

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the content of the NSImage in current size. **Example:**
```vba
dim f as FolderItem
dim n as NSImageMBS
f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyPictureWithMask
```

**Notes:**
Copies the picture and its mask. This function is faster than CopyPicture and CopyMask combined as the picture is only copied one time to an internal buffer.

A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

With Colorspace parameter you can pass a RGB CGColorSpace to define which colorspace is used. Default is DeviceRGB, but you could also pass generic RGB or other.
34.9. DRAWINTOCGCHEXTATPOINT(cgcontext as Integer, x as Double, y as Double, sx as Double, sy as Double, SourceW as Double, SourceH as Double, operation as Integer, fraction as Double) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws the image.
**Notes:** Same as DrawIntoCGContextAtRect, but with a point instead of a rectangle.

34.9.20 DrawIntoCGContextAtRect(cgcontext as Integer, x as Double, y as Double, w as Double, h as Double, SourceX as Double, SourceY as Double, SourceW as Double, SourceH as Double, operation as Integer, fraction as Double) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws the image.

**Example:**

```vbnet
Function OpenAsNSImage(extends file as folderitem) As picture
    dim width as Integer
    dim height as Integer
    dim c as NSImageMBS
    dim g as CGPictureContextMBS

    // load image from file
    c=new NSImageMBS

    // is that image valid?
    if c.initWithContentsOfURL(file) then
        Width=c.Width
        height=c.Height
    end if

    // create a drawing buffer to draw inside
    g=new CGPictureContextMBS(width,height)

    if g.Handle<>0 then // valid?
        // now draw the image inside.
        // you could scale or even apply transparency...
        if c.DrawIntoCGContextAtRect(g.Handle, 0, 0, width, height, 0,0,width,height,2,1.0) then
            // make a RB Picture from it
            Return g.CopyPicture
        end if
    end if
End Function
```
Notes:
Draws the image into a CGContext. You need to specify first the destination rectangle followed by the source rectangle.

fraction:
The opacity of the image, specified as a value from 0.0 to 1.0. Specifying a value of 0.0 draws the image as fully transparent while a value of 1.0 draws the image as fully opaque. Values greater than 1.0 are interpreted as 1.0.

operation codes:

<table>
<thead>

</table>

Returns true on success and false on failure.
34.9.21 GIFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The image as the binary data in a GIF file.
**Example:**
```vba
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=NewPicture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p,p.Mask)

f=SpecialFolder.Desktop.Child("test.gif")
b=f.CreateBinaryFile(""")
b.Write img.GIFRepresentation
b.Close

f.Launch
```

**Notes:** GIF does support masks in a limited way.

34.9.22 GIFRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The image as the binary data in a GIF file.
**Notes:**
GIF does support masks in a limited way.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

34.9.23 imageByFadingToFraction(fraction as Double) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns an image with a mask faded to the given percentage
**Example:**
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=NewPicture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByFadingToFraction(0.1)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile(""")
b.Write img.PNGRepresentation
b.Close

f.Launch

Notes: Returns nil on failure.

34.9.24 imageByScalingToSize(width as Double, height as Double) as NSImageMBS

Example:

dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=NewPicture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByScalingToSize(200,200)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile(""")
34.9. CLASS NSIMAGEMBS

b. Write img.PNGRepresentation
b. Close

f. Launch

Notes:

Returns nil on failure.
Internally creates a copy of the image.
See also:

• 34.9.25 imageByScalingToSize(width as Double, height as Double, fraction as Double) as NSImageMBS
• 34.9.26 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS

34.9.25 imageByScalingToSize(width as Double, height as Double, fraction as Double) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Scales image to the new size with given fading.
Example:

```vbnet
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=NewPicture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByScalingToSize(200,200,0.5)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile"

b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes:
CHAPTER 34. COCOA DRAWING

Returns nil on failure.

Internally creates a copy of the image.

See also:

- 34.9.24 imageByScalingToSize(width as Double, height as Double) as NSImageMBS
- 34.9.26 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS

34.9.26 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scales image to the new size with given fading fraction.

**Example:**

```plaintext
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=NewPicture(100,100,32)
p.Graphics.ForeColor=&cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByScalingToSize(200,200)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile(""
'b.Write img.PNGRepresentation
'b.Close

f.Launch
```

**Notes:**

Returns nil on failure.

The image can be flipped vertically with the flip property.

Internally creates a copy of the image.

See also:

- 34.9.24 imageByScalingToSize(width as Double, height as Double) as NSImageMBS
- 34.9.25 imageByScalingToSize(width as Double, height as Double, fraction as Double) as NSImageMBS
- 34.9.26 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS
34.9. CLASS NSIMAGEMBS

34.9.27  **imageFileTypes as string()**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings identifying the image types supported by the registered NSImageRep objects.

**Example:**
```dim types() as string = NSImageMBS.imageFileTypes
MsgBox Join(types, EndOfLine)```

**Notes:**
An array of strings, each of which identifies a single supported file type. The array can include encoded HFS file types as well as filename extensions.

This list includes all file types supported by registered subclasses of NSImageRep plus those that can be converted to a supported type by a user-installed filter service. You can pass the array returned by this method directly to NSOpenPanelMBS.

When creating a subclass of NSImageRep, do not override this method. Instead, override the imageUnfilteredFileTypes method to notify NSImage of the file types your class supports directly.

34.9.28  **imageName(name as string) as NSImageMBS**

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSImage instance associated with the specified name.

**Notes:**
This method searches for named images in several places, returning the first image it finds matching the given name. The order of the search is as follows:

1. Search for an object whose name was set explicitly using the setName: method and currently resides in the image cache.
2. Search the application’s main bundle for a file whose name matches the specified string. (For information on how the bundle is searched, see "Searching for Bundle Resources" in Bundle Programming Guide.)
3. Search the Application Kit framework for a shared image with the specified name.

When looking for files in the application bundle, it is better (but not required) to include the filename extension in the name parameter. When naming an image with the setName method, it is also convention not to include filename extensions in the names you specify. That way, you can easily distinguish between images you have named explicitly and those you want to load from the application’s bundle.
One particularly useful image you can retrieve is your application’s icon. This image is set by Cocoa automatically and referenced by the string "NSApplicationIcon". Icons for other applications can be obtained through the use of methods declared in the NSWorkspace class. You can also retrieve some standard system images using Cocoa defined constants; for more information, see the Constants section of this class.

If an application is linked in Mac OS X v10.5 or later, images requested using this method and whose name ends in the word "Template" are automatically marked as template images.

The NSImage class keeps a reference to any named images in a table until the image name is cleared. Consequently you do not need to retain the returned image object unless its name could be cleared. You can clear an image object from the table by passing nil to the setName: method of the corresponding NSImage object.

Here is a good list of identifiers you can use:
http://hetima.github.io/fucking_nsimage_syntax/

### 34.9.29 imagePasteboardTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings identifying the pasteboard types supported directly by the registered NSImageRep objects.

**Example:**

```plaintext
dim types() as string = NSImageMBS.imagePasteboardTypes
MsgBox Join(types, EndOfLine)
```

**Notes:**

Returns an array of strings, each of which identifies a single supported pasteboard type. By default, this list contains the NSPDFPboardType, NSPICTPboardType, NSPostScriptPboardType, and NSTIFFPboardType types.

This list includes all pasteboard types supported by registered subclasses of NSImageRep plus those that can be converted to a supported type by a user-installed filter service.

When creating a subclass of NSImageRep, do not override this method. Instead, override the imageUnfilteredPasteboardTypes method to notify NSImage of the pasteboard types your class supports.
34.9. CLASS NSIMAGEMBS

### 34.9.30 imageTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of UTI strings identifying the image types supported by the registered NSImageRep objects, either directly or through a user-installed filter service. **Example:**

```vba
dim types() as string = NSImageMBS.imageTypes
MsgBox Join(types, EndOfLine)
```

**Notes:**

Returns an array of strings, each of which contains a UTI identifying a supported image type. Some sample image-related UTI strings include "public.image", "public.jpeg", and "public.tiff". For a list of supported types, see UTCoreTypes.h.

The returned list includes UTIs all file types supported by registered subclasses of NSImageRep plus those that can be converted to a supported type by a user-installed filter service. You can use the returned UTI strings with any method that supports UTIs.

You should not override this method directly. Instead, you should override the imageTypes method of NSImageRep.

Available in Mac OS X v10.5 and later.

### 34.9.31 imageUnfilteredFileTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of strings identifying the file types supported directly by the registered NSImageRep objects. **Example:**

```vba
dim types() as string = NSImageMBS.imageUnfilteredFileTypes
MsgBox Join(types, EndOfLine)
```

**Notes:**

An array of strings, each of which identifies a single supported file type. File types are identified by file extension and HFS file types. The returned list does not contain pasteboard types that are available only through a user-installed filter service.
34.9.32  imageUnfilteredPasteboardTypes as string()

**Function:** Returns an array of strings identifying the pasteboard types supported directly by the registered NSImageRep objects.  

**Example:**

```vbnet
dim types() as string = NSImageMBS.imageUnfilteredPasteboardTypes
MsgBox Join(types, EndOfLine)
```

**Notes:**

An array of strings, each of which identifies a single supported pasteboard type.  
The returned list does not contain pasteboard types that are supported only through a user-installed filter service.

---

34.9.33  imageUnfilteredTypes as string()

**Function:** Returns an array of UTI strings identifying the image types supported directly by the registered NSImageRep objects.  

**Example:**

```vbnet
dim types() as string = NSImageMBS.imageUnfilteredTypes
MsgBox Join(types, EndOfLine)
```

**Notes:**

Returns an array of strings, each of which contains a UTI identifying a supported image type. Some sample image-related UTI strings include "public.image", "public.jpeg", and "public.tiff". For a list of supported types, see UTCoreTypes.h.

The returned list includes UTI strings only for those file types that are supported directly by registered subclasses of NSImageRep. It does not include types that are supported through user-installed filter services. You can use the returned UTI strings with any method that supports UTIs.

You should not override this method directly. Instead, you should override the imageUnfilteredTypes method of NSImageRep.
34.9.34  imageWithCGImage(CGImage as Variant, width as Double = 0, height as Double = 0) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes and returns an NSImage instance with the contents of the CGImage. Example:

```vbnet
dim logo as Picture = LogoMBS(500)
dim cgimage as CGImageMBS = CGCreateImageMBS(logo)
dim nsimage as NSImageMBS = NSImageMBS.imageWithCGImage(cgimage)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes:
If width is zero, we take the width from the CGImage.
If height is zero, we take the height from the CGImage.

cgImage: The source CGImageMBS object.
width & height: The size of the new image.

Returns an initialized NSImage instance, or nil if the new instance cannot be initialized.

You should not assume anything about the image, other than that drawing it is equivalent to drawing the CGImage.
Available in OS X v10.6 and later.

34.9.35  imageWithContentsOfFile(file as folderitem) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes and returns an NSImage instance with the contents of the specified file. Example:

```vbnet
dim file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
dim image as NSImageMBS = NSImageMBS.imageWithContentsOfFile(file)
Backdrop = image.CopyPictureWithMask
```

Notes:
File: The file to open.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from
CHAPTER 34. COCOA DRAWING

the contents of the specified file.

34.9.36  imageWithContentsOfFileMT(file as folderitem) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes and returns an NSImage instance with the contents of the specified file. Example:

```pascal
dim file as FolderItem = SpecialFolder.Desktop.Child(“mbs.jpg”)
dim image as NSImageMBS = NSImageMBS.imageWithContentsOfFileMT(file)
Backdrop = image.CopyPictureWithMask
```

Notes:
File: The file to open.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

34.9.37  imageWithContentsOfFile(path as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes and returns an NSImage instance with the contents of the specified file. Example:

```pascal
dim file as FolderItem = SpecialFolder.Desktop.Child(“mbs.jpg”)
dim path as string = file.UnixpathMBS
dim image as NSImageMBS = NSImageMBS.imageWithContentsOfFile(path)
Backdrop = image.CopyPictureWithMask
```

Notes:
path: A full or relative path name specifying the file with the desired image data. Relative paths must be relative to the current working directory.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.
The filename parameter should include the file extension that identifies the type of the image data. This method looks for an NSImageRep subclass that handles that data type from among those registered with NSImage.

### 34.9.38 `imageWithContentsOfPathMT(path as string) as NSImageMBS`

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified file.

**Example:**
```
    dim file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
    dim path as string = file.UnixpathMBS
    dim image as NSImageMBS = NSImageMBS.imageWithContentsOfPathMT(path)
    Backdrop = image.CopyPictureWithMask
```

**Notes:**
- **path:** A full or relative path name specifying the file with the desired image data. Relative paths must be relative to the current working directory.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

The filename parameter should include the file extension that identifies the type of the image data. This method looks for an NSImageRep subclass that handles that data type from among those registered with NSImage.

Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

### 34.9.39 `imageWithContentsOfURL(URL as string) as NSImageMBS`

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified URL.

**Example:**
```
    dim url as string = "http://www.monkeybreadsoftware.de/images/MBSLogo.jpg"
    dim img as NSImageMBS = NSImageMBS.imageWithContentsOfURL(url)
    Backdrop = img.CopyPictureWithMask
```
Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified URL.

34.9.40 `imageWithContentsOfURLMT(URL as string) as NSImageMBS`

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified URL.

**Example:**

```vba
dim url as string = "http://www.monkeybreadsoftware.de/images/MBSLogo.jpg"
dim img as NSImageMBS = NSImageMBS.imageWithContentsOfURLMT(url)
Backdrop = img.CopyPictureWithMask
```

Notes:

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified URL.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

34.9.41 `imageWithData(data as memoryblock) as NSImageMBS`

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified memoryblock.

**Example:**

```vba
dim logo as Picture = LogoMBS(500)
dim jpeg as string = PictureToJPEGStringMBS(logo, 75)
dim nsimage as NSImageMBS = NSImageMBS.imageWithData(jpeg)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.
See also:

- 34.9.42 `imageWithData(data as string) as NSImageMBS`
34.9. CLASS NSIMAGEMBS

34.9.42 imageWithData(data as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified string.

**Example:**

```plaintext
dim logo as Picture = LogoMBS(500)
dim jpeg as string = PictureToJPEGStringMBS(logo, 75)
dim nsimage as NSImageMBS = NSImageMBS.imageWithData(jpeg)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

**Notes:** Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.

See also:

- 34.9.41 imageWithData(data as memoryblock) as NSImageMBS

34.9.43 imageWithDataMT(data as memoryblock) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified memoryblock.

**Example:**

```plaintext
dim logo as Picture = LogoMBS(500)
dim jpeg as string = PictureToJPEGStringMBS(logo, 75)
dim nsimage as NSImageMBS = NSImageMBS.imageWithDataMT(jpeg)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

**Notes:**

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.

Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

See also:

- 34.9.44 imageWithDataMT(data as string) as NSImageMBS

34.9.44 imageWithDataMT(data as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified string.
Example:

```vbnet
dim logo as Picture = LogoMBS(500)
dim jpeg as string = PictureToJPEGStringMBS(logo, 75)
dim nsimage as NSImageMBS = NSImageMBS.imageWithDataMT(jpeg)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes:

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.
See also:

- 34.9.43 imageWithDataMT(data as memoryblock) as NSImageMBS

### 34.9.45 imageWithHandle(Handle as Integer) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new picture for a NSImage handle.

### 34.9.46 initWithContentsOfURL(file as folderitem) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified folderitem.
**Notes:** Returns true on success and false on failure.
See also:

- 34.9.47 initWithContentsOfURL(url as string) as boolean

### 34.9.47 initWithContentsOfURL(url as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified URL.
**Notes:** Returns true on success and false on failure.
See also:

- 34.9.46 initWithContentsOfURL(file as folderitem) as boolean
34.9.48 initWithData(data as Memoryblock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and with the contents of the specified data in the string. **Notes:** Returns true on success and false on failure.

34.9.49 initWithDataIgnoringOrientation(data as Memoryblock) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes and returns an NSImage instance with the contents of the specified memoryblock, ignoring the EXIF orientation tags. **Notes:** An initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object. Available in Mac OS X v10.6 and later.

34.9.50 initWithIconRef(IconHandle as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the image object with a Carbon-style icon resource. **Notes:** IconHandle: A reference to a Carbon icon resource (IconRef). Creates one or more bitmap image representations, one for each size icon contained in the IconRef data structure. This initialization method automatically retains the data in the iconRef parameter and loads the bitmaps from that data file lazily. Available in Mac OS X v10.5 and later.

34.9.51 initWithPasteboard as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an NSImage instance with data from the pasteboard. **Notes:** The specified pasteboard should contain a type supported by one of the registered NSImageRep subclasses. Table 1 lists the default pasteboard types and file extensions for several NSImageRep subclasses.
34.9.52 initWithPicture(img as picture, mask as picture = nil) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes the image object with image data from the Realbasic pictures.

**Example:**

```plaintext
dim img as new NSImageMBS
if img.initWithPicture(pict, pict.mask) then
    MsgBox "OK"
end if
```

**Notes:**
Optional you can pass a picture with the mask. It is valid to use the mask property of the image for the second parameter.

With 11.3 plugins we are deprecating to pass a mask. The plugin prefers to simply take the mask or alpha channel of the picture itself.

On success the image is valid and the handle is not zero.

34.9.53 initWithSize(width as Double, height as Double) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes an empty image object with the given size.

**Notes:** Returns true on success and false on failure.

34.9.54 JPEGRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a JPEG file.

**Example:**

```plaintext
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=NewPicture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
```
34.9. **CLASS NSIMAGEMBS**

```plaintext
img=new NSImageMBS(p)

f=SpecialFolder.Desktop.Child("test.jpeg")
b=f.CreateBinaryFile"
"b.Write img.JPEGRepresentation
b.Close

f.Launch
```

**Notes:** JPEG does not support masks. Uses 80% for the quality.

---

### 34.9.55 JPEGRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a JPEG file.

**Example:**

```plaintext
// take some Picture
dim logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
dim nsimage as new NSImageMBS(logo)

// use thread friendly compress function
dim jpeg as MemoryBlock = nsimage.JPEGRepresentationMT

// decode to see if it worked
dim test as Picture = JPEGStringToPictureMBS(jpeg)

// and display
Backdrop = test
```

**Notes:**

JPEG does not support masks. Uses 80% for the quality.

Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.
34.9.56 JPEGRepresentationWithCompressionFactor(factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a JPEG file. 

**Example:**

```vba
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=NewPicture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

f=SpecialFolder.Desktop.Child("test.jpeg")
b=f.CreateBinaryFile("")
b.Write img.JPEGRepresentationWithCompressionFactor(0.01)
b.Close

f.Launch
```

**Notes:**

Factor for compression goes from 0.0 to 1.0.
JPEG does not support masks.

34.9.57 JPEGRepresentationWithCompressionFactorMT(factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image as the binary data in a JPEG file. 

**Example:**

```vba
// take some Picture
dim logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
dim nsimage as new NSImageMBS(logo)

// use thread friendly compress function
dim jpeg as MemoryBlock = nsimage.JPEGRepresentationWithCompressionFactorMT(1.0)
```
// decode to see if it worked
Dim test As Picture = JPEGStringToPictureMBS(jpeg)

// and display
Backdrop = test

Notes:
Factor for compression goes from 0.0 to 1.0.
JPEG does not support masks.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

### 34.9.58 NSImageHintUserInterfaceLayoutDirection as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the dictionary keys used in the hints dictionary. **Notes:** value is a number with NSUserInterfaceLayoutDirection enum value

### 34.9.59 NSImageNameActionTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:** To access this image, pass the specified constant to the imageNamed method.
An action menu template image.
Available in Mac OS X v10.5 and later.

### 34.9.60 NSImageNameAddTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:** An add item template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.
34.9.61 NSImageNameAdvanced as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.

**Notes:**

To access this image, pass the specified constant to the imageNamed method.

Advanced preferences toolbar icon. Use in a preferences window only.

Available in Mac OS X v10.5 and later.

34.9.62 NSImageNameApplicationIcon as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.

**Notes:**

To access this image, pass the specified constant to the imageNamed method.

The application’s icon.

On versions of Mac OS X prior to v10.6, you can use the string ”NSApplicationIcon”.

Available in Mac OS X v10.6 and later.

34.9.63 NSImageNameBluetoothTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.

**Notes:**

To access this image, pass the specified constant to the imageNamed method.

A Bluetooth template image.

Available in Mac OS X v10.5 and later.

34.9.64 NSImageNameBonjour as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing Finder items.

**Notes:**

To access this image, pass the specified constant to the imageNamed method.

A Bonjour icon.

Available in Mac OS X v10.5 and later.
34.9.65 NSImageNameBookmarksTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.

**Notes:**

To access this image, pass the specified constant to the imageNamed method.

Bookmarks image suitable for a template.

Available in Mac OS X v10.6 and later.

34.9.66 NSImageNameCaution as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.

**Notes:**

To access this image, pass the specified constant to the imageNamed method.

Caution Image.

Available in Mac OS X v10.6 and later.

34.9.67 NSImageNameColorPanel as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.

**Notes:**

To access this image, pass the specified constant to the imageNamed method.

A color panel toolbar icon.

Available in Mac OS X v10.5 and later.

34.9.68 NSImageNameColumnViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images used in segmented controls to switch the current view type.

**Notes:**

To access this image, pass the specified constant to the imageNamed method.

A column view mode template image.

Available in Mac OS X v10.5 and later.
### 34.9.69 NSImageNameComputer as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing Finder items.

**Example:**

```plaintext
dim n as NSImageMBS = NSImageMBS.imageNamed(NSImageMBS.NSImageNameComputer)

// set to size you need
n.size = NSMakeSizeMBS(512,512)

// and make picture
Backdrop = n.CopyPictureWithMask
```

**Notes:**

To access this image, pass the specified constant to the imageNamed method.

A computer icon.

Available in Mac OS X v10.5 and later.

---

### 34.9.70 NSImageNameDotMac as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing Finder items.

**Notes:**

To access this image, pass the specified constant to the imageNamed method.

A Dot Mac icon.

Available in Mac OS X v10.5 and later.

---

### 34.9.71 NSImageNameEnterFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.

**Notes:**

An enter full-screen mode template image.

Available in Mac OS X v10.5 and later.

To access this image, pass the specified constant to the imageNamed method.
34.9.72  NSImageNameEveryone as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing sharing permission icons that you can use in your applications. **Notes:**
To access this image, pass the specified constant to the imageNamed method. Permissions for all users. Available in Mac OS X v10.5 and later.

34.9.73  NSImageNameExitFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**
An exit full-screen mode template image. Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

34.9.74  NSImageNameFlowViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images used in segmented controls to switch the current view type. **Notes:**
To access this image, pass the specified constant to the imageNamed method. A cover flow view mode template image. Available in Mac OS X v10.5 and later.

34.9.75  NSImageNameFolder as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars. **Notes:**
To access this image, pass the specified constant to the imageNamed method. A folder image. Available in Mac OS X v10.6 and later.
34.9.76  **NSImageNameFolderBurnable as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the images representing Finder items.  
**Notes:**  
To access this image, pass the specified constant to the imageNamed method.  
A burnable folder icon.  
Available in Mac OS X v10.5 and later.

34.9.77  **NSImageNameFolderSmart as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the images representing Finder items.  
**Notes:**  
A smart folder icon.  
Available in Mac OS X v10.5 and later.  
To access this image, pass the specified constant to the imageNamed method.

34.9.78  **NSImageNameFollowLinkFreestandingTemplate as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the images representing standard artwork and icons that you can use in your applications.  
**Notes:**  
A link template image. You can use this image to implement a borderless button.  
Available in Mac OS X v10.5 and later.  
To access this image, pass the specified constant to the imageNamed method.

34.9.79  **NSImageNameFontPanel as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the images that you can use in application toolbars.  
**Notes:**  
To access this image, pass the specified constant to the imageNamed method.  
A font panel toolbar icon.  
Available in Mac OS X v10.5 and later.
34.9.80  **NSImageNameGoBackTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** The template name for the go back image.

**Notes:**

Use these images for "go forward" or "go back" functions, as seen in Safari's toolbar. These images will automatically mirror when the user interface layout direction is right to left.

Available in macOS 10.12 and newer.

34.9.81  **NSImageNameGoForwardTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** The template name for the go forward image.

**Notes:**

Use these images for "go forward" or "go back" functions, as seen in Safari's toolbar. These images will automatically mirror when the user interface layout direction is right to left.

Available in macOS 10.12 and newer.

34.9.82  **NSImageNameGoLeftTemplate as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the images representing standard artwork and icons that you can use in your applications.

**Notes:**

To access this image, pass the specified constant to the imageNamed method.

A "go back" template image.

Available in Mac OS X v10.5 and later.

34.9.83  **NSImageNameGoRightTemplate as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the images representing standard artwork and icons that you can use in your applications.

**Notes:**

To access this image, pass the specified constant to the imageNamed method.

A "go forward" template image.

Available in Mac OS X v10.5 and later.
CHAPTER 34. COCOA DRAWING

34.9.84 NSImageNameHomeTemplate as string

Notes:
To access this image, pass the specified constant to the imageNamed method.
Home image suitable for a template.
Available in Mac OS X v10.6 and later.

34.9.85 NSImageNameIChatTheaterTemplate as string

Notes:
To access this image, pass the specified constant to the imageNamed method.
An iChat Theater template image.
Available in Mac OS X v10.5 and later.

34.9.86 NSImageNameIconViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the images used in segmented controls to switch the current view type.

Notes:
To access this image, pass the specified constant to the imageNamed method.
An icon view mode template image.
Available in Mac OS X v10.5 and later.

34.9.87 NSImageNameInfo as string

Notes:
To access this image, pass the specified constant to the imageNamed method.
An information toolbar icon.
Available in Mac OS X v10.5 and later.
34.9. NSImageNameInvalidDataFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

To access this image, pass the specified constant to the imageNamed method.
An invalid data template image. Place this icon to the right of any fields containing invalid data. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.

34.9.89 NSImageNameLeftFacingTriangleTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

To access this image, pass the specified constant to the imageNamed method.
A generic left-facing triangle template image.
Available in Mac OS X v10.5 and later.

34.9.90 NSImageNameListViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images used in segmented controls to switch the current view type. **Notes:**

To access this image, pass the specified constant to the imageNamed method.
A list view mode template image.
Available in Mac OS X v10.5 and later.

34.9.91 NSImageNameLockLockedTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

To access this image, pass the specified constant to the imageNamed method.
A locked lock template image. Use to indicate locked content.
Available in Mac OS X v10.5 and later.
34.9.92 **NSImageNameLockUnlockedTemplate as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

To access this image, pass the specified constant to the imageNamed method.

An unlocked lock template image. Use to indicate modifiable content that can be locked.

Available in Mac OS X v10.5 and later.

34.9.93 **NSImageNameMenuMixedStateTemplate as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars. **Notes:**

To access this image, pass the specified constant to the imageNamed method.

A horizontal dash. Drawing these outside of menus is discouraged.

Available in Mac OS X v10.6 and later.

34.9.94 **NSImageNameMenuOnStateTemplate as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars. **Notes:**

To access this image, pass the specified constant to the imageNamed method.

A check mark. Drawing these outside of menus is discouraged.

Available in Mac OS X v10.6 and later.

34.9.95 **NSImageNameMobileMe as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars. **Notes:**

To access this image, pass the specified constant to the imageNamed method.

MobileMe logo. Note that this is preferred to using the NSImageNameDotMac image, although that image is not expected to be deprecated.

Available in Mac OS X v10.6 and later.
34.9. **CLASS NSIMAGEMBS**

34.9.96 **NSImageNameMultipleDocuments as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Drag image you can use in your applications. **Notes:**

A drag image for multiple items.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

34.9.97 **NSImageNameNetwork as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing Finder items. **Notes:**

A network icon.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

34.9.98 **NSImageNamePathTemplate as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

To access this image, pass the specified constant to the imageNamed method.
A path button template image.
Available in Mac OS X v10.5 and later.

34.9.99 **NSImageNamePreferencesGeneral as string**

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars. **Notes:**

To access this image, pass the specified constant to the imageNamed method.
General preferences toolbar icon. Use in a preferences window only.
Available in Mac OS X v10.5 and later.
34.9.100 **NSImageNameQuickLookTemplate** as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

To access this image, pass the specified constant to the imageNamed method.
A Quick Look template image.
Available in Mac OS X v10.5 and later.

34.9.101 **NSImageNameRefreshFreestandingTemplate** as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

A refresh template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

34.9.102 **NSImageNameRefreshTemplate** as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

A refresh template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.
34.9.103 NSImageNameRemoveTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

A remove item template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

34.9.104 NSImageNameRevealFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

A reveal contents template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

34.9.105 NSImageNameRightFacingTriangleTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

To access this image, pass the specified constant to the imageNamed method.
A generic right-facing triangle template image.
Available in Mac OS X v10.5 and later.

34.9.106 NSImageNameShareTemplate as string

MBS MacBase Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images used in segmented controls to switch the current view type. **Notes:**

A share view template image.
Available in OS X v10.8 and later.
34.9.107 NSImageNameSlideshowTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

To access this image, pass the specified constant to the imageNamed method.
A slideshow template image.
Available in Mac OS X v10.5 and later.

34.9.108 NSImageNameSmartBadgeTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications. **Notes:**

A badge for a "smart" item.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

34.9.109 NSImageNameStatusAvailable as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars. **Notes:**

To access this image, pass the specified constant to the imageNamed method.
Small green indicator, similar to iChat’s available image.
Available in Mac OS X v10.6 and later.

34.9.110 NSImageNameStatusNone as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars. **Notes:**

To access this image, pass the specified constant to the imageNamed method.
Small clear indicator.
Available in Mac OS X v10.6 and later.
34.9.111 NSImageNameStatusPartiallyAvailable as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.

**Notes:**
To access this image, pass the specified constant to the imageNamed method.
Small yellow indicator, similar to iChat’s idle image.
Available in Mac OS X v10.6 and later.

34.9.112 NSImageNameStatusUnavailable as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.

**Notes:**
To access this image, pass the specified constant to the imageNamed method.
Small red indicator, similar to iChat’s unavailable image.
Available in Mac OS X v10.6 and later.

34.9.113 NSImageNameStopProgressFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.

**Notes:**
To access this image, pass the specified constant to the imageNamed method.
A stop progress template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.

34.9.114 NSImageNameStopProgressTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing standard artwork and icons that you can use in your applications.

**Notes:**
A stop progress button template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.
34.9.115  **NSImageNameTouchBarAddDetailTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAddDetailTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.116  **NSImageNameTouchBarAddTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAddTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.117  **NSImageNameTouchBarAlarmTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAlarmTemplate
```

**Notes:** Available in macOS 10.12 and newer.
34.9. **CLASS NSIMAGEMBS**

```plaintext
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.118 NSImageNameTouchBarAudioInputMuteTemplate as string

*Example:*

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioInputMuteTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.119 NSImageNameTouchBarAudioInputTemplate as string

*Example:*

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioInputTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
### 34.9.120 **NSImageNameTouchBarAudioOutputMuteTemplate as string**

**Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputMuteTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes**: Available in macOS 10.12 and newer.

### 34.9.121 **NSImageNameTouchBarAudioOutputVolumeHighTemplate as string**

**Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeHighTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes**: Available in macOS 10.12 and newer.

### 34.9.122 **NSImageNameTouchBarAudioOutputVolumeLowTemplate as string**

**Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeLowTemplate
```
34.9. **CLASS NSIMAGEMBS**

```plaintext
img = NSImageMBS:imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.123 NSImageNameTouchBarAudioOutputVolumeMediumTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

ame = NSImageMBS:NSImageNameTouchBarAudioOutputVolumeMediumTemplate
img = NSImageMBS:imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.124 NSImageNameTouchBarAudioOutputVolumeOffTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

ame = NSImageMBS:NSImageNameTouchBarAudioOutputVolumeOffTemplate
img = NSImageMBS:imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
34.9.125 NSImageNameTouchBarBookmarksTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarBookmarksTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.126 NSImageNameTouchBarColorPickerFill as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarColorPickerFill
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.127 NSImageNameTouchBarColorPickerFont as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarColorPickerFont
```
34.9. CLASS NSIMAGEMBS

```objc
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.128 NSImageNameTouchBarColorPickerStroke as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```objc
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarColorPickerStroke
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.129 NSImageNameTouchBarCommunicationAudioTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```objc
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarCommunicationAudioTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
34.9.130  **NSImageNameTouchBarCommunicationVideoTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**

```vbnet
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarCommunicationVideoTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.131  **NSImageNameTouchBarComposeTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**

```vbnet
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarComposeTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.132  **NSImageNameTouchBarDeleteTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**

```vbnet
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarDeleteTemplate
```

```
34.9. **CLASS NSIMAGEMBS**

```plaintext
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.133 **NSImageNameTouchBarDownloadTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS
name = NSImageMBS.NSImageNameTouchBarDownloadTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.134 **NSImageNameTouchBarEnterFullScreenTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS
name = NSImageMBS.NSImageNameTouchBarEnterFullScreenTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
34.9.135  *NSImageNameTouchBarExitFullScreenTemplate as string*

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.  
**Example:**

```dim name as string
dim img as NSImageMBS
name = NSImageMBS.NSImageNameTouchBarExitFullScreenTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha```

**Notes:** Available in macOS 10.12 and newer.

34.9.136  *NSImageNameTouchBarFastForwardTemplate as string*

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.  
**Example:**

```dim name as string
dim img as NSImageMBS
name = NSImageMBS.NSImageNameTouchBarFastForwardTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha```

**Notes:** Available in macOS 10.12 and newer.

34.9.137  *NSImageNameTouchBarFolderCopyToTemplate as string*

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.  
**Example:**

```dim name as string
dim img as NSImageMBS
name = NSImageMBS.NSImageNameTouchBarFolderCopyToTemplate```
34.9. **CLASS NSIMAGEMBS**

```plaintext
img = NSImageMBS.imageNamed(n)
```

Backdrop = img.CopyPictureWithAlpha

**Notes:** Available in macOS 10.12 and newer.

### 34.9.138 NSImageNameTouchBarFolderMoveToTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFolderMoveToTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.139 NSImageNameTouchBarFolderTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFolderTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
34.9.140 NSImageNameTouchBarGetInfoTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**
```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGetInfoTemplate
img = NSImageMBS.imageNamed(name)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.141 NSImageNameTouchBarGoBackTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**
```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoBackTemplate
img = NSImageMBS.imageNamed(name)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.142 NSImageNameTouchBarGoDownTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**
```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoDownTemplate
```
34.9. **CLASS NSIMAGEMBS**

```pascal
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.143 NSImageNameTouchBarGoForwardTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```pascal
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoForwardTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.144 NSImageNameTouchBarGoUpTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```pascal
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoUpTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
34.9.145  NSImageNameTouchBarHistoryTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```java
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarHistoryTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.146  NSImageNameTouchBarIconViewTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```java
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarIconViewTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.147  NSImageNameTouchBarListViewTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```java
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarListViewTemplate
```

**Notes:**
34.9. **CLASS NSIMAGEMBS**

```tcl
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.148 NSImageNameTouchBarMailTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```tcl
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarMailTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.149 NSImageNameTouchBarNewFolderTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```tcl
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarNewFolderTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
34.9.150  NSImageNameTouchBarNewMessageTemplate as string

Example:

```dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarNewMessageTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha```

Notes: Available in macOS 10.12 and newer.

34.9.151  NSImageNameTouchBarOpenInBrowserTemplate as string

Example:

```dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarOpenInBrowserTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha```

Notes: Available in macOS 10.12 and newer.

34.9.152  NSImageNameTouchBarPauseTemplate as string

Example:

```dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPauseTemplate```
34.9. **CLASS NSIMAGEMBS**

```plaintext
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

---

**34.9.153 NSImageNameTouchBarPlayheadTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.  
**Example:**
```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPlayheadTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

---

**34.9.154 NSImageNameTouchBarPlayPauseTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.  
**Example:**
```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPlayPauseTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
34.9.155 NSImageNameTouchBarPlayTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the touchbar image templates. Example:

```dim name as string
dim img as NSImageMBS
name = NSImageMBS.NSImageNameTouchBarPlayTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha```

Notes: Available in macOS 10.12 and newer.

34.9.156 NSImageNameTouchBarQuickLookTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the touchbar image templates. Example:

```dim name as string
dim img as NSImageMBS
name = NSImageMBS.NSImageNameTouchBarQuickLookTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha```

Notes: Available in macOS 10.12 and newer.

34.9.157 NSImageNameTouchBarRecordStartTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the touchbar image templates. Example:

```dim name as string
dim img as NSImageMBS
name = NSImageMBS.NSImageNameTouchBarRecordStartTemplate```
34.9. CLASS NSIMAGEMBS

\texttt{img = NSImageMBS.imageNamed(n)}

Backdrop = img.CopyPictureWithAlpha

\textbf{Notes:} Available in macOS 10.12 and newer.

34.9.158 NSImageNameTouchBarRecordStopTemplate as string

\textbf{Example:}

\begin{verbatim}
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRecordStopTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
\end{verbatim}

\textbf{Notes:} Available in macOS 10.12 and newer.

34.9.159 NSImageNameTouchBarRefreshTemplate as string

\textbf{Example:}

\begin{verbatim}
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRefreshTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
\end{verbatim}

\textbf{Notes:} Available in macOS 10.12 and newer.
34.9.160 NSImageNameTouchBarRewindTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**

```売り
Dim name As String
Dim img As NSImageMBS
name = NSImageMBS.NSImageNameTouchBarRewindTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.161 NSImageNameTouchBarRotateLeftTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**

```売り
Dim name As String
Dim img As NSImageMBS
name = NSImageMBS.NSImageNameTouchBarRotateLeftTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.162 NSImageNameTouchBarRotateRightTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.

**Example:**

```売り
Dim name As String
Dim img As NSImageMBS
name = NSImageMBS.NSImageNameTouchBarRotateRightTemplate
```
34.9. **CLASS NSIMAGEMBS**

```plaintext
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.163 **NSImageNameTouchBarSearchTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS
name = NSImageMBS.NSImageNameTouchBarSearchTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.164 **NSImageNameTouchBarShareTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS
name = NSImageMBS.NSImageNameTouchBarShareTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
34.9.165  **NSImageNameTouchBarSidebarTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.  
**Example:**

```clojure
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSidebarTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.166  **NSImageNameTouchBarSkipAhead15SecondsTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.  
**Example:**

```clojure
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipAhead15SecondsTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.167  **NSImageNameTouchBarSkipAhead30SecondsTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.  
**Example:**

```clojure
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipAhead30SecondsTemplate
```
34.9. **CLASS NSIMAGEMBS**

```python
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

---

### 34.9.168 NSImageNameTouchBarSkipAheadTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```python
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipAheadTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

---

### 34.9.169 NSImageNameTouchBarSkipBack15SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```python
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipBack15SecondsTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
CHAPTER 34. COCOA DRAWING

34.9.170 NSImageNameTouchBarSkipBack30SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```lisp
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipBack30SecondsTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.171 NSImageNameTouchBarSkipBackTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```lisp
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipBackTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.172 NSImageNameTouchBarSkipToEndTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```lisp
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipToEndTemplate
```
NSImageMBS

34.9. CLASS NSImageMBS

```plaintext
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.173 NSImageNameTouchBarSkipToStartTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipToStartTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.174 NSImageNameTouchBarSlideshowTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSlideshowTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
34.9.175  **NSImageNameTouchBarTagIconTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.  
**Example:**

```vbnet
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTagIconTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.176  **NSImageNameTouchBarTextBoldTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.  
**Example:**

```vbnet
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextBoldTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.177  **NSImageNameTouchBarTextBoxTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.  
**Example:**

```vbnet
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextBoxTemplate
```
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

**34.9.178 NSImageNameTouchBarTextCenterAlignTemplate as string**

Example:

```vba
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextCenterAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

**34.9.179 NSImageNameTouchBarTextItalicTemplate as string**

Example:

```vba
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextItalicTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.
34.9.180  **NSImageNameTouchBarTextJustifiedAlignTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the touchbar image templates.  **Example:**

```dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextJustifiedAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha```

**Notes:** Available in macOS 10.12 and newer.

34.9.181  **NSImageNameTouchBarTextLeftAlignTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the touchbar image templates.  **Example:**

```dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextLeftAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha```

**Notes:** Available in macOS 10.12 and newer.

34.9.182  **NSImageNameTouchBarTextListTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the touchbar image templates.  **Example:**

```dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextListTemplate```
34.9. CLASS NSIMAGEMBS

```plaintext
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.183 NSImageNameTouchBarTextRightAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextRightAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.184 NSImageNameTouchBarTextStrikethroughTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextStrikethroughTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
**34.9.185  NSImageNameTouchBarTextUnderlineTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextUnderlineTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

---

**34.9.186  NSImageNameTouchBarUserAddTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarUserAddTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

---

**34.9.187  NSImageNameTouchBarUserGroupTemplate as string**

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarUserGroupTemplate
```
34.9. **CLASS NSImageMBS**

```plaintext
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.188 NSImageNameTouchBarUserTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarUserTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

### 34.9.189 NSImageNameTouchBarVolumeDownTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates. **Example:**

```plaintext
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarVolumeDownTemplate
img = NSImageMBS.imageNamed(n)
Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.
34.9.190 NSImageNameTouchBarVolumeUpTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the touchbar image templates.  
**Example:**

```python
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarVolumeUpTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

**Notes:** Available in macOS 10.12 and newer.

34.9.191 NSImageNameTrashEmpty as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.  
**Notes:**

To access this image, pass the specified constant to the imageNamed method.  
An image of the empty trash can.  
Available in Mac OS X v10.6 and later.

34.9.192 NSImageNameTrashFull as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images that you can use in application toolbars.  
**Notes:**

To access this image, pass the specified constant to the imageNamed method.  
An image of the full trash can.  
Available in Mac OS X v10.6 and later.

34.9.193 NSImageNameUser as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the images representing sharing permission icons that you can use in your applications.  
**Notes:**
To access this image, pass the specified constant to the imageNamed method.
Permissions for a single user.
Available in Mac OS X v10.5 and later.

34.9.194  NSImageNameUserAccounts as string

Function: One of the images that you can use in application toolbars.
Notes:  
To access this image, pass the specified constant to the imageNamed method.
User account toolbar icon. Use in a preferences window only.
Available in Mac OS X v10.5 and later.

34.9.195  NSImageNameUserGroup as string

Function: One of the images representing sharing permission icons that you can use in your applications.
Notes:  
To access this image, pass the specified constant to the imageNamed method.
Permissions for a group of users.
Available in Mac OS X v10.5 and later.

34.9.196  NSImageNameUserGuest as string

Function: One of the images that you can use in application toolbars.
Notes:  
To access this image, pass the specified constant to the imageNamed method.
Shaded user figure.
Available in Mac OS X v10.6 and later.

34.9.197  PNGRepresentation as Memoryblock

Function: The image as the binary data in a PNG file.
Example:
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=NewPicture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p,p.Mask)

f=SpecialFolder.Desktop.Child(”test.png”)
b=f.CreateBinaryFile(””)
b.Write img.PNGRepresentation
b.Close

f.Launch

Notes: PNG does support masks.

34.9.198 PNGRepresentationMT as Memoryblock

Example:

// take some Picture
dim logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
dim nsimage as new NSImageMBS(logo)

// use thread friendly compress function
dim jpeg as MemoryBlock = nsimage.PNGRepresentationMT

// decode to see if it worked
dim test as Picture = PNGStringToPictureMBS(jpeg)

// and display
Backdrop = test

Notes:
PNG does supports masks.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

### 34.9.199 recache

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invalidates and frees the offscreen caches of all image representations.

**Notes:**
If you modify an image representation, you must send a recache message to the corresponding image object to force the changes to be recached. The next time any image representation is drawn, it is asked to recreate its cached image. If you do not send this message, the image representation may use the old cache data. This method simply clears the cached image data; it does not delete the NSCachedImageRep objects associated with any image representations.
If you do not plan to use an image again right away, you can free its caches to reduce the amount of memory consumed by your program.

### 34.9.200 removeRepresentation(img as NSImageRepMBS)

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Removes the specified image representation from the receiver and releases it.

### 34.9.201 RepresentationHeight(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Height of the representation with the given index in pixel.

**Notes:**
Index from 0 to RepesentationCount-1.
Returns 0 on invalid index.

### 34.9.202 representations as NSImageRepMBS()

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns an array containing all of the receiver’s image representations.

**Notes:**
An array containing zero or more NSImageRep objects.
Returns nil on any error.
34.9.203 **RepresentationWidth(index as Integer) as Integer**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Width of the representation with the given index in pixel.  
**Notes:**  
Index from 0 to RepresentationCount-1.  
Returns 0 on invalid index.

34.9.204 **setName(value as String) as Boolean**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Registers the image under the specified name.  
**Notes:**  
Returns true if the receiver was successfully registered with the given name; otherwise, false.  

Discussion  
If the receiver is already registered under a different name, this method unregisters the other name. If a different image is registered under the name specified in aString, this method does nothing and returns false.

When naming an image using this method, it is convention not to include filename extensions in the names you specify. That way, you can easily distinguish between images you have named explicitly and those you want to load from the application’s bundle. For information about the rules used to search for images, see the imageNamed method.

34.9.205 **setSize(width as Double, height as Double)**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the width and height of the image.  
**Notes:**  
Pass the new size of the image, measured in points.  

Discussion:  
The size of an NSImage object must be set before it can be used. If the size of the image hasn’t already been set when an image representation is added, the size is taken from the image representation’s data. For EPS images, the size is taken from the image’s bounding box. For TIFF images, the size is taken from the ImageLength and ImageWidth attributes.

Changing the size of an NSImage after it has been used effectively resizes the image. Changing the size invalidates all its caches and frees them. When the image is next composited, the selected representation
34.9. **CLASS NSIMAGEMBS**

will draw itself in an offscreen window to recreate the cache.

### 34.9.206 TIFFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns a string containing TIFF data for all of the image representations in the receiver.

**Notes:**

A string containing the TIFF data, or nil if the TIFF data could not be created.

**Discussion:**

You can use the returned data object to write the TIFF data to a file. For each image representation, this method uses the TIFF compression option associated with that representation or NSTIFFCompressionNone, if no option is set.

If one of the receiver’s image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation’s cached content.

### 34.9.207 TIFFRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns a string containing TIFF data for all of the image representations in the receiver.

**Example:**

```plaintext
// take some Picture
dim logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
dim nsimage as new NSImageMBS(logo)

// use thread friendly compress function
dim data as MemoryBlock = nsimage.TIFFRepresentationMT

// decode to see if it worked
dim test as Picture = TIFFStringToPictureMBS(data)

// and display
Backdrop = test
```

**Notes:**

A string containing the TIFF data, or nil if the TIFF data could not be created.
Discussion:
You can use the returned data object to write the TIFF data to a file. For each image representation, this method uses the TIFF compression option associated with that representation or NSTIFFCompressionNone, if no option is set.

If one of the receiver’s image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation’s cached content.

Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

34.9.208 TIFFRepresentationUsingCompression(comp as Integer, factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing TIFF data for all of the image representations in the receiver.

**Notes:**

comp: The type of compression to use. For a list of values, see the constants in NSBitmapImageRep.

aFloat: Provides a hint for compression types that implement variable compression ratios. Currently, only JPEG compression uses a compression factor.

Returns a string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. If the specified compression isn’t applicable, no compression is used. If a problem is encountered during generation of the TIFF data, this method may raise an exception.

If one of the receiver’s image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation’s cached content.

34.9.209 TIFFRepresentationUsingCompressionMT(comp as Integer, factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a string containing TIFF data for all of the image representations in the receiver.

**Notes:**
comp: The type of compression to use. For a list of values, see the constants in NSBitmapImageRep.

aFloat: Provides a hint for compression types that implement variable compression ratios. Currently, only JPEG compression uses a compression factor.

Returns a string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. If the specified compression isn’t applicable, no compression is used. If a problem is encountered during generation of the TIFF data, this method may raise an exception.

If one of the receiver’s image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation’s cached content.

Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

### 34.9.210 Properties

#### 34.9.211 accessibilityDescription as string

MBS MacBase Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image’s accessibility description. **Notes:** A short localized string that does not include the name of the interface element.

This description will be used automatically by interface elements that display images. Like all accessibility descriptions, the string should be a short localized string that does not include the name of the interface element. For instance, ”delete” rather than ”delete button”.

(Read and Write property)

#### 34.9.212 backgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The background color of image. **Notes:** The background color of the image. The default color is transparent, as returned by the clearColor method of NSColor.
The background color is visible only if the drawn image representation does not completely cover all of the pixels available for the image’s current size.

The value of this variant must be an object of class NSColorMBS.
(Read and Write property)

**34.9.213 cacheDepthMatchesImageDepth as Boolean**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether an image’s offscreen window caches use the same bit depth as the image data itself.
**Notes:**
Returns true if the offscreen window caches use the same bit depth as the image data; otherwise, false. The default value is false.
(Read and Write property)

**34.9.214 cacheMode as Integer**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver’s caching mode.
**Notes:**
The caching mode determines when the receiver’s image representations use offscreen caches. Offscreen caches speed up rendering time but do so by using extra memory. In the default caching mode (NSImageCacheDefault), each image representation chooses the caching technique that produces the fastest drawing times. For example, in the default mode, the NSPDFImageRep and NSEPSImageRep classes use the NSImageCacheAlways mode but the NSBitmapImageRep class uses the NSImageCacheBySize mode.
(Read and Write property)

**34.9.215 EXIFData as Dictionary**

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary with exif data.
**Notes:** (Read only property)

**34.9.216 Handle as Integer**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the internally used NSImage object.
34.9. CLASS NSIMAGEMBS

Notes: (Read and Write property)

34.9.217 height as Double

Notes:
If no size has been set and the size cannot be determined from any of the receiver’s image representations. (Read only property)

34.9.218 isCachedSeparately as Boolean

Notes:
Returns true if the image representations cache their content in separate offscreen windows; otherwise, false. The default value is false.
Discussion:
If this method returns false, it means that the image may be cached in a shared window but is not required to be. Images are cached in a shared window if they have the same general attributes, such as color space, resolution, and bit depth. (Read and Write property)

34.9.219 isDataRetained as Boolean

Notes:
Returns true if the image retains its source data; otherwise, false. The default value is false with some exceptions, which are covered in the discussion. (Read and Write property)
34.9.220 isFlipped as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the image uses a flipped coordinate system.

**Notes:**
Returns true if the image’s coordinate system is flipped; otherwise, false. The default is false.
(Read and Write property)

34.9.221 isTemplate as Boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value indicating whether the image is a template image.

**Notes:**
Value is true if the image is a template image; otherwise, false.
Template images consist of black and clear colors (and an alpha channel). Template images are not intended to be used as standalone images and are usually mixed with other content to create the desired final appearance.
Available in Mac OS X v10.5 and later.
Assigning value to istemplate, will internally call setTemplate.
(Read and Write property)

34.9.222 isValid as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the image can be drawn.

**Notes:**
Return value: true if the receiver can be drawn; otherwise, false.
If the object is initialized with an existing image file, but the corresponding image data is not yet loaded into memory, this method loads the data and expands it as needed. If the object contains no image representations and no associated image file, this method creates a valid cached image representation and initializes it to the default bit depth. This method returns false in cases where the file or URL from which it was initialized is nonexistent or when the data in an existing file is invalid.
(Read only property)

34.9.223 matchesOnMultipleResolution as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether image representations whose resolution is an integral multiple
of the device resolution are considered a match.

**Notes:**

Returns true if image representations whose resolution is an integral multiple of the device resolution are considered a match; otherwise, false.

**Discussion:**

When this method returns false, only image representations whose resolution is exactly the same as the device resolution are considered matches. If this method returns true and multiple image representations fit this criteria, the one whose resolution is closest to the device resolution is chosen.

The default value is true.

(Read and Write property)

---

### 34.9.224 MaximumPixelHeight as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

From all the image representation the height of the heighest one.

**Notes:**

Value is returned in pixels. Returns 0 on any error.

(Read only property)

---

### 34.9.225 MaximumPixelWidth as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

From all the image representation the width of the widest one.

**Notes:**

Value is returned in pixels. Returns 0 on any error.

(Read only property)

---

### 34.9.226 MinimumPixelHeight as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

From all the image representation the width of the smallest one.

**Notes:**

Value is returned in pixels. Returns 0 on any error.

(Read only property)
34.9.227 MinimumPixelWidth as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** From all the image representation the width of the smallest one.

**Notes:**
Value is returned in pixels. Returns 0 on any error.
(Read only property)

34.9.228 name as String

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name associated with the receiver, if any.

**Notes:** (Read only property)

34.9.229 prefersColorMatch as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the image prefers to choose image representations using color matching or resolution matching.

**Notes:**
Discussion:
Both color matching and resolution matching may influence the choice of an image representation. This method simply indicates which technique is used first during the selection process. The default value is true.
(Read and Write property)

34.9.230 RepresentationsCount as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Number of representations this image has.

**Notes:**
Same as Representations.Count
(Read only property)

34.9.231 scalesWhenResized as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether image representations are scaled to fit the receiver’s size.

**Notes:**
Returns true if image representations are scaled to fit the receiver; otherwise, false. The default value is false.

Images are not resized during drawing if this method returns true. They are only resized when you change the size by sending the receiver a setSize message.

(Read and Write property)

34.9.232 size as NSSizeMBS

Notes:
The size of the receiver or (0.0, 0.0) if no size has been set and the size cannot be determined from any of the receiver’s image representations.

The size of an NSImage object must be set before it can be used. If the size of the image hasn’t already been set when an image representation is added, the size is taken from the image representation’s data. For EPS images, the size is taken from the image’s bounding box. For TIFF images, the size is taken from the ImageLength and ImageWidth attributes.

Changing the size of an NSImage after it has been used effectively resizes the image. Changing the size invalidates all its caches and frees them. When the image is next composited, the selected representation will draw itself in an offscreen window to recreate the cache.

(Read and Write property)

34.9.233 usesEPSOnResolutionMismatch as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether EPS image representations are preferred when no other representations match the resolution of the device.

Notes: (Read and Write property)

34.9.234 width as Double

Notes:
If no size has been set and the size cannot be determined from any of the receiver’s image representations.

(Read only property)
34.9.235  Constants

34.9.236  NSImageCacheAlways=1

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image cache mode constants.  
**Notes:** Always generate a cache when drawing.

34.9.237  NSImageCacheBySize=2

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image cache mode constants.  
**Notes:** Cache if cache size is smaller than the original data.

34.9.238  NSImageCacheDefault=0

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image cache mode constants.  
**Notes:** Caching is unspecified.  
Use the image rep’s default.

34.9.239  NSImageCacheNever=3

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image cache mode constants.  
**Notes:** Never cache; always draw direct.

34.9.240  NSImageLoadStatusCancelled=1

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image load status constants.  
**Notes:** Image loading was canceled.  
The image contains the portions of the data that have already been successfully decompressed, if any.

34.9.241  NSImageLoadStatusCompleted=0

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image load status constants.  
**Notes:** Enough data has been provided to completely decompress the image.
34.9.  CLASS NSIMAGEMBS

34.9.242  NSImageLoadStatusInvalidData=2

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image load status constants.
**Notes:**
An error occurred during image decompression.
The image data is probably corrupt. The image contains the portions of the data that have already been successfully decompressed, if any.

34.9.243  NSImageLoadStatusReadError=4

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image load status constants.
**Notes:**
Not enough data was available for full decompression of the image.
The image contains the portions of the data that have already been successfully decompressed, if any.

34.9.244  NSImageLoadStatusUnexpectedEOF=3

MBS MacBase Plugin, Plugin Version: 11.2. **Function:** One of the image load status constants.
**Notes:**
Not enough data was available for full decompression of the image.
The image contains the portions of the data that have already been successfully decompressed, if any.
34.10 class NSImageRepMBS

34.10.1 class NSImageRepMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSImageRep class is a semiabstract superclass ("semi" because it has some instance variables and implementation of its own).

**Notes:**

Each of its subclasses knows how to draw an image from a particular kind of source data. While an NSImageRep subclass can be used directly, it is typically through an NSImage object. An NSImage object manages a group of image representations, choosing the best one for the current output device.

Subclasses are not implemented in the plugin currently.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

34.10.2 Methods

34.10.3 canInitWithData(data as memoryblock) as Boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver can initialize itself from the specified data.

**Notes:**

Returns true if the receiver understands the format of the specified data and can use it to initialize itself; otherwise, false.

This method should be overridden by subclasses. Note that this method does not need to do a comprehensive check of the image data; it should return false only if it knows it cannot initialize itself from the data.

34.10.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
34.10. CLASS NSIMAGEREPMB5

34.10.5  setSize(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the size of the image representation to the specified value.

**Notes:**
This method determines the size of the image when it’s rendered. It is not necessarily the same as the width and height of the image in pixels as specified by the image data, nor must it be equal to the size set for the NSImage object that wraps this image representation. You must set the image size before you can render it.

The size of an image representation combined with the physical dimensions of the image data determine the resolution of the image.

34.10.6  Properties

34.10.7  bitsPerSample as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the number of bits per sample in the receiver.

**Notes:** (Read and Write property)

34.10.8  colorSpaceName as String

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The name of the receiver’s color space.

**Notes:**
The colorspace name, or NSCalibratedRGBColorSpace if no name has been assigned.

By default, an NSImageRep object’s color space name is NSCalibratedRGBColorSpace. Color space names are defined as part of the NSColor class, in NSGraphics.h. The following are valid color space names:

- NSCalibratedWhiteColorSpace
- NSCalibratedBlackColorSpace
- NSCalibratedRGBColorSpace
- NSDeviceWhiteColorSpace
- NSDeviceBlackColorSpace
- NSDeviceRGBColorSpace
- NSDeviceCMYKColorSpace
- NSNamedColorSpace
- NSCustomColorSpace

(Read and Write property)
34.10.9 Handle as Integer

**Notes:** (Read and Write property)

34.10.10 hasAlpha as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver has an alpha channel.  
**Notes:**  
Returns true if the receiver has a known alpha channel; otherwise, false. Subclasses should call this method when loading image data to notify the parent class whether that data contains an alpha component. Passing in a value of true does not add an alpha channel to the image data itself; it merely records the fact that the data has an alpha channel.  
(Read and Write property)

34.10.11 height as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Height of image in points.  
**Notes:**  
0 on any error.  
(Read only property)

34.10.12 isOpaque as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver is opaque.  
**Notes:**  
Use this method to test whether an image representation completely covers the area within the rectangle returned by the size method.  

The returned value does not indicate whether the image has an alpha channel or if there is partial or complete transparency when drawing the image rep. Use the hasAlpha method to determine if the image has
an alpha channel.  
(Read and Write property)

### 34.10.13 pixelsHigh as Integer

**MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**  
**Function:** Returns the height of the image, measured in pixels.  
**Notes:**

Return Value:  
The height of the image, measured in the units of the device coordinate space. This value is usually derived from the image data itself.  
(Read and Write property)

### 34.10.14 pixelsWide as Integer

**MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**  
**Function:** Returns the width of the image, measured in pixels.  
**Notes:**

Return Value:  
The width of the image, measured in the units of the device coordinate space. This value is usually derived from the image data itself.  
(Read and Write property)

### 34.10.15 size as NSMBS

**MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**  
**Function:** The size of the image representation.  
**Notes:**

This size is the size of the image representation when it’s rendered. It is not necessarily the same as the width and height of the image in pixels as specified by the image data, nor must it be equal to the size set for the NSImage object that wraps this image representation.

The size of an image representation combined with the physical dimensions of the image data determine the resolution of the image.  
(Read and Write property)
34.10.16 width as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Width of image in points.  
**Notes:**  
0 on any error.  
(Read only property)

34.10.17 Constants

34.10.18 NSImageRepMatchesDevice = 0

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** One of the constants used by NSImageRep to denote an attribute whose value changes to match the display device.  
**Notes:**  
Indicates that the value of certain attributes, such as the number of colors or bits per sample, will change to match the display device.  
This value can be passed in (or received back) as the value of bitsPerSample, pixelsWide, and pixelsHigh.
34.11.1 class NSPDFImageRepMBS

34.11.2 Methods

34.11.3 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns an NSPDFImageRep object initialized with the specified PDF data. Notes: Initialized NSPDFImageRep object. Initialization may fail if the PDF data does not conform to the PDF file format. On success handle property is not zero.

34.11.4 imageRepWithData(data as Memoryblock) as NSPDFImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates and returns an NSPDFImageRep object initialized with the specified PDF data. Notes: Returns an initialized NSPDFImageRep object or nil if the object could not be initialized. Initialization may fail if the PDF data does not conform to the PDF file format.

34.11.5 PDFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the PDF representation of the receiver’s image.

34.11.6 Properties

34.11.7 bounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the receiver’s bounding rectangle. Notes:
This value is equivalent to the crop box specified by the PDF data.
(Read only property)

### 34.11.8 currentPage as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The page currently displayed by the image representation.

**Notes:**
A zero-based index indicating the page being displayed.
(Read and Write property)

### 34.11.9 pageCount as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of pages in the receiver.

**Notes:** (Read only property)
34.12. CLASS NSPICTIMAGEREPMBS

34.12 class NSPICTImageRepMBS

34.12.1 class NSPICTImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSPICTImageRep object renders an image from a PICT format data stream as described in the Carbon QuickDraw Manager documentation.

**Notes:**
This class can render PICT format version 1, version 2, and extended version 2 pictures.
Subclass of the NSImageRepMBS class.

34.12.2 Methods

34.12.3 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an NSPICTImageRep object initialized with the specified data.

**Notes:**
data: A data object containing the PICT data.

Initialization may fail if the data does not conform to the PICT file format.
On success the handle property is not zero.

If the PICT data is obtained directly from a PICT file or document, this method ignores most of the 512-byte header that occurs before the start of the actual picture data. It may retrieve some relevant meta information from the header.

34.12.4 imageRepWithData(data as Memoryblock) as NSPICTImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSPICTImageRep object initialized with the specified data.

**Notes:**
Initialization may fail if the data does not conform to the PICT file format.
On failure the handle property is nil.
34.12.5 PICTRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s PICT data.  
**Notes:** A data object containing the PICT data. The returned data does not include the 512-byte header, if it was present in the original data. If you want to write the returned data to a file, you must precede it with a 512-byte header (containing all zeros) if you want to conform to the PICT document format.

34.12.6 Properties

34.12.7 boundingBox as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rectangle that bounds the receiver.  
**Notes:**  
The rectangle bounding the receiver. This rectangle is obtained from the the picFrame field in the picture header. See the Carbon QuickDraw Manager documentation for information on the picture header. *(Read only property)*
Chapter 35

Cocoa Menus

35.1 class NSMenuItemMBS

35.1.1 class NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to represent a menuitem from the Cocoa world. **Notes:** All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

35.1.2 Methods

35.1.3 ActionSelector as String

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name of the objective-c method called for this menu event. **Notes:** You can use this to find menu items by their selector. Which is often more save than by index or title.

35.1.4 Constructor(Handle as Integer)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Constructor for creating an instanced based on an existing handle. **Example:**

```dim m as MenuItem = EditCopy
dim h as Integer = m.Handle(MenuItem.HandleType.CocoaNSMenuItem)```
dim i as new NSMenuItemMBS(h)
i.Title = "Hello"

Notes:
Useful if you get a NSMenuItem reference from a declare.
The object is retained.
See also:

- 35.1.5 Constructor(title as string="", keyEquivalent as string="")

35.1.5 Constructor(title as string="", keyEquivalent as string="")

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new menu items.
**Notes:**
Handle is not 0 after this call if it was successful.
name and charcode are optional and can be "".
Charcode is the initial keyEquivalent for this menu item.
You can set the KeyEquivalentModifierMask to get different modifier keys.
See also:

- 35.1.4 Constructor(Handle as Integer)

35.1.6 CreateMenuItem(title as string="", keyEquivalent as string="")

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new menu items.
**Notes:**
Handle is not 0 after this call if it was successful.
name and charcode are optional and can be "".
Charcode is the initial keyEquivalent for this menu item.
You can set the KeyEquivalentModifierMask to get different modifier keys.

Deprecated, please use the Constructor instead.

35.1.7 CreateSeparator

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a Separator menu item.
35.1.8 hasSubmenu as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the menuitem has a submenu, false if it doesn’t.

35.1.9 isHiddenOrHasHiddenAncestor as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the menuitem or any of its superitems is hidden. **Notes:**

Mac OS X 10.5 only.
Returns true if the receiver or any of its superitems is hidden, otherwise false.

35.1.10 isHighlighted as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the receiver should be drawn highlighted. **Notes:**

Returns true if the receiver should be drawn highlighted, otherwise false.
Mac OS X 10.5 only.

35.1.11 isSeparatorItem as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the receiver is a separator item (that is, a menu item used to visually segregate related menu items).

35.1.12 menu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The menu where this menu item is inside. **Notes:** nil if no menu belongs to this menuitem.
35.1.13 parentItem as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the menu item whose submenu contains the receiver.
**Notes:**
Returns the parent menu item, or nil if the receiver does not have a parent item.
Available in Mac OS X v10.6 and later.

35.1.14 separatorItem as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new separator menu item.

35.1.15 setTitleWithMnemonic(title as String)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the title of a menu item with a character denoting an access key.
**Notes:**
Use an ampersand character to mark the character (the one following the ampersand) to be designated.
Deprecated by Apple.

35.1.16 userKeyEquivalent as String

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The user-assigned key equivalent for the menu item.

35.1.17 usesUserKeyEquivalents as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether menu items conform to user preferences for key equivalents.
**Notes:**
If true, menu items conform to user preferences for key equivalents; if false, the key equivalents originally assigned to the menu items are used.
(Read and Write computed property)
35.1. CLASS NSMENUITEMMBS

35.1.18 Properties

35.1.19 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The reference to the NSMenuItem object used internally.
**Notes:** (Read and Write property)

35.1.20 Alternate as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether this menu item is an alternate to the previous menu item.
**Notes:**
Available in Mac OS X v10.3 and later.
(Read and Write computed property)

35.1.21 attributedTitle as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Specifies a custom string for a menu item.
**Notes:**
You can use this method to add styled text and embedded images to menu item strings. If you do not set a text color for the attributed string, it is black when not selected, white when selected, and gray when disabled. Colored text remains unchanged when selected.

When you call this method to set the menu title to an attributed string, the setTitle: method is also called to set the menu title with a plain string. If you clear the attributed title, the plain title remains unchanged.
(Read and Write computed property)

35.1.22 Enabled as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether this menu item is enabled.
**Notes:** (Read and Write computed property)
35.1.23  image as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image displayed by the menuitem, or nil if it displays no image. **Notes:** (Read and Write computed property)

35.1.24  indentationLevel as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The menu item indentation level for the menu item. **Notes:** The value will be from 0 to 15. The default indentation level is 0. Available in Mac OS X v10.3 and later. (Read and Write computed property)

35.1.25  isHidden as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the menuitem is hidden. **Notes:** Mac OS X 10.5 only. Returns true if the receiver is hidden, otherwise false. This value can be set to hide or show a menuitem. (Read and Write computed property)

35.1.26  keyEquivalent as String

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The receiver's unmodified keyboard equivalent, or the empty string if one hasn't been defined. **Example:**

```pascal
dim m as new NSMenuItemMBS
m.CreateMenuItem "Hello"
m.keyEquivalent = "a" // A
m.keyEquivalent = "A" // shift-A
```

**Notes:** Use keyEquivalentModifierMask to determine the modifier mask for the key equivalent. In the current implementation "A" can be interpreted as Shift-A by the system even without the shift in the mask.
35.1. CLASS NSMENUITEMMBS

(Read and Write computed property)

35.1.27  keyEquivalentModifierMask as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
the menu item’s keyboard equivalent modifier mask.

**Example:**

```plaintext
const NSShiftKeyMask=131072
const NSControlKeyMask=262144
const NSAlternateKeyMask=524288
const NSCommandKeyMask=1048576

dim d as new NSMenuItemMBS
d.CreateMenuItem "Last menu entry",""
d.Enabled=true
d.KeyEquivalent="A"
d.KeyEquivalentModifierMask=NSShiftKeyMask+NSCommandKeyMask+NSAlternateKeyMask // command-option-shift
```

**Notes:**

Constants for the mask:

- **NSAlphaShiftKeyMask = 65536**
  Set if Caps Lock key is pressed.
  Available in Mac OS X v10.0 and later.

- **NSShiftKeyMask = 131072**
  Set if Shift key is pressed.
  Available in Mac OS X v10.0 and later.

- **NSControlKeyMask = 262144**
  Set if Control key is pressed.
  Available in Mac OS X v10.0 and later.

- **NSAlternateKeyMask = 524288**
  Set if Option or Alternate key is pressed.
  Available in Mac OS X v10.0 and later.

- **NSCommandKeyMask = 1048576**
  Set if Command key is pressed.
Available in Mac OS X v10.0 and later.

NSNumericPadKeyMask = 2097152
Set if any key in the numeric keypad is pressed. The numeric keypad is generally on the right side of the keyboard. This is also set if any of the arrow keys are pressed (NSUpArrowFunctionKey, NSDownArrowFunctionKey, NSLeftArrowFunctionKey, and NSRightArrowFunctionKey).
Available in Mac OS X v10.0 and later.

NSHelpKeyMask = 4194304
Set if the Help key is pressed.
Available in Mac OS X v10.0 and later.

NSFunctionKeyMask = 8388608
Set if any function key is pressed. The function keys include the F keys at the top of most keyboards (F1, F2, and so on) and the navigation keys in the center of most keyboards (Help, Forward Delete, Home, End, Page Up, Page Down, and the arrow keys).
Available in Mac OS X v10.0 and later.

NSDeviceIndependentModifierFlagsMask = 16777216
Used to retrieve only the device-independent modifier flags, allowing applications to mask off the device-dependent modifier flags, including event coalescing information.
Available in Mac OS X v10.4.
(Read and Write computed property)

### 35.1.28 mixedStateImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image used to depict a "mixed state."

**Notes:**
A mixed state is useful for indicating "off" and "on" attribute values in a group of selected objects, such as a selection of text containing bold and plain (nonbolded) words.
(Read and Write computed property)

### 35.1.29 offStateImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The image used to depict the receiver’s "off" state, or nil if the image has not been set.

**Notes:**
By default, there is no off state image.
(Read and Write computed property)
35.1.30  onStateImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The image of the receiver that indicates an "on" state.
**Notes:**
The Image object to use for the "on" state of the menu item. If itemImage is nil, any current on-state image is removed.
(Read and Write computed property)

35.1.31  state as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The state of the menuitem.
**Notes:**
An integer constant representing a state; it should be one of NSOffState, NSOnState, or NSMixedState.
Same as Checked property on Real Studio’s menu items.

Constants:

- NSMixedState = -1  The corresponding feature is in effect somewhere.
- NSOffState = 0  The corresponding feature is in effect nowhere.
- NSOnState = 1  The corresponding feature is in effect everywhere.

(Read and Write computed property)

35.1.32  submenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The submenu attached to this menuitem.
**Notes:**
nil if there is no submenu.
(Read and Write computed property)
35.1.33  **tag as Integer**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The menu item tag value.
**Notes:**
You can use this value as you like.

If you need to store more custom data than just an integer, you should subclass the NSMenuItemMBS class and add properties as needed.
(Read and Write computed property)

35.1.34  **Title as String**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The title of the menu item.
**Notes:** (Read and Write computed property)

35.1.35  **toolTip as String**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The help tag for a menu item.
**Notes:** (Read and Write computed property)

35.1.36  **view as NSViewMBS**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The view to be used for this menu item.
**Notes:**
Using a view you can draw whatever you like in the menu item.
You can set it to nil to remove the view.
Requires Mac OS X 10.5.
(Read and Write computed property)
35.1. CLASS NSMENUITEMMBS

35.1.37 Events

35.1.38 Action

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The action event called when the user clicks on the statusitem.

**Notes:**

This event is coming from the Cocoa event system. What you can do is a bit limited when using GUI functions from Realbasic. To avoid some redraw errors, you may want to start a timer and let your Realbasic code run a millisecond after the menu code has finished.

Depending on what you do, you can see the menu not redrawing properly (staying highlighted) and crashes if the Realbasic code modifies some global Cocoa states.

35.1.39 validateMenuItem(menuItem as NSMenuItemMBS) as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Implemented to override the default action of enabling or disabling a specific menu item.

**Notes:**

Return true to enable menuItem, false to disable it.

This is needed to modify the menuitem for a menu attached to a NSSearchFieldMBS. Menuitem parameter is often the same as self, but for a searchfield menu, self is the template and menuitem parameter the actual menu item.

35.1.40 Constants

35.1.41 NSMixedState=-1

MBS MacBase Plugin, Plugin Version: 9.2. **Function:** One of the constants for the state property. **Notes:** The corresponding feature is in effect somewhere.

35.1.42 NSOffState=0

MBS MacBase Plugin, Plugin Version: 9.2. **Function:** One of the constants for the state property. **Notes:** The corresponding feature is in effect nowhere.
35.1.43 NSOnState=1

MBS MacBase Plugin, Plugin Version: 9.2. **Function:** One of the constants for the state property. **Notes:** The corresponding feature is in effect everywhere.
35.2. CLASS NSMENU MBS

35.2. class NSMenuMBS

35.2.1 class NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class to represent a menu in the Cocoa world.
**Notes:** All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

35.2.2 Methods

35.2.3 addItem(m as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Adds a menu item to the end.
**Notes:**
If the menu item is nil, nothing happens.
The menu item can only be in one menu.

The menu doesn’t references to the RB classes behind, so it’s up to you to keep those references if you want to get the events and avoid crashes.
The StatusItem example keeps an array with all those menu item objects it needs so RB will not destroy them.

35.2.4 cancelTracking

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Dismisses the menu and ends all menu tracking.
**Notes:** Available in Mac OS X v10.5 and later.

35.2.5 cancelTrackingWithoutAnimation

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Dismisses the menu and ends all menu tracking without displaying the associated animation.
**Notes:** Available in Mac OS X v10.6 and later.
35.2.6  **CarbonMenuRef as Integer**

MBS MacBase Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries the Carbon Menu Reference for this Cocoa menu.

**Notes:**
This is an undocumented API from Apple.
You only get a handle if the menu has been added to the menubar or popaped up.
Returns zero on failure. Returns always zero on 64 bit target.

35.2.7  **Constructor(Handle as Integer)**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Constructor for creating an instanced based on an existing handle.

**Notes:**
Useful if you get a NSMenu reference from a declare.
The object is retained.
See also:

- 35.2.8 Constructor(title as string="")

35.2.8  **Constructor(title as string=”)**

MBS MacBase Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Constructor for a new nsmenu.

**Example:**

```dim m as NSMenuMBS
m=new NSMenuMBS("Hello World")
msgbox m.title // shows "Hello World"
```

**Notes:** Title is optional.
See also:

- 35.2.7 Constructor(Handle as Integer)

35.2.9  **helpMenu as NSMenuMBS**

MBS MacBase Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the help menu if one is registered.
35.2. CLASS NSMENU MBS

35.2.10 indexOfItem(item as NSMenuItemMBS) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the index identifying the location of a specified menu item in the receiver.
**Notes:** Returns the integer index of the menu item or, if no such menu item is in the menu, 1.

35.2.11 indexOfItemWithSelector(selector as string) as Integer

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Searches menu items for one with the given selector.
**Notes:**
Returns -1 if not found.
You can use this to find menu items by their selector. Which is often more save than by index or title.

35.2.12 indexOfItemWithSubmenu(item as NSMenuMBS) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the index of the menu item in the receiver with the given submenu.
**Notes:**
item: A menu object that is a menu item of the receiver (that is, a submenu).
The integer index of the menu item or, if no such menu item is in the menu, 1.

35.2.13 indexOfItemWithTitle(title as string) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the index of the first menu item in the receiver that has a specified title.
**Notes:** Returns the integer index of the menu item or, if no such menu item is in the menu, 1.

35.2.14 indexOfItemWithTag(tag as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the index of the first menu item in the receiver identified by a tag.
**Notes:** Returns the integer index of the menu item or, if no such menu item is in the menu, 1.
35.2.15  insertItem(m as NSMenuItemMBS, index as Integer)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Inserts a menu item into the menu at a specific location.

**Notes:**
If the menuitem is nil, nothing happens. A menuitem can only be part of one menu.

index: An integer index identifying the location of the menu item in the menu. Zero based.

35.2.16  Item(index as Integer) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns the item with the given index.

**Notes:**
Index is from 0 to numberOfItems-1.
Remember: The objects returned are not the same Realbasic objects used with additem or insertitem.

35.2.17  itemWithSelector(selector as string) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Searches menu items for one with the given selector.

**Notes:** You can use this to find menu items by their selector. Which is often more safe than by index or title.

35.2.18  mainMenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  **Function:** Returns the main menu.

35.2.19  menuBarVisible as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns a Boolean value that indicates whether the menu bar is visible.

**Notes:**
Available in Mac OS X v10.2 and later.
Returns true if the menu bar is visible, otherwise false.
35.2.20  **NSMenuDidAddItemNotification as string**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notifications sent for menus.  
**Notes:**  
Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.  

Posted after a menu item is added to the menu. The notification object is the instance of NSMenuMBS that just added the new menu item.  
This is very useful to customize the menu in Real Studio. The runtime rebuilds menu bar often, so you can catch it and edit menu.  

The userInfo dictionary contains the following information:  
NSMenuMBS: The instance of NSMenuMBS with the menu item that was added.

35.2.21  **NSMenuDidBeginTrackingNotification as string**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notifications sent for menus.  
**Notes:**  
Posted when menu tracking begins. The notification object is the main menu bar (NSApplicationMBS mainMenu) or the root menu of a popup button. This notification does not contain a userInfo dictionary.  

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

35.2.22  **NSMenuDidChangeItemNotification as string**

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notifications sent for menus.  
**Notes:**  
Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.  

Posted after a menu item in the menu changes appearance. Changes include enabling/disabling, changes in state, and changes to title. The notification object is the instance of NSMenuMBS with the menu item that changed. The userInfo dictionary contains the following information:
CHAPTER 35. COCOA MENUS

Key Value
NSMenuItemIndex  An integer index of the menu item that changed.

35.2.23 NSMenuDidEndTrackingNotification as string

Notes: Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted when menu tracking ends, even if no action is sent. The notification object is the main menu bar (NSApplicationMBS mainMenu) or the root menu of a popup button. This notification does not contain a userInfo

35.2.24 NSMenuDidRemoveItemNotification as string

Notes: Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted after a menu item is removed from the menu. The notification object is the instance of NSMenu that just removed the menu item. The userInfo dictionary contains the following information:

NSMenuItemIndex: An integer index of the menu item that was removed. Note that this index may no longer be valid and in any event no longer points to the menu item that was removed.

35.2.25 NSMenuDidSendActionNotification as string

Notes: Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted just after the application dispatches a menu item’s action method to the menu item’s target. The notification object is the instance of NSMenuMBS containing the chosen menu item. The userInfo dictionary contains the following information:
35.2. CLASS NSMENUMBS

Key Value
MenuItem The menu item that was chosen.

35.2.26 NSMenuWillSendActionNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notifications sent for menus. **Notes:**

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted just before the application dispatches a menu item’s action method to the menu item’s target. The notification object is the instance of NSMenuMBS containing the chosen menu item. The userInfo dictionary contains the following information:

Key Value
MenuItem The menu item that was chosen.

35.2.27 performActionForItemAtIndex(index as Integer)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Causes the application to send the action message of a specified menu item to its target. **Notes:**

If a target is not specified, the message is sent to the first responder. As a side effect, this method posts NSMenuWillSendActionNotification and NSMenuDidSendActionNotification.

In Mac OS X v10.6 and later the performActionForItemAtIndex no longer triggers menu validation. This is because validation is typically done during menu tracking or key equivalent matching, so the subsequent performActionForItemAtIndex validation was redundant. To trigger validation explicitly, use invoke the update method.

In Mac OS X v10.6 performActionForItemAtIndex, when called, now triggers highlighting in the menu bar. It also sends out appropriate accessibility notifications indicating the item was selected.
35.2.28 popUpContextMenu(menu as NSMenuMBS, theEvent as NSEventMBS, view as NSViewMBS, font as NSFontMBS = nil)

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Displays a contextual menu over a view for an event using a specified font.

**Notes:**

- **menu:** The menu object to use for the contextual menu.
- **event:** An NSEvent object representing the event.
- **view:** The view object over which to display the contextual menu.
- **font:** An NSFont object representing the font for the contextual menu. If you pass in nil for the font, the method uses the default font for menu.

Specifying a font using the font parameter is discouraged. Instead set the menus font using the setFont: method and pass nil for the font parameter.

35.2.29 popUpMenuPositioningItem(item as NSMenuItemMBS, location as NSPointMBS, view as NSViewMBS = nil) as boolean

MBS MacBase Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Pops up the menu at the specified location.

**Example:**

```markdown
// create menu
dim m as new NSMenuMBS
m.autoenablesItems = false

// add some items
dim it as new NSMenuItemMBS
it.CreateMenuItem "Hello"
it.Enabled = true
m.addItem it

it = new NSMenuItemMBS
it.CreateMenuItem "World"
it.Enabled = true
m.addItem it

// show relative to this view
dim v as NSViewMBS = window1.PushButton1.NSViewMBS

dim r as Boolean
r = m.popUpMenuPositioningItem(nil, nil, v)

// you need to use NSMenuItemMBS subclasses with action event to get an event for which item was selected...
```
35.2. CLASS NSMENUMBS

Notes:

item: The menu item to be positioned at the specified location in the view.
location: The location in the view coordinate system to display the menu item.
view: The view to display the menu item over.

Returns true if menu tracking ended because an item was selected, and false if menu tracking was cancelled for any reason.

Pops up the receiver as a popup menu. The top left corner of the specified item (if specified, item must be present in the receiver) is positioned at the specified location in the specified view, interpreted in the view’s own coordinate system.

If item is nil, the menu is positioned such that the top left of the menu content frame is at the given location. If view is nil, the location is interpreted in the screen coordinate system. This allows you to pop up a menu disconnected from any window.

Available in OS X v10.6 and later.

35.2.30 removeAllItems

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all the menu items in the receiver.

**Example:**

```mbs
dim n as NSMenuMBS // your menu

// for Mac OS X 10.6
n.removeAllItems

// for any Mac OS X version
for i as Integer = n.numberOfItems-1 DownTo 0
    n.removeItemAtIndex i
next
```

Notes:

This method is more efficient than removing menu items individually.
Unlike the other remove methods, this method does not post NSMenuDidChangeItemNotification notifications.
Available in Mac OS X v10.6 and later.
CHAPTER 35. COCOA MENUS

35.2.31 removeItem(m as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the menuitem.
**Notes:**

Does nothing if menuitem is nil.

The Realbasic object used to add the menuitem must not be the same as the one you use here, but the values for the menuitems handle property must match.

35.2.32 removeItemAtIndex(index as Integer)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the menu item with the given index.
**Example:**

```plaintext
dim n as NSMenuMBS // your menu

// for Mac OS X 10.6
n.removeAllItems

// for any Mac OS X version
for i as Integer = n.numberOfItems-1 DownTo 0
n.removeItemAtIndex i
next
```

**Notes:** Index is from 0 to NumberOfItems-1.

35.2.33 setMenuBarVisible(value as boolean)

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets whether the menu bar is visible and selectable by the user.
**Notes:**

value: true if menu bar is to be visible, otherwise false.
Available in Mac OS X v10.2 and later.
35.2.34 update

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables or disables the receiver’s menu items based on the NSMenuValidation informal protocol and sizes the menu to fit its current menu items if necessary.

35.2.35 windowsMenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the window menu if one is registered.

35.2.36 Properties

35.2.37 allowsContextMenuPlugIns as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the popup menu allows appending of contextual menu plugin items. **Notes:** Value is true if the popup menu allows appending of contextual menu plugin items, otherwise false. Available in Mac OS X v10.6 and later. (Read and Write property)

35.2.38 autoenablesItems as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether menu items are automatically enabled and disabled. **Notes:** Mac OS X 10.5 only. (Read and Write property)

35.2.39 Font as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The font used to display the menu and its submenus. **Notes:** This font will be used to display the menu and any submenus that have not had their font set explicitly. Available in Mac OS X v10.6 and later.
35.2.40 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSMenu object. **Notes:** (Read and Write property)

35.2.41 highlightedItem as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the highlighted item in the receiver. **Notes:** Returns the highlighted item in the receiver, or nil if no item in the menu is highlighted. Available in Mac OS X v10.5 and later. (Read only property)

35.2.42 menuBarHeight as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the menu bar height for the current application’s main menu. **Notes:** Returns the receiver’s main menu bar height or 0.0 if the receiver is some other menu. This method supersedes the menuBarHeight class method of the NSMenuView class. Available in Mac OS X v10.4 and later. (Read only property)

35.2.43 minimumWidth as Double

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum width of the menu. **Notes:** The menu will not draw smaller than its minimum width, but may draw larger if it needs more space. The default value is 0. Available in Mac OS X v10.6 and later. (Read and Write property)
35.2. **CLASS NSMENU**

35.2.44 **numberOfItems** as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The number of menu items in this menu.
**Notes:** (Read only property)

35.2.45 **showsStateColumn** as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a Boolean value that indicates whether the receiver displays the state column.
**Notes:**
Available in Mac OS X v10.5 and later.
Returns true if the receiver displays the state column, otherwise false.

The state column is the area in the menu items, where state of menu items are shown like a checkmark.
(Read and Write property)

35.2.46 **size** as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the size of the menu.
**Notes:**
Returns the size of the menu in screen coordinates.
The menu may draw at a smaller size when shown, depending on its positioning and display configuration.
Available in Mac OS X v10.6 and later.
(Read only property)

35.2.47 **supermenu** as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The parent menu of this menu.
**Notes:** (Read only property)

35.2.48 **Title** as String

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The title of the menu.
**35.2.49** userInterfaceLayoutDirection as Integer

MBS MacBase Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Configures the layout direction of menu items in the menu.

**Notes:**
This property configures the layout direction (a value of type NSUserInterfaceLayoutDirection) of menu items in the menu. If no layout direction is explicitly set for a menu, then the menu defaults to the layout direction specified for the application object. See userInterfaceLayoutDirection in NSApplication Class Reference.

NSUserInterfaceLayoutDirectionLeftToRight = 0
NSUserInterfaceLayoutDirectionRightToLeft = 1

Available in OS X v10.11 and later.
(Read and Write property)

**35.2.50** Events

**35.2.51** DidClose

MBS MacBase Plugin, Plugin Version: 14.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked after a menu closed.

**Notes:** Don’t modify the structure of the menu or the menu items during this method.

**35.2.52** EnableMenuItems

MBS MacBase Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called before the menu opens so you can edit the menu.

**35.2.53** willHighlightItem(item as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 14.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked to indicate that a menu is about to highlight a given item.

**Notes:**
item: The item about to be highlighted.
Only one item per menu can be highlighted at a time. If item is nil, it means that all items in the menu are about to be unhighlighted.

### 35.2.54 WillOpen

MBS MacBase Plugin, Plugin Version: 14.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Invoked when a menu is about to open. **Notes:** Don't modify the structure of the menu or the menu items during this method.
Chapter 36

Cocoa Networking

36.1 class NSHTTPCookieMBS

36.1.1 class NSHTTPCookieMBS

Function: An NSHTTPCookie object represents an HTTP cookie.

Example:

// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// we collect domain names
dim domains(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
    if domains.IndexOf(cookie.domain) < 0 then
domains.Append cookie.domain
end if
next

// and display them
MsgBox "You have cookies from these domains: " + Join(domains, ", " )

Notes:
It’s an immutable object initialized from a dictionary containing the cookie attributes.

Two versions of cookies are supported:
Version 0: This version refers to "traditional" or "old-style" cookies, the original cookie format defined by Netscape. The majority of cookies encountered are in this format.
Version 1: This version refers to cookies as defined in RFC 2965, HTTP State Management Mechanism.

### 36.1.2 Methods

#### 36.1.3 comment as string

*Function:* Returns the receiver's comment string.
*Example:*

```vbnet
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display comment
MsgBox "Comment: " + Cookie.comment
```

*Notes:* The receiver's comment string or "" if the cookie has no comment. This string is suitable for presentation to the user, explaining the contents and purpose of this cookie.

#### 36.1.4 commentURL as string

*Function:* Returns the receiver's comment URL.
*Example:*

```vbnet
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display comment URL
MsgBox "commentURL: " + Cookie.commentURL
```

*Notes:* The receiver's comment URL or "" if the cookie has none. This value specifies a URL which is suitable for presentation to the user as a link for further information about this cookie.
36.1.5 Constructor(properties as dictionary)

**Function:** Creates an initialized NSHTTPCookie object using the provided properties.

**Example:**

```vbs
// create dictionary with properties:
dim prop as new Dictionary
dim d as new date
d.Year = d.Year + 1

prop.Value(NSHTTPCookieMBS.NSHTTPCookieVersion)="0"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieName)="test"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieValue)="some value"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieOriginURL)="http://www.mbsplugins.de/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieDomain)="www.mbsplugins.de"
prop.Value(NSHTTPCookieMBS.NSHTTPCookiePath)="/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieExpires)=d

// create cookie from properties
dim cookie as new NSHTTPCookieMBS(prop)

// and display properties
dim dic as Dictionary = cookie.properties
dim list(-1) as string

for each key as Variant in dic.keys
next

MsgBox Join(list,EndOfLine)
```

**Notes:**

properties: The properties for the new cookie object, expressed as key value pairs.

Handle is non zero on success.
36.1.6 cookiesWithResponseHeaderFields(headerFields as dictionary, URL as string) as NSHTTPCookieMBS()

Function: Returns an array of NSHTTPCookie objects corresponding to the provided response header fields for the provided URL.

Notes:

headerFields: The header fields used to create the NSHTTPCookie objects.
URL: The URL associated with the created cookies.

Returns the array of created cookies.

This method ignores irrelevant header fields in headerFields, allowing dictionaries to contain additional data.

If headerFields does not specify a domain for a given cookie, the cookie is created with a default domain value of theURL.

If headerFields does not specify a path for a given cookie, the cookie is created with a default path value of "/".

36.1.7 cookieWithProperties(dic as dictionary) as NSHTTPCookieMBS

Function: Creates and initializes an NSHTTPCookie object using the provided properties.

Example:

// create dictionary with properties:
  dim prop as new Dictionary
  dim d as new date
  d.Year = d.Year + 1

  prop.Value(NSHTTPCookieMBS.NSHTTPCookieVersion)="0"
  prop.Value(NSHTTPCookieMBS.NSHTTPCookieName)="test"
  prop.Value(NSHTTPCookieMBS.NSHTTPCookieValue)="some value"
  prop.Value(NSHTTPCookieMBS.NSHTTPCookieOriginURL)="http://www.mbsplugins.de/"
  prop.Value(NSHTTPCookieMBS.NSHTTPCookieDomain)="www.mbsplugins.de"
  prop.Value(NSHTTPCookieMBS.NSHTTPCookiePath)="/
  prop.Value(NSHTTPCookieMBS.NSHTTPCookieExpires)=d

// create cookie from properties
  dim cookie as NSHTTPCookieMBS = NSHTTPCookieMBS.cookieWithProperties(prop)

// and display properties
36.1. **CLASS NSHTTPCOOKIEMBS**

```vbnet
dim dic as Dictionary = cookie.properties
dim list(-1) as string

for each key as Variant in dic.keys
next

MsgBox Join(list, EndOfLine)
```

**Notes:**

dic: The properties for the new cookie object, expressed as key value pairs.

Returns the newly created cookie object. Returns nil if the provided properties are invalid.

See NSHTTPCookie* shared method for more information on the available header field constants and the constraints imposed on the values in the dictionary.

---

### 36.1.8 domain as string

**MBS MacControls Plugin, Plugin Version:** 11.1, **Console & Web:** Yes, **Mac:** Yes, **Win:** No, **Linux:** No.  

**Function:** Returns the domain of the receiver's cookie.  

**Example:**

```vbnet
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display domain:
MsgBox "Domain: " + Cookie.Domain
```

**Notes:** If the domain does not start with a dot, then the cookie is only sent to the exact host specified by the domain. If the domain does start with a dot, then the cookie is sent to other hosts in that domain as well, subject to certain restrictions. See RFC 2965 for more detail.
36.1.9 expiresDate as date

Function: Returns the receiver's expiration date.
Example:

// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display date:
MsgBox "Domain: " + Cookie.expiresDate.ShortTime+" " + Cookie.expiresDate.LongTime

Notes: The receiver's expiration date, or nil if there is no specific expiration date such as in the case of "session-only" cookies. The expiration date is the date when the cookie should be deleted.

36.1.10 isHTTPOnly as boolean

Function: Returns whether the receiver should only be sent to HTTP servers per RFC 2965.
Example:

// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display isHTTPOnly value:
MsgBox "isHTTPOnly: "+str(Cookie.isHTTPOnly)

Notes: Returns true if this cookie should only be sent via HTTP headers, false otherwise.

Cookies may be marked as HTTP only by a server (or by a javascript). Cookies marked as such must only be sent via HTTP Headers in HTTP requests for URL's that match both the path and domain of the respective cookies.

Important: Cookies specified as HTTP only should not be delivered to any javascript applications to prevent
36.1. CLASS NSHTTPCOOKIEMBS

cross-site scripting vulnerabilities.

36.1.11  isSecure as boolean

**Function:** Returns whether his cookie should only be sent over secure channels. 
**Example:**

```vba
// query list of all cookies in shared storage
Dim cookies(-1) As NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Dim cookie As NSHTTPCookieMBS = cookies(0)

// display isSecure value:
MsgBox "isSecure: "+str(cookie.isSecure)
```

**Notes:** True if this cookie should only be sent over secure channels, otherwise false.

36.1.12  isSessionOnly as boolean

**Function:** Returns whether the receiver should be discarded at the end of the session (regardless of expiration date). 
**Example:**

```vba
// query list of all cookies in shared storage
Dim cookies(-1) As NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Dim cookie As NSHTTPCookieMBS = cookies(0)

// display isSessionOnly value:
MsgBox "isSessionOnly: "+str(cookie.isSessionOnly)
```

**Notes:** True if the receiver should be discarded at the end of the session (regardless of expiration date), otherwise false.
**36.1.13 name as string**

**Function:** Returns the receiver’s name.  
**Example:**

```plaintext
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display name:
MsgBox "name: " + Cookie.name
```

**36.1.14 NSHTTPCookieComment as string**

**Function:** One of the dictionary constants for cookies.  
**Notes:**
An String containing the comment for the cookie.  
Only valid for Version 1 cookies and later. This header field is optional.

**36.1.15 NSHTTPCookieCommentURL as string**

**Function:** One of the dictionary constants for cookies.  
**Notes:**
An String containing the comment URL for the cookie.  
Only valid for Version 1 cookies or later. This header field is optional.

**36.1.16 NSHTTPCookieDiscard as string**

**Function:** One of the dictionary constants for cookies.  
**Notes:**
An String stating whether the cookie should be discarded at the end of the session.  
String value must be either "TRUE" or "FALSE". This header field is optional. Default is "FALSE", unless this is cookie is version 1 or greater and a value for NSHTTPCookieMaximumAge is not specified, in which
36.1. CLASS NSHTTPCOOKIEMBS

case it is assumed "TRUE".

36.1.17 NSHTTPCookieDomain as string

Function: One of the dictionary constants for cookies.
Notes:
An String containing the domain for the cookie.
A value must be specified for either NSHTTPCookieDomain or NSHTTPCookieOriginURL. If this header field is missing the domain is inferred from the value for NSHTTPCookieOriginURL.

36.1.18 NSHTTPCookieExpires as string

Function: One of the dictionary constants for cookies.
Notes:
An Date object or String specifying the expiration date for the cookie.
This header field is only used for Version 0 cookies. This header field is optional.

36.1.19 NSHTTPCookieMaximumAge as string

Function: One of the dictionary constants for cookies.
Notes:
An String containing an integer value stating how long in seconds the cookie should be kept, at most.
Only valid for Version 1 cookies and later. Default is "0". This field is optional.

36.1.20 NSHTTPCookieName as string

Function: One of the dictionary constants for cookies.
Notes: An String object containing the name of the cookie. This field is required.
36.1.21 NSHTTPCookieOriginURL as string

Function: One of the dictionary constants for cookies.
Notes:
An String containing the URL that set this cookie. A value must be specified for either NSHTTPCookieDomain or NSHTTPCookieOriginURL.

36.1.22 NSHTTPCookiePath as string

Function: One of the dictionary constants for cookies.
Notes:
An String containing the path for the cookie. This field is required if you are using the NSHTTPCookieDomain key instead of the NSHTTPCookieOriginURL key. If you are using the NSHTTPCookieOriginURL key, the path is inferred if it is not provided. The default value is "/".

36.1.23 NSHTTPCookiePort as string

Function: One of the dictionary constants for cookies.
Notes:
An String containing comma-separated integer values specifying the ports for the cookie. Only valid for Version 1 cookies or later. The default value is an empty string (""). This header field is optional.

36.1.24 NSHTTPCookieSecure as string

Function: One of the dictionary constants for cookies.
Notes:
An String indicating that the cookie should be transmitted only over secure channels. Providing any value for this key indicates that the cookie should remain secure.
36.1.25 NSHTTPCookieValue as string

Function: One of the dictionary constants for cookies.
Notes: An String containing the value of the cookie. This header field is required.

36.1.26 NSHTTPCookieVersion as string

Function: One of the dictionary constants for cookies.
Notes: An String that specifies the version of the cookie. Must be either "0" or "1". The default is "0". This header field is optional.

36.1.27 path as string

Function: Returns the receiver’s path.
Example:

// query list of all cookies in shared storage
Dim cookies(-1) As NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Dim cookie As NSHTTPCookieMBS = cookies(0)

// display path:
MsgBox "path: " + Cookie.path

Notes: The cookie will be sent with requests for this path in the cookie’s domain, and all paths that have this prefix. A path of "/" means the cookie will be sent for all URLs in the domain.

36.1.28 portList as Integer()
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display port list

dim PortList(-1) as Integer = cookie.portList
if UBound(PortList)=-1 then
    MsgBox "Port List: all ports."
else
    dim list(-1) as string
    for each port as Integer in PortList
        List.Append str(port)
    next
    MsgBox "Port List: " + Join(list, ", ")
end if

Notes: The list of ports for the cookie, returned as an array of integers. If the cookie has no port list this method returns nil and the cookie will be sent to any port. Otherwise, the cookie is only sent to ports specified in the port list.

36.1.29 properties as dictionary

Example:

// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display properties

dim dic as Dictionary = cookie.properties
dim list(-1) as string

for each key as Variant in dic.keys
    List.Append key.StringValue+": " + dic.Value(key).StringValue
next
36.1. CLASS NSHTTPCOOKIEMBS

MsgBox Join(list,EndOfLine)

Notes:

Returns dictionary representation of the receiver’s cookie properties.
This dictionary can be used with Constructor or cookieWithProperties to create an equivalent NSHTTP-Cookie object.

36.1.30 requestHeaderFieldsWithCookies(cookies() as NSHTTPCookieMBS) as dictionary

Function: Returns a dictionary of header fields corresponding to a provided array of cookies.
Example:

// create dictionary with properties:
dim prop as new Dictionary
dim d as new date
d.Year = d.Year + 1

prop.Value(NSHTTPCookieMBS.NSHTTPCookieVersion)="0"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieName)="test"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieValue)="some value"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieOriginURL)="http://www.mbsplugins.de/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieDomain)="www.mbsplugins.de"
prop.Value(NSHTTPCookieMBS.NSHTTPCookiePath)="/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieExpires)=d

// create cookie from properties
dim cookie as new NSHTTPCookieMBS(prop)
dim cookies(-1) as NSHTTPCookieMBS
cookies.Append cookie

// get request headers
dim dic as Dictionary = NSHTTPCookieMBS.requestHeaderFieldsWithCookies(cookies)

// and show them:
dim list(-1) as string

for each key as Variant in dic.keys
    List.Append key.StringValue+:"="+dic.Value(key).StringValue
next

MsgBox Join(list,EndOfLine)
Notes:

cookies: The cookies from which the header fields are created.

Returns the dictionary of header fields created from the provided cookies. This dictionary can be used to add cookies to a request.

### 36.1.31 value as string

**Function:** Returns the receiver’s value.

**Example:**

```ruby
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display value
MsgBox "Value: " +Cookie.value
```

### 36.1.32 version as Integer

**Function:** Returns the receiver’s version.

**Example:**

```ruby
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display version value:
MsgBox "Version: " +str(Cookie.Version)
```

**Notes:** Returns the receiver’s version. Version 0 maps to "old-style" Netscape cookies. Version 1 maps to RFC 2965 cookies.
36.1.33 Properties

36.1.34 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)
36.2 class NSHTTPCookieStorageMBS

36.2.1 class NSHTTPCookieStorageMBS

**Function:** NSHTTPCookieStorage implements a singleton object (shared instance) that manages the shared cookie storage.

**Example:**

```vba
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// we collect values
dim list(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
List.Append cookie.name+": " +cookie.value
next

// and display them
MsgBox join(list, EndOfLine)
```

**Notes:**

These cookies are shared among all applications and are kept in sync cross-process.

Note: Changes made to the cookie accept policy affect all currently running applications using the cookie storage.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

36.2.2 Methods

36.2.3 Constructor

**Function:** The private constructor.

36.2.4 cookies as NSHTTPCookieMBS()

**Function:** Returns the cookie storage’s cookies.

**Example:**
36.2. CLASS NSHTTPCOOKIESMBS

// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// we collect values
dim list(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
    List.Append cookie.name+": "+cookie.value
next

// and display them
MsgBox join(list, EndOfLine)

Notes: Returns an array containing all of the cookie storage’s cookies.

36.2.5 cookiesForURL(URL as string) as NSHTTPCookieMBS()

Function: Returns all the cookie storage’s cookies that are sent to a specified URL.
Example:

// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookiesForURL("http://www.apple.com/")

// we collect values for apple.com:
    dim list(-1) as string
    for each cookie as NSHTTPCookieMBS in cookies
        List.Append cookie.name+": "+cookie.value
next

// and display them
MsgBox join(list, EndOfLine)

Notes: An application can use NSHTTPCookie method requestHeaderFieldsWithCookies to turn this array into a set of header fields to add to an NSMutableURLRequest object.

36.2.6 cookiesToArray(cookies() as NSHTTPCookieMBS) as Integer

Function: Puts the cookie storage’s cookies in the given array.
Example:
 CHAPTER 36. COCOA NETWORKING

```ruby
// get storage
dim s as NSHTTPCookieStorageMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage

// predim an array with a lot of space
dim cookies(5000) as NSHTTPCookieMBS

// now ask plugin to put cookies inside
dim c as Integer = s.cookiesToArray(cookies)

// show count
MsgBox str(c)+" cookies"

// pick first and show name
dim cookie as NSHTTPCookieMBS = cookies(0)
MsgBox cookie.name
```

Notes:

Returns total number of cookies.
This is for REALbasic 2007 where the cookies function doesn’t work.
For Real Studio and Xojo you can use cookies function.

### 36.2.7 deleteCookie(cookie as NSHTTPCookieMBS)

**Function:** Deletes the specified cookie from the cookie storage.

### 36.2.8 NSHTTPCookieManagerAcceptPolicyChangedNotification as string

**Function:** One of the notification names you can register with the NSNotificationObserverMBS class.
**Notes:**
This notification is posted when the acceptance policy of the NSHTTPCookieStorage instance has changed.
In Mac OS X, cookies are shared among applications, meaning this notification can be sent in response to another application’s actions. Cookies are not shared among applications in iOS.

The notification object is the NSHTTPCookieStorage instance. This notification does not contain a userInfo dictionary.
36.2.9 NSHTTPCookieManagerCookiesChangedNotification as string

Function: One of the notification names you can register with the NSNotificationObserverMBS class.
Notes:
This notification is posted when the cookies stored in the NSHTTPCookieStorage instance have changed.
In Mac OS X, cookies are shared among applications, meaning this notification can be sent in response to
another application’s actions. Cookies are not shared among applications in iOS.

The notification object is the NSHTTPCookieStorage instance. This notification does not contain a userInfo
dictionary.

36.2.10 removeCookiesSinceDate(d as date)

Function: Delete all cookies from the cookie storage since the provided date.
Notes: Available on macOS 10.10 or newer.

36.2.11 setCookie(cookie as NSHTTPCookieMBS)

Function: Stores a specified cookie in the cookie storage if the cookie accept policy permits.
Notes: The cookie replaces an existing cookie with the same name, domain, and path, if one exists in
the cookie storage. This method accepts the cookie only if the receiver’s cookie accept policy is NSHTTP-
CookieAcceptPolicyAlways or NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain. The cookie
is ignored if the receiver’s cookie accept policy is NSHTTPCookieAcceptPolicyNever.

36.2.12 setCookies(cookies() as NSHTTPCookieMBS, URL as string, main-
DocumentURL as string)

Function: Adds an array of cookies to the receiver if the receiver’s cookie acceptance policy permits.
Notes:
cookies: The cookies to add.
URL: The URL associated with the added cookies.
mainDocumentURL: The URL of the main HTML document for the top-level frame, if known. Can be "". This URL
is used to determine if the cookie should be accepted if the cookie accept policy is NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain.
The cookies will replace existing cookies with the same name, domain, and path, if one exists in the cookie storage. The cookie will be ignored if the receiver’s cookie accept policy is NSHTTPCookieAcceptPolicyNever.

To store cookies from a set of response headers, an application can use cookiesWithResponseHeaderFields passing a header field dictionary and then use this method to store the resulting cookies in accordance with the receiver’s cookie acceptance policy.

### 36.2.13 sharedHTTPCookieStorage as NSHTTPCookieStorageMBS

**Function:** Returns the shared cookie storage instance.
**Example:**
```
Dim s As NSHTTPCookieStorageMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage
Dim cookies() As NSHTTPCookieMBS = s.cookies
MsgBox str(UBound(cookies)+1)+" cookies"
```

### 36.2.14 Properties

#### 36.2.15 Handle as Integer

**Function:** The internal reference to the NSHTTPCookieStorage object.
**Notes:** (Read and Write property)

#### 36.2.16 cookieAcceptPolicy as Integer

**Function:** The cookie storage’s cookie accept policy.
**Example:**
```
Select case NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookieAcceptPolicy
  Case NSHTTPCookieStorageMBS.NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain
    MsgBox "Cookies: only from main document domain"
  Case NSHTTPCookieStorageMBS.NSHTTPCookieAcceptPolicyNever
    MsgBox "Cookies: never"
  Case NSHTTPCookieStorageMBS.NSHTTPCookieAcceptPolicyAlways
    MsgBox "Cookies: always"
  Else
    MsgBox "Cookies: unknown setting"
End Select
```
36.2. CLASS NSHTTPCOOKIESTORAGEMBS

end Select

Notes:
The default cookie accept policy is NSHTTPCookieAcceptPolicyAlways.
Changing the cookie policy affects all currently running applications using the cookie storage.
(Read and Write computed property)

36.2.17 Constants

36.2.18 NSHTTPCookieAcceptPolicyAlways = 0

MBS MacControls Plugin, Plugin Version: 11.1. Function: One of the cookie accept policy constants.
Notes: Accept all cookies. This is the default cookie accept policy.

36.2.19 NSHTTPCookieAcceptPolicyNever = 1

MBS MacControls Plugin, Plugin Version: 11.1. Function: One of the cookie accept policy constants.
Notes: Reject all cookies.

36.2.20 NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain = 2

MBS MacControls Plugin, Plugin Version: 11.1. Function: One of the cookie accept policy constants.
Notes: Accept cookies only from the main document domain.
36.3 class NSURLAuthenticationChallengeMBS

36.3.1 class NSURLAuthenticationChallengeMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A class for an authentication challenge. Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

36.3.2 Methods

36.3.3 cancelAuthenticationChallenge

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Tells the system to cancel this challenge.

36.3.4 Constructor

36.3.5 continueWithoutCredentialForAuthenticationChallenge

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Tells the system to continue this challenge without a password.

36.3.6 error as NSErrorMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the NSError object representing the last authentication failure. Notes: This method returns nil if the protocol doesn’t use errors to indicate an authentication failure.

Available in Mac OS X v10.2 with Safari 1.0 installed. Available in Mac OS X v10.2.7 and later.
36.3. CLASS NSURLAUTHENTICATIONCHALLENGEMBS

36.3.7 failureResponse as NSURLResponseMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the response representing authentication failure. **Notes:** If there was a previous authentication failure, and this protocol uses responses to indicate authentication failure, then this method will return the response. Otherwise it will return nil.

36.3.8 previousFailureCount as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get count of previous failed authentication attempts.

36.3.9 proposedCredential as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the proposed credential for this challenge. **Notes:** proposedCredential may be nil, if there is no default credential to use for this challenge (either stored or in the URL). If the credential is not nil and returns true for hasPassword, this means the NSURL-Connection thinks the credential is ready to use as-is. If it returns false for hasPassword, then the credential is not ready to use as-is, but provides a default username the client could use when prompting.

36.3.10 protectionSpace as NSURLProtectionSpaceMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get a description of the protection space that requires authentication. **Notes:** Returns the protection space that needs authentication.

36.3.11 useCredential(credential as NSURLCredentialMBS)

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tells the system to use a certain credential for this challenge.
36.3.12 Properties

36.3.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The internal used handle for this challenge.
**Notes:** (Read and Write property)
36.4. CLASS NSURLCACHEMBS

36.4 class NSURLCacheMBS

36.4.1 class NSURLCacheMBS

Notes:

NSURLCache implements the caching of responses to URL load requests by mapping NSURLRequest objects to NSCachedURLResponse objects. It is a composite of an in-memory and an on-disk cache. Methods are provided to manipulate the sizes of each of these caches as well as to control the path on disk to use for persistent storage of cache data.

36.4.2 Methods

36.4.3 Constructor(memoryCapacity as UInt64, diskCapacity as UInt64, diskPath as folderitem)

Notes:

memoryCapacity: The memory capacity of the cache, in bytes.
diskCapacity: The disk capacity of the cache, in bytes.
diskPath: The location at which to store the on-disk cache.

The returned NSURLCache is backed by disk, so developers can be more liberal with space when choosing the capacity for this kind of cache. A disk cache measured in the tens of megabytes should be acceptable in most cases.

36.4.4 currentDiskUsage as UInt64

36.4.5 currentMemoryUsage as UInt64

36.4.6 removeAllCachedResponses

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the receiver’s cache, removing all stored cached URL responses.

36.4.7 removeCachedResponseForRequest(request as NSURLRequestMBS)

**Notes:** request: The URL request whose cached URL response should be removed. If there is no corresponding cached URL response, no action is taken.

36.4.8 setSharedURLCache(cache as NSURLCacheMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the shared NSURLCache instance to a specified cache object.
**Notes:** Applications that have special caching requirements or constraints should use this method to specify an NSURLCache instance with customized cache settings.

36.4.9 sharedURLCache as NSURLCacheMBS

**Notes:**
The disk path is set to: `<user_home_directory>/Library/Caches/<current_process_name>`. The user’s home directory is determined by calling NSHomeDirectory and the current process name is determined using NSProcessInfoMBS.processName.

Applications that do not have special caching requirements or constraints should find the default shared cache instance acceptable. Applications with more specific needs can create a custom NSURLCache object and set it as the shared cache instance using setSharedURLCache.

36.4.10 Properties

36.4.11 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal handle to the NSURLCache object.
36.4. CLASS NSURLCACHEMBS

Notes: (Read and Write property)

36.4.12  diskCapacity as UInt64

Notes: (Read and Write computed property)

36.4.13  memoryCapacity as UInt64

Notes: (Read and Write computed property)

36.4.14  Constants

36.4.15  NSURLCacheStorageAllowed = 0

MBS MacCocoa Plugin, Plugin Version: 9.7. Function: One of the constants for the cache strategy.
Notes: Specifies that storage in an NSURLCache is allowed without restriction.

36.4.16  NSURLCacheStorageAllowedInMemoryOnly = 1

MBS MacCocoa Plugin, Plugin Version: 9.7. Function: One of the constants for the cache strategy.
Notes: Specifies that storage in an NSURLCache is allowed; however storage should be done in memory only, no disk storage should be done.

36.4.17  NSURLCacheStorageNotAllowed = 2

MBS MacCocoa Plugin, Plugin Version: 9.7. Function: One of the constants for the cache strategy.
Notes: Specifies that storage in an NSURLCache is not allowed in any fashion, either in memory or on disk.
36.5 class NSURLConnectionFilterMBS

36.5.1 class NSURLConnectionFilterMBS

MBS MacCocoa Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class to filter URL connections. **Notes:** This class is designed to allow you to intercept your application creating NSURLConnection objects and change the NSURLRequest used. This can be useful to change timeouts on Xojo.Net.HTTPSocket class.

36.5.2 Properties

36.5.3 Enabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the event is enabled. **Notes:** Default is true. *(Read and Write property)*

36.5.4 Events

36.5.5 FilterConnection(request as NSURLRequestMBS) as NSURLRequestMBS

MBS MacCocoa Plugin, Plugin Version: 18.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when a new connection is made. **Example:**

```csharp
Function FilterConnection(request as NSURLRequestMBS) Handles FilterConnection as NSURLRequestMBS	system.debuglog CurrentMethodName
system.debuglog ”URL: ”+request.URL
	dim newRequest as NSMutableURLRequestMBS = request.mutableCopy

// change to 10 minutes
newRequest.setTimeoutInterval 600

return newRequest
End Function
```

**Notes:**
You get the current request and you can return a new request. If you return nil, we pass through the existing one. Only requests on main thread trigger the event.
36.6 class NSURLConnectionMBS

36.6.1 class NSURLConnectionMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSURLConnection object provides support to perform the loading of a URL request. **Notes:**

The interface for NSURLConnection is sparse, providing only the controls to start and cancel asynchronous loads of a URL request.

NSURLConnection’s events allow an object to receive informational callbacks about the asynchronous load of a URL request. Other events provide facilities that allow the subclass to customize the process of performing an asynchronous URL load. These events are called on the thread that started the asynchronous load operation for the associated NSURLConnection object.

NSURLConnection also has a convenience class method, sendSynchronousRequest, to load a URL request synchronously.

The following contract governs the events defined in this class:

- Zero or more willSendRequest events are called before any further event is called if it is determined that the download must redirect to a new location. The delegate can allow the redirect, modify the destination, or deny the redirect.
- Zero or more willSendRequestForAuthenticationChallenge events are called before a request for an authentication challenge is sent. The delegate can call the appropriate NSURLAuthenticationChallengeMBS method and perform any other required task related to credentials.
- Zero or more didReceiveAuthenticationChallenge vents are called if it is necessary to authenticate in order to download the request and the connection does not already have authenticated credentials.
- Zero or more didCancelAuthenticationChallenge vents are called if the connection cancels the authentication challenge due to the protocol implementation encountering an error.
- Zero or more didReceiveResponse events are called before receiving a didReceiveData message. The only case where didReceiveResponse is not sent to a delegate is when the protocol implementation encounters an error before a response can be created.
- Zero or more didReceiveData events are called before any of the following messages are sent to the delegate: willCacheResponse, DidFinishLoading, didFailWithError.
- Zero or one willCacheResponse events are called to the delegate after didReceiveData is sent but before a DidFinishLoading message is sent.

Unless an NSURLConnection object receives a cancel message, the subclasses receives one and only one of DidFinishLoading, or didFailWithError message, but never both. In addition, once either of these messages
36.6. CLASS NSURLCONNECTIONMBS

is sent, the delegate receives no further messages for the connection.

36.6.2 Methods

36.6.3 cancel

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Cancels an asynchronous load of a request. **Notes:** After this method is called, the connection’s delegate no longer receives any messages for the connection. If you want to reattempt the connection, you should create a new connection object.

36.6.4 canHandleRequest(request as NSURLRequestMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether a request can be handled based on a preflight evaluation. **Notes:**
request: The request to evaluate.

Returns true if a preflight operation determines that a connection with request can be created and the associated I/O can be started, false otherwise.

The result of this method is valid as long as no NSURLProtocol classes are registered or unregistered, and request remains unchanged. Applications should be prepared to handle failures even if they have performed request preflighting by calling this method.

36.6.5 Constructor(request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates URL connection and begins to load the data for the URL request. **Notes:**
request: The URL request to load. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.

On success handle property is not zero.

This is equivalent to calling Constructor and passing true for optional startImmediately.
See also:
36.6.6 Constructor(request as NSURLRequestMBS, startImmediately as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates URL connection and begins to load the data for the URL request, if specified. **Notes:**

- request: The URL request to load. The request object is deep-copied as part of the initialization process.
- Changes made to request after this method returns do not affect the request that is used for the loading process.
- startImmediately: True if the connection should being loading data immediately, otherwise false.

On success the handle property is not zero.

Available in Mac OS X v10.5 and later.

See also:

- 36.6.5 Constructor(request as NSURLRequestMBS)

36.6.7 data as MemoryBlock

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The data downloaded so far. **Notes:** The plugin adds the new data it gets in the didReceiveData event to a big memory block and gives you access to it using this event.

36.6.8 sendSynchronousRequest(request as NSURLRequestMBS, byref response as NSURLResponseMBS, byref error as NSErrorMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs a synchronous load of the specified URL request. **Example:**

```swift
dim request as new NSURLRequestMBS(“http://www.monkeybreadsoftware.de/images/MBSLogo.jpg”)
dim error as NSErrorMBS
dim response as NSURLResponseMBS
dim d as MemoryBlock = NSURLConnectionMBS.sendSynchronousRequest(request, response, error)
if d<>nil then
dim pic as Picture = JPEGStringToPictureMBS(d, true)
window1.Backdrop = pic
end if
```
if error<>Nil then
    MsgBox "Error: " + error.description
end if

Notes:

request: The URL request to load. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.
response: Out parameter for the URL response returned by the server.
error: Out parameter used if an error occurs while processing the request.

Returns the downloaded data for the URL request. Returns nil if a connection could not be created or if the download fails.

A synchronous load is built on top of the asynchronous loading code made available by the class. The calling thread is blocked while the asynchronous loading system performs the URL load on a thread spawned specifically for this load request. No special threading or run loop configuration is necessary in the calling thread in order to perform a synchronous load.

Important: Because this call can potentially take several minutes to fail (particularly when using a cellular network in iOS), you should never call this function from the main thread of a GUI application.

If authentication is required in order to download the request, the required credentials must be specified as part of the URL. If authentication fails, or credentials are missing, the connection will attempt to continue without credentials.

36.6.9 start

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Causes the connection to begin loading data, if it has not already.

Notes:

Calling this method is necessary only if you create a connection with the Constructor method and provide false for the startImmediately parameter.

Available in Mac OS X v10.5 and later.
36.6.10 Properties

36.6.11 Handle as Integer

36.6.12 Events

36.6.13 canAuthenticateAgainstProtectionSpace(protectionSpace as NSURLProtectionSpaceMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Sent to determine whether the delegate is able to respond to a protection space’s form of authentication. Notes: protectionSpace: The protection space that generates an authentication challenge. Return true if you are able to respond to a protection space’s form of authentication, otherwise false.

This method is called before didReceiveAuthenticationChallenge, allowing the class to inspect a protection space before attempting to authenticate against it. By returning true, the event indicates that it can handle the form of authentication, which it does in the subsequent call to didReceiveAuthenticationChallenge. If the event returns false, the system attempts to use the user’s keychain to authenticate. If your delegate does not implement this method and the protection space uses client certificate authentication or server trust authentication, the system behaves as if you returned false. The system behaves as if you returned true for all other authentication methods.

Available in Mac OS X v10.6 and later.

36.6.14 didCancelAuthenticationChallenge(challenge asNSURLAuthenticationChallengeMBS)

36.6.15  didFailWithError(error as NSErrorMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sent when a connection fails to load its request successfully.

**Notes:**

error: An error object containing details of why the connection failed to load the request successfully.

Once the delegate receives this message, it will receive no further messages for connection.

36.6.16  didFinishLoading

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sent when a connection has finished loading successfully.

36.6.17  didReceiveAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sent when a connection must authenticate a challenge in order to download its request.

**Notes:**

challenge: The challenge that connection must authenticate in order to download its request.

This method gives the class the opportunity to determine the course of action taken for the challenge provide credentials, continue without providing credentials, or cancel the authentication challenge and the download.

The delegate can determine the number of previous authentication challenges by sending the message previousFailureCount to challenge.

If the previous failure count is 0 and the value returned by proposedCredential is nil, the delegate can create a new NSURLCredential object, providing information specific to the type of credential, and send a useCredential:forAuthenticationChallenge: message to [challenge sender], passing the credential and challenge as parameters. If proposedCredential is not nil, the value is a credential from the URL or the shared credential storage that can be provided to the user as feedback.

The delegate may decide to abandon further attempts at authentication at any time by sending [challenge sender] a continueWithoutCredentialForAuthenticationChallenge: or a cancelAuthenticationChallenge: message. The specific action is implementation dependent.

If the delegate implements this method, the download will suspend until [challenge sender] is sent one of
the following messages: useCredential:forAuthenticationChallenge:, continueWithoutCredentialForAuthenticationChallenge: or cancelAuthenticationChallenge:.

If the delegate does not implement this method the default implementation is used. If a valid credential for the request is provided as part of the URL, or is available from the NSURLCredentialStorage the [challenge sender] is sent a useCredential:forAuthenticationChallenge: with the credential. If the challenge has no credential or the credentials fail to authorize access, then continueWithoutCredentialForAuthenticationChallenge: is sent to [challenge sender] instead.

36.6.18 didReceiveData(newData as Memoryblock)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent as a connection loads data incrementally. **Notes:**

newdata: The newly available data.

The data property is updated before this event is called and gives you a way to see all data received so far.

36.6.19 didReceiveResponse(response as NSURLResponseMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the connection has received sufficient data to construct the URL response for its request. **Notes:**

response: The URL response for the connection’s request. This object is immutable and will not be modified by the URL loading system once it is presented to the delegate.

In rare cases, for example in the case of an HTTP load where the content type of the load data is multipart/x-mixed-replace, the delegate will receive more than one didReceiveResponse message. In the event this occurs, delegates should discard all data previously delivered by didReceiveData, and should be prepared to handle the, potentially different, MIME type reported by the newly reported URL response.

The only case where this message is not sent to the delegate is when the protocol implementation encounters an error before a response could be created.
36.6. **CLASS NSURLCONNECTIONMBS**

### 36.6.20 `didSendBodyData(bytesWritten as Int64, totalBytesWritten as Int64, totalBytesExpectedToWrite as Int64)`

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent as the body (message data) of a request is transmitted (such as in an http POST request).

**Notes:**
- `bytesWritten`: The number of bytes written in the latest write.
- `totalBytesWritten`: The total number of bytes written for this connection.
- `totalBytesExpectedToWrite`: The number of bytes the connection expects to write.

This method provides an estimate of the progress of a URL upload. The value of `totalBytesExpectedToWrite` may change during the upload if the request needs to be retransmitted due to a lost connection or an authentication challenge from the server.
Available in Mac OS X v10.6 and later.

### 36.6.21 `shouldUseCredentialStorage as boolean`

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent to determine whether the URL loader should consult the credential storage for authenticating the connection.

**Notes:**
- This method is called before any attempt to authenticate is made. By returning false, the delegate tells the connection not to consult the credential storage and makes itself responsible for providing credentials for any authentication challenges. Not implementing this method is the same as returning true. The delegate is free to consult the credential storage itself when it receives a `didReceiveAuthenticationChallenge` event.

Available in Mac OS X v10.6 and later.

### 36.6.22 `willSendRequest(request as NSURLRequestMBS, redirectResponse as NSURLResponseMBS) as NSURLRequestMBS`

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the connection determines that it must change URLs in order to continue loading a request.

**Notes:**
- `request`: The proposed redirected request. You should inspect the redirected request to verify that it meets its needs, and create a copy with new attributes to return to the connection if necessary.
- `redirectResponse`: The URL response that caused the redirect. May be nil in cases where this method is not being sent as a result of involving the delegate in redirect processing.

The actual URL request to use in light of the redirection response. The event may return request unmodified.
CHAPTER 36. COCOA NETWORKING

to allow the redirect, return a new request, or return nil to reject the redirect and continue processing the connection.

If you wish to cancel the redirect connection, it should call the connection object’s cancel method. Alternatively, the delegate method can return nil to cancel the redirect connection, and the original connection will continue to process. This has special relevance in the case where redirectResponse is not nil. In this case, any data that is loaded for the connection will be sent to the delegate, and the delegate will receive a connectionDidFinishLoading or didFailLoadingWithError message, as appropriate.

Note: Prior to Mac OS X version 10.5, returning nil in this method sometimes would cancel the connection but other times would cause the connection to use the given request unmodified. In addition, prior to version 10.5, NSURLConnection would often modify the incoming NSURLRequest object before transmission without notifying the delegate. In version 10.5 and later, it always notifies the delegate via willSendRequest, and thus the delegate might receive this message before the connection has even properly begun, prior to transmitting the request to the remote server. The delegate can receive this message as a result of modifying a request before it is sent, for example to transform the request’s URL to its canonical form. To detect this case, examine redirectResponse; if it is nil, the message was not sent due to a redirect.

The delegate should be prepared to receive this message multiple times.

36.6.23 willSendRequestForAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Tells the delegate that the connection will send a request for an authentication challenge. **Notes:**

challenge: The authentication challenge for which a request is being sent.

This method allows the delegate to make an informed decision about connection authentication at once. If the delegate implements this method, it has no need to implement canAuthenticateAgainstProtectionSpace, didReceiveAuthenticationChallenge, shouldUseCredentialStorage. In fact, these other methods are not invoked.

In this method, you must invoke one of the challenge-responder methods (NSURLAuthenticationChallenge-SenderMBS):

- useCredential
- continueWithoutCredentialForAuthenticationChallenge
- cancelAuthenticationChallenge
- performDefaultHandlingForAuthenticationChallenge
You might also want to analyze challenge for the authentication scheme and the proposed credential before calling a NSURLAuthenticationChallengeSenderMBS method. You should never assume that a proposed credential is present. You can either create your own credential and respond with that, or you can send the proposed credential back. (Because this object is immutable, if you want to change it you must copy it and then modify the copy.)
36.7 class NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a stored password.

**Notes:**

dim u as NSURLCredentialMBS

dim p as Integer = NSURLCredentialMBS.NSURLCredentialPersistenceForSession

u = NSURLCredentialMBS.credential("Christian", "teddy123", p)

MsgBox u.user+EndOfLine+u.password+EndOfLine+str(u.persistence)

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

36.7.2 Methods

36.7.3 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

36.7.4 copy as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the credential object.

36.7.5 credential(User as string, password as string, persistence as Integer = 0) as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create a new NSURLCredential with a user and password.

**Example:**

dim u as NSURLCredentialMBS

dim p as Integer = NSURLCredentialMBS.NSURLCredentialPersistenceForSession

u = NSURLCredentialMBS.credential("Christian", "teddy123", p)

MsgBox u.user+EndOfLine+u.password+EndOfLine+str(u.persistence)
Notes:
user: the username
password: the password
persistence: Integer that says to store per session, permanently or not at all.
Can be NSURLCredentialPersistenceForSession, NSURLCredentialPersistenceNone or NSURLCredentialPersistencePermanent.

36.7.6 hasPassword as Boolean

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Find out if this credential has a password, without trying to get it.
**Notes:**
Returns true if this credential has a password, otherwise false.

If this credential’s password is actually kept in an external store, the password method may return "" even if this method returns true, since getting the password may fail, or the user may refuse access.

36.7.7 password as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Get the password.
**Notes:** This method might actually attempt to retrieve the password from an external store, possible resulting in prompting, so do not call it unless needed.

36.7.8 persistence as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Determine whether this credential is or should be stored persistently.
**Notes:**
Use the constants:
NSURLCredentialPersistenceNone
NSURLCredentialPersistenceForSession
NSURLCredentialPersistencePermanent
36.7.9 user as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the username.

36.7.10 Properties

36.7.11 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal used handle for this class.

**Notes:** (Read and Write property)

36.7.12 Constants

36.7.13 NSURLCredentialPersistenceForSession = 1

MBS MacBase Plugin, Plugin Version: 7.5. **Function:** This credential will only be stored for this session.

36.7.14 NSURLCredentialPersistenceNone = 0

MBS MacBase Plugin, Plugin Version: 7.5. **Function:** This credential won’t be saved.

36.7.15 NSURLCredentialPersistencePermanent = 2

MBS MacBase Plugin, Plugin Version: 7.5. **Function:** This credential will be stored permanently and shared with other applications.
36.8. CLASS NSURLCredentialStorageMBS

36.8 class NSURLCredentialStorageMBS

36.8.1 class NSURLCredentialStorageMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSURLCredentialStorage implements a singleton object (shared instance) which manages the shared credentials cache. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

36.8.2 Methods

36.8.3 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

36.8.4 defaultCredentialForProtectionSpace(space as NSURLProtectionSpaceMBS) as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the default credential for the specified protection space.

36.8.5 sharedCredentialStorage as NSURLCredentialStorageMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the shared singleton authentication storage.

36.8.6 Properties

36.8.7 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal used handle for this class. **Notes:** (Read and Write property)
36.9 class NSURLDownloadMBS

36.9.1 class NSURLDownloadMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The NSURL Download class which handles downloads for Webkit.

**Notes:**

NSURLDownload downloads a request asynchronously and saves the data to a file. The interface for NSURLDownload is sparse, providing methods to initialize a download, set the destination path and cancel loading the request.

NSURLDownload’s delegate methods defined by the NSURLDownloadDelegate allow an object to receive informational callbacks about the asynchronous load of the URL request. Other delegate methods provide facilities that allow the delegate to customize the process of performing an asynchronous URL load.

Note that these delegate methods are called on the thread that started the asynchronous load operation for the associated NSURLDownload object.

The MBS Plugins currently only implement a part of this class for use with WebDownloadDelegateMBS. So please contact us if you need more.

36.9.2 Methods

36.9.3 cancel

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Cancels the receiver’s download and deletes the downloaded file.

36.9.4 canResumeDownloadDecodedWithEncodingMimeType(MimeType as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether a URL download object can resume a download that was decoded with the specified MIME type.

**Notes:**

MimeType: The MIME type the caller wants to know about.
Returns true if the URL download object can resume a download that was decoded with the specified MIME type, false otherwise.
NSURLDownload cannot resume a download that was partially decoded in the gzip format.
36.9. CLASS NSURLDOWNLOADMBS

36.9.5 Constructor(request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an initialized URL download for a URL request and begins to download the data for the request.

**Notes:**

request: The URL request to download. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.

On success the handle property is not zero.

See also:

- 36.9.6 Constructor(resumeData as Memoryblock, path as folderitem)
- 36.9.7 Constructor(resumeData as Memoryblock, path as string)

36.9.6 Constructor(resumeData as Memoryblock, path as folderitem)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an initialized NSURLDownload object that will resume downloading the specified data to the specified file and begins the download.

**Notes:**

resumeData: Specifies the data to resume downloading.
path: The location for the downloaded data.

On success the handle property is not zero.

See also:

- 36.9.5 Constructor(request as NSURLRequestMBS)
- 36.9.7 Constructor(resumeData as Memoryblock, path as string)

36.9.7 Constructor(resumeData as Memoryblock, path as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an initialized NSURLDownload object that will resume downloading the specified data to the specified file and begins the download.

**Notes:**

resumeData: Specifies the data to resume downloading.
path: The location for the downloaded data.
On success the handle property is not zero.

See also:

- 36.9.5 Constructor(request as NSURLRequestMBS)
- 36.9.6 Constructor(resumeData as Memoryblock, path as folderitem)

36.9.8 request as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the request that initiated the receiver’s download.

36.9.9 resumeData as Memoryblock

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the resume data for a download that is not yet complete.

Notes:

The resume data for a download that is not yet complete. This data represents the necessary state information that an NSURLDownload object needs to resume a download. The resume data can later be used when initializing a download with Constructor. Returns nil if the download is not able to be resumed.

Resume data will only be returned if the protocol of the download as well as the server support resuming. In order to later resume a download you must call setDeletesFileUponFailure passing false so the partially downloaded data is not deleted when the initial connection is lost or canceled.

36.9.10 setDestination(path as folderitem, allowOverwrite as boolean)

Notes:

path: The path for the downloaded file.
allowOverwrite: true if an existing file at path can be replaced, false otherwise.

If allowOverwrite is false and a file already exists at path, a unique filename will be created for the downloaded file by appending a number to the filename. The delegate can implement didCreateDestination to determine the filename used when the file is written to disk.

An NSURLDownload instance ignores multiple calls to this method.

See also:
36.9.11 setDestination(path as string, allowOverwrite as boolean)

Notes:

path: The path for the downloaded file.
allowOverwrite: true if an existing file at path can be replaced, false otherwise.

If allowOverwrite is false and a file already exists at path, a unique filename will be created for the downloaded file by appending a number to the filename. The delegate can implement didCreateDestination to determine the filename used when the file is written to disk.

An NSURLDownload instance ignores multiple calls to this method.
See also:

• 36.9.10 setDestination(path as folderitem, allowOverwrite as boolean)

36.9.12 Properties

36.9.13 Handle as Integer

Notes: (Read and Write property)

36.9.14 deletesFileUponFailure as boolean

Notes:

True if partially downloaded files should be deleted when a download stops prematurely, false otherwise. The default is true.
(Read and Write computed property)
36.9.15 Events

36.9.16 canAuthenticateAgainstProtectionSpace(protectio

CHAPTER 36. COCOA NETWORKING

7122

36.9.15 Events

36.9.16 canAuthenticateAgainstProtectionSpace(protectionSpace as NSURL-ProtectionSpaceMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sent to determine whether the delegate is able to respond to a protection space’s form of authentication. (required)
**Notes:**
protectionSpace: The protection space that generates an authentication challenge.

This method is called before didReceiveAuthenticationChallenge, allowing the delegate to inspect a protection space before attempting to authenticate against it. By returning true, the delegate indicates that it can handle the form of authentication, which it does in the subsequent call to didReceiveAuthenticationChallenge. Not implementing this method is the same as returning false, in which case default authentication handling is used.

Available in Mac OS X v10.6 and later.

36.9.17 decideDestinationWithSuggestedFilename(filename as string)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The delegate receives this message when download has determined a suggested filename for the downloaded file. (required)
**Notes:**
filename: The suggested filename for the download.

The suggested filename is either derived from the last path component of the URL and the MIME type or, if the download was encoded, from the encoding. If the delegate wishes to modify the path, it should send setDestination to download.

The delegate will not receive this message if setDestination has already been called for the download.

Available in Mac OS X v10.2 and later.

36.9.18 DidBegin

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent immediately after a download object begins a download. (required)
36.9. CLASS NSURLDOWNLOADMBS

Notes: Available in Mac OS X v10.2 and later.

36.9.19 didCancelAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Sent if an authentication challenge is canceled due to the protocol implementation encountering an error.
(Required)
Notes:
challenge: The authentication challenge that caused the download object to cancel the download.

If the delegate receives this message the download will fail and the delegate will receive a didFailWithError message.

Available in Mac OS X v10.2 and later.

36.9.20 didCreateDestination(path as string, file as folderitem)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Sent when the destination file is created. (Required)
Notes:
path: The path to the destination file.
file: The path to the destination file as folderitem.

Available in Mac OS X v10.2 and later.

36.9.21 didFailWithError(error as NSErrorMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Sent if the download fails or if an I/O error occurs when the file is written to disk. (Required)
Notes:
error: The error that caused the failure of the download.

Any partially downloaded file will be deleted.

Once the delegate receives this message, it will receive no further messages for download.
Available in Mac OS X v10.2 and later.
36.9.22 DidFinish

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when a download object has completed downloading successfully and has written its results to disk. (required)

**Notes:**
The delegate will receive no further messages for download.
Available in Mac OS X v10.2 and later.

36.9.23 didReceiveAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sent when the URL download must authenticate a challenge in order to download the request. (required)

**Notes:**
challenge: The URL authentication challenge that must be authenticated in order to download the request.

This method gives the delegate the opportunity to determine the course of action taken for the challenge: provide credentials, continue without providing credentials or cancel the authentication challenge and the download.

The delegate can determine the number of previous authentication challenges by sending the message previousFailureCount to challenge.

If the previous failure count is 0 and the value returned by proposedCredential is nil, the delegate can create a new NSURLCredential object, providing information specific to the type of credential, and send a useCredential message to challenge, passing the credential and challenge as parameters. If proposedCredential is not nil, the value is a credential from the URL or the shared credential storage that can be provided to the user as feedback.

The delegate may decide to abandon further attempts at authentication at any time by sending challenge a continueWithoutCredentialForAuthenticationChallenge or a cancelAuthenticationChallenge message. The specific action is implementation dependent.

If the delegate implements this method, the download will suspend until [ challenge sender ] is sent one of the following messages: useCredential, continueWithoutCredentialForAuthenticationChallenge or cancelAuthenticationChallenge.
If the delegate does not implement this method the default implementation is used. If a valid credential for
the request is provided as part of the URL, or is available from the NSURLCredentialStorage the challenge
is sent a useCredential:forAuthenticationChallenge with the credential. If the challenge has no credential or
the credentials fail to authorize access, then continueWithoutCredentialForAuthenticationChallenge is sent
to challenge sender instead.

Available in Mac OS X v10.2 and later.

**36.9.24 didReceiveDataOfLength(length as UInt64)**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sent as a download object receives data incrementally. (required)
**Notes:**
length: The amount of data received in this increment of the download, measured in bytes.

Available in Mac OS X v10.2 and later.

**36.9.25 didReceiveResponse(response as NSURLResponseMBS)**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sent when a download object has received sufficient load data to construct the NSURLResponse object for
the download. (required)
**Notes:**
response: The URL response object received as part of the download. response is immutable and will not
be modified after this method is called.

In some rare cases, multiple responses may be received for a single download. In this case, the client should
assume that each new response resets the download progress to 0 and should check the new response for the
expected content length.
Available in Mac OS X v10.2 and later.

**36.9.26 shouldDecodeSourceDataOfMIMEType(encodingType as string) as boolean**

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sent when a download object determines that the downloaded file is encoded to inquire whether the file should
be automatically decoded. (required)
**Notes:**
encodingType: The type of encoding used by the downloaded file. The supported encoding formats are
MacBinary ("application/macbinary"), Binhex ("application/mac-binhex40") and gzip ("application/gzip").

Return true to decode the file, false otherwise.

The delegate may receive this message more than once if the file has been encoded multiple times. This method is not called if the downloaded file is not encoded.
Available in Mac OS X v10.2 and later.

### 36.9.27 shouldUseCredentialStorage as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sent to determine whether the URL loader should consult the credential storage to authenticate the download.
(required)
**Notes:**
This method is called before any attempt to authenticate is made. By returning false, the delegate tells the download not to consult the credential storage and makes itself responsible for providing credentials for any authentication challenges. Not implementing this method is the same as returning true. The delegate is free to consult the credential storage itself when it receives a didReceiveAuthenticationChallenge message.

Available in Mac OS X v10.6 and later.

### 36.9.28 willResumeWithResponse(response as NSURLResponseMBS, startingByte as Int64)

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sent when a download object has received a response from the server after attempting to resume a download.
(required)
**Notes:**
response: The URL response received from the server in response to an attempt to resume a download.
The location of the start of the resumed data, in bytes.
Available in Mac OS X v10.4 and later.

### 36.9.29 willSendRequest(request as NSURLRequestMBS, redirectResponse as NSURLResponseMBS) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sent when the download object determines that it must change URLs in order to continue loading a request.
36.9. **CLASS NSURLDOWNLOADMBS**

(requested)

**Notes:**

request: The proposed redirected request. The delegate should inspect the redirected request to verify that it meets its needs, and create a copy with new attributes to return to the connection if necessary.

redirectResponse: The URL response that caused the redirect. May be nil in cases where this method is not being sent as a result of involving the delegate in redirect processing.

Return the actual URL request to use in light of the redirection response. The delegate may copy and modify request as necessary to change its attributes, return request unmodified, or return nil.

If the delegate wishes to cancel the redirect, it should call the download object’s cancel method. Alternatively, the delegate method can return nil to cancel the redirect, and the download will continue to process. This has special relevance in the case where redirectResponse is not nil. In this case, any data that is loaded for the download will be sent to the delegate, and the delegate will receive a downloadDidFinish: or download:didFailWithError: message, as appropriate.

The delegate can receive this message as a result of transforming a request’s URL to its canonical form, or for protocol-specific reasons, such as an HTTP redirect. The delegate implementation should be prepared to receive this message multiple times.

Available in Mac OS X v10.2 and later.
36.10 class NSURLConnection

36.10.1 class NSURLConnection

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for URL.

**Notes:**

An NSURL object represents a URL that can potentially contain the location of a resource on a remote server, the path of a local file on disk, or even an arbitrary piece of encoded data.

Please also review Apple’s documentation on this class:

MBS Plugin only includes a part of the original class. EMail us if you miss something.

36.10.2 Methods

36.10.3 checkResourceIsReachableAndReturnError as NSError

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the URL’s resource exists and is reachable.

**Notes:** This method synchronously checks if the resource’s backing store is reachable. Checking reachability is appropriate when making decisions that do not require other immediate operations on the resource, e.g. periodic maintenance of UI state that depends on the existence of a specific document. When performing operations such as opening a file or copying resource properties, it is more efficient to simply try the operation and handle failures. If this method returns false, the optional error is populated. This method is currently applicable only to URLs for file system resources. For other URL types, NO is returned. Symbol is present in iOS 4, but performs no operation.

36.10.4 Constructor(item as folderItem)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an URL based on folderItem.

See also:

- 36.10.5 Constructor(scheme as string, host as string, path as string) 7129
- 36.10.6 Constructor(url as string) 7129
- 36.10.7 Constructor(url as string, baseURL as NSURL) 7129
### 36.10.5 Constructor(scheme as string, host as string, path as string)

**Function:** Initializes a newly created NSURL with a specified scheme, host, and path.

**Notes:**
- **scheme:** The scheme for the NSURL object. For example, in the URL http://www.example.com/index.html, the scheme is http.
- **host:** The host for the NSURL object (for example, www.example.com). May be the empty string.
- **path:** The path for the NSURL object (for example, /index.html). If the path begins with a tilde, you must first expand it by calling stringByExpandingTildeInPath.

**See also:**
- 36.10.4 Constructor(item as folderitem)
- 36.10.6 Constructor(url as string)
- 36.10.7 Constructor(url as string, baseURL as NSURLMBS)

### 36.10.6 Constructor(url as string)

**Function:** Creates and returns an NSURL object initialized with a provided URL string.

**See also:**
- 36.10.4 Constructor(item as folderitem)
- 36.10.5 Constructor(scheme as string, host as string, path as string)
- 36.10.7 Constructor(url as string, baseURL as NSURLMBS)

### 36.10.7 Constructor(url as string, baseURL as NSURLMBS)

**Function:** Creates and returns an NSURL object initialized with a base URL and a relative string.

**Notes:**
This method allows you to create a URL relative to a base path or URL. For example, if you have the URL for a folder on disk and the name of a file within that folder, you can construct a URL for the file by providing the folders URL as the base path (with a trailing slash) and the filename as the string part.

This method expects URLString to contain only characters that are allowed in a properly formed URL. All other characters must be properly percent escaped. Any percent-escaped characters are interpreted using UTF-8 encoding.

**See also:**
- 36.10.4 Constructor(item as folderitem)
CHAPTER 36. COCOA NETWORKING

- 36.10.5 Constructor(scheme as string, host as string, path as string) 7129
- 36.10.6 Constructor(url as string) 7129

36.10.8 copy as NSURLMBS

36.10.9 fileURLWithFileSystemRepresentation(path as string, isDirectory as boolean, relativeToURL as NSURLMBS) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initializes a newly created URL referencing the local file or directory at the file system representation of the path. Notes: File system representation is a string with canonical UTF-8 encoding.

36.10.10 fileURLWithPath(path as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Builds a file URL with given file path. Notes: Better to use fileURLWithPath with directory parameter if you know if the path is a directory vs non-directory, as it saves an i/o. See also:

- 36.10.11 fileURLWithPath(path as string, isDirectory as boolean) as NSURLMBS 7130

36.10.11 fileURLWithPath(path as string, isDirectory as boolean) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Builds a file URL based on a given file path. See also:

- 36.10.10 fileURLWithPath(path as string) as NSURLMBS 7130

36.10.12 fileURLWithPathComponents(components() as string) as NSURLMBS

36.10. CLASS NSURLMBS

36.10.13 getResourceValue(byref value as Variant, key as string, byref error as NSErrorMBS) as boolean

Function: Returns the value of the resource property for the specified key.

Notes:
value: The location where the value for the resource property identified by key should be stored.
key: The name of one of the URLs resource properties.
error: The error that occurred if the resource value could not be retrieved.

Returns true if value is successfully populated; otherwise, false.

This method first checks if the URL object already caches the resource value. If so, it returns the cached resource value to the caller. If not, then this method synchronously obtains the resource value from the backing store, adds the resource value to the URL object’s cache, and returns the resource value to the caller.

The type of the returned resource value varies by resource property; for details, see the documentation for the key you want to access.

If this method returns true and the value is populated with nil, it means that the resource property is not available for the specified resource, and that no errors occurred when determining that the resource property was unavailable.

If this method returns false, an error occurred. The object pointer referenced by error is populated with additional information.

This method applies only to URLs that represent file system resources.

Available in OS X v10.6 and later.

Automatic type translation applies (See FAQ about NSDictionary).
e.g. NSNumber can be converted to Integer or Boolean depending on content.

36.10.14 isEqual(other as NSURLMBS) as boolean

Function: Tests if two NSURLs are equal.

Notes: Returns a Boolean value that indicates whether the receiver and a given object have identical URL strings and base URLs.
CHAPTER 36. COCOA NETWORKING

36.10.15 **Items**(byref error as NSErrorMBS, VisibleItemsOnly as boolean = false) as NSURLMBS()

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries list of items in the directory the URL points to on disk.
**Notes:** Error is optional.
See also:
- 36.10.16 **Items**(VisibleItemsOnly as boolean = false) as NSURLMBS()

36.10.16 **Items**(VisibleItemsOnly as boolean = false) as NSURLMBS()

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries list of items in the directory the URL points to on disk.
See also:
- 36.10.15 **Items**(byref error as NSErrorMBS, VisibleItemsOnly as boolean = false) as NSURLMBS()

36.10.17 **mountedVolumeURLs**(SkipHidden as boolean = true) as NSURLMBS()

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries array of all NSURLs for mounted volumes.
**Notes:**
if SkipHidden is true, hidden volumes are skipped.
Returns nil in case of error.

36.10.18 **NSThumbnail1024x1024SizeKey** as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible keys for the NSURLThumbnailDictionaryKey dictionary.
**Notes:**
A 1024 x 1024 pixel thumbnail as an NSImage on OS X.
Available in OS X v10.10 and later.

36.10.19 **NSURLAddedToDirectoryDateKey** as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
**Notes:**
The time at which the resources was created or renamed into or within its parent directory, returned as an date. Inconsistent behavior may be observed when this attribute is requested on hard-linked items. This property is not supported by all volumes. (read-only)

Available in OS X v10.10.

### 36.10.20 NSURLAttributeModificationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**
The time at which the resources attributes were most recently modified, returned as an NSDate object if the volume supports attribute modification dates, or nil if attribute modification dates are unsupported (read-write).

Available in OS X v10.6 and later.

### 36.10.21 NSURLContentAccessDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**
The time at which the resource was most recently accessed, returned as a date object if the volume supports access dates, or nil if access dates are unsupported (read-only).

Available in OS X v10.6 and later.

### 36.10.22 NSURLContentModificationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**
The time at which the resource was most recently modified, returned as a date object if the volume supports modification dates, or nil if modification dates are unsupported (read-write).

Available in OS X v10.6 and later.
36.10.23 NSURLCreationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**
The resources creation date, returned as an NSDate object if the volume supports creation dates, or nil if creation dates are unsupported (read-write).

Available in OS X v10.6 and later.

36.10.24 NSURLCustomIconKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**
The icon stored with the resource, returned as an NSImage object, or nil if the resource has no custom icon. Available in OS X v10.6 and later.

36.10.25 NSURLDocumentIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**
The document identifier returned as a number (read-only).

The document identifier is a value assigned by the kernel to a file or directory. This value is used to identify the document regardless of where it is moved on a volume. The identifier persists across system restarts. It is not transferred when the file is copied, but it survives "safe save" operations. For example, it remains on the path to which it was assigned, even after calling the replaceItemAtURL:withItemAtURL:backupItemName:options:resultingItemAtURL:error: method. Document identifiers are only unique within a single volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.

36.10.26 NSURLEffectiveIconKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.
36.10. CLASS NSURLMBS

Notes:
The resources normal icon, returned as an NSImage object (read-only).

Available in OS X v10.6 and later.

36.10.27 NSURLFileAllocatedSizeKey as string

Notes:
Key for the total size allocated on disk for the file, returned as an NSNumber object (read-only).

Available in OS X v10.6 and later.

36.10.28 NSURLFileResourceIdentifierKey as string

Notes:
The resources unique identifier, returned as an id (read-only).

This identifier can be used to determine equality between file system resources with the isEqual: method. Two resources are equal if they have the same file-system path or if their paths link to the same inode on the same file system.

The value of this identifier is not persistent across system restarts.

Available in OS X v10.7 and later.

36.10.29 NSURLFileResourceTypeBlockSpecial as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the possible values for the NSURLFileResourceTypeKey key.

Notes:
The resource is a block special file.
Available in OS X v10.7 and later.
36.10.30 NSURLFileResourceTypeCharacterSpecial as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key.

**Notes:**
- The resource is a character special file.
- Available in OS X v10.7 and later.

36.10.31 NSURLFileResourceTypeDirectory as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key.

**Notes:**
- The resource is a directory.
- Available in OS X v10.7 and later.

36.10.32 NSURLFileResourceTypeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.

**Notes:**
- The resources object type, returned as an NSString object. See File Resource Types for possible values.
- Available in OS X v10.7 and later.

36.10.33 NSURLFileResourceTypeNamedPipe as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key.

**Notes:**
- The resource is a named pipe.
- Available in OS X v10.7 and later.
36.10.34 NSURLFileResourceTypeRegular as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key. **Notes:**

The resource is a regular file.
Available in OS X v10.7 and later.

36.10.35 NSURLFileResourceTypeSocket as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key. **Notes:**

The resource is a socket.
Available in OS X v10.7 and later.

36.10.36 NSURLFileResourceTypeSymbolicLink as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key. **Notes:**

The resource is a symbolic link.
Available in OS X v10.7 and later.

36.10.37 NSURLFileResourceTypeUnknown as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible values for the NSURLFileResourceTypeKey key. **Notes:**

The resource type is unknown.
Available in OS X v10.7 and later.

36.10.38 NSURLFileScheme as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** These schemes are the ones that NSURL can parse.
Notes: Identifies a URL that points to a file on a mounted volume.

36.10.39 NSURLFileSecurityKey as string

Notes:
The resources security information, returned as an NSFileSecurity object (read-write).
Available in OS X v10.7 and later.

36.10.40 NSURLFileSizeKey as string

Notes:
Key for the files size in bytes, returned as an NSNumber object (read-only).
Available in OS X v10.6 and later.

36.10.41 NSURLGenerationIdentifierKey as string

Notes:
An opaque generation identifier, returned as an id (read-only)

The generation identifier can be compared using isEqual to determine if the data in a document has been modified. For URLs which refer to the same file inode, the generation identifier changes when the data in the file's data fork is changed. Changes to extended attributes or other file system metadata do not change the identifier. For URLs which refer to the same directory inode, the generation identifier changes when direct children of that directory are added, removed or renamed. Changes to the data of the direct children of that directory does not change the generation identifier. The identifier persists across system restarts. It is tied to a specific document on a specific volume and is not transferred when the document is copied to another volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.
### 36.10.42 NSURLHasHiddenExtensionKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:** Key for determining whether the resources extension is normally removed from its localized name, returned as a Boolean (read-write).

### 36.10.43 NSURLIsAliasFileKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that apply to properties of files. **Notes:** Key for determining whether the file is an alias, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

### 36.10.44 NSURLIsDirectoryKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:** Key for determining whether the resource is a directory, returned as a Boolean- (read-only). Available in OS X v10.6 and later.

### 36.10.45 NSURLIsExcludedFromBackupKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:** Key for determining whether the resource is excluded from all backups of app data, returned as a Boolean NSNumber object (read-write).

You can use this property to exclude cache and other app support files which are not needed in a backup. Some operations commonly made to user documents cause this property to be reset to false; consequently, do not use this property on user documents.

Available in OS X v10.8 and later.
36.10.46 **NSURLIsExecutableKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

Key for determining whether the current process (as determined by the EUID) can execute the resource (if it is a file) or search the resource (if it is a directory), returned as a Boolean (read-only).

Available in OS X v10.7 and later.

36.10.47 **NSURLIsHiddenKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

Key for determining whether the resource is normally not displayed to users, returned as a Boolean NSNumber object (read-write).

If the resource is hidden because its name begins with a period, setting this value has no effect. Available in OS X v10.6 and later.

36.10.48 **NSURLIsMountTriggerKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

Key for determining whether the URL is a file system trigger directory, returned as a Boolean NSNumber object (read-only). Traversing or opening a file system trigger directory causes an attempt to mount a file system on the directory.

Available in OS X v10.7 and later.

36.10.49 **NSURLIsPackageKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**
36.10. **CLASS NSURLMBS**

Key for determining whether the resource is a file package, returned as a BooleanNSNumber object (read-write in OS X v10.8 and later, read-only in previous versions). A true value means that the resource is a file package.

If you attempt to set or clear this key's value on a file instead of a directory, the system ignores your attempt. If the directory is defined as a package by way of its filename extension or other reason apart from this key, setting this key's value to false has no effect.

Available in OS X v10.6 and later.

### 36.10.50 **NSURLIsReadableKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

Key for determining whether the current process (as determined by the EUID) can read the resource, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

### 36.10.51**NSURLIsRegularFileKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

Key for determining whether the resource is a regular file, as opposed to a directory or a symbolic link. Returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

### 36.10.52 **NSURLIsSymbolicLinkKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

Key for determining whether the resource is a symbolic link, returned as a Boolean NSNumber object (read-only).
36.10.53 **NSURLIsSystemImmutableKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

Key for determining whether the resource’s system immutable bit is set, returned as a Boolean NSNumber object (read-write).

Available in OS X v10.6 and later.

36.10.54 **NSURLIsUbiquitousItemKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for files. **Notes:**

A boolean that contains true if this item is in iCloud storage, false if it is a local item (read-only).

Available in OS X v10.7 and later.

36.10.55 **NSURLIsUserImmutableKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

Key for determining whether the resource’s user immutable bit is set, returned as a Boolean NSNumber object (read-write).

Available in OS X v10.6 and later.

36.10.56 **NSURLIsVolumeKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

Key for determining whether the resource is the root directory of a volume, returned as a Boolean NSNumber.
36.10. **CLASS NSURLMBS**

object (read-only).

Available in OS X v10.6 and later.

---

### 36.10.57 **NSURLIsWritableKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.

**Notes:**

Key for determining whether the current process (as determined by the EUID) can write to the resource, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.7 and later.

---

### 36.10.58 **NSURLKeysOfUnsetValueKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the resource properties that have not been set after setResourceValues returns an error, returned as an array of of strings.

---

### 36.10.59 **NSURLLabelColorKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.

**Notes:**

The resources label color, returned as an NSColor object, or nil if the resource has no label color (read-only).

Available in OS X v10.6 and later.

---

### 36.10.60 **NSURLLabelNumberKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.

**Notes:**

The resources label number, returned as an NSNumber object (read-write).
 Available in OS X v10.6 and later.

### 36.10.61 NSURLLinkCountKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

The number of hard links to the resource, returned as an NSNumber object (read-only).
Available in OS X v10.6 and later.

### 36.10.62 NSURLLocalizedLabelKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

The resources localized label text, returned as an NSString object, or nil if the resource has no localized label text (read-only).
Available in OS X v10.6 and later.

### 36.10.63 NSURLLocalizedizedNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

The resources localized or extension-hidden name, returned as an NSString object (read-only).
Available in OS X v10.6 and later.

### 36.10.64 NSURLLocalizedTypeDescriptionKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

The resources localized type description, returned as an NSString object (read-only).
Available in OS X v10.6 and later.
**36.10.65 NSURLNameKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**
The resources name in the file system, returned as an NSString object (read-write). Available in OS X v10.6 and later.

**36.10.66 NSURLParentDirectoryURLKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**
The parent directory of the resource, returned as an NSURL object, or nil if the resource is the root directory of its volume (read-only). Available in OS X v10.6 and later.

**36.10.67 NSURLPathKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**
The file system path for the URL, returned as an NSSstring object (read-only). Available in OS X v10.8 and later.

**36.10.68 NSURLPreferredIOBlockSizeKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**
The optimal block size to use when reading or writing this file's data, returned as an NSNumber object, or nil if the preferred size is not available (read-only). Available in OS X v10.7 and later.
36.10.69 NSURLQuarantinePropertiesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A key for quarantine properties.  
**Notes:**  
The quarantine properties as defined in LSQuarantine.h. To remove quarantine information from a file, pass NSNull as the value when setting this property. (Read-write, value type dictionary)  
Available on Mac OS X 10.10 and later.

36.10.70 NSURLTagNamesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.  
**Notes:**  
The names of tags attached to the resource, returned as an array of String values (read-write).  
Available in OS X v10.9 and later.

36.10.71 NSURLThumbnailDictionaryKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.  
**Notes:**  
A dictionary of NSImage objects keyed by size (read-write).  
See Thumbnail Property Keys for a list of possible keys.  
Available in OS X v10.10.

36.10.72 NSURLThumbnailKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys.  
**Notes:**  
All thumbnails as a single NSImage (read-write).  
Available in OS X v10.10.
36.10.73 **NSURLTotalFileAllocatedSizeKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that apply to properties of files. **Notes:**

Key for the total allocated size of the file in bytes, returned as an NSNumber object (read-only). This includes the size of any file metadata.

Available in OS X v10.7 and later.

36.10.74 **NSURLTotalFileSizeKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that apply to properties of files. **Notes:**

Key for the total displayable size of the file in bytes, returned as an NSNumber object (read-only). This includes the size of any file metadata.

Available in OS X v10.7 and later.

36.10.75 **NSURLTypeIdentifierKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

The resources uniform type identifier (UTI), returned as a string (read-only).

Available in OS X v10.6 and later.

36.10.76 **NSURLUbiquitousItemContainerDisplayNameKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file. **Notes:**

A string containing the name of the items container, as it is displayed to the user.

Available in OS X v10.10 and later.
36.10.77 NSURLUbiquitousItemDownloadingErrorKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.  
**Notes:**  
An error object that indicates why downloading the item from iCloud failed.  

Available in OS X v10.9 and later.

36.10.78 NSURLUbiquitousItemDownloadingStatusCurrent as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Values that describe the iCloud storage state of a file.  
**Notes:**  
A local copy of this item exists and is the most up-to-date version known to the device.  

Available in OS X v10.9 and later.

36.10.79 NSURLUbiquitousItemDownloadingStatusDownloaded as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Values that describe the iCloud storage state of a file.  
**Notes:**  
A local copy of this item exists, but it is stale. The most recent version will be downloaded as soon as possible.  

Available in OS X v10.9 and later.

36.10.80 NSURLUbiquitousItemDownloadingStatusKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.  
**Notes:**  
The current download state for the item, indicating whether a local copy exists and whether that copy is the most current version of the item. The possible values for this key are described in Ubiquitous Item Downloading Status Constants.
36.10. CLASS NSURLMBS

Available in OS X v10.9 and later.

36.10.81  NSURLUbiquitousItemDownloadingStatusNotDownloaded as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Values that describe the iCloud storage state of a file. **Notes:**

This item has not been downloaded yet. Use startDownloadingUbiquitousItemAtURL to download it.

Available in OS X v10.9 and later.

36.10.82  NSURLUbiquitousItemDownloadRequestedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file. **Notes:**

A Boolean indicating whether a call to startDownloadingUbiquitousItemAtURL has already been made to download the item. The value of this key is read-only.

Available in OS X v10.10 and later.

36.10.83  NSURLUbiquitousItemHasUnresolvedConflictsKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file. **Notes:**

A boolean NSNumber that contains true if this item has conflicts outstanding, false otherwise (read-only). Available in OS X v10.7 and later.

36.10.84  NSURLUbiquitousItemIsDownloadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file. **Notes:**

A boolean NSNumber that contains true if this item's data has been downloaded to a ubiquity container, false otherwise (read-only).
Available in OS X v10.7 and later.  
Deprecated in OS X v10.9.

### 36.10.85 NSURLUbiquitousItemIsDownloadingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.  
**Notes:** A boolean NSNumber that contains true if this item is being downloaded from iCloud, false otherwise (read-only).

Available in OS X v10.7 and later.

### 36.10.86 NSURLUbiquitousItemIsUploadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.  
**Notes:** A boolean NSNumber that contains true if this items data has been uploaded to iCloud storage, false otherwise (read-only).

When waiting for an upload to complete, do not poll this key from within a block passed to coordinateReadingItemAtURL, because the coordinated read required to obtain this value cannot be performed until that block completes and returns. Instead, use NSMetadataQuery or an NSFilePresenter delegate to asynchronously notify your app when the status changes.

Available in OS X v10.7 and later.

### 36.10.87 NSURLUbiquitousItemIsUploadingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys that describe the iCloud storage state of a file.  
**Notes:** A boolean NSNumber that contains true if this item is being uploaded to iCloud, false otherwise (read-only).

Available in OS X v10.7 and later.
36.10.88 NSURLUbiquitousItemPercentDownloadedKey as string

**Function:** Keys that describe the iCloud storage state of a file.  
**Notes:**
An NSNumber in the range 0100 that indicates the percentage of the data that has been downloaded (read-only).

Use the NSMetadataQuery class to search for NSMetadataItem objects that have the NSMetadataUbiquitousItemPercentDownloadedKey attribute instead.

Available in OS X v10.7 and later.  
Deprecated in OS X v10.8.

36.10.89 NSURLUbiquitousItemPercentUploadedKey as string

**Function:** Keys that describe the iCloud storage state of a file.  
**Notes:**
An NSNumber in the range 0100 that indicates the percentage of the data that has been uploaded (read-only).

Use the NSMetadataQuery class to search for NSMetadataItem objects that have the NSMetadataUbiquitousItemPercentUploadedKey attribute instead.

Available in OS X v10.7 and later.  
Deprecated in OS X v10.8.

36.10.90 NSURLUbiquitousItemUploadingErrorKey as string

**Function:** Keys that describe the iCloud storage state of a file.  
**Notes:**
An error object that indicates why uploading the item to iCloud failed.

Available in OS X v10.9 and later.
36.10.91 **NSURLVolumeAvailableCapacityKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes. **Notes:**

Key for the volumes available capacity in bytes, returned as an Int64 (read-only).
Available in OS X v10.6 and later.

36.10.92 **NSURLVolumeCreationDateKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes. **Notes:**

Key for the volumes creation date, returned as a date, or nil if it cannot be determined (read-only).
Available in OS X v10.7 and later.

36.10.93 **NSURLVolumeIdentifierKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file system URL resource keys. **Notes:**

The unique identifier of the resources volume, returned as an id (read-only).
This identifier can be used with the isEqual method to determine whether two file system resources are on the same volume.
The value of this identifier is not persistent across system restarts.
Available in OS X v10.7 and later.

36.10.94 **NSURLVolumeIsAutomountedKey as string**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes. **Notes:**

Key for determining whether the volume is automounted, returned as a Boolean (read-only).
Available in OS X v10.7 and later.
36.10.95  NSURLVolumeIsBrowsableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.  
**Notes:**  
Key for determining whether the volume is visible in GUI-based file-browsing environments, such as the Desktop or the Finder application, returned as a Boolean (read-only).  

Available in OS X v10.7 and later.

36.10.96  NSURLVolumeIsEjectableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.  
**Notes:**  
Key for determining whether the volume is ejectable from the drive mechanism under software control, returned as a Boolean (read-only).  

Available in OS X v10.7 and later.

36.10.97  NSURLVolumeIsInternalKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.  
**Notes:**  
Key for determining whether the volume is connected to an internal bus, returned as a Boolean, or nil if it cannot be determined (read-only).  

Available in OS X v10.7 and later.

36.10.98  NSURLVolumeIsJournalingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.  
**Notes:**  
Key for determining whether the volume is currently journaling, returned as a Boolean.  
Available in OS X v10.6 and later.
36.10.99  NSURLVolumeIsLocalKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.

**Example:**

```vbnet
dim f as FolderItem = GetFolderItem("/Volumes/Ablage1", FolderItem.PathTypeNative)

dim n as NSURLMBS = NSURLMBSWithURLWithItem(f)
dim value as Variant
dim error as NSErrorMBS

dim Local as Boolean

// network volumes are not local
if n.getResourceValue(value, n.NSURLVolumeIsLocalKey, error) then
    MsgBox "Local: " + value.StringValue
    Local = value[BooleanValue
else
    MsgBox error.localizedDescription
end if

// network volumes have an URL
if n.getResourceValue(value, n.NSURLVolumeURLForRemountingKey, error) then
    MsgBox "URLForRemounting: " + value.StringValue
else
    MsgBox error.localizedDescription
end if
```

**Notes:**

Key for determining whether the volume is stored on a local device, returned as a Boolean (read-only). Available in OS X v10.7 and later.

36.10.100  NSURLVolumeIsReadOnlyKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.

**Notes:**

Key for determining whether the volume is read-only, returned as a Boolean (read-only). Available in OS X v10.7 and later.
36.10.101 NSURLConnectionIsRemovableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.

**Example:**

```vbs
dim f as FolderItem = GetFolderItem( "/Volumes/Test", FolderItem.PathTypeNative)

dim n as NSURLConnection = NSURLURLConnectionWithURLItem(f)
dim value as Variant
dim error as NSErrorMBS

if n.getResourceValue(value, n.NSURLConnectionIsRemovableKey, error) then
    MsgBox "Removable: " + value.StringValue
else
    MsgBox error.LocalizedDescription
end if
```

**Notes:**

Key for determining whether the volume is removable from the drive mechanism, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

---

36.10.102 NSURLConnectionLocalizedFormatDescriptionKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.

**Notes:**

Key for the volumes descriptive format name, returned as a string (read-only).

Available in OS X v10.6 and later.
36.10.103 **NSURLVolumeLocalizedKeyName** as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes. **Notes:**
The name of the volume as it should be displayed in the user interface, returned as a string (read-only). Available in OS X v10.7 and later.

36.10.104 **NSURLVolumeMaximumFileSizeKey** as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes. **Notes:**
Key for the largest file size supported by the volume in bytes, returned as a Boolean, or nil if it cannot be determined (read-only).

Available in OS X v10.7 and later.

36.10.105 **NSURLVolumeNameKey** as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes. **Notes:**
The name of the volume, returned as an NSString object (read-write). Settable only if NSURLVolumeSupportsRenamingKey is true.

Available in OS X v10.7 and later.

36.10.106 **NSURLVolumeResourceCountKey** as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes. **Notes:**
Key for the total number of resources on the volume, returned as an integer (read-only). Available in OS X v10.6 and later.
36.10.107  NSURLVolumeSupportsAdvisoryFileLockingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.

**Notes:**

Key for determining whether the volume implements whole-file advisory locks in the style of flock, along with the O_EXLOCK and O_SHLOCK flags of the open function, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.7 and later.

36.10.108  NSURLVolumeSupportsCasePreservedNamesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.

**Example:**

```vbc
    Dim f As FolderItem = Volume(0)
    Dim n As New NSURLMBS(f)

    Dim v As Variant
    Dim e As NSErrorMBS
    If n.getResourceValue(v, n.NSURLVolumeSupportsCasePreservedNamesKey, e) Then
        MsgBox "VolumeSupportsCasePreservedNames: " + v.BooleanValue
    Else
        MsgBox "Failed to query: " + e.LocalizedDescription
    End If
```

**Notes:**

Key for determining whether the volume supports case-preserved names, returned as a Boolean (read-only). Available in OS X v10.6 and later.

36.10.109  NSURLVolumeSupportsCaseSensitiveNamesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.

**Example:**

```vbc
    Dim f As FolderItem = Volume(0)
    Dim n As New NSURLMBS(f)
```
dim v as Variant
dim e as NSErrorMBS
if n.getResourceValue(v, n.NSURLVolumeSupportsCaseSensitiveNamesKey, e) then
    MsgBox "VolumeSupportsCaseSensitiveNames: " + str(v[BooleanValue])
else
    MsgBox "Failed to query: " + e.LocalizedDescription
end if

Notes:
Key for determining whether the volume supports case-sensitive names, returned as a Boolean (read-only). Available in OS X v10.6 and later.

### 36.10.110 NSURLVolumeSupportsExtendedSecurityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes. **Notes:**

Key for determining whether the volume supports extended security (access control lists), returned as a Boolean (read-only) (read-only).

Available in OS X v10.7 and later.

### 36.10.111 NSURLVolumeSupportsHardLinksKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes. **Notes:**

Key for determining whether the volume supports hard links, returned as a Boolean. Available in OS X v10.6 and later.

### 36.10.112 NSURLVolumeSupportsJournalingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes. **Notes:**

Key for determining whether the volume supports journaling, returned as a Boolean. Available in OS X v10.6 and later.
36.10.113  NSURLVolumeSupportsPersistentIDsKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.

**Notes:**
Key for determining whether the volume supports persistent IDs, returned as a Boolean (read-only).
Available in OS X v10.6 and later.

36.10.114  NSURLVolumeSupportsRenamingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.

**Notes:**
Key for determining whether the volume can be renamed, returned as a Boolean (read-only).
Available in OS X v10.7 and later.

36.10.115  NSURLVolumeSupportsRootDirectoryDatesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.

**Notes:**
Key for determining whether the volume supports reliable storage of times for the root directory, returned as a Boolean (read-only).
Available in OS X v10.7 and later.

36.10.116  NSURLVolumeSupportsSparseFilesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for volumes.

**Notes:**
Key for determining whether the volume supports sparse files, returned as a Boolean.
Available in OS X v10.6 and later.
36.10.117 NSURLVolumeSupportsSymbolicLinksKey as string

Notes:
Key for determining whether the volume supports symbolic links, returned as a Boolean. Available in OS X v10.6 and later.

36.10.118 NSURLVolumeSupportsVolumeSizesKey as string

Notes:
Key for determining whether the volume supports returning volume size information, returned as a Boolean (read-only). If true, volume size information is available as values of the NSURLVolumeTotalCapacityKey and NSURLVolumeAvailableCapacityKey keys.
Available in OS X v10.7 and later.

36.10.119 NSURLVolumeSupportsZeroRunsKey as string

Notes:
Key for determining whether the volume supports zero runs, returned as a Boolean. (read-only). Available in OS X v10.6 and later.

36.10.120 NSURLVolumeTotalCapacityKey as string

Notes:
Key for the volumes capacity in bytes, returned as an Int64 (read-only).
Available in OS X v10.6 and later.
36.10.121 NSURLVolumeURLForRemountingKey as string

Notes:
Key for the URL needed to remount the network volume, returned as an NSURL object, or nil if a URL is not available (read-only).

Available in OS X v10.7 and later.

36.10.122 NSURLVolumeURLKey as string

Notes:
The root directory of the resources volume, returned as an NSURL object (read-only).
Available in OS X v10.6 and later.

36.10.123 NSURLVolumeUUIDStringKey as string

Notes:
Key for the volumes persistent UUID, returned as an NSString object, or nil if a persistent UUID is not available (read-only).

Available in OS X v10.7 and later.

36.10.124 pathComponents as string()

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: An array containing the path components. (read-only)
Notes: This property contains an array containing the individual path components of the URL. For example, in the URL file:///directory/directory2/file, the path components array would be "/", "directory", "directory2", "file".
36.10.125 removeAllCachedResourceValues

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all cached resource values and temporary resource values from the URL object. **Notes:**

This method is applicable only to URLs that represent file system resources. Available in OS X v10.9 and later.

36.10.126 removeCachedResourceValueForKey(key as string)

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the cached resource value identified by a given key from the URL object. **Notes:**

key: The resource value key whose cached values you want to remove.

Removing a cached resource value may remove other cached resource values because some resource values are cached as a set of values, and because some resource values depend on other resource values. (Temporary resource values have no dependencies.)

This method is currently applicable only to URLs for file system resources.

Available in OS X v10.9 and later.

36.10.127 resourceValuesForKeys(keys() as string, byref error as NSErrorMBS) as Dictionary

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resource values for the properties identified by specified array of keys. **Notes:**

Returns a dictionary of resource values indexed by key.

This method first checks if the URL object already caches the specified resource values. If so, it returns the cached resource values to the caller. If not, then this method synchronously obtains the resource values from the backing store, adds the resource values to the URL object’s cache, and returns the resource values to the caller.

The type of the returned resource value varies by resource property; for details, see the documentation for the key you want to access.
If the result dictionary does not contain a resource value for one or more of the requested resource keys, it means those resource properties are not available for the URL, and no errors occurred when determining those resource properties were not available.

If an error occurs, this method returns nil and populates the object pointer referenced by error with additional information.

This method applies only to URLs that represent file system resources.
Available in OS X v10.6 and later.
See also:

- 36.10.128 resourceValuesForKeys(keys() as string, targetDelegate as ResourceValuesForKeysDelegateMBS, tag as Variant = nil, PrecacheIcons as boolean = false)

36.10.128 resourceValuesForKeys(keys() as string, targetDelegate as ResourceValuesForKeysDelegateMBS, tag as Variant = nil, PrecacheIcons as boolean = false)

Notes:
The plugin will query values on a different preemptive thread and call your delegate on main thread with results as soon as possible. This way you can keep app responsive while system e.g. loads icons.
For icons, you can set PrecacheIcons to true. In that case plugin will draw icon on the preemptive thread, so icon data is really loaded from disk. When you than draw on main thread, it’s really quick.

The delegate has this parameters:
ResourceValuesForKeysDelegateMBS(URL as NSURLMBS, keys() as String, Values as Dictionary, Error as NSErrorMBS, tag as Variant)
See also:

- 36.10.127 resourceValuesForKeys(keys() as string, byref error as NSErrorMBS) as Dictionary

36.10.129 setResourceValue(value as Variant, key as string, byref error as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Sets the URLs resource property for a given key to a given value.
Notes:
value: The value for the resource property defined by key.
key: The name of one of the URLs resource properties.
error: The error that occurred if the resource value could not be set.

Returns true if the resource property named key is successfully set to value; otherwise, false.

This method synchronously writes the new resource value out to disk. Attempts to set a read-only resource property or to set a resource property that is not supported by the resource are ignored and are not considered errors.

If an error occurs, this method returns NO and populates the object pointer referenced by error with additional information.

This method applies only to URLs for file system resources.
Available in OS X v10.6 and later.

Automatic type translation applies (See FAQ about NSDictionary).

36.10.130 setResourceValues(keyedValues as Dictionary, byref error as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Sets the URLs resource properties for a given set of keys to a given set of values.
Notes:
keyedValues: A dictionary of resource values to be set.
error: The error that occurred if one or more resource values could not be set.

Returns true if all resource values in keyedValues are successfully set; otherwise, false.

This method synchronously writes the new resource value out to disk. If an error occurs after some resource properties have been successfully changed, the userInfo dictionary in the returned error object contains a kCFURLKeysOfUnsetValuesKey key whose value is an array of the resource values that were not successfully set.

Attempts to set a read-only resource property or to set a resource property that is not supported by the resource are ignored and are not considered errors.

The order in which the resource values are set is not defined. If you need to guarantee the order in which resource values are set, you should make multiple requests to this method or setResourceValue:forKey:error:.

This method applies only to URLs for file system resources.
Available in OS X v10.6 and later.

Automatic type translation applies (See FAQ about NSDictionary).

36.10.131 setTemporaryResourceValue(value as Variant, key as string)

Notes:
value: The value to store.
key: The key where the value should be stored. This key must be unique and must not conflict with any system-defined keys. Reverse-domain-name notation is recommended.

Your app can use a temporary resource value to temporarily store a value for an app-defined resource value key in memory without modifying the actual resource that the URL represents. Once set, you can copy the temporary resource value from the URL object just as you would copy system-defined keys by calling getResourceValue or resourceValuesForKeys.

Your app can remove a temporary resource value from the URL object by calling removeCachedResourceValueForKey or removeAllCachedResourceValues (to remove all temporary values).

This method is applicable only to URLs for file system resources. Available in OS X v10.9 and later.

36.10.132 startAccessingSecurityScopedResource as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Starts accessing a security scoped bookmark URL.
Notes: Given a NSURL created by resolving a bookmark data created with security scope, make the resource referenced by the url accessible to the process. When access to this resource is no longer needed the client must call stopAccessingSecurityScopedResource. Each call to startAccessingSecurityScopedResource must be balanced with a call to stopAccessingSecurityScopedResource (Note: this is not reference counted).

36.10.133 stopAccessingSecurityScopedResource

36.10.134  TagNames as string()

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** The names of tags attached to the resource, returned as an array of String values.  **Notes:** Available in OS X v10.9 and later.

36.10.135  URLByAppendingPathComponent(pathComponent as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns a new URL made by appending a path component to the original URL.  **Notes:**

pathComponent: The path component to add to the URL, in its original form (not URL encoded).

Returns a new URL with pathComponent appended.

If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.

Available in OS X v10.6 and later.

See also:

- 36.10.136 URLByAppendingPathComponent(pathComponent as string, isDirectory as boolean) as NSURLMBS

36.10.136  URLByAppendingPathComponent(pathComponent as string, isDirectory as boolean) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns a new URL made by appending a path component to the original URL, along with a trailing slash if the component is designated a directory.  **Notes:**

pathComponent: The path component to add to the URL.

isDirectory: If true, a trailing slash is appended after pathComponent.

Returns a new URL with pathComponent appended.

If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.
Available in OS X v10.7 and later.
On Mac OS X 10.6 the plugin falls back
See also:

- 36.10.135 URLByAppendingPathComponent(pathComponent as string) as NSURLMBS

36.10.137 URLByAppendingPathExtension(PathExtension as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new URL made by appending a path extension to the original URL.

**Notes:**

pathExtension: The path extension to add to the URL.

Returns a new URL with pathExtension appended.

If the original URL ends with one or more forward slashes, these are removed from the returned URL. A period is inserted between the two parts of the new URL.
Available in OS X v10.6 and later.

36.10.138 URLByDeletingLastPathComponent as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A URL created by taking the receiver and removing the last path component.

**Notes:**

If the receivers URL represents the root path, this property contains a copy of the original URL. Otherwise, if the original URL has only one path component, this property contains the empty string.

Available in OS X v10.6 and later.

36.10.139 URLByDeletingPathExtension as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A URL created by taking the receiver and removing the path extension, if any.

**Notes:**

If the receiver represents the root path, this property contains a copy of the original URL. If the URL has multiple path extensions, only the last one is removed.
CHAPTER 36. COCOA NETWORKING

Available in OS X v10.6 and later.

36.10.140 URLByResolvingSymlinksInPath as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A URL that points to the same resource as the receiver and includes no symbolic links.
Notes:
If the receiver has no symbolic links, this property contains a copy of the original URL.
If some symbolic links cannot be resolved, this property contains those broken symbolic links.
If the name of the receiving path begins with /private, this property strips off the /private designator, provided the result is the name of an existing file.
This property only works on URLs with the file: path scheme. For all other URLs, it contains a copy of the receiver.
Available in OS X v10.6 and later.

36.10.141 URLByStandardizingPath as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A URL that points to the same resource as the original URL using an absolute path.
Notes:
This property only works on URLs with the file: path scheme. For all other URLs, it returns a copy of the original URL.
Like stringByStandardizingPath, this property can make the following changes in the provided URL:

- Expand an initial tilde expression using stringByExpandingTildeInPath.
- Reduce empty components and references to the current directory (that is, the sequences "/" and "/./") to single path separators.
- In absolute paths only, resolve references to the parent directory (that is, the component "/..") to the real parent directory if possible using stringByResolvingSymlinksInPath, which consults the file system to resolve each potential symbolic link.
- In relative paths, because symbolic links can't be resolved, references to the parent directory are left in place.
• Remove an initial component of "private" from the path if the result still indicates an existing file or directory (checked by consulting the file system).

Note that the path contained by this property may still have symbolic link components in it. Note also that this property only works with file paths (not, for example, string representations of URLs).

Available in OS X v10.6 and later.

36.10.142 URLsResourceValuesForKeys(URLs() as NSURLMBS, keys() as string, targetDelegate as URLsResourceValuesForKeysDelegateMBS, tag as Variant = nil, PrecacheIcons as boolean = false)

Notes:
Similar to resourceValuesForKeys, this method will start a preemptive thread and query values for all URLs on all keys in background. Once done it calls the delegate on main thread.

For icons, you can set PrecacheIcons to true. In that case plugin will draw icon on the preemptive thread, so icon data is really loaded from disk. When you than draw on main thread, it’s really quick.

the delegate is declared like this:
URLsResourceValuesForKeysDelegateMBS(URLs() as NSURLMBS, keys() as String, Values() as Dictionary, Errors() as NSErrorMBS, tag as Variant)

36.10.143 URLWithHandle(Handle as Integer) as NSURLMBS

Notes: Will retain the reference.

36.10.144 URLWithItem(Item as FolderItem) as NSURLMBS

Example:
dim f as FolderItem = GetFolderItem("/Volumes/Ablage1", FolderItem.PathTypeNative)
dim n as NSURLMBS = NSURLMBS.URLWithItem(f)
MsgBox n.absoluteString
36.10.145 **NSURLWithString(URL as string) as NSURLMBS**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSURL object initialized with a provided URL string.

See also:

- 36.10.146 **NSURLWithString(URL as string, baseURL as NSURLMBS) as NSURLMBS**

36.10.146 **NSURLWithString(URL as string, baseURL as NSURLMBS) as NSURLMBS**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an NSURL object initialized with a base URL and a relative string.

**Notes:**

This method allows you to create a URL relative to a base path or URL. For example, if you have the URL for a folder on disk and the name of a file within that folder, you can construct a URL for the file by providing the folders URL as the base path (with a trailing slash) and the filename as the string part.

This method expects URLString to contain only characters that are allowed in a properly formed URL. All other characters must be properly percent escaped. Any percent-escaped characters are interpreted using UTF-8 encoding.

See also:

- 36.10.145 **NSURLWithString(URL as string) as NSURLMBS**

36.10.147 **Properties**

36.10.148 **absoluteString as String**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The URL string for the receiver as an absolute URL.

**Notes:**

This property's value is calculated by resolving the receivers string against its base according to the algorithm given in RFC 1808.

(Read only property)
36.10. CLASS NSURLMBS

36.10.149  absoluteURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An absolute URL that refers to the same resource as the receiver. **Notes:**

If the URL is already absolute, this property contains a copy of the receiver. Resolution is performed per RFC 1808. (Read only property)

---

36.10.150  AddedToDirectoryDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time at which the resources was created or renamed into or within its parent directory, returned as an date. **Notes:**

Inconsistent behavior may be observed when this attribute is requested on hard-linked items. This property is not supported by all volumes. (read-only)

Available in OS X v10.10. (Read only property)

---

36.10.151  AttributeModificationDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Modification date. **Notes:**

The time at which the resources attributes were most recently modified, returned as an NSDate object if the volume supports attribute modification dates, or nil if attribute modification dates are unsupported.

Available in OS X v10.6 and later. (Read only property)

---

36.10.152  baseURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The base URL. **Notes:**

This property contains the base URL. If the receiver is an absolute URL, this property contains nil.
CHAPTER 36. COCOA NETWORKING

(Read only property)

36.10.153 ContentAccessDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time at which the resource was most recently accessed.

**Notes:**
Returned as date object if the volume supports access dates, or nil if access dates are unsupported.
Available in OS X v10.6 and later.
(Read only property)

36.10.154 ContentModificationDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The modification date.

**Notes:**
The time at which the resource was most recently modified, returned as a date object if the volume supports modification dates, or nil if modification dates are unsupported.

Available in OS X v10.6 and later.
(Read only property)

36.10.155 CreationDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The creation date.

**Notes:**
The resources creation date, returned as an NSDate object if the volume supports creation dates, or nil if creation dates are unsupported.
Available in OS X v10.6 and later.
(Read only property)

36.10.156 DocumentIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The document identifier returned as a number.

**Notes:**
The document identifier is a value assigned by the kernel to a file or directory. This value is used to identify the document regardless of where it is moved on a volume. The identifier persists across system restarts. It is not transferred when the file is copied, but it survives "safe save" operations. Document identifiers are only unique within a single volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.
(Read only property)

**36.10.157 EffectiveIcon as NSImageMBS**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resources normal icon, returned as an NSImage object. **Notes:**
Available in OS X v10.6 and later.
(Read only property)

**36.10.158 filePathURL as NSURLMBS**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A file path URL that points to the same resource as the URL object. **Notes:**
If the receiver is a file reference URL, this property contains a copy of the URL converted to a file path URL. If the receivers URL is a file path URL, this property contains the original URL. If the original URL is not a file URL, or if the resource is not reachable or no longer exists, this property contains nil.

Available in OS X v10.6 and later.
(Read only property)

**36.10.159 fileReferenceURL as NSURLMBS**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new file reference URL that points to the same resource as the receiver. **Notes:**
File reference URLs use a URL path syntax that identifies a file system object by reference, not by path. This form of file URL remains valid when the file system path of the URLs underlying resource changes.

If the original URL is a file path URL, this property contains a copy of the URL converted into a file reference URL. If the original URL is a file reference URL, this property contains the original. If the original URL is
CHAPTER 36. COCOA NETWORKING

not a file URL, this property contains nil.

File reference URLs cannot be created to file system objects which do not exist or are not reachable. This property contains nil instead.

In some areas of the file system hierarchy, file reference URLs cannot be generated to the leaf node of the URL path.

A file reference URL’s path should never be persistently stored, because it is not valid across system restarts or remounts of volumes. If you need to store a persistent reference to a file system object, use a bookmark instead. You can create a bookmark by calling bookmarkDataWithOptions.

Available in OS X v10.6 and later.
(Read only property)

36.10.160 FileResourceIdentifier as String

Notes: This identifier can be used to determine equality between file system resources with the isEqual: method. Two resources are equal if they have the same file-system path or if their paths link to the same inode on the same file system.

The value of this identifier is not persistent across system restarts.

Available in OS X v10.7 and later.
(Read only property)

36.10.161 FileResourceType as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The resources object type, returned as an NSString object.
Notes: See File Resource Types for possible values.
Available in OS X v10.7 and later.
(Read only property)
36.10. CLASS NSURLMBS

36.10.162 fileSystemRepresentation as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A string containing the URLs file system path.
Notes: (Read only property)

36.10.163 fragment as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The fragment identifier, conforming to RFC 1808. (read-only)
Notes: This property contains the URLs fragment. If the receiver does not conform to RFC 1808, this property contains nil. For example, in the URL http://www.example.com/index.html# jumpLocation, the fragment identifier is jumpLocation.
(Read only property)

36.10.164 GenerationIdentifier as String

Notes: The generation identifier can be compared using isEqual to determine if the data in a document has been modified. For URLs which refer to the same file inode, the generation identifier changes when the data in the file’s data fork is changed. Changes to extended attributes or other file system metadata do not change the identifier. For URLs which refer to the same directory inode, the generation identifier changes when direct children of that directory are added, removed or renamed. Changes to the data of the direct children of that directory does not change the generation identifier. The identifier persists across system restarts. It is tied to a specific document on a specific volume and is not transferred when the document is copied to another volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.
(Read only property)

36.10.165 Handle as Integer

Notes: Can be used as NSURL* or CFURLRef for declares.
36.10.166 HasHiddenExtension as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resources extension is normally removed from its localized name. **Notes:**

Returned as a Boolean (read-write).

(Read only property)

36.10.167 host as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The host, conforming to RFC 1808. (read-only) **Notes:**

This property contains the host. For example, in the URL http://www.example.com/index.html, the host is www.example.com.

If the receiver does not conform to RFC 1808, this property contains nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808 specifically, whether the first two characters of resourceSpecifier are slashes (//). (Read only property)

36.10.168 IsDirectory as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource is a directory. **Notes:**

Available in OS X v10.6 and later.

(Read only property)

36.10.169 IsExcludedFromBackup as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource is excluded from all backups of app data. **Notes:**
You can use this property to exclude cache and other app support files which are not needed in a backup. Some operations commonly made to user documents cause this property to be reset to false; consequently, do not use this property on user documents.

Available in OS X v10.8 and later.
(Read only property)

### 36.10.170 IsExecutable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for determining whether the current process (as determined by the EUID) can execute the resource (if it is a file) or search the resource (if it is a directory), returned as a Boolean.

**Notes:**
Available in OS X v10.7 and later.
(Read only property)

### 36.10.171 isFileReferenceURL as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the URL is a file reference URL. S

**Notes:** (Read only property)

### 36.10.172 isFileURL as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the scheme is file.

**Notes:**
if myURL.isFileURL is true, then myURL.path is suitable for input into NSFileManager or NSPathUtilities.
(Read only property)

### 36.10.173 IsHidden as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource is normally not displayed to users.

**Notes:**
If the resource is hidden because its name begins with a period, setting this value has no effect.
Available in OS X v10.6 and later.
36.10.174 IsMountTrigger as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the URL is a file system trigger directory, returned as a Boolean.
Notes:
Traversing or opening a file system trigger directory causes an attempt to mount a file system on the directory.
Available in OS X v10.7 and later.
(Read only property)

36.10.175 IsPackage as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the resource is a file package
Notes:
A true value means that the resource is a file package.
Available in OS X v10.6 and later.
(Read only property)

36.10.176 IsReadable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the current process (as determined by the EUID) can read the resource.
Notes:
Available in OS X v10.7 and later.
(Read only property)

36.10.177 IsRegularFile as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Determining whether the resource is a regular file, as opposed to a directory or a symbolic link.
Notes:
Available in OS X v10.6 and later.
(Read only property)
36.10.178  **IsSymbolicLink as Boolean**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource is a symbolic link.
**Notes:**
Available in OS X v10.6 and later.
(Read only property)

36.10.179  **IsSystemImmutable as Boolean**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource’s system immutable bit is set.
**Notes:**
Available in OS X v10.6 and later.
(Read only property)

36.10.180  **IsUserImmutable as Boolean**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource’s user immutable bit is set.
**Notes:**
Available in OS X v10.6 and later.
(Read only property)

36.10.181  **IsVolume as Boolean**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the resource is the root directory of a volume.
**Notes:**
Available in OS X v10.6 and later.
(Read only property)

36.10.182  **IsWritable as Boolean**

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the current process (as determined by the EUID) can write to the resource.
**Notes:**
36.10.183 Item as FolderItem

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: For the file URLs the corresponding folderitem. Notes: (Read only property)

36.10.184 LabelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The resources label color, returned as an NSColor object, or nil if the resource has no label color. Notes: Available in OS X v10.6 and later. (Read only property)

36.10.185 LabelNumber as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The resources label number. Notes: Available in OS X v10.6 and later. (Read only property)

36.10.186 lastPathComponent as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The last path component. (read-only) Notes: This property contains the last path component. For example, in the URL file:///path/to/file, the last path component is file. Available in OS X v10.6 and later. (Read only property)
36.10.187 LinkCount as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of hard links to the resource.
**Notes:**
Available in OS X v10.6 and later.
(Read only property)

36.10.188 LocalizedLabel as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resources localized label text, returned as a string, or empty if the resource has no localized label text.
**Notes:**
Available in OS X v10.6 and later.
(Read only property)

36.10.189 LocalizedName as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resources localized or extension-hidden name, returned as a string.
**Notes:**
Available in OS X v10.6 and later.
(Read only property)

36.10.190 LocalizedTypeDescription as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resources localized type description, returned as a string.
**Notes:**
Available in OS X v10.6 and later.
(Read only property)

36.10.191 Name as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resources name in the file system, returned as a string.
Notes:
Available in OS X v10.6 and later.
(Read only property)

36.10.192  parameterString as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The parameter string conforming to RFC 1808. (read-only)
Notes:
This property contains the parameter string. If the receiver does not conform to RFC 1808, this property contains nil. For example, in the URL file:///path/to/file;foo, the parameter string is foo.
This property should not be confused with the query property, which also often contains a string of parameters.
(Read only property)

36.10.193  ParentDirectoryURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The parent directory of the resource, returned as an NSURLMBS object, or nil if the resource is the root directory of its volume.
Notes:
Available in OS X v10.6 and later.
(Read only property)

36.10.194  password as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The password conforming to RFC 1808. (read-only)
Notes:
This property contains the password. If the receiver does not conform to RFC 1808, it contains nil. For example, in the URL http://username:password@www.example.com/index.html, the password is password.
(Read only property)
36.10.195 path as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path, conforming to RFC 1808. (read-only)

**Notes:**
This property contains the path, unescaped with the stringByReplacingPercentEscapesUsingEncoding: method. If the receiver does not conform to RFC 1808, this property contains nil.

If the receiver contains a file or file reference URL (as determined with isFileURL), this property's value is suitable for input into methods of NSFileManager or NSPathUtilities. If the path has a trailing slash, it is stripped.

If the receiver contains a file reference URL, this property's value provides the current path for the referenced resource, which may be nil if the resource no longer exists.

If the parameterString property contains a non-nil value, the path may be incomplete. If the receiver contains an unencoded semicolon, the path property ends at the character before the semicolon. The remainder of the URL is provided in the parameterString property.

To obtain the complete path, if parameterString contains a non-nil value, append a semicolon, followed by the parameter string.

Per RFC 3986, the leading slash after the authority (host name and port) portion is treated as part of the path. For example, in the URL http://www.example.com/index.html, the path is /index.html.

Available in OS X v10.8 and later.
(Read only property)

36.10.196 pathExtension as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path extension. (read-only)

**Notes:**
This property contains the path extension. For example, in the URL file:///path/to/file.txt, the path extension is txt.
Available in OS X v10.6 and later.
(Read only property)
36.10.197  port as Integer

**Function:** The port, conforming to RFC 1808. (read-only)  
**Notes:**
This property contains the port number. For example, in the URL http://www.example.com:8080/index.php, the port number is 8080.

If the receiver does not conform to RFC 1808, this property contains nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808 specifically, whether the first two characters of resourceSpecifier are slashes (/).  
(Read only property)

36.10.198  PreferredIOBlockSize as Integer

**Function:** The preferred block size.  
**Notes:**
The optimal block size to use when reading or writing this file’s data, returned as an integer, or zero if the preferred size is not available (read-only).  
Available in OS X v10.7 and later.  
(Read only property)

36.10.199  QuarantineProperties as Dictionary

**Function:** The quarantine properties as defined in LSQuarantine.h.  
**Notes:**
Available on Mac OS X 10.10 and later.  
(Read only property)

36.10.200  query as String

**Function:** The query string, conforming to RFC 1808. (read-only)  
**Notes:**
This property contains the query string. If the receiver does not conform to RFC 1808, this property contains nil. For example, in the URL http://www.example.com/index.php?key1=value1& key2=value2, the query string is key1=value1& key2=value2.
36.10. CLASS NSURLMBS

(Read only property)

36.10.201  relativePath as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The relative path, conforming to RFC 1808. (read-only)
Notes:
This property contains the relative path of the receivers URL without resolving against its base URL. If the path has a trailing slash it is stripped. If the receiver is an absolute URL, this property contains the same value as path. If the receiver does not conform to RFC 1808, it contains nil.
(Read only property)

36.10.202  relativeString as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A string representation of the relative portion of the URL. (read-only)
Notes:
This property contains a string representation of the relative portion of the URL. If the receiver is an absolute URL this method returns the same value as absoluteString.
(Read only property)

36.10.203  resourceSpecifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The resource specifier. (read-only)
Notes:
This property contains the resource specifier. For example, in the URL http://www.example.com/index.html?key1=value1#jumplink, the resource specifier is //www.example.com/index.html?key1=value1#jumplink (everything after the colon).
(Read only property)

36.10.204  scheme as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The scheme. (read-only)
Notes:
This property contains the scheme. For example, in the URL http://www.example.com/index.html, the
scheme is http.

The full URL is the concatenation of the scheme, a colon (:), and the value of resourceSpecifier.

The term "protocol" is also sometimes used when talking about network-based URL schemes. However, not all URL schemes are networking protocols, data:// URLs, for example.

(Read only property)

36.10.205  standardizedURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A copy of the URL with any instances of "." or "." removed from its path. (read-only) **Notes:**

This property contains a new NSURL object, initialized using the receivers path with any instances of "." or "." removed.

If the URL conforms to RFC 1808 (the most common form of URL), this property contains the specified URL component; otherwise it contains nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808 specifically, whether the first two characters of resourceSpecifier are slashes (/\/).

(Read only property)

36.10.206  TypeIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resources uniform type identifier (UTI), returned as a string.

**Notes:**

Available in OS X v10.6 and later.

(Read only property)

36.10.207  user as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The user name, conforming to RFC 1808. (read-only) **Notes:**

This property contains the user name. For example, in the URL ftp://username@www.example.com/, the user name is username.
If the receiver's URL does not conform to RFC 1808, this property returns nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808 specifically, whether the first two characters of resourceSpecifier are slashes (//).

(Read only property)

### 36.10.208 VolumeIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The unique identifier of the resources volume, returned as an id.

**Notes:**

The unique identifier of the resources volume, returned as an id (read-only).
This identifier can be used with the isEqual method to determine whether two file system resources are on the same volume.
The value of this identifier is not persistent across system restarts.
Available in OS X v10.7 and later.
(Read only property)

### 36.10.209 VolumeURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The root directory of the resources volume, returned as an NSURL object.

**Notes:**

Available in OS X v10.6 and later.
(Read only property)
36.11 class NSURLProtectionSpaceMBS

36.11.1 class NSURLProtectionSpaceMBS

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for the Cocoa URL protection space class. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

36.11.2 Methods

36.11.3 authenticationMethod as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the authentication method to be used for this protection space

36.11.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

36.11.5 host as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the proxy host if this is a proxy authentication, or the host from the URL. **Notes:** Returns the host for this protection space.

36.11.6 isProxy as boolean

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Determine if this authenticating protection space is a proxy server **Notes:** Returns true if a proxy, false otherwise.

36.11.7 port as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get the proxy port if this is a proxy authentication, or the port from the URL.
36.11. CLASS NSURLPROTECTIONSPACEMBS

Notes: Returns the port for this protection space, or 0 if not set.

36.11.8 protocol as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Get the protocol of this protection space, if not a proxy.
Notes: Returns the type string, or "" if a proxy.

36.11.9 proxyType as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Get the type of this protection space, if a proxy.
Notes: Returns the type string, or "" if not a proxy.

36.11.10 realm as string

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Get the authentication realm for which the protection space that needs authentication
Notes: This is generally only available for http authentication, and may be "" otherwise.

36.11.11 receivesCredentialSecurely as boolean

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Determine if the password for this protection space can be sent securely
Notes: True if a secure authentication method or protocol will be used, false otherwise.

36.11.12 Properties

36.11.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The internal used handle for this class.
Notes: (Read and Write property)
36.12 class NSURLRequestCertificateFilterMBS

36.12.1 class NSURLRequestCertificateFilterMBS

MBS MacCocoa Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to filter certificate requests. **Notes:** This is the only way to fix the problem with the webview that certificates which are not valid can still be used.

36.12.2 Events

36.12.3 allowsAnyHTTPSCertificateForHost(host as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An event being called for each host which may have a https certificate. **Notes:**

This event is called very often, so make it very fast.
Also this event is often called with the same host value as it is called for each request.

Return true to allow this host to run without a valid https certificate.
# 36.13. class NSURLRequestMBS

## 36.13.1 class NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An NSURLRequest object represents a URL load request in a manner independent of protocol and URL scheme.  
**Example:**

```markdown
msgbox HTMLViewer1.mainFrameMBS.DataSource.Request.url
```

**Notes:**

NSURLRequest encapsulates two basic data elements about a URL load request:

The URL to load.  
The policy to use when consulting the URL content cache made available by the implementation.

## 36.13.2 Methods

### 36.13.3 allHTTPHeaderFields as Dictionary

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary of the HTTP header fields associated with the receiver.

### 36.13.4 cachePolicy as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the cache policy of the request.  
**Example:**

```markdown
dim r as NSURLRequestMBS
r=new NSURLRequestMBS("http://www.apple.com",0,5.0)
MsgBox str(r.cachePolicy)
```

**Notes:** Value is one of the constants in this class.
36.13.5 Constructor(url as string)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSURLRequest with the given URL.

**Example:**

```vbnet
dim r as NSURLConnection
r=new NSURLConnection("http://www.apple.com")
```

**Notes:**
Default values are used for cache policy (NSURLRequestUseProtocolCachePolicy) and timeout interval (60 seconds).
On success, handle property is not zero.

See also:
- 36.13.6 Constructor(url as string, cachePolicy as Integer, timeoutInterval as Double)

36.13.6 Constructor(url as string, cachePolicy as Integer, timeoutInterval as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSURLRequest with the given URL.

**Example:**

```vbnet
dim r as NSURLConnection
r=new NSURLConnection("http://www.apple.com",NSURLRequestMBS.NSURLRequestReturnCacheDataElseLoad,5.0)
```

**Notes:** On success, handle property is not zero.

See also:
- 36.13.5 Constructor(url as string)

36.13.7 copy as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the request.

**Example:**

```vbnet
// create PUT request
dim m as new NSMutableURLRequestMBS("http://test.test")
m.setHTTPMethod "PUT"

// make a copy
```
dim r as NSURLRequestMBS = m.copy

// change first request to POST
m.setHTTPMethod "POST"

// and check values
MsgBox m.HTTPMethod+ " " + r.HTTPMethod

36.13.8 HTTPBody as memoryblock

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the body of the request.  
**Notes:** This is the data sent in a POST request.

36.13.9 HTTPMethod as string

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the HTTP method associated with the receiver.  
**Example:**

```cpp
dim m as new NSMutableURLRequestMBS("http://test.test")
m.setHTTPMethod "PUT"
MsgBox m.HTTPMethod
```

36.13.10 HTTPShouldHandleCookies as boolean

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a flag indicating whether this request should use standard cookie handling (sending of cookies with the request and storing any cookies returned in the response.

36.13.11 HTTPShouldUsePipelining as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reports whether the receiver is not expected to wait for the previous response before transmitting.  
**Notes:**

Returns true if the receiver should transmit before the previous response is received. False if the receiver should wait for the previous response before transmitting.
Available in Mac OS X 10.7 or newer.

### 36.13.12 `isHTTPRequest` as boolean

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this is an HTTP request. **Notes:** If true, the `allHTTPHeaderFields`, `HTTPShouldHandleCookies`, `HTTPMethod` and `HTTPBody` methods do work.

### 36.13.13 `mainDocumentURL` as string

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The main document URL associated with this load. **Example:**

```perl
dim m as new NSURLConnectionMBS("http://test.test/test.jpg")
m.setMainDocumentURL "http://test.test/"
MsgBox m.mainDocumentURL
```

**Notes:**
This URL is used for the cookie "same domain as main document" policy. There may also be other future uses.

**NOTE:** In the current implementation, this value is unused by the webkit framework. A fully functional version of this method will be available in the future.

### 36.13.14 `mutableCopy` as `NSMutableURLRequestMBS`

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an editable copy of the request. **Example:**

```perl
// create PUT request
dim m as new NSURLConnectionMBS("http://test.test")
m.setHTTPMethod "PUT"

// make a copy
dim r as NSMutableURLRequestMBS = m.mutableCopy

// change request to POST
```

r.setHTTPMethod "POST"

// and check values
MsgBox m.HTTPMethod+ " " +r.HTTPMethod

36.13.15 networkServiceType as Integer

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the service type associated with this request. Notes: This will return NSURLNetworkServiceTypeDefault for requests that have not explicitly set a networkServiceType (using the setNetworkServiceType method). See NSURLNetworkServiceType* constants.

Available in Mac OS X 10.7 or newer.

36.13.16 requestWithHandle(Handle as Integer) as NSURLRequestMBS

36.13.17 requestWithURL(url as string) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates an NSURLRequest with the given URL. Example:

dim r as NSURLRequestMBS

r=r.requestWithURL("http://www.apple.com",0,5.0)

Notes: Default values are used for cache policy (NSURLRequestUseProtocolCachePolicy) and timeout interval (60 seconds). See also:

• 36.13.18 requestWithURL(url as string, cachePolicy as Integer, timeoutInterval as Double) as NSURLRequestMBS
36.13.18 requestWithURL(url as string, cachePolicy as Integer, timeoutInterval as Double) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an NSURLRequest with the given URL.

**Example:**

```vba
dim r as NSURLRequestMBS

r=r.requestWithURL("http://www.apple.com", NSURLRequestMBS.NSURLRequestUseProtocolCachePolicy, 5.0)
```

See also:

- 36.13.17 requestWithURL(url as string) as NSURLRequestMBS

36.13.19 timeoutInterval as Double

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the timeout interval of the request.

**Example:**

```vba
dim r as NSURLRequestMBS

r=new NSURLRequestMBS("http://www.apple.com",0,5.0)

MsgBox str(r.timeoutInterval)
```

**Notes:** The timeout interval specifies the limit on the idle interval allotted to a request in the process of loading. The "idle interval" is defined as the period of time that has passed since the last instance of load activity occurred for a request that is in the process of loading. Hence, when an instance of load activity occurs (e.g. bytes are received from the network for a request), the idle interval for a request is reset to 0. If the idle interval ever becomes greater than or equal to the timeout interval, the request is considered to have timed out. This timeout interval is measured in seconds.

36.13.20 URL as string

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the URL of the request.

**Example:**

```vba
dim r as NSURLRequestMBS
```
r=new NSURLRequestMBS("http://www.apple.com")

MsgBox r.URL

36.13.21 `valueForHTTPHeaderField(field as string) as string`

MBS MacBase Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value of the specified HTTP header field.

**Example:**

dim m as new NSMutableURLRequestMBS("http://test.test")
m.setValue("just a test", "test")
MsgBox m.valueForHTTPHeaderField("test")

**Notes:**

- field: The name of the header field whose value is to be returned. In keeping with the HTTP RFC, HTTP header field names are case-insensitive.

- Returns the value associated with the header field field, or "" if there is no corresponding header field.

36.13.22 **Properties**

36.13.23 **Handle as Integer**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The reference to the internal used NSURLRequest object.

**Notes:** (Read and Write property)

36.13.24 **Constants**

36.13.25 `NSURLNetworkServiceTypeBackground = 3`

MBS MacBase Plugin, Plugin Version: 11.3. **Function:** One of the constants that can be used to specify the service type to associate with this request.

**Notes:**

- Specifies that the request is for background traffic (such as a file download).
- The service type is used to provide the networking layers a hint of the purpose of the request.
36.13.26 NSURLNetworkServiceTypeDefault = 0

MBS MacBase Plugin, Plugin Version: 11.3. **Function:** One of the constants that can be used to specify the service type to associate with this request.

**Notes:**

Is the default value for an NSURLRequest when created. This value should be left unchanged for the vast majority of requests.
The service type is used to provide the networking layers a hint of the purpose of the request.

36.13.27 NSURLNetworkServiceTypeVideo = 2

MBS MacBase Plugin, Plugin Version: 11.3. **Function:** One of the constants that can be used to specify the service type to associate with this request.

**Notes:**

Specifies that the request is for video traffic.
The service type is used to provide the networking layers a hint of the purpose of the request.

36.13.28 NSURLNetworkServiceTypeVoice = 4

MBS MacBase Plugin, Plugin Version: 11.3. **Function:** One of the constants that can be used to specify the service type to associate with this request.

**Notes:**

Specifies that the request is for voice data.
The service type is used to provide the networking layers a hint of the purpose of the request.

36.13.29 NSURLNetworkServiceTypeVoIP = 1

MBS MacBase Plugin, Plugin Version: 11.3. **Function:** One of the constants that can be used to specify the service type to associate with this request.

**Notes:**

Specifies that the request is for voice over IP control traffic.
The service type is used to provide the networking layers a hint of the purpose of the request.
### 36.13.30 `NSURLRequestReloadIgnoringCacheData = 1`

MBS MacBase Plugin, Plugin Version: 7.2. **Function:** A constant that can be used to specify the type of interactions that take place with the caching system when the URL loading system processes a request. **Notes:**

Specifically, these constants cover interactions that have to do with whether already-existing cache data is returned to satisfy a URL load request.

`NSURLRequestReloadIgnoringCacheData` Specifies that the data for the URL load should be loaded from the origin source. No existing cache data, regardless of its freshness or validity, should be used to satisfy a URL load request.

### 36.13.31 `NSURLRequestReloadIgnoringLocalAndRemoteCacheData = 4`

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** A constant that can be used to specify the type of interactions that take place with the caching system when the URL loading system processes a request. **Notes:**

Specifies that not only should the local cache data be ignored, but that proxies and other intermediates should be instructed to disregard their caches so far as the protocol allows.

Available in Mac OS X v10.5 and later.

### 36.13.32 `NSURLRequestReloadRevalidatingCacheData = 5`

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** A constant that can be used to specify the type of interactions that take place with the caching system when the URL loading system processes a request. **Notes:**

Specifies that the existing cache data may be used provided the origin source confirms its validity, otherwise the URL is loaded from the origin source.

Available in Mac OS X v10.5 and later.

### 36.13.33 `NSURLRequestReturnCacheDataDontLoad = 3`

MBS MacBase Plugin, Plugin Version: 7.2. **Function:** A constant that can be used to specify the type of interactions that take place with the caching system when the URL loading system processes a request. **Notes:**
Specifically, these constants cover interactions that have to do with whether already-existing cache data is returned to satisfy a URL load request.

NSURLRequestReturnCacheDataDontLoad Specifies that the existing cache data should be used to satisfy a URL load request, regardless of its age or expiration date. However, if there is no existing data in the cache corresponding to a URL load request, no attempt is made to load the URL from the origin source, and the load is considered to have failed. This constant specifies a behavior that is similar to an "offline" mode.

36.13.34 NSURLRequestReturnCacheDataElseLoad = 2

MBS MacBase Plugin, Plugin Version: 7.2. **Function:** A constant that can be used to specify the type of interactions that take place with the caching system when the URL loading system processes a request. **Notes:**

Specifically, these constants cover interactions that have to do with whether already-existing cache data is returned to satisfy a URL load request.

NSURLRequestReturnCacheDataElseLoad Specifies that the existing cache data should be used to satisfy a URL load request, regardless of its age or expiration date. However, if there is no existing data in the cache corresponding to a URL load request, the URL is loaded from the origin source.

36.13.35 NSURLRequestUseProtocolCachePolicy = 0

MBS MacBase Plugin, Plugin Version: 7.2. **Function:** A constant that can be used to specify the type of interactions that take place with the caching system when the URL loading system processes a request. **Notes:**

Specifically, these constants cover interactions that have to do with whether already-existing cache data is returned to satisfy a URL load request.

NSURLRequestUseProtocolCachePolicy Specifies that the caching logic defined in the protocol implementation, if any, is used for a particular URL load request. This is the default policy for URL load requests.
36.14. class NSURLResponseMBS

36.14.1 class NSURLResponseMBS

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
An NSURLResponse object represents a URL load response in a manner independent of protocol and URL scheme.

**Notes:**
NSURLResponse encapsulates the metadata associated with a URL load. Note that NSURLResponse objects do not contain the actual bytes representing the content of a URL.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

36.14.2 Methods

36.14.3 allHeaderFields as Dictionary

MBS MacBase Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns all the HTTP header fields of the receiver.

**Notes:** A dictionary containing all the HTTP header fields of the receiver. By examining this dictionary clients can see the "raw" header information returned by the HTTP server.

36.14.4 Constructor(URL as string, MimeType as string, expectedContentLength as Integer, textEncodingName as string)

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Initialize an NSURLResponse with the provided values.

**Notes:**
URL: the URL
MIMETYPE: the MIME content type of the response
expectedContentLength: the expected content length of the associated data
textEncodingName: the name of the text encoding for the associated data, if applicable, else "."

Use -1 for an unknown length.
See also FileExtensionToMimeTypeMBS function.
36.14.5  **copy as NSURLResponseMBS**

MBS MacBase Plugin, Plugin Version: 9.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Creates a copy of the object.
**Notes:** Makes a copy of the RB object and the NSURLResponse object behind.

36.14.6  **expectedContentLength as int64**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Returns the expected content length of the response.
**Notes:**
Some protocol implementations report a content length as part of delivering load metadata, but not all protocols guarantee the amount of data that will be delivered in actuality.
Hence, this method returns an expected amount. Clients should use this value as an advisory, and should be prepared to deal with either more or less data.

Returns the expected content length of the receiver, or -1 if there is no expectation that can be arrived at regarding expected content length.

36.14.7  **isHTTPRequest as boolean**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Whether this response is a http response.
**Notes:** the StatusCode property can only be used on HTTP Responses.

36.14.8  **localizedStringForStatusCode(statusCode as Integer) as string**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Convenience method which returns a localized string corresponding to the status code for this response.
**Notes:**
statusCode: the status code to use to produce a localized string.
Returns a localized string corresponding to the given status code or an empty string.

36.14.9  **MIMEType as string**

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Returns the MIME type of the response.
**Example:**
Notes:
The MIME type is based on the information provided from an origin source. However, that value may be changed or corrected by a protocol implementation if it can be determined that the origin server or source reported the information incorrectly or imprecisely. An attempt to guess the MIME type may be made if the origin source did not report any such information.
See also FileExtensionToMimeTypeMBS function.

36.14.10 statusCode as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the HTTP status code of the response.
**Notes:**
Returns -1 if no statuscode is available (e.g. in case this is no ta http response)
See also: localizedStringForStatusCode

36.14.11 suggestedFilename as string

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a suggested filename if the resource were saved to disk.
**Notes:**
The method first checks if the server has specified a filename using the content disposition header. If no valid filename is specified using that mechanism, this method checks the last path component of the URL. If no valid filename can be obtained using the last path component, this method uses the URL’s host as the filename.
If the URL’s host can’t be converted to a valid filename, the filename "unknown" is used. In mose cases, this method appends the proper file extension based on the MIME type. This method always returns a valid filename.

36.14.12 textEncodingName as string

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the name of the text encoding of the response.
**Notes:**
This name will be the actual string reported by the origin source during the course of performing a protocol-specific URL load. Clients can inspect this string and convert it to a TextEncoding using the methods and
functions made available in the appropriate framework.

Returns the name of the text encoding of the response, or an empty string if no text encoding was specified.

### 36.14.13 URL as string

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the URL of the response.

**Example:**

```
msgbox HTMLViewer1.mainFrameMBS.DataSource.response.URL
```

### 36.14.14 Properties

#### 36.14.15 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal used reference to the NSURLResponse object.

**Notes:** (Read and Write property)

### 36.14.16 Constants

#### 36.14.17 NSURLResponseUnknownLength=-1

MBS MacBase Plugin, Plugin Version: 9.6. **Function:** The constant for use with expectedContentLength for an unknown length.
Chapter 37

Cocoa Printing

37.1  class NSPageLayoutMBS

37.1.1  class NSPageLayoutMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSPageLayout is a panel that queries the user for information such as paper type and orientation. **Notes:** It is normally displayed in response to the user selecting the Page Setup menu item. You obtain an instance with the pageLayout class method. The pane can then be run as a sheet using beginSheetWithPrintInfo or modally using runModal or runModalWithPrintInfo.

37.1.2  Methods

37.1.3  beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Presents a page setup sheet for the given NSPrintInfo object, document-modal relative to the given window. **Notes:** printInfo: The NSPrintInfo object to use. win: The window to which the sheet is attached.

This method calls the printPanelDidEnd event later passing returnCode which is either NSCancelButton (0) or NSOKButton (1). See also:

7205
CHAPTER 37. COCOA PRINTING

- 37.1.4 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window)

37.1.4 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Presents a page setup sheet for the given NSPrintInfo object, document-modal relative to the given window.

**Notes:**

printInfo: The NSPrintInfo object to use.
win: The window to which the sheet is attached.

This method calls the printPanelDidEnd event later passing returnCode which is either NSCancelButton (0) or NSOKButton (1).

See also:

- 37.1.3 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS)

37.1.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a new page layout object.

37.1.6 pageLayout as NSPageLayoutMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a newly created NSPageLayout object.

37.1.7 printInfo as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSPrintInfo object used when the receiver is run.

**Notes:** The NSPrintInfo object is set using the beginSheetWithPrintInfo or runModalWithPrintInfo method. The shared NSPrintInfo object is used if the receiver is run using runModal.

37.1.8 runModal as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Displays the receiver and begins the modal loop using the shared NSPrintInfo object.

**Example:**
37.1. CLASS NSPAGELAYOUTMBS

```vbnet
dim p as new NSPageLayoutMBS
MsgBox str(p.runModal)
```

**Notes:**

Returns NSCancelButton (0) if the user clicks the Cancel button; otherwise, NSOKButton (1).
The receiver's values are recorded in the shared NSPrintInfo object.

### 37.1.9 runModalWithPrintInfo(printInfo as NSPrintInfoMBS) as Integer

**Function:** Displays the receiver and begins the modal loop using the given NSPrintInfo object.

**Notes:**

`printInfo`: The NSPrintInfo object to use.

Returns NSCancelButton if the user clicks the Cancel button; otherwise, NSOKButton.
The receiver's values are recorded in `printInfo`.

### 37.1.10 runPageLayout

**Function:** Displays the app's page layout panel, an instance of NSPageLayout.

**Example:**

```vbnet
NSPageLayoutMBS.runPageLayout
```

**Notes:** If the NSPageLayout instance does not exist, this method creates one. This method is typically
invoked when the user chooses Page Setup from the application's File menu.

### 37.1.11 Properties

#### 37.1.12 Handle as Integer

**Function:** The internal object reference.

**Notes:** (Read and Write property)
37.1.13 Events

37.1.14 printPanelDidEnd(returnCode as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when the sheet is dismissed.
37.2. CLASS NSPRINTERMBS

37.2 class NSPrinterMBS

37.2.1 class NSPrinterMBS

Function: An NSPrinter object describes a printer’s capabilities as defined in its PPD file.

Example:

```vba
Dim p As NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox p.name + vbCrLf + p.type
```

Notes: An NSPrinter object can be constructed by specifying either the printer name or the make and model of an available printer. You use a printer object to get information about printers, not to modify printer attributes or control a printing job.

37.2.2 Methods

37.2.3 booleanForKey(key as string, table as string) as boolean

Function: Returns the Boolean value associated with the specified key.

Notes:

- key: The key whose value you want.
- table: The name of a table from the printer’s PPD file.

Returns the Boolean value associated with the key. Returns false if the key is not in the table or the receiver lacks a PPD file.

37.2.4 Constructor(name as string = "")

Function: Initializes a printer object.

Notes:

- On success the handle property is not zero.
- Name can be empty to pick default printer. Else pass name of printer.
37.2.5 copy as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a clone of the printer object.

37.2.6 defaultPrinter as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default printer.

**Example:**

```lisp
dim p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox p.name
```

37.2.7 deviceDescription as Dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a dictionary of keys and values describing the device.

**Notes:** A dictionary of the device properties. See NSGraphics.h for possible keys. The only key guaranteed to exist is NSDeviceIsPrinter.

37.2.8 floatForKey(key as string, table as string) as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the floating-point value associated with the specified key.

**Notes:**

key: The key whose value you want.
table: The name of a table from the printer’s PPD file.

Returns the floating-point value. Returns 0.0 if the key is not in the table or the receiver lacks a PPD file.

37.2.9 intForKey(key as string, table as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the integer value associated with the specified key.

**Notes:**

key: The key whose value you want.
37.2. CLASS NSPRINTERMBS

**table**: The name of a table from the printer’s PPD file.

Returns the integer value. Returns 0 if the key is not in the table or the receiver lacks a PPD file.

### 37.2.10 isKey(key as string, table as string) as boolean

**Function**: Returns a Boolean value indicating whether the specified key is in the specified table.

**Notes**:
- **key**: The key whose value you want.
- **table**: The name of a table from the printer’s PPD file.
- Returns true if the key is in the table; otherwise, false.

### 37.2.11 languageLevel as Integer

**Function**: Returns the PostScript language level recognized by the printer.

**Example**:
```pascal
dim p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox "languageLevel: " + str(p.languageLevel)
```

**Notes**: Returns the PostScript language level. The value is 0 if the receiver is not a PostScript printer.

### 37.2.12 name as string

**Function**: Returns the printer’s name.

**Example**:
```pascal
dim p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox p.name
```

### 37.2.13 pageSizeForPaper(paperName as string) as NSSizeMBS

**Function**: Returns the size of the page for the specified paper type.
CHAPTER 37. COCOA PRINTING

Notes:

paperName: Possible values are printer-dependent and are contained in the printer's PPD file. Typical values are "Letter" and "Legal".

Returns the size of the page, measured in points in the user coordinate space. The returned size is zero if the specified paper name is not recognized or its entry in the PPD file cannot be parsed.

37.2.14 printerNames as string()

Example:
MsgBox Join(NSPrinterMBS.printerNames, EndOfLine)

Notes:

An array of strings, each of which contains the name of an available printer.
The user constructs the list of available printers using the Print Center application.

37.2.15 printerTypes as string()

Notes: An array of strings, each of which contains the make and model information for a supported printer.

37.2.16 printerWithName(name as string) as NSPrinterMBS

Notes:
name: The name of the printer.

Returns an initialized NSPrinter object, or nil if the specified printer was not available.
37.2. CLASS NSPRINTERMBS

37.2.17 printerWithType(type as string) as NSPrinterMBS

Function: Creates and returns an NSPrinter object initialized to the first available printer with the specified
make and model information.
Notes:
type: A string describing the make and model information. You can get this string using the printerTypes
method.

Returns an initialized NSPrinter object, or nil if the specified printer was not available.

37.2.18 rectForKey(key as string, table as string) as NSRectMBS

Function: Returns the rectangle associated with the specified key.
Notes:
key: The key whose value you want.
table: The name of a table from the printer’s PPD file.

Returns the rectangle value. Returns NSRectMBS.Zero if the key is not in the table or the receiver lacks a
PPD file.

37.2.19 sizeForKey(key as string, table as string) as NSSizeMBS

Function: Returns the size data type associated with the specified key.
Notes:
key: The key whose value you want.
table: The name of a table from the printer’s PPD file.

Returns the size value. Returns NSZeroSize if the key is not in the table or the receiver lacks a PPD file.

37.2.20 statusForTable(paperName as string) as Integer

Function: Returns the status of the specified table.
Notes:
table: The name of a table from the printer’s PPD file.

Returns one of the return values described in Constants.

### 37.2.21 stringForKey(key as string, table as string) as string

**Function:** Returns the first occurrence of a value associated with specified key.
**Notes:**
- key: The key whose value you want.
- table: The name of a table from the printer’s PPD file.

Returns the value for the specified key, or nil if the key is not in the table. The returned string may also be empty.

If key is a main keyword only, and if that keyword has options in the PPD file, this method returns an empty string. Use stringListForKey to retrieve the values for all occurrences of a main keyword.

### 37.2.22 stringListForKey(key as string, table as string) as string()

**Function:** Returns an array of strings, one for each occurrence, associated with specified key.
**Notes:**
- key: The key whose value you want.
- table: The name of a table from the printer’s PPD file.

Returns an array of strings, each containing a value associated with the specified key. Returns nil if the key is not in the table.

### 37.2.23 type as string

**Function:** Returns a description of the printer’s make and model.
**Example:**

```
dim p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox p.type
```
37.2. CLASS NSPRINTERMBS

37.2.24 Properties

37.2.25 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

37.2.26 Constants

37.2.27 NSPrinterTableError = 2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the state constants for printer information table.  
**Notes:** Printer table is not valid.

37.2.28 NSPrinterTableNotFound = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the state constants for printer information table.  
**Notes:** Printer table was not found.

37.2.29 NSPrinterTableOK = 0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the state constants for printer information table.  
**Notes:** Printer table was found and is valid.
37.3 class NSPrintInfoMBS

37.3.1 class NSPrintInfoMBS

Function: An NSPrintInfo object stores information that’s used to generate printed output.

Example:

```dim p as new PrinterSetup```
```dim n as new NSPrintInfoMBS```
```n.SetupString = p.SetupString```
```dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")```
```n.SetSaveDestination(f)```
```p.SetupString = n.SetupString```
```dim g as Graphics = OpenPrinter(p)```
```g.DrawString "Hello World", 20, 20```

Notes:

- A shared NSPrintInfo object is automatically created for an application and is used by default for all printing jobs for that application.

- The printing information in an NSPrintInfo object is stored in a dictionary. To access the standard attributes in the dictionary directly, this class defines a set of keys and provides the dictionary method. You can also initialize an instance of this class using the Constructor method.

- You can use this dictionary to store custom information associated with a print job. Any non-object values should be stored as NSNumber or NSValue objects in the dictionary. See NSNumber Class Reference for a list of types which should be stored as numbers. For other non-object values, use the NSValue class.

- Beginning with OS X v10.5, to store custom information that belongs in printing presets you should use the dictionary returned by the printSettings method.
37.3. CLASS NSPRINTINFOMBS

37.3.2 Methods

37.3.3 Constructor

Function: Initializes the print info with a new instance.
Example:

```vbs
// get Xojo printer setup
dim p as new PrinterSetup

// now put it into NSPrintInfo to manipulate
dim n as new NSPrintInfoMBS
n.SetupString = p.SetupString

// change destination to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
n.SetSaveDestination(f)

// move back
p.SetupString = n.SetupString

// and print as usual
dim g as Graphics = OpenPrinter(p)
g.DrawString "Hello World", 20, 20
```

See also:

- 37.3.4 Constructor(attributes as Dictionary) 7217
- 37.3.5 Constructor(Data as Memoryblock) 7218

37.3.4 Constructor(attributes as Dictionary)

Function: Initialize the print info with the parameters in the specified dictionary.
See also:

- 37.3.3 Constructor 7217
- 37.3.5 Constructor(Data as Memoryblock) 7218
37.3.5 Constructor (Data as Memoryblock)

MBS MacCocoa Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initialize the print info with serialized dictionary or NSPrintInfo.

**Example:**

```vbscript
dim p as new PrinterSetup
dim info as new NSPrintInfoMBS(p.SetupString)
MsgBox info.paperName
```

See also:

- 37.3.3 Constructor
- 37.3.4 Constructor (attributes as Dictionary)

37.3.6 copy as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the object.

37.3.7 defaultPrinter as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the default printer.

37.3.8 NSPrintAllPages as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo.

**Notes:** A boolean.

37.3.9 NSPrintBottomMargin as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the dictionary keys to access pagination attributes.

**Notes:** Number, containing a floating-point value that specifies the bottom margin, in points.
37.3. **CLASS NSPRINTINFOMBS**

### 37.3.10 NSPrintCancelJob as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible job disposition values. **Notes:** Cancel print job.

### 37.3.11 NSPrintCopies as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo. **Notes:** a number containing the number of copies of the print job to be printed

### 37.3.12 NSPrintDetailedErrorReporting as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo. **Notes:** A boolean.

### 37.3.13 NSPrintFaxNumber as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo. **Notes:** A string containing a fax number.

### 37.3.14 NSPrintFirstPage as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo. **Notes:** A number containing the one-based index of the first job in the page to print.

### 37.3.15 NSPrintHeaderAndFooter as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo. **Notes:** A boolean for whether the results of NSView pageHeader and NSView pageFooter should be drawn on pages
37.3.16  **NSPrintHorizontallyCentered as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the dictionary keys to access pagination attributes.  **Notes:** Number, containing a Boolean value that is true if pages are centered horizontally.

37.3.17  **NSPrintHorizontalPagination as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the dictionary keys to access pagination attributes.  **Notes:** Number, containing a NSPrintingPaginationMode value. NSAutoPagination, NSFitPagination, or NSClipPagination. See HorizontalPagination for details.

37.3.18  **NSPrintJobDisposition as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the dictionary keys to access pagination attributes.  **Notes:** A string equal to NSPrintSpoolJob, NSPrintPreviewJob, NSPrintSaveJob, or NSPrintCancelJob.

37.3.19  **NSPrintJobSavingFileNameExtensionHidden as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the dictionary keys to access pagination attributes.  **Notes:** A boolean for whether the job file’s name extension should be hidden, for NSPrintSaveJob.  Available on Mac OS X 10.6.

37.3.20  **NSPrintJobSavingURL as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** One of the dictionary keys to access pagination attributes.  **Notes:** An URL containing the location to which the job file will be saved, for NSPrintSaveJob.  Available on Mac OS X 10.6.
37.3. CLASS NSPRINTINFOMBS

37.3.21 NSPrintLastPage as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo.  
**Notes:** An number containing the one-based index of the last job in the page to print.

37.3.22 NSPrintLeftMargin as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the dictionary keys to access pagination attributes.  
**Notes:** Number, containing a floating-point value that specifies the left margin, in points.

37.3.23 NSPrintMustCollate as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo.  
**Notes:** A boolean value.

37.3.24 NSPrintOrientation as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the dictionary keys to access page format attributes.  
**Notes:** A number containing an NSPrintingOrientation.  
NSPortraitOrientation or NSLandscapeOrientation

37.3.25 NSPrintPagesAcross as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo.  
**Notes:** A number containing the number of logical pages to be placed across a physical sheet.

37.3.26 NSPrintPagesDown as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A number containing the number of logical pages to be placed down a physical sheet.

**37.3.27 NSPrintPaperName as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the dictionary keys to access page format attributes. **Notes:** A string containing the paper name.

**37.3.28 NSPrintPaperSize as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the dictionary keys to access page format attributes. **Notes:** A size value specifying the height and width of paper in points.

**37.3.29 NSPrintPreviewJob as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible job disposition values. **Notes:** Send to Preview application.

**37.3.30 NSPrintPrinter as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo. **Notes:** Value in dictionary is a NSPrinterMBS.

**37.3.31 NSPrintPrinterName as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo. **Notes:** A string containing the name of a printer.

**37.3.32 NSPrintReversePageOrder as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo.
37.3. **CLASS NSPRINTINFO**

**Notes:** Value for this key is a boolean value.

### 37.3.33 NSPrintRightMargin as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the dictionary keys to access pagination attributes. **Notes:** Number, containing a floating-point value that specifies the right margin, in points.

### 37.3.34 NSPrintSaveJob as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible job disposition values. **Notes:** Save to a file.

### 37.3.35 NSPrintScalingFactor as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the dictionary keys to access page format attributes. **Notes:** Scale factor percentage before pagination.

### 37.3.36 NSPrintSelectionOnly as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo. **Notes:** A boolean value. Available on Mac OS X 10.6 or newer.

### 37.3.37 NSPrintSpoolJob as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the possible job disposition values. **Notes:** Normal print job.
37.3.38  **NSPrintTime as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for print job attributes that are recognized by NSPrintInfo. 
**Notes:** An NSDate containing the time at which printing should begin.

37.3.39  **NSPrintTopMargin as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the dictionary keys to access pagination attributes. 
**Notes:** Number, containing a floating-point value that specifies the top margin, in points.

37.3.40  **NSPrintVerticallyCentered as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the dictionary keys to access pagination attributes. 
**Notes:** Number, containing a Boolean value that is true if pages are centered vertically.

37.3.41  **NSPrintVerticalPagination as string**

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the dictionary keys to access pagination attributes. 
**Notes:**
Number, containing a NSPrintingPaginationMode value.  
NSAutoPagination, NSFitPagination, or NSClipPagination. See VerticalPagination for details.

37.3.42  **SetSaveDestination(file as folderitem)**

MBS MacCocoa Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the print job to go to a PDF file. 
**Example:**
```cocoa
// print to PDF in Xojo Cocoa app

// change print info to go to
dim s as NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
dim d as MemoryBlock = s.data // save old
s.SetSaveDestination SpecialFolder.Desktop.Child("test.pdf")
```
37.3. CLASS NSPRINTINFOMBS

// now print something
dim g as Graphics = OpenPrinter
if g<>Nil then
g.DrawString "Hello World PDF", 20, 20
end if

s.data = d // restore original settings

// now print something to regular printer
g = OpenPrinter
if g<>Nil then
g.DrawString "Hello World Printer", 20, 20
end if

37.3.43 setSharedPrintInfo(printInfo as NSPrintInfoMBS)

Function: Sets the shared NSPrintInfo object to the specified object.
Notes:
printInfo: The new shared printer information. This value must not be nil.
The shared NSPrintInfo object defines the settings for the NSPageLayout panel and print operations that
will be used if no NSPrintInfo object is specified for those operations.

37.3.44 setUpPrintOperationDefaultValues

Notes: Invoked when the print operation is about to start. Subclasses may override this method to set
default values for any attributes that are not set.

37.3.45 sharedPrintInfo as NSPrintInfoMBS

37.3.46 Properties

37.3.47 bottomMargin as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The bottom margin, measured in points in the user coordinate space. **Notes:** (Read and Write property)

37.3.48 data as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Query or set the current settings as data. **Example:**

```vbnet
// print to PDF in Xojo Cocoa app
// change print info to go to
dim s as NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
dim d as MemoryBlock = s.data // save old
s.SetSaveDestination SpecialFolder.Desktop.Child("test.pdf")

// now print something
dim g as Graphics = OpenPrinter
if g<>Nil then
g.DrawString "Hello World PDF", 20, 20
end if

s.data = d // restore original settings

// now print something to regular printer
g = OpenPrinter
if g<>Nil then
g.DrawString "Hello World Printer", 20, 20
end if
```

**Notes:**
The plugin archives the current settings and you can later assign them back. (Read and Write property)
37.3. **CLASS NSPRINTINFOMBS**

### 37.3.49 dictionary as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s dictionary that contains the printing attributes. **Notes:**
The key-value pairs contained in the dictionary are described in Constants. Modifying the returned dictionary changes the receiver’s attributes.
This dictionary is key-value observing compliant.
(Read and Write property)

### 37.3.50 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:**
(Read and Write property)

### 37.3.51 HorizontallyCentered as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the image is centered horizontally. **Notes:**
True if you want the image to be centered horizontally; otherwise, false.
(Read and Write property)

### 37.3.52 horizontalPagination as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The horizontal pagination to the specified mode. **Notes:**
One of the pagination modes described in constants.
(Read and Write property)

### 37.3.53 imageablePageBounds as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the imageable area of a sheet of paper specified by the receiver.
Notes:

Return the imageable area, measured in points in the user coordinate space.

This method takes into account the current printer, paper size, and orientation settings, but not scaling factors. Imageable area is the maximum area that can possibly be marked on by the printer hardware, not the area defined by the current margin settings.

The origin (0, 0) of the returned rectangle is in the lower-left corner of the oriented sheet. The imageable bounds may extend past the edges of the sheet when, for example, a printer driver specifies it so that borderless printing can be done reliably.

(Read only property)

### 37.3.54 `jobDisposition` as string

**Function:** The action specified for the job.

**Notes:**

One of the following value:

- **NSPrintSpoolJob** is a normal print job.
- **NSPrintPreviewJob** sends the print job to the Preview application.
- **NSPrintSaveJob** saves the print job to a file.
- **NSPrintCancelJob** aborts the print job.

(Read and Write property)

### 37.3.55 `leftMargin` as Double

**Function:** The left margin to the specified size.

**Notes:**

The size for the left margin, measured in points in the user coordinate space.

(Read and Write property)
37.3. **CLASS NSPRINTINFOMBS**

37.3.56  **localizedPaperName as string**

**Function:** Returns the human-readable name of the currently selected paper size, suitable for presentation in user interfaces.

**Notes:**
This is typically different from the name returned by paperName, which is almost never suitable for presentation to the user.
(Read only property)

37.3.57  **orientation as Integer**

**Function:** The page orientation to the specified value.

**Notes:**
This printing orientation. See constants for possible values.
For consistency, this method may change either the paper name or the paper size.
(Read and Write property)

37.3.58  **paperName as string**

**Function:** The paper name to the specified value.

**Notes:**
The name for the paper size. The string contains a value such as Letter or Legal. Paper names are implementation specific.
For consistency, this method may change either the paper size or the page orientation.
(Read and Write property)

37.3.59  **paperSize as NSSizeMBS**

**Function:** The width and height of the paper to the specified size.

**Notes:**
The new size of the paper, measured in points in the user coordinate space.
For consistency, this method may change either the paper name or the page orientation.
(Read and Write property)
37.3.60  printer as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The printer object used for subsequent printing jobs.  
**Notes:**  
This method iterates through the receiver’s dictionary. If a feature in the dictionary is not supported by the new printer (as determined by a query to the PPD file), that feature is removed from the dictionary.  
(Read and Write property)

37.3.61  printerName as String

MBS MacCocoa Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The printer name of printer used for subsequent printing jobs.  
**Notes:** (Read only property)

37.3.62  printSettings as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a mutable dictionary containing the print settings from Core Printing.  
**Notes:**  
A mutable dictionary containing the printing system's current settings.  
You can use this method to get and set values from the system print settings. The keys in the returned dictionary represent the values returned by the Core Printing function PMPrintSettingsGetValue. They correspond to the settings currently in the print panel and include everything from custom values set by your accessory panels to values provided by the printer driver’s print dialog extension.  
(Read only property)

37.3.63  rightMargin as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The right margin to the specified size.  
**Notes:**  
The size for the right margin, measured in points in the user coordinate space.  
(Read and Write property)
37.3. CLASS NSPRINTINFOMBS

37.3.64 scalingFactor as Double

Function: The print info’s scaling factor.
Notes:
Default is 1.0.
Using smaller value increases paper size.
(Read and Write property)

37.3.65 SelectionOnly as boolean

Function: Whether only the current selection should be printed.
Notes:
True if only the current selection should be printed, otherwise false.
(Read and Write property)

37.3.66 SetupString as Memoryblock

Function: Query or set the current settings as data.
Example:

```
// start with a printer setup
dim p as new PrinterSetup

// clone to NSPrintInfo
dim info as new NSPrintInfoMBS(p.SetupString)

// find out what name second printer has
dim printers() as string = NSPrinterMBS.printerNames
dim printer as NSPrinterMBS = NSPrinterMBS.printerWithName(printers(1))
System.DebugLog printers(1)

// now set a new paper size and this printer
info.paperSize = new NSSizeMBS(72*5, 72*6) // 5 by 6 inch
info.printer = printer

// and clone back
p.SetupString = info.SetupString

// now print to this printer with this paper
dim g as Graphics = OpenPrinter(p)
```
g.DrawString "Hello", 10, 10

Notes:
While data property encodes the dictionary, this property encodes the NSPrintInfo which is same format as PrinterSetup.SetupString in Xojo.
(Read and Write property)

37.3.67 topMargin as Double

Function: The top margin, measured in points in the user coordinate space.
Notes: The size for the top margin, measured in points in the user coordinate space.
(Read and Write property)

37.3.68 VerticallyCentered as boolean

Function: Whether the image is centered vertically.
Notes: True if you want the image to be centered vertically; otherwise, false.
(Read and Write property)

37.3.69 verticalPagination as Integer

Function: The vertical pagination mode.
Notes: One of the pagination modes described in constants.
(Read and Write property)
37.3. CLASS NSPRINTINFOMBS

37.3.70 Constants

37.3.71 NSAutoPagination = 0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the pagination mode constants. **Notes:** The image is divided into equal-sized rectangles and placed in one column of pages.

37.3.72 NSClipPagination = 2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the pagination mode constants. **Notes:** The image is clipped to produce one column or row of pages.

37.3.73 NSFitPagination = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the pagination mode constants. **Notes:** The image is scaled to produce one column or one row of pages.

37.3.74 NSLandscapeOrientation = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the page orientation constants. **Notes:** Orientation is portrait (page is taller than it is wide).

37.3.75 NSPortraitOrientation = 0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the page orientation constants. **Notes:** Orientation is landscape (page is wider than it is tall).
37.4 class NSPrintOperationMBS

37.4.1 class NSPrintOperationMBS

Function: An NSPrintOperation object controls operations that generate Encapsulated PostScript (EPS) code, Portable Document Format (PDF) code, or print jobs.

Notes: An NSPrintOperation object works in conjunction with two other objects: an NSPrintInfo object, which specifies how the code should be generated, and an NSView object, which generates the actual code.

It is important to note that the majority of methods in NSPrintOperation copy the instance of NSPrintInfo passed into them. Future changes to that print info are not reflected in the print info retained by the current NSPrintOperation object. All changes should be made to the print info before passing to the methods of this class.

37.4.2 Methods

37.4.3 Constructor

Function: Initialize the object the current print operation for this thread.

Notes: On success the handle property is not zero.

See also:

- 37.4.4 Constructor(other as NSPrintOperationMBS) 7234
- 37.4.5 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) 7235
- 37.4.6 Constructor(view as NSViewMBS) 7235
- 37.4.7 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS) 7236

37.4.4 Constructor(other as NSPrintOperationMBS)

Function: Special constructor to create new NSPrintOperationMBS for existing NSPrintOperationMBS object.

Notes: If you have a NSPrintOperationMBS and you want to use printOperationDidRun event, you can initialize a subclass of NSPrintOperationMBS with your existing object to get the event there.

See also:

- 113.2.65 Constructor 16489
37.4. CLASS NSPRINTOPERATIONMBS

- 37.4.5 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil)
- 37.4.6 Constructor(view as NSViewMBS)
- 37.4.7 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS)

37.4.5 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil)

**Function:** Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.

**Example:**

```vbnet
// print a HTMLViewer
dim n as new NSPrintOperationMBS(HTMLViewer1)

n.showsPrintPanel = true
n.showsProgressPanel = true
n.runOperationModalForWindow(self)
```

**Notes:**

View: The view whose contents you want to print.

PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

See also:

- 113.2.65 Constructor
- 37.4.4 Constructor(other as NSPrintOperationMBS)
- 37.4.6 Constructor(view as NSViewMBS)
- 37.4.7 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS)

37.4.6 Constructor(view as NSViewMBS)

**Function:** Creates and returns an NSPrintOperation object ready to control the printing of the specified view.

**Notes:**
CHAPTER 37. COCOA PRINTING

View: The view whose contents you want to print.

Returns the new NSPrintOperation object. You must run the operation to print the view.

The new NSPrintOperation object uses the settings stored in the shared NSPrintInfo object. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

See also:
- 113.2.65 Constructor
- 37.4.4 Constructor(other as NSPrintOperationMBS)
- 37.4.5 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil)
- 37.4.7 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS)

37.4.7 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS)

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.

Notes:
View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

See also:
- 113.2.65 Constructor
- 37.4.4 Constructor(other as NSPrintOperationMBS)
- 37.4.5 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil)
- 37.4.6 Constructor(view as NSViewMBS)

37.4.8 context as NSGraphicsMBS

Function: Returns the graphics context object used for generating output.
37.4.9 currentOperation as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current print operation for this thread. **Notes:** The print operation object, or nil if there is no current operation.

37.4.10 currentPage as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current page number being printed.

37.4.11 data as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the data in PDF/EPS after the operation finished.

37.4.12 Destructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

37.4.13 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new NSPrintOperation object ready to control the copying of EPS graphics from the specified view. **Notes:** View: The view containing the data to be turned into EPS data. rect: The portion of the view (specified in points in the view’s coordinate space) to be rendered as EPS data. After the job is run, use the Data function to get the EPS data. Returns the new NSPrintOperation object. You must run the operation to generate the EPS data. The new NSPrintOperation object uses the default NSPrintInfo object. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread. See also:
37.4.14  EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

Function: Creates and returns a new NSPrintOperation object ready to control the copying of EPS graphics from the specified view using the specified print settings.

Notes:

View: The view containing the data to be turned into EPS data.
rect: The portion of the view (specified in points in the view’s coordinate space) to be rendered as EPS data.
PrintInfo: The print settings to use when generating the EPS data.

After the job is run, use the Data function to get the EPS data.
Returns the new NSPrintOperation object. You must run the operation to generate the EPS data.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

See also:

37.4.13 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS

37.4.15  EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS

Function: Creates and returns a new NSPrintOperation object ready to control the copying of EPS graphics from the specified view and write the resulting data to the specified file.

Notes:
37.4. CLASS NSPRINTOPERATIONMBS

View: The view containing the data to be turned into EPS data.
rect: The portion of the view (specified in points in the view’s coordinate space) to be rendered as EPS data.
path: The path to a file. After the job is run, this file contains the EPS data.
PrintInfo: The print settings to use when generating the EPS data.

Returns the new NSPrintOperation object. You must run the operation to generate the EPS data. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

See also:

- 37.4.13 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS
- 7237

- 37.4.14 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS
- 7238

- 37.4.16 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS
- 7239

37.4.16 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS

Function: Creates and returns a new NSPrintOperation object ready to control the copying of EPS graphics from the specified view and write the resulting data to the specified file.
Notes:

View: The view containing the data to be turned into EPS data.
rect: The portion of the view (specified in points in the view’s coordinate space) to be rendered as EPS data.
path: The path to a file. After the job is run, this file contains the EPS data.
PrintInfo: The print settings to use when generating the EPS data.

Returns the new NSPrintOperation object. You must run the operation to generate the EPS data. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

See also:

- 37.4.13 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS
- 7237

- 37.4.14 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS
- 7238

- 37.4.15 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS
- 7238
37.4.17 isCopyingOperation as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether the receiver is an EPS or PDF copy operation. **Notes:** True if the receiver is an EPS or PDF copy operation; otherwise, false.

37.4.18 NSPrintOperationExistsException as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of an exception raised when there is already a print operation in process. **Notes:** The methods that raise the NSExceptionMBS exception are the EPSOperation... and printOperation....

37.4.19 pageRange as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the print order for the pages. **Notes:** The print order. For a list of possible values, see Constants.

37.4.20 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view. **Notes:**

View: The view containing the data to be turned into PDF data.
rect: The portion of the view (specified in points in the view’s coordinate space) to be rendered as PDF data.

After the job is run, the data function gives you the PDF data.

Returns the new NSPrintOperation object. You must run the operation to generate the PDF data.

The new NSPrintOperation object uses the default NSPrintInfo object. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread. **See also:**

- 37.4.21 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintIn-
37.4. **CLASS NSPRINTOPERATIONMBS**

- 37.4.22 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS

- 37.4.23 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS

### 37.4.21 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

**Function:** Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view using the specified print settings.

**Notes:**
- **View:** The view containing the data to be turned into PDF data.
- **rect:** The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.
- **PrintInfo:** The print settings to use when generating the PDF data.

After the job is run, the data function returns the PDF data.

Returns the new NSPrintOperation object. You must run the operation to generate the PDF data. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

See also:

- 37.4.20 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS

- 37.4.22 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS

- 37.4.23 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS

### 37.4.22 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS

**Function:** Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view and write the resulting data to the specified file.

**Notes:**
CHAPTER 37. COCOA PRINTING

View: The view containing the data to be turned into PDF data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.
path: The path to a file. After the job is run, this file contains the PDF data.
PrintInfo: The print settings to use when generating the PDF data.

Returns the new NSPrintOperation object. You must run the operation to generate the PDF data.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

See also:

- 37.4.20 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS
- 37.4.21 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS
- 37.4.23 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS

37.4.23 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS

Function: Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view and write the resulting data to the specified file.

Notes:

View: The view containing the data to be turned into PDF data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.
path: The path to a file. After the job is run, this file contains the PDF data.
PrintInfo: The print settings to use when generating the PDF data.

Returns the new NSPrintOperation object. You must run the operation to generate the PDF data.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

See also:

- 37.4.20 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS
37.4.24 preferredRenderingQuality as Integer

**Function:** Returns the printing quality.

**Notes:**
The preferred printing quality. See constants for the possible values.

If the print sheet is unresponsive or sluggish due to the time is takes to fully render a page, you can check this method in drawRect: and other printing methods such as beginDocument and knowsPageRange: to determine if the print operation prefers speed over fidelity. Most applications render each page fast enough and do not need to call this method. Only use this method after establishing that best quality rendering does indeed make the user interface unresponsive.

37.4.25 printOperationWithView(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS

**Function:** Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.

**Example:**

```// print a HTMLViewer
dim n as NSPrintOperationMBS = NSPrintOperationMBS.printOperationWithView(HTMLViewer1)

n.showsPrintPanel = true
n.showsProgressPanel = true
n.runOperationModalForWindow(self)
```

**Notes:**

View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress;
otherwise the returned object is made the current print operation for this thread.
See also:

- 37.4.26 printOperationWithView(view as NSViewMBS) as NSPrintOperationMBS
- 37.4.27 printOperationWithView(view as NSViewMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

### 37.4.26 printOperationWithView(view as NSViewMBS) as NSPrintOperationMBS

**Function:** Creates and returns an NSPrintOperation object ready to control the printing of the specified view.
**Example:**

```vbscript
// print a text area
dim textView as NSTextViewMBS = TextArea1.NSTextViewMBS
dim o as NSPrintOperationMBS = NSPrintOperationMBS.printOperationWithView(textView)
o.showsPrintPanel = true
o.runOperationModalForWindow(Window1)
o = nil
```

**Notes:**

View: The view whose contents you want to print.

Returns the new NSPrintOperation object. You must run the operation to print the view.

The new NSPrintOperation object uses the settings stored in the shared NSPrintInfo object. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 37.4.25 printOperationWithView(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS
- 37.4.27 printOperationWithView(view as NSViewMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS
37.4. CLASS NSPRINTOPERATIONMBS

37.4.27 printOperationWithView(view as NSViewMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.

Notes:
View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

See also:
- 37.4.25 printOperationWithView(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS
- 37.4.26 printOperationWithView(view as NSViewMBS) as NSPrintOperationMBS

37.4.28 runOperation as boolean

Function: Runs the print operation on the current thread.

Notes:
Returns true if the operation was successful; otherwise, false.

The operation runs to completion in the current thread, blocking the application. A separate thread is not spawned, even if canSpawnSeparateThread is true. Use runOperationModalForWindow to use document-modal sheets and to allow a separate thread to perform the operation.

37.4.29 runOperationModalForWindow(win as NSWindowMBS)

Function: Runs the print operation, calling your custom delegate method upon completion.

Notes:
win: The document window to receive a print progress sheet.

Calls the printOperationDidRun event.

See also:
37.4.30 runOperationModalForWindow(win as window)

Function: Runs the print operation, calling your custom delegate method upon completion.
Notes:
win: The document window to receive a print progress sheet.

Calls the printOperationDidRun event.
See also:
• 37.4.29 runOperationModalForWindow(win as NSWindowMBS)

37.4.31 setCurrentOperation(operation as NSPrintOperationMBS)

Function: Sets the current print operation for this thread.
Notes: operation: The print operation to make current. You may specify nil to clear the current print operation.

37.4.32 view as NSViewMBS

Function: Returns the view object that generates the actual data for the print operation.

37.4.33 Properties

37.4.34 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

37.4.35 canSpawnSeparateThread as boolean

Function: Whether the receiver is allowed to spawn a separate printing thread.
37.4. **CLASS NSPRINTOPERATIONMBS**

**Notes:**

canSpawnSeparateThread: True if the receiver is allowed to spawn a separate thread; otherwise, false.

If canSpawnSeparateThread is true, an NSThread object is detached when the print panel is dismissed (or immediately, if the panel is not to be displayed). The new thread performs the print operation, so that control can return to your application. A thread is detached only if the print operation is run using the runOperationModalForWindow:delegate:didRunSelector:contextInfo: method. If canSpawnSeparateThread is false, the operation runs on the current thread, blocking the application until the operation completes.

If you send setCanSpawnSeparateThread: to an NSPrintOperation object with an argument of true, then the delegate specified in a subsequent invocation of runOperationModalForWindow may be messaged in that spawned, non-main thread.

(Read and Write computed property)

**37.4.36  jobTitle as string**

**Function:** The title of the print job.
**Notes:**

A string containing the print job title. If set, this value overrides the title returned by the printing view. Available in OS X v10.5 and later.

(Read and Write computed property)

**37.4.37  pageOrder as Integer**

**Function:** Returns the print order for the pages.
**Notes:**

The print order. For a list of possible values, see Constants.

(Read and Write computed property)

**37.4.38  printInfo as NSPrintInfoMBS**

**Function:** Returns the receiver’s NSPrintInfo object.
**Notes:** (Read and Write computed property)
37.4.39 printPanel as NSPrintPanelMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NSPrintPanel object used when running the operation. **Notes:** (Read and Write computed property)

37.4.40 showsPrintPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** boolean value indicating whether a print panel is displayed during the operation. **Notes:**

True if the operation displays a print panel; otherwise, false. Operations that generate EPS or PDF data do no display a print panel (instance of NSPrintPanel), regardless of the value returned by this method. (Read and Write computed property)

37.4.41 showsProgressPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the receiver displays a progress panel for this operation. **Notes:**

True if you want to display a progress panel; otherwise, false. This method does not affect the display of a print panel; that operation is controlled by the ShowsPrintPanel method. Operations that generate EPS or PDF data do no display a progress panel, regardless of the value in the flag parameter. (Read and Write computed property)

37.4.42 Events

37.4.43 printOperationDidRun(success as boolean)

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when the print operation ends.
37.4.44 Constants

37.4.45 NSAscendingPageOrder = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the page order constants. **Notes:** Ascending (back to front) page order.

37.4.46 NSDescendingPageOrder = -1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the page order constants. **Notes:** Descending (front to back) page order.

37.4.47 NSPrintRenderingQualityBest = 0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the print quality constants. **Notes:** Renders the printing at the best possible quality, regardless of speed. Available in OS X v10.7 and later.

37.4.48 NSPrintRenderingQualityResponsive = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the print quality constants. **Notes:** Sacrifices the least possible amount of rendering quality for speed to maintain a responsive user interface. This option should be used only after establishing that best quality rendering does indeed make the user interface unresponsive. Available in OS X v10.7 and later.

37.4.49 NSSpecialPageOrder = 0

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the page order constants. **Notes:** The spooler does not rearrange pages; they are printed in the order received by the spooler.
37.4.50  NSUnknownPageOrder = 2

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the page order constants.  **Notes:** No page order specified.
37.5.  CLASS NSPRINTPANELMBS

37.5  class NSPrintPanelMBS

37.5.1  class NSPrintPanelMBS

Function:  An NSPrintPanel object creates the Print panel used to query the user for information about a print job.

Notes:

This panel may let the user select the range of pages to print and the number of copies before executing the Print command.

Print panels can display a simplified interface when printing certain types of data. For example, the panel can display a list of print-setting presets, which lets the user enable print settings in groups as opposed to individually. The JobStyleHint property activates the simplified interface and identifies which presets to display.

37.5.2  Methods

37.5.3  beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS)

Function:  Displays a Print panel sheet and runs it modally for the specified window.

Notes:

printInfo:  The printing information for the current job.
win:  The window on which to display the sheet.

When the modal session ends, if printPanelDidEnd event is invoked on the object.
See also:

- 37.5.4 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window)

37.5.4  beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window)

Function:  Displays a Print panel sheet and runs it modally for the specified window.

Notes:

printInfo:  The printing information for the current job.
win:  The window on which to display the sheet.
When the modal session ends, if printPanelDidEnd event is invoked on the object.
See also:

- 37.5.3 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS)

## 37.5.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initializes a new print panel.

## 37.5.6 NSPrintAllPresetsJobStyleHint as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values can be passed to the jobStyleHint property to activate the simplified Print panel interface and specify which presets to display.
**Notes:**
Output appropriate to all graphics types. Equivalent to Core Printing's kPMPresetGraphicsTypeAll. Available in OS X v10.6 and later.

## 37.5.7 NSPrintNoPresetsJobStyleHint as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values can be passed to the jobStyleHint property to activate the simplified Print panel interface and specify which presets to display.
**Notes:**
Output excludes all graphics printing. Equivalent to Core Printing’s kPMPresetGraphicsTypeNone. Available in OS X v10.6 and later.

## 37.5.8 NSPrintPhotoJobStyleHint as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values can be passed to the jobStyleHint property to activate the simplified Print panel interface and specify which presets to display.
**Notes:** Output contains photographic data.
37.5. CLASS NSPRINTPANELMBS

37.5.9 printInfo as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the printing information associated with the running Print panel.  
**Notes:** The current printing information. May return nil if the Print panel is not currently running. This method is a convenience method that your delegate can use to get the printing information while the Print Panel is visible. Available in OS X v10.5 and later.

37.5.10 printPanel as NSPrintPanelMBS

37.5.11 runModal as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Displays the receiver’s Print panel and begins the modal loop.  
**Notes:** NSCancelButton (0) if the user clicks the Cancel button; otherwise NSOKButton (1). This method uses the printing information associated with the current printing operation.

37.5.12 runModalWithPrintInfo(printInfo as NSPrintInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Displays the receiver’s Print panel and runs the modal loop using the specified printing information.  
**Notes:** printInfo: The printing information to use while displaying the Print panel. Returns NSCancelButton (0) if the user clicks the Cancel button; otherwise NSOKButton (1).
37.5.13 Properties

37.5.14 Handle as Integer

Notes: (Read and Write property)

37.5.15 defaultButtonTitle as string

Notes: defaultButtonTitle: The string to use for the button title.

You can use this method to change the default button title from "Print" to something more appropriate for your usage of the panel. For example, if you are using the Print panel to save a representation of the document to a file, you might change the title to "Save".
Available in OS X v10.5 and later.
(Read and Write computed property)

37.5.16 helpAnchor as string

Notes: helpAnchor: The anchor name in your Apple Help file. This parameter should contain just the name portion of the HTML anchor element.

For information on how to insert anchors into your Apple Help files, see Authoring User Help in Apple Help Programming Guide.
Available in OS X v10.5 and later.
(Read and Write computed property)

37.5.17 jobStyleHint as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The type of content the Print panel is representing.
Notes:
hint: For a list of supported job style hints, see Job Style Hints functions. Pass nil to this method to deactivate the simplified Print panel interface and use the standard interface instead (the equivalent of Core Printing’s kPMPresetGraphicsTypeGeneral).

This method controls the set of items that appear in the Presets menu of the simplified Print panel interface. (Read and Write computed property)

### 37.5.18 options as Integer

**Function:** The configuration options for the Print panel.

**Notes:**

The configuration options, which you specify by adding together the appropriate constant values.
Available in OS X v10.5 and later.
(Read and Write computed property)

### 37.5.19 Events

### 37.5.20 printPanelDidEnd(returnCode as Integer)

**Function:** The event called when the sheet ends.

**Notes:** The value passed as returnCode is either NSCancelButton or NSOKButton. The value NSOKButton is returned even if the user clicked the Preview button.

### 37.5.21 Constants

### 37.5.22 NSPrintPanelShowsCopies = 1

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the print panel option constants.

**Notes:**

The Print panel includes a field for manipulating the number of copies being printed. This field is separate from any accessory views.
Available in OS X v10.5 and later.
37.5.23  **NSPrintPanelShowsOrientation = 8**

MBS MacCocoa Plugin, Plugin Version: 12.4.  **Function:** One of the print panel option constants.
**Notes:**
The Print panel includes a control for manipulating the page orientation. This control is separate from any accessory views.
Available in OS X v10.5 and later.

37.5.24  **NSPrintPanelShowsPageRange = 2**

MBS MacCocoa Plugin, Plugin Version: 12.4.  **Function:** One of the print panel option constants.
**Notes:**
The Print panel includes a set of fields for manipulating the range of pages being printed. These fields are separate from any accessory views.
Available in OS X v10.5 and later.

37.5.25  **NSPrintPanelShowsPageSetupAccessory = 256**

MBS MacCocoa Plugin, Plugin Version: 12.4.  **Function:** One of the print panel option constants.
**Notes:**
The Print panel includes a separate accessory view for manipulating the paper size, orientation, and scaling attributes. Page setup fields that are already configured for display on the main portion of the Print panel appear there and not on this accessory panel.
Available in OS X v10.5 and later.

37.5.26  **NSPrintPanelShowsPaperSize = 4**

MBS MacCocoa Plugin, Plugin Version: 12.4.  **Function:** One of the print panel option constants.
**Notes:**
The Print panel includes a control for manipulating the paper size of the printer. This control is separate from any accessory views.
Available in OS X v10.5 and later.

37.5.27  **NSPrintPanelShowsPreview = 131072**

MBS MacCocoa Plugin, Plugin Version: 12.4.  **Function:** One of the print panel option constants.
**Notes:**
The Print panel displays a built-in preview of the document contents. This option is only appropriate when the Print panel is used in conjunction with an NSPrintOperation object to print a document. Available in OS X v10.5 and later.

37.5.28  **NSPrintPanelShowsPrintSelection = 32**

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the print panel option constants. **Notes:**
The Print panel includes an additional selection option for paper range. This control is separate from any accessory views. Available in OS X v10.6 and later.

37.5.29  **NSPrintPanelShowsScaling = 16**

MBS MacCocoa Plugin, Plugin Version: 12.4. **Function:** One of the print panel option constants. **Notes:**
The Print panel includes a control for scaling the printed output. This control is separate from any accessory views. Available in OS X v10.5 and later.
Chapter 38

Cocoa Tasks

38.1 class NSFileHandleMBS

38.1.1 class NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** NSFileHandle objects provide an object-oriented wrapper for accessing open files or communications channels.

**Example:**

```vbscript
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)

if n<>Nil then
    MsgBox n.readDataToEndOfFile
end if
```

**Notes:**

Please call closeFile on the end if you want to close the file.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.
CHAPTER 38. COCOA TASKS

38.1.2 Methods

38.1.3 acceptConnectionInBackgroundAndNotify

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Accepts a socket connection (for stream-type sockets only) in the background and creates a file handle for the "near" (client) end of the communications channel.

**Notes:**

This method is asynchronous. In a separate "safe" thread it accepts a connection, creates a file handle for the other end of the connection, and returns that object to the client by posting an NSFileHandleConnectionAcceptedNotification in the run loop of the client. The notification includes as data a userInfo dictionary containing the created NSFileHandle object; access this object using the NSFileHandleNotificationFileHandleItem key.

The receiver must be created by an fileHandleWithFileDescriptor message that takes as an argument a stream-type socket created by the appropriate system routine. The object that will write data to the returned file handle must add itself as an observer of NSFileHandleConnectionAcceptedNotification.

Note that this method does not continue to listen for connection requests after it posts NSFileHandleConnectionAcceptedNotification. If you want to keep getting notified, you need to call acceptConnectionInBackgroundAndNotify again in your observer method.

38.1.4 AvailableBytes as Integer

MBS MacCocoa Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries number of available bytes.

**Notes:**

Returns -1 if query failed.

You can use this value with readDataOfLength function to have it not block.

38.1.5 availableData as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the data available through the receiver.

**Notes:** If the receiver is a file, returns the data obtained by reading the file from the file pointer to the end of the file. If the receiver is a communications channel, reads up to a buffer of data and returns it; if no data is available, the method blocks. Returns an empty data object if the end of file is reached. Raises NSFileHandleOperationException if attempts to determine file-handle type fail or if attempts to read from the file or channel fail.
38.1.6 closeFile

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Disallows further access to the represented file or communications channel and signals end of file on communications channels that permit writing.

**Example:**

```vbscript
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child(“test.txt”)  
dim e as NSErrorMBS  
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingFromFile(f,e)

if e<>Nil then  
    MsgBox e.localizedDescription  
end if

if n<>Nil then  
    MsgBox n.readDataOfSize(5)  
n.closeFile  
end if
```

**Notes:**

The file or communications channel is available for other uses after the file handle represented by the receiver is closed. Further read and write messages sent to a file handle to which closeFile has been sent raises an exception. Sending closeFile to a file handle does not cause its deallocation. The deallocation of an NSFileHandle object deletes its descriptor and closes the represented file or channel unless the NSFileHandle object was created with fileHandleWithFileDescriptor with false as the parameter argument.

38.1.7 Constructor

38.1.8 fileDescriptor as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the file descriptor associated with the receiver.

**Notes:**

Returns the POSIX file descriptor associated with the receiver.
You can send this message to file handles originating from both file descriptors and file handles and receive a valid file descriptor so long as the file handle is open. If the file handle has been closed by sending it closeFile, this method raises an exception.

### 38.1.9 `fileHandleForReadingAtFile(path as folderitem) as NSFileHandleMBS`  

**Function:** Returns a file handle initialized for reading the file, device, or named socket at the specified path.  

**Example:**  
```mbs
def f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
def n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)
if n<>Nil then
    MsgBox n.readDataToEndOfFile
end if
```

**Notes:**  
- **path:** The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds only to NSFileHandle read... messages.

### 38.1.10 `fileHandleForReadingAtPath(path as string) as NSFileHandleMBS`  

**Function:** Returns a file handle initialized for reading the file, device, or named socket at the specified path.  

**Notes:**  
- **path:** The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds only to NSFileHandle read... messages.
38.1. CLASS NSFILEHANDLEMBS

messages.

38.1.11 fileHandleForReadingFromFile(URL as folderitem, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a file handle initialized for reading the file, device, or named socket at the specified URL. **Example:**

```vbnet
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim e as NSErrorMBS
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingFromFile(f, e)

if e<>Nil then
    MsgBox e.localizedDescription
end if

if n<>Nil then
    MsgBox n.readDataOfLength(5)
    MsgBox str(n.offsetInFile) // shows 5
end if
```

**Notes:**

- **url:** The URL of the file, device, or named socket to access.
- **error:** If an error occurs, upon return contains an NSError object that describes the problem.

Returns the initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds only to NSFileHandler read...

38.1.12 fileHandleForReadingFromURL(URL as string, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a file handle initialized for reading the file, device, or named socket at the specified URL. **Notes:**

- **url:** The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns the initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds only to NSFileHandle read...

38.1.13 fileHandleForUpdatingAtFile(path as folderitem) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified path.

Notes:
path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds to both NSFileHandle read...

38.1.14 fileHandleForUpdatingAtPath(path as string) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified path.

Notes:
path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds to both NSFileHandle read...

38.1.15  fileHandleForUpdatingFile(URL as folderitem, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified URL.

**Notes:**

url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

The initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds to both NSFileHandleRead... messages and writeData.

38.1.16  fileHandleForUpdatingURL(URL as string, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified URL.

**Notes:**

url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

The initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds to both NSFileHandleRead... messages and writeData.

38.1.17  fileHandleForWritingAtFile(path as folderitem) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a file handle initialized for writing to the file, device, or named socket at the specified path.

**Example:**

// file must exist for this sample:

```cpp
dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForWritingAtFile(f)
```
if n<>Nil then
n.writeData "Hello World"
n.closeFile
end if

Notes:

path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds only to writeData.

38.1.18 fileHandleForWritingAtPath(path as string) as NSFileHandleMBS

Notes:

path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds only to writeData.

38.1.19 fileHandleForWritingToFile(URL as folderitem, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a file handle initialized for writing to the file, device, or named socket at the specified URL.

Example:

// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim e as NSErrorMBS
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForWritingToFile(f, e)

if e<>Nil then
MsgBox e.localizedDescription
else
n.writeData "Hello World"
n.closeFile
end if

Notes:
url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns the initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds only to writeData.

38.1.20 fileHandleForWritingToURL(URL as string, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a file handle initialized for writing to the file, device, or named socket at the specified URL.

Notes:
url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns the initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds only to writeData.

38.1.21 fileHandleWithFileDescriptor(fd as Integer) as NSFileHandleMBS

Notes:
You can create a file handle for a socket by using the result of a socket call as fileDescriptor. The object creating a file handle using this method owns fileDescriptor and is responsible for its disposition. See also:

- 38.1.22 fileHandleWithFileDescriptor(fd as Integer, closeOnDealloc as boolean) as NSFileHandleMBS
38.1.22  `fileHandleWithFileDescriptor(fd as Integer, closeOnDealloc as boolean)` as NSFileHandleMBS

**Notes:**
You can create a file handle for a socket by using the result of a socket call as fileDescriptor. The object creating a file handle using this method owns fileDescriptor and is responsible for its disposition.

closeOnDealloc: True if the file descriptor should be closed when the receiver is deallocated, otherwise false.

See also:
- 38.1.21 `fileHandleWithFileDescriptor(fd as Integer)` as NSFileHandleMBS

38.1.23  `fileHandleWithNullDevice as NSFileHandleMBS`

**Notes:** You can use null-device file handles as ”placeholders” for standard-device file handles or in collection objects to avoid exceptions and other errors resulting from messages being sent to invalid file handles. Read messages sent to a null-device file handle return an end-of-file indicator (an empty NSData object) rather than raise an exception. Write messages are no-ops, whereas fileDescriptor returns an illegal value. Other methods are no-ops or return ”sensible” values.

38.1.24  `fileHandleWithStandardError as NSFileHandleMBS`

**Example:**

```markdown
// for GUI apps this ends on the console: (see console.app)

dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleWithStandardError

n.writeData "Hello World"
```

**Notes:** Conventionally this is a terminal device to which error messages are sent. There is one standard error file handle per process; it is a shared instance.
38.1. CLASS NSFILEHANDLEMBS

38.1.25 fileHandleWithStandardInput as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the file handle associated with the standard input file. **Notes:** Conventionally this is a terminal device on which the user enters a stream of data. There is one standard input file handle per process; it is a shared instance.

38.1.26 fileHandleWithStandardOutput as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the file handle associated with the standard output file. **Example:**

```// for GUI apps this ends on the console: (see console.app)
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleWithStandardOutput
n.writeData "Hello World"
```

**Notes:** Conventionally this is a terminal device that receives a stream of data from a program. There is one standard output file handle per process; it is a shared instance.

38.1.27 NSFileHandleConnectionAcceptedNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This notification is posted when an NSFileHandle object establishes a socket connection between two processes, creates an NSFileHandle object for one end of the connection, and makes this object available to observers by putting it in the userInf0 dictionary. **Notes:**

To cause the posting of this notification, you must send either acceptConnectionInBackgroundAndNotify to an NSFileHandle object representing a server stream-type socket. The notification object is the NSFileHandle object that sent the notification. The userInfo dictionary contains the following information:

- **NSFileHandleNotificationFileHandleItem** The NSFileHandle object representing the "near" end of a socket connection
- **NSFileHandleError** An integer representing the UNIX-type error which occurred
38.1.28  **NSFileHandleDataAvailableNotification as string**

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This notification is posted when the background thread determines that data is currently available for reading in a file or at a communications channel.

**Notes:**

The observers can then issue the appropriate messages to begin reading the data. To cause the posting of this notification, you must send either waitForDataInBackgroundAndNotify or waitForDataInBackgroundAndNotifyForModes: to an appropriate NSFileHandle object.

The notification object is the NSFileHandle object that sent the notification. This notification does not contain a userInfo dictionary.

38.1.29  **NSFileHandleNotificationDataItem as string**

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A key in the userinfo dictionary in a NSFileHandleReadCompletionNotification and NSFileHandleReadToEndTimeOfFileCompletionNotification.

**Notes:** The corresponding value is an memoryblock containing the available data read from a socket connection.

38.1.30  **NSFileHandleNotificationFileHandleItem as string**

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A key in the userinfo dictionary in a NSFileHandleConnectionAcceptedNotification notification.

**Notes:** The corresponding value is the NSFileHandle object handle representing the "near" end of a socket connection.

38.1.31  **NSFileHandleNotificationMonitorModes as string**

38.1.32  **NSFileHandleOperationException as string**

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Constant that defines the name of a file operation exception.

**Notes:** Raised by NSFileHandle if attempts to determine file-handle type fail or if attempts to read from a file or channel fail.
38.1. CLASS NSFILEHANDLEMBS

38.1.33 NSFileHandleReadCompletionNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the notification strings for the file handle class.

**Notes:**

This notification is posted when the background thread reads the data currently available in a file or at a communications channel. It makes the data available to observers by putting it in the userInfo dictionary. To cause the posting of this notification, you must send either readInBackgroundAndNotify to an appropriate NSFileHandle object.

The notification object is the NSFileHandle object that sent the notification. The userInfo dictionary contains the following information:

- **NSFileHandleNotificationDataItem**: An string containing the available data read from a socket connection
- **NSFileHandleError**: An integer representing the UNIX-type error which occurred

38.1.34 NSFileHandleReadToEndOfFileCompletionNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This notification is posted when the background thread reads all data in the file or, if a communications channel, until the other process signals the end of data.

**Notes:**

It makes the data available to observers by putting it in the userInfo dictionary. To cause the posting of this notification, you must send either readToEndOfFileInBackgroundAndNotify to an appropriate NSFileHandle object.

The notification object is the NSFileHandle object that sent the notification. The userInfo dictionary contains the following information:

- **NSFileHandleNotificationDataItem**: A string containing the available data read from a socket connection
- **NSFileHandleError**: An integer representing the UNIX-type error which occurred

38.1.35 readDataOfLength(length as Integer) as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads data up to a specified number of bytes from the receiver.

**Example:**

```// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")```
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)
if n<>Nil then
    MsgBox n.readDataOfLength(5)
end if

Notes:
length: The number of bytes to read from the receiver.

Returns the data available through the receiver up to a maximum of length bytes.

If the receiver is a file, returns the data obtained by reading from the file pointer to length or to the end of the file, whichever comes first. If the receiver is a communications channel, the method reads data from the channel up to length. Returns an empty memoryblock if the file is positioned at the end of the file or if an end-of-file indicator is returned on a communications channel. Raises NSFileHandleOperationException if attempts to determine file-handle type fail or if attempts to read from the file or channel fail.

38.1.36  readDataToEndOfFile as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the data available through the receiver up to the end of file or maximum number of bytes. Example:

// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)
if n<>Nil then
    MsgBox n.readDataToEndOfFile
end if

Notes:
Returns the data available through the receiver up to UINT_MAX bytes (the maximum value for unsigned integers) or, if a communications channel, until an end-of-file indicator is returned.

This method invokes readDataOfLength as part of its implementation.
38.1. CLASS NSFILEHANDLEMBS

38.1.37  readInBackgroundAndNotify

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads from the file or communications channel in the background and posts a notification when finished.

**Notes:**

This method performs an asynchronous availableData operation on a file or communications channel and posts an NSFileHandleReadCompletionNotification to the client process’s run loop.

The length of the data is limited to the buffer size of the underlying operating system. The notification includes a userInfo dictionary that contains the data read; access this object using the NSFileHandleNotificationDataItem key.

Any object interested in receiving this data asynchronously must add itself as an observer of NSFileHandleReadCompletionNotification. In communication via stream-type sockets, the receiver is often the object returned in the userInfo dictionary of NSFileHandleConnectionAcceptedNotification.

Note that this method does not cause a continuous stream of notifications to be sent. If you wish to keep getting notified, you’ll also need to call readInBackgroundAndNotify in your observer method.

38.1.38  readToEndOfFileInBackgroundAndNotify

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads to the end of file from the file or communications channel in the background and posts a notification when finished.

**Example:**

```vbs
dim path as string = "\tmp/NSFileHandle async reading.txt"
dim f as FolderItem = GetFolderItem(path, FolderItem.PathTypeShell)
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)
n.readToEndOfFileInBackgroundAndNotify
```

**Notes:**

This method performs an asynchronous readToEndOfFile operation on a file or communications channel and posts an NSFileHandleReadToEndOfFileCompletionNotification to the client process’s run loop.

The notification includes a userInfo dictionary that contains the data read; access this object using the NSFileHandleNotificationDataItem key.

Any object interested in receiving this data asynchronously must add itself as an observer of NSFileHandleReadToEndOfFileCompletionNotification. In communication via stream-type sockets, the receiver is often the object returned in the userInfo dictionary of NSFileHandleConnectionAcceptedNotification.
38.1.39 seekToEndOfFile as UInt64

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Puts the file pointer at the end of the file referenced by the receiver and returns the new file offset. **Notes:**

Returns the file offset with the file pointer at the end of the file. This is therefore equal to the size of the file.

Raises an exception if the message is sent to an NSFileHandle object representing a pipe or socket or if the file descriptor is closed.

38.1.40 seekToFileOffset(offset as UInt64)

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Moves the file pointer to the specified offset within the file represented by the receiver. **Notes:** Raises an exception if the message is sent to an NSFileHandle object representing a pipe or socket, if the file descriptor is closed, or if any other error occurs in seeking.

38.1.41 synchronizeFile

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Causes all in-memory data and attributes of the file represented by the receiver to be written to permanent storage. **Notes:** This method should be invoked by programs that require the file to always be in a known state. An invocation of this method does not return until memory is flushed.

38.1.42 truncateFileAtOffset(offset as UInt64)

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Truncates or extends the file represented by the receiver to a specified offset within the file and puts the file pointer at that position. **Notes:**

offset: The offset within the file that will mark the new end of the file.

If the file is extended (if offset is beyond the current end of file), the added characters are null bytes.
### 38.1.43 waitForDataInBackgroundAndNotify

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Checks to see if data is available in a background thread.  
**Notes:** When the data becomes available, the thread notifies all observers with NSFileHandleDataAvailableNotification. After the notification has been posted, the thread is terminated.

### 38.1.44 writeData(data as MemoryBlock)

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Synchronously writes data to the file, device, pipe, or socket represented by the receiver.  
**Example:**

```plaintext
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForWritingAtFile(f)

if n<>Nil then
    n.writeData "Hello World"
    n.closeFile
end if
```

**Notes:** If the receiver is a file, writing takes place at the file pointer’s current position. After it writes the data, the method advances the file pointer by the number of bytes written. Raises an exception if the file descriptor is closed or is not valid, if the receiver represents an unconnected pipe or socket endpoint, if no free space is left on the file system, or if any other writing error occurs.

### 38.1.45 Properties

#### 38.1.46 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal handle to the NSFileHandle object.  
**Notes:** (Read and Write property)

#### 38.1.47 offsetInFile as UInt64

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the position of the file pointer within the file represented by the receiver.
Example:

// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim e as NSErrorMBS
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingFromFile(f,e)

if e<>Nil then
    MsgBox e.localizedDescription
end if

if n<>Nil then
    MsgBox n.readDataOfLength(5)
    MsgBox str(n.offsetInFile) // shows 5
end if

Notes:

The position of the file pointer within the file represented by the receiver.

Raises an exception if the message is sent to a file handle representing a pipe or socket or if the file descriptor
is closed.
(Read and Write computed property)
38.2  CLASS NSPIPEMBS

38.2  class NSPipeMBS

38.2.1  class NSPipeMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: NSPipe objects provide an object-oriented interface for accessing pipes. Notes: An NSPipe object represents both ends of a pipe and enables communication through the pipe. A pipe is a one-way communications channel between related processes; one process writes data, while the other process reads that data. The data that passes through the pipe is buffered; the size of the buffer is determined by the underlying operating system. NSPipe is an abstract class, the public interface of a class cluster.

38.2.2  Methods

38.2.3  Constructor

38.2.4  fileHandleForReading as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the receiver’s read file handle. Notes: You use the returned file handle to read from the pipe using NSFileHandle’s read methods availableData, readDataToEndOfFile, and readDataOfLength. You don’t need to send closeFile to this object or explicitly release the object after you have finished using it.

38.2.5  fileHandleForWriting as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the receiver’s write file handle. Notes: You use the returned file handle to write to the pipe using NSFileHandle’s writeData: method. When you are finished writing data to this object, send it a closeFile message to delete the descriptor. Deleting the descriptor causes the reading process to receive an end-of-data signal (an empty memoryblock).
38.2.6 pipe as NSPipeMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an initialized NSPipe object. **Notes:** Returns nil if the method encounters errors while attempting to create the pipe or the NSFileHandle objects that serve as endpoints of the pipe.

38.2.7 Properties

38.2.8 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSPipe object. **Notes:** (Read and Write property)
38.3.1 class NSTaskMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Using the NSTask class, your program can run another program as a subprocess and can monitor that program’s execution.

**Example:**

```vbnet
// Launch "ls -l -a -t" in the current directory, and then read the result into a string:

dim task as new NSTaskMBS

task.launchPath = "/bin/ls"

dim arguments(-1) as string = array("-l", "-a", "-t")

task.setArguments arguments

dim pipe as new NSPipeMBS

task.setStandardOutput pipe

dim file as NSFileHandleMBS = pipe.fileHandleForReading

task.launch

dim data as string = file.readDataToEndOfFile

dim text as string = DefineEncoding(data, encodings.UTF8)

MsgBox text
```

**Notes:**

An NSTask object creates a separate executable entity; it differs from NSThread in that it does not share memory space with the process that creates it.

A task operates within an environment defined by the current values for several items: the current directory, standard input, standard output, standard error, and the values of any environment variables. By default, an NSTask object inherits its environment from the process that launches it. If there are any values that should be different for the task, for example, if the current directory should change, you must change the value before you launch the task. A task’s environment cannot be changed while it is running. An NSTask object can only be run once. Subsequent attempts to run the task raise an error.

This class is comparable to the shell class built into REALbasic.
### 38.3.2 Methods

#### 38.3.3 arguments as string()

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The command arguments that should be used to launch the executable.

#### 38.3.4 Constructor

**Notes:** On success the handle value is not zero.

#### 38.3.5 Destructor

MBS MacCocoa Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.

#### 38.3.6 interrupt

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends an interrupt signal to the receiver and all of its subtasks.  
**Notes:**  
If the task terminates as a result, which is the default behavior, an NSTaskDidTerminateNotification gets sent to the default notification center. This method has no effect if the receiver was already launched and has already finished executing. If the receiver has not been launched yet, this method raises an NSInvalidArgumentException.  
It is not always possible to interrupt the receiver because it might be ignoring the interrupt signal. interrupt sends SIGINT.

#### 38.3.7 launch

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Launches the task represented by the receiver.  
**Example:**  
```cpp
// Launch "ls -l -a -t" in the current directory, and then read the result into a string:

dim task as new NSTaskMBS
```
task.launchPath = "/bin/ls"

dim arguments(-1) as string = array("-l", "-a", "-t")

task.setArguments arguments

dim pipe as new NSPipeMBS

task.setStandardOutput pipe

dim file as NSFileHandleMBS = pipe.fileHandleForReading

task.launch

dim data as string = file.readDataToEndOfFile

dim text as string = DefineEncoding(data, encodings.UTF8)

MsgBox text

Notes:

Raises an NSInvalidArgumentException if the launch path has not been set or is invalid or if it fails to create a process.

If you get an exception with posix.spawn and error 13, that’s a permission denied.

38.3.8 launchedTaskWithLaunchPath(path as string, arguments() as string) as NSTaskMBS

Example:

dim args(-1) as string

dim task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)

Notes:

path: The path to the executable.
arguments: An array of strings that supplies the arguments to the task.

The task inherits its environment from the process that invokes this method.
The NSTask object converts both path and the strings in arguments to appropriate C-style strings (using
fileSystemRepresentation) before passing them to the task via argv [] . The strings in arguments do not undergo shell expansion, so you do not need to do special quoting, and shell variables, such as $PWD, are not resolved.

### 38.3.9 NSTaskDidTerminateNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The notification name used to notify you that the task terminated. **Notes:**

Posted when the task has stopped execution. This notification can be posted either when the task has exited normally or as a result of terminate being sent to the NSTask object. If the NSTask object gets released, however, this notification will not get sent, as the port the message would have been sent on was released as part of the task release. The observer method can use terminationStatus to determine why the task died. See "Ending an NSTask" for an example.

The notification object is the NSTask object that was terminated. This notification does not contain a userInfo dictionary.

### 38.3.10 resume as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Resumes execution of the receiver task that had previously been suspended with a suspend message. **Notes:** If multiple suspend messages were sent to the receiver, an equal number of resume messages must be sent before the task resumes execution.

### 38.3.11 setArguments(arguments() as string)

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the command arguments that should be used to launch the executable. **Example:**

```swift
// Performing complex pipelines.
// You can create multiple NSTasks and a bunch of NSPipes and hook them together,
// or you can use the "sh -c" trick to feed a shell a command, and let it parse
// it and set up all the IPC. This pipeline cats /usr/share/dict/words, finds
// all the words with 'ham' in them, reverses them, and shows you the last 5.

dim task as new NSTaskMBS

task.LaunchPath="/bin/sh"
```
38.3. CLASS NSTASKMBS

dim arguments(-1) as string

arguments.Append "-c"
arguments.Append "cat /usr/share/dict/words | grep -i ham | rev | tail -5"

task.setArguments arguments

38.3.12 setStandardError(p as NSFileHandleMBS)

Notes:
This method can be used with NSPipeMBS or NSFileHandleMBS object.

If file is an NSPipe object, launching the receiver automatically closes the write end of the pipe in the current task. Don’t create a handle for the pipe and pass that as the argument, or the write end of the pipe won’t be closed automatically.
If this method isn’t used, the standard error is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.

See also:
- 38.3.13 setStandardError(p as NSPipeMBS)

38.3.13 setStandardError(p as NSPipeMBS)

Notes:
This method can be used with NSPipeMBS or NSFileHandleMBS object.

If file is an NSPipe object, launching the receiver automatically closes the write end of the pipe in the current task. Don’t create a handle for the pipe and pass that as the argument, or the write end of the pipe won’t be closed automatically.
If this method isn’t used, the standard error is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.

See also:
- 38.3.12 setStandardError(p as NSFileHandleMBS)
38.3.14 setStandardInput(p as NSFileHandleMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the standard input for the receiver.

**Notes:**
file: The standard input for the receiver, which can be either an NSFileHandle or an NSPipe object.

If file is an NSPipe object, launching the receiver automatically closes the read end of the pipe in the current task. Don’t create a handle for the pipe and pass that as the argument, or the read end of the pipe won’t be closed automatically.

If this method isn’t used, the standard input is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.

See also:
- 38.3.15 setStandardInput(p as NSPipeMBS)

38.3.15 setStandardInput(p as NSPipeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the standard input for the receiver.

**Notes:**
file: The standard input for the receiver, which can be either an NSFileHandle or an NSPipe object.

If file is an NSPipe object, launching the receiver automatically closes the read end of the pipe in the current task. Don’t create a handle for the pipe and pass that as the argument, or the read end of the pipe won’t be closed automatically.

If this method isn’t used, the standard input is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.

See also:
- 38.3.14 setStandardInput(p as NSFileHandleMBS)

38.3.16 setStandardOutput(p as NSFileHandleMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the standard output for the receiver.

**Notes:**
file: The standard output for the receiver, which can be either an NSFileHandle or an NSPipe object.

If file is an NSPipe object, launching the receiver automatically closes the write end of the pipe in the current task. Don’t create a handle for the pipe and pass that as the argument, or the write end of the pipe won’t be closed automatically.
If this method isn’t used, the standard output is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.

See also:

- 38.3.17 setStandardOutput(p as NSPipeMBS)

### 38.3.17 setStandardOutput(p as NSPipeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the standard output for the receiver.

**Notes:**

file: The standard output for the receiver, which can be either an NSFileHandle or an NSPipe object.

If file is an NSPipe object, launching the receiver automatically closes the write end of the pipe in the current task. Don’t create a handle for the pipe and pass that as the argument, or the write end of the pipe won’t be closed automatically.

If this method isn’t used, the standard output is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.

See also:

- 38.3.16 setStandardOutput(p as NSFileHandleMBS)

### 38.3.18 standardError as Variant

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the standard error file used by the receiver.

**Notes:**

The standard error file used by the receiver.

Standard error is where all diagnostic messages are sent. The object returned is either an NSFileHandle or an NSPipe instance, depending on what type of object was passed to setStandardError.

### 38.3.19 standardInput as Variant

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the standard input file used by the receiver.

**Notes:**

The standard input file used by the receiver.
Standard input is where the receiver takes its input from unless otherwise specified. The object returned is either an NSFileHandle or an NSPipe instance, depending on what type of object was passed to the setStandardInput method.

### 38.3.20 standardOutput as Variant

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the standard output file used by the receiver. **Notes:** Standard output is where the receiver displays its output. The object returned is either an NSFileHandle or an NSPipe instance, depending on what type of object was passed to the setStandardOutput method.

### 38.3.21 suspend as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Suspends execution of the receiver task. **Notes:** Returns true if the receiver was successfully suspended, false otherwise.

Multiple suspend messages can be sent, but they must be balanced with an equal number of resume messages before the task resumes execution.

### 38.3.22 terminate

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends a terminate signal to the receiver and all of its subtasks. **Notes:** If the task terminates as a result, which is the default behavior, an NSTaskDidTerminateNotification gets sent to the default notification center. This method has no effect if the receiver was already launched and has already finished executing. If the receiver has not been launched yet, this method raises an NSInvalidArgumentException.

It is not always possible to terminate the receiver because it might be ignoring the terminate signal. terminate sends SIGTERM.

### 38.3.23 waitUntilExit

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Block until the receiver is finished.
Example:

```vbnet
dim args(-1) as string
dim task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)

  task.waitUntilExit

  MsgBox "done"
```

**Notes:** This method first checks to see if the receiver is still running using isRunning. Then it polls the current run loop using NSDefaultRunLoopMode until the task completes.

### 38.3.24 Properties

#### 38.3.25 currentDirectoryPath as string

**Notes:** (Read and Write property)

#### 38.3.26 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal reference to the NSTask object.  
**Notes:** (Read and Write property)

#### 38.3.27 isRunning as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether the receiver is still running.  
**Notes:** (Read only property)

#### 38.3.28 launchPath as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The path of the receiver’s executable.  
**Notes:** (Read and Write property)
CHAPTER 38. COCOA TASKS

38.3.29 processIdentifier as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the receiver’s process identifier.

**Example:**

```vbscript
dim args(-1) as string
dim task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath(”/bin/ls”, args)
MsgBox ”PID: ”+str(task.processIdentifier)
```

**Notes:** (Read only property)

38.3.30 qualityOfService as Integer

MBS MacCocoa Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The quality of service setting for this application.

**Notes:**

read-only after the task is launched.
(Read and Write property)

38.3.31 terminationReason as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the reason the task was terminated.

**Example:**

```vbscript
// Launch ”ls -l -a -t” in the current directory, and then read the result into a string:

dim args(-1) as string
dim task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath(”/bin/ls”, args)
if not task.isRunning then
dim status as Integer = Task.terminationReason
MsgBox ”Task termination reason is: ”+str(status)
end if
```

**Notes:**

Available in Mac OS X v10.6 and later.
see this constants:

<table>
<thead>
<tr>
<th>NSTaskTerminationReasonExit</th>
<th>= 1</th>
<th>The task exited normally.</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSTaskTerminationReasonUncaughtSignal</td>
<td>= 2</td>
<td>The task exited due to an uncaught signal.</td>
</tr>
</tbody>
</table>

(Read only property)

### 38.3.32 terminationStatus as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the exit status returned by the receiver’s executable.

**Example:**

```vbscript
// Launch "ls -l -a -t" in the current directory, and then read the result into a string:

dim args(-1) as string

dim task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)

if not task.isRunning then

dim status as Integer = Task.terminationStatus

MsgBox "Task return value is: " +str(status)
end if
```

**Notes:**

The exit status returned by the receiver’s executable.

Each task defines and documents how its return value should be interpreted. For example, many commands return 0 if they complete successfully or an error code if they don’t. You’ll need to look at the documentation for that task to learn what values it returns under what circumstances.

This method raises an NSInvalidArgumentException if the receiver is still running. Verify that the receiver is not running before you use it.

(Read only property)

### 38.3.33 environment as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A dictionary of variables for the environment from which the receiver was launched.

**Notes:**
The dictionary keys are the environment variable names.
(Read and Write computed property)

### 38.3.34 Events

#### 38.3.35 Terminated

MBS MacCocoa Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Event called when task terminated.

### 38.3.36 Constants

#### 38.3.37 NSQualityOfServiceBackground = & h09

MBS MacCocoa Plugin, Plugin Version: 15.3. **Function:** One of the quality of service constants. **Notes:** Background QoS is used for work that is not user initiated or visible. In general, a user is unaware that this work is even happening and it will run in the most efficient manner while giving the most deference to higher QoS work. For example, pre-fetching content, search indexing, backups, and syncing of data with external systems.

#### 38.3.38 NSQualityOfServiceDefault = -1

MBS MacCocoa Plugin, Plugin Version: 15.3. **Function:** One of the quality of service constants. **Notes:** Default QoS indicates the absence of QoS information. Whenever possible QoS information will be inferred from other sources. If such inference is not possible, a QoS between UserInitiated and Utility will be used.

#### 38.3.39 NSQualityOfServiceUserInitiated = & h19

MBS MacCocoa Plugin, Plugin Version: 15.3. **Function:** One of the quality of service constants. **Notes:** UserInitiated QoS is used for performing work that has been explicitly requested by the user and for which results must be immediately presented in order to allow for further user interaction. For example, loading an email after a user has selected it in a message list.
38.3.40  **NSQualityOfServiceUserInteractive = & h21**

MBS MacCocoa Plugin, Plugin Version: 15.3. **Function:** One of the quality of service constants.  
**Notes:** UserInteractive QoS is used for work directly involved in providing an interactive UI such as processing events or drawing to the screen.

38.3.41  **NSQualityOfServiceUtility = & h11**

MBS MacCocoa Plugin, Plugin Version: 15.3. **Function:** One of the quality of service constants.  
**Notes:** Utility QoS is used for performing work which the user is unlikely to be immediately waiting for the results. This work may have been requested by the user or initiated automatically, does not prevent the user from further interaction, often operates at user-visible timescales and may have its progress indicated to the user by a non-modal progress indicator. This work will run in an energy-efficient manner, in deference to higher QoS work when resources are constrained. For example, periodic content updates or bulk file operations such as media import.

38.3.42  **NSTaskTerminationReasonExit = 1**

MBS MacCocoa Plugin, Plugin Version: 9.7. **Function:** One of the constants used to specify the values that are returned by terminationReason.  
**Notes:** The task exited normally.

38.3.43  **NSTaskTerminationReasonUncaughtSignal = 2**

MBS MacCocoa Plugin, Plugin Version: 9.7. **Function:** One of the constants used to specify the values that are returned by terminationReason.  
**Notes:** The task exited due to an uncaught signal.
38.4 class NSUserAppleScriptTaskMBS

38.4.1 class NSUserAppleScriptTaskMBS

Function: The class to run an AppleScript script.
Example:

```dim file as FolderItem = SpecialFolder.Desktop.Child("Hello.scpt")
dim e as NSErrorMBS
dim n as new NSUserAppleScriptTaskMBS(file, e)
if e <> nil then
    MsgBox e.localizedDescription
end if
n.execute
exception u as UnsupportedOperationException
if e <> nil then
    MsgBox e.localizedDescription
end if```

Notes:
These classes are intended to execute user-supplied scripts, and will execute them outside of the application’s sandbox, if any. (They are *not* intended to execute scripts built into an application; for that, use NSTaskMBS, NSAppleScript classes, or AMWorkflow classes.) If the application is sandboxed, then the script must be in the "application scripts" folder, which you can get using ScriptFolder function. A sandboxed application may read from, but not write to, this folder.

If you simply need to execute scripts without regard to input or output, use NSUserScriptTaskMBS, which can execute any of the specific types. If you need specific control over the input to or output from the script, use one of the sub-classes, which have more detailed "execute" methods.
Subclass of the NSUserScriptTaskMBS class.
38.4.2 Methods

38.4.3 Constructor(file as folderitem, byref error as NSErrorMBS)

Function: Initialize given a folderitem for a script file.
Notes: The returned object will be of one of the specific sub-classes, or raises exception if the file does not appear to match any of the known types. (If used from a sub-class, the result will be of that class, or raises exception.)
See also:

- 38.4.4 Constructor(URL as String, byref error as NSErrorMBS)

38.4.4 Constructor(URL as String, byref error as NSErrorMBS)

Function: Initialize given a URL for a script file.
Notes: The returned object will be of one of the specific sub-classes, or raises exception if the file does not appear to match any of the known types. (If used from a sub-class, the result will be of that class, or raises exception.)
See also:

- 38.4.3 Constructor(file as folderitem, byref error as NSErrorMBS)

38.4.5 executeWithAppleEvent(eventDesc as NSAppleEventDescriptorMBS, tag as Variant = nil)

Function: Execute the AppleScript script by sending it the given Apple event.
Notes:
Pass nil for eventDesc to execute the script’s default "run" handler.
Calls later ExecuteFinished event.
The tag value is passed to the executeFinished event.
38.5 class NSUserAutomatorTaskMBS

38.5.1 class NSUserAutomatorTaskMBS

Function: The class to run an Automator workflow.
Notes:
These classes are intended to execute user-supplied scripts, and will execute them outside of the application’s sandbox, if any. (They are *not* intended to execute scripts built into an application; for that, use NSTaskMBS, NSAppleScript classes, or AMWorkflow classes.) If the application is sandboxed, then the script must be in the ”application scripts” folder, which you can get using ScriptFolder function. A sandboxed application may read from, but not write to, this folder.

If you simply need to execute scripts without regard to input or output, use NSUserScriptTaskMBS, which can execute any of the specific types. If you need specific control over the input to or output from the script, use one of the sub-classes, which have more detailed ”execute” methods.

Subclass of the NSUserScriptTaskMBS class.

38.5.2 Methods

38.5.3 Constructor(file as folderitem, byref error as NSErrorMBS)

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:

- 38.5.4 Constructor(URL as String, byref error as NSErrorMBS)

38.5.4 Constructor(URL as String, byref error as NSErrorMBS)

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:

- 38.5.3 Constructor(file as folderitem, byref error as NSErrorMBS)
38.5.5 executeWithInput(input as Variant, tag as Variant = nil)

Function: Execute the Automator workflow, passing it the given input.
Notes:
Calls later ExecuteFinished event.
The tag value is passed to the executeFinished event.

38.5.6 Properties

38.5.7 Variables as Dictionary

Function: Workflow variables.
Notes:
If you want to change, query the current dictionary, change it and assign it back to the variables property.
(Read and Write property)
38.6 class NSUserScriptTaskMBS

38.6.1 class NSUserScriptTaskMBS

MBS Mac Extras Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to run a script. **Notes:** These classes are intended to execute user-supplied scripts, and will execute them outside of the application’s sandbox, if any. (They are *not* intended to execute scripts built into an application; for that, use NSTaskMBS, NSAppleScript classes, or AMWorkflow classes.) If the application is sandboxed, then the script must be in the "application scripts" folder, which you can get using ScriptFolder function. A sandboxed application may read from, but not write to, this folder.

If you simply need to execute scripts without regard to input or output, use NSUserScriptTaskMBS, which can execute any of the specific types. If you need specific control over the input to or output from the script, use one of the sub-classes, which have more detailed "execute" methods.

38.6.2 Methods

38.6.3 Available as Boolean

MBS Mac Extras Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the class is available. **Notes:** Should return true on OS X 10.8 and newer.

38.6.4 Constructor(file as folderitem, byref error as NSErrorMBS)

MBS Mac Extras Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initialize given a URL for a script file. **Notes:** The returned object will be, or raises exception if the file does not appear to match any of the known types. See also:

- 38.6.5 Constructor(URL as String, byref error as NSErrorMBS)

38.6.5 Constructor(URL as String, byref error as NSErrorMBS)

MBS Mac Extras Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Initialize given a URL for a script file. **Notes:** The returned object will be, or raises exception if the file does not appear to match any of the known types.
38.6. **CLASS NSUSERSCRIPTTASKMBS**

types.
See also:

- 38.6.4 Constructor(file as folderitem, byref error as NSErrorMBS)

### 38.6.6 execute(tag as Variant = nil)

MBS MacExtras Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Execute the script with no input and ignoring any result.

**Example:**

```vba
dim file as FolderItem = SpecialFolder.Desktop.Child("Hello.scpt")
dim e as NSErrorMBS
dim n as new NSUserScriptTaskMBS(file, e)

n.execute
```

**Notes:**
This and the other "execute" methods may be called at most once on any given instance. If the script completed normally, the ExecuteFinished event’s "error" parameter will be nil.

Calls later ExecuteFinished event.
The tag value is passed to the executeFinished event.

### 38.6.7 ScriptFolder as FolderItem

MBS MacExtras Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The script folder for the application.

### 38.6.8 Properties

### 38.6.9 Handle as Integer

**Notes:** (Read and Write property)
38.6.10 scriptURL as String

MBS MacExtras Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The script URL used for initialization. **Notes:** (Read only property)

38.6.11 Events

38.6.12 executeFinished(error as NSErrorMBS, tag as Variant, result as Variant, input as Variant)

MBS MacExtras Plugin, Plugin Version: 16.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when execution is finished. **Notes:**

For AppleEvent call the result and input are NSAppleEventDescriptorMBS objects.
For Automator scripts the result and input are set to the values.
For all other scripts, they are nil.

While a script executes the plugin keeps a reference to the tag and itself, so the script object is not released too early.
38.7  class NSUserUnixTaskMBS

38.7.1  class NSUserUnixTaskMBS

Function: The class to run a Unix executable file, typically a shell script.
Notes:
These classes are intended to execute user-supplied scripts, and will execute them outside of the application’s sandbox, if any. (They are *not* intended to execute scripts built into an application: for that, use NSTaskMBS, NSAppleScript classes, or AMWorkflow classes.) If the application is sandboxed, then the script must be in the ”application scripts” folder, which you can get using ScriptFolder function. A sandboxed application may read from, but not write to, this folder.

If you simply need to execute scripts without regard to input or output, use NSUserScriptTaskMBS, which can execute any of the specific types. If you need specific control over the input to or output from the script, use one of the sub-classes, which have more detailed ”execute” methods.
Subclass of the NSUserScriptTaskMBS class.

38.7.2  Methods

38.7.3  Constructor(file as folderitem, byref error as NSErrorMBS)

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:
- 38.7.4 Constructor(URL as String, byref error as NSErrorMBS)

38.7.4  Constructor(URL as String, byref error as NSErrorMBS)

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:
- 38.7.3 Constructor(file as folderitem, byref error as NSErrorMBS)
38.7.5  `executeWithArguments(arguments() as string, tag as Variant = nil)`

**Function:** Execute the file with the given arguments.
**Notes:**
The arguments do not undergo shell expansion, so you do not need to do special quoting, and shell variables are not resolved.
Calls later `executeFinished` event.
The tag value is passed to the `executeFinished` event.

38.7.6  Properties

38.7.7  `standardError as NSFileHandleMBS`

**Function:** Standard I/O stream for error.
**Notes:**
Setting this to nil (the default) will bind it to `/dev/null`.
(Read and Write property)

38.7.8  `standardInput as NSFileHandleMBS`

**Function:** Standard I/O stream for input.
**Notes:**
Setting this to nil (the default) will bind it to `/dev/null`.
(Read and Write property)

38.7.9  `standardOutput as NSFileHandleMBS`

**Function:** Standard I/O stream for output.
**Notes:**
Setting this to nil (the default) will bind it to `/dev/null`.
(Read and Write property)
Chapter 39

Cocoa Threading

39.1 class NSOperationMBS

39.1.1 class NSOperationMBS

Function: The class to do operations in Cocoa.

Notes:

Requires Mac OS X 10.5.

The NSOperation class manages the execution of a single encapsulated task. Operations are typically scheduled by adding them to an operation queue object (an instance of the NSOperationQueue class), although you can also execute them directly by explicitly invoking their start method.

Operation objects are single-shot objects, that is, they perform their task once. You cannot reuse the same NSOperation object to perform a task (or a slight variant of the task) multiple times in succession. Attempting to execute an operation that has already finished results in an exception.

When manually executing operations, you are responsible for making sure the object is ready to execute. Starting an operation that is not in the ready state generally results in an exception being thrown. If you use an operation queue to manage the execution, the NSOperationQueue object ensures that the operation is executed only when it is ready.
39.1.2 Methods

39.1.3 addDependency(op as NSOperationMBS)

Function: Makes the receiver dependent on the completion of the specified operation.
Notes:

op: The operation on which the operation is dependent. The same dependency should not be added more than once to the operation, and the results of doing so are undefined.

The dependent is not considered ready to execute until all of its dependent operations finish executing. If the receiver is already executing its task, adding dependencies is unlikely to have any practical effect. This method may change the isReady and dependencies properties of the dependent.

It is a programmer error to create any circular dependencies among a set of operations. Doing so can cause a deadlock among the operations and may freeze your program.

Please setup dependencies before you add the operation to a queue. Once the operation is in the queue it may be executed directly.

39.1.4 cancel

Function: Advises the operation object that it should stop executing its task.
Notes:

This method does not force your operation code to stop. The code for your operation must invoke the isCancelled method periodically to determine whether the operation should be stopped. Once cancelled, an operation cannot be restarted.

If the operation is already finished executing, this method has no effect. Canceling an operation that is currently in an operation queue, but not yet executing, causes it to be removed from the queue (although not necessarily right away).

39.1.5 Constructor

Function: The constructor.
See also:

- 39.1.6 Constructor(Handle as Integer)
39.1. CLASS NSOPERATIONMBS

39.1.6 Constructor(Handle as Integer)

Function: The constructor.
Notes: You can pass in handle to NSOperation object.
See also:
• 39.1.5 Constructor

39.1.7 dependencies as NSOperationMBS()

Function: the operations on which the operation is dependent.
Notes: The receiver is not considered ready to execute until all of its dependent operations finish executing.

39.1.8 dependenciesCount as Integer

Function: The number of the dependencies.

39.1.9 dependency(index as Integer) as NSOperationMBS

Function: Returns the dependency at the given index.
Notes: The receiver is not considered ready to execute until all of its dependent operations finish executing.

Operations are not removed from this dependency list as they finish executing. You can therefore use this list to track all dependent operations, including those that have already finished executing. The only way to remove an operation from this list is to use the removeDependency method.

Available in Mac OS X v10.5 and later.

39.1.10 isCancelled as boolean

Function: Returns a Boolean value indicating whether the operation has been cancelled.
Notes:
True if the operation was explicitly cancelled by an invocation of the operation’s cancel method; otherwise, false. This method may return true even if the operation is currently executing.

Discussion
Canceling an operation does not actively stop the operation’s code from executing. An operation object is responsible for calling this method periodically and stopping itself if the method returns true.

39.1.11 isConcurrent as boolean

Function: Returns a Boolean value indicating whether the operation runs asynchronously.
Notes: True if the operation is asynchronous; otherwise, false if the operation runs synchronously on whatever thread started it. This method returns false by default.

39.1.12 isExecuting as boolean

Function: Returns a Boolean value indicating whether the operation is currently executing.
Notes: True if the operation is executing; otherwise, false if the operation has not been started or is already finished.

39.1.13 isFinished as boolean

Function: A Boolean value indicating whether the operation is done executing.
Notes: True if the operation is no longer executing; otherwise, false.

39.1.14 isReady as boolean

Function: Returns a Boolean value indicating whether the operation can be performed now.
Notes: True if the operation can be performed now; otherwise, false.

Operations may not be ready due to dependencies on other operations or because of external conditions that might prevent needed data from being ready. The NSOperation class manages dependencies on other operations and reports the readiness of the receiver based on those dependencies.
Note: If the operation is cancelled before it starts, operations that are dependent on the completion of the receiver will never become ready.

### 39.1.15 Lock

**MBS MacFrameworks Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Locks the semaphore.

**Example:**

```vbs
dim o as NSOperationMBS // your operation
dim myarray(-1) as window

o.lock
myarray.append window1
o.unlock
```

**Notes:**

You need to pair all calls to REALbasic runtime into lock and unlock to make sure you don’t crash. REALbasic is not reentrant safe, so you need to lock.

Be aware that locking costs performance. You should do locks often, so in the time between two locks another thread can get a lock. Also you should group locks nearby so you don’t waste too much time waiting for the lock. Finally you need your main application thread to run nice so it doesn’t lock too much, too.

### 39.1.16 main

**MBS MacFrameworks Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Performs the operation’s non-concurrent task.

**Notes:** This will just call to the work event.

### 39.1.17 removeDependency(op as NSOperationMBS)

**MBS MacFrameworks Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Removes the operation’s dependence on the specified operation.

**Notes:** This method may change the isReady and dependencies properties of the operation.
39.1.18 start

**Function:** Begins the execution of the operation.
**Notes:** The default implementation of this method configures the execution environment for a non-concurrent operation and invokes the operation's main method. As part of the default configuration, this method performs several checks to ensure that the non-concurrent operation can actually run and generates appropriate KVO notifications for each change in the operation's state. If the operation’s operation has already been performed, was cancelled, or is not yet ready to run, this method throws an NSInvalidArgumentException exception. If the operation is to be performed on a separate thread, this method may return before the operation itself completes on the other thread.

39.1.19 Unlock

**Function:** Unlocks the semaphore.
**Example:**
```
    dim o as NSOperationMBS // your operation
    dim myarray(-1) as window

    o.lock
    myarray.append window1
    o.unlock
```

**Notes:**
You need to pair all calls to REALbasic runtime into lock and unlock to make sure you don't crash. REALbasic is not reentrant safe, so you need to lock.

Be aware that locking costs performance. You should do locks often, so in the time between two locks another thread can get a lock. Also you should group locks nearby so you don’t waste too much time waiting for the lock. Finally you need your main application thread to run nice so it doesn’t lock too much, too.

39.1.20 waitUntilFinished

**Function:** Spend time waiting for the operation to finish.
39.1. CLASS NSOPERATIONMBS

39.1.21 Properties

39.1.22 Handle as Integer

Function: The handle to the internal used NSOperation reference.
Notes: (Read and Write property)

39.1.23 queuePriority as Integer

Function: The priority of the operation in an operation queue.
Notes: The relative priority of the operation. The returned value always corresponds to one of the predefined constants. If no priority is explicitly set, this method returns NSOperationQueuePriorityNormal.

You should use priority values only as needed to classify the relative priority of non-dependent operations. Priority values should not be used to implement dependency management among different operation objects. If you need to establish dependencies between operations, use the addDependency method instead.

If you attempt to specify a priority value that does not match one of the defined constants, this method automatically adjusts the value you specify towards the NSOperationQueuePriorityNormal priority, stopping at the first valid constant value. For example, if you specified the value -10, this method would adjust that value to match the NSOperationQueuePriorityVeryLow constant. Similarly, if you specified +10, this method would adjust the value to match the NSOperationQueuePriorityVeryHigh constant.
(Read and Write computed property)

39.1.24 threadPriority as Double

Function: The thread priority to use when executing the operation.
Notes: A floating-point number in the range 0.0 to 1.0, where 1.0 is the highest priority. The default thread priority is 0.5.

Available in Mac OS X v10.6 and later.
(Read and Write computed property)
CHAPTER 39. COCOA THREADING

39.1.25 Events

39.1.26 Close

MBS MacFrameworks Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called just before the operation object is destroyed.

39.1.27 Finished

MBS MacFrameworks Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called after work has finished.
Notes: This event is called on the main thread, so you can do GUI stuff here to show the result.

39.1.28 Open

MBS MacFrameworks Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called when the object is created.
Notes: Called on the main thread.

39.1.29 Work

MBS MacFrameworks Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: The event called for an operation to do the work.
Notes: You should test isCancelled regularly to see whether operation was cancelled.

Please read on the ThreadMBS.Work event for more details.
(NSOperationMBS is a Mac OS X feature, but the ThreadMBS class, does nearly the same on all platforms)

39.1.30 Constants

39.1.31 NSOperationQueuePriorityHigh=4

MBS MacFrameworks Plugin, Plugin Version: 8.0. Function: One of the constants for the priority property.
Notes: Operations receive high priority for execution.
39.1.32  **NSOperationQueuePriorityLow**=-4

MBS MacFrameworks Plugin, Plugin Version: 8.0. **Function:** One of the constants for the priority property. **Notes:** Operations receive low priority for execution.

39.1.33  **NSOperationQueuePriorityNormal**=0

MBS MacFrameworks Plugin, Plugin Version: 8.0. **Function:** One of the constants for the priority property. **Notes:** Operations receive the normal priority for execution.

39.1.34  **NSOperationQueuePriorityVeryHigh**=8

MBS MacFrameworks Plugin, Plugin Version: 8.0. **Function:** One of the constants for the priority property. **Notes:** Operations receive very high priority for execution.

39.1.35  **NSOperationQueuePriorityVeryLow**=-8

MBS MacFrameworks Plugin, Plugin Version: 8.0. **Function:** One of the constants for the priority property. **Notes:** Operations receive very low priority for execution.
CHAPTER 39. COCOA THREADING

39.2 class NSOperationQueueMBS

39.2.1 class NSOperationQueueMBS

Function: Queues NSOperations for later execution.

Notes:

Available in Mac OS X v10.5 and later.

The NSOperationQueue class manages a set of NSOperation objects in a priority queue and regulates their execution. Operations remain in the queue until they are explicitly cancelled or finish executing. An application may create multiple operation queues, with each queue running up to its designated maximum number of operations.

A specific NSOperation object can be in only one operation queue at a time. Operations within a single queue coordinate their execution order using both priority levels and inter-operation object dependencies. Operation objects in different queues can coordinate their execution order using dependencies, which are not queue-specific.

Inter-operation dependencies provide an absolute execution order for operations. An operation object is not considered ready to execute until all of its dependent operations have finished executing. For operations that are ready to execute, the operation queue always executes the one with the highest priority relative to the other ready operations. For details on how to set priority levels and dependencies, see NSOperation Class Reference.

You should never manually start an operation while it is sitting in an operation queue. Once added, an operation stays in its queue until it finishes executing or is cancelled.

39.2.2 Methods

39.2.3 addOperation(op as NSOperationMBS)

Function: Adds the specified operation object to the operation queue.

Notes:

An operation object can be in at most one operation queue at a time and cannot be added if it is currently executing or finished. This method throws an NSInvalidArgumentException exception if any of these conditions is true.

Once added, the specified operation remains in the queue until it is executed or cancelled.
39.2. **CLASS NSOPERATIONQUEUEMBS**

Please setup dependencies before you add the operation to a queue. Once the operation is in the queue it may be executed directly.

### 39.2.4 **addOperations(ops() as NSOperationMBS, wait as boolean)**

**Function:** Adds the specified array of operations to the queue.

**Notes:**
- **ops:** The array of NSOperation objects that you want to add to the receiver.
- **wait:** If true, the current thread is blocked until all of the specified operations finish executing. If false, the operations are added to the queue and control returns immediately to the caller.

An operation object can be in at most one operation queue at a time and cannot be added if it is currently executing or finished. This method throws an NSInvalidArgumentException exception if any of those error conditions are true for any of the operations in the ops parameter.

Once added, the specified operation remains in the queue until it its isFinished method returns true.

Available in Mac OS X v10.6 and later.

### 39.2.5 **areAllOperationsFinished as boolean**

**Function:** Returns whether all operations have been finished.

**Notes:** True if all operations have finished.

### 39.2.6 **cancelAllOperations**

**Function:** Cancels all queued and executing operations.

**Notes:** This method sends a cancel message to all operations currently in the queue or executing. Queued operations are cancelled before they begin executing. If an operation is already executing, it is up to that operation to recognize the cancellation and stop what it is doing.
39.2.7 Constructor

**Function:** The constructor creating a new operation queue.
**Notes:** On success the handle property is not 0.

39.2.8 currentQueue as NSOperationQueueMBS

**Function:** Returns the operation queue that launched the current operation.
**Notes:**
Returns the operation queue that started the operation or nil if the queue could not be determined.

You can use this method from within a running operation object to get a reference to the operation queue that started it. Calling this method from outside the context of a running operation typically results in nil being returned.

Available in Mac OS X v10.6 and later.

39.2.9 isOneOperationExecuting as boolean

**Function:** Whether at least one operation is still executing.
**Notes:**
True if one of the operations is executing.
False if no operation is executing.

39.2.10 mainQueue as NSOperationQueueMBS

**Function:** Returns the operation queue associated with the main thread.
**Notes:**
The returned queue executes operations serially on the main thread. The main thread's run loop controls the execution times of these operations.
Available in Mac OS X v10.6 and later.
39.2. CLASS NSOPERATIONQUEUEMBS

39.2.11 operation(index as UInt32) as NSOperationMBS

**Function:** Returns a noperations currently in the queue at the given index.  
**Notes:**
You can use this method to access the operations queued at any given moment. Operations remain queued until they finish their task. Therefore, the returned array may contain operations that are either executing or waiting to be executed.

Available in Mac OS X v10.5 and later.

39.2.12 operationCount as Integer

**Function:** Returns the number of operations currently in the queue.  
**Notes:**
The value returned by this method reflects the instantaneous number of objects in the queue and changes as operations are completed. As a result, by the time you use the returned value, the actual number of operations may be different. You should therefore use this value only for approximate guidance and should not rely on it for object enumerations or other precise calculations.

Available in Mac OS X v10.6 and later.

39.2.13 operations as NSOperationMBS()

**Function:** The operations currently in the queue.

39.2.14 waitUntilAllOperationsAreFinished

**Function:** Blocks the current thread until all of the receiver’s queued and executing operations finish executing.  
**Notes:** When called, this method blocks the current thread and waits for the receiver’s current and pending operations to finish executing. While the thread is blocked, the receiver continues to launch already queued operations and monitor those that are executing. During this time, the current thread cannot add operations to the queue, but other threads may. Once all of the pending operations are finished, this method returns.
CHAPTER 39. COCOA THREADING

39.2.15 Properties

39.2.16 Handle as Integer

Function: The handle to the internal used NSOperationQueue reference.
Notes: (Read and Write property)

39.2.17 isSuspended as boolean

Function: A Boolean value indicating whether the receiver is scheduling queued operations for execution.
Notes:
True if operations are being scheduled for execution; otherwise, false.
(Read and Write computed property)

39.2.18 maxConcurrentOperationCount as Integer

Function: The maximum number of concurrent operations that the queue can execute.
Notes: (Read and Write computed property)

39.2.19 name as string

Function: The name of this queue.
Notes:
The default value of this string is "NSOperationQueue <id>", where <id> is the memory address of the operation queue. If you want to know when a queue's name changes, configure a KVO observer to observe the name key path of the operation queue.
Available in Mac OS X v10.6 and later.
(Read and Write computed property)
39.2.21  NSOperationQueueDefaultMaxConcurrentOperationCount==-1

MBS MacFrameworks Plugin, Plugin Version: 8.0.  **Function:** One of the constants to be used with the maxConcurrentOperationCount property.

**Notes:** The default maximum number of operations is determined dynamically by the NSOperationQueue object based on current system conditions.
Chapter 40

Collaboration

40.1 class CBGroupIdentityMBS

40.1.1 class CBGroupIdentityMBS

**Function:** An object of the CBGroupIdentity class represents a group identity and is used for viewing the attributes of group identities from an identity authority.

**Example:**

```vbs
// get staff group
dim a as CBIdentityAuthorityMBS = CBIdentityAuthorityMBS.localIdentityAuthority
dim i as CBGroupIdentityMBS = CBGroupIdentityMBS.groupIdentityWithPosixGID(20,a)
MsgBox i.fullName
```

**Notes:**

The principal attributes of a CBGroupIdentity object are a POSIX group identifier (GID) and a list of members.
Available in OS X v10.5 and later.
Subclass of the CBIdentityMBS class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.
40.1.2 Methods

40.1.3 Constructor

Function: The private constructor.

40.1.4 copy as CBGroupIdentityMBS

Function: Creates a copy of the object.

40.1.5 groupIdentityWithPosixGID(groupID as Integer, authority as CBIdentityAuthorityMBS) as CBGroupIdentityMBS

Function: Returns the group identity with the given POSIX GID in the specified identity authority. 
Example: 

// get staff group
dim a as CBIdentityAuthorityMBS = CBIdentityAuthorityMBS.localIdentityAuthority
dim i as CBGroupIdentityMBS = CBGroupIdentityMBS.groupIdentityWithPosixGID(20,a)

MsgBox i.fullName

Notes:

- groupID: The GID of the group identity you are searching for.
- authority: An identity authority in which to search for the group identity.

Returns the group identity object with the given GID in the specified identity authority, or nil if no identity exists with the specified GID.

40.1.6 members as CBIdentityMBS()

Function: An array of CBIdentity objects each representing a member of the group identity. 
Example:
// get staff group
dim a as CBIdentityAuthorityMBS = CBIdentityAuthorityMBS.localIdentityAuthority
dim i as CBGroupIdentityMBS = CBGroupIdentityMBS.groupIdentityWithPosixGID(20,a)

MsgBox i.fullName

dim members() as CBIdentityMBS = i.members
for each m as CBIdentityMBS in members
  MsgBox m.fullName
next

Notes: This method only returns direct members of a group, it does not return members of members. Both user and group identities can be members of a group, but a group cannot be a member of itself. You also cannot have "circular" membership, i.e. a group be a member of another group that is a member of the first group.

40.1.7 posixGID as Integer

Function: Returns the POSIX GID of the identity.
Notes: The POSIX GID is an integer that can identify a group within an identity authority. GIDs are not guaranteed to be unique within an identity authority.
40.2 class CBIdentityAuthorityMBS

40.2.1 class CBIdentityAuthorityMBS

Function: An identity authority is a database that stores information about identities.
Notes:
The CBIdentityAuthority class defines one or more identity authorities. This database can be searched for
identities in conjunction with the CBIdentity class factory methods.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

40.2.2 Methods

40.2.3 Available as Boolean

Function: Whether this class is available.
Example:
if CBIdentityAuthorityMBS.Available then
    MsgBox "CBIdentityAuthorityMBS class is available"
else
    MsgBox "CBIdentityAuthorityMBS class is not available"
end if

Notes: Returns true on Mac OS X 10.5 and newer.

40.2.4 Constructor

Function: The private constructor.

40.2.5 CSIdentityAuthority as Variant

Function: Returns an identity authority for use with the Core Services Identity API.
Notes:
Returns CSIdentityAuthorityMBS object.
40.2. CLASS CBIDENTITYAUTHORITYMBS

This method, along with identityAuthorityWithCSIdentityAuthority:, is used for interoperability with the Core Services Identity API.
Available in OS X v10.5 and later.

40.2.6 defaultIdentityAuthority as CBIdentityAuthorityMBS

**Function:** Returns an identity authority that contains the identities in both the local and the network-bound authorities.
**Example:**
MsgBox CBIdentityAuthorityMBS.defaultIdentityAuthority.localizedDescriptionName

**Notes:** The default identity authority is the logical union of the identities in the local and managed authori-
ties.

40.2.7 identityAuthorityWithCSIdentityAuthority(CSIdentityAuthority as Vari-
ant) as CBIdentityMBS

**Function:** Returns an identity authority specified by a given Core Services Identity authority object.
**Notes:**
CSIdentityAuthority: The Core Services Identity opaque object. Must be a CSIdentityAuthorityMBS.
Returns the identity authority object for use with the Collaboration framework.
This method, along with CSIdentityAuthority, is used for interoperability with the Core Services Identity API.
Available in OS X v10.5 and later.

40.2.8 localIdentityAuthority as CBIdentityAuthorityMBS

**Function:** Returns the identity authority on the local system.
**Example:**
MsgBox CBIdentityAuthorityMBS.localIdentityAuthority.localizedDescriptionName

**Notes:** Any identities stored on the local system are contained within this identity authority.
40.2.9  localizedName as string

Function: Returns the localized name of the identity authority.
Notes: The computer’s name if the authority is local, or Managed Network Directory if the authority is managed.

40.2.10  managedIdentityAuthority as CBIIdentityAuthorityMBS

Function: Returns the identity authority that contains all the identities in bound network directory servers.
Example:
MsgBox CBIIdentityAuthorityMBS.managedIdentityAuthority.localizedDescriptionedName

Notes: If you are bound to a network directory server (such as an LDAP server) that has an identity authority, use this method to search those authorities.

40.2.11  Properties

40.2.12  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
40.3. **CLASS CBIDENTITYMBS**

### 40.3 class CBIdentityMBS

**40.3.1 class CBIdentityMBS**

**Function:** A CBIdentity object is used for accessing the attributes of an identity stored in an identity authority.

**Notes:**

You can use an identity object for finding identities, and storing them in an access control list (ACL). If you need to edit these attributes, take advantage of the CSIIdentity class in Core Services.

You can obtain a CBIdentity object from one of the following class factory methods: identityWithName, identityWithUUIDString, identityWithPersistentReference, or identityWithCSIIdentity.

There are two subclasses of CBIdentity: CBGroupIdentity and CBUserIdentity. If you are working specifically with a group identity, use CBGroupIdentityMBS. Similarly, if you are working with a user identity, use CBUserIdentityMBS.

**see also**

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

### 40.3.2 Methods

#### 40.3.3 aliases as string()

**Function:** Returns an array of aliases (alternate names) for the identity.

**Notes:**

Returns an array of strings containing the alternate names for the identity.

An identity can have zero or more aliases. Like the full and short names, two identities cannot share an alias.

#### 40.3.4 authority as CBIdentityAuthorityMBS

**Function:** Returns the identity authority where the identity is stored.
40.3.5 Available as Boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.5 and newer.

40.3.6 Constructor

Function: The private constructor.

40.3.7 copy as CBIdentityMBS

Function: Creates a copy of the object.

40.3.8 CSIdentity as Variant

Function: Returns an opaque object for use with the Core Services Identity API.
Notes: This method, along with identityWithCSIdentity, is used for interoperability with the Core Services Identity API.
Available in OS X v10.5 and later.

40.3.9 emailAddress as string

Function: Returns the email address of an identity.
Notes: The email address of an identity or "" if none exists.

40.3.10 fullName as string

Function: Returns the full name of the identity.
40.3.11 identityWithCSIIdentity(CSIdentity as Variant) as CBIdentityMBS

Function: Returns an identity object created from the specified Core Services Identity opaque object.
Notes:

CSIdentity: The Core Services Identity opaque object. Must be a CSIdentityMBS object.

Returns the identity object for use with the Collaboration framework.
This method is used for interoperability with the Core Services Identity API.

Available in OS X v10.5 and later.

40.3.12 identityWithName(name as string, authority as CBIdentityAuthorityMBS) as CBUserIdentityMBS

Function: Returns the identity object with the given name from the specified identity authority.
Example:

```basic
Dim name As String = "cs" ' put your name here
Dim a As CBIdentityAuthorityMBS = CBIdentityAuthorityMBS.LocalIdentityAuthority
Dim i As CBIdentityMBS = CBIdentityMBS.identityWithName(name, a)
MsgBox i.FullName + " : " + Join(i.Aliases, ", ")
```

Notes:

name: The name of the identity.
authority: The identity authority to search.

Returns the identity object, or nil if no identity is found with the specified name.
The name is compared against all valid identity names, including full names, short names, email addresses, and aliases.

40.3.13 identityWithPersistentReference(ref as Memoryblock) as CBUserIdentityMBS

Function: Returns the identity object matching the persistent reference data.
Notes:
CHAPTER 40. COLLABORATION

ref: The persistent data object that refers to an identity.

Returns the identity object matching the persistent data object, or nil if the identity is not found.
A persistent reference is an opaque data object suitable for persistent storage.

40.3.14 identityWithUUIDString(uuid as string, authority as CBIdentityAuthorityMBS) as CBUserIdentityMBS

Function: Returns the identity object with the given UUID from the specified identity authority.
Notes:

uuid: The UUID of the identity you are searching for.
authority: The identity authority to search.

Returns the identity object, or nil if no identity is found with the matching criteria.

40.3.15 image as NSImageMBS

Function: Returns the image associated with an identity.
Notes: The image associated with an identity, or nil if none exists.

40.3.16 isHidden as boolean

Function: Returns a Boolean value indicating the state of the identity's hidden property.
Notes:

A hidden identity does not show up in the Identity Picker. A hidden identity refers to system identities such as root, www, and wheel.
True if the identity is hidden; false if it is not.

40.3.17 isMemberOfGroup(g as CBGroupIdentityMBS) as boolean

Function: Returns a Boolean value indicating whether the identity is a member of the specified group.
Notes:
40.3. CLASS CBIDENTITYMBS

The group to check for membership.

Returns true if the identity is a member of the group; false if it is not.

40.3.18 persistentReference as MemoryBlock

Function: Returns a persistent reference to store a reference to an identity.
Notes:
Returns a memoryblock that uniquely references an identity.

A persistent reference data object is an object generated from an identity. Persistent data objects can be written to and read from a file, making them extremely useful for storing identities in an ACL.

40.3.19 posixName as string

Function: Returns the POSIX name of the identity.
Notes: The POSIX name is also referred to as the "short name" for an identity. It can only contain the characters A-Z, a-z, 0-9, -, _, ., and @.

40.3.20 UUIDString as string

Function: Returns the UUID of the identity as a string.
Notes: The UUID string is generated so it is unique across all identity authorities. When storing ACLs, one method is to store the UUID of each identity. However, it is recommended that you use a persistent data object instead (see persistentReference).

40.3.21 Properties

40.3.22 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
40.4  class CBIdentityPickerMBS

40.4.1  class CBIdentityPickerMBS

**Function:** A CBIdentityPicker object allows a user to select identities for example, user or group objects that it wants one or more services or shared resources to have access to.

**Example:**

```vba
dim c as new CBIdentityPickerMBS
    c.Title = "Please choose your identity"

dim n as Integer = c.runModal
    if n = c.NSOKButton then
        for each i as CBIdentityMBS in c.identities
            MsgBox i.fullName
        next
    end if
```

**Notes:** An identity picker can be displayed either as an application-modal dialog or as a sheet attached to a document window. An identity picker returns the selected records to be added to access control lists using Collaboration. If a selected record is not a user or group identity, then an identity picker prompts the end user for additional informations such as a password to promote that record to a sharing account.

40.4.2  Methods

40.4.3  Available as Boolean

**Function:** Whether this class is available.
**Notes:** Returns true on Mac OS X 10.5 and newer.

40.4.4  Constructor

**Function:** The constructor.
40.4. CLASS CBIDENTITYPICKERMBS

40.4.5 identities as CBIdentityMBS()

Function: Returns an array of the identities selected using the identity picker.

40.4.6 runModal as Integer

Function: Runs the receiver as an application-modal dialog.
Notes:
NSOKButton if the user selected OK; otherwise, NSCancelButton.
The receiver may create identities for selected records if necessary.

40.4.7 runModalForWindow(win as window)

Function: Runs the receiver modally as a sheet attached to a specified window.
Notes:
window: The parent window for the sheet.
Calls identityPickerDidEnd event later.

40.4.8 Properties

40.4.9 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

40.4.10 allowsMultipleSelection as boolean

Function: Allows a user to make select multiple identities.
Notes:
By default, you cannot select multiple records.
Set to true if you can select multiple records; otherwise, false.
40.4.11  title as string

Function: The title of the identity picker.
Example:

    dim c as new CBIdentityPickerMBS
    c.Title = "Please choose your identity"

Notes: (Read and Write computed property)

40.4.12  Events

40.4.13  identityPickerDidEnd(returnCode as Integer)

Function: The event called when runModalForWindow finished.
Notes: ReturnCode is NSOKButton if the user selected OK; otherwise, NSCancelButton.

40.4.14  Constants

40.4.15  NSCancelButton = 0

MBS MacFrameworks Plugin, Plugin Version: 12.3. Function: One of the result codes you may need with this class.

40.4.16  NSOKButton = 1

MBS MacFrameworks Plugin, Plugin Version: 12.3. Function: One of the result codes you may need with this class.
40.5. **CLASS CBUSERIDENTITYMBS**

40.5.1 **class CBUserIdentityMBS**

**Function:** An object of the CBUserIdentity class represents a user identity and is used for accessing the attributes of a user identity from an identity authority.

**Notes:**

The principal attributes of CBUserIdentity are a POSIX user identifier (UID), password, and certificate.

Subclass of the CBIdentityMBS class.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

40.5.2 **Methods**

40.5.3 **authenticateWithPassword(password as string) as boolean**

**Function:** Returns a Boolean value indicating whether the given password is correct for the identity.

**Notes:** Returns true if the password is correct; otherwise, false.

40.5.4 **Constructor**

**Function:** The private constructor.

40.5.5 **copy as CBUserIdentityMBS**

**Function:** Creates a copy of the object.

40.5.6 **isEnabled as boolean**

**Function:** Returns a Boolean value indicating whether the identity is allowed to authenticate.

**Notes:**

If the identity does not have authentication credentials (a password or certificate), it is not able to log in. However, an identity with authentication credentials does not ensure that it is enabled. Any identity can be
Returns true if the identity can authenticate; otherwise, false.

40.5.7   posixUID as Integer

Function: Returns the POSIX UID of the identity.
Notes: The POSIX UID is a integer that can identify a user within an identity authority. UIDs are not
guaranteed to be unique within an identity authority.

40.5.8   userIdentityWithPosixUID(userID as Integer, authority as CBIdentityAuthorityMBS) as CBUserIdentityMBS

Function: Returns the user identity with the given POSIX UID in the specified identity authority.
Example:
// get first user
dim a as CBIdentityAuthorityMBS = CBIdentityAuthorityMBS.localIdentityAuthority
dim i as CBUserIdentityMBS = CBUserIdentityMBS.userIdentityWithPosixUID(501,a)
MsgBox i.fullName

Notes:
uid: The UID of the identity you are searching for.
authority: The identity authority to search.

Retruns the user identity with the given UID in the specified identity authority, or nil if no identity exists
with the specified UID.
Available in OS X v10.5 and later.
40.6. Class CSIdentityAuthorityMBS

40.6.1. Class CSIdentityAuthorityMBS

**Function:** A CSIdentityAuthority object represents an identity authority.

**Example:**

```vba
dim a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.localIdentityAuthority
MsgBox a.localizedName
```

**Notes:**

An identity authority is a logical repository of user and group information, such as the users and groups database on a local system or on a directory server.

The local authority contains all users and groups defined on the local system. The managed authority contains all users and groups defined in directory servers to which the system is bound (LDAP, ActiveDirectory, etc.). The Default authority is a union of the local and managed authorities and is used to locate user/group info from both sources in one query.

Use one of the class factory methods to return a CSIdentityAuthority object, which can be used to search for an identity with an CSIdentityQuery object.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

40.6.2. Methods

40.6.3. Available as Boolean

**Function:** Whether the CSIdentityAuthority functions are available.

**Example:**

```vba
if not CSIdentityAuthorityMBS.Available then
MsgBox "not supported."
end if
```
40.6.4 Constructor

Function: The private constructor.

40.6.5 defaultIdentityAuthority as CSIdentityAuthorityMBS

Function: Returns the system’s default identity authority.
Example:
```vba
dim a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.defaultIdentityAuthority
MsgBox a.localizedName
```

Notes: The default identity authority is a pseudo-authority representing the union of the local identity authority and the managed identity authority. The function CSIdentityMBS.Authority will never return the default authority instance.

40.6.6 localIdentityAuthority as CSIdentityAuthorityMBS

Function: Returns the identity authority for identities defined on the local host.
Example:
```vba
dim a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.localIdentityAuthority
MsgBox a.localizedName
```

40.6.7 localizedName as string

Function: Returns the localized name of an identity authority.
Example:
```vba
dim a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.localIdentityAuthority
MsgBox a.localizedName
```
40.6.8 managedIdentityAuthority as CSIdentityAuthorityMBS

**Function:** Returns the identity authority for identities defined in the system’s managed directory server(s).
**Example:**
```
dim a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.managedIdentityAuthority
MsgBox a.localizedName
```

**Notes:** There is always a valid managed identity authority instance, but if the system is not bound to any managed directory servers, the managed identity authority will contain no identities.

40.6.9 Properties

40.6.10 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)
40.7  class CSIdentityMBS

40.7.1  class CSIdentityMBS

**Function:** A CSIdentity object represents a user or group entity known to the system.

**Notes:**

An identity object has the following required attributes: a class (user or group), a unique identifier (UUID), a full name, a Posix ID (UID or GID), and a Posix name (a.k.a. "short" name). There are also a number of optional attributes such as email address, image data, etc.

Group identities have a membership which may include both users as well as other groups. An identity can be tested for membership in a specific group.

A CSIdentity object is a private copy of the identity information. It can be modified in memory, but requires authorization to commit changes back to the identity authority database. On OS X version 10.5, only local identities can be created, modified or deleted, and only by users with Administrator credentials.

Changes may be committed synchronously or asynchronously. All data validation occurs at commit time. Two identities are equal if they have the same class and UUID.

40.7.2  Methods

40.7.3  AddAlias(alias as string)

**Function:** Add a name alias to an identity.

**Example:**

```text
dim c as CSIdentityMBS = CSIdentityMBS.CurrentUser
c.AddAlias "Hello"
MsgBox join(c.Aliases, EndOfLine)
```

**Notes:** This change must be committed.

40.7.4  AddMember(user as CSIdentityMBS)

**Function:** Add an identity to a group.
40.7. **CLASS CSIDENTITYMBS**

**Notes:**

User: The identity to add to the group. Can be a user or group identity.

Please call only on group identities. This change to the group must be committed.

### 40.7.5 Aliases as string()

**Function:** Retrieve the aliases of an identity.

**Example:**

```vba
Dim c As CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox Join(c.Aliases, EndOfLine)
```

**Notes:**

Returns an array containing the identity's name aliases as strings. The array may be empty.

Aliases are alternate names for identities. As with all identity names, aliases must be unique within the entire namespace of the identity authority.

### 40.7.6 AuthenticateUsingPassword(password as string) as Boolean

**Function:** Attempt to authenticate a password for a user identity.

**Notes:**

password: The password to authenticate
Returns true if the password is correct for the specified user.
Please call only on user identity.

### 40.7.7 Authority as CSIdentityAuthorityMBS

**Function:** Returns the identity authority of an identity.

**Example:**

```vba
Dim u As CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox u.Authority.localizedDescription
```
40.7.8 Available as Boolean

Function: Whether the CSIdentity functions are available.
Example:
if not CSIdentityMBS.Available then
MsgBox "not supported."
end if

40.7.9 Commit as Boolean

Function: Synchronously commit all pending changes to the identity authority database.
Notes:
error: Optional variant for CFErrorMBS which will be set if this function returns false. When this occurs, the caller is responsible for releasing the error.
Returns true if successful, false if an error occurred.
See also:

- 40.7.10 Commit(byref error as Variant) as Boolean

40.7.10 Commit(byref error as Variant) as Boolean

Function: Synchronously commit all pending changes to the identity authority database.
Notes:
error: Optional variant for CFErrorMBS which will be set if this function returns false. When this occurs, the caller is responsible for releasing the error.
Returns true if successful, false if an error occurred.
See also:

- 40.7.9 Commit as Boolean
40.7. **CLASS CSIDENTITYMBS**

### 40.7.11 Constructor

(identityClass as Integer, fullName as string, posixName as string, flags as Integer, authority as CSIdentityAuthorityMBS)

**Function:** Creates a new identity.

**Example:**

```vbs
    dim a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.localIdentityAuthority
    dim c as new CSIdentityMBS(CSIdentityMBS.kCSIdentityClassUser, "Test User", "TestUser", 0, a)

    dim e as CFErroMBS
    dim v as Variant
    if c.Commit(v) then
        MsgBox "OK"
    else
        e = v
        if e<>Nil then
            MsgBox "Failed" + EndOfLine + e.Description
        else
            MsgBox "Failed"
        end if
    end if
```

**Notes:**

- identityClass: The type of identity to be created. Specifying kCSIdentityClassUser creates a user, while kCSIdentityClassGroup creates a group.
- fullName: The primary name of the new identity.
- posixName: The POSIX name of the new identity. Specify kCSIdentityGeneratePosixName to have a name generated automatically from the full name.
- flags: Attributes of the new identity
- authority: The identity authority to host the identity. Caller must have write access to the identity authority or commit will fail. Currently, only local identities may be created, so callers must specify the local identity authority for this argument.

On success the handle property is not zero.

The new identity is allocated but is not committed to the identity authority’s database. It will become persistent and available to other clients after being committed using Commit or CommitAsynchronously.

### 40.7.12 copy as CSIdentityMBS

**Function:** Creates a copy of an identity.
Example:

```vbnet
dim u as CSIdentityMBS = CSIdentityMBS.CurrentUser
dim v as CSIdentityMBS = u.copy
v.SetFullName "Hello World" ' modify the copy only
MsgBox u.fullName + " " + v.fullName
```

### 40.7.13 CurrentUser as CSIdentityMBS

**Function:** Queries current user identity.

**Example:**

```vbnet
dim u as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox u.fullName
```

### 40.7.14 Delete

**Function:** Permanently delete an identity from the identity database.

**Notes:** Sets an identity to deleted state. This change must be committed.

### 40.7.15 GroupMembershipQuery as CSIdentityQueryMBS

**Function:** Creates a query to find a group’s members.

**Notes:**

Please call on the group identity whose members are to be queried

Returns the CSIdentityQueryMBS of the newly created object. The query is ready to be executed.

Using a query to lookup group membership allows the caller to execute the query synchronously or asynchronously.

### 40.7.16 IdentityClass as Integer

**Function:** Returns an identity’s class.

**Example:**
40.7. CLASS CSIDENTITYMBS

```vbs
dim u as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox str(u.IdentityClass) // shows 1 for user
```

40.7.17 ImageData as memoryblock

**Function:** Retrieve the image associated with a user identity.
**Example:**
```vbs
dim c as CSIdentityMBS = CSIdentityMBS.CurrentUser
dim data as MemoryBlock = c.ImageData
dim pic as Picture = JPEGStringToPictureMBS(data)
Backdrop = pic
```

**Notes:** Returns the identity’s image data as a memoryblock or nil if there is no image data.

40.7.18 ImageDataType as string

**Function:** Retrieve the uniform type identifier (UTI) of an identity’s image.
**Example:**
```vbs
dim c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox c.ImageDataType
```

**Notes:** Returns a UTI as a string for this identity’s image data or "" if there is no image data. The identity object may release its reference to the return value when the identity is modified.

40.7.19 IsCommitting as Boolean

**Function:** Determine if a commit operation is in progress.
**Notes:** Returns true if a commit operation is in progress.
40.7.20 IsGroup as Boolean

Function: Checks if identity class is group.
Example:

```vbnet
dim c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox str(c.IsUser)+" "+str(c.IsGroup)
```

40.7.21 IsHidden as Boolean

Function: Determine if a identity's hidden attribute is enabled.
Example:

```vbnet
dim u as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox str(u.IsHidden)
```

Notes: Returns true if the identity was created with the hidden attribute

40.7.22 IsMemberOfGroup(group as CSIdentityMBS) as Boolean

Function: Check if an identity is a memeber of a group.
Notes:
Please call only on a group identity.
group: The group identity whose membership is to be checked
Returns true if the identity is a member (directly or indirectly) of the specified group

40.7.23 IsUser as Boolean

Function: Checks if identity class is user.
Example:

```vbnet
dim c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox str(c.IsUser)+" "+str(c.IsGroup)
```
40.7.24 kCSIIdentityGeneratePosixName as string

Function: A special string for posix names to use to auto generate the posix name.

40.7.25 PersistentReference as memoryblock

Function: Create an opaque, persistent data reference to an identity.
Example:

```vbscript
// get a reference
dim u as CSIdentityMBS = CSIdentityMBS.CurrentUser
dim p as MemoryBlock = u.PersistentReference
u = nil

// and search back later:
dim q as CSIdentityQueryMBS = CSIdentityQueryMBS.CreateForPersistentReference(p)
if q.Execute then
dim r() as CSIdentityMBS = q.Results
MsgBox r(0).fullName
end if
```

Notes:

Returns a new persistent reference for the identity.
A persistent identity reference is an opaque data object from which an identity object may queried the future (see CreateForPersistentReference). A persistent reference is suitable for storage in an external data store, for example, as an entry in an application-specific access control list associated with a shared resource. Use of a persistent identity reference is preferred over a pure UUID-based identity reference because the persistent reference contains additional information needed to optimize the identity query and to improve the user experience when working in a distributed identity environment (LDAP, Active Directory, etc.).

40.7.26 PosixID as Integer

Function: Retrieve POSIX ID of an identity.
Example:

```vbscript
dim c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox str(c.PosixID)
```
CHAPTER 40. COLLABORATION

Notes: Returns an identity’s POSIX identifier (a UID or GID).

40.7.27 PosixName as string

Function: Retrieve the POSIX name (short name) of an identity.
Example:

```vba
dim c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox c.PosixName
```

Notes:
Returns an identity’s POSIX name. This attribute is always non-empty. The POSIX name cannot be changed after an identity has been created.

40.7.28 RemoveAlias(alias as string)

Function: Remove an alias name from an identity.
Example:

```vba
dim c as CSIdentityMBS = CSIdentityMBS.CurrentUser
c.AddAlias "Hello"
MsgBox join(c.Aliases, EndOfLine)
c.RemoveAlias "Hello"
MsgBox join(c.Aliases, EndOfLine)
```

Notes:
alias: The alias name to remove
This change must be committed.

40.7.29 RemoveClient

Function: Invalidate an identity’s client structure to stop client events.
Notes: After returning, this function guarantees that client event will never be invoked again. Use this function when releasing an identity which may have an outstanding asynchronous request. This function does not cancel an outstanding commit operation because a commit cannot be interrupted.
40.7.30 RemoveMember(user as CSIdentityMBS)

**Function:** Remove a member from a group.

**Notes:**
Please call only on group identities.
member: The member identity to remove
This change to the group must be committed.

40.7.31 SetEmailAddress(email as string = ””)

**Function:** Set an identity’s email address.

**Example:**
```vba
dim u as CSIdentityMBS = CSIdentityMBS.CurrentUser

u.SetEmailAddress(”test@test.test”)
MsgBox u.emailAddress
```

**Notes:**
emailAddress: The user’s new email address value. Pass ”” to remove an email address.
This change must be committed.

40.7.32 SetFullName(name as string)

**Function:** Sets an identity’s full name.

**Example:**
```vba
dim u as CSIdentityMBS = CSIdentityMBS.CurrentUser

// get old name
dim o as string = u.fullName

// change
u.SetFullName(”Hello World”)

// and report
```
CHAPTER 40. COLLABORATION

MsgBox o+” -”+u.fullName

Notes:

fullName: The new full name of the identity
This change must be committed.

40.7.33 SetImageData(data as memoryblock = nil, datatype as string = ”public.jpeg”)

Function: Set the internally-stored image data and data type for an identity.
Notes:

imageData: The image data. Pass nil to remove image data.
imageDataType: The uniform type identifier (UTI) of the image data. Currently, kUTTypeJPEG (”public.jpeg”) is the only type supported.
This change must be committed.

40.7.34 SetImageURL(URL as string)

Function: Set the URL of an identity’s external image storage.
Notes:

url: The URL file of the image. For local identities, this must be a file URL. Pass ”” to remove the image URL from the identity.
This change must be committed.

40.7.35 SetIsEnabled(value as boolean)

Function: Enable or disable a user.
Example:

dim u as CSIdentityMBS = CSIdentityMBS.CurrentUser

u.SetIsEnabled(true)
MsgBox str(u.isEnabled)
Notes:

isEnabled: The new value of the isEnabled attribute
A disabled user account cannot authenticate. Credentials (password and certificate) are not affected. This change must be committed.

40.7.36 SetPassword(password as string)

Function: Set a user password.
Notes:
Please call only on user identities.
password: The new password, or "" to remove the current password and disable password-based authentication.
Setting the password to "" removes the current password and disables password authentication for the user.
Setting the password to a zero-length string allows authentication with a blank password. This change must be committed.

40.7.37 UUID as string

Function: Returns an identity's UUID as string.
Example:
```vba
dim c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox c.UUID
```

40.7.38 Properties

40.7.39 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

40.7.40 EmailAddress as string

Function: Retrieve the email address of a user identity.
Example:

```vba
dim c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox c.emailAddress
```

Notes:

Returns the email address of the identity or "" if there is no email address.
(Read and Write computed property)

### 40.7.41 FullName as string

Function: Retrieve the full name of an identity.
Example:

```vba
dim i as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox i.fullName
```

Notes:

The full name is the name that is displayed in the user interface.
(Read and Write computed property)

### 40.7.42 ImageURL as string

Function: Retrieve the URL to an identity’s image file.
Example:

```vba
dim c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox c.ImageURL
```

Notes:

Returns a URL that contains the location of the user’s image file, or niol if there is no image URL.
(Read and Write computed property)
40.7. **CLASS CSIDENTITYMBS**

### 40.7.43 IsEnabled as Boolean

**Function:** Determine if a user is enabled.

**Example:**

```vbnet
dim c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox str(c.IsEnabled)
```

**Notes:**

Returns true if the user is enabled. A user that is not enabled cannot authenticate.

A user that is not enabled cannot authenticate. This setting may be used to temporarily allow a user’s access to all services and resources.

(Read and Write computed property)

---

### 40.7.44 Constants

#### 40.7.45 kCSIdentityClassGroup = 2

MBS MacFrameworks Plugin, Plugin Version: 13.0. **Function:** One of the class constants.

**Notes:** The class value for group identities.

---

#### 40.7.46 kCSIdentityClassUser = 1

MBS MacFrameworks Plugin, Plugin Version: 13.0. **Function:** One of the class constants.

**Notes:** The class value for user identities.

---

#### 40.7.47 kCSIdentityFlagHidden = -1

MBS MacFrameworks Plugin, Plugin Version: 13.0. **Function:** One of the flags for identity creation.

**Notes:** This flag causes the identity to be “hidden,” that is, excluded from most user-visible identity lists. Hidden identities include administrative users and groups such as root, www, and mysql. System service access control groups should be created with the hidden flag.

---

#### 40.7.48 kCSIdentityFlagNone = 0

MBS MacFrameworks Plugin, Plugin Version: 13.0. **Function:** One of the flags for identity creation.

**Notes:** Use this flag to set no optional attributes for a new identity.
40.8. class CSIdentityQueryMBS

40.8.1 class CSIdentityQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A CSIdentityQuery object provides synchronous or asynchronous access to a collection of identities managed by an identity authority.

**Notes:**

Clients call one of the CSIdentityQueryCreate* functions to define the query criteria. A query can be executed exactly once, in either synchronous or asynchronous mode.

For synchronous execution, the client calls CSIdentityQueryExecute. This function will return when all identities matching the criteria have been found. The results are accessed as an array via Results(). No live updates to the results array are provided in synchronous mode.

To execute in asynchronous mode, the client calls ExecuteAsynchronously, specifying a client object to receive callbacks and a runloop/mode on which callbacks are scheduled.

ExecuteAsynchronously returns immediately, and events will be reported to the callback function as results are added by the query. The client may request live updates to the query which will track changes to the results as changes are made to the identity authority by other processes. Currently, only changes to the local identity authority are monitored.

Asynchronous clients must call Stop when done processing query results to prevent the client callbacks from being called again.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

40.8.2 Methods

40.8.3 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the CSIdentityQuery functions are available.

**Example:**

```plaintext
if not CSIdentityQueryMBS.Available then
  MsgBox "not supported."
end if
```
40.8.4 Constructor

Function: The private constructor.

40.8.5 Create(identityClass as Integer, authority as CSIdentityAuthorityMBS) as CSIdentityQueryMBS

Function: Creates an identity query object for all identities in the specified authority.

Example:

```vba
dim c as CSIdentityQueryMBS = CSIdentityQueryMBS.Create(CSIdentityMBS.kCSIdentityClassUser, CSIdentityAuthorityMBS.localIdentityAuthority)

if c.Execute then
    dim a() as CSIdentityMBS = c.Results

    dim names() as string
    for each p as CSIdentityMBS in a
        names.append p.fullName
    next

    MsgBox join(names,EndOfLine)
end if
```

Notes:

identityClass: The class of identity to find

authority: The identity authority to query

Returns a new CSIdentityQuery object.

The results of this query include all of the identities in the specified authority’s database.

40.8.6 CreateCurrentUser as CSIdentityQueryMBS

Function: Creates a query for the current session user’s identity.

Example:
dim q as CSIdentityQueryMBS = CSIdentityQueryMBS.CreateForCurrentUser

if q.Execute then
    dim r() as CSIdentityMBS = q.Results
    if UBound(r) = 0 then
        dim i as CSIdentityMBS = r(0)
        MsgBox i.fullName
    end if
end if

40.8.7 CreateForName(name as string, comparisonMethod as Integer, identityClass as Integer, authority as CSIdentityAuthorityMBS) as CSIdentityQueryMBS

Function: Creates an identity query object based on a name.

Example:

    // search for short name and show full name
    dim name as string = SystemInformationMBS.ShortUsername
    dim a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.defaultIdentityAuthority
    dim f as Integer = CSIdentityQueryMBS.kCSIdentityQueryStringEquals
    dim q as CSIdentityQueryMBS = CSIdentityQueryMBS.CreateForName(name, f, CSIdentityMBS.kCSIdentityClassUser, a)

    if q.Execute then
        dim r() as CSIdentityMBS = q.Results
        MsgBox r(0).fullName
    end if

Notes:

name: The name criteria for the query.
comparisonMethod: The comparison function (equal or begins with)
identityClass: The class of identity to find
authority: The identity authority to query

Returns a new CSIdentityQuery object
The query finds identities by name. It searches the full names, posix names and aliases for matches.
40.8.8  CreateForPersistentReference(data as memoryblock) as CSIdentityQueryMBS

Function: Creates an identity query object based on an identity reference data object.

Example:

```vbnet
// get a reference
dim u as CSIdentityMBS = CSIdentityMBS.CurrentUser
dim p as MemoryBlock = u.PersistentReference
u = nil

// and search back later:
dim q as CSIdentityQueryMBS = CSIdentityQueryMBS.CreateForPersistentReference(p)
if q.Execute then
dim r() as CSIdentityMBS = q.Results
MsgBox r(0).fullName
end if
```

Notes:

- referenceData: The reference data that fully describes an identity
- Returns a new CSIdentityQuery object.
- Finds an identity by reference data obtained from ReferenceData.

40.8.9  CreateForPosixID(posixID as Integer, identityClass as Integer, authority as CSIdentityAuthorityMBS) as CSIdentityQueryMBS

Function: Creates an identity query object based on a POSIX ID.

Example:

```vbnet
// search for short name and show full name
dim a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.defaultIdentityAuthority
dim f as Integer = CSIdentityQueryMBS.kCSIdentityQueryStringEquals

dim q as CSIdentityQueryMBS = CSIdentityQueryMBS.CreateForPosixID(501, CSIdentityMBS.kCSIdentityClassUser, a)

if q.Execute then
dim r() as CSIdentityMBS = q.Results
MsgBox r(0).fullName
end if
```

Notes:
40.8. **CLASS CSIDENTITYQUERYMBS**

posixID: The UID or GID of the identity to find
identityClass: The class of identity to find
authority: The identity authority to query

Returns a new CSIdentityQuery object
Finds an identity by its UID or GID

40.8.10  **CreateForUUID(uuid as string, authority as CSIdentityAuthorityMBS) as CSIdentityQueryMBS**

**Function:** Creates an identity query object based on a UUID.
**Notes:**

uuid: The UUID of the identity to find
authority: The identity authority to query
Returns a new CSIdentityQuery object
Finds an identity by its UUID.

40.8.11  **Execute(flags as Integer = 0) as Boolean**

**Function:** Execute an identity query synchronously.
**Notes:**

flags: Execution options.
error: Optional pointer to a variant which is filled with CFErrorMBS object if function returns false.
Returns true if the query executed successfully, false if an error occurred.
See also:

- 40.8.12 Execute(flags as Integer, byref error as Variant) as Boolean

40.8.12  **Execute(flags as Integer, byref error as Variant) as Boolean**

**Function:** Execute an identity query synchronously.
**Notes:**

flags: Execution options.
error: Optional pointer to a variant which is filled with CFErrorMBS object if function returns false.
Returns true if the query executed successfully, false if an error occurred.
See also:
40.8.11 Execute(flags as Integer = 0) as Boolean

40.8.13 Results as CSIdentityMBS()

**Function:** Retrieve the results of executing an identity query.

40.8.14 Stop

**Function:** Invalidate an identity query client.
**Notes:** Invalidate a query client so that its callback will never be called in the future. Clients should call Stop when an query will no longer be used, prior to releasing the final query reference.

40.8.15 Properties

40.8.16 Handle as Integer

**Function:** The internal object reference.
**Notes:** (Read and Write property)

40.8.17 Constants

40.8.18 kCSIdentityQueryGenerateUpdateEvents = 1

MBS MacFrameworks Plugin, Plugin Version: 13.0. **Function:** Execution options for an identity query.
**Notes:** After the initial query phase is complete, monitor the result set for live updates.

40.8.19 kCSIdentityQueryIncludeHiddenIdentities = 2

MBS MacFrameworks Plugin, Plugin Version: 13.0. **Function:** Execution options for an identity query.
**Notes:** Include all matching identities in the result set, including hidden "system" users and groups (root, www, etc.).
40.8.20  kCSIdentityQueryStringBeginsWith = 2

MBS MacFrameworks Plugin, Plugin Version: 13.0. **Function:** Options for querying the database by name. **Notes:**
The identity name must begin with the search string.
When searching for identities by name, this value specifies the string comparison function.

40.8.21  kCSIdentityQueryStringEquals = 1

MBS MacFrameworks Plugin, Plugin Version: 13.0. **Function:** Options for querying the database by name. **Notes:**
The identity name must equal the search string.
When searching for identities by name, this value specifies the string comparison function.
Chapter 41  

ColorSync  

41.1  Globals  

41.1.1  ColorsyncAvailableMBS as boolean  

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** Returns true if ColorSync is installed on this computer.  

41.1.2  CountColorSyncCMMInfoMBS as Integer  

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** Returns how many CMMs were found.  
**Notes:**  
Will return 0 if you don’t call LoadColorsyncProfiles before.  
Requires ColorSync 2.6 or newer.  

41.1.3  CountColorSyncProfileInfoMBS as Integer  

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Function:** Returns how many Profiles were found in the folder "Colorsync profiles".  
**Notes:** Will return 0 if you don’t call LoadColorsyncProfiles before.
CHAPTER 41. COLORSINC

41.1.4 CreateColorSyncBitmapMBS(p as picture,dontcopy as boolean) as ColorSyncBitmapMBS

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a bitmap matching the picture.

**Notes:**

If the parameter dontcopy is true the ColorSyncBitmapMBS refers to the original data from the picture and any change of them is seen in the picture. Inside the ColorSyncBitmapMBS object a reference to this picture is kept, so it is not destroyed by Realbasic if you don’t need it anymore. The memoryblock of the data property is pointing to the original data of the picture.

If dontcopy is false then the pixels are copied into a new memoryblock which is later stored in the data property of the bitmap object.

This function was designed to test the MatchBitmap functions.

The PixelSize property of the bitmap is set to 32 as a good guess.

Does not support Cocoa. In Cocoa, please use CGBitmapContext and CGColorSpace classes for ColorSync.

41.1.5 GetColorSyncCMMInfoMBS(index as Integer) as ColorSyncCMMInfoMBS

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns details about the CMM with the specified index.

**Notes:**

Index is 0 based.
Will return nil if you don’t call LoadColorsyncProfiles before.
Requires ColorSync 2.6 or newer.

41.1.6 GetColorSyncProfileInfoMBS(index as Integer) as ColorSyncProfileInfoMBS

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns details about the profiles in the folder ”Colorsync profiles”.

**Notes:**

Index is 0 based.
Will return nil if you don’t call LoadColorsyncProfiles before.
41.1. GLOBALS

41.1.7 GetDisplayColorSyncProfileMBS(index as UInt32) as ColorSyncProfileMBS

MBS MacClassic Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: No, Linux: No.
Function: Returns the system colorsync profile.
Example:

```pascal
dim p as colorSyncProfileMBS

p=GetDisplayColorSyncProfileMBS(0)

msgBox p.Name
```

Notes:
Index is zero based.
Returns nil on any error.
Deprecated by Apple in OS X 10.6. Please move to use NSScreenMBS and NSColorSpaceMBS.

41.1.8 GetSystemColorSyncProfileMBS as ColorSyncProfileMBS

Function: Returns the system colorsync profile.
Example:

```pascal
dim p as colorSyncProfileMBS

p=getsystemColorSyncProfileMBS

msgBox p.Name
```

Notes:
Returns nil on any error.
Deprecated by Apple in OS X 10.6. Please move to use NSScreenMBS and NSColorSpaceMBS.

41.1.9 LaunchColorsyncControlPanelMBS

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Launches the control panel for ColorSync.
41.1.10  LoadColorsyncProfilesMBS

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Call this to load the information about the colorsync profiles.

**Notes:**
You can call this function at any time to update.
If you have ColorSync 2.6 or newer the list of CMMs is also loaded.

41.1.11  OpenColorSyncProfileMBS(data as string) as ColorSyncProfileMBS

MBS MacClassic Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Opens a color sync profile which is in memory inside a string.

**Example:**

```vba
// create some profile
dim p as LCMS2ProfileMBS = LCMS2ProfileMBS.CreateSRGBProfile

// save to string in memory
dim s as string = p.SaveProfileToString

// and open with colorsync
dim c as ColorSyncProfileMBS = OpenColorSyncProfileMBS(s)

// show name
MsgBox c.Name
```

41.2  class ColorSyncBitmapMBS

41.2.1  class ColorSyncBitmapMBS

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for the bitmaps for ColorSync.

**Notes:**
If you can use a Realbasic picture, but if you can’t (e.g. if you use CMYK data) you can use this class and set all properties as you like. They are not checked by the plugin so listen to the error codes of MatchBitmap. See the ColorSpaceType for the Color space constants.
41.2. CLASS COLORSYNCBITMAPMBS

41.2.2 Properties

41.2.3 ColorSpaceType as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color space in which the colors of the bitmap image are specified.

**Notes:**

The constants for the ColorSpace:

```plaintext
cmNoSpace & h0000
cmRGBSpace & h0001
cmCMYKSpace & h0002
cmHSVSpace & h0003
cmHLSSpace & h0004
cmYXYSpace & h0005
cmXYZSpace & h0006
cmLUVSpace & h0007
cmLABSpace & h0008
cmReservedSpace1 & h0009
cmGraySpace & h000A
cmReservedSpace2 & h000B
cmGamutResultSpace & h000C
cmNamedIndexedSpace & h0010
cmMCFiveSpace & h0011
cmMCSixSpace & h0012
cmMCSevenSpace & h0013
cmMCEightSpace & h0014
cmAlphaPmulSpace & h0040
cmAlphaSpace & h0080
cmRGBASpace cmRGBSpace + cmAlphaSpace
cmGrayASpace cmGraySpace + cmAlphaSpace
cmRGBAPmulSpace cmRGBASpace + cmAlphaPmulSpace
cmGrayAPmulSpace cmGrayASpace + cmAlphaPmulSpace
```

**Discussion**

This enumeration defines constants for color spaces which can specify color values for a bitmap image. As a rule, these constants include a packing format, defined in "Color Packing for Color Spaces". You can use these constants to set the space field of the CMBitmapMBS type definition identifies the color space in which the colors of the bitmap image are specified, as described in "Abstract Color Space Constants".

**Color Packing for Color Spaces:**
41.2.4 Data as memoryblock

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A memoryblock with the bitmap’s binary data.  **Notes:** (Read and Write property)

41.2.5 height as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The height of the bit image, that is, the number of rows in the image.  **Notes:** (Read and Write property)

41.2.6 PixelSize as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of bits per pixel.  **Notes:**
The pixel size should correspond to the packing size specified in the space field. This requirement is not enforced as of ColorSync version 2.5, but it may be enforced in future versions.  **(Read and Write property)**

41.2.7 PixmapHandle as Integer

MBS MacClassic Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal handle of the picture bitmap.  **Notes:**
Only when the bitmap is linked to a REALbasic picture.  **(Read only property)**

41.2.8 RowBytes as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The bytes of one row of pixels of the bitmap.  **Notes:**
41.2. **CLASS COLORSYNCRGBBITMAPMBS**

If you have a 32bit RGB bitmap with 200 pixels width you get 200*32/8 or 800 bytes per row. (Read and Write property)

41.2.9 **width as Integer**

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The width of the bit image, that is, the number of pixels in a row. **Notes:** (Read and Write property)
A luminance color space with a single 16-bit component, gray.

A luminance color space with two components, a gray component followed by an alpha channel component. Each component value is 16 bits.

An RGB color space composed of red, green, and blue components whose values are packed with 5 bits of storage per component. The storage size for a color value expressed in this color space is 16 bits, with the high-order bit not used.

An RGB color space composed of red, green, and blue components whose values are packed with 8 bits of storage per component. The storage size for a color value expressed in this color space is 24 bits.

An RGB color space composed of red, green, and blue components whose values are packed with 8 bits of storage per component. The storage size for a color value expressed in this color space is 32 bits, with bits 24-31 not used.

An RGB color space composed of red, green, and blue components whose values are packed with 16 bits of storage per component. The storage size for a color value expressed in this color space is 48 bits.

An RGB color space composed of red, green, and blue color value components preceded by an alpha channel component whose values are packed with 8 bits of storage per component. The storage size for a color value expressed in this color space is 32 bits.

An RGB color space composed of red, green, and blue color value components, followed by an alpha channel component. Values are packed with 8 bits of storage per component. The storage size for a color value expressed in this color space is 32 bits.

A CMYK color space composed of cyan, magenta, yellow, and black components whose values are packed with 8 bits of storage per component. The storage size for a color value expressed in this color space is 32 bits.

A CMYK color space composed of cyan, magenta, yellow, and black components whose values are packed with 16 bits of storage per component. The storage size for a color value expressed in this color space is 64 bits.

An HSV color space composed of hue, saturation, and value components whose values are packed with 10 bits of storage per component. The storage size for a color value expressed in this color space is 32 bits, with the high-order 2 bits not used.

An HLS color space composed of hue, lightness, and saturation components whose values are packed with 10 bits of storage per component. The storage size for a color value expressed in this color space is 32 bits, with the high-order 2 bits not used.

A Yxy color space composed of Y, x, and y components whose values are packed with 10 bits of storage per component. The storage size for a color value expressed in this color space is 32 bits, with the high-order 2 bits not used.

An XYZ color space composed of X, Y, and Z components whose values are packed with 10 bits per component. The storage size for a color value expressed...
41.2. CLASS COLORSYNCBITMAPMBS

This constant is not used for ColorSync bitmaps.

This constant is used in conjunction with the ColorMapIndex
constant to indicate whether the channel bitmap is bleed
or opaque. This constant is defined in the ColorSyncBitmap
function (page 3-123); the bitmap must be only 1 bit deep.

The constant is defined as follows:

- ColorPacking & h0000: The bitmap is not used for ColorSync bitmaps.
- ColorPacking & h0080: The alpha channel component is not used for ColorSync bitmaps.
- ColorPacking & h0000: The alpha channel component is used for ColorSync bitmaps.
- ColorPacking & h0080: The alpha channel component is not used for ColorSync bitmaps.
- ColorPacking & h0000: The alpha channel component is used for ColorSync bitmaps.
- ColorPacking & h0080: The alpha channel component is not used for ColorSync bitmaps.
- ColorPacking & h0000: The alpha channel component is used for ColorSync bitmaps.
- ColorPacking & h0080: The alpha channel component is not used for ColorSync bitmaps.
- ColorPacking & h0000: The alpha channel component is used for ColorSync bitmaps.

The constant is defined as follows:

- ColorPacking & h2100: The color values for three 8-bit color channels are stored in consecutive bytes, for a total of 24 bits.
- ColorPacking & h0800: The color values for four 8-bit color channels are stored in consecutive bytes, for a total of 32 bits.
- ColorPacking & h2200: The color values for five 8-bit color channels are stored in consecutive bytes, for a total of 40 bits.
- ColorPacking & h2300: The color values for six 8-bit color channels are stored in consecutive bytes, for a total of 48 bits.
- ColorPacking & h2400: The color values for seven 8-bit color channels are stored in consecutive bytes, for a total of 56 bits.
- ColorPacking & h2500: The color values for eight 8-bit color channels are stored in consecutive bytes, for a total of 64 bits.
- ColorPacking & h2600: The color values for two 16-bit color channels are stored in a 32-bit word.
- ColorPacking & h2700: The color values for a 32-bit color channel are stored in a 32-bit word.
41.3 class ColorSyncCMMInfoMBS

41.3.1 class ColorSyncCMMInfoMBS

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A class for informations about a CMM known to the operation system.
Notes: Requires ColorSync 2.6 or newer.

41.3.2 Properties

41.3.3 Description as String

Notes:
If DescriptionUnicode is not "", it's returned, else DescriptionASCII.
Requires ColorSync 2.6 or newer.
(Read only property)

41.3.4 DescriptionASCII as string

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The description string for this CMM as ASCII string.
Notes:
Requires ColorSync 2.6 or newer.
(Read only property)

41.3.5 DescriptionUnicode as string

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The description string for this CMM as an Unicode string.
Notes:
 Only useful on REALbasic 4.5 or later.
Requires ColorSync 2.6 or newer.
(Read only property)
41.3.6 **Name as String**

MBS MacClassic Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name string for this CMM as a string.

**Notes:**
If NameUnicode is not "", it’s returned, else NameASCII.
Requires ColorSync 2.6 or newer.
(Read only property)

41.3.7 **NameASCII as string**

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name string for this CMM as ASCII string.

**Notes:**
Requires ColorSync 2.6 or newer.
(Read only property)

41.3.8 **NameUnicode as string**

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name string for this CMM as Unicode string.

**Notes:**
Only useful on REALbasic 4.5 or later.
Requires ColorSync 2.6 or newer.
(Read only property)

41.3.9 **Type as string**

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Type Code for this CMM.

**Notes:**
Requires ColorSync 2.6 or newer.
(Read only property)
41.3.10 Vendor as string

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Vendor Code for this CMM.
**Notes:**
Requires ColorSync 2.6 or newer.
(Read only property)

41.3.11 Version as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Version Code for this CMM.
**Notes:**
Requires ColorSync 2.6 or newer.
(Read only property)
41.4. class ColorSyncProfileInfoMBS

41.4.1 class ColorSyncProfileInfoMBS

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for informations about a profile file known to the operation system. **Deprecated:** This item is deprecated and should no longer be used.

41.4.2 Methods

41.4.3 OpenProfile as ColorSyncProfileMBS

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens this profile.

41.4.4 Properties

41.4.5 className as string

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class of the profile’s device. **Notes:** Possible values:

- "scnr" An input device profile defined for a scanner.
- "mntr" A display device profile defined for a monitor.
- "prtr" An output device profile defined for a printer.
- "link" A device link profile.
- "abst" An abstract profile.
- "spac" A color space profile.
- "nmcl" A named color space profile.

Renamed in Plugin version 3.3 to "classname" instead of "class". (Read only property)
41.4.6 DataColorSpace as string

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The color space signature of the profile's device.

**Notes:**

Possible values:

- "XYZ" The XYZ data color space.
- "Lab" The L*a*b* data color space.
- "Luv" The L*u*v* data color space.
- "Yxy" The Yxy data color space.
- "RGB" The RGB data color space.
- "sRGB" The RGB data color space.
- "GRAY" The Gray data color space.
- "HSV" The HSV data color space.
- "HLS" The HLS data color space.
- "CMYK" The CMYK data color space.
- "CMY" The CMY data color space.
- "MCH5" The five-channel multichannel (HiFi) data color space.
- "MCH6" The six-channel multichannel (HiFi) data color space.
- "MCH7" The seven-channel multichannel (HiFi) data color space.
- "MCH8" The eight-channel multichannel (HiFi) data color space.

Other values without a definition from Apple:

- "3CLR", "4CLR", "5CLR", "6CLR", "7CLR", "8CLR", "NAME", "9CLR", "ACLR", "BCLR", "CCLR", "DCLR", "ECLR", "FCLR".

(Read only property)

41.4.7 Location as ColorSyncProfileLocationMBS

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The location of the profile as a ColorSyncProfileLocationMBS object.

**Notes:** (Read only property)

41.4.8 ManufacturerDate as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A code for the date where the manufacturer made this profile.
41.4. CLASS COLORSYNCPROFILEINFOMBS

Notes: (Read only property)

41.4.9 ManufacturerID as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ID of the manufacturer.

Notes: (Read only property)

41.4.10 ManufacturerModel as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The model code of the manufacturer.

Notes: (Read only property)

41.4.11 ManufacturerSerialNumber as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The serial number from the manufacturer for this device.

Notes: (Read only property)

41.4.12 name as string

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the profile.

Notes: (Read only property)

41.4.13 Platform as string

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The signature of the platform for this profile.

Notes:

(Read only property)
"APPL" Apple.
"MSFT" Microsoft
"SUNW" Sun.
"SGI" Silicon graphics.
"TGNT" Taligent

41.4.14  PreferredCMM as string

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The code for the preferred ColorMatchingModule of this profile.
**Notes:**
Most times you'll get "appl" for Apple.
(Read only property)

41.4.15  ScriptCode as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The scriptcode for the name of the string.
**Notes:** (Read only property)

41.4.16  Version as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The version of the profile format.
**Notes:**
The first 8 bits indicate the major version number, followed by 8 bits indicating the minor version number. The following 2 bytes are reserved.

The profile version number is not tied to the version of the ColorSync Manager. Profile formats and their versions are defined by the ICC. For example, a major version change may indicate the addition of new required tags to the profile format; a minor version change may indicate the addition of new optional tags. (Read only property)
41.5. class ColorSyncProfileLocationMBS

41.5.1 class ColorSyncProfileLocationMBS

41.5.2 Properties

41.5.3 Data as MemoryBlock

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The memory-block for this location if it is memory-based.

Notes:
This memory is generated as a wrapper to the original data in memory. So if you have created the profile using a memory block this is not your original block, but a copy of it pointing to the same data in memory.
(Read and Write property)

41.5.4 FilePath as String

Notes:
Only valid with type=5.
(Read and Write property)

41.5.5 isFile as Boolean

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Is the profile read from a file?

Notes: (Read and Write property)

41.5.6 isMemory as Boolean

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Is the profile read from a memory block?

Notes: (Read and Write property)
41.5.7 Path as folderitem

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The folderitem for this location if it is disk-based. **Notes:** (Read and Write property)

41.5.8 Type as Integer

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of location where the profile is from. **Notes:**

Possible values:

0  profile is temporary
1  profile is disk-based
2  profile in relocatable memory
3  profile in nonrelocatable memory
4  profile is accessed by procedure
5  profile is path-based
6  profile is buffer-based

(Read and Write property)
41.6. CLASS COLORSYNCPROFILEMBS

41.6 class ColorSyncProfileMBS

41.6.1 class ColorSyncProfileMBS

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for an opened profile. 
**Deprecated:** This item is deprecated and should no longer be used. **Notes:** For newer apps, better use CSProfileMBS or LCMS2ProfileMBS classes instead.

41.6.2 Methods

41.6.3 Copy(target as folderitem) as ColorSyncProfileMBS

MBS MacClassic Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the profile at the given file specification. **Notes:** Target uses FSSpec so it’s limited to 31 characters for the filename, but you can of course rename the file after creating it.

Requires ColorSync 2.0 or newer.

41.6.4 CountElements as UInt32

MBS MacClassic Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Counts the elements in the profile. **Example:**

```vba
dim fi as FolderItem = GetFolderItem("/system/Library/ColorSync/Profiles/Generic RGB Profile.icc", folderitem.PathType-Shell)
dim ip as ColorSyncProfileMBS = fi.OpenAsColorSyncProfileMBS
MsgBox str(ip.CountElements) // shows 11
```

**Notes:** Lasterror is set.
41.6.5 Description as string

**Function:** The localized description of the profile.

**Example:**

```vba
Dim fi As FolderItem = GetFolderItem("/system/Library/ColorSync/Profiles/Generic RGB Profile.icc", folderitem.PathType-Shell)
Dim ip As ColorSyncProfileMBS = fi.OpenAsColorSyncProfileMBS

MsgBox ip.Description
```

**Notes:** `LastError` is set.

41.6.6 ICCData as string

**Function:** Returns the ICC Data of the profile.

**Example:**

```vba
Dim fi As FolderItem = GetFolderItem("/system/Library/ColorSync/Profiles/Generic RGB Profile.icc", folderitem.PathType-Shell)
Dim ip As ColorSyncProfileMBS = fi.OpenAsColorSyncProfileMBS

MsgBox str(lenb(ip.ICCData)) // shows len in bytes
```

**Notes:**

You can use this data and write it into an *.ICC file or embed it in a picture file.

Requires Mac OS X 10.4.

41.6.7 MD5 as string

**Function:** The MD5 checksum of this profile.

**Example:**

```vba
Dim fi As FolderItem = GetFolderItem("/system/Library/ColorSync/Profiles/Generic RGB Profile.icc", folderitem.PathType-Shell)
Dim ip As ColorSyncProfileMBS = fi.OpenAsColorSyncProfileMBS

MsgBox EncodingToHexMBS(ip.MD5)
```
41.6. CLASS COLORSYNCPROFILEMBS

Notes:
Returns a binary string. To get the hex number for displaying, use EncodingToHexMBS. Lasterror is set.

41.6.8 Modified as boolean

Function: Whether the profile has been modified.
Example:

```vba
dim fi as FolderItem = GetFolderItem(“/system/Library/ColorSync/Profiles/Generic RGB Profile.icc”, folderitem.PathType-Shell)
dim ip as ColorSyncProfileMBS = fi.OpenAsColorSyncProfileMBS
MsgBox str(ip.Modified) // shows false
```

Notes: Lasterror is set.

41.6.9 Name as String

Function: Returns the name of the profile.
Notes:
Returns the first name property which is not "" in this order:
1. unicode encoded name
2. MacRoman encoded name
3. ASCII encoded name

41.6.10 ProfileElementMemory(tag as string) as Memoryblock

Function: Returns the profile element with the given tag.
Notes:
Tag must be a 4 letter string.
Returns nil on any error.
e.g. cmMediaBlackPointTag = "bkpt" and cmMediaWhitePointTag = "wtpt".

### 41.6.11 ProfileElementString(tag as string) as string

**MBS MacClassic Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Returns the profile element with the given tag.

**Notes:**
- Tag must be a 4 letter string.
- Returns "" on any error.

### 41.6.12 RefCount as Integer

**MBS MacClassic Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** The reference count for this profile.

**Example:**

```vba
    dim fi as FolderItem = GetFolderItem("/system/Library/ColorSync/Profiles/Generic RGB Profile.icc", folderitem.PathType-Shell)
    dim ip as ColorSyncProfileMBS = fi.OpenAsColorSyncProfileMBS
    MsgBox str(ipRefCount) // shows 1
```

**Notes:**
- While the ColorSyncProfileMBS object has a reference count, the ProfileRef handle has a reference count, too.
- So if RefCount is 1, your ColorSyncProfileMBS object is the only owner and can modify the profile without disturbing other application parts.
- Lasterror is set.

### 41.6.13 Save as boolean

**MBS MacClassic Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.**

**Function:** Saves the profile back to disc.

**Notes:** Requires ColorSync 2.6 or newer.
41.6. **CLASS COLORSYNCPROFILEMBS**

### 41.6.14 Validate as boolean

MBS MacClassic Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Validates whether the profile works with the installed CMMs. 
**Notes:** Requires ColorSync 2.6 or newer.

### 41.6.15 Properties

#### 41.6.16 Handle as Integer

**Function:** The handle of the profile. 
**Notes:** May be useful for declares. 
(Read only property)

#### 41.6.17 Lasterror as Integer

**Function:** The last error code. 
**Notes:** Zero is for no error. -1 is a plugin error, normally with wrong parameters, no handle or not supported. 
(Read only property)

#### 41.6.18 Location as ColorSyncProfileLocationMBS

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The location of the profile as a ColorSyncProfileLocationMBS object. 
**Notes:** (Read only property)

#### 41.6.19 NameASCII as string

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the profile as an ASCII string (7bit). 
**Notes:** Requires ColorSync 2.6 or newer. 
(Read only property)
41.6.20 NameMac as string

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the profile as a Mac string.

**Notes:**

Requires ColorSync 2.6 or newer.
(Read only property)

41.6.21 NameUnicode as string

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the profile as a Unicode string.

**Notes:**

Only useful on REALbasic 4.5 or later.
Requires ColorSync 2.6 or newer.
(Read only property)
41.7. class ColorSyncProfileSetItemMBS

41.7.1. class ColorSyncProfileSetItemMBS

MBS MacClassic Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: This class is used for the ColorSyncWorldMBS constructor to create a color transformation with specifying rendering intents and the CMM engine.

41.7.2. Properties

41.7.3. profile as ColorSyncProfileMBS

MBS MacClassic Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The profile you want to use. Notes: (Read and Write property)

41.7.4. renderingIntent as Integer

41.7.5. transformTag as Integer

41.7.6. Constants

41.7.7. cmAbsoluteColorimetric = 3

MBS MacClassic Plugin, Plugin Version: 10.5. Function: One of the rendering intent constants. Notes: Absolute Colorimetric
41.7.8  \texttt{cmPerceptual} = 0

MBS MacClassic Plugin, Plugin Version: 10.5. \textbf{Function:} One of the rendering intent constants. \textbf{Notes:} Perceptual

41.7.9  \texttt{cmRelativeColorimetric} = 1

MBS MacClassic Plugin, Plugin Version: 10.5. \textbf{Function:} One of the rendering intent constants. \textbf{Notes:} Relative Colorimetric

41.7.10 \texttt{cmSaturation} = 2

MBS MacClassic Plugin, Plugin Version: 10.5. \textbf{Function:} One of the rendering intent constants. \textbf{Notes:} Saturation

41.7.11 \texttt{kDeviceToPCS} = 1

MBS MacClassic Plugin, Plugin Version: 10.5. \textbf{Function:} One of the transform constants.

41.7.12 \texttt{kNoTransform} = 0

MBS MacClassic Plugin, Plugin Version: 10.5. \textbf{Function:} One of the transform constants.

41.7.13 \texttt{kPCSToDevice} = 2

MBS MacClassic Plugin, Plugin Version: 10.5. \textbf{Function:} One of the transform constants.

41.7.14 \texttt{kPCSToPCS} = 3

MBS MacClassic Plugin, Plugin Version: 10.5. \textbf{Function:} One of the transform constants.
41.7.15  kUseAtoB = 1

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the transform constants.

41.7.16  kUseBtoA = 2

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the transform constants.

41.7.17  kUseBtoB = 3

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the transform constants.

41.7.18  kUseProfileIntent = -1

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the rendering intent constants.
41.8  class ColorSyncWorldMBS

41.8.1  class ColorSyncWorldMBS

MBS MacClassic Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a Colorsync world. **Deprecated:** This item is deprecated and should no longer be used. **Notes:**

A ColorSyncWorldMBS is an object which holds two profiles to match pictures between.

Possible error codes from Colorsync:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>noErr</td>
<td>No error</td>
</tr>
<tr>
<td>cmProfileError</td>
<td>-170  There is something wrong with the content of the profile</td>
</tr>
<tr>
<td>cmMethodError</td>
<td>-171  An error occurred during the CMM arbitration process that determines the CMM to use</td>
</tr>
<tr>
<td>cmMethodNotFound</td>
<td>-175  CMM not present</td>
</tr>
<tr>
<td>cmProfileNotFound</td>
<td>-176  Responder error</td>
</tr>
<tr>
<td>cmProfilesIdentical</td>
<td>-177  Profiles are the same</td>
</tr>
<tr>
<td>cmCantConcatenateError</td>
<td>-178  Profiles can’t be concatenated</td>
</tr>
<tr>
<td>cmCantXYZ</td>
<td>-179  CMM does not handle XYZ color space</td>
</tr>
<tr>
<td>cmCantDeleteProfile</td>
<td>-180  Responder error</td>
</tr>
<tr>
<td>cmUnsupportedDataType</td>
<td>-181  Responder error</td>
</tr>
<tr>
<td>cmNoCurrentProfile</td>
<td>-182  Responder error</td>
</tr>
<tr>
<td>cmElementTagNotFound</td>
<td>-4200  The tag you specified is not in the specified profile</td>
</tr>
<tr>
<td>cmIndexRangeErr</td>
<td>-4201  Tag index out of range</td>
</tr>
<tr>
<td>cmFatalProfileErr</td>
<td>-4203  Returned from File Manager while updating a profile file in response to CMUpdateProfile; profile content may be corrupted.</td>
</tr>
<tr>
<td>cmInvalidProfileLocation</td>
<td>-4205  Operation not supported for this profile location</td>
</tr>
<tr>
<td>cmInvalidSearch</td>
<td>-4206  Bad search handle</td>
</tr>
<tr>
<td>cmSearchError</td>
<td>-4207  Internal error occurred during profile search</td>
</tr>
<tr>
<td>cmInvalidColorSpace</td>
<td>-4209  Profile color space does not match bitmap type</td>
</tr>
<tr>
<td>cmInvalidSrcMap</td>
<td>-4210  Source pixel map or bitmap was invalid</td>
</tr>
<tr>
<td>cmInvalidDstMap</td>
<td>-4211  Destination pix/bit map was invalid</td>
</tr>
<tr>
<td>cmNoGDevicesError</td>
<td>-4212  Begin matching or end matching - no graphics devices available</td>
</tr>
<tr>
<td>cmInvalidProfileComment</td>
<td>-4213  Bad profile comment during drawpicture</td>
</tr>
<tr>
<td>cmRangeoverFlow</td>
<td>-4214  One or more output color value overflows in color conversion; all input color values will be converted and the overflow will be clipped</td>
</tr>
<tr>
<td>cmCantCopyModifiedV1Profile</td>
<td>-4215  It is illegal to copy version 1.0 profiles that have been modified</td>
</tr>
<tr>
<td>cmNamedColorNotFound</td>
<td>-4216  The specified named color was not found in the specified profile</td>
</tr>
<tr>
<td>cmCantGamutCheckError</td>
<td>-4217  Gamut checking not supported by this color world - that is, the color world does not contain a gamut table because it was built with gamut checking turned off</td>
</tr>
</tbody>
</table>
41.8. CLASS COLORSYNCWORLDMBS

41.8.2 Methods

41.8.3 Constructor(CMM as Integer, flags as Integer, flagsMask as Integer, profiles() as ColorSyncProfileSetItemMBS)

Function: Creates a new ColorSync World from the given profile list.
Example:

dim fi as FolderItem = GetFolderItem("/system/Library/ColorSync/Profiles/Generic RGB Profile.icc", folderitem.PathType-Shell)
dim fo as FolderItem = GetFolderItem("/system/Library/ColorSync/Profiles/Generic CMYK Profile.icc", folderitem.PathTypeShell)

dim ip as ColorSyncProfileMBS = fi.OpenAsColorSyncProfileMBS
dim op as ColorSyncProfileMBS = fo.OpenAsColorSyncProfileMBS

dim si as new ColorSyncProfileSetItemMBS
si.profile = ip
si.renderingIntent = si.cmPerceptual
si.transformTag = si.kDeviceToPCS

dim so as new ColorSyncProfileSetItemMBS
so.profile = op
so.renderingIntent = si.cmPerceptual
so.transformTag = si.kPCSToDevice

dim a(-1) as ColorSyncProfileSetItemMBS
a.Append si
a.Append so

dim cw as new ColorSyncWorldMBS(ColorSyncWorldMBS.kDefaultCMMSignature, 0, 0, a)

if cw.Handle = 0 then
MsgBox "Failed to setup color world."
else
MsgBox "Success."
end if

Notes: Lasterror is set.

See also:
• 41.8.4 Constructor(profiles() as ColorSyncProfileMBS)
• 41.8.5 Constructor(source as ColorSyncProfileMBS, destination as ColorSyncProfileMBS)
41.8.4 Constructor(profiles() as ColorSyncProfileMBS)

Function: Creates a new ColorSync World from an array of profiles.
Notes:
Requires Colorsync 3.0 or newer.
Lasterror is set.
See also:
- 41.8.3 Constructor(CMM as Integer, flags as Integer, flagsMask as Integer, profiles() as ColorSyncProfileSetItemMBS) 7387
- 41.8.5 Constructor(source as ColorSyncProfileMBS, destination as ColorSyncProfileMBS) 7388

41.8.5 Constructor(source as ColorSyncProfileMBS, destination as ColorSyncProfileMBS)

Function: Creates a new ColorSync World from two profiles.
Notes: Lasterror is set.
See also:
- 41.8.3 Constructor(CMM as Integer, flags as Integer, flagsMask as Integer, profiles() as ColorSyncProfileSetItemMBS) 7387
- 41.8.4 Constructor(profiles() as ColorSyncProfileMBS) 7388

41.8.6 GetCMMSignature as UInt32

Function: Queries the CMM signature for this colorsync setup.
Example:
```vbnet
dim fi as FolderItem = GetFolderItem("/system/Library/ColorSync/Profiles/Generic RGB Profile.icc", folderItem.PathTypeShell)
dim fo as FolderItem = GetFolderItem("/system/Library/ColorSync/Profiles/Generic CMYK Profile.icc", folderItem.PathTypeShell)

dim ip as ColorSyncProfileMBS = fi.OpenAsColorSyncProfileMBS
dim op as ColorSyncProfileMBS = fo.OpenAsColorSyncProfileMBS

dim cw as new ColorSyncWorldMBS(ip,op)
MsgBox StringFromOSTypeMBS(cw.GetCMMSignature) // shows appl for Apple's ColorSync
```
41.8. CLASS COLORSYNCWORLDMBS

41.8.7 MatchBitmap(source as ColorSyncBitmapMBS, dest as ColorSyncBitmapMBS)

Function: Convert this bitmap between profiles.
Notes:
See the Class notes for possible error codes returned.
If source and destination are the same, only pass one of them.
LastError is set.
See also:
- 41.8.8 MatchBitmap(sourcedest as ColorSyncBitmapMBS)

41.8.8 MatchBitmap(sourcedest as ColorSyncBitmapMBS)

Function: Convert this bitmap between profiles.
Notes:
Short version of MatchBitmap where source and destination are only one bitmap.
LastError is set.
See also:
- 41.8.7 MatchBitmap(source as ColorSyncBitmapMBS, dest as ColorSyncBitmapMBS)

41.8.9 MatchPicture(p as picture)

Function: Convert this picture between profiles.
Notes:
Not supported for Cocoa target.
See the Class notes for possible error codes returned.
LastError is set.

41.8.10 Properties

41.8.11 Handle as Integer

Function: The handle of the colorsync world.
Notes:
May be useful for declares.
(Read only property)
### 41.8.12 Lasterror as Integer

MBS MacClassic Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code. **Notes:** (Read only property)

### 41.8.13 Constants

#### 41.8.14 cmBestMode = & h00020000

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the quality options. **Notes:** Best Mode.

#### 41.8.15 cmBlackPointCompensation = 4

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the flags. **Notes:** 0 do not apply Black Point Compensation, 4 apply.

#### 41.8.16 cmBlackPointCompensationMask = 4

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the flags. **Notes:** If bit 2 is 1 then CMM will enable Black Point Compensation if applicable.

#### 41.8.17 cmCMSReservedFlagsMask = & hFFFF0000

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the flags. **Notes:** These bits of the flags field are defined and reserved by CMS vendor.

#### 41.8.18 cmDraftMode = & h00010000

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the quality options. **Notes:** Draft Mode.
41.8. **CLASS COLORSYNCWORLDMBS**

### 41.8.19 cmEmbeddedMask = 1

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the flags.  
**Example:**

```vbnet
dim flags as Integer ' your flags  
if bitwiseand(flags, ColorSyncWorldMBS.cmEmbeddedMask) = 1 then  
    MsgBox "set"  
end if
```

**Notes:** Whether to use embedded profile or not.

### 41.8.20 cmEmbeddedProfile = 0

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the flags.

### 41.8.21 cmEmbeddedUse = 2

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the flags.  
**Example:**

```vbnet
dim flags as Integer ' your flags  
if bitwiseand(flags, ColorSyncWorldMBS.cmEmbeddedUseMask) = ColorSyncWorldMBS.cmEmbeddedUse  
then  
    MsgBox "set"  
end if
```

### 41.8.22 cmEmbeddedUseMask = 2

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the flags.  
**Example:**

```vbnet
dim flags as Integer ' your flags  
if bitwiseand(flags, ColorSyncWorldMBS.cmEmbeddedUseMask) = ColorSyncWorldMBS.cmEmbeddedUse  
then  
    MsgBox "set"  
end if
```
Notes: Whether to allow embedded profile or not.

41.8.23 cmGamutCheckingMask = & h00080000

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the flags.  
**Notes:** If bit 19 is 0 then create gamut checking info, if 1 then no gamut checking info.

41.8.24 cmICCReservedFlagsMask = & h0000FFFF

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the flags.  
**Notes:** These bits of the flags field are defined and reserved by ICC

41.8.25 cmInterpolationMask = & h00040000

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the flags.  
**Notes:** if bit 18 is 0 then interpolation, if 1 then lookup only.

41.8.26 cmNormalMode = & h00000000

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the quality options.  
**Notes:** Normal Mode.

41.8.27 cmQualityMask = & h00030000

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the constants for the flags.  
**Example:**

```pascal
dim flags as Integer // your flags
if bitwiseand(flags, ColorSyncWorldMBS.cmQualityMask) = ColorSyncWorldMBS.cmBestMode then
MsgBox "Best Mode."
end if
```

**Notes:** if bits 16-17 is 0 then normal, if 1 then draft, if 2 then best.
41.8.28  kAdobeCMMSignature = & h41444245

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the signature constants. **Notes:** Use Adobe’s CMM. Works only if Adobe CMM is installed.

41.8.29  kAppleCMMSignature = & h6170706C

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the signature constants. **Notes:** Use Apple’s CMM.

41.8.30  kDefaultCMMSignature = & h6170706C

MBS MacClassic Plugin, Plugin Version: 10.5. **Function:** One of the signature constants. **Notes:** The default = Apple.
41.9  module CSDeviceMBS

41.9.1  module CSDeviceMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A module for device related Colorsync methods.

41.9.2  Methods

41.9.3  DeviceInfo(deviceClass as string, deviceID as CFUUIDMBS) as dictionary

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries information on the device. **Notes:**

Returns a dictionary with the following keys and values resolved for the current host and current user.

- kColorSyncDeviceClass: camera, display, printer, scanner
- kColorSyncDeviceID: CFUUIDRef registered with ColorSync
- kColorSyncDeviceDescription: localized device description
- kColorSyncDeviceUserScope: kCFPreferencesAnyUser or kCFPreferencesCurrentUser
- kColorSyncDeviceHostScope: kCFPreferencesAnyHost or kCFPreferencesCurrentHost
- kColorSyncFactoryProfiles: dictionary with ProfileID and kColorSyncCustomProfiles keys.
- kColorSyncCustomProfiles: dictionary with keys ProfileID and values CFURLMBS or nil.

ProfileID is a dictionary with the following keys:

- kColorSyncDeviceProfileURL: CFURLMBS or kCFNull
- kColorSyncDeviceModeDescription: localized mode description

41.9.4  DeviceProfiles as dictionary()

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries the device profiles. **Notes:**

The dictionaries contain the following keys:
41.9. kColorSyncDeviceClass as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A constant for a possible value for the device class.

41.9.6 kColorSyncCustomProfiles as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.
**Notes:** Dictionary containing custom profile info.

41.9.7 kColorSyncDeviceClass as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.

41.9.8 kColorSyncDeviceDefaultProfileID as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.

41.9.9 kColorSyncDeviceDescription as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.
**Notes:** String with a name in current locale.
41.9.10 kColorSyncDeviceDescriptions as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the key constants for the info/options dictionaries. **Notes:** Dictionary with localized names.

41.9.11 kColorSyncDeviceHostScope as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the key constants for the info/options dictionaries.

41.9.12 kColorSyncDeviceID as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the key constants for the info/options dictionaries. **Notes:** Value is a CFUUIDMBS for this key.

41.9.13 kColorSyncDeviceModeDescription as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the key constants for the info/options dictionaries. **Notes:** String, e.g. Glossy, Best Quality.

41.9.14 kColorSyncDeviceModeDescriptions as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the key constants for the info/options dictionaries. **Notes:** Dictionary with localized mode names.

41.9.15 kColorSyncDeviceProfileID as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the key constants for the info/options dictionaries.
41.9.16  kColorSyncDeviceProfileIsCurrent as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.

41.9.17  kColorSyncDeviceProfileIsDefault as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.

41.9.18  kColorSyncDeviceProfileIsFactory as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.

41.9.19  kColorSyncDeviceProfilesNotification as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.

41.9.20  kColorSyncDeviceProfileURL as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.

41.9.21  kColorSyncDeviceRegisteredNotification as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.

41.9.22  kColorSyncDeviceUnregisteredNotification as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.
41.9.23  kColorSyncDeviceUserScope as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.

41.9.24  kColorSyncDisplayDeviceClass as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A constant for a possible value for the device class.

41.9.25  kColorSyncDisplayDeviceProfilesNotification as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.

41.9.26  kColorSyncFactoryProfiles as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.
**Notes:** Dictionary containing factory profile info.

41.9.27  kColorSyncPrinterDeviceClass as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A constant for a possible value for the device class.

41.9.28  kColorSyncProfileHostScope as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.

41.9.29  kColorSyncProfileUserScope as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the key constants for the info/options dictionaries.
## 41.9.30 kColorSyncScannerDeviceClass as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A constant for a possible value for the device class.

## 41.9.31 RegisterDevice(deviceClass as string, deviceID as CFUUIDMBS, deviceInfo as dictionary) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Registers a device.

**Notes:**

deviceInfo: A dictionary containing information needed to register a device.

**Required keys:**

- kColorSyncDeviceDescriptions: Dictionary with localized names of the device. Localization keys must be five character strings containing language code and region code in the lc:RG format and it must contain (at least) the "en_US" locale.
- kColorSyncFactoryProfiles: Dictionary with factory profile info. Dictionaries The keys are the profile IDs and the values are the profile info dictionaries.

**Optional keys:**

- kColorSyncDeviceHostScope: host scope of the device; one of kCFPreferences { Current,Any } Host; if unspecified kCFPreferencesCurrentHost is assumed.
- kColorSyncDeviceUserScope: user scope of the device; one of kCFPreferences { Current,Any } User; if unspecified kCFPreferencesCurrentUser is assumed.

**factory profiles dictionary - value for the key kColorSyncFactoryProfiles in deviceInfo**

**Required keys and values:**

Each profile is identified by a ProfileID (of String type) which used as the key. Value associated with the key is a profile info dictionary that describes an individual device profile.

- kColorSyncDeviceDefaultProfileID: the associated value must be one of the ProfileID present in the dictionary. Presence of this key is not required if there is only one factory profile.

**profile info Dictionary**
Required keys:

kColorSyncDeviceProfileURL: CFURLMBS of the profile to be registered
kColorSyncDeviceModeDescriptions: Dictionary with localized device mode names for the profile. Localization keys must be five character strings containing language code and region code in the lc_RG format and it must contain (at least) the "en_US" locale. E.g. "en_US" "Glossy Paper with best quality"

Example of deviceInfo dictionary:

kColorSyncDeviceDescriptions:
en_US My Little Printer
de_DE Mein Kleiner Drucker
fr_FR Mon petit imprimante
...

colorSyncFactoryProfiles: "Profile 1"
kColorSyncDeviceProfileURL: CFURLMBS
colorSyncDeviceModeDescriptions:
en_US Glossy Paper
de_DE Glanzpapier
fr_FR Papier glace
...

colorSyncDeviceDefaultProfileID: "Profile 1"
kColorSyncDeviceUserScope: kCFPreferencesAnyUser
colorSyncDeviceHostScope: kCFPreferencesCurrentHost

Notes:
1. Scope for factory profiles is exactly the same as the device scope.
2. Pass CFNullRef in lieu of the profile URL or no URL key/value pair at all if factory profile is not available. This will enable setting custom profile.
3. For the reasons of compatibility with legacy API, it is recommended that the profile keys are created as CFStrings from uint32 numbers as follows: key = encodings.UTF32.chr(value)

Returns true on success and false in case of failure

41.9.32 SetCustomProfiles(deviceClass as string, deviceID as CFUUIDMBS, profileInfo as dictionary) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Sets a custom profile:
Notes:

profileInfo is a CFDictionary containing the information about custom profiles to be set in lieu of factory profiles.

Required keys:

ProfileIDs which must be the subset of the ProfileIDs that device was registered with or kColorSyncDeviceDefaultProfileID for setting custom default profile.

Required values:

CFURLMBS (folderitem) of the profile to be set as a custom profile.

Optional keys:

kColorSyncProfileHostScope: host scope of the profile; one of kCFPreferences { Current, Any } Host; if unspecified kCFPreferencesCurrentHost is assumed.

kColorSyncProfileUserScope: user scope of the profile; one of kCFPreferences { Current, Any } User; if unspecified kCFPreferencesCurrentUser is assumed.

Notes:
1. Profile scope for custom profiles cannot exceed scope of the factory profiles.
2. There is only one host scope and user scope per dictionary (i.e. per call)
3. Pass CFNullRef in lieu of the profile URL to unset the custom profile and reset the current profile to the factory profile.

Returns true on success and false in case of failure.

41.9.33 UnregisterDevice(deviceClass as string, deviceID as CFUUIDMBS) as boolean

Notes: Returns true on success and false in case of failure.
41.10 class CSManagementModuleMBS

41.10.1 class CSManagementModuleMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The class for a Color Management Module module.

**Notes:**
Color conversions are performed by a Color Management Module (CMM) which is a plugin to ColorSync. ColorSync contains Apple CMM, which is not replaceable, but third parties can install their own CMMs. ColorSync provides access to installed CMMs as well as those that can be part of the application bundle. CMM can be selected and specified as a preferred CMM per color transform created by the application. If the third party CMM fails to perform a task, Apple CMM will take it over.
Subclass of the CFObjectMBS class.

41.10.2 Methods

41.10.3 Bundle as CFBundleMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The bundle of the Color Management Module.

**Notes:** Nil for built-in Apple CMM.

41.10.4 CMMIdentifier as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The internal identifier for this Color Management Module.

**Example:**
```vbk
dim a(-1) as CSManagementModuleMBS = CSManagementModuleMBS.InstalledCMMs
for each m as CSManagementModuleMBS in a
    MsgBox m.CMMIdentifier
next
```

41.10.5 Constructor(Bundle as CFBundleMBS)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a Color Management Module object from a given CF Bundle.

**Example:**
41.10. CLASS CSMANAGEMENTMODULEMBS

```
dim f as FolderItem = GetFolderItem("/Library/ColorSync/CMMs/AdobeCMM.cmm", FolderItem.PathType-Shell)
dim b as CFBundleMBS = CreateBundleMBS(F)
dim m as new CSManagementModuleMBS(b)

' MsgBox stR(m.Handle) // must be non zero

MsgBox m.LocalizedName
MsgBox m.CMMIdentifier
```

### 41.10.6 InstalledCMMs as CSManagementModuleMBS()

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The list of installed Color Management Modules.

**Example:**
```
dim a(-1) as CSManagementModuleMBS = CSManagementModuleMBS.InstalledCMMs
for each m as CSManagementModuleMBS in a
    dim path as string
    dim bundle as CFBundleMBS = m.Bundle
    if bundle<>nil then
        dim ExecutableFileURL as CFURLMBS = bundle.URL
        if ExecutableFileURL<>nil then
            dim s as CFStringMBS = ExecutableFileURL.Str
            if s<>nil then
                path = s.str
            end if
        end if
    end if
end if
MsgBox m.CMMIdentifier+EndOfLine+EndOfLine+m.LocalizedName+EndOfLine+path
next
```

**Notes:** Returns an empty array on failure.

### 41.10.7 LocalizedName as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The localized name of this Color Management Module.

**Example:**
```
dim a(-1) as CSManagementModuleMBS = CSManagementModuleMBS.InstalledCMMs

for each m as CSManagementModuleMBS in a
    MsgBox m.LocalizedName
next
41.11. CLASS CSMUTABLEPROFILEMBS

41.11 class CSMutableProfileMBS

41.11.1 class CSMutableProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The class for a mutable colorsync profile.
**Notes:** Subclass of the CSProfileMBS class.

41.11.2 Methods

41.11.3 Constructor

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new empty mutable profile.
See also:

- 41.11.4 Constructor(profile as CSProfileMBS)

41.11.4 Constructor(profile as CSProfileMBS)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a mutable copy of the given profile.
See also:

- 41.11.3 Constructor

41.11.5 RemoveTag(signature as string)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Removes the tag with the signature.

41.11.6 SetHeader(data as string)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the raw header data.
41.11.7 SetRawTag(signature as string, data as string)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets a tag with the raw data in a string.
41.12  class CSProfileMBS

41.12.1  class CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The class for a Colorsync profile.
**Notes:** Subclass of the CFObjectMBS class.

41.12.2  Methods

41.12.3  Constructor(data as string, byref error as CFErrorMBS)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a profile with the data in the given string.
**Example:**
```vbs
    dim file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic Gray Profile.icc",
    FolderItem.PathTypeShell)
    dim stream as BinaryStream = file.OpenAsBinaryFile(False) // BinaryStream.Open(f, false)
    dim data as string = stream.read(stream.length)
    dim e as CFErrorMBS
    dim p as new CSProfileMBS(data, e)
    MsgBox p.Description
```

**Notes:** On success the handle property is not zero.
See also:

- 41.12.4 Constructor(DisplayID as Integer) 7407
- 41.12.5 Constructor(file as folderitem) 7408
- 41.12.6 Constructor(file as folderitem, byref error as CFErrorMBS) 7408
- 41.12.7 Constructor(name as string) 7409
- 41.12.8 Constructor(profileSequence() as dictionary, options as dictionary) 7409

41.12.4  Constructor(DisplayID as Integer)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new profile with the given display.
**Notes:**
displayID: system-wide unique display ID (defined by IOKIt); pass 0 for main display.

On success the handle property is not zero.

See also:

- 41.12.3 Constructor(data as string, byref error as CFErrorMBS)
- 41.12.5 Constructor(file as folderitem)
- 41.12.6 Constructor(file as folderitem, byref error as CFErrorMBS)
- 41.12.7 Constructor(name as string)
- 41.12.8 Constructor(profileSequence() as dictionary, options as dictionary)

41.12.5 Constructor(file as folderitem)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new profile based on the given file.

**Example:**

```vbnet
dim file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic XYZ Profile.icc", FolderItem.PathTypeShell)
dim p as new CSProfileMBS(file)
MsgBox p.Description
```

**Notes:** On success the handle property is not zero.

See also:

- 41.12.3 Constructor(data as string, byref error as CFErrorMBS)
- 41.12.4 Constructor(DisplayID as Integer)
- 41.12.6 Constructor(file as folderitem, byref error as CFErrorMBS)
- 41.12.7 Constructor(name as string)
- 41.12.8 Constructor(profileSequence() as dictionary, options as dictionary)

41.12.6 Constructor(file as folderitem, byref error as CFErrorMBS)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new profile based on the given file.

**Example:**
41.12. CLASS CSPROFILEMBS

```vba
    dim file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic XYZ Profile.icc", FolderItem.PathTypeShell)
dim e as CFErrorMBS
dim p as new CSProfileMBS(file, e)
```

MsgBox p.Description

Notes: On success the handle property is not zero.
See also:

- 41.12.3 Constructor(data as string, byref error as CFErrorMBS)
- 41.12.4 Constructor(DisplayID as Integer)
- 41.12.5 Constructor(file as folderitem)
- 41.12.7 Constructor(name as string)
- 41.12.8 Constructor(profileSequence() as dictionary, options as dictionary)

41.12.7 Constructor(name as string)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a profile with the given predefined name.
**Example:**
```vba
    dim c as new CSProfileMBS(CSProfileMBS.kColorSyncGenericXYZProfile)
    MsgBox c.Description
```

Notes: On success the handle property is not zero.
See also:

- 41.12.3 Constructor(data as string, byref error as CFErrorMBS)
- 41.12.4 Constructor(DisplayID as Integer)
- 41.12.5 Constructor(file as folderitem)
- 41.12.6 Constructor(file as folderitem, byref error as CFErrorMBS)
- 41.12.8 Constructor(profileSequence() as dictionary, options as dictionary)

41.12.8 Constructor(profileSequence() as dictionary, options as dictionary)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a link profile.
**Notes:**
profileSequence: An array of dictionaries, each one containing a profile object and the information on the usage of the profile in the transform.

Required keys:

- kColorSyncProfile: CSProfileMBS
- kColorSyncRenderingIntent: String defining rendering intent
- kColorSyncTransformTag: String defining which tags to use

Optional key:

- kColorSyncBlackPointCompensation: Boolean to enable/disable BPC

options: dictionary with additional public global options (e.g. preferred CMM, quality, etc... It can also contain custom options that are CMM specific.

On success the handle property is not zero.

See also:

- 41.12.3 Constructor(data as string, byref error as CFErrorMBS) 7407
- 41.12.4 Constructor(DisplayID as Integer) 7407
- 41.12.5 Constructor(file as folderitem) 7408
- 41.12.6 Constructor(file as folderitem, byref error as CFErrorMBS) 7408
- 41.12.7 Constructor(name as string) 7409

41.12.9 ContainsTag(signature as string) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether the tag is contained in the profile.

41.12.10 CreateDeviceProfile(deviceClass as string, deviceID as CFUUIDMBS, profileID as Variant) as CSProfileMBS

Notes:

deviceClass: ColorSync device class
deviceID: deviceID registered with ColorSync
profilename: profileID registered with ColorSync; pass kColorSyncDeviceDefaultProfileID to get the default profile.

See CSDeviceMBS for more info on deviceClass, deviceID and profileID

Returns nil on failure and Profile object on success.

41.12.11 CreateLink(profileSequence() as dictionary, options as dictionary) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a link profile.  
**Notes:** 
profileSequence: An array of dictionaries, each one containing a profile object and the information on the usage of the profile in the transform.

Required keys:

kColorSyncProfile: CSProfileMBS  
kColorSyncRenderingIntent: String defining rendering intent  
kColorSyncTransformTag: String defining which tags to use

Optional key:

kColorSyncBlackPointCompensation: Boolean to enable/disable BPC

options: dictionary with additional public global options (e.g. preferred CMM, quality, etc... It can also contain custom options that are CMM specific.

Returns nil on failure and Profile object on success.

41.12.12 CreateWithData(data as string) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a profile with the data in the given string.  
**Notes:** Returns nil on failure and Profile object on success.  
See also:
41.12.13 CreateWithData(data as string, byref error as CFErrorMBS) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a profile with the data in the given string. **Notes:** Returns nil on failure and Profile object on success. **See also:**

- 41.12.12 CreateWithData(data as string) as CSProfileMBS

41.12.14 CreateWithDisplayID(DisplayID as Integer) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new profile with the given display. **Notes:**

- displayID: system-wide unique display ID (defined by IOKIt); pass 0 for main display.

Returns nil on failure and Profile object on success.

41.12.15 CreateWithFile(file as folderitem) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new profile based on the given file. **Notes:** Returns nil on failure and Profile object on success. **See also:**

- 41.12.16 CreateWithFile(file as folderitem, byref error as CFErrorMBS) as CSProfileMBS

41.12.16 CreateWithFile(file as folderitem, byref error as CFErrorMBS) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new profile based on the given file. **Example:**

```plaintext
dim file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic XYZ Profile.icc", FolderItem.PathTypeShell)
dim e as CFErrorMBS
dim p as new CSProfileMBS(file, e)
```
MsgBox p.Description

Notes: Returns nil on failure and Profile object on success.
See also:

- 41.12.15 CreateWithFile(file as folderitem) as CSProfileMBS 7412

41.12.17 CreateWithName(name as string) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a profile with the given name.
**Example:**
```vba
    dim s as string = CSProfileMBS.kColorSyncGenericXYZProfile
dim c as CSProfileMBS = CSProfileMBS.CreateWithName(s)
MsgBox c.Description
```

Notes: Returns nil on failure and Profile object on success.

41.12.18 CreateWithURL(url as string) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new profile based on the file at the given URL.
**Notes:** Returns nil on failure and Profile object on success.
See also:

- 41.12.19 CreateWithURL(url as string, byref error as CFErrorMBS) as CSProfileMBS 7413

41.12.19 CreateWithURL(url as string, byref error as CFErrorMBS) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new profile based on the file at the given URL.
**Notes:** Returns nil on failure and Profile object on success.
See also:

- 41.12.18 CreateWithURL(url as string) as CSProfileMBS 7413
## 41.12.20 Data as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns a string with the raw data of the profile.

## 41.12.21 Edit as CSMutableProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates an editable copy of the profile.

**Notes:** Returns nil on any error.

## 41.12.22 EstimateGamma as Double

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Calculates the estimated gamma for this profile.

**Example:**

```
    dim file as FolderItem = GetFolderItem(“/System/Library/ColorSync/Profiles/Generic Gray Profile.icc”, FolderItem.PathTypeShell)
    dim p as new CSProfileMBS(file)
    MsgBox str(p.EstimateGamma) ' 1.8
```

**Notes:** Returns non-zero value if success or 0.0 in case of error.

See also:

- 41.12.23 EstimateGamma(byref error as CFErrorMBS) as Double

## 41.12.23 EstimateGamma(byref error as CFErrorMBS) as Double

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Calculates the estimated gamma for this profile.

**Notes:** Returns non-zero value if success or 0.0 in case of error.

See also:

- 41.12.22 EstimateGamma as Double

## 41.12.24 EstimateGammaWithDisplayID(displayID as Integer) as Double

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Calculates the estimated gamma value for the given display.
41.12. **CLASS CSPROFILEMBS**

**Notes:** displayID: system-wide unique display ID.
See also:

- 41.12.25 EstimateGammaWithDisplayID(displayID as Integer, byref error as CFErrorMBS) as Double

### 41.12.25 EstimateGammaWithDisplayID(displayID as Integer, byref error as CFErrorMBS) as Double

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Calculates the estimated gamma value for the given display.
**Notes:** displayID: system-wide unique display ID.
See also:

- 41.12.24 EstimateGammaWithDisplayID(displayID as Integer) as Double

### 41.12.26 File as folderitem

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The file reference for this profile.
See also:

- 41.12.27 File(byref error as CFErrorMBS) as folderitem

### 41.12.27 File(byref error as CFErrorMBS) as folderitem

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The file reference for this profile.
See also:

- 41.12.26 File as folderitem

### 41.12.28 Header as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string with the raw header content.

### 41.12.29 InstalledProfiles as dictionary()

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries the list of installed profiles.
**Example:**
dim a(-1) as Dictionary = CSProfileMBS.InstalledProfiles
dim lines(-1) as string

for each d as Dictionary in a
    lines.Append d.Value(CSProfileMBS.kColorSyncProfileDescription)
next

MsgBox Join(lines, EndOfLine)

Notes: Returns an empty array on any error.

41.12.30  kColorSyncAdobeRGB1998Profile as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the predefined profile names.

41.12.31  kColorSyncGenericCMYKProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the predefined profile names.

41.12.32  kColorSyncGenericGrayGamma22Profile as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the predefined profile names.

41.12.33  kColorSyncGenericGrayProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the predefined profile names.

41.12.34  kColorSyncGenericLabProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the predefined profile names.
41.12.35 kColorSyncGenericRGBProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the predefined profile names.

41.12.36 kColorSyncGenericXYZProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the predefined profile names.

41.12.37 kColorSyncProfileClass as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the tag signature constants.
**Notes:** Can be used with the dictionary returned by the InstalledProfiles method.

41.12.38 kColorSyncProfileColorSpace as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the tag signature constants.
**Notes:** Can be used with the dictionary returned by the InstalledProfiles method.

41.12.39 kColorSyncProfileDescription as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the tag signature constants.
**Notes:** Can be used with the dictionary returned by the InstalledProfiles method.

41.12.40 kColorSyncProfileHeader as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the tag signature constants.
**Notes:** Can be used with the dictionary returned by the InstalledProfiles method.
41.12.41  kColorSyncProfileMD5Digest as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
One of the tag signature constants.
**Notes:** Can be used with the dictionary returned by the InstalledProfiles method.

41.12.42  kColorSyncProfilePCS as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
One of the tag signature constants.
**Notes:** Can be used with the dictionary returned by the InstalledProfiles method.

41.12.43  kColorSyncProfileURL as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
One of the tag signature constants.
**Notes:** Can be used with the dictionary returned by the InstalledProfiles method.

41.12.44  kColorSyncSRGBProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
One of the tag signature constants.
**Notes:** Can be used with the dictionary returned by the InstalledProfiles method.

41.12.45  MD5 as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
MD5 digest for the profile calculated as defined by ICC specification.
**Notes:**
Returns a 16 byte string with the raw bytes of the signature.
Returns an empty string on any error.

41.12.46  RawTag(signature as string) as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Returns the raw tag value as string.
41.12. CLASS CSPROFILEMBS

41.12.47 TagSignatures as string()

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of the tag signatures.

41.12.48 URL as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The URL reference for this profile.

**Example:**

```vba
dim file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic XYZ Profile.icc", FolderItem.PathTypeShell)
dim p as new CSProfileMBS(file)
MsgBox p.URL
```

See also:

- 41.12.49 URL(byref error as CFErrorMBS) as string

41.12.49 URL(byref error as CFErrorMBS) as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The URL reference for this profile.

See also:

- 41.12.48 URL as string

41.12.50 Verify(byref errors as CFErrorMBS, byref warnings as CFErrorMBS) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Verifies the profile.

**Notes:**

errors: returns error strings in case problems are found which would prevent use of the profile.

warnings: returns warning strings indicating problems due to lack of conformance with the ICC specification, but not preventing use of the profile.

Returns true if profile can be used or false otherwise.
41.12.51 Properties

41.12.52 Description as string

Example:

```vba
dim file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic XYZ Profile.icc", FolderItem.PathTypeShell)
dim p as new CSProfileMBS(file)
MsgBox p.Description
```

Notes: (Read only property)

41.12.53 MD5String as String

Example:

```vba
dim file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic XYZ Profile.icc", FolderItem.PathTypeShell)
dim p as new CSProfileMBS(file)
MsgBox p.MD5String
```

Notes:

Returns a 32 byte human readable hexstring with the bytes of the signature.
Returns an empty string on any error.
(Read only property)
41.13 class CSTransformMBS

41.13.1 class CSTransformMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for a ColorSync transformation.

**Notes:**
This class uses newer APIs than those in the older ColorSyncWorldMBS class.
Subclass of the CFObjectMBS class.

41.13.2 Methods

41.13.3 Constructor(profileSequence() as dictionary, options as dictionary)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new transformation.

**Notes:**
profileSequence: Array of dictionaries, each one containing a profile object and the information on the usage of the profile in the transform.

Required keys:

kColorSyncProfile: CSProfileMBS
kColorSyncRenderingIntent: String defining rendering intent
kColorSyncTransformTag: String defining which tags to use

Optional key:

kColorSyncBlackPointCompensation: Boolean to enable/disable BPC

options: dictionary with additional public global options (e.g. preferred CMM, quality, etc... It can also contain custom options that are CMM specific.

On success the handle property is not zero.
41.13.4  Convert(dest as picture, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the convert methods to transform data.

**Notes:**

dest: Destination picture.

source: Source picture.

src: A memoryblock to the data to be converted.

srcDepth: Describes the bit depth and type of the source color components.

srcFormat: Describes the format and byte packing of the source pixels.

srcBytesPerRow: Number of bytes in the row of data.

returns true if conversion was successful or false otherwise.

See also:

- 41.13.5 Convert(dest as picture, src as picture, options as dictionary) as boolean
- 41.13.6 Convert(dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as picture, options as dictionary) as boolean
- 41.13.7 Convert(width as Integer, height as Integer, dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as picture, options as dictionary) as boolean

41.13.5  Convert(dest as picture, src as picture, options as dictionary) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the convert methods to transform data.

**Notes:**

dest: Destination picture.

source: Source picture.

Should only be used with RGB for source/dest profile.

returns true if conversion was successful or false otherwise.

See also:

- 41.13.4 Convert(dest as picture, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean
- 41.13.6 Convert(dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as picture, options as dictionary) as boolean
41.13. CLASS CSTRANSFORMMBS

- 41.13.7 Convert(width as Integer, height as Integer, dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean

41.13.6 Convert(dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as picture, options as dictionary) as boolean

Notes:

dest: Destination picture.
dst: A memoryblock to the destination where the results will be written.
dstDepth: Describes the bit depth and type of the destination color components
dstFormat: Describes the format and byte packing of the destination pixels
dstBytesPerRow: number of bytes in the row of data
source: Source picture.

returns true if conversion was successful or false otherwise

See also:

- 41.13.4 Convert(dest as picture, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean
- 41.13.5 Convert(dest as picture, src as picture, options as dictionary) as boolean
- 41.13.7 Convert(width as Integer, height as Integer, dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean

41.13.7 Convert(width as Integer, height as Integer, dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean

Notes:

width: Width of the image in pixels. (or taken from picture object)
height: Height of the image in pixels. (or taken from picture object)
dst: A memoryblock to the destination where the results will be written.
dstDepth: Describes the bit depth and type of the destination color components
dstFormat: Describes the format and byte packing of the destination pixels
dstBytesPerRow: number of bytes in the row of data
src: A memory block to the data to be converted.
srcDepth: Describes the bit depth and type of the source color components
srcFormat: Describes the format and byte packing of the source pixels
srcBytesPerRow: Number of bytes in the row of data

returns true if conversion was successful or false otherwise
See also:

- 41.13.4 Convert(dest as picture, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean

- 41.13.6 Convert(dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as picture, options as dictionary) as boolean

41.13.8 GetProperty(key as Variant) as Variant
Notes: Returns nil if the value is nil or we had an error.

41.13.9 kColorSyncBestQuality as string
MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the value constants for use with the kColorSyncConvertQuality key.
Notes: do not coalesce profile transforms (default)

41.13.10 kColorSyncBlackPointCompensation as string

41.13.11 kColorSyncConversion1DLut as string
Notes: For more information lookup details in Apples headers/documentation.
41.13. CLASS CTRANSFORMMBS

41.13.12  kColorSyncConversion3DLut as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the option keys.
**Notes:** For more information lookup details in Apples headers/documentation.

41.13.13  kColorSyncConversionBPC as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the option keys.
**Notes:** For more information lookup details in Apples headers/documentation.

41.13.14  kColorSyncConversionChannelID as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the option keys.
**Notes:** For more information lookup details in Apples headers/documentation.

41.13.15  kColorSyncConversionGridPoints as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the option keys.
**Notes:** For more information lookup details in Apples headers/documentation.

41.13.16  kColorSyncConversionInpChan as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the option keys.
**Notes:** For more information lookup details in Apples headers/documentation.

41.13.17  kColorSyncConversionMatrix as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the option keys.
**Notes:** For more information lookup details in Apples headers/documentation.
41.13.18  kColorSyncConversionOutChan as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the option keys.
**Notes:** For more information lookup details in Apples headers/documentation.

41.13.19  kColorSyncConversionParamCurve0 as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the option keys.
**Notes:** For more information lookup details in Apples headers/documentation.

41.13.20  kColorSyncConversionParamCurve1 as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the option keys.
**Notes:** For more information lookup details in Apples headers/documentation.

41.13.21  kColorSyncConversionParamCurve2 as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the option keys.
**Notes:** For more information lookup details in Apples headers/documentation.

41.13.22  kColorSyncConversionParamCurve3 as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the option keys.
**Notes:** For more information lookup details in Apples headers/documentation.

41.13.23  kColorSyncConversionParamCurve4 as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the option keys.
**Notes:** For more information lookup details in Apples headers/documentation.
41.13. CLASS CTRANSFORMMBS

41.13.24  kColorSyncConvertQuality as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the transform options keys.

41.13.25  kColorSyncConvertThreadCount as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the conversion option keys. **Notes:** Applies to large amounts of data; 0 for number of CPUs.

41.13.26  kColorSyncDraftQuality as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the value constants for use with the kColorSyncConvertQuality key. **Notes:** coalesce all transforms, do not interpolate

41.13.27  kColorSyncNormalQuality as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the value constants for use with the kColorSyncConvertQuality key. **Notes:** coalesce all transforms

41.13.28  kColorSyncPreferredCMM as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the transform options keys. **Notes:** Value is a CSManagementModuleMBS object.

41.13.29  kColorSyncProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used for profile info and options.
41.13.30 kColorSyncRenderingIntent as string
MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys used for profile info and options.

41.13.31 kColorSyncRenderingIntentAbsolute as string
MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the value constants for use with the kColorSyncRenderingIntent key.

41.13.32 kColorSyncRenderingIntentPerceptual as string
MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the value constants for use with the kColorSyncRenderingIntent key.

41.13.33 kColorSyncRenderingIntentRelative as string
MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the value constants for use with the kColorSyncRenderingIntent key.

41.13.34 kColorSyncRenderingIntentSaturation as string
MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the value constants for use with the kColorSyncRenderingIntent key.

41.13.35 kColorSyncRenderingIntentUseProfileHeader as string
MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the value constants for use with the kColorSyncRenderingIntent key.

41.13.36 kColorSyncTranformInfo as string
MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for copying transform properties.
**Notes:** dictionary.
41.13.37  kColorSyncTransformCreator as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the value constants for use with the dictionary used with the kColorSyncTransformInfo keys. **Notes:** name of the CMM that created the transform.

41.13.38  kColorSyncTransformDeviceToDevice as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the value constants for use with the kColorSyncTransformTag key.

41.13.39  kColorSyncTransformDeviceToPCS as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the value constants for use with the kColorSyncTransformTag key.

41.13.40  kColorSyncTransformDstSpace as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the value constants for use with the dictionary used with the kColorSyncTransformInfo keys.

41.13.41  kColorSyncTransformFullConversionData as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the option keys. **Notes:** For more information lookup details in Apples headers/documentation.

41.13.42  kColorSyncTransformGamutCheck as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the value constants for use with the kColorSyncTransformTag key.

41.13.43  kColorSyncTransformParametricConversionData as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the option keys.
CHAPTER 41. COLORSYNCE

Notes: For more information lookup details in Apples headers/documentation.

41.13.44  kColorSyncTransformPCSToDevice as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the value constants for use with the kColorSyncTransformTag key.

41.13.45  kColorSyncTransformPCSToPCS as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the value constants for use with the kColorSyncTransformTag key.

41.13.46  kColorSyncTransformSimplifiedConversionData as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

41.13.47  kColorSyncTransformSrcSpace as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the value constants for use with the dictionary used with the kColorSyncTransfromInfo keys.

41.13.48  kColorSyncTransformTag as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys used for profile info and options.

41.13.49  PrintClasses

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Writes the declarations of the plugin classes to the console.
Notes: Call in console applications.
41.13. \textit{CLASS CTRANSFORMMBS}

41.13.50 \textbf{SetProperty(key as Variant, value as Variant)}

41.13.51 \textbf{Constants}

41.13.52 \textbf{kColorSync16BitFloat = 4}

MBS MacCF Plugin, Plugin Version: 10.5. \textbf{Function:} One of the possible data depth values constants. \textbf{Notes:} 16 bit floats.

41.13.53 \textbf{kColorSync16BitInteger = 3}

MBS MacCF Plugin, Plugin Version: 10.5. \textbf{Function:} One of the possible data depth values constants. \textbf{Notes:} 16 bit integers (short)

41.13.54 \textbf{kColorSync1BitGamut = 1}

MBS MacCF Plugin, Plugin Version: 10.5. \textbf{Function:} One of the possible data depth values constants. \textbf{Notes:} 1 bit graphics.

41.13.55 \textbf{kColorSync32BitFloat = 7}

MBS MacCF Plugin, Plugin Version: 10.5. \textbf{Function:} One of the possible data depth values constants. \textbf{Notes:} 32 bit float (single in Real Studio)

41.13.56 \textbf{kColorSync32BitInteger = 5}

MBS MacCF Plugin, Plugin Version: 10.5. \textbf{Function:} One of the possible data depth values constants. \textbf{Notes:} 32 bit integer
41.13.57 kColorSync32BitNamedColorIndex = 6

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the possible data depth values constants. **Notes:** 32 bit integers with index of named color.

41.13.58 kColorSync8BitInteger = 2

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the possible data depth values constants. **Notes:** 8 bit graphics (this is used in Real Studio Picture objects)

41.13.59 kColorSyncAlphaFirst = 4

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the alpha constants. **Notes:** For example, non-premultiplied ARGB

41.13.60 kColorSyncAlphaInfoMask = & h1F

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the alpha constants. **Notes:** The bitmask for bitwise.BitAnd to extract the alpha value.

41.13.61 kColorSyncAlphaLast = 3

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the alpha constants. **Notes:** For example, non-premultiplied RGBA

41.13.62 kColorSyncAlphaNone = 0

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the alpha constants. **Notes:** For example, RGB.

41.13.63 kColorSyncAlphaNoneSkipFirst = 6

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the alpha constants. **Notes:** For example, XRGB.
41.13. CLASS CSTRANFORMMBS

41.13.64 kColorSyncAlphaNoneSkipLast = 5

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the alpha constants. **Notes:** For example, RBGX.

41.13.65 kColorSyncAlphaPremultipliedFirst = 2

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the alpha constants. **Notes:** For example, premultiplied ARGB

41.13.66 kColorSyncAlphaPremultipliedLast = 1

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the alpha constants. **Notes:** For example, premultiplied RGBA

41.13.67 kColorSyncByteOrder16Big = 12288

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the byte order constants. **Notes:** 16 bit, big endian.

41.13.68 kColorSyncByteOrder16Little = 4096

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the byte order constants. **Notes:** 16 bit, little endian.

41.13.69 kColorSyncByteOrder32Big = 16384

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the byte order constants. **Notes:** 32 bit, big endian.

41.13.70 kColorSyncByteOrder32Little = 8192

MBS MacCF Plugin, Plugin Version: 10.5. **Function:** One of the byte order constants. **Notes:** 32 bit, little endian.
41.13.71  \texttt{kColorSyncByteOrderDefault} = 0

MBS MacCF Plugin, Plugin Version: 10.5. \textbf{Function}: One of the byte order constants.

41.13.72  \texttt{kColorSyncByteOrderMask} = \& h7000

MBS MacCF Plugin, Plugin Version: 10.5. \textbf{Function}: One of the byte order constants.
Chapter 42

Common Types

42.1 Globals

42.1.1 GetAvailableWindowPositioningBoundsMBS as IntegerRectMBS

MBS Util Plugin, Plugin Version: 2.9, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the available window positioning bounds on the main screen (i.e., the screen rect minus the MenuBar
and Dock if located on that screen).
Example:
Dim rec as IntegerRectMBS
rec=GetAvailableWindowPositioningBoundsMBS
if rec<>Nil then
msgBox str(rec.Left)
else
msgBox "NIL"
end if

Notes: Return nil on any error.

42.1.2 MacZoomRectMBS(fromRect as IntegerRectMBS, toRect as IntegerRectMBS, steps as Integer, ZoomAcceleration as Integer) as Integer

MBS Util Plugin, Plugin Version: 2.9, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Animates a rectangle into a second rectangle.
Example:
CHAPTER 42. COMMON TYPES

```vba
dim fromrect as IntegerRectMBS

dim torect as IntegerRectMBS

if MacZoomRectMBS(fromrect, torect, 25, 0)<>0 then
  'Windows?
end if
```

**Notes:**

The `ZoomRects` function animates a movement between two rectangles on the screen. It does this by drawing gray dithered rectangles incrementally toward the destination rectangle.

Steps is a number from 4 to 25.

Values for the acceleration

- `kZoomNoAcceleration 0` Use linear interpolation for each frame of animation between the source and destination.
- `kZoomAccelerate 1` Increment the step size for each frame of animation between the source and destination. This option produces the visual appearance of the animation speeding up as it approaches the destination.
- `kZoomDecelerate 2` Decrement the step size for each frame of animation between the source and destination. This option produces the visual appearance of the animation slowing down as it approaches the destination.

Requires Mac OS 8.1 or newer.

Returns an error code. -1 if not supported, 0 if successful or a Mac OS error code.

---

**42.1.3 MakeDoublePointMBS(x as Double, y as Double) as DoublePointMBS**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Creates a new double point.

**Notes:** Returns nil on low memory.

---

**42.1.4 MakeDoubleRectMBS(left as Double, top as Double, width as Double, height as Double) as DoubleRectMBS**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Creates a new double rectangle.
42.2.  **CLASS DOUBLEPOINTMBS**  

Notes: Returns nil on low memory.

### 42.1.5  **MakeIntegerPointMBS(x as Integer, y as Integer) as IntegerPointMBS**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new integer point.  
**Notes:** Returns nil on low memory.

### 42.1.6  **MakeIntegerRectMBS(left as Integer, top as Integer, width as Integer, height as Integer) as IntegerRectMBS**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new integer rectangle.  
**Notes:** Returns nil on low memory.

42.2  **class DoublePointMBS**

#### 42.2.1  **class DoublePointMBS**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class for a double point.

#### 42.2.2  **Methods**

#### 42.2.3  **Move(deltax as Double, deltay as Double)**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Moves the point.

#### 42.2.4  **Properties**

#### 42.2.5  **x as Double**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The X property of the point.
42.2.6 y as Double

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The Y property of the point.
**Notes:** (Read and Write property)
42.3.  CLASS DOUBLERECTMBS

42.3  class DoubleRectMBS

42.3.1  class DoubleRectMBS

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class for a double rectangle.

42.3.2  Methods

42.3.3  Intersection(other as DoubleRectMBS) as DoubleRectMBS

MBS Util Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The intersection area of two rectangles. **Notes:** Returns nil if no intersection was found.

42.3.4  Intersects(other as DoubleRectMBS) as boolean

MBS Util Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether two rectangle intersect. **Notes:** Returns true if yes and no on false.

42.3.5  Move(deltax as Double, deltay as Double)

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Moves the rectangle.

42.3.6  Properties

42.3.7  Bottom as Double

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The bottom property of the rectangle. **Notes:** (Read and Write property)
42.3.8  **height as Double**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The height property of the rectangle. 
**Notes:** Setting this property changes the right property. (Read and Write property)

42.3.9  **left as Double**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The left property of the rectangle.
**Notes:** (Read and Write property)

42.3.10  **right as Double**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The right property of the rectangle.
**Notes:** (Read and Write property)

42.3.11  **Size as Double**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The size of this rectangle. 
**Notes:** (Read only property)

42.3.12  **top as Double**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The top property of the rectangle. 
**Notes:** (Read and Write property)

42.3.13  **width as Double**

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width property of the rectangle. 
**Notes:**
42.3. CLASS DOUBLERECTMBS

Setting this property changes the bottom property.
(Read and Write property)
CHAPTER 42. COMMON TYPES

42.4 class IntegerPointMBS

42.4.1 class IntegerPointMBS

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A class for an integer point.

42.4.2 Methods

42.4.3 Move(deltax as Integer, deltay as Integer)

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Moves the point.

42.4.4 Properties

42.4.5 x as Integer

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The X property of the point.
**Notes:** (Read and Write property)

42.4.6 y as Integer

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The Y property of the point.
**Notes:** (Read and Write property)
42.5. CLASS INTEGERRECTMBS

42.5 class IntegerRectMBS

42.5.1 class IntegerRectMBS

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A class for an integer rectangle.

42.5.2 Methods

42.5.3 Intersection(other as IntegerRectMBS) as IntegerRectMBS

MBS Util Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The intersection area of two rectangles.
**Notes:** Returns nil if no intersection was found.

42.5.4 Intersects(other as IntegerRectMBS) as boolean

MBS Util Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether two rectangle intersect.
**Notes:** Returns true if yes and no on false.

42.5.5 Move(deltax as Integer, deltay as Integer)

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Moves the rectangle.

42.5.6 Properties

42.5.7 bottom as Integer

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The bottom property of the rectangle.
**Notes:** (Read and Write property)
42.5.8 height as Integer

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The height property of the rectangle.
**Notes:**
Setting this property changes the right property.
(Read and Write property)

42.5.9 left as Integer

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The left property of the rectangle.
**Notes:** (Read and Write property)

42.5.10 right as Integer

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The right property of the rectangle.
**Notes:** (Read and Write property)

42.5.11 Size as Integer

MBS Util Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The size of this rectangle.
**Notes:** (Read only property)

42.5.12 top as Integer

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The top property of the rectangle.
**Notes:** (Read and Write property)

42.5.13 width as Integer

MBS Util Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The width property of the rectangle.
**Notes:**
42.5. *CLASS INTEGERRECTMBS*

Setting this property changes the right property.
(Read and Write property)
Chapter 43

Compression

43.1 Globals

43.1.1  CompressBZip2MBS(buf as string, level as Integer) as string

Function: Compresses the data and returns it as string.
Example:

    dim s as string = "Hello World"
    s = CompressBZip2MBS(s, 9)

Notes: Compression level is going from 0 to 9, where 0 is no compression and 9 is best compression.

43.1.2  DecompressBZip2MBS(buf as string, size as Integer) as string

Function: Decompresses the data and returns it as string.
Example:

    dim s as string = "Hello World"
    s = CompressBZip2MBS(s, 9)
    s = DecompressBZip2MBS(s, 10000)

    MsgBox s

Notes: As DecompressZLibMBS can’t know the size of the decompressed data you should give it a hint.
Best is to save the size of the decompressed data on compression. Else you must guess the size which can be 10 times the size of the compressed data.

### 43.1.3 CompressZLibMBS(buf as string, level as Integer) as string

MBS Compression Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compresses the data and returns it as string.

**Example:**

```vbs
    dim s as string = "Hello World"
    dim l as Integer = lenb(s)

    dim c as string = CompressZLibMBS(s, 9)
    dim d as string = DecompressZLibMBS(c, l)
```

**Notes:**

Compression level is going from 0 to 9, where 0 is no compression and 9 is best compression. Error: Optional parameter to receive the error code. (see error codes in ZLibCompressMBS)

For result and temp memory this function needs maximum something like 110% of lenb(buf). See also:

- 43.1.4 CompressZLibMBS(buf as string, level as Integer, byref error as Integer) as string

### 43.1.4 CompressZLibMBS(buf as string, level as Integer, byref error as Integer) as string

MBS Compression Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compresses the data and returns it as string.

**Notes:**

Compression level is going from 0 to 9, where 0 is no compression and 9 is best compression. Error: Optional parameter to receive the error code. (see error codes in ZLibCompressMBS)

For result and temp memory this function needs maximum something like 110% of lenb(buf). See also:

- 43.1.3 CompressZLibMBS(buf as string, level as Integer) as string
43.1.5 DecompressZLibMBS(buf as string, size as Integer) as string

MBS Compression Plugin, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decompresses the data and returns it as string.

**Example:**

```vba
dim s as string = "Hello World"
s=CompressZLibMBS(s,9)
s=DecompressZLibMBS(s,10000)
MsgBox s
```

**Notes:**
As DecompressZLibMBS can’t know the size of the decompressed data you should give it a hint. Best is to save the size of the decompressed data on compression. Else you must guess the size which can be 10 times the size of the compressed data.

Error: Optional parameter to receive the error code. (see error codes in ZLibCompressMBS)

See also:

- 43.1.6 DecompressZLibMBS(buf as string, size as Integer, byref error as Integer) as string

43.1.6 DecompressZLibMBS(buf as string, size as Integer, byref error as Integer) as string

MBS Compression Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decompresses the data and returns it as string.

**Notes:**
As DecompressZLibMBS can’t know the size of the decompressed data you should give it a hint. Best is to save the size of the decompressed data on compression. Else you must guess the size which can be 10 times the size of the compressed data.

Error: Optional parameter to receive the error code. (see error codes in ZLibCompressMBS)

Returned data is a string without known encoding.

See also:

- 43.1.5 DecompressZLibMBS(buf as string, size as Integer) as string

43.1.7 CompressLZWMBS(buf as string) as string

**Example:**
dim s as string
dim b as BinaryStream
dim f as FolderItem
dim l as Integer

f=SpecialFolder.Desktop.Child("output.tiff")
b=f.OpenAsBinaryFile(false)
s=b.Read(b.Length)
b.Close

l=lenb(s)
s=CompressLZWMBS(s)

f=SpecialFolder.Desktop.Child("output.compressed.tiff")
b=f.CreateBinaryFile("text")
b.Write s
b.Close

s=DecompressLZWMBS(s,l)

f=SpecialFolder.Desktop.Child("output.uncompressed.tiff")
b=f.CreateBinaryFile("text")
b.Write s
b.Close

Notes:
Please remember that the LZW algorithm can be implemented quite different. This one is byte based, uses 12bit offsets and a 4096 entry table.

Returns "" on low memory or Stack Overflow or Output buffer overflow.
(buffer and stack size may be increased on request for future plugin versions)

43.1.8 DecompressLZWMBS(buf as string, size as Integer) as string

Function: Decompresses string using LZW algorithm.
Notes:
Please remember that the LZW algorithm can be implemented quite different. This one is byte based, uses 12bit offsets and a 4096 entry table.

Returns "" on low memory or Stack Overflow or Output buffer overflow.
(buffer and stack size may be increased on request for future plugin versions)
43.2. CLASS BZIP2COMPRESSMBS

Size of the uncompressed length is only a guess for how big the output buffer needs to be. Actual string returned will often be smaller.

43.2 class BZip2CompressMBS

43.2.1 class BZip2CompressMBS

Function: A class for bzip2 compression.

43.2.2 Methods

43.2.3 Close

Function: The destructor.
Notes:
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

43.2.4 Constructor(BufferSize as Integer=20000)

Function: The constructor.
Notes:
The buffer size you specify is the output buffer size.
If this size is small, you need to flush with ProcessZip.

43.2.5 EndZip

Function: Finalizes the current compression stream.
Notes:
CHAPTER 43. COMPRESSION

You may check the Output property after this.
Error is set.

43.2.6  GetOutput as string

Function: Returns the content of the output buffer.
Notes: The buffer is cleared after this function returns.

43.2.7  InitZip(level as Integer)

Function: Initializes the stream.
Notes:
Level is from 0 to 9.
Error is set.

43.2.8  InputAvail as Integer

Function: Returns the number of bytes available in the input buffer.

43.2.9  OutputSize as Integer

Function: The size of bytes available in the output buffer.

43.2.10 ProcessZip(Flush as boolean=false)

Function: Does zip compression.
Notes:
Reduces the size of the input buffer and writes new data to the output buffer.
If the input buffer is not empty after this call, you need to call it again, but empty the output buffer before.
Error is set.
43.2. CLASS BZIP2COMPRESSMBS

If flush is true, the data is flushed to output. Using flush=true all the the time will slow down compression, so use it only on the end to clear the output buffers.

### 43.2.11 SetInput(data as Memoryblock) as boolean

*Function:* Fills the input buffer.
*Notes:*
- Returns true if successful.
- The current plugin uses a 128 K input buffer.

See also:

- 43.2.12 SetInput(data as string) as boolean

### 43.2.12 SetInput(data as string) as boolean

*Function:* Fills the input buffer.
*Notes:*
- Returns true if successful.
- The current plugin uses a 128 K input buffer.

See also:

- 43.2.11 SetInput(data as Memoryblock) as boolean

### 43.2.13 Properties

### 43.2.14 Error as Integer

*Function:* The last error code.
*Notes:* (Read and Write property)

### 43.2.15 OutputBufferSize as Integer

*Function:* The output buffer size used in the constructor.
*Notes:* (Read only property)
43.2.16 TotalInput as Uint64

Function: The number of bytes processed so far.
Notes: (Read and Write property)

43.2.17 TotalOutput as Uint64

Function: The number of bytes processed so far.
Notes: (Read and Write property)

43.2.18 Version as String

Function: The version string of the used zlib library.
Notes: (Read only property)

43.2.19 Constants

43.2.20 kCONFIG_ERROR = -9

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the error constants.
Notes:
Indicates that the library has been improperly compiled on your platform – a major configuration error. Specifically, it means that sizeof(char), sizeof(short) and sizeof(int) are not 1, 2 and 4 respectively, as they should be. Note that the library should still work properly on 64-bit platforms which follow the LP64 programming model – that is, where sizeof(long) and sizeof(void*) are 8. Under LP64, sizeof(int) is still 4, so libbzip2, which doesn’t use the long type, is OK.

This should never happen with the plugin.

43.2.21 kDATA_ERROR = -4

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the error constants.
Notes: Returned when a data integrity error is detected during decompression. Most importantly, this means when stored and computed CRCs for the data do not match. This value is also returned upon detec-
43.2. **CLASS BZIP2COMPRESSMBS**

...tion of any other anomaly in the compressed data.

### 43.2.22 kDATA_ERROR_MAGIC = -5

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the error constants.  
**Notes:** As a special case of kDATA_ERROR, it is sometimes useful to know when the compressed stream does not start with the correct magic bytes (‘B’ ’Z’ ’h’).

### 43.2.23 kFINISH = 2

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the command constants for bzip.

### 43.2.24 kFINISH_OK = 3

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the error constants.  
**Notes:** In Compress, the requested flush/finish/nothing-special action was completed successfully.

### 43.2.25 kFLUSH = 1

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the command constants for bzip.

### 43.2.26 kFLUSH_OK = 2

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the error constants.  
**Notes:** In Compress, the requested flush/finish/nothing-special action was completed successfully.

### 43.2.27 kIO_ERROR = -6

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the error constants.  
**Notes:** Returned by Read and Write when there is an error reading or writing in the compressed file, and by ReadOpen and WriteOpen for attempts to use a file for which the error indicator (viz, ferror(f)) is set. On receipt of kIO_ERROR, the caller should consult errno and/or perror to acquire operating-system specific information about the problem.
43.2.28 \texttt{kMEM\_ERROR = -3}

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: One of the error constants. 
\textbf{Notes}: Returned when a request to allocate memory failed. Note that the quantity of memory needed to decompress a stream cannot be determined until the stream’s header has been read. So Decompress and Read may return \texttt{kMEM\_ERROR} even though some of the compressed data has been read. The same is not true for compression; once CompressInit or WriteOpen have successfully completed, \texttt{kMEM\_ERROR} cannot occur.

43.2.29 \texttt{kOK = 0}

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: One of the error constants. 
\textbf{Notes}: The requested action was completed successfully.

43.2.30 \texttt{kOUTBUFF\_FULL = -8}

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: One of the error constants. 
\textbf{Notes}: Returned by BuffToBuffCompress and BuffToBuffDecompress to indicate that the output data will not fit into the output buffer provided.

43.2.31 \texttt{kPARAM\_ERROR = -2}

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: One of the error constants. 
\textbf{Notes}: Returned when a parameter to a function call is out of range or otherwise manifestly incorrect. As with \texttt{kSEQUENCE\_ERROR}, this denotes a bug in the client code. The distinction between \texttt{kPARAM\_ERROR} and \texttt{kSEQUENCE\_ERROR} is a bit hazy, but still worth making.

43.2.32 \texttt{kRUN = 0}

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: One of the command constants for bzip.

43.2.33 \texttt{kRUN\_OK = 1}

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: One of the error constants. 
\textbf{Notes}: In Compress, the requested flush/finish/nothing-special action was completed successfully.
43.2.34 kSEQUENCE\_ERROR = -1

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the error constants.  
**Notes:** When using the library, it is important to call the functions in the correct sequence and with data structures (buffers etc) in the correct states. libbz2 checks as much as it can to ensure this is happening, and returns kSEQUENCE\_ERROR if not. Code which complies precisely with the function semantics, as detailed below, should never receive this value; such an event denotes buggy code which you should investigate.

43.2.35 kSTREAM\_END = 4

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the error constants.  
**Notes:** Compression of data was completed, or the logical stream end was detected during decompression.

43.2.36 kUNEXPECTED\_EOF = -7

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the error constants.  
**Notes:** Returned by Read when the compressed file finishes before the logical end of stream is detected.
43.3 class BZip2DecompressMBS

43.3.1 class BZip2DecompressMBS

Function: A class for bzip2 decompression.

43.3.2 Methods

43.3.3 Close

Function: The destructor.
Notes:
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

43.3.4 Constructor(BufferSize as Integer=20000)

Function: The constructor.
Notes:
The buffer size you specify is the output buffer size.
If this size is small, you need to flush with ProcessZip.

43.3.5 EndZip

Function: Finalizes the current decompression stream.
Notes:
You may check the Output property after this.
Error is set.
43.3. CLASS BZIP2DECOMPRESSMBS

43.3.6  GetOutput as string

**Function:** Returns the content of the output buffer.
**Notes:** The buffer is cleared after this function returns.

43.3.7  InitZip

**Function:** Initializes the stream.
**Notes:** Error is set.

43.3.8  InputAvail as Integer

**Function:** Returns the number of bytes available in the input buffer.

43.3.9  OutputSize as Integer

**Function:** The size of bytes available in the output buffer.

43.3.10  ProcessZip

**Function:** Does zip compression.
**Notes:**
Reduces the size of the input buffer and writes new data to the output buffer.
If the input buffer is not "" after this call, you need to call it again, but empty the output buffer before.
Error is set.

43.3.11  SetInput(data as Memoryblock) as boolean

**Function:** Fills the input buffer.
**Notes:**
Returns true if successful.
The current plugin uses a 128 K input buffer.
See also:

- 43.3.12 SetInput(data as string) as boolean

### 43.3.12 SetInput(data as string) as boolean

**Function:** Fills the input buffer.
**Notes:**
Returns true if successful.
The current plugin uses a 128 K input buffer.
See also:

- 43.3.11 SetInput(data as Memoryblock) as boolean

### 43.3.13 Properties

#### 43.3.14 Error as Integer

**Function:** The last error code.
**Notes:** (Read and Write property)

#### 43.3.15 OutputBufferSize as Integer

**Function:** The output buffer size used in the constructor.
**Notes:** (Read only property)

#### 43.3.16 TotalInput as UInt64

**Function:** The number of bytes processed so far.
**Notes:** (Read and Write property)
43.3. CLASS BZIP2DECOMPRESSMBS

43.3.17 TotalOutput as Uint64

Function: The number of bytes processed so far.
Notes: (Read and Write property)

43.3.18 Version as String

Function: The version string of the used zlib library.
Notes: (Read only property)

43.3.19 Constants

43.3.20 kCONFIG_ERROR = -9

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the error constants.
Notes: Indicates that the library has been improperly compiled on your platform – a major configuration error. Specifically, it means that sizeof(char), sizeof(short) and sizeof(int) are not 1, 2 and 4 respectively, as they should be. Note that the library should still work properly on 64-bit platforms which follow the LP64 programming model – that is, where sizeof(long) and sizeof(void*) are 8. Under LP64, sizeof(int) is still 4, so libbzip2, which doesn’t use the long type, is OK.

This should never happen with the plugin.

43.3.21 kDATA_ERROR = -4

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the error constants.
Notes: Returned when a data integrity error is detected during decompression. Most importantly, this means when stored and computed CRCs for the data do not match. This value is also returned upon detection of any other anomaly in the compressed data.

43.3.22 kDATA_ERROR_MAGIC = -5

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the error constants.
Notes: As a special case of kDATA_ERROR, it is sometimes useful to know when the compressed stream
does not start with the correct magic bytes ('B' 'Z' 'h').

43.3.23 \( k\text{FINISH} = 2 \)

MBS Compression Plugin, Plugin Version: 9.7. **Function**: One of the command constants for bzip.

43.3.24 \( k\text{FINISH}_{\text{OK}} = 3 \)

MBS Compression Plugin, Plugin Version: 9.7. **Function**: One of the error constants. **Notes**: In Compress, the requested flush/finish/nothing-special action was completed successfully.

43.3.25 \( k\text{FLUSH} = 1 \)

MBS Compression Plugin, Plugin Version: 9.7. **Function**: One of the command constants for bzip.

43.3.26 \( k\text{FLUSH}_{\text{OK}} = 2 \)

MBS Compression Plugin, Plugin Version: 9.7. **Function**: One of the error constants. **Notes**: In Compress, the requested flush/finish/nothing-special action was completed successfully.

43.3.27 \( k\text{IO\_ERROR} = -6 \)

MBS Compression Plugin, Plugin Version: 9.7. **Function**: One of the error constants. **Notes**: Returned by Read and Write when there is an error reading or writing in the compressed file, and by ReadOpen and WriteOpen for attempts to use a file for which the error indicator (viz, ferror(f)) is set. On receipt of \( k\text{IO\_ERROR} \), the caller should consult errno and/or perror to acquire operating-system specific information about the problem.

43.3.28 \( k\text{MEM\_ERROR} = -3 \)

MBS Compression Plugin, Plugin Version: 9.7. **Function**: One of the error constants. **Notes**: Returned when a request to allocate memory failed. Note that the quantity of memory needed to decompress a stream cannot be determined until the stream’s header has been read. So Decompress and Read may return \( k\text{MEM\_ERROR} \) even though some of the compressed data has been read. The same is not true for compression; once CompressInit or WriteOpen have successfully completed, \( k\text{MEM\_ERROR} \) cannot
43.3.29  kOK = 0

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the error constants. Notes: The requested action was completed successfully.

43.3.30  kOUTBUFF_FULL = -8

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the error constants. Notes: Returned by BuffToBuffCompress and BuffToBuffDecompress to indicate that the output data will not fit into the output buffer provided.

43.3.31  kPARAM_ERROR = -2

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the error constants. Notes: Returned when a parameter to a function call is out of range or otherwise manifestly incorrect. As with kSEQUENCE_ERROR, this denotes a bug in the client code. The distinction between kPARAM_ERROR and kSEQUENCE_ERROR is a bit hazy, but still worth making.

43.3.32  kRUN = 0

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the command constants for bzip.

43.3.33  kRUN_OK = 1

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the error constants. Notes: In Compress, the requested flush/finish/nothing-special action was completed successfully.

43.3.34  kSEQUENCE_ERROR = -1

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the error constants. Notes: When using the library, it is important to call the functions in the correct sequence and with data structures (buffers etc) in the correct states. libbzip2 checks as much as it can to ensure this is happening,
and returns kSEQUENCE_ERROR if not. Code which complies precisely with the function semantics, as detailed below, should never receive this value; such an event denotes buggy code which you should investigate.

43.3.35  kSTREAM_END = 4

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the error constants.  
**Notes:** Compression of data was completed, or the logical stream end was detected during decompression.

43.3.36  kUNEXPECTED_EOF = -7

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the error constants.  
**Notes:** Returned by Read when the compressed file finishes before the logical end of stream is detected.
43.4. CLASS BZIP2FILEMBS

43.4 class BZip2FileMBS

43.4.1 class BZip2FileMBS

Function: A class to read and write bzip2 byte streams.
Notes: A .bz2 file is just the content of the original file compressed. No header.

43.4.2 Methods

43.4.3 Close

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

43.4.4 Flush

Function: Flushes all pending output into the compressed file.

43.4.5 Open(file as folderitem, mode as string) as boolean

Function: Opens a .bz2 file for reading or writing, using the given file path.
Notes: Returns false on failure.
Mode can be "r" for reading and "w" for writing. Or other values fopen accepts.

43.4.6 OpenString(data as string) as boolean

Function: Opens a bzip compressed file from the given string.
Notes: Returns true on success and false on failure.
43.4.7 Read(data as Integer) as string

Function: Reads data form a compressed file.

43.4.8 Write(data as string)

Function: Writes data to the file and compresses it.

43.4.9 Properties

43.4.10 ErrorCode as Integer

Function: The last error code.
Notes: (Read only property)

43.4.11 ErrorMessage as String

Function: The last error message.
Notes: (Read only property)

43.4.12 Handle as Integer

Function: The current bzip file handle.
Notes: (Read and Write property)

43.4.13 Lasterror as Integer

Function: The last error value.
Notes: (Read and Write property)
43.4.14 Version as String

MBS Compression Plugin, Plugin Version: 9.7, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a string indicating the library version. **Notes:** (Read only property)
43.5 class GZipFileMBS

43.5.1 class GZipFileMBS

Function: A class to read and write gzip byte streams.
Notes: A .gz file is just the content of the original file compressed. No header.

43.5.2 Methods

43.5.3 Adler32(start as UInt32, data as string) as UInt32

Function: Calculates a 32bit Adler Checksum about a given string.
Notes:
Set start to 0 for the first call.
Later you can pass the result as the new start value to add data to your checksum.

This function is part of the zlib library and given as a free utility function to this class.

43.5.4 Close

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without
waiting for Realbasic to do it for you.

43.5.5 CloseForString as string

Function: Closes the file and returns the string.
Example:

Function GZIPStringWriteMBS(data as string) As string
    dim g as new GZipFileMBS
    if g.CreateForString then
        g.Write data
    Return g.CloseForString
}
43.5. CLASS GZIPFILEMBS

end if
End Function

Notes:

Only for use with CreateForString function.
Returns empty string on any error.

43.5.6 CRC32(start as UInt32, data as string) as UInt32

Function: Calculates a 32bit Checksum about a given string.
Notes:

Set start to 0 for the first call.
Later you can pass the result as the new start value to add data to your checksum.

This function is part of the zlib library and given as a free utility function to this class.

43.5.7 CreateForString as boolean

Function: Creates a new gzip file in memory.
Example:

Function GZIPStringWriteMBS(data as string) As string
dim g as new GZipFileMBS

if g.CreateForString then
g.Write data

Return g.CloseForString
end if
End Function

Notes:

Use with the CloseForString method to compress data in memory.
Returns false on any error and true on success.
43.5.8 Flush(flush as Integer)

Function: Flushes all pending output into the compressed file.
Notes:
The parameter flush is as in the zlib deflate() function.
LastError is set.
Flush should be called only when strictly necessary because it can degrade compression.

43.5.9 Open(file as folderitem, mode as string) as boolean

Function: Opens a gzip (.gz) file for reading or writing.
Notes:
The mode parameter is as in fopen ("rb" read binary or "wb" for write binary) but can also include a compression level ("wb9") or a strategy: 'F' for filtered data as in "wb6f", 'h' for Huffman only compression as in "wb1h".

Open can be used to read a file which is not in gzip format; in this case Read will directly read from the file without decompression.

Open returns NULL if the file could not be opened or if there was insufficient memory to allocate the (de)compression state; errno can be checked to distinguish the two cases (if errno is zero, the zlib error is Z_MEM_ERROR).

Returns false on any error and true on success.

43.5.10 OpenString(data as string) as boolean

Function: Opens a gzip (.gz) file for reading from a file.
Example:
Function GZipStringReadMBS(compressedData as string) As string
    dim g as new GZipFileMBS
    const BlockSize=1000000
    if g.OpenString(compressedData) then
        dim parts(-1) as string
        "Code block here"
while not g.eof
    dim s as string=g.Read(BlockSize)
    parts.Append s
wend

Return Join(parts,"")
end if
End Function

Notes: Same as Open, but reading from the given string.

43.5.11 Read(ByteCount as Int64) as string

Function: Reads the given number of bytes into a string.
Notes:
Returns "" on any error.
May return less bytes than requested.
Lasterror is set.

43.5.12 ReadByte as Integer

Function: Reads one byte from the file.

43.5.13 ReadData(ByteCount as Int64) as Memoryblock

MBS Compression Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Reads the given number of bytes into a memoryblock.
Notes:
Returns nil on any error.
May return less bytes than requested.
Lasterror is set.
43.5.14 **Rewind**

**Function:** Moves the file position for reading files to the file start.
**Notes:** Equal to: position=0

43.5.15 **SetParameter(level as Integer, strategy as Integer)**

**Function:** Dynamically update the compression level or strategy.
**Notes:**
Lasterror is set.

Possible values:

- FILTERED 1
- HUFFMAN_ONLY 2
- DEFAULT_STRATEGY 0

43.5.16 **Write(data as Memoryblock)**

MBS Compression Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Writes a Memoryblock to a file.
**Notes:** Lasterror is set.
See also:
- 43.5.17 Write(data as string)

43.5.17 **Write(data as string)**

**Function:** Writes a string to a file.
**Notes:**
Note that encoding can make trouble as the raw bytes from the string are written.
Lasterror is set.
See also:
- 43.5.16 Write(data as Memoryblock)
43.5. CLASS GZIPFILEMBS

43.5.18 WriteByte(data as Integer)

Function: Writes one byte to the file.

43.5.19 Properties

43.5.20 Direct as Boolean

Function: Returns true if file is being copied directly while reading, or false if file is a gzip stream being decompressed.
Notes:
If the input file is empty, Direct will return true, since the input does not contain a gzip stream.
(Read only property)

43.5.21 EOF as Boolean

Function: Returns true if reading is on the end of the file.
Notes:
Returns true on any error.
(Read only property)

43.5.22 ErrorCode as Integer

Function: Returns the last zlib error number.
Notes:
If an error occurred in the file system and not in the compression library, errnum is set to Z_ERRNO and the application may consult errno to get the exact error code. (errno is currently not available in Realbasic)

Error codes:

(Read only property)
43.5.23 ErrorMessage as String

Function: Returns the error message for the last error which occurred on the given compressed file.
Notes: (Read only property)

43.5.24 Handle as Integer

Function: The current zlib file handle.
Notes: (Read and Write property)

43.5.25 Lasterror as Integer

Function: The last error code reported.
Notes:
0 for success.
-1 for failure.
(Read and Write property)

43.5.26 Position as Integer

Function: The current file position.
Notes:
Not all positions are available.
e.g. on writing you can not move back.
Moving forward will add bytes with value 0 to the file.
Lasterror is set.
(Read and Write property)

43.5.27  Version as String

**Function:** The version string of the used zlib library.
**Notes:** (Read only property)
43.6 module PackbitsMBS

43.6.1 module PackbitsMBS
MBS Compression Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: A module with functions for packbits compression/decompression.
Notes:
see wikipedia:  
http://en.wikipedia.org/wiki/PackBits

43.6.2 Methods

43.6.3 Compress(data as MemoryBlock) as MemoryBlock
MBS Compression Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Compresses data in a memoryblock.
Notes: Can raise out of memory exception if running low on memory.
See also:

- 43.6.4 Compress(data as string) as string
- 43.6.5 Compress(InputFile as FolderItem, OutputFile as Folderitem) as boolean

43.6.4 Compress(data as string) as string
MBS Compression Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Compresses data in a string.
Notes:
Can raise out of memory exception if running low on memory.
Returned data is a string without known encoding. If you plan to store it in a file, use binarystream class,  
not textoutputstream. If you plan to store it in a database, please use BLOB field. For storing in a text  
field, you may need to use Base64 encoding.
See also:

- 43.6.3 Compress(data as MemoryBlock) as MemoryBlock
- 43.6.5 Compress(InputFile as FolderItem, OutputFile as Folderitem) as boolean

43.6.5 Compress(InputFile as FolderItem, OutputFile as Folderitem) as boolean
MBS Compression Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Compresses data in a file.
43.6. MODULE PACKBITSMBS

Notes: Returns true on success.
See also:

- 43.6.3 Compress(data as MemoryBlock) as MemoryBlock
- 43.6.4 Compress(data as string) as string

43.6.6 Decompress(data as MemoryBlock) as MemoryBlock

MBS Compression Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Decompresses data in a memoryblock.
Notes: Can raise out of memory exception if running low on memory.
See also:

- 43.6.7 Decompress(data as string) as string
- 43.6.8 Decompress(InputFile as FolderItem, OutputFile as Folderitem) as boolean

43.6.7 Decompress(data as string) as string

MBS Compression Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Decompresses data in a string.
Notes: Can raise out of memory exception if running low on memory.
Returned data is a string without known encoding.
See also:

- 43.6.6 Decompress(data as MemoryBlock) as MemoryBlock
- 43.6.8 Decompress(InputFile as FolderItem, OutputFile as Folderitem) as boolean

43.6.8 Decompress(InputFile as FolderItem, OutputFile as Folderitem) as boolean

MBS Compression Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Decompresses data in a file.
Notes: Returns true on success.
See also:

- 43.6.6 Decompress(data as MemoryBlock) as MemoryBlock
- 43.6.7 Decompress(data as string) as string
43.7 class UnZipFileInfoMBS

43.7.1 class UnZipFileInfoMBS

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** This class keeps the metadata for a zip file.

43.7.2 Properties

43.7.3 CompressedSize as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The compressed file size.
**Notes:** (Read and Write property)

43.7.4 CompressionMethod as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The compression method.
**Notes:** (Read and Write property)

43.7.5 CRC as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The 32bit file checksum.
**Notes:** (Read and Write property)

43.7.6 Date as Date

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The date as a REALbasic date object.
**Notes:** (Read and Write property)

43.7.7 Day as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The file time.
43.7. CLASS UNZIPFILEINFOMBS

Notes:

day of the month - [ 1,31 ]
(Read and Write property)

43.7.8 DiskNumStart as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Disk number start.
Notes: (Read and Write property)

43.7.9 DosDate as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Last mod file date in DOS format.
Notes: (Read and Write property)

43.7.10 ExternalFileAttributes as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: External file attributes.
Notes: (Read and Write property)

43.7.11 Flag as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: general purpose bit flag.
Notes:

A 16 bit value.

The flag is a bit field with various values.
Last bit of the flag is encryption state: value is 1 (odd) for encrypted and 0 (even) for unencrypted value.
The bit values 2 and 4 define compression level between 0 to 9.

(Read and Write property)
Flag Value | Encryption | Compression Level
---|---|---
0 | no | 6
1 | yes | 6
2 | no | 9
3 | yes | 9
4 | no | 2
5 | yes | 2
6 | no | 1
7 | yes | 1

### 43.7.12 Hour as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The file time.
**Notes:**
hours since midnight - [0, 23]
(Read and Write property)

### 43.7.13 InternalFileAttributes as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Internal file attributes.
**Notes:** (Read and Write property)

### 43.7.14 Minute as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The file time.
**Notes:**
minutes after the hour - [0, 59]
(Read and Write property)

### 43.7.15 Month as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The file time.
**Notes:**
months since January - [0, 11]
43.7. CLASS UNZIPFILEINFOMBS
(Read and Write property)

43.7.16  Second as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The file time.
Notes:
seconds after the minute - [0, 59]
(Read and Write property)

43.7.17  SizeFileComment as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: file comment length.
Notes: (Read and Write property)

43.7.18  SizeFileExtra as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: extra field length.
Notes: (Read and Write property)

43.7.19  SizeFilename as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: filename length.
Notes: (Read and Write property)

43.7.20  UncompressedSize as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The uncompressed file size.
Notes: (Read and Write property)
43.7.21 Version as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The version used to make the archive.
Notes: (Read and Write property)

43.7.22 VersionNeeded as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The version needed to extract.
Notes: (Read and Write property)

43.7.23 Year as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The file time.
Notes: years - [1980..2044]
(Read and Write property)
43.8.  class UnZipFilePositionMBS

43.8.1  class UnZipFilePositionMBS

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: This class contains information about a file in the zipfile.

43.8.2  Properties

43.8.3  NumberOfFile as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The index of the file.
Notes: (Read and Write property)

43.8.4  PositionInZipDirectory as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Offset in zip file directory.
Notes: (Read and Write property)
CHAPTER 43. COMPRESSION

43.9 class UnZipMBS

43.9.1 class UnZipMBS

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: A class to decompress a zip archive.

Example:

```vba
// open zip archive
Dim f As FolderItem = SpecialFolder.Desktop.Child("test.zip")
Dim z As New UnZipMBS(f)

// let's start
z.GoToFirstFile
Do

// get details on this file:
Dim info As UnZipFileInfoMBS = z.FileInfo
Dim name As String = z.FileName
If Left(name, 8) <> "MACOSX" Then // ignore Mac special files for metadata
    z.OpenCurrentFile
    If z.Lasterror = 0 Then
        // create output file (if you want to support folders, this needs to be changed. See other examples)
        Dim outfile As FolderItem = GetFolderItem(Name)
        Dim b As BinaryStream = BinaryStream.Create(outfile, True)
        Dim s As String

        // now read 100 KB chunks and write them to new file
        Do
            s = z.ReadCurrentFile(100000)
            b.Write s
        Loop Until Lenb(s) = 0

        // cleanup
        b.Close
        z.CloseCurrentFile
    End If
End If

// move to next file until we reach the end
z.GoToNextFile
Loop Until z.Lasterror <> 0
```

```
43.9. **CLASS UNZIPMBS**

**Notes:**
This is a simple class which uses zlib and has some limitations:

- only deflate as compression method
- only one date per file is preserved
- no resource forks on Mac OS
- no text encoding handling
- no Apple or Microsoft extensions for special file flags or permissions.

43.9.2 **Methods**

43.9.3 **Close**

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Close a ZipFile.
**Notes:**
Use CloseCurrentFile to close any open file before using Close.
Lasterror is UnZipOK on success.

43.9.4 **CloseCurrentFile**

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Close the file in the zip archive opened with OpenCurrentFile.
**Notes:** Lasterror is set to UnzipCRCError if all the file was read but the CRC was not correct.

43.9.5 **Comment as string**

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Get the global comment string of the ZipFile.

43.9.6 **CommentSize as UInt32**

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Size of the global comment of the zipfile.
43.9.7 CompareFileNames(filename1 as string, filename2 as string, CaseSensitive as Integer) as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Compare two filename (fileName1,fileName2).

Notes:
If iCaseSensitivity = 1, comparison is case sensitivity (like strcmp)
If iCaseSensitivity = 2, comparison is not case sensitivity (like strcmpi or strcasecmp)
If iCaseSensitivity = 0, case sensitivity is default of your operating system (like 1 on Unix, 2 on Windows)

43.9.8 Constructor(data as memoryblock)

Function: Open a Zip file from data in the memoryblock.

Notes:
The Handle property is zero on failure and not zero on success.
The memory block must have a known size.
See also:

- 43.9.9 Constructor(data as string) 7486
- 43.9.10 Constructor(file as folderitem) 7486
- 43.9.11 Constructor(file as folderitem, Offset as Integer) 7487

43.9.9 Constructor(data as string)

Function: Open a Zip file from data in the string.

Notes: The Handle property is zero on failure and not zero on success.
See also:

- 43.9.8 Constructor(data as memoryblock) 7486
- 43.9.10 Constructor(file as folderitem) 7486
- 43.9.11 Constructor(file as folderitem, Offset as Integer) 7487

43.9.10 Constructor(file as folderitem)

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Open a Zip file from a file.

Notes:
43.9. **CLASS UNZIPMBS**

The Handle property is zero on failure and not zero on success.

If you run this class in a thread, please make sure your thread has a big stack (1 MB or more). Else it will crash.

See also:

- 43.9.8 Constructor(data as memoryblock)
- 43.9.9 Constructor(data as string)
- 43.9.11 Constructor(file as folderitem, Offset as Integer)

### 43.9.11 Constructor(file as folderitem, Offset as Integer)

**Function:** Open a Zip file from a file starting at the offset.

**Notes:** The Handle property is zero on failure and not zero on success.

See also:

- 43.9.8 Constructor(data as memoryblock)
- 43.9.9 Constructor(data as string)
- 43.9.10 Constructor(file as folderitem)

### 43.9.12 Count as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Total number of entries in the zip archive.

**Notes:** This value is stored in the zip archive as 16 bit integer, so maximum value is 65535. The plugin can extract more files than that number.

### 43.9.13 EOF as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Returns 1 if you are on the end of a file.

**Notes:** This is not to test whether you are on the end of the zip archive.
43.9.14 **ExtractFiles(DestFolder as FolderItem, ExtractWithoutPath as boolean = false, Overwrite as Boolean = false, Password as String = ””, byref ErrorMessage as String) as boolean**

**Function:** Simple function to extract all files from archive into folder. 
**Example:**
```
    dim f as FolderItem = SpecialFolder.Desktop.Child("test.zip")
    dim folder as FolderItem = SpecialFolder.Desktop.Child("test")
    folder.CreateAsFolder
    dim u as new UnZipMBS(f)
    dim error as string
    if u.ExtractFiles(folder, error) then
        MsgBox "OK"
    else
        MsgBox "Error: " + error
    end if
```

**Notes:**
- DestFolder: Destination folder.
- ExtractWithoutPath: If true, all files are put in one folder.
- Overwrite: Whether to allow overwriting files.
- Password: The password to decrypt files.
- ErrorMessage: An english error message.

Returns true on success or false on failure. 
This function does not restore file permissions or other metadata. 
And it may not work with non ASCII characters.

If you need more control over files being extracted, stored or error checking, please use example projects coming with plugin.

43.9.15 **FileInfo as UnZipFileInfoMBS**

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. 
**Function:** Queries file information for the current file. 
**Notes:** Returns nil on any error.
43.9.16  **FileName as string**

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** The filename of the current open file.

**Notes:**
This name has no text encoding defined, as the plugin has no idea what text encoding was used. You may need to define the text encoding as being ASCII, Windows, MacRoman or whatever, when you work with this file name.
This name may include path components for folders.

43.9.17  **GetLocalExtrafield as string**

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Read extra field from the current file (opened by unzOpenCurrentFile)

**Notes:** This is the local-header version of the extra field (sometimes, there is more info in the local-header version than in the central-header)

43.9.18  **GoToFirstFile**

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Set the current file of the zipfile to the first file.

**Notes:** Lasterror is UnzipOk on success.

43.9.19  **GoToNextFile**

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Set the current file of the zipfile to the next file.

**Notes:** Lasterror is UnzipOk if there is no problem and UnzipEndOfListError if the actual file was the latest.

43.9.20  **LocateFile(filename as string, CaseSensitive as Integer)**

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Try locate the file filename in the zipfile.

**Example:**

```vbscript
// open zip archive
dim f as FolderItem=SpecialFolder.Desktop.Child("test.zip")
dim z as new UnZipMBS(f)
```
// let's search the file
z.LocateFile "test.rtf",2

if z.Lasterror = z.UnzipOk then
dim info as UnZipFileInfoMBS = z.FileInfo
MsgBox "OK: " +str(info.UncompressedSize)+” bytes”
else
MsgBox "Failed."
end if

Notes:

For the CaseSensitivity signification, see CompareFileNames. Text encoding must match the text encoding of the files.

Lasterror is UnzipOk if the file is found. It becomes the current file, UnzipEndOfListError if the file is not found.

43.9.21 OpenCurrentFile

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. 
Function: Open for reading data the current file in the zipfile.

See also:

- 43.9.22 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean) 7490
- 43.9.23 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean, password as string) 7491
- 43.9.24 OpenCurrentFile(password as string) 7491

43.9.22 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean)

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. 
Function: Same than OpenCurrentFile, but opens file for reading raw data (not uncompressed).

Notes:

if raw=true the file data is returned uncompressed. If raw is false, it is decompressed for you.
Method will receive the method of compression.
level will receive the level of compression.
See also:

- 43.9.21 OpenCurrentFile 7490
43.9. **CLASS UNZIPMBS**

- 43.9.23 **OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean, password as string)**
- 43.9.24 **OpenCurrentFile(password as string)**

### 43.9.23 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean, password as string)

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Same than OpenCurrentFile, but opens file for reading raw data (not uncompressed) and with a password.

**Notes:**
- If raw=true the file data is returned uncompressed. If raw is false, it is decompressed for you.
- Method will receive the method of compression.
- Level will receive the level of compression.

See also:

- 43.9.21 OpenCurrentFile
- 43.9.22 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean)
- 43.9.24 OpenCurrentFile(password as string)

### 43.9.24 OpenCurrentFile(password as string)

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Open for reading data the current file in the zipfile.

**Notes:** password is a crypting password.

### 43.9.25 Position as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Returns the current position in uncompressed data.
43.9.26 Position2 as UInt64

**Function:** Returns the current position in compressed data.
**Notes:** This property is useful to show progressbar with progress over reading the original zip file.

43.9.27 ReadCurrentFile(size as Integer) as string

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** Read bytes from the current file (opened by OpenCurrentFile).
**Notes:** Returns "" on any error or on file end.

43.9.28 Properties

43.9.29 Handle as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The internal handle for the unzip object.
**Notes:** (Read and Write property)

43.9.30 Lasterror as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The last error code.
**Notes:** (Read and Write property)

43.9.31 FilePosition as UnZipFilePositionMBS

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The current file position.
**Notes:**
You can read or set the current file you edit.
(Read and Write computed property)
43.9. **CLASS UNZIPMBS**

### 43.9.32 Offset as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  
**Function:** Get or set the current index of the file in the zip directory.  
**Notes:**  
If you set this value, you basically move to another file.  
(Read and Write computed property)

### 43.9.33 Constants

#### 43.9.34 CompressionBestCompression=9

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the compression level constants.

#### 43.9.35 CompressionBestSpeed=1

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the compression level constants.

#### 43.9.36 CompressionDefault=-1

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the compression level constants.

#### 43.9.37 CompressionNo=0

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the compression level constants.

#### 43.9.38 MethodDeflated=8

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the compression methods.

**43.9.50 UnzipParameterError=-102**

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the error constants.
CHAPTER 43. COMPRESSION

43.10 class ZipFileInfoMBS

43.10.1 class ZipFileInfoMBS

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: This class keeps the metadata for a zip file.

43.10.2 Methods

43.10.3 SetDate(d as date)

Function: Sets the date with a REALbasic date object.
Notes: A convenience function to make your life easier.

43.10.4 Properties

43.10.5 Day as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The file time.
Notes:

day of the month - [ 1,31 ]
(Read and Write property)

43.10.6 DosDate as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The date in the 32bit DOS format.
Notes:

If dos_date = 0, the plugin will calculate it from the day, month, year, hour, minute and second properties.
(Read and Write property)

43.10.7 ExternalFileAttributes as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: external file attributes.
43.10. CLASS ZIPFILEINFOMBS

Notes:
A 32 bit value.
(Read and Write property)

43.10.8 Hour as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The file time.
Notes:
hours since midnight - [ 0,23 ]
(Read and Write property)

43.10.9 InternalFileAttributes as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Internal file attributes.
Notes:
A 16 bit value.
(Read and Write property)

43.10.10 Minute as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The file time.
Notes:
minutes after the hour - [ 0,59 ]
(Read and Write property)

43.10.11 Month as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The file time.
Notes:
months since January - [ 0,11 ]
(Read and Write property)
43.10.12 Second as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The file time.
**Notes:**
seconds after the minute - [0,59]
(Read and Write property)

43.10.13 Year as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
**Function:** The file time.
**Notes:**
years - [1980..2044]
(Read and Write property)
43.11. Class ZipMBS

43.11.1 Class ZipMBS

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: The class for writing to a zip file.

Notes:

This is a simple class which uses zlib and has some limitations:

- only deflate as compression method
- only one date per file is preserved
- no resource forks on Mac OS
- no encoding handling
- no Apple or Microsoft extensions for special file flags or permissions.

But it works nice to provide a zip file to clients. For example a download of JPEG files in an archive with one download from Web Edition.

Be aware that you can’t compress Mac applications with this class, as the we don’t preserve permissions, so the decompressed file has not the right flags set to make it executable.

43.11.2 Methods

43.11.3 Close(GlobalComment as string="")

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Close the zipfile.

43.11.4 CloseFile

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

Function: Close the current file in the zipfile.
7500

43.11.5

CHAPTER 43. COMPRESSION

CloseFileRaw(UncompressedSize as Integer, CRC32 as Integer)

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Close the current file in the zipfile.
Notes:
For files opened with parameter raw=true in CreateFile
UncompressedSize and crc32 are value for the uncompressed size,

43.11.6

CompressFiles(ZipFile as FolderItem, SourceFolder as FolderItem, files()
as string, Overwrite as Integer = 0, Password as string = ””, CompressionLevel as Integer = 9, byref ErrorMessage as string) as Integer

Function: Simple implementation of a batch file compression method.
Example:
dim f as FolderItem = SpecialFolder.Desktop.Child(”test.zip”)
dim folder as FolderItem = SpecialFolder.Pictures // some folder with images
dim files() As string
dim c as Integer = folder.count
for i as Integer = 1 to c
dim file as FolderItem = folder.TrueItem(i)
if file.Directory then
// we go here for this example only one level deep
dim subfolder as FolderItem = file
dim cc as Integer = subfolder.count
for ii as Integer = 1 to cc
dim subfile as FolderItem = subfolder.TrueItem(ii)
if subfile.name.Right(4) = ”.jpg” then
// here we pass a relative path
files.Append subfolder.name+”/”+subfile.name
end if
next
else
if file.name.Right(4) = ”.jpg” then
// just padd a file name for files directly in source folder
files.Append file.name
end if
end if
next


**43.11. CLASS ZIPMBS**

```vbnet
dim ErrorMessage as string
Dim e as Integer = ZipMBS.CompressFiles(f, folder, files, errorMessage)

MsgBox "Error: " + str(e)
```

**Notes:**

ZipFile: The destination zip file.
SourceFolder: The source folder for the files.
files: relative file paths to source folder.
Overwrite: pass 1 to overwrite zip archive, 2 to append or 0 to not overwrite.
Password: the password for encryption.
CompressionLevel: The compression level to use from 0 (no compression) to 9 (maximum).
ErrorMessage: An english error message.

Returns 0 on success or error code on failure.

This is a simple function to compress a couple of files.
It does not preserve file permissions on Mac/Linux or other metadata.
And it may not work with non ASCII characters.

If you need more control over files being added, compression or error checking, please use example projects coming with plugin.

**43.11.7 Constructor(file as folderitem, append as Integer = 0)**

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: Create a zipfile.
Notes:

If the file exist and append is AppendStatusCreateAfter, the zip will be created at the end of the file.
(useful if the file contain a self extractor code)
If the file exist and append is AppendStatusAddInZip, we will add files in existing zip (be sure you don’t add file that doesn’t exist)
If the zipfile cannot be opened, the handle value will be zero.

AppendStatusCreateAfter seems not to be working currently.

If you run this class in a thread, please make sure your thread has a big stack (1 MB or more). Else it will crash.
43.11.8  CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string = "", ExtraGlobal as string = "", Comment as String = "", CompressionMethod as Integer = 8, Level as Integer = 9, Zip64 as boolean = false)

Function: Open a file in the ZIP for writing.
Notes:
filename: the filename in zip. This can include path information with slash as delimiter. e.g. "folder-name/file.txt"
FileInfo: the file date.
ExtraLocal: contains the extrafield data the the local header.
ExtraGlobal: contains the extrafield data the the local header.
Comment: comment contain the comment string
CompressionMethod: contain the compression method (see Method* constants)
Level: contain the level of compression (a value from -1 to 9. see Compression* constants)
Zip64: If you want to have the zip file support more than 2 GB of data, set this to true to create a 64 bit file.
See also:

- 43.11.9 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean) 7502

- 43.11.10 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean, WindowBits as Integer, MemLevel as Integer, Strategy as Integer, Password as string, crcForCtypting as UInt32) 7503

- 43.11.11 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean, WindowBits as Integer, MemLevel as Integer, Strategy as Integer, Password as string, crcForCtypting as UInt32, versionMadeBy as UInt32, flagBase as UInt32) 7505

43.11.9  CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean)

Function: Open a file in the ZIP for writing with the possibility to write raw files.
Notes:
filename: the filename in zip. This can include path information with slash as delimiter. e.g. "folder-name/file.txt"
FileInfo: the file date.
ExtraLocal: contains the extrafield data the the local header.
43.11. CLASS ZIPMBS

ExtraGlobal: contains the extrafield data the the local header.
Comment: comment contain the comment string
CompressionMethod: contain the compression method (see Method* constants)
Level: contain the level of compression (a value from -1 to 9. see Compression* constants)
Zip64: If you want to have the zip file support more than 2 GB of data, set this to true to create a 64 bit file.
Raw: If true you read the file raw (the data will not be compressed).
See also:

- 43.11.8 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string = "", ExtraGlobal as string = "", Comment as String = "", CompressionMethod as Integer = 8, Level as Integer = 9, Zip64 as boolean = false) 7502
- 43.11.10 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean, WindowBits as Integer, MemLevel as Integer, Strategy as Integer, Password as string, crcForCtypting as UInt32) 7503
- 43.11.11 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean, WindowBits as Integer, MemLevel as Integer, Strategy as Integer, Password as string, crcForCtypting as UInt32, versionMadeBy as UInt32, flagBase as UInt32) 7505

43.11.10 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean, WindowBits as Integer, MemLevel as Integer, Strategy as Integer, Password as string, crcForCtypting as UInt32)

Function: Open a file in the ZIP for writing with the possibility to write raw files, change the compression and add a password.
Notes:
filename: the filename in zip. This can include path information with slash as delimiter. e.g. "folder-name/file.txt"
FileInfo: the file date.
ExtraLocal: contains the extrafield data the the local header.
ExtraGlobal: contains the extrafield data the the local header.
Comment: comment contain the comment string
CompressionMethod: contain the compression method (see Method* constants)
Level: contain the level of compression (a value from -1 to 9. see Compression* constants)
Zip64: If you want to have the zip file support more than 2 GB of data, set this to true to create a 64 bit file.
Raw: If true you read the file raw (the data will not be compressed).
WindowBits: Parameters for zlib compression. (for example -15)
MemLevel: Parameters for zlib compression. (for example 8 or 9)
Strategy: Parameters for zlib compression. (See Strategy* constants)
Password: The password to use.
crcForCtypting: the CRC value of the input file.

The windowBits parameter is the base two logarithm of the window size (the size of the history buffer). It should be in the range 8..15 for this version of the library. Larger values of this parameter result in better compression at the expense of memory usage. The default value is 15.

windowBits can also be -8..-15 for raw deflate. In this case, -windowBits determines the window size.

The memLevel parameter specifies how much memory should be allocated for the internal compression state. memLevel=1 uses minimum memory but is slow and reduces compression ratio; memLevel=9 uses maximum memory for optimal speed. The default value is 8. See zconf.h for total memory usage as a function of windowBits and memLevel.

The strategy parameter is used to tune the compression algorithm. Use the value StrategyDefault for normal data, StrategyFiltered for data produced by a filter (or predictor), StrategyHuffmanOnly to force Huffman encoding only (no string match), or StrategyRLE to limit match distances to one (run-length encoding). Filtered data consists mostly of small values with a somewhat random distribution. In this case, the compression algorithm is tuned to compress them better. The effect of StrategyFiltered is to force more Huffman coding and less string matching; it is somewhat intermediate between StrategyDefault and StrategyHuffmanOnly. StrategyRLE is designed to be almost as fast as StrategyHuffmanOnly, but give better compression for PNG image data. The strategy parameter only affects the compression ratio but not the correctness of the compressed output even if it is not set appropriately. StrategyFixed prevents the use of dynamic Huffman codes, allowing for a simpler decoder for special applications.

43.11.12 Write(data as string)

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** Write data in the zipfile.

**Notes:** A file in the zip archive must have been created.

43.11.13 Properties

43.11.14 Handle as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** The internal handle for the open zip archive.

**Notes:**

If 0 the construct failed to create the file.

(Read and Write property)

43.11.15 Lasterror as Integer

MBS Compression Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.

**Function:** The last error code.
43.11. **CLASS ZIPMBS**

Notes: (Read and Write property)

---

**43.11.16 ZipFileVersion32 as Integer**

**Function:** The version number to put in Zip file header for 32bit zip archives.  
**Notes:**  
Default is 20 for version 4.5. Apple Finder seems to prefer 10 for 1.0.  
(Read and Write property)

---

**43.11.17 ZipFileVersion64 as Integer**

**Function:** The version number to put in Zip file header for 32bit zip archives.  
**Notes:**  
Default is 45 for version 4.5. Apple Finder seems to prefer 10 for 1.0.  
(Read and Write property)

---

**43.11.18 Constants**

**43.11.19 AppendStatusAddInZip=2**

MBS Compression Plugin, Plugin Version: 8.6.  
**Function:** One of the values for the constructor.

---

**43.11.20 AppendStatusCreate=0**

MBS Compression Plugin, Plugin Version: 8.6.  
**Function:** One of the values for the constructor.

---

**43.11.21 AppendStatusCreateAfter=1**

MBS Compression Plugin, Plugin Version: 8.6.  
**Function:** One of the values for the constructor.
43.11.22  **CompressionBestCompression=9**

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the compression level constants.

43.11.23  **CompressionBestSpeed=1**

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the compression level constants.

43.11.24  **CompressionDefault=-1**

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the compression level constants.

43.11.25  **CompressionNo=0**

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the compression level constants.

43.11.26  **MethodDeflated=8**

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the compression method constants.

43.11.27  **MethodNone=0**

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the compression method constants. **Notes:** Use this value for no compression.

43.11.28  **StrategyDefault=0**

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the strategy modes.

43.11.29  **StrategyFiltered=1**

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the strategy modes.
43.11. CLASS ZIPMBS

43.11.35  ZipOk=0

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the error constants.

43.11.36  ZipParameterError=-102

MBS Compression Plugin, Plugin Version: 8.6. **Function:** One of the error constants.
43.12  class ZLibCompressMBS

43.12.1  class ZLibCompressMBS

Function: A class for zlib compression.

43.12.2  Methods

43.12.3  Adler32(start as UInt32, data as string) as UInt32

Function: Calculates a 32bit Adler Checksum about a given string.
Notes:
Set start to 0 for the first call.
Later you can pass the result as the new start value to add data to your checksum.

This function is part of the zlib library and given as a free utility function to this class.

43.12.4  close

MBS Compression Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The destructor.
Notes:
There is no need to call this method except you want to free all resources of this object now without waiting
for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

43.12.5  Constructor(BufferSize as Integer=20000)

Function: The constructor.
Notes:
The buffer size you specify is the output buffer size.
If this size is small, you need to flush with ProcessZip.
43.12. CLASS ZLIBCOMPRESSMBS

43.12.6  CRC32(start as UInt32, data as string) as UInt32

Function: Calculates a 32bit Checksum about a given string.
Notes:
Set start to 0 for the first call.
Later you can pass the result as the new start value to add data to your checksum.

This function is part of the zlib library and given as a free utility function to this class.

43.12.7  EndZip

Function: Finalizes the current compression stream.
Notes:
You may check the Output buffer after this.
Error is set.

43.12.8  GetOutput as string

Function: Returns the contents of the output buffer.
Notes: The buffer is cleared after this function returns.

43.12.9  InitZip(level as Integer)

Function: Initializes the stream.
Notes:
Level is from 0 to 9.
Error is set.

43.12.10  InputAvail as Integer

Function: Returns the number of bytes available in the input buffer.
43.12.11 OutputSize as Integer

**Function:** The size of bytes available in the output buffer.

43.12.12 ProcessFinish

**Function:** Same as process, but for finishing.
**Notes:**
If error is zero after this function, please call it again. Error is 1 if stream is at end, so you can call EndZip to finish.

43.12.13 ProcessZip(Flush as boolean=false)

**Function:** Does zip compression.
**Notes:**
Reduces the size of the input buffer and writes new data to the output buffer.
If the input buffer is not empty after this call, you need to call it again, but empty the output buffer before. Error is set.

If flush is true, the data is flushed to output. Using flush=true all the the time will slow down compression, so use it only on the end to clear the output buffers.

43.12.14 SetInput(data as MemoryBlock) as boolean

**Function:** Fills the input buffer.
**Notes:**
Returns true if successful.
The current input buffer size is 128 K, so you may use something smaller.
See also:

- 43.12.15 SetInput(data as string) as boolean
43.12. CLASS ZLIBCOMPRESSMBS

43.12.15 SetInput(data as string) as boolean

Function: Fills the input buffer.

Notes:
Returns true if successful.
The current input buffer size is 128 K, so you may use something smaller.
See also:

- 43.12.14 SetInput(data as MemoryBlock) as boolean

43.12.16 Properties

43.12.17 CRC as UInt32

Function: The Adler32 CRC value of the uncompressed data.

Notes: (Read only property)

43.12.18 Error as Integer

Function: The last error code.

Notes:

Values:

- Z_OK 0 (no error)
- Z_STREAM_END 1 (Should be handled by the plugin inside)
- Z_NEED_DICT 2
- Z_ERRNO -1
- Z_STREAM_END -2
- Z_DATA_ERROR -3
- Z_MEM_ERROR -4
- Z_BUF_ERROR -5
- Z_VERSION_ERROR -6

(Read and Write property)
43.12.19  ErrorMessage as String

**Function:** The error message for the last error.
**Notes:** (Read only property)

43.12.20  OutputBufferSize as Integer

**Function:** The output buffer size used in the constructor.
**Notes:** (Read only property)

43.12.21  TotalInput as Integer

**Function:** The number of bytes processed so far.
**Notes:** (Read and Write property)

43.12.22  TotalOutput as Integer

**Function:** The number of bytes processed so far.
**Notes:** (Read and Write property)

43.12.23  Version as String

**Function:** The version string of the used zlib library.
**Notes:** (Read only property)

43.12.24  Constants

43.12.25  kASCII = 1

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the data type constants.
43.12. CLASS ZLIBCOMPRESSMBS

43.12.26  kBEST_COMPRESSION = 9

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression level constants.

43.12.27  kBEST_SPEED = 1

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression level constants.

43.12.28  kBINARY = 0

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the data type constants.

43.12.29  kBLOCK = 5

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the flush constants.

43.12.30  kBUF_ERROR = -5

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/de-
compression functions.
**Notes:** Negative values are errors, positive values are used for special but normal events.

43.12.31  kDATA_ERROR = -3

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/de-
compression functions.
**Notes:** Negative values are errors, positive values are used for special but normal events.

43.12.32  kDEFAULT_COMPRESSION = -1

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression level constants.
43.12.33 kDEFAULT_STRATEGY = 0

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression strategy constants.

43.12.34 kDEFLATED = 8

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression method constants. **Notes:** The deflate compression method (the only one supported in this version)

43.12.35 kERRNO = -1

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/de-compression functions. **Notes:** Negative values are errors, positive values are used for special but normal events.

43.12.36 kFILTERED = 1

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression strategy constants.

43.12.37 kFINISH = 4

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the flush constants.

43.12.38 kFIXED = 4

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression strategy constants.

43.12.39 kFULL_FLUSH = 3

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the flush constants.
43.12. CLASS ZLIBCOMPRESSMBS

43.12.40  \texttt{kHUFFMAN\_ONLY} = 2

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: One of the compression strategy constants.

43.12.41  \texttt{kMEM\_ERROR} = -4

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: One of the return codes for the compression/de-compression functions.
\textbf{Notes}: Negative values are errors, positive values are used for special but normal events.

43.12.42  \texttt{kNEED\_DICT} = 2

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: One of the return codes for the compression/de-compression functions.
\textbf{Notes}: Negative values are errors, positive values are used for special but normal events.

43.12.43  \texttt{kNO\_COMPRESS}ION = 0

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: One of the compression level constants.

43.12.44  \texttt{kNO\_FLUSH} = 0

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: One of the flush constants.

43.12.45  \texttt{kNULL} = 0

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: The null value.

43.12.46  \texttt{kOK} = 0

MBS Compression Plugin, Plugin Version: 9.7. \textbf{Function}: One of the return codes for the compression/de-compression functions.
\textbf{Notes}: Negative values are errors, positive values are used for special but normal events.
43.12.47  kPARTIAL_FLUSH = 1

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the flush constants.

43.12.48  kRLE = 3

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression strategy constants.

43.12.49  kSTREAM_END = 1

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/de-compression functions.

**Notes:** Negative values are errors, positive values are used for special but normal events.

43.12.50  kSTREAM_ERROR = -2

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/de-compression functions.

**Notes:** Negative values are errors, positive values are used for special but normal events.

43.12.51  kSYNC_FLUSH = 2

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the flush constants.

43.12.52  kTEXT = 1

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the data type constants.

43.12.53  kUNKNOWN = 2

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the data type constants.
43.12.54  kVERSION_ERROR = -6

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/decompression functions.  
**Notes:** Negative values are errors, positive values are used for special but normal events.
43.13  class ZLibDecompressMBS

43.13.1  class ZLibDecompressMBS

Function: A class for zlib decompression.

43.13.2  Methods

43.13.3  Adler32(start as UInt32, data as string) as UInt32

Function: Calculates a 32bit Adler Checksum about a given string.
Notes: Set start to 0 for the first call.
Later you can pass the result as the new start value to add data to your checksum.
This function is part of the zlib library and given as a free utility function to this class.

43.13.4  close

MBS Compression Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.
Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

43.13.5  Constructor(BufferSize as Integer=20000)

Function: The constructor.
Notes: The buffer size you specify is the output buffer size.
If this size is small, you need to flush with ProcessZip.
43.13. **CLASS ZLIBDECOMPRESSMBS**

### 43.13.6 **CRC32(start as UInt32, data as string) as UInt32**

**Function:** Calculates a 32bit Checksum about a given string.
**Notes:**
Set start to 0 for the first call.
Later you can pass the result as the new start value to add data to your checksum.
This function is part of the zlib library and given as a free utility function to this class.

### 43.13.7 **EndZip**

**Function:** Finalizes the current decompression stream.
**Notes:**
You may check the Output property after this.
Error is set.

### 43.13.8 **GetOutput as string**

**Function:** Returns the content of the output buffer.
**Notes:** The buffer is cleared after this function returns.

### 43.13.9 **InitZip**

**Function:** Initializes the stream.
**Notes:** Error is set.

### 43.13.10 **InputAvail as Integer**

**Function:** The number of bytes available in the input buffer.
43.13.11 OutputSize as Integer

**Function:** The number of bytes available in the output buffer.

43.13.12 ProcessZip(Flush as boolean=false)

**Function:** Does zip compression.
**Notes:**
Reduces the size of the input buffer and writes new data to the output buffer.
If the input buffer is not "" after this call, you need to call it again, but empty the output buffer before.
Error is set.

If flush is true, the data is flushed to output. Using flush=true all the time will slow down compression,
so use it only on the end to clear the output buffers.

43.13.13 SetInput(data as Memoryblock) as boolean

**Function:** Fills the input buffer.
**Notes:**
Returns true if successful.
The current plugin uses a 128 K input buffer.
See also:

- 43.13.14 SetInput(data as string) as boolean

43.13.14 SetInput(data as string) as boolean

**Function:** Fills the input buffer.
**Notes:**
Returns true if successful.
The current plugin uses a 128 K input buffer.
See also:

- 43.13.13 SetInput(data as Memoryblock) as boolean
43.13.15 Properties

43.13.16 CRC as UInt32

Function: The CRC checksum.
Notes: (Read only property)

43.13.17 Error as Integer

Function: The last error code.
Notes:
Values:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Z_OK</td>
<td>0 (no error)</td>
</tr>
<tr>
<td>Z_STREAM_END</td>
<td>1 (Should be handled by the plugin inside)</td>
</tr>
<tr>
<td>Z_NEED_DICT</td>
<td>2</td>
</tr>
<tr>
<td>Z_ERRNO</td>
<td>-1</td>
</tr>
<tr>
<td>Z_STREAM_ERROR</td>
<td>-2</td>
</tr>
<tr>
<td>Z_DATA_ERROR</td>
<td>-3</td>
</tr>
<tr>
<td>Z_MEM_ERROR</td>
<td>-4</td>
</tr>
<tr>
<td>Z_BUF_ERROR</td>
<td>-5</td>
</tr>
<tr>
<td>Z_VERSION_ERROR</td>
<td>-6</td>
</tr>
</tbody>
</table>

(Read and Write property)

43.13.18 ErrorMessage as String

Function: The error message for the last error.
Notes: (Read only property)

43.13.19 OutputBufferSize as Integer

Function: The output buffer size used in the constructor.
Notes: (Read only property)
43.13.20  TotalInput as Integer

Function: The number of bytes processed so far.
Notes: (Read and Write property)

43.13.21  TotalOutput as Integer

Function: The number of bytes processed so far.
Notes: (Read and Write property)

43.13.22  Version as String

Function: The version string of the used zlib library.
Notes: (Read only property)

43.13.23  Constants

43.13.24  kASCII = 1

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the data type constants.

43.13.25  kBEST_COMPRESSION = 9

43.13.26  kBEST_SPEED = 1

43.13. CLASS ZLIBDECOMPRESSMBS

43.13.27  kBINARY = 0

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the data type constants.

43.13.28  kBLOCK = 5

43.13.29  kBUF_ERROR = -5

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the return codes for the compression/de-compression functions.
Notes: Negative values are errors, positive values are used for special but normal events.

43.13.30  kDATA_ERROR = -3

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the return codes for the compression/de-compression functions.
Notes: Negative values are errors, positive values are used for special but normal events.

43.13.31  kDEFAULT_COMPRESSION = -1

43.13.32  kDEFAULT_STRATEGY = 0

MBS Compression Plugin, Plugin Version: 9.7. Function: One of the compression strategy constants.

43.13.33  kDEFLATED = 8

Notes: The deflate compression method (the only one supported in this version)
43.13.34  **kERRNO = -1**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/decompression functions.
**Notes:** Negative values are errors, positive values are used for special but normal events.

43.13.35  **kFILTERED = 1**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression strategy constants.

43.13.36  **kFINISH = 4**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the flush constants.

43.13.37  **kFIXED = 4**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression strategy constants.

43.13.38  **kFULL_FLUSH = 3**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the flush constants.

43.13.39  **kHUFFMAN_ONLY = 2**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression strategy constants.

43.13.40  **kMEM_ERROR = -4**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/decompression functions.
**Notes:** Negative values are errors, positive values are used for special but normal events.
43.13. **CLASS ZLIBDECOMPRESSMBS**

43.13.41  **kNEED_DICT = 2**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/de-compression functions.
**Notes:** Negative values are errors, positive values are used for special but normal events.

43.13.42  **kNO_COMPRESSION = 0**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression level constants.

43.13.43  **kNO_FLUSH = 0**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the flush constants.

43.13.44  **kNULL = 0**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** The null value.

43.13.45  **kOK = 0**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/de-compression functions.
**Notes:** Negative values are errors, positive values are used for special but normal events.

43.13.46  **kPARTIAL_FLUSH = 1**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the flush constants.

43.13.47  **kRLE = 3**

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the compression strategy constants.
43.13.48 kSTREAM_END = 1

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/de-compression functions.  
**Notes:** Negative values are errors, positive values are used for special but normal events.

43.13.49 kSTREAM_ERROR = -2

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/de-compression functions.  
**Notes:** Negative values are errors, positive values are used for special but normal events.

43.13.50 kSYNC_FLUSH = 2

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the flush constants.

43.13.51 kTEXT = 1

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the data type constants.

43.13.52 kUNKNOWN = 2

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the data type constants.

43.13.53 kVERSION_ERROR = -6

MBS Compression Plugin, Plugin Version: 9.7. **Function:** One of the return codes for the compression/de-compression functions.  
**Notes:** Negative values are errors, positive values are used for special but normal events.
Chapter 44

Contacts

44.1 class CNContactFetchRequestMBS

44.1.1 class CNContactFetchRequestMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A contact fetch request. Notes: The CNContactFetchRequest class defines fetching options to use while fetching contacts. It is required to have contact property key(s) to fetch a contacts properties. Use this class with the enumerateContactsWithFetchRequest method to execute the contact fetch request.

44.1.2 Methods

44.1.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether this class is available. Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.1.4 Constructor(keysToFetch() as CNKeyDescriptorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The designated initializer for a fetch request that uses the specified keys. Notes: keysToFetch: An array of contact property keys and/or key descriptors from contacts objects to be fetched in the returned contacts.
44.1.5 **keysToFetch as CNKeyDescriptorMBS()**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The properties to fetch in the returned contacts. **Notes:** An array of contact property keys or key descriptors from contact objects to be fetched in the returned contacts. For example, CNContactEmailAddressesKey, CNContactPhoneNumbersKey, CNContactFormatterStyleFullName fetches the contacts email addresses, phone numbers, and contacts full name with the contact formatter.

44.1.6 **setKeysToFetch(keysToFetch() as CNKeyDescriptorMBS)**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the properties to fetch in the returned contacts.

44.1.7 **Properties**

44.1.8 **Handle as Integer**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference. **Notes:** Value is a pointer to a CNContactFetchRequest object. (Read and Write property)

44.1.9 **mutableObjects as Boolean**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A Boolean value that indicates whether to return mutable contacts. **Notes:** When the value of this property is true, the fetch returns CNMutableContact objects; otherwise it returns CNContact objects. The default value of this property is false. (Read and Write property)

44.1.10 **predicate as NSPredicateMBS**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The predicate to match contacts against. **Notes:**
Set the value of this property to nil to match all contacts or use the predicates defined in CNContact Predicates. Compound predicates are not supported.
(Read and Write property)

### 44.1.11 SortOrder as Integer

**Function:** The sort order for contacts.

**Notes:**
The default sort order is CNContactSortOrderNone.
(Read and Write property)

### 44.1.12 unifyResults as Boolean

**Function:** A Boolean value that indicates whether to return linked contacts as unified contacts.

**Notes:**
A unified contact is an aggregation of properties from a set of linked individual contacts. When the value of this property is true, the fetch returns unified contacts; otherwise, it returns individual contacts. The default value of this property is true.
(Read and Write property)
44.2 class CNContactFormatterMBS

44.2.1 class CNContactFormatterMBS

Function: The CNContactFormatter class defines the different formatting styles for contacts.

Example:

```vbnet
dim m as new CNMutableContactMBS
m.givenName = "Bob"
m.familyName = "Miller"

dim f as new CNContactFormatterMBS
dim style as Integer = CNContactFormatterMBS.CNContactFormatterStyleFullName
MsgBox CNContactFormatterMBS.stringFromContact(m, style)
```

Notes: This class handles international ordering and delimiting for the contact name components. When formatting many contacts, create an instance of this class and use the instance methods; otherwise use the class methods.

44.2.2 Methods

44.2.3 attributedStringFromContact(contact as CNContactMBS, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS

Function: Formats the contact name as an attributed string.

Notes:

contact: The contact whose name is to be formatted.

attributes: The default attributes to use. For more information, see NSFormatter.

Returns the formatted contact name as an attributed string.

This method behaves similarly to stringFromContact, except that it returns an attributed string. It includes the attribute key CNContactPropertyAttribute whose attribute values are contact property keys, such as CNContactGivenNameKey. This identifies the name components in the formatted contact name.

See also:

- 44.2.4 attributedStringFromContact(contact as CNContactMBS, Style as Integer, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS
44.2.4 attributedStringFromContact(contact as CNContactMBS, Style as Integer, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS

Function: Formats the contact name as an attributed string.

Notes:
contact: The contact whose name is to be formatted.
styless: The formatting style to be used for the contact name.
attributes: The default attributes to use. For more information, see NSFormatter.

Returns the formatted contact name as an attributed string.

This method behaves similarly to stringFromContact, except that it returns an attributed string. It includes the attribute key CNContactPropertyAttribute, whose attribute values are contact property keys, such as CNContactGivenNameKey. This identifies the name components in the formatted contact name.

See also:
• 44.2.3 attributedStringFromContact(contact as CNContactMBS, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS

44.2.5 available as Boolean

Function: Whether this class is available.

Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.2.6 CNContactPropertyAttribute as String

Function: One of the attributes in the attribute dictionary.

Notes: If the attributes include the key CNContactPropertyAttribute whose attribute values are contact property keys, such as CNContactGivenNameKey. This identifies the name components in the formatted contact name.

44.2.7 Constructor

Function: The constructor.
44.2.8 delimiterForContact(contact as CNContactMBS) as String

Function:
Returns the delimiter to use between name components.

Notes:
- contact: The contact whose name is to be formatted.

Returns the delimiter to use between name components.

If contact is nil, or if it has no first name, middle name, or last name, this method returns an empty string.

44.2.9 descriptorForRequiredKeysForStyle(Style as Integer) as CNKeyDescriptorMBS

Function:
Returns the required key descriptor for the specified formatting style of the contact.

Notes:
- style: The formatting style to be used for contact name.

Returns the contact key descriptor for the formatting style.

Include this method with the keys to fetch when fetching contacts. To format multiple styles, you can include multiple key descriptors with the keys to fetch.

44.2.10 nameOrderForContact(contact as CNContactMBS) as Integer

Function:
Returns the display name order.

Notes:
- contact: The contact whose name is to be formatted.

Returns the display order to use when combining the given name and family name components.

For more information about display name orders, see CNContactDisplayNameOrder.
44.2. CLASS CNCONTACTFORMATTERMBS

44.2.11 stringFromContact(contact as CNContactMBS) as String

Function: Formats the contact name.
See also:

- 44.2.12 stringFromContact(contact as CNContactMBS, Style as Integer) as String

44.2.12 stringFromContact(contact as CNContactMBS, Style as Integer) as String

Function: Returns the contact name, formatted with the specified formatter.
Notes:
contact: The contact whose name is to be formatted.
style: The formatting style to be used for the contact name.
See also:

- 44.2.11 stringFromContact(contact as CNContactMBS) as String

44.2.13 Properties

44.2.14 Handle as Integer

Function: The internal object reference.
Notes:
Value is a pointer to a CNContactFormatter object.
(Read and Write property)

44.2.15 Style as Integer

Function: The formatting style for the contact name.
Notes:
The style for a contact formatter instance. The default value for this property is CNContactFormatterStyle-FullName. For more information on formatting styles, see CNContactFormatterStyle.
(Read and Write property)
44.2.16 Constants

44.2.17 CNContactDisplayNameOrderFamilyNameFirst = 2

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the formatting orders for contact names component.
**Notes:** Display name order by family name first.

44.2.18 CNContactDisplayNameOrderGivenNameFirst = 1

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the formatting orders for contact names component.
**Notes:** Display name order by given name first.

44.2.19 CNContactDisplayNameOrderUserDefault = 0

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the formatting orders for contact names component.
**Notes:** Display name order by user default.

44.2.20 CNContactFormatterStyleFullName = 0

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the formatting styles for contact names.
**Notes:** Combines the contact name components into a full name.

44.2.21 CNContactFormatterStylePhoneticFullName = 1

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the formatting styles for contact names.
**Notes:** Combines the contact phonetic name components into a phonetic full name.
44.3. CLASS CNCONTACTMBS

44.3 class CNContactMBS

44.3.1 class CNContactMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for a contact.  
**Notes:** The CNContact is a thread-safe class that represents an immutable value object for contact properties, such as the first name and phone numbers of a contact. CNContact is similar to a complex Foundation collection, in that it has a mutable subclass (CNMutableContact). Neither the CNContact nor CNMutableContact class maintain a reference to their data store. Every contact has a unique ID, which you obtain using the identifier property.

44.3.2 Methods

44.3.3 areKeysAvailable(keyDescriptors() as CNKeyDescriptorMBS) as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Determines whether all contact property values for the specified keys are fetched. 
**Notes:** The isKeyAvailable or areKeysAvailable methods are used where you are not certain of the keys that when fetched. If this method returns false, refetch the contact using the contact identifier and the keys you want to fetch. Accessing a property that was not fetched will throw an CNContactPropertyNotFetchedExceptionName exception.

44.3.4 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available. 
**Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.3.5 CNContactBirthdayKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. 
**Notes:** Birthday.

44.3.6 CNContactDatesKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties.
Notes: Contact dates.

44.3.7  **CNContactDepartmentNameKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Department name.

44.3.8  **CNContactEmailAddressesKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Email address.

44.3.9  **CNContactFamilyNameKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Family name.

44.3.10  **CNContactGivenNameKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Given name.

44.3.11  **CNContactIdentifierKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** The identifier.

44.3.12  **CNContactImageDataAvailableKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties.
44.3. CLass CNContactMBS

Notes:

Image data availability.
Available in OS X 10.12 or newer.

44.3.13 CNContactImageDataKey as String

44.3.14 CNContactInstantMessageAddressesKey as String

44.3.15 CNContactJobTitleKey as String

44.3.16 CNContactMiddleNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the keys for contact properties. Notes: Middle name.

44.3.17 CNContactNamePrefixKey as String

44.3.18  **CNContactNameSuffixKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Name suffix.

44.3.19  **CNContactNicknameKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Nickname.

44.3.20  **CNContactNonGregorianBirthdayKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Non-Gregorian birthday.

44.3.21  **CNContactNoteKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Note.

44.3.22  **CNContactOrganizationNameKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Organization name.

44.3.23  **CNContactPhoneNumbersKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Phone number.
44.3.24  **CNContactPhoneticFamilyNameKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Phonetic family name.

44.3.25  **CNContactPhoneticGivenNameKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Phonetic given name.

44.3.26  **CNContactPhoneticMiddleNameKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Phonetic middle name.

44.3.27  **CNContactPostalAddressesKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Postal address.

44.3.28  **CNContactPreviousFamilyNameKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties. **Notes:** Previous family name.

44.3.29  **CNContactPropertyNotFetchedExceptionName as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Exception thrown when an accessed property was not fetched. **Notes:** The plugin throws a NSExceptionMBS where the name is this value in case a property is not available.
44.3.30  **CNContactRelationsKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties.  
**Notes:** Contact relations.

44.3.31  **CNContactSocialProfilesKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties.  
**Notes:** Social profile.

44.3.32  **CNContactThumbnailImageDataKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties.  
**Notes:** Thumbnail data.

44.3.33  **CNContactTypeKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties.  
**Notes:** Contact type.

44.3.34  **CNContactUrlAddressesKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for contact properties.  
**Notes:** URL Address.

44.3.35  **Constructor**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
44.3.36  **contactRelations as CNLabeledValueMBS()**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of labeled relations for the contact. **Notes:** This property is an array of CNLabeledValue objects, each of which has a label and a CNContactRelation value. This property was previously known as related names.

44.3.37  **copy as CNContactMBS**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create a copy of the contact object.

44.3.38  **dates as CNLabeledValueMBS()**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array containing labeled Gregorian dates. **Notes:** This property is an array of CNLabeledValue objects, each of which has an NSString label and NSDateComponents value. You can use this property to store Gregorian dates such as anniversaries. Day and month components are required and year is optional. The calendar component can be nil or NSCalendarIdentifierGregorian. All other date components are invalid and including them results in an NSError object that includes the key paths of the invalid components and the error code CNErrorCodeValidationConfigurationError.

44.3.39  **descriptorForAllComparatorKeys as CNKeyDescriptorMBS**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Fetches all the keys required for the contact sort comparator. **Notes:** This method implements the CNKeyDescriptor protocol and can be used as an array element when fetching keys for contacts.

44.3.40  **emailAddresses as CNLabeledValueMBS()**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of labeled email addresses for the contact. **Notes:** This property is an array of CNLabeledValue objects, each of which has a label and an NSString that contains the email address.
44.3.41 instantMessageAddresses as CNLabeledValueMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of labeled IM addresses for the contact.  
**Notes:** This property is an array of CNLabeledValue objects, each of which has a label and a CNInstantMessageAddress value.

44.3.42 isKeyAvailable(key as String) as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Determines whether the contact property value for the specified key is fetched.  
**Notes:** The isKeyAvailable or areKeysAvailable methods are used when you are not certain of the keys that were fetched. If this method returns false, refetch the contact using the contact identifier and the keys you want to fetch. Accessing a property that was not fetched will throw CNContactPropertyNotFetchedExceptionName.

44.3.43 isUnifiedWithContactWithIdentifier(contactIdentifier as String) as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the receiver was fetched as a unified contact and includes the contact having contactIdentifier in its unification.

44.3.44 localizedStringForKey(key as String) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string containing the localized contact property name.  
**Notes:**

- key: A string containing the contact property key.

Returns a localized string containing the contact property name.

This method returns a localized string for a contact property key. For example, the value of a Canadian CNContactPostalAddressesKey field would be Postal Code, while the value of a French one would be Code Postal.
44.3. CLASS CNCONTACTMBS

44.3.45 mutableCopy as CNMutableContactMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a mutable copy of this contact.

44.3.46 phoneNumbers as CNLabeledValueMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of labeled phone numbers for a contact. **Notes:** This property is an array of CNLabeledValue objects, each of which has a label and a CNPhoneNumber value.

44.3.47 postalAddresses as CNLabeledValueMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An array of labeled postal addresses for a contact. **Notes:** This property is an array of CNLabeledValue objects, each of which has a label and a CNPostalAddress value.

44.3.48 predicateForContactsInContainerWithIdentifier(containerIdentifier as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a predicate to find the contacts in the specified container. **Notes:** Returns a predicate that can be used to fetch contacts from CNContactStore.

44.3.49 predicateForContactsInGroupWithIdentifier(groupIdentifier as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a predicate to find the contacts that are members in the specified group. **Notes:** Returns a predicate that can be used to fetch contacts from CNContactStore.

44.3.50 predicateForContactsMatchingName(name as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a predicate to find the contacts matching the specified name.
CHAPTER 44. CONTACTS

Notes:

The name can contain any number of words.
Returns a predicate that can be used to fetch contacts from CNContactStore.

44.3.51 predicateForContactsWithIdentifiers(Identifiers() as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a predicate to find the contacts matching the specified identifiers.
Notes: Returns a predicate that can be used to fetch contacts from CNContactStore.

44.3.52 socialProfiles as CNLabeledValueMBS()

Notes: This property is an array of CNLabeledValue objects, each of which has a label and a CNSocialProfile value.

44.3.53 urlAddresses as CNLabeledValueMBS()

Notes: This property is an array of CNLabeledValue objects, each of which has a label and an NSString value that contains the URL.

44.3.54 valueForKey(key as String) as Variant

Example:

// your contact
dim c as CNContactMBS

dim value as Variant = c.valueForKey(c.CNContactPreviousFamilyNameKey)
if value = nil then
  // empty
else
  MsgBox value.StringValue

Notes: Normally you use the properties, but if you loop over a list of keys, you can use this function to query value for key.

### 44.3.55 Properties

#### 44.3.56 birthday as NSDateComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A date component for the Gregorian birthday of the contact. **Notes:** Birthdays are represented by this property, whose values are the relevant properties of an NSDateComponents object. Day and month components are required for this property, and year is optional. The calendar component can be nil or NSCalendarIdentifierGregorian. All other date components are invalid and including them results in an NSError object that includes the key paths of the invalid components and the error code CNErrorCodeValidationConfigurationError. (Read only property)

#### 44.3.57 contactType as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An enum identifying the contact type. **Notes:** Can be CNContactMBS.CNContactTypeOrganization or CNContactMBS.CNContactTypePerson. (Read only property)

#### 44.3.58 departmentName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the department associated with the contact. **Notes:** (Read only property)

#### 44.3.59 familyName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The family name of the contact.
44.3.60  **givenName as String**

**Function:** The given name of the contact.
**Notes:**
The given name is often known as the first name of the contact.
(Read only property)

44.3.61  **Handle as Integer**

**Function:** The internal object reference.
**Notes:**
Value is a pointer to a CNContact object.
(Read and Write property)

44.3.62  **identifier as String**

**Function:** A value that uniquely identifies a contact on the device.
**Notes:**
It is recommended that you use the identifier when re-fetching the contact. An identifier can be persisted between the app launches. Note that this identifier only uniquely identifies the contact on the current device.
(Read only property)

44.3.63  **imageData as MemoryBlock**

**Function:** The profile picture of a contact.
**Notes:**
It is recommended that you fetch this property only when you need to access its value, such as when you need to display the contacts profile picture.
(Read only property)
44.3.64  imageDataAvailable as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Indicates whether a contact has a profile picture.
Notes: (Read only property)

44.3.65  jobTitle as String

Notes: (Read only property)

44.3.66  middleName as String

Notes: (Read only property)

44.3.67  namePrefix as String

Notes: (Read only property)

44.3.68  nameSuffix as String

Notes: (Read only property)

44.3.69  nickname as String

Notes: (Read only property)
44.3.70  **nonGregorianBirthday as NSCalendarDateComponents**

**Function:** A date component for the non-Gregorian birthday of the contact.  
**Notes:**  
Non-Gregorian birthdays can be displayed using this property, whose values are the relevant properties of an NSCalendar object. Day and month components are required; year and leap month are optional. The calendar component is also required and must be an NSCalendar object with an identifier other than NSCalendarIdentifierGregorian. For example, some supported calendars are Chinese, Hebrew, and Islamic. All other date components are invalid and including them results in an NSError object that includes the key paths of the invalid components and the error code CNErrorCodeValidationConfigurationError.  
(Read only property)

44.3.71  **note as String**

**Function:** A string containing notes for the contact.  
**Notes:**  
(Read only property)

44.3.72  **organizationName as String**

**Function:** The name of the organization associated with the contact.  
**Notes:**  
(Read only property)

44.3.73  **phoneticFamilyName as String**

**Function:** A string for the phonetic family name of the contact.  
**Notes:**  
This property contains a string that specifies the pronunciation of the contact’s family (or last) name.  
(Read only property)

44.3.74  **phoneticGivenName as String**

**Function:** The phonetic given name of the contact.  
**Notes:**
This property contains a string that specifies the pronunciation of the contacts given (or first) name. (Read only property)

44.3.75  phoneticMiddleName as String

Function: The phonetic middle name of the contact.
Notes: This property contains a string that specifies the pronunciation of the contacts middle name. (Read only property)

44.3.76  previousFamilyName as String

Function: A string for the previous family name of the contact.
Notes: The previous family name is often known as the maiden name of the contact. (Read only property)

44.3.77  thumbnailImageData as MemoryBlock

Function: The thumbnail version of the contacts profile picture.
Notes: The thumbnailImageData property is derived from the imageData property, including cropping information from vCards or edits from contact viewing. It is recommended that you fetch this property only when you need to access its value, such as when you need to display the contacts profile thumbnail picture. (Read only property)

44.3.78  Constants

44.3.79  CNContactSortOrderFamilyName = 3

MBS Mac64bit Plugin, Plugin Version: 16.3. Function: One of the sort order constants.
Notes: Order by Family Name.
44.3.80  **CNContactSortOrderGivenName = 2**

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the sort order constants.  
**Notes:** Order by Given Name.

44.3.81  **CNContactSortOrderNone = 0**

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the sort order constants.  
**Notes:** Order by no order.

44.3.82  **CNContactSortOrderUserDefault = 1**

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the sort order constants.  
**Notes:** Order by user preference.

44.3.83  **CNContactTypeOrganization = 1**

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the contact types.  
**Notes:** The contact is an Organization.

44.3.84  **CNContactTypePerson = 0**

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the contact types.  
**Notes:** The contact is a person.
44.4. CLASS CNCONTACTPICKERMBS

44.4  class CNContactPickerMBS

44.4.1  class CNContactPickerMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CNContactPicker object displays the popover-based system interface for selecting a contact. **Notes:** The methods and properties of this class help you choose a contact or a contact’s value, such as a phone number or email address, of a contact.

44.4.2  Methods

44.4.3  available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available. **Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.4.4  close

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the popover.

44.4.5  Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

44.4.6  Destructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

44.4.7  displayedKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The keys to be displayed when a contact is expanded. **Notes:** If no keys are provided, the picker selects contacts instead of values. For a list of possible keys, see
CHAPTER 44. CONTACTS

Metadata Keys in CNContact.

44.4.8 setDisplayedKeys(keys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Set the keys to be displayed when a contact is expanded. Notes: If no keys are provided, the picker selects contacts instead of values. For a list of possible keys, see Metadata Keys in CNContact.

44.4.9 showRelativeToRect(positioningRect as NSRectMBS, view as NSViewMBS, edge as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Shows the picker popover anchored to the specified view. Notes:

positioningRect: The content size of the popover.
positioningView: The view to which the popover should be positioned.
pREFERREDge: The edge to which the popover should be anchored to. Can be MinYEdge, MinXEdge, MaxYEdge or MaxXEdge.

44.4.10 Properties

44.4.11 Handle as Integer

Value is a pointer to a CNContactPicker object. (Read and Write property)

44.4.12 Events

44.4.13 DidClose

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Called when the contact pickers popover has closed.
44.4.14  didSelectContact(contact as CNContactMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called after a contact has been selected by the user.

44.4.15  didSelectContactProperty(contactProperty as CNContactPropertyMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called when a contact property was selected.

44.4.16  WillClose

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when the contact pickers popover is about to close.

44.4.17  Constants

44.4.18  MaxXEdge = 2

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the edge constants.

44.4.19  MaxYEdge = 3

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the edge constants.

44.4.20  MinXEdge = 0

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the edge constants.

44.4.21  MinYEdge = 1

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the edge constants.
44.5 class CNContactPropertyMBS

44.5.1 class CNContactPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The CNContactProperty is a convenience class and returns a tuple or quadruple to a contacts property. Notes: A property contains related information for a specific contact. A contact (an instance of CNContact) has properties, such as firstName, phoneNumber, and jobTitle. Each property is represented by an instance of CNContactProperty, which provides a tuple that can contain three or five values, depending on whether the property is a member of an array of labeled values. For example, the phoneNumbers property is a member of an array of labeled values, so the CNContactProperty tuple contains the contact, key, value, identifier, and label. For the givenName property, which is not contained in a labeled array, CNContactProperty returns a tuple that contains the contact, key, and value. The CNContactProperty class is used by the CNContactPicker to return the user’s selected property.

44.5.2 Methods

44.5.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether this class is available. Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.5.4 Constructor

44.5.5 copy as CNContactPropertyMBS

44.5.6 Properties

44.5.7 Contact as CNContactMBS

*Function:* CNContact property of the selected contact.
*Notes:* This property is used for properties that may or may not be in labeled arrays.
(Read only property)

44.5.8 Handle as Integer

*Function:* The internal object reference.
*Notes:* Value is a pointer to a CNContactProperty object.
(Read and Write property)

44.5.9 Identifier as String

*Function:* The identifier of the labeled value in the array of labeled.
*Notes:* Identifier is used only for properties in labeled arrays. If the property is not an array of labeled values, the value of the identifier is "".
(Read only property)

44.5.10 Key as String

*Function:* The key of the contact property.
*Notes:* This property is used for properties that may or may not be in labeled arrays.
(Read only property)
44.5.11 Label as String

**Function:** The label of the labeled value of the property array.
**Notes:**
Labeled property is used only for properties that are in labeled arrays. If the property is not an array of labeled values, the value of the label is "".
(Read only property)

44.5.12 Value as Variant

**Function:** The value of the property.
**Notes:**
This property is used for properties that may or may not be in labeled arrays.
(Read only property)
44.6. CLASS CNCONTACTRELATIONMBS

44.6  class CNContactRelationMBS

44.6.1  class CNContactRelationMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CNContactRelation class defines an immutable value object representing a contact related to another.
**Notes:** This is a thread-safe class.

44.6.2  Methods

44.6.3  available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.
**Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.6.4  CNLabelContactRelationAssistant as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the relation values.
**Notes:** Assistant.

44.6.5  CNLabelContactRelationBrother as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the relation values.
**Notes:** Brother

44.6.6  CNLabelContactRelationChild as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the relation values.
**Notes:** Child
CHAPTER 44. CONTACTS

44.6.7 CNLabelContactRelationDaughter as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. 
Function: One of the relation values. 
Notes: 
Daughter 
for macOS 10.13 or newer.

44.6.8 CNLabelContactRelationFather as String

Notes: Father

44.6.9 CNLabelContactRelationFriend as String

Notes: Friend

44.6.10 CNLabelContactRelationManager as String

Notes: Manager

44.6.11 CNLabelContactRelationMother as String

Notes: Mother

44.6.12 CNLabelContactRelationParent as String

Notes: Parent

44.6.13 CNLabelContactRelationPartner as String

Notes: Partner

44.6.14 CNLabelContactRelationSister as String

Notes: Sister

44.6.15 CNLabelContactRelationSon as String

Notes:
Son
for macOS 10.13 or newer.

44.6.16 CNLabelContactRelationSpouse as String

Notes: Spouse

44.6.17 Constructor(name as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Initialize a class instance with the name of the related contact.
44.6.18  **contactRelationWithName(name as string)** as CNContactRelationMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Creates a new contact relation with a name.

44.6.19  **copy** as CNContactRelationMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Create a copy of the contact relation object.

44.6.20  **Properties**

44.6.21  **Handle as Integer**

**Notes:**
Value is a pointer to a CNContactRelation object.
(Read and Write property)

44.6.22  **Name as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** The name of the related contact.

**Notes:** (Read only property)
44.7 class CNContactStoreMBS

44.7.1 class CNContactStoreMBS

Function: The CNContactStore class is a thread-safe class that can fetch and save contacts, groups, and containers.

Notes:
The CNContactStore class provides ways to execute fetch and save requests. There are a few recommended ways you can implement these requests in your app to load contacts:

- Fetch only the contact properties that will be used.
- When fetching all contacts and caching the results, first fetch all contacts identifiers, then fetch batches of detailed contacts by identifiers as required.
- To aggregate several contacts fetches, first collect a set of unique identifiers from the fetches. Then fetch batches of detailed contacts by those unique identifiers.
- If you cache the fetched contacts, groups, or containers, you need to refetch these objects (and release the old cached objects) when CNContactStoreDidChangeNotification is posted.

Because CNContactStore fetch methods perform I/O, it’s recommended that you avoid using the main thread to execute fetches.

Your app must be code signed to see contacts.

44.7.2 Methods

44.7.3 authorizationStatusForEntityType(entityType as Integer = 0) as Integer

Function: Returns the current authorization status to access the contact data.

Notes:
entityType: Set to CNEntityType, e.g. CNEntityTypeContacts.

Returns the current authorization status to access the contact data.

Based on the authorization status, your application might display or hide its UI elements that access any Contacts API. This method is thread-safe and will not block your application. To see different authorization status, see CNAuthorizationStatus.
44.7.4 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available. **Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.7.5 CNContactStoreDidChangeNotification as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The notification posted when changes occur in another CNContactStore.

44.7.6 CNErrorDomain as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The error domain for NSErrorMBS.

44.7.7 CNErrorUserInfoAffectedRecordIdentifiersKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A key for the NSError userInfo dictionary. **Notes:** When available an array of one or more NSString objects for which the error code applies.

44.7.8 CNErrorUserInfoAffectedRecordsKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A key for the NSError userInfo dictionary. **Notes:** When available an array of one or more CNContact, CNGroup or CNContainer objects for which the error code applies.

44.7.9 CNErrorUserInfoKeyPathsKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A key for the NSError userInfo dictionary. **Notes:** An array of key paths associated with a given error. For validation errors this will contain key paths to specific object properties.
44.7. CLASS CNCONTACTSTOREMBS

44.7.10 CNErroUserInfoValidationErrorsKey as String

44.7.11 Constructor

44.7.12 ContactsWithFetchRequest(fetchRequest as CNContactFetchRequestMBS, byref error as NSErrorMBS) as CNContactMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns all contacts matching a contact fetch request. Notes:

fetchRequest: The contact fetch request that specifies the search criteria. error: Error information, if an error occurred.

This method waits until the enumeration is finished. If there are no results, the method returns an empty array. This can be used to fetch all contacts without keeping all of them at once in memory because this is expensive.

Your app must be code signed to see contacts.

44.7.13 containersMatchingPredicate(predicate as NSPredicateMBS, byref error as NSErrorMBS) as CNContainerMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Fetches all containers matching the specified predicate. Notes:

predicate: The predicate to use to fetch matching containers. Set this property to nil to match all containers. error: Error information, if an error occurred.

Returns an array of CNContainer objects that match the predicate.

A container holds a collection of contacts, a contact (each contact can be in only one container). CardDAV
accounts usually have only one container of contacts. Exchange accounts may have multiple containers, where each container represents an Exchange folder.

This method returns an empty array when no matching container is found. In case of an error this method returns nil. You should use only the predicates defined CNContainer class. Compound predicates are not supported.

### 44.7.14 defaultContainerIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the identifier of the default container. **Notes:** This identifier can be used to fetch a default container. A default container is where the user wants new contacts to be added implicitly.

### 44.7.15 Destructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

### 44.7.16 enumerateContactsWithFetchRequest(fetchRequest as CNContactFetchRequestMBS, byref error as NSErrorMBS, tag as Variant = nil) as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value that indicates whether the enumeration of all contacts matching a contact fetch request executed successfully. **Notes:**

- fetchRequest: The contact fetch request that specifies the search criteria.
- error: Error information, if an error occurred.

Calls enumerateContactsWithFetchRequest event for each contact found.

Returns true if enumeration of all contacts matching a contact fetch request executes successfully; otherwise, false.

This method waits until the enumeration is finished. If there are no results, the event is not called and the method returns true.

This can be used to fetch all contacts without keeping all of them at once in memory because this is expensive.
44.7. CLASS CNCONTACTSTOREMBS

See also:

- 44.7.27 enumerateContactsWithFetchRequest(contact as CNContactMBS, byref stop as boolean, tag as Variant)

44.7.17 executeSaveRequest(saveRequest as CNSaveRequestMBS, byref Error as NSErrorMBS) as Boolean

Function: Executes a save request and returns success or failure.  
Notes:  
saveRequest: The save request to execute.  
error: Error information, if an error occurred.  

Returns true if the save request executes successfully; otherwise, false.  

It is recommended that you do not access objects in the save request from other threads when it is in the process of being executed, because it may modify the contacts in the process. A save request only applies the changes to the objects. If there are overlapping changes with multiple or concurrent CNSaveRequest then the last saved change wins.

44.7.18 groupsMatchingPredicate(predicate as NSPredicateMBS, byref error as NSErrorMBS) as CNGroupMBS()

Function: Fetches all groups matching the specified predicate.  
Notes:  
predicate: The predicate to use to fetch the matching groups. Set predicate to nil to match all groups.  
error: Error information, if an error occurred.  

Returns an array of CNGroup objects that match the predicate.  

This method returns an empty array when no matching groups are found. If an error occurs, this method returns nil. You should use only the predicates defined in CNGroup class predicates. Compound predicates are not supported. Contacts may be members of one or more groups, depending upon the account they come from.
CHAPTER 44. CONTACTS

44.7.19  requestAccessForEntityType(entityType as Integer = 0, tag as Variant = nil)

**Function:** Requests access to the user’s contacts.

**Notes:**

entityType: Set to CNEntityTypeContacts.

Users are able to grant or deny access to contact data on a per-application basis. Request access to contact data by calling requestAccessForEntityType method. This will not block your application while the user is being asked for permission. The user will only be prompted the first time access is requested; any subsequent CNContactStore calls will use the existing permissions. The requestAccessForEntityType event is later called. This method is optional when CNContactStore is used in the background thread. If this method is not used, CNContactStore may block your application while the user is asked for access permission.

Your app must be code signed to see contacts.

See also:

- 44.7.28 requestAccessForEntityType(granted as boolean, error as NSErrorMBS, tag as Variant) 7570

44.7.20  unifiedContactsMatchingPredicate(predicate as NSPredicateMBS, keysToFetch() as CNKeyDescriptorMBS, byref error as NSErrorMBS) as CNContactMBS()

**Function:** Fetches all unified contacts matching the specified predicate.

**Notes:**

predicate: The predicate to match against.

keys: The properties to fetch in the returned CNContact objects. You should fetch only the properties that you plan to use. Note that you can combine contact keys and contact key descriptors.

error: Error information, if an error occurred.

Returns an array of CNContact objects matching the predicate.

If no matches are found, this method returns an empty array (or nil in case of error). Use only the predicates from the CNContact class predicates. Compound predicates are not supported by this method. Due to unification, the returned contacts may have different identifiers than you specify. To fetch all contacts, use enumerateContactsWithFetchRequest.
44.7.21 unifiedContactWithIdentifier(identifier as string, keys() as CNKeyDescriptorMBS, byref error as NSErrorMBS) as CNContactMBS

**Function:** Fetches a unified contact for the specified contact identifier.  
**Notes:**
- identifier: The identifier of the contact to fetch.  
- keys: The properties to fetch in the returned CNContact object.  
- error: Error information, if an error occurred.

Returns an unified contact matching or linked to the identifier.

Due to unification, the returned contact may have a different identifier, than you specify. To fetch a batch of contacts by identifiers use predicateForContactsWithIdentifiers with unifiedContactsMatchingPredicate.  
It is recommended to fetch only the properties that will be used. You can combine contact keys and contact key descriptors together.

44.7.22 unifiedMeContactWithKeysToFetch(keys() as CNKeyDescriptorMBS, byref error as NSErrorMBS) as CNContactMBS

**Function:** Queries an unified contact for the user.

44.7.23 Properties

44.7.24 Handle as Integer

**Function:** The internal object reference.  
**Notes:**
- Value is a pointer to a CNContactStore object.  
  (Read and Write property)
44.7.25 Events

44.7.26 DidChange

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event posted when changes occur in another CNContactStore.

44.7.27 enumerateContactsWithFetchRequest(contact as CNContactMBS, byref stop as boolean, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The event called by enumerateContactsWithFetchRequest for each new contact found.

See also:

- 44.7.16 enumerateContactsWithFetchRequest(fetchRequest as CNContactFetchRequestMBS, byref error as NSErrorMBS, tag as Variant = nil) as Boolean

44.7.28 requestAccessForEntityType(granted as boolean, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The request for access completed.

**Notes:** Set granted to true if the user allows access and error is nil.

See also:

- 44.7.19 requestAccessForEntityType(entityType as Integer = 0, tag as Variant = nil)

44.7.29 Constants

44.7.30 CNAuthorizationStatusAuthorized = 3

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the authorization status values the user can grant for an app to access the specified entity type.

**Notes:** The application is authorized to access contact data.

44.7.31 CNAuthorizationStatusDenied = 2

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the authorization status values the user can grant for an app to access the specified entity type.

**Notes:** The user explicitly denied access to contact data for the application.
44.7.32  CNAuthorizationStatusNotDetermined = 0

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the authorization status values the user can grant for an app to access the specified entity type.
**Notes:** The user has not yet made a choice regarding whether the application may access contact data.

44.7.33  CNAuthorizationStatusRestricted = 1

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the authorization status values the user can grant for an app to access the specified entity type.
**Notes:** The application is not authorized to access contact data. The user cannot change this applications status, possibly due to active restrictions such as parental controls being in place.

44.7.34  CNEntityTypeContacts = 0

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the contact types.
**Notes:** Contacts

44.7.35  CNErrorCodeAuthorizationDenied = 100

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.
**Notes:** Authentication denied error.

44.7.36  CNErrorCodeCommunicationError = 1

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.
**Notes:** Communication error.

44.7.37  CNErrorCodeContainmentCycle = 202

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.
**Notes:** Code containment cycle error.
44.7.38  CNErrorCodeContainmentScope = 203

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.
**Notes:** Code containment scope error.

44.7.39  CNErrorCodeDataAccessError = 2

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.
**Notes:** Data access error.

44.7.40  CNErrorCodeInsertedRecordAlreadyExists = 201

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.
**Notes:** Record already exists.

44.7.41  CNErrorCodeParentRecordDoesNotExist = 204

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.
**Notes:** The contact does not exist error.

44.7.42  CNErrorCodePolicyViolation = 500

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.
**Notes:** Policy validation error.

44.7.43  CNErrorCodePredicateInvalid = 400

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.
**Notes:** Invalid predicate error.
44.7.44  **CNErrorCodeRecordDoesNotExist = 200**

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.  
**Notes:** Record not found.

44.7.45  **CNErrorCodeValidationConfigurationError = 302**

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.  
**Notes:** Configuration validation error.

44.7.46  **CNErrorCodeValidationMultipleErrors = 300**

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.  
**Notes:** Multiple validation error.

44.7.47  **CNErrorCodeValidationTypeMismatch = 301**

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the error codes that may be returned when calling Contacts methods.  
**Notes:** Type mismatch validation error.
44.8 class CNContactsUserDefaultsMBS

44.8.1 class CNContactsUserDefaultsMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CNContactsUserDefaults class defines properties used to access the user defaults for a contact.

44.8.2 Methods

44.8.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.  
**Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.8.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

44.8.5 sharedDefaults as CNContactsUserDefaultsMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The singleton instance of the CNContactsUserDefaults class.

44.8.6 Properties

44.8.7 countryCode as String

**Notes:**  
ISO is the default country code for phone numbers. This is determined by the devices SIM card or the operating systems configured language.  
(Read only property)
44.8. **CLASS CNCONTACTSUSERDEFAULTSMBS**

44.8.8 **Handle as Integer**

**Function:** The internal object reference.

**Notes:**
Value is a pointer to a CNContactsUserDefaults object.
(Read and Write property)

44.8.9 **sortOrder as Integer**

**Function:** Default sorting order by name.

**Notes:**
Sort order is determined by the operating systems configured language or overridden by the user.
(Read only property)
44.9 class CNContactVCardSerializationMBS

44.9.1 class CNContactVCardSerializationMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CNContactVCardSerialization supports vCard representation for the given set of contacts. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

44.9.2 Methods

44.9.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available. **Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.9.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

44.9.5 contactsWithData(Data as MemoryBlock, byref error as NSErrorMBS) as CNContactMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the contacts from the vCard data.

44.9.6 dataWithContacts(Contacts() as CNContactMBS, byref error as NSErrorMBS) as MemoryBlock

44.9.7 descriptorForRequiredKeys as CNKeyDescriptorMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Use to fetch all contact keys required to create vCard data from a contact. **Notes:** A key descriptor to be used in the keysToFetch array when fetching the contacts.
CHAPTER 44. CONTACTS

44.10 class CNContactViewControllerMBS

44.10.1 class CNContactViewControllerMBS

Function: The CNContactViewController class implements the view to display a contact.

Notes:

CNContactViewController can display a new contact, unknown contact, or existing contact.
Subclass of the NSViewControllerMBS class.

44.10.2 Methods

44.10.3 available as Boolean

Function: Whether this class is available.

Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.10.4 Constructor

Function: The constructor.

44.10.5 descriptorForRequiredKeys as CNKeyDescriptorMBS

Function: Descriptor for all keys that must be fetched on a contact before setting it on the view controller.

Notes: Pass this descriptor to the keysToFetch of the CNContactFetchRequest if you want to display the contact in a CNContactViewController.

44.10.6 Properties

44.10.7 Contact as CNContactMBS

Function: A contact to display.

Notes:
When contact is nil, displays an empty selection state.
(Read and Write property)
44.11  class CNContainerMBS

44.11.1  class CNContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CNContainer class is a thread-safe class that defines an immutable object that represents a container.

**Notes:** A container has a collection of contacts. A contact can be in only one container. CardDAV accounts usually have only one container whereas Exchange accounts may have multiple containers, where each container represents an Exchange folder.

44.11.2  Methods

44.11.3  available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.

**Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.11.4  CNContainerIdentifierKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the predefined keys representing container properties that can be used with key value coding on CNContainer objects.

**Notes:**

Identifier key. This key represents the container identifier property for KVC/KVO usage. This property is always fetched.

44.11.5  CNContainerNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the predefined keys representing container properties that can be used with key value coding on CNContainer objects.

**Notes:**

Name key. This key represents the container identifier property for KVC/KVO usage. This property is always fetched.
44.11.6 CNContainerTypeKey as String

**Function:** One of the predefined keys representing container properties that can be used with key value coding on CNContainer objects.  
**Notes:**  
Type key.  
This key represents the container identifier property for KVC/KVO usage. This property is always fetched.

44.11.7 Constructor

**Function:** The private container.

44.11.8 copy as CNContainerMBS

**Function:** Create a copy of the container object.

44.11.9 predicateForContainerOfContactWithIdentifier(contactIdentifier as String) as NSPredicateMBS

**Function:** Returns a predicate to find the container of the specified contact.  
**Notes:** If the identifier is for a unified contact then this method returns an empty array. To fetch the containers of a unified contact, first fetch the linked contacts and then fetch the container of each linked contact.

44.11.10 predicateForContainerOfGroupWithIdentifier(groupIdentifier as String) as NSPredicateMBS

**Function:** Returns a predicate to find the container of the specified group.
44.11.11 predicateForContainersWithIdentifiers(Identifiers() as String) as NSPredicate

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a predicate to find the containers with the specified identifiers.

44.11.12 Properties

44.11.13 Handle as Integer

Notes:
Value is a pointer to a CNContainer object.
(Read and Write property)

44.11.14 Identifier as String

Notes:
It is recommended that you use the identifier when re-fetching the container. The identifier can be persisted between app launches.
(Read only property)

44.11.15 Name as String

Notes: (Read only property)

44.11.16 Type as Integer

Notes:
can be CNContainerTypeUnassigned, CNContainerTypeLocal, CNContainerTypeExchange or CNContainerTypeCardDAV.
(Read only property)

### 44.11.17 Constants

#### 44.11.18 CNContainerTypeCardDAV = 3

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the container type constants.  
**Notes:** A container for contacts stored in an CardDAV server, such as iCloud.

#### 44.11.19 CNContainerTypeExchange = 2

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the container type constants.  
**Notes:** A container for contacts stored in an Exchange folder from an Exchange server.

#### 44.11.20 CNContainerTypeLocal = 1

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the container type constants.  
**Notes:** A container for contacts only stored locally on the device. There is only one local container for a device.

#### 44.11.21 CNContainerTypeUnassigned = 0

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the container type constants.
44.12 class CNGroupMBS

44.12.1 class CNGroupMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CNGroup is a thread-safe class that defines an immutable object that represents a group. **Notes:** Contacts may be members of one or more groups, depending upon their accounts.

44.12.2 Methods

44.12.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available. **Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.12.4 CNGroupIdentifierKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the predefined keys representing group properties that can be used with key value coding on CNGroup objects. **Notes:** Group identifier. This key takes a string value.

44.12.5 CNGroupNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the predefined keys representing group properties that can be used with key value coding on CNGroup objects. **Notes:** Group name. This key takes a string value.

44.12.6 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
44.12.7 copy as CNGroupMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create a copy of the group object.

44.12.8 mutableCopy as CNMutableGroupMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a mutable copy of this group.

44.12.9 predicateForGroupsInContainerWithIdentifier(groupIdentifier as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a predicate to find groups in the specified container.

**Notes:**

containerIdentifier: The container identifier to be matched.

Returns a predicate that can be used to fetch groups from CNContactStore.

44.12.10 predicateForGroupsWithIdentifiers(Identifiers() as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a predicate to find groups with the specified identifiers.

**Notes:**

identifiers: The group identifiers to be matched.

Returns a predicate that can be used to fetch groups from CNContactStore.
44.12.11  predicateForSubgroupsInGroupWithIdentifier(contactIdentifier as String) as NSPredicateMBS

44.12.12  valueForKey(key as String) as Variant

44.12.13  Properties

44.12.14  Handle as Integer

Notes: Value is a pointer to a CNGroup object.
(Read and Write property)

44.12.15  Identifier as String

Notes: It is recommended that you use the identifier when re-fetching the group. The identifier can be persisted between app launches.
(Read only property)

44.12.16  Name as String

Notes: (Read only property)
44.13 class CNInstantMessageAddressMBS

44.13.1 class CNInstantMessageAddressMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CNInstantMessageAddress class is a thread-safe class that defines an immutable value object representing an instant message address. **Notes:** Use the methods and properties of this class to identify instant messaging address. Some instant message services, such as Facebook and Skype are predefined in this class. You can also specify your own instant message service using Constructor.

44.13.2 Methods

44.13.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available. **Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.13.4 CNInstantMessageAddressServiceKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Instant message address service key. **Notes:** This key takes a string value.

44.13.5 CNInstantMessageAddressUsernameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Instant message address user name key. **Notes:** This key takes a string value.

44.13.6 CNInstantMessageServiceAIM as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the service types. **Notes:** Instant message service for AIM. This key takes a string value.
44.13.7  CNInstantMessageServiceFacebook as String

Function: One of the service types.
Notes:
Instant message service for Facebook.
This key takes a string value.

44.13.8  CNInstantMessageServiceGaduGadu as String

Function: One of the service types.
Notes:
Instant message service for Gadu Gadu.
This key takes a string value.

44.13.9  CNInstantMessageServiceGoogleTalk as String

Function: One of the service types.
Notes:
Instant message service for Google Talk.
This key takes a string value.

44.13.10  CNInstantMessageServiceICQ as String

Function: One of the service types.
Notes:
Instant message service for ICQ.
This key takes a string value.
44.13. **CLASS CNINSTANCMESAGEADDRESSMBS**

### 44.13.11 CNInstantMessageServiceJabber as String

**Function:** One of the service types.

**Notes:**
Instant message service for Jabber.
This key takes a string value.

### 44.13.12 CNInstantMessageServiceMSN as String

**Function:** One of the service types.

**Notes:**
Instant message service for MSN.
This key takes a string value.

### 44.13.13 CNInstantMessageServiceQQ as String

**Function:** One of the service types.

**Notes:**
Instant message service for QQ.
This key takes a string value.

### 44.13.14 CNInstantMessageServiceSkype as String

**Function:** One of the service types.

**Notes:**
Instant message service for Skype.
This key takes a string value.

### 44.13.15 CNInstantMessageServiceYahoo as String

**Function:** One of the service types.

**Notes:**
44.13.16 Constructor(username as String, Service as String)

**Function:** Returns a CNInstantMessageAddress object initialized with the specified user name and service.

**Notes:**

username: The user name with which to initialize the CNInstantMessageAddress object.

service: The service with which to Initialize the CNInstantMessageAddress object.

Returns the initialized CNInstantMessageAddress object with the specified user name and service. User name and service are required to initialize CNInstantMessageAddress object.

44.13.17 copy as CNInstantMessageAddressMBS

**Function:** Create a copy of the instant message address object.

44.13.18 localizedStringForKey(key as String) as String

**Function:** Returns a string containing the localized property name.

44.13.19 localizedStringForService(key as String) as String

**Function:** Returns a string containing the localized name of the specified service.

44.13.20 Properties

44.13.21 Handle as Integer

**Function:** The internal object reference.

**Notes:**
44.13. CLASS CNINSTANTMESSAGEADDRESSMBS

Value is a pointer to a CNInstantMessageAddress object.  
(Read and Write property)

44.13.22  service as String

Function: Instant message address service.  
Notes: (Read only property)

44.13.23  username as String

Function: The user name for instant message service address.  
Notes: (Read only property)
44.14 class CNKeyDescriptorMBS

44.14.1 class CNKeyDescriptorMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for key descriptors.

44.14.2 Methods

44.14.3 Constructor(Key as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a key descriptor from a string value.

44.14.4 copy as CNKeyDescriptorMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create a copy of the key descriptor object.

44.14.5 Operator_Convert as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts key to string value. **Notes:** Same as using StringValue property, but automatic. See also:

- 44.14.6 Operator_Convert(Key as String)

44.14.6 Operator_Convert(Key as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a key descriptor from a string value. **Example:**

```vbnet
dim k as CNKeyDescriptorMBS = CNContactMBS.CNContactJobTitleKey
```

**Notes:** Same as constructor, but automatic. See also:
44.14. CLASS CNKEYDESCRIPTORMBS

- 44.14.5 Operator_Convert as String

44.14.7 Properties

44.14.8 Handle as Integer

**Function:** The internal object reference.
**Notes:**
Value is a pointer to a CNKeyDescriptor object.
(Read and Write property)

44.14.9 StringValue as String

**Function:** Queries string value of the key descriptor.
**Notes:** (Read only property)
44.15 class CNLabeledValueMBS

44.15.1 class CNLabeledValueMBS
MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for labeled values. **Notes:** The CNLabeledValue class is a thread-safe class that defines an immutable value object that combines a contact property value with a label. For example, a contact phone number could have a label of Home, Work, iPhone, etc.

44.15.2 Methods

44.15.3 available as Boolean
MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available. **Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.15.4 CNLabelDateAnniversary as String
MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This constant is a predefined label that can be used in a CNLabeledValue object having an NSDateComponents value.

44.15.5 CNLabelEmailiCloud as String
MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This constant is a predefined label that can be used in a CNLabeledValue object having an email address string value. **Notes:** Email.

This label takes a string value.

44.15.6 CNLabelHome as String
MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the predefined labels that can be used in a CNLabeledValue object having any value.
44.15. CLASS CNLABELEDVALUEMBS

Notes:
Home label.
This label takes a string value.

44.15.7  CNLabelOther as String

Function: One of the predefined labels that can be used in a CNLabeledValue object having any value.
Notes:
Other label.
This label takes a string value.

44.15.8  CNLabelURLAddressHomePage as String

Function: This constant is a predefined label that can be used in a CNLabeledValue object having a URL address string value.
Notes:
Identifier for the URL property.
This label takes a string value.

44.15.9  CNLabelWork as String

Function: One of the predefined labels that can be used in a CNLabeledValue object having any value.
Notes:
Work label.
This label takes a string value.

44.15.10 Constructor(label as string, value as Variant)

Function: Returns a new labeled value identifier initialized with the specified label and value.
Notes:
label: A string value for the label of the labeled value object, or nil if the value doesn't have a label.
value: A value for the labeled value object. For valid values, see CNContact properties that are arrays of
labeled value objects.

Returns a new labeled value object initialized with the specified identifier.

44.15.11 copy as CNLabeledValueMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create a copy of the labeled value object.

44.15.12 labeledValueBySettingLabel(label as string) as CNLabeledValueMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a labeled value object with an existing value and identifier. **Notes:** label: The label of the copied labeled value object, or nil if the contact property value doesn’t have a label.

Returns a labeled value object with an existing value and identifier. See also:

- 44.15.13 labeledValueBySettingLabel(label as string, value as Variant) as CNLabeledValueMBS

44.15.13 labeledValueBySettingLabel(label as string, value as Variant) as CNLabeledValueMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a labeled value object with the specified label and value with the existing identifier. **Notes:** label: The label of the copied labeled value object, or “” if the contact property value doesn’t have a label. value: The copied labeled value object. For valid values, see CNContact properties that are arrays of labeled value objects.

Returns a labeled value object with the existing identifier. See also:

- 44.15.12 labeledValueBySettingLabel(label as string) as CNLabeledValueMBS
44.15.14 labeledValueBySettingValue(value as Variant) as CNLabeledValueMBS

Function: Returns a new value for an existing label and identifier.
Notes:
value: A new value for the copied labeled value object. For valid values, see CNContact properties that are arrays of labeled value objects.

Returns the CNLabeledValue object with an existing label and identifier.

44.15.15 labeledValueWithLabel(label as string, value as Variant) as CNLabeledValueMBS

Function: Returns a new labeled value identifier object with the specified label and value.
Notes:
label: A string value for the label of the labeled value object, or nil if the value doesnt have a label.
value: A value for the labeled value object. For valid values, see CNContact properties that are arrays of labeled value objects.

Returns a new CNLabeledValue object with a new identifier.

44.15.16 localizedStringForLabel(label as string) as string

Function: Returns a localized string for the specified label.
Notes:
label: The label to be localized.

Returns a localized string for the label.

All predefined label constants are localized and this method returns their localized strings. A custom label will be returned as is, so this method can be used to convert all labels for display.
**44.15.17 Properties**

**44.15.18 Handle as Integer**

*Function*: The internal object reference.
*Notes*: 
Value is a pointer to a CNLabeledValue object.
(Read and Write property)

**44.15.19 Identifier as String**

*Function*: A unique identifier for the labeled value object.
*Notes*: 
It is recommended that you use the identifier when searching for a previously known labeled value object in a re-fetched contact. The identifier can be persisted between the app launches.
(Read only property)

**44.15.20 Label as String**

*Function*: The label for a contact property value.
*Notes*: 
A contact property can have a label, such as Home, Work, iPhone, etc. For some predefined label constants, see CNPhoneNumber, and CNContactRelation. Custom labels can also be used. Labels are not used for CNSocialProfile and CNInstantMessageAddress properties.
(Read only property)

**44.15.21 Value as Variant**

*Function*: A contact property value.
*Notes*: 
A contact property value, such as CNPhoneNumberMBS for a phone number, String for an email address, and so on. For valid values, see CNContact properties that are arrays of labeled value objects.
(Read only property)
44.16. CLASS CNMUTABLECONTACTMBS

44.16 class CNMutableContactMBS

44.16.1 class CNMutableContactMBS

**Function:** The CNMutableContact class represents a mutable value object for the contact properties, such as the first name and the phone number of a contact.

**Notes:**
The CNMutableContact is not a thread-safe class. When CNMutableContact object is a mutable copy of a CNContact object, if you access a CNMutableContact property value that was not fetched for the CNContact object, it throws an CNContactPropertyNotFetchedExceptionName exception. When needed, you can remove contact properties by setting string and array properties to empty, and all other properties to nil. Available in OS X v10.11 and later. Subclass of the CNContactMBS class.

44.16.2 Methods

44.16.3 Constructor

**Function:** The constructor.

44.16.4 setContactRelations(contactRelations() as CNLabeledValueMBS)

**Function:** Sets the array of labeled contact relations for the contact.

**Notes:** This property is an array of CNLabeledValue objects, each of which has a label and a CNContactRelationMBS value.

44.16.5 setDates(dates() as CNLabeledValueMBS)

**Function:** Sets the array containing labeled Gregorian dates.

**Notes:** This property is an array of CNLabeledValue objects, each of which has an String label and NSDateComponentsMBS value. You can use this property to store Gregorian dates such as anniversaries. Day and month are required and year is optional. Calendar is nil or Gregorian. All other date components are invalid.
44.16.6 setEmailAddresses(emailAddresses() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the array of labeled email addresses for the contact. **Notes:** This property is an array of CNLabeledValue objects, each of which has a label and a String value.

44.16.7 setInstantMessageAddresses(instantMessageAddresses() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the array of labeled IM addresses for the contact. **Notes:** This property is an array of CNLabeledValue objects, each of which has a label and a CNInstantMessageAddressMBS value.

44.16.8 setPhoneNumbers(phoneNumbers() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the array of labeled phone numbers for a contact. **Notes:** This property is an array of CNLabeledValue objects, each of which has a label and a CNPhoneNumberMBS value.

44.16.9 setPostalAddresses(postalAddresses() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the array of labeled postal addresses for a contact. **Notes:** This property is an array of CNLabeledValue objects, each of which has a label and a CNPostalAddressMBS value.

44.16.10 setSocialProfiles(socialProfiles() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the array of labeled social profiles for a contact. **Notes:** This property is an array of CNLabeledValue objects, each of which has a label and a CNSocialProfileMBS value.
44.16.11 setURLAddresses(urlAddresses() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the array of labeled URL addresses for a contact. **Notes:** This property is an array of CNLabeledValue objects, each of which has a label and a string value that contains the URL.

44.16.12 Properties

44.16.13 birthday as NSDateComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A date component for the Gregorian birthday of the contact. **Notes:**

A Gregorian birthday can be displayed using this property, whose values are the relevant properties of an NSDateComponents object. Day and month are required for this property, and year is optional. Calendar can be nil or Gregorian. All other date components are invalid. (Read and Write property)

44.16.14 contactType as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An enum identifying the contact type. **Notes:**

Can be CNContactMBS.CNContactTypeOrganization or CNContactMBS.CNContactTypePerson. (Read and Write property)

44.16.15 departmentName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the department associated with the contact. **Notes:** (Read and Write property)

44.16.16 familyName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The family name of the contact. **Example:**
CHAPTER 44. CONTACTS

```
dim m as new CNMutableContactMBS
m.familyName = "Miller"
msgbox "name: " + m.familyName
```

Notes:
The family name is often known as the last name of the contact.
(Read and Write property)

#### 44.16.17 givenName as String

**Function:** The given name of the contact.
**Notes:**
The given name is often known as the first name of the contact.
(Read and Write property)

#### 44.16.18 imageData as MemoryBlock

**Function:** The profile picture of a contact.
**Notes:**
It is recommended that you fetch this property only when you need to access its value, such as when you need to display the contacts profile picture.
(Read and Write property)

#### 44.16.19 jobTitle as String

**Function:** The contacts job title.
**Notes:** (Read and Write property)

#### 44.16.20 middleName as String

**Function:** The middle name of the contact.
44.16. CLASS CNMUTABLECONTACTMBS

Notes: (Read and Write property)

44.16.21 namePrefix as String

Notes: (Read and Write property)

44.16.22 nameSuffix as String

Notes: (Read and Write property)

44.16.23 nickname as String

Notes: (Read and Write property)

44.16.24 nonGregorianBirthday as NSDateComponentsMBS

Notes: A non-Gregorian birthday such as Lunisolar birthdays can be displayed using this property, whose values are the relevant properties of an NSDateComponents object. Day and month are required; year and leapMonth are optional. The calendar property is also required and must be non-Gregorian. Some supported calendars are Buddhist, Chinese, and Islamic. All other date components are invalid.
(Read and Write property)

44.16.25 note as String

Notes: (Read and Write property)
**44.16.26** organizationName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the organization associated with the contact. **Notes:** (Read and Write property)

**44.16.27** phoneticFamilyName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The phonetic family name of the contact. **Notes:**

This property contains a string that specifies the pronunciation of the contact's family (or last) name. (Read and Write property)

**44.16.28** phoneticGivenName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The phonetic given name of the contact. **Notes:**

This property contains a string that specifies the pronunciation of the contact's given (or first) name. (Read and Write property)

**44.16.29** phoneticMiddleName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The phonetic middle name of the contact. **Notes:**

This property contains a string that specifies the pronunciation of the contact’s middle name. (Read and Write property)

**44.16.30** previousFamilyName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The previous family name of the contact. **Notes:**

The previous family name is often known as the maiden name of the contact. (Read and Write property)
44.16.31  `valueForKey(key as String) as Variant`

MBS Mac64bit Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries or sets value for a given key. **Notes:** (Read and Write computed property)
44.17 class CNMutableGroupMBS

44.17.1 class CNMutableGroupMBS

**Function:** The CNMutableGroup class defines a mutable value object representing a group for a contact.  
**Notes:**  
Contacts may be members of one or more groups, depending upon the accounts they come from. The CNMutableGroup is not a thread-safe class.  
Subclass of the CNGroupMBS class.

44.17.2 Methods

44.17.3 Constructor

**Function:** The constructor.

44.17.4 Properties

44.17.5 Name as String

**Function:** Name of the group.  
**Example:**

```vbnet
dim m as new CNMutableGroupMBS  
m.Name = "Hello"
```

**Notes:** (Read and Write property)

44.17.6 valueForKey(key as String) as Variant

**Function:** Queries or sets value for a given key.  
**Notes:** (Read and Write computed property)
44.18  class CNMutablePostalAddressMBS

44.18.1  class CNMutablePostalAddressMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CNMutablePostalAddress class defines a mutable value object representing the postal address for a contact.

**Notes:**

It is not a thread-safe class. To remove properties when saving a mutable postal address, set string properties to empty values.

Subclass of the CNPostalAddressMBS class.

44.18.2  Methods

44.18.3  Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

44.18.4  Properties

44.18.5  City as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The city name.

**Example:**

```vbnet
dim m as new CNMutablePostalAddressMBS
m.City = "New York"
MsgBox m.city
```

**Notes:** (Read and Write property)

44.18.6  Country as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The country name.

**Notes:** (Read and Write property)
44.18.7 ISOCountryCode as String

Notes: (Read and Write property)

44.18.8 PostalCode as String

Notes: (Read and Write property)

44.18.9 State as String

Notes: (Read and Write property)

44.18.10 Street as String

Notes:
A multiline address is delimited with carriage returns (that is, \n).
(Read and Write property)
44.19. **CLASS CNPHONENUMBERMBS**

44.19  **class CNPhoneNumberMBS**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CNPhoneNumber class defines an immutable value object representing a phone number for a contact.  
**Notes:** It is a thread-safe class.

44.19.2  **Methods**

44.19.3  **available as Boolean**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.  
**Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.19.4  **CNLabelPhoneNumberHomeFax as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Home fax number.  
**Notes:** This label takes a string value.

44.19.5  **CNLabelPhoneNumberiPhone as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** iPhone number.  
**Notes:** This label takes a string value.

44.19.6  **CNLabelPhoneNumberMain as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Main phone number.  
**Notes:** This label takes a string value.
44.19.7  CNLabelPhoneNumberMobile as String

Notes: This label takes a string value.

44.19.8  CNLabelPhoneNumberOtherFax as String

Notes: This label takes a string value.

44.19.9  CNLabelPhoneNumberPager as String

Notes: This label takes a string value.

44.19.10  CNLabelPhoneNumberWorkFax as String

Notes: This label takes a string value.

44.19.11  Constructor(value as string)

Notes: You should initialize this with a phone number string. This method fails when the value of string is empty.

44.19.12  copy as CNPhoneNumberMBS

44.19. CLASS CNPHONENUMBERMBS

44.19.13 phoneNumberWithStringValue(p as string) as CNPhoneNumberMBS

Function: Returns a new phone number object initialized with the specified phone number string.
Notes:
This is a convenience class method that provides the same functionality as Constructor.
This method fails when the value of stringValue is "."

44.19.14 Properties

44.19.15 Handle as Integer

Function: The internal object reference.
Notes:
Value is a pointer to a CNPhoneNumber object.
(Read and Write property)

44.19.16 stringValue as String

Function: The string value of the phone number.
Notes: (Read only property)
44.20 class CNPostalAddressFormatterMBS

44.20.1 class CNPostalAddressFormatterMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The CNPostalAddressFormatter class formats the postal address in a contact.
Notes: This class handles international formatting of postal addresses. It is recommended that you create an instance of this class when formatting many postal addresses, and use the instance methods; otherwise use the class methods.

44.20.2 Methods

44.20.3 attributedStringFromPostalAddress(postalAddress as CNPostalAddressMBS, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS

Notes:
postalAddress: The postal address to format.
DefaultAttributes: The default attributes to use. To learn more, see NSFormatter.

Returns the formatted postal address as an attributed string.

This method behaves similarly to stringFromPostalAddress, except that it returns an attributed string. It includes the attribute key CNPostalAddressPropertyAttribute, whose attribute values are postal address property keys, such as CNPostalAddressStreetKey. This identifies the postal address components in the formatted postal address. Also includes the attribute key CNPostalAddressLocalizedPropertyNameAttribute whose attribute values are the localized strings for the postal address property keys.
See also:
• 44.20.4 attributedStringFromPostalAddress(postalAddress as CNPostalAddressMBS, style as Integer, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS

44.20.4 attributedStringFromPostalAddress(postalAddress as CNPostalAddressMBS, style as Integer, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS

Notes:
postalAddress: The postal address to format.
DefaultAttributes: The default attributes to use. To learn more, see NSFormatter.

Returns the formatted postal address as an attributed string.

This method behaves similarly to stringFromPostalAddress, except that it returns an attributed string. It includes the attribute key CNPostalAddressPropertyAttribute, whose attribute values are postal address property keys, such as CNPostalAddressStreetKey. This identifies the postal address components in the formatted postal address. Also includes the attribute key CNPostalAddressLocalizedPropertyAttributeNameAttribute whose attribute values are the localized strings for the postal address property keys.

See also:
- 44.20.3 attributedStringFromPostalAddress(postalAddress as CNPostalAddressMBS, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS

44.20.5 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.20.6 CNPostalAddressLocalizedPropertyAttributeNameAttribute as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: This constant is a key in the attributed string whose value is a localized version of the CNPostalAddress property key.
Notes: This label takes a string value.

44.20.7 CNPostalAddressPropertyAttribute as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: This constant is a key in the attributed string whose value is a CNPostalAddress property key.
Notes: This key takes a string value.

44.20.8 Constructor

CHAPTER 44. CONTACTS

44.20.9  stringFromPostalAddress(postalAddress as CNPostalAddressMBS) as String

Function: Returns a formatted postal address.
See also:

- 44.20.10 stringFromPostalAddress(postalAddress as CNPostalAddressMBS, style as Integer) as String

44.20.10  stringFromPostalAddress(postalAddress as CNPostalAddressMBS, style as Integer) as String

Function: Returns a formatted postal address.
Notes: Style can currently only be CNPostalAddressFormatterStyleMailingAddress.
See also:

- 44.20.9 stringFromPostalAddress(postalAddress as CNPostalAddressMBS) as String

44.20.11  Properties

44.20.12  Handle as Integer

Function: The internal object reference.
Notes:
Value is a pointer to a CNPostalAddressFormatter object.
(Read and Write property)

44.20.13  Style as Integer

Function: The style to use.
Notes:
Style can currently only be CNPostalAddressFormatterStyleMailingAddress.
(Read and Write property)
44.20.14 Constants

44.20.15 CNPostalAddressFormatterStyleMailingAddress = 0

MBS Mac64bit Plugin, Plugin Version: 16.3. **Function:** One of the style constants.
44.21 class CNPostalAddressMBS

44.21.1 class CNPostalAddressMBS

Function: The CNPostalAddress class defines an immutable object that represents the postal address for a contact.
Notes:
This is a thread-safe class.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

44.21.2 Methods

44.21.3 available as Boolean

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

44.21.4 CNPostalAddressCityKey as String

Function: One of the keys for properties to fetch.
Notes:
City.
This key takes a string value.

44.21.5 CNPostalAddressCountryKey as String

Function: One of the keys for properties to fetch.
Notes:
Country.
This key takes a string value.
44.21.6  **CNPostalAddressISOCountryCodeKey as String**

**Function:** One of the keys for properties to fetch.
**Notes:**
ISO country code.
This key takes a string value.

44.21.7  **CNPostalAddressPostalCodeKey as String**

**Function:** One of the keys for properties to fetch.
**Notes:**
Postal code.
This key takes a string value.

44.21.8  **CNPostalAddressStateKey as String**

**Function:** One of the keys for properties to fetch.
**Notes:**
State.
This key takes a string value.

44.21.9  **CNPostalAddressStreetKey as String**

**Function:** One of the keys for properties to fetch.
**Notes:**
Street.
This key takes a string value.

44.21.10  **Constructor**

**Function:** The constructor.
44.21.11 copy as CNPostalAddressMBS

44.21.12 localizedStringForKey(key as String) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the localized name for the property associated with the specified key. Example:

MsgBox CNPostalAddressMBS.localizedDescriptionedStringForKey(CNPostalAddressMBS.CNPostalAddressStreetKey)

44.21.13 mutableCopy as CNMutablePostalAddressMBS

44.21.14 Properties

44.21.15 City as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The city name in a postal address. Notes: (Read only property)

44.21.16 Country as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The country name in a postal address. Notes: (Read only property)

44.21.17 Handle as Integer

44.21. **CLASS CNPOSTALADDRESSMBS**

Value is a pointer to a CNPostalAddress object.
(Read and Write property)

---

44.21.18 **ISOCountryCode as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The ISO country code for the country in a postal address.
**Notes:** (Read only property)

---

44.21.19 **PostalCode as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The postal code in a postal address.
**Notes:** (Read only property)

---

44.21.20 **State as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The state name in a postal address.
**Notes:** (Read only property)

---

44.21.21 **Street as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The street name in a postal address.
**Notes:**

Multiline addresses are delimited by carriage returns (that is, \n).
(Read only property)
**44.22** class CNSaveRequestMBS

**44.22.1** class CNSaveRequestMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CNSaveRequest class defines a save request operation for contacts. **Notes:** The CNSaveRequest class creates a new save request for each save operation on the contact store. You can batch multiple changes into one save request (note that these changes only apply to objects). In the case of overlapping changes in multiple or concurrent save requests, the last change wins. If you try to add an object (that is, a contact, or a group,) that already exists in the contact store, the CNErrorCodeInsertedRecordAlreadyExists error occurs and the CNErrorUserInfoAffectedRecordsKey array is updated to contain the object you tried to add. If you try to update or delete an object that is not present in the contact store, the save request does not perform the update or deletion, the CNErrorCodeRecordDoesNotExist error occurs, and the CNErrorUserInfoAffectedRecordsKey array is updated to contain the object you tried to update or delete. Do not access objects in the save request while a save request is executing.

**44.22.2** Methods

**44.22.3** addContact(contact as CNMutableContactMBS, ContainerIdentifier as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the specified contact to the contact store. **Notes:**

- contact: The new contact to add.
- identifier: The identifier of the container to add the new contact. To add the new contact to the default container set identifier to ""

This method overrides any previously made deletion requests for the contact. The new contact may be modified by executing the save request.

**44.22.4** addGroup(group as CNMutableGroupMBS, identifier as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a group to the contact store. **Notes:**

- group: The group to add.
- identifier: The identifier of the container to add the new group. To add the new group to the default container, set identifier to ""
This method overrides any previously made delete request for the group.

### 44.22.5 addMember(contact as CNContactMBS, group as CNGroupMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a contact as a member of a group.  
**Notes:**
- contact: The contact to add to the group membership.
- group: The group to add the contact to its membership.

This method overrides any previously made remove membership request on the contact from the group.

### 44.22.6 addSubgroup(subgroup as CNGroupMBS, group as CNGroupMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a subgroup to a group.

### 44.22.7 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether this class is available.  
**Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

### 44.22.8 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor.

### 44.22.9 deleteContact(contact as CNMutableContactMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Deletes a contact from the contact store.  
**Notes:** contact: Contact to be delete.
44.22.10  deleteGroup(contact as CNMutableGroupMBS)

Function: Deletes a group from the contact store.
Notes:

group: The group to delete.

This method overrides any previously made add request on the group. The group to be deleted must already exist in the contact store. If it does not, the delete request fails, the CNErrorCodeRecordDoesNotExist error is thrown, and the CNErrorUserInfoAffectedRecordsKey array is updated to contain that object.

44.22.11  removeMember(contact as CNContactMBS, group as CNGroupMBS)

Function: Removes a contact as a member of a group.
Notes:

contact: The contact to remove from the group membership.
group: The group to remove the contact from its membership.

This method removes the contact from the group, but does not delete it from the contact store. This method overrides any previously made add membership request on the contact to the group.

44.22.12  removeSubgroup(subgroup as CNGroupMBS, group as CNGroupMBS)

44.22.13  updateContact(contact as CNMutableContactMBS)

Function: Updates an existing contact in the contact store.
Notes:

contact: The contact to update.

The contact to be updated must already exist in the contact store. If it does not, the update request fails, the CNErrorCodeRecordDoesNotExist error occurs, and the CNErrorUserInfoAffectedRecordsKey array is updated to contain the object. Note that the contact may be modified when the save request is executing.
44.22. **CLASS CNSAVEREQUESTMBS**

### 44.22.14 updateGroup(contact as CNMutableGroupMBS)

**Function:** Updates an existing group in the contact store.

**Notes:**

- `group`: The group to update.

The group to be updated must already exist in the contact store. If it does not, the update request fails, the CNErrordCodeRecordDoesNotExist error is thrown, and the CNErrordUserInfoAffectedRecordsKey array is updated to contain that object.

### 44.22.15 Properties

#### 44.22.16 Handle as Integer

**Function:** The internal object reference.

**Notes:**

- Value is a pointer to a CNSaveRequest object.
  - (Read and Write property)
44.23  class CNSocialProfileMBS

44.23.1  class CNSocialProfileMBS

**Function:** The CNSocialProfile class defines an immutable object representing a social profile.

**Example:**
```vba
dim ContactStore as new CNContactStoreMBS
dim c as new CNMutableContactMBS

c.givenName = "Bob"

dim sr as new CNSaveRequestMBS

dim ContainerIdentifier as string = ContactStore.defaultContainerIdentifier
sr.addContact c, ContainerIdentifier

dim e as NSErrorMBS
if ContactStore.executeSaveRequest(sr, e) then
    MsgBox "Saved"
else
    MsgBox "Failed to save contact" + vbCrLf + e.localizedDescription
end if
```

**Notes:** This is a thread-safe class. Some social profile services, such as Facebook and Twitter are predefined in this class. You can also specify your own social profile service with Constructor.

---

44.23.2  Methods

44.23.3  available as Boolean

**Function:** Whether this class is available.

**Notes:** Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

---

44.23.4  CNSocialProfileServiceFacebook as String

**Function:** One of the possible service keys.

**Notes:** Facebook
44.23. **CLASS CNSOCIALPROFILEMBS**

44.23.5 **CNSocialProfileServiceFlickr as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: One of the possible service keys. **Notes**: Flickr

44.23.6 **CNSocialProfileServiceGameCenter as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: One of the possible service keys. **Notes**: Game Center

44.23.7 **CNSocialProfileServiceKey as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: One of the keys for properties. **Notes**: The social profile service. This key takes a string value.

44.23.8 **CNSocialProfileServiceLinkedIn as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: One of the possible service keys. **Notes**: LinkedIn

44.23.9 **CNSocialProfileServiceMySpace as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: One of the possible service keys. **Notes**: MySpace

44.23.10 **CNSocialProfileServiceSinaWeibo as String**

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function**: One of the possible service keys.
CHAPTER 44. CONTACTS

Notes: Sina Weibo

44.23.11 CNSocialProfileServiceTencentWeibo as String

Notes: Tencent Weibo

44.23.12 CNSocialProfileServiceTwitter as String

Notes: Twitter

44.23.13 CNSocialProfileServiceYelp as String

Notes: Yelp

44.23.14 CNSocialProfileURLStringKey as String

Notes: The URL of the service.

44.23.15 CNSocialProfileUserIdentifierKey as String

Notes:
The social profile user identifier.
This key takes a string value.
44.23. CLASS CNSOCIALPROFILEMBS

44.23.16 CNSocialProfileUsernameKey as String

Function: One of the keys for properties.
Notes:
The social profile user name.
This key takes a string value.

44.23.17 Constructor(URLString as String, UserName as String, Identifier as String, Service as String)

Function: Initializes a new social profile object with the specified URL.
Notes:
urlString: The URL for the social profile.
username: The user name for the social profile.
userIdentifier: The services user identifier for the social profile.
service: The service name of the social profile.

44.23.18 copy as CNSocialProfileMBS

Function: Create a copy of the social profile object.

44.23.19 localizedStringForKey(key as String) as String

Function: Returns the localized name of the property for the specified key.
Example:
MsgBox CNSocialProfileMBS.localizedDescriptionForService(CNSocialProfileServiceGameCenter)

Notes: key: Key for which to get the localized property name.
### 44.23.20 localizedStringForService(service as String) as String

**Function:** Returns the localized name of the specified service.
**Example:**

MsgBox CNSocialProfileMBS.localizedStringForKey(CNSocialProfileUsernameKey)

**Notes:** service: The service name for which to get the localized name.

### 44.23.21 Properties

#### 44.23.22 Handle as Integer

**Function:** The internal object reference.
**Notes:**

Value is a pointer to a CNSocialProfile object.
(Read and Write property)

#### 44.23.23 service as String

**Function:** The social profiles service name.
**Notes:** (Read only property)

#### 44.23.24 urlString as String

**Function:** The URL associated with the social profile.
**Notes:** (Read only property)

#### 44.23.25 userIdentifier as String

**Function:** The services user identifier associated with the social profile.
**Notes:** (Read only property)
44.23. CLASS CNSOCIALPROFILEMBS

44.23.26 username as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The user name for the social profile. **Notes:** (Read only property)
Chapter 45

Controls

45.1 class Bevelbutton

45.1.1 class Bevelbutton

Plugin Version: 3.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An extension of Realbasic’s internal control.

**Notes:**

The clock functions are hacks to REALbasic which uses undocumented functions.

This function does currently not work with the Mac Cocoa target of REALbasic. If you need it, please send in a feature request.

45.1.2 Methods

45.1.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSButtonMBS object for the given control.

**Example:**

MsgBox BevelButton1.NSButtonMBS.className

**Notes:** This way you can manipulate Cocoa controls directly.
45.2 control ButtonMBS

45.2.1 control ButtonMBS

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A control to have a custom button in REALbasic. **Deprecated:** This item is deprecated and should no longer be used. **Notes:**

You provide the images for the button and the control will do the rest.

There are possibilities that this control shows thru pagepanels from a hidden panel.

45.2.2 Properties

45.2.3 ImageDisabled as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The image used if the button is disabled. **Notes:** (Read and Write property)

45.2.4 ImageMouseOver as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The image used for the unpressed button if the mouse is over the button. **Notes:** (Read and Write property)

45.2.5 ImageNormal as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The image for the normal state. **Notes:** (Read and Write property)

45.2.6 ImagePressed as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The image used for the pressed button. **Notes:** (Read and Write property)
45.2. CONTROL BUTTONMBS

45.2.7  ImagePressedDisabled as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The image used when the button is pressed and the button is disabled.
**Notes:**
If this image is nil, the ImagePressed picture is used.
(Read and Write property)

45.2.8  ImagePressedMouseOver as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The image used when the button is pressed and the mouse is over the button.
**Notes:**
If this image is nil, the ImagePressed picture is used.
(Read and Write property)

45.2.9  Sticky as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether the button is sticky.
**Notes:**
Normally the value is set to false when you release the mouse button.
If Sticky is true, the button is not unpressed.
(Read and Write property)

45.2.10  TestEnabled as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This property can be used to see in the window editor how the button looks like when the button is enabled.
**Notes:**
This property is only for designing, not for runtime.
(Read and Write property)

45.2.11  TestMouseOver as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This property can be used to see in the window editor how the button looks like if the mouse is over the
45.2.12 TestPressed as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This property can be used to see in the window editor how the button looks like when the button is pressed. **Notes:** This property is only for designing, not for runtime. (Read and Write property)

45.2.13 Toggle as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the button should toggle. **Notes:** If pressed the button switches the value property.

Set Sticky to true if use set Toggle to true. (Read and Write property)

45.2.14 Value as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the button is currently pressed. **Notes:** True if the button is pressed. (Read and Write property)

45.2.15 Events

45.2.16 Action(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when the mouse button is clicked in the control.
45.2. CONTROL BUTTONMBS

Notes: Currently called after each MouseUp event.

45.2.17 EnableMenuItems

45.2.18 MenuAction(HitItem as MenuItem) As Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: Called when a menu item is chosen. Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

45.2.19 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: The mouse button was pressed inside the controls region at the location passed in to x, y. Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control. Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

45.2.20 MouseDrag(x as Integer, y as Integer)

45.2.21 MouseUp(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when the mouse button is released.

45.2.22 ScaleFactorChanged(NewFactor as Double)

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The backing store scale factor has changed. **Notes:** Please invalidate any cached bitmaps or other relevant state.
45.3. **CLASS CHECKBOX**

45.3 class Checkbox

45.3.1 class Checkbox

Plugin Version: 2.9, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An extension of Realbasic’s internal control.

45.3.2 Methods

45.3.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSButtonMBS object for the given control.

**Example:**

MsgBox CheckBox1.NSButtonMBS.className

**Notes:** This way you can manipulate Cocoa controls directly.
45.4  control CustomControlMBS

45.4.1  control CustomControlMBS

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A control where you can in the IDE define the paint event and see in the IDE what you see in the compiled application.
**Deprecated:** This item is deprecated and should no longer be used. You can use Oval instead.

45.4.2  Properties

45.4.3  Code as String

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The code for the paint event.
**Notes:**
Commands:
PenWidth n
PenHeight n
ForeColor n
FillRect x,y,w,h
DrawRect x,y,w,h
FillRoundRect x,y,w,h,X,Y
DrawRoundRect x,y,w,h,X,Y
FillOval x,y,w,h
DrawOval x,y,w,h
DrawPicture X,x,y,w,h - draws picture number X into the given rectangle
DrawLine x1,y1,x1,y1 - draws line

Variables:
width: width of control
height: height of control
left: left position of control
top: top position of control
ValueX: Value of the ValueX property (X from 1 to 4)
ColorX: Value of the Color1 property (X from 1 to 4)
(Read and Write property)

45.4.4  Color1 as Color

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the color properties.
45.4. CONTROL CUSTOMCONTROLMBS

Notes: (Read and Write property)

45.4.5 Color2 as Color

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the color properties.
Notes: (Read and Write property)

45.4.6 Color3 as Color

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the color properties.
Notes: (Read and Write property)

45.4.7 Color4 as Color

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the color properties.
Notes: (Read and Write property)

45.4.8 Picture1 as Picture

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the picture properties you can use for the drawpicture command.
Notes: (Read and Write property)

45.4.9 Picture2 as Picture

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the picture properties you can use for the drawpicture command.
Notes: (Read and Write property)

45.4.10 Picture3 as Picture

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the picture properties you can use for the drawpicture command.
45.4.11 Picture4 as Picture

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the picture properties you can use for the drawpicture command.
Notes: (Read and Write property)

45.4.12 Value1 as String

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the value properties.
Notes: (Read and Write property)

45.4.13 Value2 as String

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the value properties.
Notes: (Read and Write property)

45.4.14 Value3 as String

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the value properties.
Notes: (Read and Write property)

45.4.15 Value4 as String

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the value properties.
Notes: (Read and Write property)
45.4.16 Events

45.4.17 EnableMenuItems

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event where you can enable menu items.

45.4.18 MenuAction(HitItem as MenuItem) As Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Called when a menuitem is choosen. **Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

45.4.19 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when the user clicks with the mouse in the control area. **Notes:** Return true to handle the event and enable the MouseUp event.

This event exists because RB does not add a Mousedown event by default to the plugin control.

45.4.20 MouseDrag(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The mouse drag event.

45.4.21 MouseUp(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when the user releases the mouse button and you returned true on the MouseDown event.
45.4.22  ScaleFactorChanged(NewFactor as Double)

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The backing store scale factor has changed.  
**Notes:** Please invalidate any cached bitmaps or other relevant state.
45.5. CLASS HIVIEWMBS

45.5 class HIViewMBS

45.5.1 class HIViewMBS

Function: A class to represent a native Carbon control on a Realbasic window.
Deprecated: This item is deprecated and should no longer be used. You can use NSViewMBS instead.
Notes:
Only used for some interface hacks like moving the scrollbars of an editfield.
Not available on Cocoa targets.

45.5.2 Methods

45.5.3 AccessibilityActionDescription(action as string) as string

Function: Returns the action description string for a standard accessibility action.
Notes: This routine is useful if you are implementing an accessible object that implements a standard action and you want to make sure your object provides the same role action string that the a system-supplied object provides. This routine can provide action description strings for all actions that are used in the standard/system accessible objects on Mac OS X 10.4 and later. Once this routine is able to provide a description string for an action, it will continue to do so on subsequent system releases, even if the system no longer produces a standard accessible object that supports the action.

45.5.4 available as boolean

Function: Whether HIView is available.
Notes: Currently only true on Carbon target.

45.5.5 BoundsHeight as Double

Function: Height of the view bounds.
Notes: Returns the local bounds of a view. The local bounds are the coordinate system that is completely view-relative. A view’s top left coordinate starts out at 0, 0. Most operations are done in these local coordinates. Moving a view is done via the frame instead.
45.5.6 **BoundsLeft as Double**

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Left of the view bounds. **Notes:** Returns the local bounds of a view. The local bounds are the coordinate system that is completely view-relative. A view’s top left coordinate starts out at 0, 0. Most operations are done in these local coordinates. Moving a view is done via the frame instead.

45.5.7 **BoundsTop as Double**

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Top of the view bounds. **Notes:** Returns the local bounds of a view. The local bounds are the coordinate system that is completely view-relative. A view’s top left coordinate starts out at 0, 0. Most operations are done in these local coordinates. Moving a view is done via the frame instead.

45.5.8 **BoundsWidth as Double**

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Width of the view bounds. **Notes:** Returns the local bounds of a view. The local bounds are the coordinate system that is completely view-relative. A view’s top left coordinate starts out at 0, 0. Most operations are done in these local coordinates. Moving a view is done via the frame instead.

45.5.9 **CountSubviews as Integer**

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Counts the number of subviews embedded in a view. **Notes:** 0 on any error.

45.5.10 **CreateImage as picture**

MBS MacClassic Plugin, Plugin Version: 8.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a picture from the control. **Notes:** Returns nil on any error. See also:

- 45.5.11 CreateImage(byref x as Double, byref y as Double, byref width as Double, byref height as Double) as picture
45.5. **CLASS HVIEWMBS**

### 45.5.11 CreateImage(byref x as Double, byref y as Double, byref width as Double, byref height as Double) as picture

**Function:** Creates a picture from the control.

**Notes:**

Returns nil on any error.

In the double values, you will get the control rectangle within the picture returned.

See also:

- 45.5.10 CreateImage as picture

### 45.5.12 FirstSubview as HViewMBS

**Function:** Returns the first subview of a container.

**Notes:**

The first subview is the topmost subview in z-order.

Nil on any error.

### 45.5.13 FrameHeight as Double

**Function:** Height of frame of a view.

**Notes:** The frame is the bounds of a view relative to its parent’s local coordinate system.

### 45.5.14 FrameLeft as Double

**Function:** Left of frame of a view.

**Notes:** The frame is the bounds of a view relative to its parent’s local coordinate system.

### 45.5.15 FrameTop as Double

**Function:** Top of frame of a view.

**Notes:** The frame is the bounds of a view relative to its parent’s local coordinate system.
45.5.16  FrameWidth as Double

**Notes:** The frame is the bounds of a view relative to its parent’s local coordinate system.

45.5.17  IndexedSubview(index as Integer) as HIViewMBS

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Get the Nth subview of a view.  
**Example:**

```vbnet
Sub List(h as hiviewMBS, tab as string=””)
    dim i,c as Integer
    dim t as string
    dim s as HIViewMBS

    ListBox1.AddRow tab+h.Kind
    ListBox1.Cell(ListBox1.LastIndex,1)=h.Signature

    c=h.CountSubviews
    for i=1 to c
        s=h.IndexedSubview(i)
        list s,tab+” ”
    next
End Sub
```

**Notes:**

Instead of calling IndexedSubview repeatedly, it may be more efficient to iterate through the subviews of a view with calls FirstSubview and NextView.
Nil on any error.

Index is from 1 to count.

45.5.18  IsAccessibilityIgnored as Boolean

MBS MacClassic Plugin, Plugin Version: 10.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Reports whether or not the given HIObject is marked as ignored for accessibility.  
**Notes:** See the discussion of HIObjectSetAccessibilityIgnored for details on what it means to be accessibility ignored.
45.5. **CLASS HIVIEWMBS**

### 45.5.19 Kind as string

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Kind of this view.  
**Notes:** e.g. a scrollbar has "sbar", a slider has "sldr".

### 45.5.20 LastSubview as HIViewMBS

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the last subview of a container.  
**Notes:**  
The last subview is the bottommost subview in z-order.  
Nil on any error.

### 45.5.21 LatentlyVisible as Boolean

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether or not a view is latently visible.  
**Notes:** The view’s visibility is also affected by the visibility of its parents; if any parent view is invisible, this view is considered invisible as well. LatentlyVisible returns whether a view is latently visible, even if its parents are invisible.

### 45.5.22 MoveBy(dx as Double, dy as Double)

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Moves a view by a certain distance, relative to its current location.  
**Notes:** This affects a view’s frame, but not its bounds.

### 45.5.23 NextView as HIViewMBS

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the next view after the one given, in z-order.  
**Notes:** Nil on any error.
45.5.24 PreviousView as HIViewMBS

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the previous view before the one given, in z-order. **Notes:** Nil on any error.

45.5.25 SetAccessibilityIgnored(value as Boolean)

MBS MacClassic Plugin, Plugin Version: 10.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Marks an HIObject as ignored (or not) for the purposes of the accessibility APIs. **Notes:**

An HIObject that is ignored for accessibility will never be shown to an assistive application that uses the accessibility APIs to examine an interface. Your application’s accessibility implementation can (and should) still report an ignored HIObject as usual. Carbon’s accessibility engine will automatically prune any ignored HIObjects out of the data that is shown to an assistive application.

By default, an HIObject is *not* accessibility ignored.

45.5.26 SetAuxiliaryAccessibilityDescriptionAttribute(identifier as UInt64, value as string)

MBS MacClassic Plugin, Plugin Version: 10.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Associates an additional accessibility description attribute with a UIElement that is used to represent a given HIObject or a part thereof. **Notes:**

This routine lets your application provide the name of and data for an accessibility attribute that you want to add to the UIElement used to represent a given HIObject-identifier pair. Normally, accessibility attributes can only be supplied dynamically via Carbon Events, but this routine allows you to supply them statically.

When an accessibility attribute Carbon Event is handled by the HIObject with a given identifier, the toolbox automatically supplies the names and/or values of any auxiliary attributes associated with that HIObject-identifier pair.

This routine is particularly useful for supplying values for the kAXDescriptionAttribute, kAXTitleUIElementAttribute, AXServesAsTitleUIElementAttribute, kAXLinkedUIElementsAttribute and other attributes whose value is specific to the layout and usage of your application.

This routine only allows you to associate attributes whose values never change. If you need to supply attributes whose values are determined dynamically or whose values are settable, you must install the normal accessibility Carbon Event handlers.
45.5. **CLASS HIVIEWMBS**

The auxiliary attribute store is consulted during the HIOBJECT's default handling of the accessibility attribute Carbon Events. This means that any programmatic handling of a given accessibility attribute will have a chance to override or block the consultation of the store. The general rule is that if the toolbox or a Carbon Event handler can provide the attribute value some other way, the store will not be consulted.

**self**: The HIOBJECT part of the object-identifier pair to which the attribute data is associated. **Identifier**: The 64-bit identifier part of the object-identifier pair to which the attribute data is associated. When you want to associate the attribute data to the HIOBJECT as a whole – such as when you want to give a description attribute to a push button – you should pass zero in this parameter.

**Value**: The description text.

### 45.5.27 Signature as string

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: Signature of this view. **Notes**: Most times "appl" for Apple Inc.

### 45.5.28 Superview as HVIEWMBS

### 45.5.29 Properties

### 45.5.30 Handle as Integer

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: The handle of the hiview control. **Notes**: (Read and Write property)

### 45.5.31 DrawingEnabled as Boolean

MBS MacClassic Plugin, Plugin Version: 7.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function**: Turns control drawing on or off. **Notes**: 
You can use this to ensure that no drawing events are sent to the control. Even Draw1Control will not draw! NeedsDisplay is also rendered useless when drawing is off.
(Read and Write computed property)

45.5.32 Maximum as Integer

Function: The maximum value of this control.
Notes:
Sliders and Scrollbars do use this property.
(Read and Write computed property)

45.5.33 Minimum as Integer

Function: The minimum value of this control.
Notes:
Sliders and Scrollbars do use this property.
(Read and Write computed property)

45.5.34 NeedsDisplay as Boolean

Function: Whether this control needs to be redrawn soon.
Notes:
Marks a view as needing to be completely redrawn, or completely valid. If the view is not visible, or is obscured completely by other views, no action is taken.
(Read and Write computed property)

45.5.35 Text as String

Function: The text of the view.
Notes:
The "text" of the view is the text that will be displayed when drawing the view.
(Read and Write computed property)
45.5. **CLASS HIVIEWMBS**

### 45.5.36 Value as Integer

**Function:** The value of the view.

**Example:**

```plaintext
dim s as HIViewMBS
'... fill s with hiview
slider1.Value=s.Value
```

**Notes:** (Read and Write computed property)

### 45.5.37 ViewSize as Integer

**Function:** View’s view size.

**Notes:**

The view size is the size of the content to which a view’s display is proportioned. Most commonly used to set the proportional size of a scroll bar’s thumb indicator.

(Read and Write computed property)

### 45.5.38 Visible as Boolean

**Function:** Whether this view is visible.

**Notes:**

Hides or shows a view. Marks the area the view will occupy or used to occupy as needing to be redrawn later.

Note that Visible returns a view’s effective visibility, which is determined both by the view’s own visibility and the visibility of its parent views. If a parent view is invisible, then this view is considered to be invisible also.

Latent visibility can be determined with LatentlyVisible.

(Read and Write computed property)
45.6 control ImageMBS

45.6.1 control ImageMBS

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: A control for REALbasic to draw an image into a window.
Deprecated: This item is deprecated and should no longer be used. You can use Oval instead. Notes: The image is scaled to the size of the control.

45.6.2 Properties

45.6.3 Backdrop as Picture

Notes: This image is scaled to the needed size.
(Read and Write property)

45.6.4 Events

45.6.5 EnableMenuItems

45.6.6 MenuAction(HitItem as MenuItem) As Boolean

Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

45.6.7 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: The event called when the user clicks with the mouse in the control area.
Notes:
Return true to handle the event and enable the MouseUp event.

This event exists because RB does not add a Mousedown event by default to the plugin control.

**45.6.8 MouseDrag(x as Integer, y as Integer)**

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The mouse drag event.

**45.6.9 MouseUp(x as Integer, y as Integer)**

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The event called when the user releases the mouse button and you returned true on the MouseDown event.

**45.6.10 ScaleFactorChanged(NewFactor as Double)**

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The backing store scale factor has changed.
**Notes:** Please invalidate any cached bitmaps or other relevant state.
45.7 class Label

45.7.1 class Label

Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** An extension of Realbasic’s internal control.

45.7.2 Methods

45.7.3 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 13.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSTextFieldMBS object for the given control. **Notes:** This way you can manipulate Cocoa controls directly.

45.7.4 SetTextThreadSafeMBS(text as string)

MBS Util Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets text property on main thread. **Notes:**

This method is to allow you to set the text property of a label in a thread without a problem.

If called on main thread, the plugin will simply set text property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.
45.8. CONTROL LINEMBS

45.8  control LineMBS

45.8.1  control LineMBS

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A control for REALbasic to draw a line into a window.

**Deprecated:** This item is deprecated and should no longer be used. You can use Oval instead. **Notes:**
Basicly the same as the original Line control from REALbasic.

45.8.2  Properties

45.8.3  BorderWidth as Integer

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The width of the line.

**Notes:**
Set to 0 to disabled the border.
(Read and Write property)

45.8.4  LineColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The color for drawing the line.

**Notes:**
There is a bug in REALbasic. If you enter the color as a hex value (e.g. ";& c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color.
(Read and Write property)

45.8.5  Mirror as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether the line is mirrored.

**Notes:**
Normally the line is drawn from top left to bottom right.
If Mirror is true, the line is drawn from bottom left to top right.
(Read and Write property)
45.8.6 Events

45.8.7 EnableMenuItems

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event where you can enable menu items.

45.8.8 MenuAction(HitItem as MenuItem) As Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Called when a menuitem is choosen. **Notes:** This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

45.8.9 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when the user clicks with the mouse in the control area. **Notes:** Return true to handle the event and enable the MouseUp event.

This event exists because RB does not add a Mousedown event by default to the plugin control.

45.8.10 MouseDrag(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The mouse drag event.

45.8.11 MouseUp(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when the user releases the mouse button and you returned true on the MouseDown event.
45.8.12 ScaleFactorChanged(NewFactor as Double)

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The backing store scale factor has changed. **Notes:** Please invalidate any cached bitmaps or other relevant state.
45.9 class Listbox

45.9.1 class Listbox

Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The built in listbox class in REALbasic.

45.9.2 Methods

45.9.3 `HorizontalNSScrollerMBS as NSScrollerMBS`

MBS MacControls Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns horizontal scrollbar for a listbox.
**Notes:** Only for Cocoa target.

45.9.4 `InvalidateCellThreadSafeMBS(Row as Integer, Column as Integer)`

MBS Util Plugin, Plugin Version: 13.5, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Calls invalidate cell on main thread.
**Notes:** This method is to allow you to invalidate a listbox cell in a thread without a problem.

If called on main thread, the plugin will simply call through directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

45.9.5 `VerticalNSScrollerMBS as NSScrollerMBS`

MBS MacControls Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns vertical scrollbar for a listbox.
**Notes:** Only for Cocoa target.
45.10  Globals

45.10.1  ShowModalThreadSafeMBS(extends theMessageDialog as MessageDialog)

MBS Util Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Call ShowModal method on main thread.
**Notes:**
This method is to allow you to call the ShowModal method of a MessageDialog in a thread without a problem.

If called on main thread, the plugin will simply call method directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

Of course as this is asynchronously, you do not get details on which button was pressed.
Deprecated. Behavior from Xojo changed, so this method does no longer work.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

45.10.2  ShowModalWithinThreadSafeMBS(extends theMessageDialog as MessageDialog, parent as window)

MBS Util Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Call ShowModalWithin method on main thread.
**Notes:**
This method is to allow you to call the ShowModalWithin method of a MessageDialog in a thread without a problem.

If called on main thread, the plugin will simply call method directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

Of course as this is asynchronously, you do not get details on which button was pressed.
Deprecated. Behavior from Xojo changed, so this method does no longer work.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.
45.10.3 TabpanelCountMBS(‘theTabpanel as Tabpanel) as Integer

Function: Returns the number of pages on a tabpanel.
Example:

dim i,c as Integer

c=TabpanelCountMBS(TabPanel1)

for i=0 to c
TabpanelEnabledMBS TabPanel1,i,false
next

Notes:
This function does currently not work with the Mac Cocoa target of REALbasic. If you need it, please send in a feature request.

You can do the same with PanelCount property in newer Real Studio versions.

45.10.4 TabpanelEnabledMBS(‘theTabpanel as Tabpanel, index as Integer, value as boolean)

Function: Enables or disables a tabpanel.
Example:

dim i,c as Integer

c=TabpanelCountMBS(TabPanel1)

for i=0 to c
TabpanelEnabledMBS TabPanel1,i,false
next

Notes:
Index is from 1 to count.
Make sure the disabled tab panel is not used while you disable it.
You may need to call refresh to redraw the tabpanel.
PS: Can’t find a way to disable tabs on Windows. Any hint is welcome.
This function works only on Carbon targets.
For Cocoa, please use enabled property of NSTabViewItemMBS class.

45.11 control OvalMBS

45.11.1 control OvalMBS

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A control for REALbasic to draw an oval into a window. **Deprecated:** This item is deprecated and should no longer be used. You can use Oval instead. **Notes:** Basically the same as the original Oval control from REALbasic.

45.11.2 Properties

45.11.3 BorderColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color for drawing the border. **Notes:** There is a bug in REALbasic. If you enter the color as a hex value (e.g. "& c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color. (Read and Write property)

45.11.4 BorderWidth as Integer

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of the border line. **Notes:** Set to 0 to disabled the border. (Read and Write property)

45.11.5 FillColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color for filling the oval. **Notes:**
There is a bug in REALbasic. If you enter the color as a hex value (e.g. "& c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color. (Read and Write property)

45.11.6 Events

45.11.7 EnableMenuItems

45.11.8 MenuAction(HitItem as MenuItem) As Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: Called when a menuitem is choosen. Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

45.11.9 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: The event called when the user clicks with the mouse in the control area. Notes: Return true to handle the event and enable the MouseUp event.

This event exists because RB does not add a Mousedown event by default to the plugin control.

45.11.10 MouseDrag(x as Integer, y as Integer)

45.11.11 MouseUp(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: The event called when the user releases the mouse button and you returned true on the MouseDown event.
45.11.12 ScaleFactorChanged(NewFactor as Double)

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The backing store scale factor has changed. **Notes:** Please invalidate any cached bitmaps or other relevant state.
45.12  class Radiobutton

45.12.1  class Radiobutton

Plugin Version: 2.9, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** An extension of Realbasic’s internal control.

45.12.2  Methods

45.12.3  NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSButtonMBS object for the given control.

**Example:**

MsgBox RadioButton1.NSButtonMBS.className

**Notes:** This way you can manipulate Cocoa controls directly.
45.13 control RectangleMBS

45.13.1 control RectangleMBS

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A control for REALbasic to draw a rectangle into a window. **Deprecated:** This item is deprecated and should no longer be used. You can use Oval instead. **Notes:** Basically the same as the original Rectangle control from REALbasic.

45.13.2 Properties

45.13.3 BorderWidth as Integer

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of the border line. **Notes:** Set to 0 to disable the border. (Read and Write property)

45.13.4 BottomRightColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color for drawing the bottom and right border lines. **Notes:** There is a bug in REALbasic. If you enter the color as a hex value (e.g. "& c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color. (Read and Write property)

45.13.5 FillColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color for filling the rectangle. **Notes:** There is a bug in REALbasic. If you enter the color as a hex value (e.g. "& c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color. (Read and Write property)
45.13.6  TopLeftColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color for drawing the top and left border lines.

**Notes:**
There is a bug in REALbasic. If you enter the color as a hex value (e.g. "& c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color.
(Read and Write property)

45.13.7  Events

45.13.8  EnableMenuItems

45.13.9  MenuAction(HitItem as MenuItem) As Boolean

45.13.10  MouseDown(x as Integer, y as Integer, Modifiers as Integer) as boolean

45.13.11  MouseDrag(x as Integer, y as Integer)
45.13.12 **MouseUp(x as Integer, y as Integer)**

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The event called when the user releases the mouse button and you returned true on the MouseDown event.

45.13.13 **ScaleFactorChanged(NewFactor as Double)**

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The backing store scale factor has changed. **Notes:** Please invalidate any cached bitmaps or other relevant state.
45.14 class RectControl

45.14.1 class RectControl

Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** An extension of Realbasic’s internal control.

45.14.2 Methods

45.14.3 InvalidateThreadSafeMBS(EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Call invalidate method on main thread.

**Notes:**

This method is to allow you to call the invalidate method of a control in a thread without a problem.

If called on main thread, the plugin will simply call method directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

See also:

- 45.14.4 InvalidateThreadSafeMBS(X as Integer, Y as Integer, Width as Integer, Height as Integer, EraseBackground as boolean = true)

45.14.4 InvalidateThreadSafeMBS(X as Integer, Y as Integer, Width as Integer, Height as Integer, EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Call invalidate method on main thread.

**Notes:**

This method is to allow you to call the invalidate method of a control in a thread without a problem.

If called on main thread, the plugin will simply call method directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

See also:
45.14. CLASS RECTCONTROL

- 45.14.3 InvalidateThreadSafeMBS(EraseBackground as boolean = true)

45.14.5 RefreshThreadSafeMBS(EraseBackground as boolean = true)

Notes:
This method is to allow you to call the refresh method of a control in a thread without a problem.

If called on main thread, the plugin will simply call method directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

45.14.6 SetEnabledThreadSafeMBS(value as boolean)

Notes:
This method is to allow you to set the enabled property of a control in a thread without a problem.

If called on main thread, the plugin will simply set enabled property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

45.14.7 SetVisibleThreadSafeMBS(value as boolean)

Notes:
This method is to allow you to set the visible property of a control in a thread without a problem.

If called on main thread, the plugin will simply set visible property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.
It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.
45.15  control RoundRectangleMBS

45.15.1  control RoundRectangleMBS

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A control for REALbasic to draw a round rectangle into a window.
**Deprecated:** This item is deprecated and should no longer be used. You can use Oval instead. **Notes:**
Basically the same as the original round rectangle control from REALbasic.
For composite windows there is a non zero chance that you see redraw problems.

45.15.2  Properties

45.15.3  BorderColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The color for drawing the border lines.
**Notes:**
There is a bug in REALbasic. If you enter the color as a hex value (e.g. "&c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color.
(Read and Write property)

45.15.4  BorderWidth as Integer

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The width of the border line.
**Notes:**
Set to 0 to disabled the border.
(Read and Write property)

45.15.5  FillColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The color for filling the rectangle.
**Notes:**
There is a bug in REALbasic. If you enter the color as a hex value (e.g. "&c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color.
(Read and Write property)
45.15.6 OvalHeight as Integer

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The height of the rounded corners in pixels.
**Notes:** (Read and Write property)

45.15.7 OvalWidth as Integer

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The width of the rounded corners in pixels.
**Notes:** (Read and Write property)

45.15.8 Events

45.15.9 EnableMenuItems

45.15.10 MenuAction(HitItem as MenuItem) As Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The event where you can enable menu items.

45.15.11 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The event called when the user clicks with the mouse in the control area.
**Notes:**
Return true to handle the event and enable the MouseUp event.

This event exists because RB does not add a Mousedown event by default to the plugin control.
45.15.12 MouseDrag(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The mouse drag event.

45.15.13 MouseUp(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The event called when the user releases the mouse button and you returned true on the MouseDown event.

45.15.14 ScaleFactorChanged(NewFactor as Double)

MBS Overlay Plugin, Plugin Version: 17.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The backing store scale factor has changed.
**Notes:** Please invalidate any cached bitmaps or other relevant state.
CHAPTER 45. CONTROLS

45.16  class TabPanel

45.16.1 class TabPanel

Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Extends the TabPanel control inside Realbasic.

45.16.2 Methods

45.16.3 NSTabViewMBS as NSTabViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a NSTabViewMBS object for the given control.

**Example:**

MsgBox TabPanel1.NSTabViewMBS.className

**Notes:** This way you can manipulate Cocoa controls directly.
Chapter 46

CoreAnimation

46.1 class CALayerMBS

46.1.1 class CALayerMBS

Function: The plugin class for a CoreAnimation.  
Notes:  
The CALayer class manages image-based content and allows you to perform animations on that content. Layers are often used to provide the backing store for views but can also be used without a view to display content. A layer’s main job is to manage the visual content that you provide but the layer itself has visual attributes that can be set, such as a background color, border, and shadow. In addition to managing visual content, the layer also maintains information about the geometry of its content (such as its position, size, and transform) that is used to present that content onscreen. Modifying the properties of the layer is how you initiate animations on the layer’s content or geometry. A layer object encapsulates the duration and pacing of a layer and its animations by adopting the CAMediaTiming protocol, which defines the layer’s timing information.

If the layer object was created by a view, the view typically assigns itself as the layer’s delegate automatically, and you should not change that relationship. For layers you create yourself, you can assign a delegate object and use that object to provide the contents of the layer dynamically and perform other tasks. A layer may also have a layout manager object (assigned to the layoutManager property) to manage the layout of subviews separately.

Available in OS X v10.5 and later.
46.1.2 Methods

46.1.3 addSublayer(layer as CALayerMBS)

Function: Appends the layer to the layer’s list of sublayers.
Notes: If the array in the sublayers property is nil, calling this method creates an array for that property and adds the specified layer to it.

46.1.4 available as boolean

Function: Returns true if CALayer is available.
Notes: True on Mac and False on Windows/Linux.

46.1.5 Constructor

Function: Initializes the layer.
Notes: Available in OS X v10.5 and later.

46.1.6 display

Function: Reloads the content of this layer.
Notes: Do not call this method directly. The layer calls this method at appropriate times to update the layer’s content. If the layer has a delegate object, this method attempts to call the delegate’s Configuring the Layer’s Rendering Behavior method, which the delegate can use to update the layer’s contents. If the delegate does not implement the Configuring the Layer’s Rendering Behavior method, this method creates a backing store and calls the layer’s drawInContext: method to fill that backing store with content. The new backing store replaces the previous contents of the layer.

Subclasses can override this method and use it to set the layer’s contents property directly. You might do this if your custom layer subclass handles layer updates differently.
46.1.7  displayIfNeeded

**Function:** Initiates the update process for a layer if it is currently marked as needing an update.
**Notes:**
You can call this method as needed to force an update to your layer’s contents outside of the normal update cycle. Doing so is generally not needed, though. The preferred way to update a layer is to call setNeedsDisplay and let the system update the layer during the next cycle. Available in OS X v10.6 and later.

46.1.8  layer as CALayerMBS

**Function:** Creates and returns an instance of the layer object.
**Notes:**
Returns the initialized layer object or nil if initialization was not successful.
If you subclass CALayer, you may override this method and use it to provide an instance of your specific subclass.

46.1.9  layoutIfNeeded

**Function:** Recalculate the receiver’s layout, if required.
**Notes:** When this message is received, the layer’s super layers are traversed until a ancestor layer is found that does not require layout. Then layout is performed on the entire layer-tree beneath that ancestor.

46.1.10  layoutSublayers

**Function:** Tells the layer to update its layout.
**Notes:**
Subclasses can override this method and use it to implement their own layout algorithm. Your implementation must set the frame of each sublayer managed by the receiver.

The default implementation of this method calls the layoutSublayersOfLayer method of the layer’s delegate object. If there is no delegate object, or the delegate does not implement that method, this method calls the layoutSublayersOfLayer method of the object in the layoutManager property.
CHAPTER 46. COREANIMATION

46.1.11 removeAllAnimations

Function: Remove all animations attached to the layer.

46.1.12 removeFromSuperlayer

Function: Detaches the layer from its parent layer.
Notes:
You can use this method to remove a layer (and all of its sublayers) from a layer hierarchy. This method updates both the superlayer’s list of sublayers and sets this layer’s superlayer property to nil. Available in OS X v10.5 and later.

46.1.13 renderInContext(CGContextHandle as Integer) as boolean

Function: Renders content of CALayer into given CGContext.
Notes:
Renders the receiver and its sublayers into the specified context. This method renders directly from the layer tree, ignoring any animations added to the render tree. Renders in the coordinate space of the layer.

Returns true if plugin called render command, so layer can draw itself.
Not all layers support drawing into context.

46.1.14 renderInPicture(Pic as Picture) as boolean

Function: Renders content of CALayer into given Picture.
Notes:
Renders the receiver and its sublayers into the specified context. This method renders directly from the layer tree, ignoring any animations added to the render tree. Renders in the coordinate space of the layer.

Returns true if plugin called render command, so layer can draw itself.
Not all layers support drawing into context.
46.1.15  setNeedsDisplay

Function: Marks the layer’s contents as needing to be updated.
Notes:
Calling this method causes the layer to recache its content. This results in the layer potentially calling either the displayLayer or drawLayer:inContext method of its delegate. The existing content in the layer’s contents property is removed to make way for the new content.

Available in OS X v10.5 and later.

46.1.16  setNeedsDisplayInRect(r as CGRectMBS)

Function: Marks the region within the specified rectangle as needing to be updated.
Notes:
r: The rectangular region of the layer to mark as invalid. You must specify this rectangle in the layer’s own coordinate system.
Available in OS X v10.5 and later.

46.1.17  setNeedsLayout

Function: Invalidates the layer’s layout and marks it as needing an update.
Notes:
You can call this method to indicate that the layout of a layer’s sublayers has changed and must be updated. The system typically calls this method automatically when the layer’s bounds change or when sublayers are added or removed. In OS X, if your layer’s layoutManager property contains an object that implements the invalidateLayoutOfLayer method, that method is called too.

During the next update cycle, the system calls the layoutSublayers method of any layers requiring layout updates.
Available in OS X v10.5 and later.

46.1.18  sublayers as CALayerMBS()

Function: The array with sublayers.
46.1.19 Properties

46.1.20 affineTransform as CGAffineTransformMBS

Function: The affine version of the layer’s transform.
Notes: The affine transform structure that corresponds to the value in the layer’s transform property.
(Read and Write property)

46.1.21 anchorPoint as CGRectMBS

Function: Defines the anchor point of the layer’s bounds rectangle. Animatable.
Notes: You specify the value for this property using the unit coordinate space. The default value of this property
is (0.5, 0.5), which represents the center of the layer’s bounds rectangle. All geometric manipulations to the
view occur about the specified point. For example, applying a rotation transform to a layer with the default
anchor point causes the layer to rotate around its center. Changing the anchor point to a different location
would cause the layer to rotate around that new point.
For more information about the relationship between the frame, bounds, anchorPoint and position proper-
ties, see Core Animation Programming Guide.
Available in OS X v10.5 and later.
(Read and Write property)

46.1.22 anchorPointZ as Double

Function: The anchor point for the layer’s position along the z axis. Animatable.
Notes: This property specifies the anchor point on the z axis around which geometric manipulations occur. The
point is expressed as a distance (measured in points) along the z axis. The default value of this property is 0.
Available in OS X v10.6 and later.
(Read and Write property)
46.1.23  AutoresizingMask as Integer

**Function:** A bitmask defining how the layer is resized when the bounds of its superlayer changes.
**Notes:**
If your app does not use a layout manager or constraints to handle layout changes, you can assign a value to this property to adjust the layer’s size in response to changes in the superlayer’s bounds. For a list of possible values, see “Autoresizing Mask”.

The default value of this property is kCALayerNotSizable.
(Read and Write property)

46.1.24  backgroundColor as Variant

**Function:** The background color of the receiver. Animatable.
**Notes:**
Value must be a CGColorMBS.
The default value of this property is nil.

The value of this property is retained using the Core Foundation retain/release semantics. This behavior occurs despite the fact that the property declaration appears to use the default assign semantics for object retention.
(Read and Write property)

46.1.25  borderColor as Variant

**Function:** The color of the layer’s border. Animatable.
**Notes:**
Value must be a CGColorMBS.
The default value of this property is an opaque black color.

The value of this property is retained using the Core Foundation retain/release semantics. This behavior occurs despite the fact that the property declaration appears to use the default assign semantics for object retention.
(Read and Write property)
CHAPTER 46. COREANIMATION

46.1.26  borderWidth as Double

Function: The width of the layer’s border. Animatable.
Notes: When this value is greater than 0.0, the layer draws a border using the current borderColor value. The
border is drawn inset from the receiver’s bounds by the value specified in this property. It is composited
above the receiver’s contents and sublayers and includes the effects of the cornerRadius property.

The default value of this property is 0.0.
(Read and Write property)

46.1.27  bounds as CGRectMBS

Function: The layer’s bounds rectangle. Animatable.
Notes: The bounds rectangle is the origin and size of the layer in its own coordinate space. When you create a new
standalone layer, the default value for this property is an empty rectangle, which you must change before
using the layer. The values of each coordinate in the rectangle are measured in points.

For more information about the relationship between the frame, bounds, anchorPoint and position proper-
ties, see Core Animation Programming Guide.
(Read and Write property)

46.1.28  className as string

Function: The class name of the layer.
Notes: Useful for debugging.
(Read only property)

46.1.29  classPath as string

Function: The path of this layer class.
Notes:
46.1. **CLASS CALAYERMBS**

Useful for debugging to know what super classes the layer has.

(Read only property)

---

46.1.30 **contents as Variant**

MBS AVFoundation Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

**Function:** The contents of the layer.

**Notes:**

Currently only CGImageMBS is allowed.

(Read and Write property)

---

46.1.31 **contentsCenter as CGRectMBS**

**Function:** The rectangle that defines how the layer contents are scaled during a resizing operation. Animatable.

**Notes:**

You can use this property to subdivide the layer’s content into a 3x3 grid. The value in this property specifies the location and size of the center rectangle in that grid. If the layer’s contentsGravity property is set to one of the resizing modes, resizing the layer causes scaling to occur differently in each rectangle of the grid. The center rectangle is stretched in both dimensions, the top-center and bottom-center rectangles are stretched only horizontally, the left-center and right-center rectangles are stretched only vertically, and the four corner rectangles are not stretched at all. Therefore, you can use this technique to implement stretchable backgrounds or images using a three-part or nine-part image.

The value in this property is set to the unit rectangle (0.0,0.0) (1.0,1.0) by default, which causes the entire image to scale in both dimensions. If you specify a rectangle that extends outside the unit rectangle, the result is undefined. The rectangle you specify is applied only after the contentsRect property has been applied to the image.

Note: If the width or height of the rectangle in this property is very small or 0, the value is implicitly changed to the width or height of a single source pixel centered at the specified location.

(Read and Write property)

---

46.1.32 **contentsRect as CGRectMBS**

**Function:** The rectangle, in the unit coordinate space, that defines the portion of the layer’s contents that should be used. Animatable.
Notes:
Defaults to the unit rectangle (0.0, 0.0, 1.0, 1.0).
If pixels outside the unit rectangle are requested, the edge pixels of the contents image will be extended outwards.
If an empty rectangle is provided, the results are undefined.
(Read and Write property)

46.1.33 contentsScale as Double

Function: The scale factor applied to the layer.
Notes:
This value defines the mapping between the logical coordinate space of the layer (measured in points) and the physical coordinate space (measured in pixels). Higher scale factors indicate that each point in the layer is represented by more than one pixel at render time. For example, if the scale factor is 2.0 and the layer’s bounds are 50 x 50 points, the size of the bitmap used to present the layer’s content is 100 x 100 pixels.

The default value of this property is 1.0. For layers attached to a view, the view changes the scale factor automatically to a value that is appropriate for the current screen. For layers you create and manage yourself, you must set the value of this property yourself based on the resolution of the screen and the content you are providing. Core Animation uses the value you specify as a cue to determine how to render your content.

Available in OS X v10.7 and later.
(Read and Write property)

46.1.34 cornerRadius as Double

Function: The radius to use when drawing rounded corners for the layer’s background. Animatable.
Notes:
Setting the radius to a value greater than 0.0 causes the layer to begin drawing rounded corners on its background. By default, the corner radius does not apply to the image in the layer’s contents property; it applies only to the background color and border of the layer. However, setting the masksToBounds property to true causes the content to be clipped to the rounded corners.

The default value of this property is 0.0.
(Read and Write property)
46.1.35 DoubleSided as boolean

**Function:** A Boolean indicating whether the layer displays its content when facing away from the viewer. Animatable.

**Notes:**
When the value in this property is false, the layer hides its content when it faces away from the viewer. The default value of this property is true.
Available in OS X v10.5 and later.
(Read and Write property)

46.1.36 drawsAsynchronously as boolean

**Function:** A Boolean indicating whether drawing commands are deferred and processed asynchronously in a background thread.

**Notes:**
When this property is set to true, the graphics context used to draw the layer’s contents queues drawing commands and executes them on a background thread rather than executing them synchronously. Performing these commands asynchronously can improve performance in some apps. However, you should always measure the actual performance benefits before enabling this capability.

The default value for this property is false.
Available in OS X v10.8 and later.
(Read and Write property)

46.1.37 frame as CGRectMBS

**Function:** The layer’s frame rectangle.

**Notes:**
The frame rectangle is position and size of the layer specified in the superlayer’s coordinate space. For layers, the frame rectangle is a computed property that is derived from the values in the bounds, anchorPoint and position properties. When you assign a new value to this property, the layer changes its position and bounds properties to match the rectangle you specified. The values of each coordinate in the rectangle are measured in points.

For more information about the relationship between the frame, bounds, anchorPoint and position properties, see Core Animation Programming Guide.
Note: The frame property is not directly animatable. Instead you should animate the appropriate combination of the bounds, anchorPoint and position properties to achieve the desired result.
(Read and Write property)

46.1.38 Handle as Integer

Function: The internal reference to the layer.
Notes: (Read and Write property)

46.1.39 Hidden as boolean

Function: A Boolean indicating whether the layer is displayed. Animatable.
Notes: The default value of this property is false.
(Read and Write property)

46.1.40 mask as CALayerMBS

Function: The layer to be used as mask for this layer.
Notes: A layer whose alpha channel is used as a mask to select between the layer’s background and the result of compositing the layer’s contents with its filtered background. Defaults to nil. When used as a mask the layer’s ‘compositingFilter’ and ‘backgroundFilters’ properties are ignored. When setting the mask to a new layer, the new layer must have a nil superlayer, otherwise the behavior is undefined. Nested masks (mask layers with their own masks) are unsupported.
(Read and Write property)

46.1.41 masksToBounds as Boolean

Function: Whether to mask by bounds.
Notes: When true an implicit mask matching the layer bounds is applied to the layer (including the effects of the ‘cornerRadius’ property). If both ‘mask’ and ‘masksToBounds’ are non-nil the two masks are multiplied to get the actual mask values. Defaults to false. Animatable.
46.1. **minificationFilterBias as Double**

**Function:** The bias factor used by the minification filter to determine the levels of detail.

**Notes:**
- This value is used by the minificationFilter when it is set to kCAFilterTrilinear.
- The default value of this property is 0.0.
- Available in OS X v10.6 and later.

(Read and Write property)

46.1.43 **modelLayer as CALayerMBS**

**Function:** Returns the model layer object associated with the receiver, if any.

**Notes:**
- Calling this method on a layer in the presentation tree returns the corresponding layer object in the model tree. This method returns a value only when a transaction involving changes to the presentation layer is in progress. If no transaction is in progress, the results of calling this method are undefined.

Available in OS X v10.5 and later.

(Read only property)

46.1.44 **needsDisplay as boolean**

**Function:** Returns a Boolean indicating whether the layer has been marked as needing an update.

**Notes:**
- True if the layer needs to be updated.

Available in OS X v10.6 and later.

(Read only property)

46.1.45 **needsDisplayOnBoundsChange as boolean**

**Function:** A Boolean indicating whether the layer contents must be updated when its bounds rectangle
When this property is set to true, the layer automatically calls its `setNeedsDisplay` method whenever its bounds property changes. The default value of this property is false.

(Read and Write property)

### 46.1.46 needsLayout as boolean

**Function:** Returns a Boolean indicating whether the layer has been marked as needing a layout update.

**Notes:**
True if the layer has been marked as requiring a layout update.
Available in OS X v10.6 and later.
(Read only property)

### 46.1.47 opacity as Double

**Function:** The opacity of the receiver. Animatable.

**Notes:**
The value of this property must be in the range 0.0 (transparent) to 1.0 (opaque). Values outside that range are clamped to the minimum or maximum. The default value of this property is 1.0.
(Read and Write property)

### 46.1.48 Opaque as boolean

**Function:** A Boolean value indicating whether the layer contains completely opaque content.

**Notes:**
The default value of this property is false. If your app draws completely opaque content that fills the layer’s bounds, setting this property to true lets the system optimize the rendering behavior for the layer. Specifically, when the layer creates the backing store for your drawing commands, Core Animation omits the alpha channel of that backing store. Doing so can improve the performance of compositing operations. If you set the value of this property to true, you must fill the layer’s bounds with opaque content.

Setting this property affects only the backing store managed by Core Animation. If you assign an image with an alpha channel to the layer’s contents property, that image retains its alpha channel regardless of the value of this property.
46.1. **CLASS CALAYERMBS**

(Read and Write property)

### 46.1.49 position as CGRectMBS

**Function:** The layer’s position in its superlayer’s coordinate space. Animatable.

**Notes:**

The value of this property is specified in points and is always specified relative to the value in the anchorPoint property. For new standalone layers, the default position is set to (0.0, 0.0). Changing the frame property also updates the value in this property.

For more information about the relationship between the frame, bounds, anchorPoint and position properties, see Core Animation Programming Guide.

(Read and Write property)

### 46.1.50 preferredFrameSize as CGSizeMBS

**Function:** Returns the preferred size of the layer in the coordinate space of its superlayer.

**Notes:**

In OS X, the default implementation of this method calls the preferredSizeOfLayer method of its layout manager that is, the object in its layoutManager property. If that object does not exist or does not implement that method, this method returns the size of the layer’s current bounds rectangle mapped into the coordinate space of its superlayer.

(Read only property)

### 46.1.51 presentationLayer as CALayerMBS

**Function:** Returns a copy of the presentation layer object that represents the state of the layer as it currently appears onscreen.

**Notes:**

The layer object returned by this method provides a close approximation of the layer that is currently being displayed onscreen. While an animation is in progress, you can retrieve this object and use it to get the current values for those animations.

The sublayers, mask, and superlayer properties of the returned layer return the corresponding objects from the presentation tree (not the model tree). This pattern also applies to any read-only layer methods. For
example, the hitTest: method of the returned object queries the layer objects in the presentation tree.

Available in OS X v10.5 and later.
(Read only property)

#### 46.1.52 rasterizationScale as Double

**Function:** The scale at which the layer will be rasterized.
**Notes:**
(when the shouldRasterize property has been set to true) relative to the coordinate space of the layer. Defaults to one. Animatable.
(Read and Write property)

#### 46.1.53 shadowColor as Variant

MBS AVFoundation Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** The color of the layers shadow. Animatable.
**Notes:**
The default value of this property is an opaque black color.

The value of this property is retained using the Core Foundation retain/release semantics. This behavior occurs despite the fact that the property declaration appears to use the default assign semantics for object retention.

Value is a CGColorMBS object.
(Read and Write property)

#### 46.1.54 shadowOffset as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
**Function:** The offset (in points) of the layers shadow. Animatable.
**Notes:**
The default value of this property is (0.0, -3.0).
(Read and Write property)
46.1. Shadow opacity as Double

**Function:** The opacity of the layer's shadow. Animatable.  
**Notes:**  
The value in this property must be in the range 0.0 (transparent) to 1.0 (opaque). The default value of this property is 0.0.  
Available in OS X v10.5 and later.  
(Read and Write property)

46.1. Shadow path as Variant

MBS AVFoundation Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  
**Function:** The shadow path.  
**Notes:**  
Value is a CGPathMBS object.  
The default value of this property is nil, which causes the layer to use a standard shadow shape. If you specify a value for this property, the layer creates its shadow using the specified path instead of the layers composited alpha channel. The path you provide defines the outline of the shadow. It is filled using the non-zero winding rule and the current shadow color, opacity, and blur radius.  
Unlike most animatable properties, this property (as with all CGPathRef animatable properties) does not support implicit animation. However, the path object may be animated using any of the concrete subclasses of CAPROPERTYAnimation. Paths will interpolate as a linear blend of the "on-line" points; "off-line" points may be interpolated non-linearly (to preserve continuity of the curve’s derivative). If the two paths have a different number of control points or segments, the results are undefined. If the path extends outside the layer bounds it will not automatically be clipped to the layer, only if the normal layer masking rules cause that.  
Specifying an explicit path usually improves rendering performance.  
The value of this property is retained using the Core Foundation retain/release semantics. This behavior occurs despite the fact that the property declaration appears to use the default assign semantics for object retention.  
(Read and Write property)
46.1.57  shadowRadius as Double

MBS AVFoundation Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.
Function: The blur radius (in points) used to render the layers shadow. Animatable.
Notes:
You specify the radius The default value of this property is 3.0.
(Read and Write property)

46.1.58  shouldRasterize as Boolean

Function: Whether view should raster.
Notes:
When true, the layer is rendered as a bitmap in its local coordinate space ("rasterized"), then the bitmap is
composited into the destination (with the minificationFilter and magnificationFilter properties of the layer
applied if the bitmap needs scaling). Rasterization occurs after the layer's filters and shadow effects are
applied, but before the opacity modulation. As an implementation detail the rendering engine may attempt
to cache and reuse the bitmap from one frame to the next. (Whether it does or not will have no affect on
the rendered output.) When false the layer is composited directly into the destination whenever possible
(however, certain features of the compositing model may force rasterization, e.g. adding filters). Defaults to
false. Animatable.
(Read and Write property)

46.1.59  superlayer as CALayerMBS

Function: The superlayer of the layer.
Notes:
The superlayer manages the layout of its sublayers.
Available in OS X v10.5 and later.
(Read only property)

46.1.60  zPosition as Double

Function: The layer's position on the z axis. Animatable.
Notes:
The default value of this property is 0. Changing the value of this property changes the the front-to-back
ordering of layers onscreen. This can affect the visibility of layers whose frame rectangles overlap.
The value of this property is measured in points.
Available in OS X v10.5 and later.
(Read and Write property)

46.1.61 Constants

46.1.62 kCALayerBottomEdge = 4

MBS AVFoundation Plugin, Plugin Version: 13.1. **Function:** Edge constants for edgeAntialiasingMask property.
**Notes:** Specifies that the bottom edge of the receiver’s content should be antialiased.

46.1.63 kCALayerHeightSizable = 16

MBS AVFoundation Plugin, Plugin Version: 13.1. **Function:** One of the constants for the autoresizingmask property.
**Notes:** The receiver’s height is flexible.

46.1.64 kCALayerLeftEdge = 1

MBS AVFoundation Plugin, Plugin Version: 13.1. **Function:** Edge constants for edgeAntialiasingMask property.
**Notes:** Specifies that the left edge of the receiver’s content should be antialiased.

46.1.65 kCALayerMaxXMargin = 4

MBS AVFoundation Plugin, Plugin Version: 13.1. **Function:** One of the constants for the autoresizingmask property.
**Notes:** The left margin between the receiver and its superview is flexible.

46.1.66 kCALayerMaxYMargin = 32

MBS AVFoundation Plugin, Plugin Version: 13.1. **Function:** One of the constants for the autoresizingmask property.
**Notes:** The top margin between the receiver and its superview is flexible.
**46.1.67**  \( \text{kCALayerMinXMargin} = 1 \)

MBS AVFoundation Plugin, Plugin Version: 13.1. **Function:** One of the constants for the autoresizingmask property.
**Notes:** The left margin between the receiver and its superview is flexible.

**46.1.68**  \( \text{kCALayerMinYMargin} = 8 \)

MBS AVFoundation Plugin, Plugin Version: 13.1. **Function:** One of the constants for the autoresizingmask property.
**Notes:** The top margin between the receiver and its superview is flexible.

**46.1.69**  \( \text{kCALayerNotSizable} = 0 \)

MBS AVFoundation Plugin, Plugin Version: 13.1. **Function:** One of the constants for the autoresizingmask property.
**Notes:** The receiver cannot be resized.

**46.1.70**  \( \text{kCALayerRightEdge} = 2 \)

MBS AVFoundation Plugin, Plugin Version: 13.1. **Function:** Edge constants for edgeAntialiasingMask property.
**Notes:** Specifies that the right edge of the receiver’s content should be antialiased.

**46.1.71**  \( \text{kCALayerTopEdge} = 8 \)

MBS AVFoundation Plugin, Plugin Version: 13.1. **Function:** Edge constants for edgeAntialiasingMask property.
**Notes:** Specifies that the top edge of the receiver’s content should be antialiased.

**46.1.72**  \( \text{kCALayerWidthSizable} = 2 \)

MBS AVFoundation Plugin, Plugin Version: 13.1. **Function:** One of the constants for the autoresizingmask property.
**Notes:** The receiver’s width is flexible.
46.2. class CATransactionMBS

46.2.1 class CATransactionMBS

Function: The plugin class for a CoreAnimation transaction.

Notes:

CATransaction is the Core Animation mechanism for batching multiple layer-tree operations into atomic updates to the render tree. Every modification to a layer tree must be part of a transaction. Nested transactions are supported.

Core Animation supports two types of transactions: implicit transactions and explicit transactions. Implicit transactions are created automatically when the layer tree is modified by a thread without an active transaction and are committed automatically when the thread’s run-loop next iterates. Explicit transactions occur when the application sends the CATransaction class a begin message before modifying the layer tree, and a commit message afterwards.

CATransaction allows you to override default animation properties that are set for animatable properties. You can customize duration, timing function, whether changes to properties trigger animations, and provide a handler that informs you when all animations from the transaction group are completed.

During a transaction you can temporarily acquire a recursive spin-lock for managing property atomicity. This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

46.2.2 Methods

46.2.3 animationDuration as Double

Function: Returns the animation duration used by all animations within this transaction group.

46.2.4 available as boolean

Function: Returns true if transaction class is available.

Notes: Returns true on Mac and false on Linux/Windows.
46.2.5  begin

Function: Begin a new transaction for the current thread.
Notes:
The transaction is nested within the thread’s current transaction, if there is one.
Available in OS X v10.5 and later.

46.2.6  commit

Function: Commit all changes made during the current transaction.
Notes:
Raises an exception if no current transaction exists.
Available in OS X v10.5 and later.

46.2.7  Constructor

Function: The private constructor.

46.2.8  flush

Function: Flushes any extant implicit transaction.
Notes:
Delays the commit until any nested explicit transactions have completed.
Flush is typically called automatically at the end of the current runloop, regardless of the runloop mode. If your application does not have a runloop, you must call this method explicitly.

However, you should attempt to avoid calling flush explicitly. By allowing flush to execute during the runloop your application will achieve better performance, atomic screen updates will be preserved, and transactions and animations that work from transaction to transaction will continue to function.

Available in OS X v10.5 and later.
46.2.9  kCATransactionAnimationDuration as string

Function: One of the keys for values of a transaction.
Notes:
Duration, in seconds, for animations triggered within the transaction group. The value for this key must be a number.
Available in OS X v10.5 and later.

46.2.10  kCATransactionDisableActions as string

Function: One of the keys for values of a transaction.
Notes:
If true, implicit actions for property changes made within the transaction group are suppressed. The value for this key must be a boolean.
Available in OS X v10.5 and later.

46.2.11  setAnimationDuration(value as Double)

Function: Sets the animation duration used by all animations within this transaction group.
Notes: Available in OS X v10.6 and later.

46.2.12  setValue(value as Variant, key as string)

Function: Sets the arbitrary keyed-data for the specified key.
Notes:
value: The value for the key identified by key.
key: The name of one of the receiver's properties.

Nested transactions have nested data scope; setting a key always sets it in the innermost scope.
Available in OS X v10.5 and later.
46.2.13 `valueForKey(key as string) as Variant`

**Function:** Returns the arbitrary keyed-data specified by the given key.

**Notes:**

`key`: The name of one of the receiver’s properties.

Returns the value for the data specified by the key.
Nested transactions have nested data scope. Requesting a value for a key first searches the innermost scope, then the enclosing transactions.
Available in OS X v10.5 and later.

### 46.2.14 Properties

#### 46.2.15 Handle as Integer

**Function:** The internal transaction handle.

**Notes:** (Read and Write property)
Chapter 47

CoreAudio

47.1 class AudioPlayThruMBS

47.1.1 class AudioPlayThruMBS

47.1.2 Methods

47.1.3 Constructor

    dim a as AudioPlayThruMBS
    a=new AudioPlayThruMBS

Notes:

Does nothing. Only useful if you want to create an object, set the buffersize and call Init after that. See also:

- 47.1.4 Constructor(InputDeviceID as Integer, OutputDeviceID as Integer, BufferSizeWish as Integer = 0)
47.1.4 Constructor(InputDeviceID as Integer, OutputDeviceID as Integer, BufferSizeWish as Integer = 0)

MBS MacOSX Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The constructor.
**Example:**
```vba
dim InputDeviceID,OutputDeviceID as Integer
// get device IDs
dim a as AudioPlayThruMBS

a=new AudioPlayThruMBS(InputDeviceID, OutputDeviceID)
```

**Notes:**
Calls Init method behind scenes with default buffer size.
LastError is set.
Device IDs are the IDs you get in the CoreAudio classes.
BufferSizeWish is the buffer size you prefer to use. If value is too small the default value will be used.
See also:
- 47.1.3 Constructor

47.1.5 Init(InputDeviceID as Integer, OutputDeviceID as Integer, BufferSizeWish as Integer = 0)

MBS MacOSX Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Initializes the engine behind this class.
**Example:**
```vba
dim InputDeviceID as Integer
dim OutputDeviceID as Integer
// get device IDs

dim a as AudioPlayThruMBS
a=new AudioPlayThruMBS
a.Init(InputDeviceID, OutputDeviceID)
```

**Notes:**
LastError is set.
Device IDs are the IDs you get in the CoreAudio classes.
Can be used to set the buffersize before calling this method.
47.1. CLASS AUDIOPLAYTHRUMBS

47.1.6 IsRunning as boolean

MBS MacOSX Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether playthrough is active.

47.1.7 SetInputDeviceAsCurrent(DeviceID as Integer)

MBS MacOSX Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets input device.
**Notes:** Device IDs are the IDs you get in the CoreAudio classes.

47.1.8 SetOutputDeviceAsCurrent(DeviceID as Integer)

MBS MacOSX Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets output device.
**Notes:** Lasterror is set.
Device IDs are the IDs you get in the CoreAudio classes.

47.1.9 Start

MBS MacOSX Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Starts playing.
**Notes:** Lasterror is set.

47.1.10 Stop

MBS MacOSX Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops playing.
**Notes:** Lasterror is set.

47.1.11 Properties

**47.1.12 Lasterror as Integer**

MBS MacOSX Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code reported.
Notes:
0 for success. -1 in case function is not available.
(Read and Write property)

47.1.13 Volume as Double

MBS MacOSX Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Get or set the volume of the output audio unit.

Notes:
Lasterror is set.
Range is from 0.0 to 1.0.
(Read and Write computed property)
Chapter 48

CoreFoundation

48.1 Globals

48.1.1 NewCFStringMBS2(s as string) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Returns a CFStringMBS object created using the given string.

**Example:**

```plaintext
dim s as CFStringMBS
s=NewCFStringMBS2("")
// s is not nil here
MsgBox str(s.Handle)
```

**Notes:**
The cfstring may be unicode.
See also NewCFStringMBS.

48.1.2 kCFCharacterSetMBSTypeID as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFCharacterSetMBS object.

7703
48.1.3 NewCFObjectMBSFromXMLMT(data as string) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Parses the XML data and returns a CFObject.

**Notes:**
Same as NewCFObjectMBSFromXML, but with additional multithreading.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

Note that the CFObject returned is in most times a CFDictionary or a CFArray.
This function takes text and binary plist file content.

See also:
- 48.1.4 NewCFObjectMBSFromXMLMT(file as folderitem) as CFObjectMBS
- 48.1.5 NewCFObjectMBSFromXMLMT(XMLdata as CFBinaryDataMBS) as CFObjectMBS

48.1.4 NewCFObjectMBSFromXMLMT(file as folderitem) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Parses the XML data and returns a CFObject.

**Example:**

```
  dim f as FolderItem = SpecialFolder.Desktop.Child("test.xml")
  dim o as CFObjectMBS = NewCFObjectMBSFromXMLMT(f)

  if o = nil then
    MsgBox "Error"
  else
    MsgBox "OK"
  end if
```

**Notes:**
Same as NewCFObjectMBSFromXML, but with additional multithreading.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.
Reading the file is done on the workthread.

Note that the CFObject returned is in most times a CFDictionary or a CFArray.
This function takes text and binary plist file content.

See also:
- 48.1.3 NewCFObjectMBSFromXMLMT(data as string) as CFObjectMBS
48.1.5 **NewCFObjectMBSFromXMLMT**(XMLdata as CFBinaryDataMBS) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Parses the XML data and returns a CFObject.

**Notes:**
Note that the CFObject returned is in most times a CFDictionary or a CFArray. This function takes text and binary plist file content.

See also:
- 48.1.3 **NewCFObjectMBSFromXMLMT**(data as string) as CFObjectMBS
- 48.1.4 **NewCFObjectMBSFromXMLMT**(file as folderitem) as CFObjectMBS

48.1.6 **kCFTreeMBSTypeID** as Integer

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the type ID for the CFTree class.

48.1.7 **NewCFTreeMBS** as CFTreeMBS

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CFTree object.

**Notes:** Returns nil on any error.

48.1.8 **kCFXMLNodeMBSTypeID** as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the type ID for the XMLNode class.

48.1.9 **kCFXMLParserMBSTypeID** as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the type ID for the XMLParser class.
48.1.10 UseMBSCFXMLPlugin

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Forces RB to include the CF XML Plugin in the compiled application.
**Notes:**
If a plugin is using the CF XML Plugin, but you don’t use it the application will crash on launching because of a missing plugin. To fix this, call this function somewhere in your application.
Realbasic 5.2 has this bug fixed.

48.1.11 CFShowCFStringMBS(cfstring as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Prints the content of the given CFString to the console.

48.1.12 CFShowMBS(cfobject as CFObjectMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Prints the content of the given CFObject to the console.
**Notes:** Very useful for e.g. CFDictionarys.

48.1.13 CreateBundleMBS(file as folderitem) as CFBundleMBS

MBS MacCF Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a CFBundle object for the bundle folder on the given position.
**Example:**
// Find and show the main executable file of a bundled application

dim f as FolderItem
f=SpecialFolder.Applications.Child("Mail.app")
MsgBox f.AbsolutePath // shows app bundle path

dim b as CFBundleMBS
dim u as CFURLMBS
b=CreateBundleMBS(f)
if b<>nil then
u=b.ExecutableFile
if u<>nil then
MsgBox f.AbsolutePath // shows app executable path
48.1. GLOBALS

end if
end if

**Notes:** Returns nil on any error.

See also:

- 48.1.14 CreateBundleMBS(url as CFURLMBS) as CFBundleMBS

### 48.1.14 CreateBundleMBS(url as CFURLMBS) as CFBundleMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a CFBundle object for the bundle folder on the given position.

**Example:**

// Find and show the main executable file of a bundled application

dim f as FolderItem

f=SpecialFolder.Applications.Child("Mail.app")
MsgBox f.AbsolutePath // shows app bundle path

dim b as CFBundleMBS
dim u as CFURLMBS

u=NewCFURLMBSFile(f)
if u<>Nil then
b=CreateBundleMBS(u)
if b<>nil then
u=b.ExecutableFile
if u<>nil then
MsgBox f.AbsolutePath // shows app executable path
end if
end if
end if

**Notes:** Returns nil on any error.

See also:

- 48.1.13 CreateBundleMBS(file as folderitem) as CFBundleMBS
48.1.15 CreateBundlesFromDirectoryMBS(url as CFURLMBS, type as CFStringMBS) as CFArrayMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a list of all bundles in a folder.
**Notes:**

Returns nil on any error.

With the Type parameter you can limit the bundles to a certain type. The abstract type of the bundles you wish to locate and create. The type is expressed as a filename extension, such as bundle. Pass NULL to create CFBundle objects for bundles of any type.

48.1.16 CreateCFTimeZoneMBS(name as CFStringMBS, data as CFBinaryDataMBS) as CFTimeZoneMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new timezone object with the given name and data.
**Notes:** Returns nil on any error.

48.1.17 CreateCFTimeZoneMBSWithName(name as CFStringMBS, TryAbbrev as boolean) as CFTimeZoneMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new timezone object with the object from the system which matches the given name.
**Notes:**

If TryAbbrev is true the system also checks if the name matches the abbreviated name of the timezone object.
Returns nil on any error.

48.1.18 CreateCFTimeZoneMBSWithTimeIntervalFromGMT(time as CFTimeIntervalMBS) as CFTimeZoneMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new timezone object with the given time interval.
**Notes:** Returns nil on any error.
48.1.19  CreateStringByAddingPercentEscapesMBS (original as CFStringMBS, charactersToLeaveEscaped as CFStringMBS, legalURLCharactersToBeEscaped as CFStringMBS, encoding as Integer) as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Adds percent escapes inside a string.
**Notes:** If charactersToLeaveEscaped=nil then no string is changed. If charactersToLeaveEscaped contains an empty string (""") all escapes are changed and if charactersToLeaveEscaped contains a string<>”” then these characters are not escaped.

48.1.20  CreateStringByReplacingPercentEscapesMBS (original as CFStringMBS, charactersToLeaveEscaped as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Replaces percent escapes inside a string.
**Notes:** If charactersToLeaveEscaped=nil then no string is changed. If charactersToLeaveEscaped contains an empty string (""") all escapes are changed and if charactersToLeaveEscaped contains a string<>”” then these characters are not escaped.

48.1.21  CurrentCFAbsoluteTimeMBS as CFAbsoluteTimeMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** The current time as an absolute time object.
**Example:**
```octave
// get current timezone
dim c as CFTimeZoneMBS = SystemCFTimeZoneMBS

// and current time
dim time as CFAbsoluteTimeMBS = CurrentCFAbsoluteTimeMBS

// Do we have daylight saving time?
MsgBox str(c.IsDaylightSavingTime(time))
```

**Notes:** Returns nil on any error.

48.1.22  GetAllBundlesMBS as CFArrayMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns a list of all known bundles on the system.
48.1.23 GetBundleWithIdentifierMBS(id as CFStringMBS) as CFBundleMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a CFBundle object for the bundle with the given ID.

**Notes:**

Returns nil on any error.

Returns only a bundle if that bundle has been loaded before.

For a bundle to be located using its identifier, the bundle object must have already been created. The principal intended purpose for locating bundles by identifier is so that code (in frameworks, plugins, etc.) can find its own bundle. If a bundle is created, then the bundle deleted from the filesystem and this function invoked afterwards, it will still return the original bundle.

48.1.24 GetDefaultCFTimeZoneMBS as CFTimeZoneMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default time zone.

**Example:**

```plaintext
msgBox str(GetDefaultCFTimeZoneMBS.SecondsFromGMT(nil).Value)
```

**Notes:** Returns nil on any error.

48.1.25 kCFArrayMBSTypeID as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFArrayMBS object.

48.1.26 kCFBagMBSTypeID as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFBagMBS object.
48.1.27  kCFBinaryDataMBSTypeID as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFBinary object.

48.1.28  kCFBooleanMBSTypeID as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFBooleanMBS object.

48.1.29  kCFBundleMBSTypeID as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFBundle object.

**Notes:**

CFBundle objects may be supported in a future version of this plugin. Request if you need more than the app.bundle functions offer you.

48.1.30  kCFDateMBSTypeID as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFDateMBS object.

48.1.31  kCFDictionaryMBSTypeID as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFDictionaryMBS object.

48.1.32  kCFNumberMBSNaN as CFNumberMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a CFNumberMBS object for NaN (not a number).
48.1.33  kCFNumberMBSNegativeInfinity as CFNumberMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a CFNumberMBS object for negative infinity.

48.1.34  kCFNumberMBSPositiveInfinity as CFNumberMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a CFNumberMBS object for positive infinity.

48.1.35  kCFNumberMBSTypeID as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFNumberMBS object.

48.1.36  kCFSetMBSTypeID as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFSetMBS object.

48.1.37  kCFStringMBSTypeID as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFStringMBS object.

48.1.38  kCFTimeZoneMBSTypeID as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFTimeZone object.

48.1.39  kCFURLMBSTypeID as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFURLMBS object.
48.1.40 KnownTimeZoneNamesAsCFArrayMBS as CFArrayMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
An array of all known time zone names.
**Notes:** Returns nil on any error.

48.1.41 MacShowAboutBoxMBS(options as CFDictionaryMBS) as Integer

MBS MacCF Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Displays an HI-conformant about box.
**Example:**
```plaintext
dim kHIAboutBoxNameKey as CFStringMBS = NewCFStringMBS("HIAboutBoxName")
dim kHIAboutBoxVersionKey as CFStringMBS = NewCFStringMBS("HIAboutBoxVersion")
dim kHIAboutBoxCopyrightKey as CFStringMBS = NewCFStringMBS("HIAboutBoxCopyright")
dim kHIAboutBoxDescriptionKey as CFStringMBS = NewCFStringMBS("HIAboutBoxDescription")
dim kHIAboutBoxStringFileKey as CFStringMBS = NewCFStringMBS("HIAboutBoxStringFile")

dim d as CFMutableDictionaryMBS

d=NewCFMutableDictionaryMBS

// name, version and copyright are optional:
d.add(kHIAboutBoxNameKey, NewCFStringMBS("MyApp"))
d.add(kHIAboutBoxVersionKey, NewCFStringMBS("1.0"))
d.add(kHIAboutBoxCopyrightKey, NewCFStringMBS("2009 by Christian Schmitz"))

// description is needed
d.add(kHIAboutBoxDescriptionKey, NewCFStringMBS("The best application I ever made!"))

// optional
d.add(kHIAboutBoxStringFileKey, NewCFStringMBS("somefile"))

MsgBox Str(MacShowAboutBoxMBS(d))
```

**Notes:**
This about box is a generic about box that automatically can display your application name, version string, and copyright string. It peeks into either the Info.plist (for the CFBundleName, CFBundleVersion, and CFBundleGetInfoString keys) or your bundle resource (not recommended) to get the information by default. You can customize what it displays by passing in various options in the input dictionary. Note that currently the description string can only be specified in the options dictionary; this function does not check your Info.plist for a descriptions string.
There are three basic ways to call this function. First, you can pass nil for inOptions. As mentioned, default information will be displayed. Second, you can pass the actual values for the strings displayed by passing the strings in the inOptions dictionary using the keys provided, such as kHIAboutBoxNameKey. If a replacement string is not passed, the default behavior kicks in. For example, you could pass some variant of your application name in the dictionary, but not pass a replacement version or copyright strings. The Toolbox would display your replacement string, and fall back to looking in the Info.plist for the other strings. The third way to call this is to pass the name of a string file in the dictionary with the key kHIAboutBoxStringFileKey. We will automatically use that file to find the strings for the about box. The keys in the string file should be the same value as the keys you would use to pass into the inOptions dictionary. Again, if a string is not found in that file, we would fall back to looking for a string in the dictionary, and then finally the Info.plist. Certainly this is not the be-all-end-all of about boxes, but it does provide a simple no-work about box for your application. The standard Toolbox application handler now responds to the kHICommandAbout command ID by calling HIAboutBox for you. This means that any Carbon Event-based application will get this behavior for free right out of the box. If you wish for the window to respond to cmd-W in the menu bar, you should make sure that menu item has the kHICommandClose commandID.

Options: A dictionary of replacement strings, or the name of a string file to retrieve the strings from, or nil. See the discussion for how this is used.

Returns a Mac OS error code or -1 if function is not available.
Not supported on 64 bit targets.

48.1.42 NewCFAbsoluteTimeMBS(time as Double) as CFAbsoluteTimeMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a new absolute time object with the given value.
Notes: Returns nil on any error.

48.1.43 NewCFBinaryDataMBSMem(mem as memoryblock,len as Integer) as CFBinaryDataMBS

48.1.44 NewCFBinaryDataMBSStr(s as string) as CFBinaryDataMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a CFBinary object for the given string.
Example:
48.1. GLOBA L S

dim t as TextOutputStream
dim f as FolderItem
dim o as CFObjectMBS
dim s as string
dim i as TextInputStream

f=SpecialFolder.Desktop.Child("test")
o=NewCFStringMBS("Hello")

// write
s=o.XML.str
s=ConvertEncoding(s,Encodings.UTF8)

t=f.CreateTextFile
  t.Write s
  t.Close

// clear

o=nil

// now read back

i=f.OpenAsTextFile
  s=i.ReadAll(Encodings.UTF8)
  i.Close

  o=NewCFObj ectMBSFromXML(NewCFBinaryDataMBSStr(s))

  MsgBox CFStringMBS(o).str

48.1.45 NewCFBooleanMBS(value as boolean) as CFBooleanMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a CF-
BooleanMBS object created using the given boolean.

48.1.46 NewCFDateMBS as CFDateMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a new
empty CFDateMBS.
48.1.47  NewCFMutableArrayMBS as CFMutableArrayMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new empty mutable array.  
**Notes:** The array’s maximum capacity is unlimited (or rather, only limited by address space and available memory constraints).

48.1.48  NewCFMutableBagMBS as CFMutableBagMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new empty CFMutableBagMBS.

48.1.49  NewCFMutableBinaryDataMBSMem(len as Integer) as CFMutableBinaryDataMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a CFMutableBinary object with the given size in bytes.

48.1.50  NewCFMutableDictionaryMBS as CFMutableDictionaryMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new empty CFMutableDictionaryMBS.  
**Example:**

```c
    dim d as CFMutableDictionaryMBS
    d=NewCFMutableDictionaryMBS
    d.Add NewCFStringMBS("Key"),NewCFStringMBS("Value")
    MsgBox d.XML.str
```

48.1.51  NewCFMutableSetMBS as CFMutableSetMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new empty CFMutableSetMBS.
48.1.52 NewCFNumberMBSDouble(doubleValue as Double) as CFNumberMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a CFNumberMBS object for the given double value.

48.1.53 NewCFNumberMBSInteger(integerValue as Integer) as CFNumberMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a CFNumberMBS object for the given integer value.

48.1.54 NewCFNumberMBSSingle(singleValue as single) as CFNumberMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a CFNumberMBS object for the given single value.

48.1.55 NewCFOBJECTMBS(handle as Integer) as CFOBJECTMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a CFOBJECTMBS object for the given handle.

**Example:**

```vb
Dim d as CFMutableDictionaryMBS
Dim s as CFStringMBS
Dim o as CFOBJECTMBS
Dim t as CFStringMBS

d=NewCFMutableDictionaryMBS
s=NewCFStringMBS(“Hello”)

d.Add s,s

o=d.Value(s) // uses NewCFOBJECTMBS internally

t=cfstringMBS(o) // Now you can cast here in v5.2!

MsgBox t.str
```

**Notes:**

Handle is just a CFTypeRef.
If release is true, the destructor of the CFOBJECTMBS will release the handle later.
In Version 5.2 this function can return objects which may be casted to CFURL, CFDictionary, CFString, CFNumber, CFCharacterSet, CFBag, CFArray, CFBoolean, CFBinaryData or CFSet.

48.1.56 NewCFObj ectMBSFromXML(XMLdata as CFBinaryDataMBS) as CFObj ectMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Parses the XML data and returns a CFObj ect.

Example:

```vbnet
dim f as FolderItem
dim t as TextInputStream
dim s as String
dim o as CFObj ectMBS
dim d as CFDictionaryMBS

// get file name
f=GetFolderItem("CF XML Test.txt")
// open file
f.OpenAsTextFile
// Read String
s=t.ReadAll

// Create back
o=NewCFObj ectMBSFromXML(NewCFBinaryDataMBSStr(s))

// now check if the dictionary we saved is there:
if o<>nil then
    if o isa CFDictionaryMBS then
        d=CFDictionaryMBS(o)
        MsgBox CFStringMBS(d.Value(NewCFStringMBS("Key"))).str
    end if
end if
```

Notes:

Same as NewCFObj ectMBSFromXML, but with additional multithreading.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

Note that the CFObj ect returned is in most times a CFDictionary or a CFArray.
This function takes text and binary plist file content.
48.1.57  NewCFStringMBS(s as string) as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns a CFStringMBS object created using the given string.

**Notes:**
Returns nil if s is empty.
The cfstring may be unicode.

See also NewCFStringMBS2 if you want to get an empty CFString object for an empty string.

48.1.58  NewCFTimeIntervalMBS(time as Double) as CFTimeIntervalMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Returns a new time interval object with the given value.

**Notes:** Returns nil on any error.

48.1.59  NewCFURLMBSCFStringMBS(cfstr as CFStringMBS, baseurl as CFURLMBS) as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Creates a new CFURLMBS from the CFStringMBS.

48.1.60  NewCFURLMBSFile(f as folderitem) as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Creates a new CFURLMBS from a file.

48.1.61  NewCFURLMBSHFSPath(cfstr as CFStringMBS, directory as boolean) as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Creates a new CFURLMBS from the CFStringMBS which is interpreted as a HFS path.
48.1.62 NewCFURLMBSMem(mem as memoryblock, len as Integer, encoding as Integer, baseurl as CFURLMBS) as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CFURLMBS from the data inside the memoryblock.

**Notes:**
- Len is the len of the data inside the memoryblock.
- Encoding the ID of the text encoding.
- BaseURL is the base url. If baseurl=nil then the current application directory is used.

48.1.63 NewCFURLMBSPosixPath(cfstr as CFStringMBS, directory as boolean) as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CFURLMBS from the CFStringMBS which is interpreted as a Posix path.

48.1.64 NewCFURLMBSStr(str as string, baseurl as CFURLMBS) as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CFURLMBS from the string.

**Example:**

```vbscript
dim s as string
dim f as FolderItem
dim cu as CFURLMBS

s="file://localhost/Users/cs/Music/iTunes/iTunes%20Music"

cu=NewCFURLMBSStr(s,nil) // true=isdirectory
f= cu.file

MsgBox f.AbsolutePath
```

**Notes:** BaseURL is the base url. If baseurl=nil then the current application directory is used.
48.1.65  **NewCFURLMBSWindowsPath(cfstr as CFStringMBS, directory as boolean) as CFURLMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CFURLMBS from the CFStringMBS which is interpreted as a Windows path.

48.1.66  **SetDefaultCFTimeZoneMBS(timezone as CFTimeZoneMBS)**

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default time zone.  
**Example:**
```
msgBox str(GetDefaultCFTimeZoneMBS.SecondsFromGMT(nil).Value)
```

**Notes:** Returns nil on any error.

48.1.67  **SystemCFTimeZoneMBS as CFTimeZoneMBS**

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The current system time zone.  
**Example:**
```
dim s as CFTimeZoneMBS
s=SystemCFTimeZoneMBS
MsgBox s.Name.str
```

**Notes:** Returns nil on any error.

48.1.68  **TypeIDDescriptionMBS(TypeID as Integer) as CFStringMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a string with the name for the CoreFoundation data type.  
**Notes:** e.g. "CFStringMBS" for a CFStringMBS.
48.2 class CFAbsoluteTimeMBS

48.2.1 class CFAbsoluteTimeMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for an absolute time value.

**Example:**

```
dim t as new CFAbsoluteTimeMBS
MsgBox str(T.Value)
```

**Notes:**

Basicly just a double property.
Subclass of the CFTimeIntervalMBS class.

48.2.2 Methods

48.2.3 AddGregorianUnits(timezone as CFTimeZoneMBS, units as CFGregorianUnitsMBS) as CFAbsoluteTimeMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds gregorian time units to the given absolute time and returns the result.

**Notes:**

Returns nil on any error.
Timezone is optional and can be nil.

48.2.4 Constructor

MBS MacCF Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor to initialize the absolution time with the current time.

**Example:**

```
dim CFDateLocal as new CFAbsoluteTimeMBS
```

```
dim CFTimeZone as new CFTimeZoneMBS
```

```
dim MyDSTState as Boolean = CFTimeZone.IsDaylightSavingTime(CFDateLocal)
```

MsgBox str(MyDSTState)
48.2. CLASS CFABSOLUTETIMEMBS

See also:

- 48.2.5 Constructor(value as Double)

48.2.5 Constructor(value as Double)

MBS MacCF Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The constructor to initialize the absolute time with the given value.

**Example:**
```plaintext
dim a as new CFAbsoluteTimeMBS(5)
MsgBox str(a.Value)
```

See also:

- 48.2.4 Constructor

48.2.6 DayOfWeek(timezone as CFTimeZoneMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns an integer representing the day of the week indicated by the specified date.

**Example:**
```plaintext
dim t as new CFAbsoluteTimeMBS
MsgBox str(t.DayOfWeek(nil))
```

48.2.7 DayOfYear(timezone as CFTimeZoneMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns an integer representing the day of the year indicated by the specified date.

**Example:**
```plaintext
dim t as new CFAbsoluteTimeMBS
MsgBox str(t.DayOfYear(nil))
```
GetDifferenceAsGregorianUnits

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns the difference of the two absolute times in gregorian units.

**Notes:**

Timezone is optional and may be nil.

For flags:

- `kCFGregorianUnitsYears` = 1
- `kCFGregorianUnitsMonths` = 2
- `kCFGregorianUnitsDays` = 4
- `kCFGregorianUnitsHours` = 8
- `kCFGregorianUnitsMinutes` = 16
- `kCFGregorianUnitsSeconds` = 32
- `kCFGregorianAllUnits` = & hFFFFFFF

GregorianDate

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns the gregorian date for the given absolute time.

**Example:**

```vbscript
dim t as new CFAbsoluteTimeMBS
dim g as CFGregorianDateMBS = t.GregorianDate(nil)
MsgBox str(g.Year)
```

**Notes:**

Timezone is optional and can be nil.

Returns nil on any error.

WeekOfYear

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns an integer representing the week of the year indicated by the specified date.

**Example:**

```vbscript
dim t as new CFAbsoluteTimeMBS
MsgBox str(t.WeekOfYear(nil))
```
48.2.11 Properties

48.2.12 Date as CFDateMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The date object representing this absolute time value.

**Notes:**
Returns nil on any error.
(Read only property)
48.3. class CFArrayMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation Array.  

**Example:**

```plaintext
// copy names of recent items in Real Studio Preferences

dim names() as string
dim c as new CFPreferencesMBS

dim o as CFObj
```

```plaintext
    ectMBS = c.CopyAppValue(NewCFStringMBS("Recent Items Dict"), NewCFStringMBS("com.realsoftware.realstudio"))
```

```plaintext
if o isa CFArrayMBS then
    dim a as CFArrayMBS = CFArrayMBS(o)

    dim u as Integer = a.Count-1
    for i as Integer = 0 to u
        o = a.Item(i)

    if o isa CFDictionaryMBS then
        dim d as CFDictionaryMBS = CFDictionaryMBS(o)

        dim no as CFObj = d.Value(NewCFStringMBS("Name"))
        if no isa CFStringMBS then
            dim ns as CFStringMBS = CFStringMBS(no)

            names.Append ns.str
        end if
    end if
next
end if
```

MsgBox Join(names, EndOfLine)

**Notes:**

If the release property is true, the destructor of this class will release the array reference.

From CFArrayMBS.h:
48.3. CLASS CFARRAYMBS

CFArray implements an ordered, compact container of pointer-sized values. Values are accessed via integer keys (indices), from the range 0 to N-1, where N is the number of values in the array when an operation is performed. The array is said to be “compact” because deleted or inserted values do not leave a gap in the key space – the values with higher-numbered indices have their indices renumbered lower (or higher, in the case of insertion) so that the set of valid indices is always in the integer range \([0, N-1]\). Thus, the index to access a particular value in the array may change over time as other values are inserted into or deleted from the array.

Arrays come in two flavors, immutable, which cannot have values added to them or removed from them after the array is created, and mutable, to which you can add values or from which remove values. Mutable arrays have two subflavors, fixed-capacity, for which there is a maximum number set at creation time of values which can be put into the array, and variable capacity, which can have an unlimited number of values (or rather, limited only by constraints external to CFArray, like the amount of available memory). Fixed-capacity arrays can be somewhat higher performing, if you can put a definite upper limit on the number of values that might be put into the array.

As with all CoreFoundation collection types, arrays maintain hard references on the values you put in them, but the retaining and releasing functions are user-defined callbacks that can actually do whatever the user wants (for example, nothing).

Computational Complexity The access time for a value in the array is guaranteed to be at worst \(O(\lg N)\) for any implementation, current and future, but will often be \(O(1)\) (constant time). Linear search operations similarly have a worst case complexity of \(O(N\lg N)\), though typically the bounds will be tighter, and so on. Insertion or deletion operations will typically be linear in the number of values in the array, but may be \(O(N\lg N)\) clearly in the worst case in some implementations. There are no favored positions within the array for performance; that is, it is not necessarily faster access values with low indices, or to insert or delete values with high indices, or whatever.

This class works on Windows with QuickTime 7 installed. Subclass of the CFOBJECTMBS class.

48.3.2 Methods

48.3.3 arrayWithContentsOfFile(file as folderitem) as CFArrayMBS

MBS MacCF Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns an array containing the contents of the file specified by a given path.

**Example:**

```plaintext
dim a as new CFMutableArrayMBS
a.Append NewCFStringRefMBS("Hello")
a.Append NewCFStringRefMBS("World")

dim f as FolderItem = SpecialFolder.Desktop.Child("test.xml")
```
if a.writeToFile(f, true) then
  MsgBox "OK"
else
  MsgBox "Failed"
end if

dim x as CFArrayMBS = CFArrayMBS.arrayWithContentsOfFile(f)
MsgBox x.XML.str

Notes:
file: The path to a file containing a string representation of an array produced by the writeToFile method.

Returns an array containing the contents of the file specified by aPath. Returns nil if the file can’t be opened or if the contents of the file can’t be parsed into an array.

The array representation in the file identified by aPath must contain only property list objects (NSString/CF-String, NSData/CFData, NSArray/CFArray, or NSDictionary/CFDictionary objects).

Returns nil on any error.

48.3.4 arrayWithContentsOfURL(URL as string) as CFArrayMBS

MBS MacCF Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Creates and returns an array containing the contents specified by a given URL.

Notes:
URL: The location of a file containing a string representation of an array produced by the writeToURL method.

Returns an array containing the contents specified by aURL. Returns nil if the location can’t be opened or if the contents of the location can’t be parsed into an array.

The array representation at the location identified by aURL must contain only property list objects (NSString/CF-String, NSData/CFData, NSArray/CFArray, or NSDictionary/CFDictionary objects).

Returns nil on any error.
48.3. CLASS CFARRAYMBS

48.3.5 arrayWithHandle(Handle as Integer) as CFArrayMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new array object based on a handle value. **Notes:** Will retain the reference.

48.3.6 clone as CFArrayMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new immutable array with the values from the given array. **Notes:** The values itself are not duplicated, but retained.

48.3.7 Constructor

MBS MacCF Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Creates a new editable array object. **Example:**

```dim b as new CFMutableArrayMBS
b.Append(NewCFStringMBS("Hello"))
MsgBox str(b.Count)```

See also:

- 48.3.8 Constructor(values() as string)

48.3.8 Constructor(values() as string)

MBS MacCF Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Creates a new CFArrayMBS object with CFString objects created from the given string array. **Example:**

```dim values() as string = array("Hello", "World", "Just", "a", "Test")
dim a as new CFArrayMBS(values)
MsgBox str(a.Count)+" elements"
MsgBox a.XML.Str // show as xml```
48.3.9 **ContainsValue(value as CFObjectMBS) as boolean**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reports whether or not the value is in the array.

48.3.10 **CountOfValue(value as CFObjectMBS) as Integer**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Counts the number of times the given value occurs in the array.

48.3.11 **Edit as CFMutableArrayMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new mutable array with the values from the current array.

48.3.12 **FirstIndexOfValue(value as CFObjectMBS) as Integer**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Searches the array for the value.  
**Notes:**
- Result: The lowest index of the matching values, or -1 if no value matched.

48.3.13 **Item(index as Integer) as CFObjectMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the entry with the given index.  
**Notes:** Index from 0 to count-1.
48.3. **CLASS CFARRAYMBS**

### 48.3.14 `LastIndexOfValue(value as CFObjectMBS) as Integer`

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Searches the array for the value.

**Notes:**
Result:
The lowest highest of the matching values, or -1 if no value matched.

### 48.3.15 `writeToFile(file as folderitem, useAuxiliaryFile as boolean) as boolean`

MBS MacCF Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the contents of the receiver to a file at a given path.

**Example:**
```plaintext
dim a as new CFMutableArrayMBS
a.Append NewCFStringMBS(“Hello”)
a.Append NewCFStringMBS(“World”)
dim f as FolderItem = SpecialFolder.Desktop.Child(“test.xml”)
if a.writeToFile(f, true) then
    MsgBox “OK”
else
    MsgBox “Failed”
end if

dim x as CFArrayMBS = CFArrayMBS.arrayWithContentsOfFile(f)
MsgBox x.XML.str
```

**Notes:**
file: The path at which to write the contents of the receiver.
useAuxiliaryFile: If true, the array is written to an auxiliary file, and then the auxiliary file is renamed to path. If false, the array is written directly to path. The true option guarantees that path, if it exists at all, won’t be corrupted even if the system should crash during writing.

Returns true if the file is written successfully, otherwise false.

If the receiver’s contents are all property list objects (NSString, NSData, NSArray, or NSDictionary objects), the file written by this method can be used to initialize a new array with the class method arrayWithContentsOfFile. This method recursively validates that all the contained objects are property list objects before writing out the file, and returns false if all the objects are not property list objects, since the resultant file
would not be a valid property list.

48.3.16  **writeToURL(url as string, atomically as boolean) as boolean**

MBS MacCF Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes the contents of the receiver to the location specified by a given URL. **Notes:**

URL: The location at which to write the receiver.
atomically: If true, the array is written to an auxiliary location, and then the auxiliary location is renamed to aURL. If false, the array is written directly to aURL. The true option guarantees that aURL, if it exists at all, won’t be corrupted even if the system should crash during writing.

Returns true if the location is written successfully, otherwise false.

If the receiver’s contents are all property list objects (NSString, NSData, NSArray, or NSDictionary objects), the location written by this method can be used to initialize a new array with the class method arrayWithContentsOfURL.

48.3.17  **Properties**

48.3.18  **count as Integer**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of values currently in the array. **Example:**

```bash
dim x as new CFMutableDictionaryMBS
x.Add(NewCFStringMBS("Hello"), NewCFStringMBS("World"))
MsgBox str(x.Count)
```

**Notes:** (Read only property)
48.4.  CLASS CFATTRIBUTESTRINGMBS

48.4  class CFAttributedStringMBS

48.4.1  class CFAttributedStringMBS

MBS MacCF Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
This is the class for a CoreFoundation attributed string.
**Notes:** Subclass of the CFObjectMBS class.

48.4.2  Methods

48.4.3  AsNSAttributedString as Variant

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Returns a new NSAttributedStringMBS object pointing to same attributed string.
**Example:**

```
// make CF version
dim c as CFAttributedStringMBS = CFAttributedStringMBS.Create("Hello World", nil)
MsgBox c.String

// get NS Version
dim n as NSAttributedStringMBS = c.AsNSAttributedString
MsgBox n.text
```

**Notes:** For passing to functions which need a NSAttributedStringMBS.

48.4.4  AttributeAndLongestEffectiveRange(location as Integer, attrName as CFStringMBS, inRange as CFRangeMBS, byref effectiveRange as CFRangeMBS) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Returns the value of a given attribute of an attributed string at a specified location.
**Notes:**
location: The location in str at which to determine the attributes. It is a programming error for loc to specify a location outside the bounds of str.
attrName: The name of the attribute whose value you want to determine.
inRange: The range in str within which you want to find the longest effective range of the attributes at loc.
inRange must not exceed the bounds of str.
effectiveRange: upon return contains the maximal range within inRange over which the exact same set of attributes apply. The returned range is clipped to inRange.
Returns the attribute value of str at the specified location.

### 48.4.5 AttributesAndLongestEffectiveRange

(location as Integer, inRange as CFRangeMBS, byref effectiveRange as CFRangeMBS) as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns the attributes of an attributed string at a specified location.

**Notes:**

- **location:** The location in str at which to determine the attributes. loc must not exceed the bounds of str.
- **inRange:** The range in str within to find the longest effective range of the attributes at loc. inRange must not exceed the bounds of str.
- **effectiveRange:** upon return contains the maximal range within inRange over which the exact same set of attributes apply. The returned range is clipped to inRange.

### 48.4.6 AttributesDictionary

(location as Integer, byref effectiveRange as CFRangeMBS) as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns the attributes of an attributed string at a specified location.

**Notes:**

- **location:** The location in str at which to determine the attributes. loc must not exceed the bounds of str.
- **effectiveRange:** upon return contains a range including loc over which exactly the same set of attributes apply as at loc.

Returns a dictionary that contains the attributes of str at the specified location. Ownership follows the Get Rule.

For performance reasons, a range returned in effectiveRange is not necessarily the maximal range. If you need the maximum range, you should use AttributesAndLongestEffectiveRange.

Note that the returned attribute dictionary might change in unpredictable ways if the attributed string is edited after this call. If you want to preserve the state of the dictionary, you should make an actual copy of it rather than just retaining it. In addition, you should make no assumptions about the relationship of the actual dictionary returned by this call and the dictionary originally used to set the attributes, other than the fact that the values stored in the dictionaries will be identical (that is, \(==\)) to those originally specified.
48.4. **CLASS CFATTRIBUTEDSTRINGMBS**

### 48.4.7 AttributeValue(location as Integer, attrName as CFStringMBS, byref effectiveRange as CFRangeMBS) as CFObj ectMBS

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns the value of a given attribute of an attributed string at a specified location.

**Notes:**

- location: The location in str at which to determine the attributes. loc must not exceed the bounds of str.
- attrName: The name of the attribute whose value you want to determine.
- effectiveRange: upon return contains a range including loc over which exactly the same set of attributes apply as at location.

Returns the value of the specified attribute at the specified location in str. Ownership follows the Get Rule.

For performance reasons, a range returned in effectiveRange is not necessarily the maximal range. If you need the maximum range, you should use AttributeAndLongestEffectiveRange.

### 48.4.8 Constructor(str as CFAttributedStringMBS, range as CFRangeMBS)

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates a sub-attributed string from the specified range.

**Notes:**

- str: The attributed string to copy.
- range: The range of the attributed string to copy. range must not exceed the bounds of Str.

Returns a new attributed string whose string and attributes are copied from the specified range of the supplied attributed string. Raises OutOfMemory exception if there was a problem copying the object. Ownership follows the Create Rule.

See also:

- 48.4.9 Constructor(str as CFStringMBS, attributeDictionary as CFDictionaryMBS = nil)

### 48.4.9 Constructor(str as CFStringMBS, attributeDictionary as CFDictionaryMBS = nil)

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates an attributed string with specified string and attributes.

**Notes:**

- str: A string that specifies the characters to use in the new attributed string. This value is copied.
- attributeDictionary: A dictionary that contains the attributes to apply to the new attributed string. This value is copied.
Returns an attributed string that contains the characters from str and the attributes specified by attributes. Raises OutOfMemory exception if there was a problem in creating the attributed string.

Note that both the string and the attributes dictionary are copied. The specified attributes are applied to the whole string. If you want to apply different attributes to different ranges of the string, you should use a mutable attributed string.

See also:

• 48.4.8 Constructor(str as CFAttributedStringMBS, range as CFRangeMBS)

48.4.10 Copy as CFAttributedStringMBS

48.4.11 Create(str as CFStringMBS, attributeDictionary as CFDictionaryMBS = nil) as CFAttributedStringMBS

Notes:

str: A string that specifies the characters to use in the new attributed string. This value is copied.
attributeDictionary: A dictionary that contains the attributes to apply to the new attributed string. This value is copied.

Returns an attributed string that contains the characters from str and the attributes specified by attributes. The result is nil if there was a problem in creating the attributed string.

Note that both the string and the attributes dictionary are copied. The specified attributes are applied to the whole string. If you want to apply different attributes to different ranges of the string, you should use a mutable attributed string.

48.4.12 CreateWithSubstring(str as CFAttributedStringMBS, range as CFRangeMBS) as CFAttributedStringMBS

Notes:

str: The attributed string to copy.
range: The range of the attributed string to copy. range must not exceed the bounds of Str.

Returns a new attributed string whose string and attributes are copied from the specified range of the supplied attributed string. Returns nil if there was a problem copying the object. Ownership follows the Create Rule.

48.4.13 GetLength as Integer

MBS MacCF Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries the length of the string. **Deprecated:** This item is deprecated and should no longer be used. **Notes:** Deprecated in favor of Length property.

48.4.14 GetString as CFStringMBS

MBS MacCF Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries the text of the attributed string. **Deprecated:** This item is deprecated and should no longer be used. **Notes:** Deprecated in favor of String function.

48.4.15 MutableCopy(maxLength as Integer = 0) as CFAttributedStringMBS

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a mutable attributed string copy. **Notes:** maxLength, if not 0, is a hard bound on the length of the attributed string; exceeding this size limit during any editing operation is a programming error. If 0, there is no limit on the length.

48.4.16 String as CFStringMBS

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string for an attributed string. **Notes:** For performance reasons, the string returned will often be the backing store of the attributed string, and it might therefore change if the attributed string is edited. However, this is an implementation detail, and you should not rely on this behavior.
48.4.17 Properties

48.4.18 Length as Integer

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the length of the attributed string in characters.
**Notes:** (Read only property)
48.5. **CLASS CFBAGLEISTMBS**

48.5  **class CFBagListMBS**

48.5.1  **class CFBagListMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for the items of a CFBag.

48.5.2  **Methods**

48.5.3  **Value(index as Integer) as CFObjectMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value with the given index.

48.5.4  **Properties**

48.5.5  **Count as Integer**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Counts the items in the set.  
**Notes:** (Read and Write property)
48.6 class CFBagMBS

48.6.1 class CFBagMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation bag.  
**Notes:**  
If the release property is true, the destructor of this class will release the set reference.  
Subclass of the CFOBJECTMBS class.

48.6.2 Methods

48.6.3 clone as CFBagMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clones the set and all values.

48.6.4 Constructor

MBS MacCF Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor which creates a new editable bag.  
**Example:**  
```dim b as new CFMutableBagMBS```

48.6.5 ContainsValue(value as CFOBJECTMBS) as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Does the set contain this value?

48.6.6 CountValue(value as CFOBJECTMBS) as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Counts how often this value is inside the set.
48.6. **CLASS CFBAGMBS**

48.6.7  **edit as CFMutableBagMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** To edit a set, this method returns you a CFMutableBagMBS.

48.6.8  **List as CFBagListMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a list of all values.  
**Notes:** This list will be invalid whenever this set is destroyed.

48.6.9  **Value(value as CFObjectMBS) as CFObjectMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the value is found the value is returned.  
**Notes:** Returns nil if key is not found.

48.6.10  **Properties**

48.6.11  **Count as Integer**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Counts all values.  
**Example:**

```plaintext
dim b as new CFMutableBagMBS
b.Add(NewCFStringMBS("Hello"))
MsgBox str(b.Count)
```

**Notes:** (Read only property)
48.7 class CFBinaryDataMBS

48.7.1 class CFBinaryDataMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for core foundation data.

**Notes:**

If the release property is true, the destructor of this class will release the data reference.

This class works on Windows with QuickTime 7 installed.

This wraps a CFDataRef from Apple. It was named CFBinaryDataMBS instead of CFDataMBS over 10 years ago.

Subclass of the CFObjectMBS class.

48.7.2 Methods

48.7.3 clone as CFBinaryDataMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes a deep copy of the CFBinaryDataMBS object.

48.7.4 Constructor(data as MemoryBlock)

MBS MacCF Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Creates a new data object with given content.

**Example:**

```plaintext
dim m as MemoryBlock = "Hello"
dim d as new CFBinaryDataMBS(m)
```

MsgBox d.Str

See also:

- 48.7.5 Constructor(data as string)
48.7. **CLASS CFBINARYDATAMBS**

### 48.7.5 Constructor(data as string)

MBS MacCF Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Creates a new data object with given content.

**Example:**

```vba
dim m as string = "Hello"
dim d as new CFBinaryDataMBS(m)

MsgBox d.Str
```

See also:

- 48.7.4 Constructor(data as MemoryBlock)

### 48.7.6 Edit as CFMutableBinaryDataMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes a copy of the CFBinaryDataMBS object for editing.

### 48.7.7 Mem as Memoryblock

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The binary data returned as a Realbasic memoryblocks.

See also:

- 48.7.8 Mem(pos as Integer,len as Integer) as Memoryblock

### 48.7.8 Mem(pos as Integer,len as Integer) as Memoryblock

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The binary data returned as a Realbasic memoryblocks.

See also:

- 48.7.7 Mem as Memoryblock

### 48.7.9 Str as String

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The binary data returned as a Realbasic string.

See also:
48.7.10 Str(pos as Integer, len as Integer) as String

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The binary data returned as a Realbasic string.

See also:

- 48.7.9 Str as String

48.7.11 Properties

48.7.12 len as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The length of this binary data in bytes.

**Example:**

```realbasic
dim b as CFBinaryDataMBS = NewCFBinaryDataMBSStr("Hello")
MsgBox str(b.Len) // shows 5
```

**Notes:** (Read only property)
48.8.  **CLASS CFBOOLEANMBS**

48.8  **class CFBooleanMBS**

48.8.1  **class CFBooleanMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation boolean.  
**Notes:**  
If the release property is true, the destructor of this class will release the boolean reference.  
This class works on Windows with QuickTime 7 installed.  
Subclass of the CFObjectMBS class.

48.8.2  **Methods**

48.8.3  **Constructor(value as Boolean)**

MBS MacCF Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The constructor.

48.8.4  **Operator_Convert as Boolean**

MBS MacCF Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** A helper method for auto conversion between boolean and CFBooleanMBS.  
See also:

- 48.8.5 **Operator_Convert(v As Boolean)**

48.8.5  **Operator_Convert(v As Boolean)**

MBS MacCF Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** A helper method for auto conversion between boolean and CFBooleanMBS.  
See also:

- 48.8.4 **Operator_Convert as Boolean**

48.8.6  **Properties**

48.8.7  **Value as boolean**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of this CFBooleanMBS object.
Notes: (Read only property)
48.9. class CFBundleMBS

48.9.1 class CFBundleMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation bundle.

**Example:**

```vbnet
// get FolderItem
dim f as FolderItem = SpecialFolder.Applications.Child("Safari.app")

// make bundle
dim b as CFBundleMBS = CreateBundleMBS(f)

// make a key
dim k as CFStringMBS = NewCFStringMBS("CFBundleShortVersionString")

// lookup the value
dim i as CFObjectMBS = b.GetValueForInfoDictionaryKey(k)

// it's a string, so show it
dim s as CFStringMBS = CFStringMBS(i)
MsgBox s.str
```

**Notes:**

If the release property is true, the destructor of this class will release the boolean reference.

Subclass of the CFObjectMBS class.

This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

48.9.2 Methods

48.9.3 BuiltInPlugInsDirectory as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The built in plugins folder of the bundle.

**Notes:** Returns nil on any error.

48.9.4 Constructor

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
48.9.5 DevelopmentRegion as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The development region of the bundle.  
**Notes:** Returns nil on any error.

48.9.6 ExecutableFile as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The executable file of the bundle.  
**Example:**

```
// The following code does not have any check for nil, so it may crash at any point!

dim f as FolderItem
dim c as CFBundleMBS
dim url as CFURLMBS

// Get Path to Mail
f=ApplicationsFolderMBS(-32766).Child("mail.app")

// Make a CFURL from the file
url=NewCFURLMBSFile(f)
// Create a bundle object
c=CreateBundleMBS(url)

// show the path
MsgBox c.ExecutableFile.file.AbsolutePath
```

**Notes:** Returns nil on any error.

48.9.7 GetInfoDictionary as CFDictionaryMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The information dictionary for the bundle.  
**Notes:** Returns nil on any error.
48.9. **CLASS CFBUNDLEMBS**

### 48.9.8 GetLocalInfoDictionary as CFDictionaryMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The local information dictionary for the bundle.  
**Notes:** Returns nil on any error.

### 48.9.9 GetValueForInfoDictionaryKey(key as CFStringMBS) as CFOBJECTMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a value from the information dictionary for the given key.  
**Example:**

```plaintext
// lists the document types Mail.app can read

dim f as FolderItem
dim b as CFBundleMBS
dim u as CFURLMBS
dim s as string
dim a as CFArryMBS
dim i as Integer
dim c as Integer
dim o as CFOBJECTMBS
dim d as CFdictionaryMBS
dim t(-1) as string

f=ApplicationsFolderMBS(-32766).Child("Mail.app")
u=NewCFURLMBSFile(f)
b=CreateBundleMBS(u)
o=b.GetValueForInfoDictionaryKey(NewCFStringMBS("CFBundleDocumentTypes"))

if o isa CFArryMBS then
a=cfaarraymbs(o)

  c=a.Count-1
  for i=0 to c
    o=a.Item(i)
    if o isa CFDictionaryMBS then
      d=CFDictionaryMBS(o)
      o=d.Value(NewCFStringMBS("CFBundleTypeName"))
    if o isa CFStringMBS then
      s=CFStringMBS(o).str
      t.Append s
    end if
  end if
end if
next
end if
```
s=Join(t," ","")
MsgBox s

Notes: Returns nil on any error.

### 48.9.10 Identifier as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The identifier for the bundle.
Notes: Returns nil on any error.

### 48.9.11 kCFBundleDevelopmentRegionKey as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionaries.
Notes: Returns nil on any error.

### 48.9.12 kCFBundleDisplayNameKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionaries.
Notes: Display name of the bundle. Can be localized.
Returns nil on any error.

### 48.9.13 kCFBundleExecutableKey as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionaries.
Notes: Returns nil on any error.

### 48.9.14 kCFBundleIdentifierKey as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionaries.
Example:

```vba
// Find the bundle id for Mail.app

dim f as FolderItem
dim b as CFBundleMBS
dim u as CFURLMBS
dim s as string
dim o as CFObj ectMBS

f=ApplicationsFolderMBS(-32766).Child("Mail.app")
u=NewCFURLMBSFile(f)
b=CreateBundleMBS(u)
o=b.GetValueForInfoDictionaryKey(b.kCFBundleIdentifierKey)

if o isa CFStringMBS then
  s=cfstringmbs(o).str
end if

msgbox s
```

Notes: Returns nil on any error.

### 48.9.15 kCFBundleInfoDictionaryVersionKey as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionaries.

**Notes:** Returns nil on any error.

### 48.9.16 kCFBundleNameKey as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionaries.

**Notes:** Returns nil on any error.

### 48.9.17 kCFBundleVersionKey as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the dictionaries.
Notes: Returns nil on any error.

48.9.18 LocalizedString(key as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Same as the other LocalizedString functions, but the default table and not value is always used.
See also:
- 48.9.19 LocalizedString(key as CFStringMBS, value as CFStringMBS) as CFStringMBS
- 48.9.20 LocalizedString(key as CFStringMBS, value as CFStringMBS, TableName as CFStringMBS) as CFStringMBS

48.9.19 LocalizedString(key as CFStringMBS, value as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Same as the other LocalizedString functions, but the default table is always used.
See also:
- 48.9.18 LocalizedString(key as CFStringMBS) as CFStringMBS
- 48.9.20 LocalizedString(key as CFStringMBS, value as CFStringMBS, TableName as CFStringMBS) as CFStringMBS

48.9.20 LocalizedString(key as CFStringMBS, value as CFStringMBS, TableName as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the localized string for the given key and table.
**Notes:**
The table parameter is optional to specify which ".strings"-file to use.
without table or table="" the "Localizable.strings" file is used by Mac OS X.

key: The key for the localized string you wish to retrieve. This key will be used to look up the localized string in the strings file. Typically the key is identical to the value of the localized string in the development language.

value: A comment which might assist the translator. As used by the localized string macros and the gens-strings tool, this value becomes an annotation in the generated strings file.
48.9.  CLASS CFBUNDLEMBS

tableName: The name of the strings file you wish to search. The name should not include the strings filename extension.

Returns "" (empty string) on Mac OS Classic or Windows.
See also:

- 48.9.18 LocalizedString(key as CFStringMBS) as CFStringMBS
- 48.9.19 LocalizedString(key as CFStringMBS, value as CFStringMBS) as CFStringMBS

48.9.21  MainBundle as CFBundleMBS

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a CFBundle for the main bundle (current app).
**Example:**

MsgBox CFBundleMBS.MainBundle.Identifier

48.9.22  PackageMacCreator as string

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Mac OS creator code for this bundle.
**Notes:** Returns "" on any error.

48.9.23  PackageMacType as string

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Mac OS file type code for this bundle.
**Notes:**

Returns "" on any error.
Should be "APPL" for applications.

48.9.24  PrivateFrameworksDirectory as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private framework folder of the bundle.
**Notes:** Returns nil on any error.
48.9.25 ResourceDirectory as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The resource folder of the bundle.  
**Notes:** Returns nil on any error.

48.9.26 ResourceURL(resourceName as CFStringMBS, resourceType as CFStringMBS, subDirName as CFStringMBS) as CFURLMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Searches inside the application bundle for a file.  
**Example:**

```plaintext
dim b as CFBundleMBS
dim u as CFURLMBS
dim f as FolderItem

b=app.MainBundleMBS

u=b.ResourceURL(NewCFStringMBS("Photo"),NewCFStringMBS("tif"),nil)

f=u.file

MsgBox f.AbsolutePath
// e.g. "Content/Resources/Photo.tif" inside your bundle.
```

**Notes:**

- resourceName is the filename of the resource file.
- resourceType is the file extension.
- subDirName is the name of the directory.
- This function will take care for localization folders.

48.9.27 ResourceURLForLocalization(resourceName as CFStringMBS, resourceType as CFStringMBS, subDirName as CFStringMBS, localizationName as CFStringMBS) as CFURLMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Searches inside the application bundle for a file with the given localization.  
**Notes:**

- resourceName is the filename of the resource file.
- resourceType is the file extension.
48.9. **CLASS CFBUNDLEMBS**

SubDirectory is the name of the directory.
localizationName is the name of the localization requested.
This function will take care for localization folders.

48.9.28 **ResourceURLsOfType**(resourceType as CFStringMBS, subDirName as CFStringMBS) as CFArrayMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Searches inside the bundle like ResourceURL, but returns an array of all matching files.

48.9.29 **ResourceURLsOfTypeForLocalization**(resourceType as CFStringMBS, subDirName as CFStringMBS, localizationName as CFStringMBS) as CFArrayMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Searches inside the bundle like ResourceURLForLocalization, but returns an array of all matching files.

48.9.30 **SharedFrameworksDirectory** as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The shared framework folder of the bundle.
**Notes:** Returns nil on any error.

48.9.31 **SharedSupportURL** as CFURLMBS

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The shared support files folder of the bundle.
**Notes:** Returns nil on any error.

48.9.32 **SupportFilesDirectory** as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The support files folder of the bundle.
**Notes:** Returns nil on any error.
48.9.33 URL as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The URL for the given bundle.  
**Notes:** Returns nil on any error.

48.9.34 Version as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The version of the bundle.  
**Notes:** Returns nil on any error.
48.10. class CFCharacterSetMBS

48.10.1. class CFCharacterSetMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation character set.
**Notes:**
If the release property is true, the destructor of this class will release the set reference.
This class works on Windows with QuickTime 7 installed.
Subclass of the CFObjectMBS class.

48.10.2. Methods

48.10.3. Binary as CFBinaryDataMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This function returns the content of the CharacterSet as a CFBinaryData.
**Notes:** Returns nil on any error.

48.10.4. edit as CFMutableCharacterSetMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** To edit a character set, this method returns you a CFMutableCharacterSetMBS.

48.10.5. GetPredefinedCFCharacterSet(id as Integer) as CFCharacterSetMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a predefined Character set.

48.10.6. IsMember(charcode as Integer) as Boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the unicode character is part of this CharacterSet.
**Notes:** Works only for charcode from 0 to &hFFFF.
48.10.7  kCFCharacterSetAlphaNumeric as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the predefined character set for alpha numeric characters.

48.10.8  kCFCharacterSetControl as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the predefined character set for control characters.

48.10.9  kCFCharacterSetDecimalDigit as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the predefined character set for decimal digit characters.

48.10.10  kCFCharacterSetDecomposable as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the predefined character set for decomposable characters.

48.10.11  kCFCharacterSetIllegal as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the predefined character set for illegal characters.

48.10.12  kCFCharacterSetLetter as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the predefined character set for letter characters.

48.10.13  kCFCharacterSetLowercaseLetter as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the predefined character set for lowercase letter characters.
48.10. **CLASS CFCHARACTERSETMBS**

### 48.10.14 kCFCharacterSetNonBase as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the predefined character set for non base characters.

### 48.10.15 kCFCharacterSetPunctuation as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the predefined character set for punctuation characters.

### 48.10.16 kCFCharacterSetUppercaseLetter as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the predefined character set for uppercase letter characters.

### 48.10.17 kCFCharacterSetWhitespace as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the predefined character set for whitespace characters.

### 48.10.18 kCFCharacterSetWhitespaceAndNewline as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ID of the predefined character set for whitespace characters and newline.

### 48.10.19 NewCFCharacterSet(str as CFBinaryDataMBS) as CFCharacterSetMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Character set with characters inside the CFBinary object.

See also:
- 48.10.20 NewCFCharacterSet(str as CFStringMBS) as CFCharacterSetMBS

### 48.10.20 NewCFCharacterSet(str as CFStringMBS) as CFCharacterSetMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Character set with characters inside the CFStringMBS object.
48.10.21 NewCFCharacterSetRange(min as Integer, length as Integer) as CFCharacterSetMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Character set with chars between min and max.

**Example:**

```vbnet
dim c as new CFCharacterSetMBS

c = CFCharacterSetMBS.NewCFCharacterSetRange(asc("A"), 26)

MsgBox str(c.IsMember(asc("C"))) // true
MsgBox str(c.IsMember(asc("1"))) // false
```

**Notes:** Use Unicode charcodes for min and max.
48.11. **CLASS CFDATEMBS**

48.11 **class CFDateMBS**

48.11.1 **class CFDateMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation date.

**Notes:**

If the release property is true, the destructor of this class will release the date reference. Subclass of the CFObjectMBS class.

48.11.2 **Methods**

48.11.3 **AbsoluteTime as CFAbsoluteTimeMBS**

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The absolute time value for this date.

**Notes:**

Returns nil on any error.

timezone is optional and may be nil.

48.11.4 **Compare(otherdate as CFDateMBS) as Integer**

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Compares two date objects.

**Notes:**

Result codes:
kCFCompareLessThan = -1
kCFCompareEqualTo = 0
kCFCompareGreaterThan = 1

On any error returns 0.

48.11.5 **TimeIntervalSinceDate(otherdate as CFDateMBS) as CFTimeIntervalMBS**

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

The difference between two dates as a time interval.

**Notes:** Returns nil on any error.
48.12 class CFDictionaryListMBS

48.12.1 class CFDictionaryListMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for the items of a CFDictionaryMBS.  
**Notes:** This class works on Windows with QuickTime 7 installed.

48.12.2 Methods

48.12.3 close

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.  
**Notes:** There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.  
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

48.12.4 Key(index as Integer) as CObjectMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the key with the given index.  
**Notes:** Index between 0 and count-1.

48.12.5 Value(index as Integer) as CObjectMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value with the given index.  
**Notes:** Index between 0 and count-1.

48.12.6 Properties

48.12.7 count as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Counts the elements inside this list.
48.12. CLASS CF DICTIONARYLISTMBS

Notes: (Read and Write property)
48.13 class CFDictionaryMBS

48.13.1 class CFDictionaryMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation dictionary.

**Example:**

```vbs
dim c as new CFPreferencesMBS
dim o as CFObjectMBS = c.CopyAppValue(NewCFStringMBS("VisibleIdentifiers"), NewCFStringMBS("com.apple.speech.voice.prefs"))
Dim d as CFDictionaryMBS = CFDictionaryMBS(o)

break // see dictionary in debugger
```

**Notes:**

If the release property is true, the destructor of this class will release the dictionary reference.
This class works on Windows with QuickTime 7 installed.
Subclass of the CFObjectMBS class.

48.13.2 Methods

48.13.3 clone as CFDictionaryMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clones the dictionary and all values.

48.13.4 Constructor

MBS MacCF Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new editable dictionary.

**Example:**

```vbs
Dim m as new CFMutableDictionaryMBS
m.Add(NewCFStringMBS("Key"), NewCFStringMBS("value"))
MsgBox str(m.Count)
```

See also:

• 48.13.5 Constructor(dic as dictionary)
48.13. **CLASS CFDICTIONARYMBS**

### 48.13.5 Constructor(dic as dictionary)

MBS MacCF Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CFDictionary based on the REALbasic Dictionary.

**Example:**

```vbnet
// build a dictionary
dim d as new Dictionary

d.Value("Hello")=2
d.Value("test")="World"
d.Value("ddd")=5.6

// convert to CFDictionary
dim c as new CFDictionaryMBS(d)

// Display as XML
dim b as CFBinaryDataMBS = c.XML
MsgBox b.str

// now convert back
dim e as Dictionary = c.dictionary

// and display values
for each key as Variant in e.keys
    MsgBox key+" ->"+e.Value(key)
next
```

**Notes:**

Be aware that the Dictionary is converted as good as possible. Unsupported datatype will be missing.

See the FAQ for the supported type translation between CoreFoundation and REALbasic data types.

See also:

- 48.13.4 Constructor

### 48.13.6 ContainsKey(value as CFObjectMBS) as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Does the dictionary contain this key?

**Example:**

```vbnet
dim c as CFMutableDictionaryMBS = NewCFMutableDictionaryMBS

c.Add NewCFStringMBS("test"),NewCFStringMBS("Value")
```
MsgBox c.XML.Str

if c.ContainsKey(NewCFStringMBS("test")) then
    MsgBox "OK"
else
    MsgBox "Failed"
end if

if c.ContainsKey(NewCFStringMBS("missing")) then
    MsgBox "Failed"
else
    MsgBox "OK"
end if

### 48.13.7 ContainsValue(value as CFObjectMBS) as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Does the dictionary contain this value?

### 48.13.8 CountKey(value as CFObjectMBS) as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Counts how often this key is inside the dictionary.

### 48.13.9 CountValue(value as CFObjectMBS) as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Counts how often this value is inside the dictionary.

### 48.13.10 Dictionary as Dictionary

MBS MacCF Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a REALbasic Dictionary from this CFDictionary.

**Example:**

```realbasic
// build a dictionary
dim d as new Dictionary
```
48.13. CLASS CFDictionaryMBS

```vbnet
Dim d As New CFDictionaryMBS(new Dictionary
Dim f As FolderItem = SpecialFolder.Desktop.Child("test.plist")
Dim d As CFDictionaryMBS = CFDictionaryMBS.dictionaryWithContentsOfFile(f)
MsgBox d.XML.Str
```

Notes:

Be aware that the CFDictionary is converted as good as possible. Unsupported datatype will be missing.

See the FAQ for the supported type translation between CoreFoundation and REALbasic data types.

48.13.11 dictionaryWithContentsOfFile(file as folderitem) as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates and returns a dictionary using the keys and values found in a file specified by a given path.

**Example:**

```vbnet
Dim f As FolderItem = SpecialFolder.Desktop.Child("test.plist")
Dim d As CFDictionaryMBS = CFDictionaryMBS.dictionaryWithContentsOfFile(f)
MsgBox d.XML.Str
```

Notes:

path: A full or relative pathname. The file identified by path must contain a string representation of a property list whose root object is a dictionary. The dictionary must contain only property list objects (instances of NSData, NSDate, NSNumber, NSString, NSArray, or NSDictionary).

Returns a new dictionary that contains the dictionary at path, or nil if there is a file error or if the contents
of the file are an invalid representation of a dictionary.

48.13.12 dictionaryWithContentsOfURL(URL as string) as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates and returns a dictionary using the keys and values found in a resource specified by a given URL. **Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("test.plist")
dim d as CFDictionaryMBS = CFDictionaryMBS.dictionaryWithContentsOfURL(f.URLPath)
MsgBox d.XML.Str
```

**Notes:**
URL: An URL that identifies a resource containing a string representation of a property list whose root object is a dictionary. The dictionary must contain only property list objects (instances of NSData, NSDate, NSNumber, NSString, NSArray, or NSDictionary).

Returns a new dictionary that contains the dictionary at aURL, or nil if there is an error or if the contents of the resource are an invalid representation of a dictionary.

48.13.13 dictionaryWithHandle(Handle as Integer) as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new dictionary object based on a handle value. **Notes:** Will retain the reference.

48.13.14 edit as CFMutableDictionaryMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** To edit a dictionary, this method returns you a CFMutableDictionaryMBS.

48.13.15 list as CFDictionaryListMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a list of all values.
48.13. **CLASS CF DICTIONARY MBS**

**Notes:** This list will be invalid whenever this dictionary is destroyed.

### 48.13.16 Value(key as CFObjectMBS) as CFObjectMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the key is found the value for this key is returned. **Notes:** Returns nil if key is not found.

### 48.13.17 writeToFile(file as folderitem, useAuxiliaryFile as boolean) as boolean

MBS MacCF Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes a property list representation of the contents of the receiver to a given path. **Example:**

```plaintext
dim m as new CFMutableDictionaryMBS
m.Set(NewCFStringMBS(“key”), NewCFStringMBS(“value”))
dim f as FolderItem = SpecialFolder.Desktop.Child(“test.plist”)
if m.writeToFile(f, true) then
    MsgBox “OK”
else
    MsgBox “Failed”
end if
```

**Notes:**
- path: The path at which to write the file. Must be an absolute URL.
- useAuxiliaryFile: A flag that specifies whether the file should be written atomically.

If flag is true, the receiver is written to an auxiliary file, and then the auxiliary file is renamed to path. If flag is false, the dictionary is written directly to path. The true option guarantees that path, if it exists at all, won’t be corrupted even if the system should crash during writing.

Returns true if the file is written successfully, otherwise false.

This method recursively validates that all the contained objects are property list objects (instances of NSData, NSDate, NSNumber, NSString, NSArray, or NSDictionary) before writing out the file, and returns false if all the objects are not property list objects, since the resultant file would not be a valid property list.
CHAPTER 48. COREFOUNDATION

If the receiver’s contents are all property list objects, the file written by this method can be used to initialize a new dictionary with the class method dictionaryWithContentsOfFile or dictionaryWithContentsOfURL.

48.13.18  WRITE TO URL (url as string, atomically as boolean) as boolean

Function: Writes a property list representation of the contents of the receiver to a given URL.

Example:

```vba
dim m as new CFMutableDictionaryMBS
m.Set(NewCFStringMBS("key"), NewCFStringMBS("value"))
dim f as FolderItem = SpecialFolder.Desktop.Child("test.plist")
if m.writeTourl(f.URLPath, true) then
    MsgBox "OK"
else
    MsgBox "Failed"
end if
```

Notes:

url: The URL to which to write the receiver.
atomically: A flag that specifies whether the output should be written atomically.

If flag is YtrueES, the receiver is written to an auxiliary location, and then the auxiliary location is renamed to aURL. If flag is false, the dictionary is written directly to aURL. The true option guarantees that aURL, if it exists at all, won’t be corrupted even if the system should crash during writing. flag is ignored if aURL is of a type that cannot be written atomically.

Returns true if the location is written successfully, otherwise false.

This method recursively validates that all the contained objects are property list objects (instances of NSData, NSDate, NSNumber, NSString, NSArray, or NSDictionary) before writing out the file, and returns false if all the objects are not property list objects, since the resultant output would not be a valid property list.

If the receiver’s contents are all property list objects, the location written by this method can be used to initialize a new dictionary with the class method dictionaryWithContentsOfURL or dictionaryWithContentsOfFile.
For more information about property lists, see Property List Programming Guide.

### 48.13.19 Properties

#### 48.13.20 Count as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Counts all values.  
**Example:**

```vbnet
dim x as new CFMutableDictionaryMBS

x.Add(NewCFStringMBS("Hello"), NewCFStringMBS("World"))

MsgBox str(x.Count)
```

**Notes:** (Read only property)
48.14  class CFErrorMBS

48.14.1  class CFErrorMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Core Foundation error class.

**Notes:**

A CFError object encapsulates rich and extensible error information than is possible using only an error code or error string. The core attributes of a CFError object are an error domain (represented by a string), a domain-specific error code and a user info dictionary containing application specific information. Errors are required to have a domain and an error code within that domain. The optional "userInfo" dictionary may provide additional information that might be useful for the interpretation and reporting of the error. This dictionary can even contain an "underlying" error, which is wrapped as an error bubbles up through various layers.

Several well-known domains are defined corresponding to Mach, POSIX, and OSStatus errors. In addition, CFError allows you to attach an arbitrary user info dictionary to an error object, and provides the means to return a human-readable description for the error.

In general, a method should signal an error condition by for example returning false or nil rather than by the simple presence of an error object. The method can then optionally return an CFError object by reference, in order to further describe the error.

CFError is toll-free bridged to NSError in the Foundation framework for more details on toll-free bridging, see Interchangeable Data Types. NSError has some additional guidelines which makes it easy to automatically report errors to users and even try to recover from them. See Error Handling Programming Guide for more information on NSError programming guidelines.

Requires Mac OS X 10.5 or newer.
Subclass of the CFObjectMBS class.

48.14.2  Methods

48.14.3  Code as Integer

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the error code for a given CFError.
48.14. Class CFERRORMBS

48.14.4 Description as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a human-presentable description for a given error.

48.14.5 Domain as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the error domain for a given CFError.

48.14.6 FailureReason as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a human-presentable failure reason for a given error.

48.14.7 kCFErrorDescriptionKey as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys in the userInfo dictionary.

**Notes:**
Key to identify the description in the userInfo dictionary.
When you create a CFError, you can provide a value for this key if you do not have localizable error strings.
The description should be a complete sentence if possible, and should not contain the domain name or error.

48.14.8 kCFErrorDomainCocoa as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants defining domains for CFError objects.

**Notes:** A constant that specified the Cocoa domain.

48.14.9 kCFErrorDomainMach as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants defining domains for CFError objects.

**Notes:** A constant that specified the Mach domain.
48.14.10 kCFErrorDomainOSStatus as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants defining domains for CFError objects. **Notes:** A constant that specified the OS domain.

48.14.11 kCFErrorDomainPOSIX as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the constants defining domains for CFError objects. **Notes:** A constant that specified the POSIX domain.

48.14.12 kCFErrorLocalizedStringDescriptionKey as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys in the userInfo dictionary. **Notes:** Key to identify the end user-presentable description in the userInfo dictionary.

48.14.13 kCFErrorLocalizedStringFailureReasonKey as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys in the userInfo dictionary. **Notes:** Key to identify the end user-presentable failure reason in the userInfo dictionary.

48.14.14 kCFErrorLocalizedStringRecoverySuggestionKey as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys in the userInfo dictionary. **Notes:** Key to identify the end user-presentable recovery suggestion in the userInfo dictionary.

48.14.15 kCFErrorUnderlyingErrorKey as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys in the userInfo dictionary. **Notes:** Key to identify the underlying error in the userInfo dictionary.
48.14.16  RecoverySuggestion as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a human presentable recovery suggestion for a given error.

48.14.17  UserInfo as dictionary

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the user info dictionary for a given CFError.
48.15 class CFGregorianDateMBS

48.15.1 class CFGregorianDateMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation gregorian date value.

48.15.2 Methods

48.15.3 AbsoluteTime(timezone as CFTimeZoneMBS) as CFAbsoluteTimeMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The absolute time value for this date. **Notes:** Returns nil on any error.

48.15.4 DateValid as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Are all those date properties in this object valid?

48.15.5 IsValid(flags as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the requested parts of the date values are valid. **Notes:**

Flags can be a combination of the following values:

- kCFGregorianUnitsYears = 1
- kCFGregorianUnitsMonths = 2
- kCFGregorianUnitsDays = 4
- kCFGregorianUnitsHours = 8
- kCFGregorianUnitsMinutes = 16
- kCFGregorianUnitsSeconds = 32
- kCFGregorianAllUnits = & hFFFFFF

Combine using BitwiseOr.
48.15.6 TimeValid as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Are all those time properties in this object valid?

48.15.7 Valid as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Are all those properties in this object valid?

48.15.8 Properties

48.15.9 Day as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The day value.
**Notes:**
Setting this property does not run a test for validation like Realbasic’s date class does.
(Read and Write property)

48.15.10 Hour as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The hour value.
**Notes:**
Setting this property does not run a test for validation like Realbasic’s date class does.
(Read and Write property)

48.15.11 Minute as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The minute value.
**Notes:**
Setting this property does not run a test for validation like Realbasic’s date class does.
(Read and Write property)
48.15.12 Month as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The month value.
**Notes:** Setting this property does not run a test for validation like Realbasic’s date class does. (Read and Write property)

48.15.13 Second as Double

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The second value.
**Notes:** Setting this property does not run a test for validation like Realbasic’s date class does. (Read and Write property)

48.15.14 Year as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The year value.
**Notes:** Setting this property does not run a test for validation like Realbasic’s date class does. (Read and Write property)
48.16 class CFGregorianUnitsMBS

48.16.1 class CFGregorianUnitsMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for gregorian time units.

48.16.2 Properties

48.16.3 Days as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The days.  
**Notes:** (Read and Write property)

48.16.4 Hours as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The hours.  
**Notes:** (Read and Write property)

48.16.5 Minutes as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minutes.  
**Notes:** (Read and Write property)

48.16.6 Months as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The months.  
**Notes:** (Read and Write property)

48.16.7 Seconds as Double

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The seconds.
Notes: (Read and Write property)

48.16.8 Years as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The years.
Notes: (Read and Write property)
48.17. CLASS CFMUTABLEARRAYMBS

48.17 class CFMutableArrayMBS

48.17.1 class CFMutableArrayMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation Array.

**Notes:**
If the release property is true, the destructor of this class will release the array reference. This class works on Windows with QuickTime 7 installed. Subclass of the CFArrayMBS class.

48.17.2 Methods

48.17.3 Append(value as CFObjectMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends an item to this array.

**Example:**

```vba
dim a as CFMutableArrayMBS

a=NewCFMutableArrayMBS

a.Append NewCFStringMBS("Hello")

MsgBox str(a.Count)

MsgBox CFStringMBS(a.Item(0)).str
```

48.17.4 AppendArray(sourcearray as CFArrayMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the values from an array to another array.

**Notes:** The whole array should be copied.

See also:

- 48.17.5 AppendArray(sourcearray as CFArrayMBS,min as Integer,max as Integer)
48.17.5 AppendArray(sourcearray as CFArrayMBS, min as Integer, max as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds the values from an array to another array.

**Notes:**
The whole array should be copied.
Min and Max are the range to be copied. Make sure they are correct indexes!
See also:

- 48.17.4 AppendArray(sourcearray as CFArrayMBS)

48.17.6 Exchange(index1 as Integer, index2 as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Exchanges the values at two indices of the array.

**Notes:** Make sure indexes are in range between 0 and count-1.

48.17.7 Insert(index as Integer, value as CFObjectMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts an item to this array.

**Notes:**
Make sure index is in range between 0 and count.
If Index=count then this function does like append.

48.17.8 Remove(index as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the value with the given index from the array.

**Notes:** Make sure index is in range between 0 and count-1.

48.17.9 RemoveAll

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all the values from the array, making it empty.
48.17. **CLASS CFMUTABLEARRAYMBS**

48.17.10 **SetValue(index as Integer, value as CFOBJECTMBS)**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes the value with the given index in the array.
CHAPTER 48. COREFOUNDATION

48.18 class CFMutableAttributedStringMBS

48.18.1 class CFMutableAttributedStringMBS

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The mutable version of an CoreFoundation attributed string.
**Notes:** Subclass of the CFAttributedStringMBS class.

48.18.2 Methods

48.18.3 AsNSMutableAttributedString as Variant

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a new NSMutableAttributedStringMBS object pointing to same mutable attributed string.
**Notes:** For passing to functions which need a NSMutableAttributedStringMBS.

48.18.4 BeginEditing

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Marks the beginning of a series of changes.
**Notes:** In cases where attributed string might do a bunch of work to assure self-consistency, BeginEditing/EndEditing allow disabling that to allow deferring and coalescing any work. It’s a good idea to call these around a set of related mutation calls which don’t require the string to be in consistent state in between. These calls can be nested.

48.18.5 Constructor(maxLength as Integer = 0)

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a mutable empty attributed string.
**Notes:** maxLength, if not 0, is a hard bound on the length of the attributed string; exceeding this size limit during any editing operation is a programming error. If 0, there is no limit on the length.
See also:

- 48.18.6 Constructor(str as CFAttributedStringMBS, range as CFRangeMBS) 7785
- 48.18.7 Constructor(str as CFStringMBS, attributeDictionary as CFDictionaryMBS = nil) 7785
48.18.6 Constructor(str as CFAttributedStringMBS, range as CFRangeMBS)

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a sub-attributed string from the specified range.

**Notes:**

str: The attributed string to copy.
range: The range of the attributed string to copy. range must not exceed the bounds of Str.

Returns a new attributed string whose string and attributes are copied from the specified range of the supplied attributed string. Raises OutOfMemory exception if there was a problem copying the object. Ownership follows the Create Rule.

See also:

- 48.18.5 Constructor(maxLength as Integer = 0)
- 48.18.7 Constructor(str as CFStringMBS, attributeDictionary as CFDictionaryMBS = nil)

48.18.7 Constructor(str as CFStringMBS, attributeDictionary as CFDictionaryMBS = nil)

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an attributed string with specified string and attributes.

**Notes:**

str: A string that specifies the characters to use in the new attributed string. This value is copied.
attributeDictionary: A dictionary that contains the attributes to apply to the new attributed string. This value is copied.

Returns an attributed string that contains the characters from str and the attributes specified by attributes. Raises OutOfMemory exception if there was a problem in creating the attributed string.

Note that both the string and the attributes dictionary are copied. The specified attributes are applied to the whole string. If you want to apply different attributes to different ranges of the string, you should use a mutable attributed string.

See also:

- 48.18.5 Constructor(maxLength as Integer = 0)
- 48.18.6 Constructor(str as CFAttributedStringMBS, range as CFRangeMBS)

48.18.8 EndEditing

Notes: In cases where attributed string might do a bunch of work to assure self-consistency, BeginEditing/EndEditing allow disabling that to allow deferring and coalescing any work. It’s a good idea to call these around a set of related mutation calls which don’t require the string to be in consistent state in between. These calls can be nested.

48.18.9 MutableString as CFMutableStringMBS

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Gets the string for the attributed string as a mutable string, allowing editing the character contents of the string as if it were an CFMutableString.

**Notes:**

Attributes corresponding to the edited range are appropriately modified. If, as a result of the edit, new characters are introduced into the string, they inherit the attributes of the first replaced character from range. If no existing characters are replaced by the edit, the new characters inherit the attributes of the character preceding range if it has any, otherwise of the character following range. If the initial string is empty, the attributes for the new characters are also empty.

(Note: This function is not yet implemented and will return NULL except for toll-free bridged instances.)

48.18.10 RemoveAttribute(Range as CFRangeMBS, attrName as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Removes the value of a single attribute over the specified range, which should be valid.

**Notes:** It’s OK for the attribute not the exist over the specified range.

48.18.11 ReplaceAttributedString(Range as CFRangeMBS, Replacement as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Replaces the attributed substring over the specified range with the attributed string specified in replacement.

**Notes:** range should be valid. To delete a range of the attributed string, call ReplaceString() with empty string and specified range.

48.18.12 ReplaceString(Range as CFRangeMBS, Replacement as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Modifies the string for the attributed string, much like CFString.Replace.
**48.18.** \textit{CLASS CFMUTABLEATTRIBUTEDSTRINGMBS}

\textbf{Notes:} It’s an error for range to specify characters outside the bounds of aStr.

\subsection*{48.18.13 SetAttribute(Range as CFRangeMBS, attrName as CFStringMBS, Value as CFObjectMBS)}

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Sets the value of a single attribute over the specified range, which should be valid. \textbf{Notes:} value should not be nil.

\subsection*{48.18.14 SetAttributes(Range as CFRangeMBS, replacements as CFDictionaryMBS, clearOtherAttributes as boolean)}

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. \textbf{Function:} Sets the value of multiple attributes over the specified range, which should be valid. \textbf{Notes:} If clearOtherAttributes is false, existing attributes (which aren’t being replaced) are left alone; otherwise they are cleared. The dictionary should be setup for ”usual” CF type usage — CFString keys, and arbitrary CFType values. Note that after this call, further mutations to the replacement dictionary argument by the caller will not affect the contents of the attributed string.
48.19 class CFMutableBagMBS

48.19.1 class CFMutableBagMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation mutable bag.

**Notes:**
If the release property is true, the destructor of this class will release the set reference.
Subclass of the CFBagMBS class.

48.19.2 Methods

48.19.3 Add(value as CFOBJECTMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds an object to this bag.

48.19.4 Remove(value as CFOBJECTMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes an object in this bag.

48.19.5 RemoveAll

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all items from this bag.

48.19.6 Replace(value as CFOBJECTMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces an object in this bag.

48.19.7 Set(value as CFOBJECTMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets an object in this bag.
48.20  class CFMutableBinaryDataMBS

48.20.1  class CFMutableBinaryDataMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for core foundation data.

**Notes:**
If the release property is true, the destructor of this class will release the data reference.
This class works on Windows with QuickTime 7 installed.
Subclass of the CFBinaryDataMBS class.

48.20.2  Methods

48.20.3  AppendCFBinaryDataMBS(m as CFBinaryDataMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends the bytes from the given CFBinary object.

**Notes:** This method may fail on low memory, e.g. on Mac OS Classic running a Carbon application with a small application memory partition size.
See also:
- 48.20.4 AppendCFBinaryDataMBS(m as CFBinaryDataMBS,len as Integer) 7790

48.20.4  AppendCFBinaryDataMBS(m as CFBinaryDataMBS,len as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends the bytes from the given CFBinary object.

**Notes:** This method may fail on low memory, e.g. on Mac OS Classic running a Carbon application with a small application memory partition size.
See also:
- 48.20.3 AppendCFBinaryDataMBS(m as CFBinaryDataMBS) 7790

48.20.5  AppendMem(m as memoryblock)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends the bytes from the given memoryblock.

**Notes:** This method may fail on low memory, e.g. on Mac OS Classic running a Carbon application with a small application memory partition size.
See also:
- 48.20.6 AppendMem(m as memoryblock,len as Integer) 7791
48.20.  CLASS CFMUTABLEBINARYDATAMBS

48.20.6  AppendMem(m as memoryblock, len as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends the bytes from the given memoryblock.
**Notes:** This method may fail on low memory, e.g. on Mac OS Classic running a Carbon application with a small application memory partition size.
See also:

- 48.20.5 AppendMem(m as memoryblock)

48.20.7  AppendStr(s as string)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends the bytes from the given string.
**Notes:** This method may fail on low memory, e.g. on Mac OS Classic running a Carbon application with a small application memory partition size.
See also:

- 48.20.8 AppendStr(s as string, len as Integer)

48.20.8  AppendStr(s as string, len as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends the bytes from the given string.
**Notes:** This method may fail on low memory, e.g. on Mac OS Classic running a Carbon application with a small application memory partition size.
See also:

- 48.20.7 AppendStr(s as string)

48.20.9  Constructor(capacity as Integer)

MBS MacCF Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** The constructor for creating a new mutable data object.
**Example:**
```plaintext
// creates empty data object
dim c as new CFMutableBinaryDataMBS(10)
MsgBox str(c.Len) + " length"
```

See also:

- 48.20.10 Constructor(data as MemoryBlock)
48.20.10 Constructor (data as MemoryBlock)

MBS MacCF Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Creates a new data object with given content.

**Example:**

```vbnet
dim m as MemoryBlock = "Hello"
dim d as new CFMutableBinaryDataMBS(m)
```

MsgBox d.Str

See also:

- 48.20.9 Constructor (capacity as Integer)
- 48.20.11 Constructor (data as string)

48.20.11 Constructor (data as string)

MBS MacCF Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: No. **Function:** Creates a new data object with given content.

**Example:**

```vbnet
dim m as string = "Hello"
dim d as new CFMutableBinaryDataMBS(m)
```

MsgBox d.Str

See also:

- 48.20.9 Constructor (capacity as Integer)
- 48.20.10 Constructor (data as MemoryBlock)

48.20.12 Delete (pos as Integer, len as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Deletes bytes from a binary data object.

**Notes:** This method may fail on low memory, e.g. on Mac OS Classic running a Carbon application with a small application memory partition size.
48.20. **CLASS CFMUTABLEBINARYDATAMBS**

### 48.20.13 IncreaseLength(extralen as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Resizes the binary data by extralen adding additional bytes.  
**Notes:** This method may fail on low memory, e.g. on Mac OS Classic running a Carbon application with a small application memory partition size.

### 48.20.14 ReplaceCFBinaryDataMBS(m as CFBinaryDataMBS,pos as Integer,len as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces len bytes inside the binary data which start at position pos with the bytes from the given binary data.  
See also:

- 48.20.15 ReplaceCFBinaryDataMBS(m as CFBinaryDataMBS,pos as Integer,len as Integer,newlen as Integer) 7793

### 48.20.15 ReplaceCFBinaryDataMBS(m as CFBinaryDataMBS,pos as Integer,len as Integer,newlen as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces len bytes inside the binary data which start at position pos with the bytes from the given binary data.  
See also:

- 48.20.14 ReplaceCFBinaryDataMBS(m as CFBinaryDataMBS,pos as Integer,len as Integer) 7793

### 48.20.16 ReplaceMem(m as memoryblock,pos as Integer,len as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces len bytes inside the binary data which start at position pos with the bytes from the memoryblock.  
See also:

- 48.20.17 ReplaceMem(m as memoryblock,pos as Integer,len as Integer,newlen as Integer) 7793

### 48.20.17 ReplaceMem(m as memoryblock,pos as Integer,len as Integer,newlen as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces len bytes inside the binary data which start at position pos with the bytes from the memoryblock.  
See also:

- 48.20.16 ReplaceMem(m as memoryblock,pos as Integer,len as Integer) 7793
48.20.18 ReplaceStr(s as string,pos as Integer,len as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces len bytes inside the binary data which start at position pos with the bytes from the string. See also:

- 48.20.19 ReplaceStr(s as string,pos as Integer,len as Integer,newlen as Integer)

48.20.19 ReplaceStr(s as string,pos as Integer,len as Integer,newlen as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces len bytes inside the binary data which start at position pos with the bytes from the string. See also:

- 48.20.18 ReplaceStr(s as string,pos as Integer,len as Integer)

48.20.20 SetLength(len as Integer)

MBS MacCF Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets length of the data.
48.21. CLASS CFMUTABLECHARACTERSETMBS

48.21 class CFMutableCharacterSetMBS

48.21.1 class CFMutableCharacterSetMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation character set.

**Notes:**

If the release property is true, the destructor of this class will release the set reference.
This class works on Windows with QuickTime 7 installed.
Subclass of the CFCharacterSetMBS class.

48.21.2 Methods

48.21.3 AddCFStringMBS(s as CFStringMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a range of characters from the CFStringMBS.

48.21.4 AddRange(min as Integer,max as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a range of characters from min to max to the character set.

48.21.5 Intersect(value as CFCharacterSetMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes a intersection between both CFCharacterSets.

48.21.6 Invert

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inverts this character set.
48.21.7  RemoveCFStringMBS(s as CFStringMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes a range of characters from the CFStringMBS.

48.21.8  RemoveRange(min as Integer, max as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes a range of characters from min to max to the character set.

48.21.9  Union(value as CFCharacterSetMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Makes a Union between both CFCharacterSets.
48.22. CLASS CFMUTABLEDICTIONARYMBS

48.22 class CFMutableDictionaryMBS

48.22.1 class CFMutableDictionaryMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation dictionary.
**Notes:**
If the release property is true, the destructor of this class will release the dictionary reference.
This class works on Windows with QuickTime 7 installed.
Subclass of the CFDictionaryMBS class.

48.22.2 Methods

48.22.3 Add(key as CFOBJECTMBS, value as CFOBJECTMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a key value combination to the dictionary.
**Example:**
```pascal
dim d as CFMutableDictionaryMBS

d=NewCFMutableDictionaryMBS

d.Add NewCFSStringMBS("Key"), NewCFSStringMBS("Value")
MsgBox d.XML.str
```

48.22.4 Remove(key as CFOBJECTMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all entries with the given key.
**Notes:** Maybe no key is found.

48.22.5 RemoveAll

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all entries.
48.22.6  Replace(key as CFObj ectMBS, value as CFObj ectMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces all entries with the given key to contain the given value.
**Notes:** Maybe no key is found.

48.22.7  Set(key as CFObj ectMBS, value as CFObj ectMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the entry with the given key to the given value.
**Example:**

```vbnet
dim d as new CFMutableDictionaryMBS

d.Add NewCFStringMBS("Key"), NewCFStringMBS("Value")
d.Set NewCFStringMBS("Key"), NewCFStringMBS("Value2") // set changes value, add would not change it here

MsgBox d.XML.Str
```
48.23  class CFMutableSetMBS

48.23.1 class CFMutableSetMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation set.  
**Notes:**  
If the release property is true, the destructor of this class will release the set reference.  
Subclass of the CFSetMBS class.

48.23.2 Methods

48.23.3 Add(value as CFOBJECTMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds an object to this set.

48.23.4 Remove(value as CFOBJECTMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes an object in this set.

48.23.5 RemoveAll

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all items from this set.

48.23.6 Replace(value as CFOBJECTMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces an object in this set.

48.23.7 Set(value as CFOBJECTMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets an object in this set.
class CFMutableStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: A class for a core foundation mutable string.

Notes:

If the release property is true, the destructor of this class will release the set reference.
This class works on Windows with QuickTime 7 installed.
Subclass of the CFStringMBS class.

Methods

AppendCFStringMBS(s as CFStringMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: Appends the given CFStringMBS.

AppendString(s as String)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: Appends the given REALbasic String.

Capitalize

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: Changes the first character represented by a CFStringMBS object to uppercase (if it is a lowercase alphabetical character).

Delete(pos as Integer,len as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.

Function: Deletes a range of characters in a mutable CFStringMBS object.
48.24.7  **Insert(index as Integer,s as CFStringMBS)**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts a string at a specified location in the character buffer of a mutable CFStringMBS object.

48.24.8  **LocalizedCapitalize(LocaleIdentifier as String)**

**Notes:**
Locale identifier can be "de", "de_DE" or "German" style.
Raises RaiseUnsupportedOperationException if locale identifier is not known.

48.24.9  **LocalizedLowercase(LocaleIdentifier as String)**

**Notes:**
Locale identifier can be "de", "de_DE" or "German" style.
Raises RaiseUnsupportedOperationException if locale identifier is not known.

48.24.10 **LocalizedUppercase(LocaleIdentifier as String)**

**Example:**
```
dim m1 as new CFMutableStringMBS("i")
dim m2 as new CFMutableStringMBS("i")
```
```
m1.Uppercase
m2.LocalizedUppercase("Turkish")
```
```
MsgBox m1.Str+EndOfLine+m2.Str
// shows to variants of capital I
```

**Notes:**
Locale identifier can be "de", "de_DE" or "German" style.
Raises RaiseUnsupportedOperationException if locale identifier is not known.
48.24.11 Lowercase

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes all uppercase alphabetical characters in a mutable CFStringMBS to lowercase.

48.24.12 Normalize(NormalizationForm as Integer)

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Normalizes the string into the specified form as described in Unicode Technical Report # 15.

**Example:**

```plaintext
const kCFStringNormalizationFormD = 0 // Canonical Decomposition
const kCFStringNormalizationFormKD = 1 // Compatibility Decomposition
const kCFStringNormalizationFormC = 2 // Canonical Decomposition followed by Canonical Composition
const kCFStringNormalizationFormKC = 3 // Compatibility Decomposition followed by Canonical Composition

dim s as CFStringMBS
dim m as CFMutableStringMBS

s=NewCFStringMBS(“Hello ”)
m=s.Normalize(kCFStringNormalizationFormD)

MsgBox str(s.Len)+” ”+str(m.len)

// decomposed the length is one more.
```

**Notes:** Requires Mac OS X 10.2 or newer.

48.24.13 Pad(padstr as CFStringMBS,len as Integer,indexIntoPad as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enlarges the string represented by a CFStringMBS object, padding it with specified characters, or truncates the string.

**Notes:**

The CFStringMBS.Pad function has two purposes. It either enlarges the character buffer of a mutable CFStringMBS object to a given length, padding the added length with a given character or characters, or it truncates the character buffer to a smaller size. The key parameter for this behavior is the length parameter; if it is greater than the current length of the represented string, padding takes place, and if it is less than that
length, truncation occurs.

For example, say you have a mutable CFStringMBS (aMutStr) containing the characters "abcdef". The call

CFStringMBS.Pad(newcfstring(". " ), 12, 1)

results in aMutStr containing "abcdef . . .". However, the following call

CFStringMBS.Pad( nil, 3, 0)

results in aMutStr containing "abc".

48.24.14 Replace(newstr as CFStringMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the content of this CFMutableStringMBS with the one from newstr.

See also:

- 48.24.15 Replace(pos as Integer,len as Integer,newstr as CFStringMBS) 7804

48.24.15 Replace(pos as Integer,len as Integer,newstr as CFStringMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replaces the substring with the given range of this CFMutableStringMBS with the one from newstr.

See also:

- 48.24.14 Replace(newstr as CFStringMBS) 7804

48.24.16 Trim

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Trims whitespace from the beginning and end of the characters represented by a mutable CFStringMBS object.

See also:

- 48.24.17 Trim(trimchar as CFStringMBS) 7804

48.24.17 Trim(trimchar as CFStringMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Trims a specified substring from the beginning and end of the character contents represented by a mutable CFStringMBS
48.24. **CLASS CFMUTABLESTRINGMBS**

object.

See also:

- 48.24.16 Trim

### 48.24.18 Truncate(len as Integer)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the string is longer than len, it is truncated to len.

### 48.24.19 Uppercase

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Changes all lowercase alphabetical characters in a mutable CFStringMBS object to uppercase.
48.25  class CFNumberMBS

48.25.1  class CFNumberMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation number.

**Example:**

```vb
dim n as CFNumberMBS = NewCFNumberMBSDouble(4.3)
MsgBox str(n.doubleValue)
```

**Notes:**

If the release property is true, the destructor of this class will release the number reference.
Subclass of the CFObjectMBS class.

48.25.2  Methods

48.25.3  Compare(other as CFNumberMBS) as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compares two CFNumbers.

**Notes:**

Return values:

- Less Than    -1
- Equal To     0
- Greater Than 1

From CFNumberMBS.h:

Compares the two CFNumberMBS instances. If conversion of the types of the values is needed, the conversion and comparison follow human expectations and not C’s promotion and comparison rules. Negative zero compares less than positive zero.
Positive infinity compares greater than everything except itself, to which it compares equal. Negative infinity compares less than everything except itself, to which it compares equal. Unlike standard practice, if both numbers are NaN, then they compare equal; if only one of the numbers is NaN, then the NaN compares greater than the other number if it is negative, and smaller than the other number if it is positive.
48.25.4  **NewWithDouble(value as Double) as CFNumberMBS**

MBS MacCF Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new CFNumberMBS with a 64bit float value.

48.25.5  **NewWithInt16(value as Int16) as CFNumberMBS**

MBS MacCF Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new CFNumberMBS with a 16bit integer value.

48.25.6  **NewWithInt32(value as Int32) as CFNumberMBS**

MBS MacCF Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new CFNumberMBS with a 32bit integer value.

48.25.7  **NewWithInt64(value as Int64) as CFNumberMBS**

MBS MacCF Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new CFNumberMBS with a 64bit integer value.

**Example:**
```
dim c as CFNumberMBS = CFNumberMBS.NewWithInt64(123456789123456789)
// shows type. 4 is signed 64-bit integer
MsgBox str(c.NumberType)+": " +str(c.int64Value)
```

48.25.8  **NewWithInt8(value as Int8) as CFNumberMBS**

MBS MacCF Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new CFNumberMBS with a 8bit integer value.

48.25.9  **NewWithSingle(value as Single) as CFNumberMBS**

MBS MacCF Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new CFNumberMBS with a 32bit float value.
48.25.10 Properties

48.25.11 ByteSize as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the size in bytes of the type of the number.
**Notes:** (Read only property)

48.25.12 doubleValue as Double

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of this CFNumberMBS object.
**Notes:** (Read only property)

48.25.13 int16Value as Int16

MBS MacCF Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries value as 16bit integer.
**Notes:** (Read only property)

48.25.14 int32Value as Int32

MBS MacCF Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries value as 32bit integer.
**Notes:** (Read only property)

48.25.15 int64Value as Int64

MBS MacCF Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries value as 64bit integer.
**Example:**

```vba
dim c as CFNumberMBS = CFNumberMBS.NewWithInt64(123456789123456789)
// shows type. 4 is signed 64-bit integer
MsgBox str(c.NumberType)+"": ""+str(c.int64Value)
```
48.25. CLASS CFNUMBERMBS

Notes: (Read only property)

48.25.16 int8Value as Int8

MBS MacCF Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Queries value as 8bit integer. Notes: (Read only property)

48.25.17 integerValue as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The value of this CFNumberMBS object. Example:

dim n as CFNumberMBS
n=NewCFNumberMBSInteger(45)
MsgBox str(n.doubleValue)+” ”+str(n.integerValue)+” ”+str(n.singleValue)
n=NewCFNumberMBSSingle(45.67)
MsgBox str(n.doubleValue)+” ”+str(n.integerValue)+” ”+str(n.singleValue)
n=NewCFNumberMBSDouble(45.6789)
MsgBox str(n.doubleValue)+” ”+str(n.integerValue)+” ”+str(n.singleValue)

// in version 5.1 of the plugins:
// 45 45 45
// 45.67 0 45.67
// 45.6789 0 0
//
// in version 5.2 of the plugins: (after a fix)
// 45 45 45
// 45.67 45 45.67
// 45.6789 45 45.6789

Notes:
Returns a truncated value if the number is not storeable in an integer. (Read only property)
### 48.25.18 isFloat as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns TRUE if the type of the CFNumberMBS’s value is one of the defined floating point types. **Notes:** (Read only property)

### 48.25.19 NumberType as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the storage format of the CFNumberMBS’s value. **Notes:**

Possible values:

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Realbasic Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIInt8</td>
<td>1</td>
<td>-</td>
</tr>
<tr>
<td>SIInt16</td>
<td>2</td>
<td>-</td>
</tr>
<tr>
<td>SIInt32</td>
<td>3</td>
<td>integer</td>
</tr>
<tr>
<td>SIInt64</td>
<td>4</td>
<td>-</td>
</tr>
<tr>
<td>Float32</td>
<td>5</td>
<td>single</td>
</tr>
<tr>
<td>Float64</td>
<td>6</td>
<td>double</td>
</tr>
<tr>
<td>Char</td>
<td>7</td>
<td>-</td>
</tr>
<tr>
<td>Short</td>
<td>8</td>
<td>-</td>
</tr>
<tr>
<td>Int</td>
<td>9</td>
<td>-</td>
</tr>
<tr>
<td>Long</td>
<td>10</td>
<td>integer</td>
</tr>
<tr>
<td>LongLong</td>
<td>11</td>
<td>-</td>
</tr>
<tr>
<td>Float</td>
<td>12</td>
<td>single</td>
</tr>
<tr>
<td>Double</td>
<td>13</td>
<td>double</td>
</tr>
<tr>
<td>CFIndex</td>
<td>14</td>
<td>integer</td>
</tr>
</tbody>
</table>

(Read only property)

### 48.25.20 singleValue as single

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The value of this CFNumberMBS object. **Example:**

```
dim n as CFNumberMBS

n=NewCFNumberMBSInteger(45)
```
MsgBox str(n.doubleValue) + " + str(n.integerValue) + " + str(n.singleValue)

n=NewCFNumberMBSSingle(45.67)
MsgBox str(n.doubleValue) + " + str(n.integerValue) + " + str(n.singleValue)

n=NewCFNumberMBSDouble(45.6789)
MsgBox str(n.doubleValue) + " + str(n.integerValue) + " + str(n.singleValue)

// in version 5.1 of the plugins:
// 45 45 45
// 45.67 0 45.67
// 45.6789 0 0

// in version 5.2 of the plugins: (after a fix)
// 45 45 45
// 45.67 45 45.67
// 45.6789 45 45.6789

Notes:

Returns a truncated value if the number is not storeable in a single.
(Read only property)
48.26  class CFObjectMBS

48.26.1  class CFObjectMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation object.

**Example:**

```realbasic
// is object is a CFStringMBS, return it a Realbasic string.
Function st(o as CFObjectMBS) As string
    if o isa CFStringMBS then
        return CFStringMBS(o).str
    end if
End Function
```

**Notes:** If the release property is true, the destructor of this class will release the object reference.

48.26.2  Methods

48.26.3  close

MBS MacCF Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The destructor.

**Notes:**

There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

48.26.4  DeepCopy as CFObjectMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a deep copy of the CFObject.

**Notes:** Copies all sub objects if the Object has sub objects (like the Dictionary).

48.26.5  EncodedData as MemoryBlock

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the content of the object and all subobjects as a binary encoded plist file content.

**Notes:**
Returns nil on any error. For example if you have CFDictionary with keys not being CFStringMBS objects. You can write this to a plist file.

48.26.6 Equal(o as CFObjectMBS) as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns true if both CFOObjects are equal in type and content.

48.26.7 NewCFObject(handle as Integer) as CFObjectMBS

Example:

```javascript
// make string
dim s as CFStringMBS = NewCFStringMBS("Hello World")

// get handle
dim h as Integer = s.Handle

// get back from handel to plugin object
dim o as CFObjectMBS = CFObjectMBS.NewCFObject(h)

// and see if plugin detected a string
if o isa CFStringMBS then
    dim t as CFStringMBS = CFStringMBS(o)
    MsgBox t.str
end if
```

48.26.8 ReleaseObject

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Decreases the retain count of this object.
Notes: If the retain count falls below 1, the object is destroyed.
48.26.9 RetainCount as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the reference counter of the object.

**Example:**

```vbs
Dim o As CFObjectMBS
Dim s As CFStringMBS
s = NewCFStringMBS("Hello")
MsgBox "s has "+Str(s.RetainCount)+" refs in CF"
o = s
MsgBox "o has "+Str(o.RetainCount)+" refs in CF"
o.RetainObject
MsgBox "o has "+Str(o.RetainCount)+" refs in CF"
o.ReleaseObject
MsgBox "o has "+Str(o.RetainCount)+" refs in CF"
o.Close
MsgBox "o has "+Str(o.RetainCount)+" refs in CF"
```

**Notes:** If the retain count falls below 1, the object is destroyed.

48.26.10 RetainObject

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Increases the retain count of this object.

**Example:**

```vbs
Function CFDateFromCFObject(o As cfobjectMBS) As cfdateMBS
Dim d As CFDateMBS
If o <> nil Then
  If o.Type = kCFDateMBSTypeID Then
    d = new CFDateMBS
    d.Handle = o.Handle
    d.RetainObject
  End If
End If
```
48.26. **CLASS CFOBJECTMBS**

end if

Exception
End Function

**Notes:** If the retain count falls below 1, the object is destroyed.

---

**48.26.11 XML as CFBinaryDataMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the content of the object and all subobjects as a XML file content. **Example:**

```plaintext
// Save a dictionary in a XML file:

dim d as CFMutableDictionaryMBS
dim f as FolderItem
dim t as TextOutputStream

// Create dictionary
d=NewCFMutableDictionaryMBS
// Fill dictionary
d.Add NewCFStringMBS("Key"),NewCFStringMBS("Value")

// get file name
f=GetFolderItem("CF XML Test.txt")

// create file
t=f.CreateTextFile
// Write XML
t.Write d.XML.Str
// close file
t.Close
```

**Notes:**
Returns nil on any error. For example if you have CFDictionary with keys not being CFStringMBS objects. You can write this to a plist file.
48.26.12 Properties

48.26.13 Handle as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The core foundation object references.  
**Notes:** (Read and Write property)

48.26.14 Hash as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a hash code for this object.  
**Notes:** (Read only property)

48.26.15 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code reported.  
**Notes:**  
Please check each function on whether it sets the lasterror property.  
(Read and Write property)

48.26.16 Type as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID for this object.  
**Notes:** (Read only property)

48.26.17 TypeDescription as String

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the type description for this object.  
**Notes:**  
e.g. "CFString" or "CFNumber".  
(Read only property)
48.27.1 class CFPreferencesMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for the core foundation preferences services.

**Example:**

```vba
Sub Open()
    '// in a listbox on a window, list all preferences applications for the current user
    Dim c As CFArrayMBS
    Dim p As CFPreferencesMBS
    Dim i As Integer
    Dim count As Integer
    Dim o As CFObj ectMBS
    Dim s As CFStringMBS
    p = New CFPreferencesMBS
    c = p.CopyApplicationList(p.kCFPreferencesCurrentUser, p.kCFPreferencesAnyHost)
    count = c.Count - 1
    For i = 0 To count
        o = c.Item(i)
        If o isa CFStringMBS Then
            s = CFStringMBS(o)
            Window1.listbox1.AddRow s.str
        End If
    Next
    Title = str(ListBox1.ListBox) + " " + Title
End Sub
```

**Notes:** Search for Apple Developer documentation on CFPreferences for details on functionality these plugin functions provide.

48.27.2 Methods

48.27.3 AddSuitePreferencesToApp(ApplicationID as CFStringMBS, SuiteID as CFStringMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a new suite to the application preferences.
48.27.4 AppSynchronize(ApplicationID as CFStringMBS) as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Synchronizes the values in the RAM with the disk for the given application. **Notes:** Returns false on any error.

48.27.5 CopyAppBooleanValue(Key as CFStringMBS, ApplicationID as CFStringMBS) as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the application preferences boolean value. **Notes:** On an error it returns false and KeyExistsAndHasValidFormat is set to false.

48.27.6 CopyAppIntegerValue(Key as CFStringMBS, ApplicationID as CFStringMBS) as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies the application preferences integer value. **Notes:** On an error it returns false and KeyExistsAndHasValidFormat is set to false.

48.27.7 CopyApplicationList(userName as CFStringMBS, hostName as CFStringMBS) as CFArrayMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a list of all applications which have preferences. **Example:**

```vba
Sub Open()
    // in a listbox on a window, list all preferences applications for the current user
    dim c as CFArrayMBS
    dim p as CFPreferencesMBS
    dim i as Integer
    dim count as Integer
    dim o as CFObjectMBS
    dim s as CFStringMBS

    p=new CFPreferencesMBS
    c=p.CopyApplicationList(p.kCFPreferencesCurrentUser, p.kCFPreferencesAnyHost)
    count=c.Count-1
    for i=0 to count
        o=c.Item(i)
```
if o isa CFStringMBS then
s=CFStringMBS(o)
ListBox1.AddRow s.str
end if
next

Title=str(ListBox1.ListCount)+" " +Title
End Sub

Notes: Returns false on any error.

48.27.8 CopyAppValue(Key as CFStringMBS, ApplicationID as CFStringMBS) as CFOBJECTMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Copies the application preferences value.

Example:

// copy names of recent items in Real Studio Preferences

dim names() as string
dim c as new CFPreferencesMBS

dim o as CFOBJECTMBS = c.CopyAppValue(NewCFStringMBS("Recent Items Dict"), NewCFStringMBS("com.realsoftware.realstudio"))

if o isa CFArrayMBS then
dim a as CFArrayMBS = CFArrayMBS(o)

dim u as Integer = a.Count-1
for i as Integer = 0 to u
o = a.Item(i)
if o isa CFDictionaryMBS then
dim d as CFDictionaryMBS = CFDictionaryMBS(o)

dim no as CFOBJECTMBS = d.Value(NewCFStringMBS("Name"))
if no isa CFStringMBS then
dim ns as CFStringMBS = CFStringMBS(no)
names.Append ns.str
end if
CHAPTER 48. COREFOUNDATION

end if
next
end if

MsgBox Join(names, EndOfLine)

Notes: Returns nil on any error.

48.27.9 CopyDictionary(ApplicationID as CFStringMBS, userName as CFStringMBS, hostName as CFStringMBS) as CFDictionaryMBS

Example:

dim p as new CFPREFERENCESMBS
p.SetValue(NewCFStringMBS("TestString"), NewCFStringMBS("Hello World"), p.kCFPreferencesCurrentApplication, p.kCFPreferencesCurrentUser, p.kCFPreferencesCurrentHost)
p.SetValue(NewCFStringMBS("TestIdDouble"), NewCFNumberMBSDouble(5.6), p.kCFPreferencesCurrentApplication, p.kCFPreferencesCurrentUser, p.kCFPreferencesCurrentHost)
p.SetValue(NewCFStringMBS("TestIdInteger"), NewCFNumberMBSInteger(3), p.kCFPreferencesCurrentApplication, p.kCFPreferencesCurrentUser, p.kCFPreferencesCurrentHost)

dim d as CFDICTIONARYMBS = p.CopyDictionary(p.kCFPreferencesCurrentApplication, p.kCFPreferencesCurrentUser, p.kCFPreferencesCurrentHost)
dim x as CFBinaryDataMBS = d.XML
dim s as string = x.Str

break
// check data in variable s with xml of all properties

Notes: Returns nil on any error.

48.27.10 CopyKeyList(ApplicationID as CFStringMBS, userName as CFStringMBS, hostName as CFStringMBS) as CFArrayMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a list of all preferences keys for the given application.
Notes: Returns false on any error.
48.27.11 CopyMultiple(Key as CFArrayMBS, ApplicationID as CFStringMBS, userName as CFStringMBS, hostName as CFStringMBS) as CFDictionaryMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies several preferences value.
**Notes:** Returns nil on any error.

48.27.12 CopyValue(Key as CFStringMBS, ApplicationID as CFStringMBS, userName as CFStringMBS, hostName as CFStringMBS) as CFObjectMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Copies a preferences value.
**Example:**

```plaintext
dim c as CFPREFERENCESMBS
dim o as CFOBJECTMBS
dim a as CFStringMBS // application
dim k as CFStringMBS // key

k=NewCFStringMBS("AvailableLanguages")
a=NewCFStringMBS("com.apple.systempreferences")
c=new CFPREFERENCESMBS

o=c.CopyValue(k,a,c.kCFPreferencesCurrentUser,c.kCFPreferencesAnyHost)

CFShowMBS o

// Shows in the console application something like this:
// <CFArray>
// 0 : <CFString>{ contents = "en" }
// 1 : <CFString>{ contents = "de" }
// </CFArray>
```

**Notes:** Returns nil on any error.
48.27.13 kCFPreferencesAnyApplication as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A constant for preferences functions of Mac OS X.

48.27.14 kCFPreferencesAnyHost as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A constant for preferences functions of Mac OS X.

48.27.15 kCFPreferencesAnyUser as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A constant for preferences functions of Mac OS X.

48.27.16 kCFPreferencesCurrentApplication as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A constant for preferences functions of Mac OS X.

48.27.17 kCFPreferencesCurrentHost as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A constant for preferences functions of Mac OS X.

48.27.18 kCFPreferencesCurrentUser as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A constant for preferences functions of Mac OS X.

48.27.19 RemoveSuitePreferencesFromApp(ApplicationID as CFStringMBS, SuiteID as CFStringMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes a new suite to the application preferences.
48.27.20  
SetAppValue(Key as CFStringMBS, value as CFObjectMBS, ApplicationID as CFStringMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets an application preferences value.  
**Notes:** Note that on saving all strings are internally converted to UTF-8.

48.27.21  
SetMultiple(KeysToSet as CFDictionaryMBS, KeysToRemove as CFArrayMBS, ApplicationID as CFStringMBS, userName as CFStringMBS, hostName as CFStringMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets several preferences values.  
**Notes:** Note that on saving all strings are internally converted to UTF-8.

48.27.22  
SetValue(Key as CFStringMBS, Value as CFObjectMBS, ApplicationID as CFStringMBS, userName as CFStringMBS, hostName as CFStringMBS)

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a preferences value.  
**Notes:** Note that on saving all strings are internally converted to UTF-8.

48.27.23  
Synchronize(ApplicationID as CFStringMBS, userName as CFStringMBS, hostName as CFStringMBS) as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Synchronizes the values in the RAM with the disk for the given application.  
**Notes:** Returns false on any error.

48.27.24  
**Properties**

48.27.25  
**KeyExistsAndHasValidFormat as Boolean**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Set by CopyAppStateBooleanValue and CopyAppStateIntegerValue.  
**Notes:** (Read and Write property)
48.28 class CFRangeMBS

48.28.1 class CFRangeMBS

**Notes:** A range of sequential items in a container, such as characters in a buffer or elements in a collection.

48.28.2 Methods

48.28.3 Constructor(location as Integer = 0, length as Integer = 0)

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new range with given values.

48.28.4 Properties

48.28.5 length as Integer

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** An integer representing the number of items in the range.  
**Notes:** (Read and Write property)

48.28.6 location as Integer

MBS MacCF Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** An integer representing the starting location of the range.  
**Notes:** (Read and Write property)
48.29. **CLASS CFSETLISTMBS**

---

### 48.29 class CFSetListMBS

**48.29.1 class CFSetListMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for the items of a CFSetMBS.

**48.29.2 Methods**

#### 48.29.3 Value(index as Integer) as CFObjectMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value with the given index.

**48.29.4 Properties**

#### 48.29.5 Count as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Counts the items in the set.  
**Notes:** (Read and Write property)
CHAPTER 48. COREFOUNDATION

48.30 class CFSetMBS

48.30.1 class CFSetMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation set.

**Notes:**

If the release property is true, the destructor of this class will release the set reference.

Subclass of the CFObjectMBS class.

48.30.2 Methods

48.30.3 clone as CFSetMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clones the set and all values.

48.30.4 Constructor

MBS MacCF Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new editable set object.

**Example:**

```plaintext
dim e as new CFMutableSetMBS
e.Add(NewCFStringMBS("Hello"))
MsgBox str(e.Count)
```

48.30.5 ContainsValue(value as CFObjectMBS) as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Does the set contain this value?

48.30.6 CountValue(value as CFObjectMBS) as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Counts how often this value is inside the set.
48.30. CLASS CFSETMBS

48.30.7 edit as CFMutableSetMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: To edit a set, this method returns you a CFMutableSetMBS.

48.30.8 list as CFSetListMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns a list of all values.
Notes: This list will be invalid whenever this set is destroyed.

48.30.9 Value(value as CFObjectMBS) as CFObjectMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: If the value is found the value is returned.
Notes: Returns nil if key is not found.

48.30.10 Properties

48.30.11 Count as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Counts all values.
Example:

Dim x As New CFMutableSetMBS
x.Set(New CFRingMBS("Hello"))
MsgBox str(x.Count)

Notes: (Read only property)
48.31 class CFStringMBS

48.31.1 class CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation string.

**Example:**

```vbnet
dim s as CFStringMBS
dim t as CFStringMBS
dim x as string
dim o as CFObjectMBS

s=NewCFStringMBS("hello")

// make XML as string
x=s.XML.str

// recreate object from XML
o=NewCFOBJECTMBSFromXML(NewCFBinaryDataMBSStr(x))

if o isa CFStringMBS then
t=CFStringMBS(o)

// show string content
MsgBox t.str
end if
```

**Notes:**

If the release property is true, the destructor of this class will release the string reference.

This class works on Windows with QuickTime 7 installed.

Subclass of the CFOBJECTMBS class.

48.31.2 Methods

48.31.3 Character(index as Integer) as string

**Function:** Returns the character from this string with the given index.

**Notes:** The returned REALbasic string contains a Unicode character.
48.31. **CLASS CFSTRINGMBS**

### 48.31.4 Characters(pos as Integer, len as Integer) as string

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the characters from this string in the given range.

**Notes:** The returned REALbasic string contains Unicode characters.

### 48.31.5 Compare(other as CFStringMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compares two strings.

**Notes:**

Return values:

<table>
<thead>
<tr>
<th>Less Than</th>
<th>-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equal To</td>
<td>0</td>
</tr>
<tr>
<td>Greater Than</td>
<td>1</td>
</tr>
<tr>
<td>Function not available</td>
<td>-2</td>
</tr>
</tbody>
</table>

See also:

- 48.31.6 Compare(other as CFStringMBS, CaseInsensitive as boolean) as Integer
- 48.31.7 Compare(other as CFStringMBS, CaseInsensitive as boolean, Numerically as boolean) as Integer
- 48.31.8 Compare(other as CFStringMBS, Options as Integer) as Integer

### 48.31.6 Compare(other as CFStringMBS, CaseInsensitive as boolean) as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compares two strings.

**Notes:**

Return values:

<table>
<thead>
<tr>
<th>Less Than</th>
<th>-1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equal To</td>
<td>0</td>
</tr>
<tr>
<td>Greater Than</td>
<td>1</td>
</tr>
<tr>
<td>Function not available</td>
<td>-2</td>
</tr>
</tbody>
</table>

See also:
48.31.7 Compare(other as CFStringMBS, CaseInsensitive as boolean, Numerically as boolean) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Compares two strings.

**Example:**

```vba
dim s as CFStringMBS
dim t as CFStringMBS
dim n1,n2 as Integer

s=NewCFStringMBS("Hello7.txt")
t=NewCFStringMBS("Hello10.txt")
n1=s.Compare(t,false)
n2=s.Compare(t,false,true)

MsgBox "Without numerical: "+str(n1)+", With numerical: "+str(n2)+".
```

**Notes:**

Numerically works only if Mac OS X 10.2 or newer is running.

**Return values:**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less Than</td>
<td>-1</td>
</tr>
<tr>
<td>Equal To</td>
<td>0</td>
</tr>
<tr>
<td>Greater Than</td>
<td>1</td>
</tr>
<tr>
<td>Function not available</td>
<td>-2</td>
</tr>
</tbody>
</table>

See also:

- 48.31.5 Compare(other as CFStringMBS) as Integer
- 48.31.6 Compare(other as CFStringMBS, CaseInsensitive as boolean) as Integer
- 48.31.8 Compare(other as CFStringMBS, Options as Integer) as Integer
48.31. **CLASS CFSTRINGMBS**

### 48.31.8 Compare(other as CFStringMBS, Options as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 7.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Compares two strings.

**Example:**

// Just a quick and dirty test for this function:

```vba
dim s(10) as string
dim i as Integer
dim temp as string
dim isDirty as boolean
dim a,b as CFStringMBS

s(1)="Apfel"
s(2)="Strasse"
s(3)="Bum"
s(4)="Strae"
s(5)="Zaun"
s(6)="pfel"
s(7)="bum"
s(8)="Baum"
s(9)="pfel"
s(10)="Ende"

// if kCFCompareLocalized is used, the pfel come near Apfel.

const kCFCompareCaseInsensitive = 1
const kCFCompareBackwards = 4 // Starting from the end of the string */
const kCFCompareAnchored = 8 // Only at the specified starting point */
const kCFCompareNonliteral = 16 // If specified, loose equivalence is performed (o-umlaut == o, umlaut) */
const kCFCompareLocalized = 32 // User’s default locale is used for the comparisons */
const kCFCompareNumerically = 64 // Numeric comparison is used; that is, Foo2.txt < Foo7.txt < Foo25.txt */

'Sortieren
do
isDirty = false // we haven’t touched anything yet
for i = 1 to 10-1 // loop through all the numbers

a=NewCFStringMBS(s(i))
b=NewCFStringMBS(s(i+1))

if a.Compare(b,kCFCompareLocalized)>0 then
    temp = s(i+1)
s(i+1) = s(i)
s(i) = temp
```

isDirty = true // we touched the data so mark it as dirty
end
next
loop until isDirty = false // if we made it without touching the data then we are done

for i=1 to 10
    EditField1.text = EditField1.text + s(i) + chr(13)
next i

Notes:
Numerically works only if Mac OS X 10.2 or newer is running.

Return values:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less Than</td>
<td>-1</td>
</tr>
<tr>
<td>Equal To</td>
<td>0</td>
</tr>
<tr>
<td>Greater Than</td>
<td>1</td>
</tr>
<tr>
<td>Function not available</td>
<td>-2</td>
</tr>
</tbody>
</table>

See also:

- 48.31.5 Compare(other as CFStringMBS) as Integer 7829
- 48.31.6 Compare(other as CFStringMBS, CaseInsensitive as boolean) as Integer 7829
- 48.31.7 Compare(other as CFStringMBS, CaseInsensitive as boolean, Numerically as boolean) as Integer 7830

48.31.9 Constructor(text as string = "")

Example:

dim c as new CFStringMBS("Hello")
MsgBox c
48.31. CLASS CFSTRINGMBS

48.31.10 Edit as CFMutableStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a mutable string.

48.31.11 ExactFind(stringtofind as CFStringMBS) as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Finds the given string.
**Notes:** Exactly, so case sensitive.

48.31.12 Find(stringtofind as CFStringMBS) as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Finds the given string.

48.31.13 HasPrefix(s as CFStringMBS) as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Does this string start with s.

48.31.14 HasSuffix(s as CFStringMBS) as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Does this string end with s.

48.31.15 Mid(pos as Integer,len as Integer) as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new CFStringMBS with a substring from the current CFStringMBS.
**Notes:** Compare to Mid in RB.

48.31.16 Normalize(NormalizationForm as Integer) as CFMutableStringMBS

MBS MacCF Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Normalizes the string into the specified form as described in Unicode Technical Report # 15.
Example:

```vbs
const kCFStringNormalizationFormD = 0 // Canonical Decomposition
const kCFStringNormalizationFormKD = 1 // Compatibility Decomposition
const kCFStringNormalizationFormC = 2 // Canonical Decomposition followed by Canonical Composition
const kCFStringNormalizationFormKC = 3 // Compatibility Decomposition followed by Canonical Composition

dim s as CFStringMBS
dim m as CFMutableStringMBS

s=NewCFStringMBS("Hello ")
m=s.Normalize(kCFStringNormalizationFormD)

MsgBox str(s.Len)+" "+str(m.len)

// decomposed the length is one more.
```

Notes:

Requires Mac OS X 10.2 or newer.
Returns nil on any error.

48.31.17 Operator_Convert as String

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An internal method for Realbasic 5.x.

**Example:**

```vbs
dim s as cfstringmbs
s=NewCFStringMBS("Hello")
msgbox s
```

**Notes:**

This method is used by Realbasic 5.x to allow you to directly create a Realbasic string based on a CoreFoundation string.
Realbasic may create a NilObjectException if the cfstring object is nil.
See also:

- 48.31.18 Operator_Convert(v As String)
48.31. **CLASS CFSTRINGMBS**

### 48.31.18 Operator_Convert(v As String)

MBS MacCF Plugin, Plugin Version: 4.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An internal method for Realbasic 5.x.

**Example:**

```vbnet
dim s as cfstringmbs
s="Hello"
// replaces: s=NewCFStringMBS("Hello")
```

**Notes:** This method is used by Realbasic 5.x to allow you to directly create a corefoundation string object based on a Realbasic string.

See also:

- 48.31.17 Operator_Convert as String

### 48.31.19 stringWithHandle(Handle as Integer) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new string object based on a handle value.

**Notes:** Will retain the reference.

### 48.31.20 Properties

#### 48.31.21 DisplayString as String

MBS MacCF Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** For the debugger the string of this CFString reduced to maximum of 1000 characters.

**Notes:** (Read only property)

### 48.31.22 DoubleValue as Double

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string interpreted as an double value.

**Example:**

```vbnet
dim d as CFStringMBS = NewCFStringMBS("3.4")
MsgBox str(d.DoubleValue)
```

**Notes:**
CHAPTER 48. COREFOUNDATION

Compare to val.
Skips whitespace; returns 0.0 on error.
(Read only property)

48.31.23  FastestEncoding as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Obtains the encoding for the characters in a CFString that requires the least conversion time.

**Notes:**
-1 on Windows.
(Read only property)

48.31.24  IntegerValue as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string interpreted as an integer value.

**Example:**

dim d as CFStringMBS = NewCFStringMBS(”3.4”)
MsgBox str(d.IntegerValue) // shows 3

**Notes:**
Compare to val.
Skips whitespace; returns 0 on error, MAX or -MAX on overflow.
(Read only property)

48.31.25  Len as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the length in chars of the string.

**Notes:** (Read only property)

48.31.26  SmallestEncoding as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Obtains the smallest encoding on the current system for the character contents of a CFString object.

Notes:
48.31. CLASS CFSTRINGMBS

Value is -1 on Windows and Mac OS Classic.
(Read only property)

48.31.27 Str as String

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string data as Realbasic string.

**Notes:**
Returns the string in a one byte encoding. If possible ASCII string, else if possible MacRoman encoded else UTF8.
(Read and Write computed property)

48.31.28 UStr as String

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string data as Realbasic unicode string (16bit).

**Deprecated:** This item is deprecated and should no longer be used. You can use Str instead. **Notes:**
If the string can not be returned as an unicode string, this function returns it as a normal string in System script (e.g. MacRoman).
(Read and Write computed property)
48.32 class CFTimeIntervalMBS

48.32.1 class CFTimeIntervalMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: A class for a time interval value. Notes: The time interval is basically a double property inside the class.

48.32.2 Properties

48.32.3 Value as Double

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The value of the class. Notes: (Read and Write property)
48.33.1 class CFTimeZoneMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation time zone.

**Example:**

```
dim t as new CFTimeZoneMBS
MsgBox t.Name.str
```

**Notes:** Subclass of the CFObjectMBS class.

### 48.33.2 Methods

#### 48.33.3 Abbreviation(atTime as CFAbsoluteTimeMBS) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The abbreviation for the given timezone name.

**Example:**

```
dim t as new CFTimeZoneMBS
MsgBox t.Abbreviation(nil)
```

**Notes:**

Returns nil on any error.

As the name may change depending on whether it’s daylight saving time, you should give an absolute time value.

### 48.33.4 Constructor

MBS MacCF Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A constructor which fills the object with the system timezone.

**Example:**

```
dim CFDateLocal as new CFAbsoluteTimeMBS
dim CFTimeZone as new CFTimeZoneMBS

dim MyDSTState as Boolean = CFTimeZone.IsDaylightSavingTime(CFDateLocal)
```
48.33.5  Data as CFBinaryDataMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The binary data for the timezone.

**Example:**

```pascal
dim t as new CFTimeZoneMBS
MsgBox t.Data.Str
```

48.33.6  IsDaylightSavingTime(atTime as CFAbsoluteTimeMBS) as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** whether it’s daylight saving time at the given absolute time.

**Example:**

```pascal
// get current timezone
dim c as CFTimeZoneMBS = SystemCFTimeZoneMBS

// and current time
dim time as CFAbsoluteTimeMBS = CurrentCFAbsoluteTimeMBS

// Do we have daylight saving time?
MsgBox str(c.IsDaylightSavingTime(time))
```

48.33.7  Name as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the timezone.

**Example:**

```pascal
dim s as CFTimeZoneMBS
s=SystemCFTimeZoneMBS
MsgBox s.Name
```
48.33. **CLASS CFTIMEZONEMBS**

48.33.8 **SecondsFromGMT(atTime as CFAbsoluteTimeMBS) as CFTimeIntervalMBS**

MBS MacCF Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the time difference to GMT for the given time (for daylight saving).

**Example:**

```plaintext
dim s as cfTimeZoneMBS
s=SystemCFTimeZoneMBS
MsgBox str(s.SecondsFromGMT(nil).Value) // 3600 in Germany
```

**Notes:** Returns nil on any error.
**48.34 class CFTreeMBS**

### 48.34.1 class CFTreeMBS

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for the CoreFoundation tree collection.  
**Notes:**

An CFXMLTree is simply a CFTree whose context data is known to be an CFXMLNode. As such, an CFXMLTree can be used to represent an entire XML document; the CFTree provides the tree structure of the document, while the CFXMLNodes identify and describe the nodes of the tree. An XML document can be parsed to a CFXMLTree, and a CFXMLTree can generate the data for the equivalent XML document. Subclass of the CFObjectMBS class.

### 48.34.2 Methods

#### 48.34.3 AppendChild(tree as CFTreeMBS)

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends a tree as a child.  
**Example:**

```plaintext
dim documentinfo as new CFXMLDocumentInfoMBS
dim docnode as new CFXMLNodeMBS
dim instructionNode as new CFXMLNodeMBS
dim xmldocument as new CFTreeMBS
dim rootInfo as new CFXMLElementInfoMBS
dim rootNode as new CFXMLNodeMBS
dim rootTree as new CFTreeMBS
dim nameInfo as new CFXMLElementInfoMBS
dim nameNode as new CFXMLNodeMBS
dim nameTree as new CFTreeMBS
dim nameNode as new CFXMLNodeMBS
dim nameTree as new CFTreeMBS
dim nameTextNode as new CFXMLNodeMBS
dim nameTextNode2 as new CFXMLNodeMBS
dim nameTextTree2 as new CFTreeMBS
dim root as CFStringMBS

const kCFStringEncodingUTF8=& h08000100

// create a document node
documentinfo.SourceURL=nil
documentinfo.CFStringEncoding=kCFStringEncodingUTF8

docnode.CreateDocument(documentinfo)
```

xmlDocument.CreateWithXmlNode docNode

// root element

rootInfo.XMLAttributes=nil
docNode.AttributeOrder=nil
docNode.IsEmpty=false

root=NewCFStringMBS("root")
rTourNode.CreateElement root, rootInfo
rootTree.CreateWithXmlNode rootNode

nameInfo.XMLAttributes=nil
docNode.AttributeOrder=nil
docNode.IsEmpty=false

nameNode.CreateElement NewCFStringMBS("FirstName"), nameInfo
tourTree.CreateWithXmlNode nameNode
rootTree.AppendChild nameTree

nameTextNode.CreateText NewCFStringMBS("Dean")
nameTextTree.CreateWithXmlNode nameTextNode
nameTree.AppendChild nameTextTree

nameInfo.XMLAttributes=nil
docNode.AttributeOrder=nil
docNode.IsEmpty=false

nameNode.CreateElement NewCFStringMBS("LastName"), nameInfo
tourTree.CreateWithXmlNode nameNode
rootTree.AppendChild nameTree

nameTextNode2.CreateText NewCFStringMBS("Davis")
nameTextTree2.CreateWithXmlNode nameTextNode2
nameTree.AppendChild nameTextTree2

CFShowMBS(xmlDocument)

xmlDocument.AppendChild rootTree

MsgBox xmlDocument.XMLData.str

// shows "<root><FirstName>Dean</FirstName><LastName>Davis</LastName></root>"
48.34.4 ChildAtIndex(index as Integer) as CFTreeMBS

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the child with the given index.
**Notes:** nil on any error.

48.34.5 ChildCount as Integer

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the number of child nodes.
**Notes:** 0 on any error.

48.34.6 Children as CFTreeMBS

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the child tree node.
**Notes:** nil on any error.

48.34.7 Create

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new empty tree and stores the handle in this object.
**Notes:** Handle is 0 on failure.

48.34.8 CreateFromXMLData(data as CFBinaryDataMBS, url as CFURLMBS, ParseOptions as Integer)

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new XMLTree from the given data.
**Notes:**
URL is needed to resolve external references.

These are the various options you can configure the parser with. These are chosen such that an option flag of 0 (kCFXMLParserNoOptions) leaves the XML as "intact" as possible (reports all structures; performs no replacements).
Hence, to make the parser do the most work, returning only the pure element tree, set the option flag to kCFXMLParserAllOptions:
# 48.34. **CLASS CFREETMBS**

<table>
<thead>
<tr>
<th>Function</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>kCFXMLParserValidateDocument</td>
<td>1</td>
</tr>
<tr>
<td>kCFXMLParserSkipMetaData</td>
<td>2</td>
</tr>
<tr>
<td>kCFXMLParserReplacePhysicalEntities</td>
<td>4</td>
</tr>
<tr>
<td>kCFXMLParserResolveExternalEntities</td>
<td>16</td>
</tr>
<tr>
<td>kCFXMLParserAddImpliedAttributes</td>
<td>32</td>
</tr>
<tr>
<td>kCFXMLParserAllOptions</td>
<td>&amp; hFFFFFF</td>
</tr>
<tr>
<td>kCFXMLParserNoOptions</td>
<td>0</td>
</tr>
</tbody>
</table>

validate the document against its grammar from the DTD, reporting any errors. Currently not supported.

silently skip over metadata constructs (the DTD and comments)

replace declared entities like &lt; Note that other than the 5 predefined entities (lt, gt, quot, amp, apos), these must be defined in the DTD. Currently not supported.

skip over all whitespace that does not abut non-whitespace character data. In other words, given `<foo>`<bar>blah </bar>`</foo>`, the whitespace between foo’s open tag and bar’s open tag would be suppressed, but the whitespace around blah would be preserved.

where the DTD specifies implied attribute-value pairs for a particular element, add those pairs to any occurrences of the element in the element tree. Currently not supported.

| kCFXMLParserValidateDocument                  | 1     |
| kCFXMLParserSkipMetaData                      | 2     |
| kCFXMLParserReplacePhysicalEntities           | 4     |
| kCFXMLParserResolveExternalEntities           | 16    |
| kCFXMLParserAddImpliedAttributes              | 32    |
| kCFXMLParserAllOptions                        | & hFFFFFF |
| kCFXMLParserNoOptions                         | 0     |

# 48.34.9 **CreateWithXMLDataFromURL(URL as CFURLMBS, ParseOptions as Integer)**

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates a new XMLTree from the given data at the URL.

**Notes:**

The handle property is set if the function is successful.

These are the various options you can configure the parser with. These are chosen such that an option flag of 0 (kCFXMLParserNoOptions) leaves the XML as ”intact” as possible (reports all structures; performs no replacements).

Hence, to make the parser do the most work, returning only the pure element tree, set the option flag to kCFXMLParserAllOptions:
48.34.10 CreateWithXMLNode(node as CFXMLNodeMBS)

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a XML tree based on the given node.

48.34.11 FindRoot as CFTreeMBS

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the tree root node.  
**Notes:** nil on any error.

48.34.12 FirstChild as CFTreeMBS

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the first child node.  
**Notes:** nil on any error.

48.34.13 InsertSibling(tree as CFTreeMBS)

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts a new tree as the sibling of this tree.

48.34.14 NextSibling as CFTreeMBS

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the next sibling.  
**Notes:** nil on any error.

48.34.15 Parent as CFTreeMBS

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the parent of the tree.  
**Notes:** nil on any error.
48.34. **CLASS CFTREEMBS**

48.34.16 **PrependChild**(tree as CFTreeMBS)

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inserts a new tree as the first child.

48.34.17 **Remove**

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes this tree from its parent.

48.34.18 **RemoveAllChildren**

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes all child nodes.

48.34.19 **XMLData as CFBinaryDataMBS**

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates XML Data from the tree. **Notes:**
Generate the XMLData (ready to be written to whatever permanent storage is to be used) from an CFXML-Tree. Will NOT regenerate entity references (except those required for syntactic correctness) if they were replaced at the parse time; clients that wish this should walk the tree and re-insert any entity references that should appear in the final output file.

Returns nil on any error.

48.34.20 **XMLNode as CFXMLNodeMBS**

MBS MacCF Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the xml node for this tree node. **Notes:** nil on any error.
48.35  class CFURLMBS

48.35.1 class CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core foundation boolean.

**Notes:**

If the release property is true, the destructor of this class will release the url reference.
This class works on Windows with QuickTime 7 installed.
Subclass of the CObjectMBS class.

48.35.2 Methods

48.35.3 AbsoluteURL as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the absolute URL.

**Notes:** A URL contains normally a base and a relative part. This function creates one absolute URL from those parts.

48.35.4 AppendPathComponent(pathcomponent as CFStringMBS,isDirectory as boolean) as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends a path component to this URL.

48.35.5 AppendPathExtension(extension as CFStringMBS) as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Appends a path extension to this URL.

48.35.6 BaseURL as CFURLMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the base URL.

**Notes:** A URL contains normally a base and a relative part.
48.35. **CLASS CFURLMBS**

48.35.7 **CanBeDecomposed as boolean**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Can this url be decomposed?

48.35.8 **Constructor(File as FolderItem)**

MBS MacCF Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates new CFURLMBS based on given folderitem.

**Notes:** Raises exception if not called on macOS or called with invalid URL.

See also:

- 48.35.9 Constructor(URL as string)

48.35.9 **Constructor(URL as string)**

MBS MacCF Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates new CFURLMBS based on given URL.

**Notes:** Raises exception if not called on macOS or called with invalid URL.

See also:

- 48.35.8 Constructor(File as FolderItem)

48.35.10 **Data(encoding as Integer, escapeWhitespace as boolean) as CFBinaryDataMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the URL as binary data using the given encoding.

48.35.11 **DeleteLastPathComponent as CFURLMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Deletes the last path component of this URL.

48.35.12 **DeletePathExtension as CFURLMBS**

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Deletes the path extension of this URL.
48.35.13 DisplayName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 2.9, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the display name for the url. **Notes:** Returns "" on any error.

48.35.14 file as folderitem

MBS MacCF Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the URL as a folderitem. **Notes:** Works only on RB 4.5 or later and if the file exists.

48.35.15 Fragment(charactersToLeaveEscaped as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Fragment part of this URL.

48.35.16 HasDirectoryPath as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Has this URL a directory path?

48.35.17 HFSFileSystemPath as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the URL as HFSFileSystemPath.

48.35.18 HostName as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the HostName part of this URL.

48.35.19 isAbsolutePath as boolean

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Is the path an absolute path?
48.35.20 kCFURLAddedToDirectoryDateKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:**
The date the resource was created, or renamed into or within its parent directory. Note that inconsistent behavior may be observed when this attribute is requested on hard-linked items. This property is not supported by all volumes. (Read-only, value type CFDateMBS) for macOS 10.10 or later.

48.35.21 kCFURLApplicationIsScriptableKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:**
True if the resource is scriptable. Only applies to applications. (Read-only, value type CFBooleanMBS) for macOS 10.11 or later.

48.35.22 kCFURLAttributeModificationDateKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:**
The time the resource's attributes were last modified (Read-only, value type CFDateMBS)

48.35.23 kCFURLCanonicalPathKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:**
the URL's path as a canonical absolute file system path (Read-only, value type CFStringMBS) for macOS 10.12 or later.
48.35.24 kCFURLContentAccessDateKey as CFStringMBS

**Function:** One of the resource keys.
**Notes:** The date the resource was last accessed (Read-only, value type CFDateMBS)

48.35.25 kCFURLContentModificationDateKey as CFStringMBS

**Function:** One of the resource keys.
**Notes:** The time the resource content was last modified (Read-write, value type CFDateMBS)

48.35.26 kCFURLCreationDateKey as CFStringMBS

**Function:** One of the resource keys.
**Notes:** The date the resource was created (Read-write, value type CFDateMBS)

48.35.27 kCFURLDocumentIdentifierKey as CFStringMBS

**Function:** One of the resource keys.
**Notes:**
The document identifier – a value assigned by the kernel to a document (which can be either a file or directory) and is used to identify the document regardless of where it gets moved on a volume. The document identifier survives "safe save operations; i.e it is sticky to the path it was assigned to (NSURL - replaceItemAtURL:withItemAtURL:backupItemName:options:resultingItemURL:error: is the preferred safe savesave API). The document identifier is persistent across system restarts. The document identifier is not transferred when the file is copied. Document identifiers are only unique within a single volume. This property is not supported by all volumes. (Read-only, value type CFNumberMBS) for macOS 10.10 or later.

48.35.28 kCFURLFileAllocatedSizeKey as CFStringMBS

**Function:** One of the resource keys.
**Notes:** Total size allocated on disk for the file in bytes (number of blocks times block size) (Read-only, value type CFNumberMBS)
48.35. **CLASS CFURLMBS**

### 48.35.29 kCFURLFileResourceIdentifierKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.

**Notes:** An identifier which can be used to compare two file system objects for equality using CFObjectMBS.Equal (i.e., two object identifiers are equal if they have the same file system path or if the paths are linked to same inode on the same file system). This identifier is not persistent across system restarts. (Read-only, value type CFObjectMBS)

### 48.35.30 kCFURLFileResourceTypeBlockSpecial as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file resource type values.

**Notes:** Special block device.

### 48.35.31 kCFURLFileResourceTypeCharacterSpecial as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file resource type values.

**Notes:** Special charset device.

### 48.35.32 kCFURLFileResourceTypeDirectory as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the file resource type values.

**Notes:** A folder.

### 48.35.33 kCFURLFileResourceTypeKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.

**Notes:**

Returns the file system object type. (Read-only, value type CFStringMBS) for macOS 10.7 or later.
48.35.34 kCFURLFileResourceTypeNamedPipe as CFStringRefMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the file resource type values.
**Notes:** A named pipe.

48.35.35 kCFURLFileResourceTypeRegular as CFStringRefMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the file resource type values.
**Notes:** Regular file.

48.35.36 kCFURLFileResourceTypeSocket as CFStringRefMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the file resource type values.
**Notes:** A network socket.

48.35.37 kCFURLFileResourceTypeSymbolicLink as CFStringRefMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the file resource type values.
**Notes:** An symbolic link.

48.35.38 kCFURLFileResourceTypeUnknown as CFStringRefMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the file resource type values.
**Notes:** Unknown.

48.35.39 kCFURLFileSecurityKey as CFStringRefMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** The file system object’s security information encapsulated in a CFFileSecurity object. (Read-write, value type CFFileSecurity)
48.35.40 kCFURLFileSizeKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** Total file size in bytes (Read-only, value type CFNumberMBS)

48.35.41 kCFURLGenerationIdentifierKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:**
An opaque generation identifier which can be compared using CFObj ectMBS.Equal() to determine if the
data in a document has been modified. For URLs which refer to the same file inode, the generation identifier
will change when the data in the file’s data fork is changed (changes to extended attributes or other file
system metadata do not change the generation identifier). For URLs which refer to the same directory inode,
the generation identifier will change when direct children of that directory are added, removed or renamed
(changes to the data of the direct children of that directory will not change the generation identifier). The
generation identifier is persistent across system restarts. The generation identifier is tied to a specific doc-
ument on a specific volume and is not transferred when the document is copied to another volume. This
property is not supported by all volumes. (Read-only, value type CFObj ectMBS)
for macOS 10.10 or later.

48.35.42 kCFURLHasHiddenExtensionKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** True for resources whose filename extension is removed from the localized name property (Read-
write, value type CFBooleanMBS)

48.35.43 kCFURLIsAliasFileKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** true if the resource is a Finder alias file or a symlink, false otherwise (Read-only, value type CF-
BooleanMBS)
48.35.44  kCFURLIsApplicationKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:**

True if resource is an application (Read-only, value type CFBooleanMBS)
for macOS 10.11 or later.

48.35.45  kCFURLIsDirectoryKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:** True for directories (Read-only, CFBooleanMBS)

48.35.46  kCFURLIsExcludedFromBackupKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:**

true if resource should be excluded from backups, false otherwise (Read-write, value type CFBooleanMBS). This property is only useful for excluding cache and other application support files which are not needed in a backup. Some operations commonly made to user documents will cause this property to be reset to false and so this property should not be used on user documents.
for macOS 10.8 or later.

48.35.47  kCFURLIsExecutableKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:**

true if this process (as determined by EUID) can execute a file resource or search a directory resource. (Read-only, value type CFBooleanMBS)
for macOS 10.7 or later.

48.35.48  kCFURLIsHiddenKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
CLASS CFURLMBS

Notes:

True for resources normally not displayed to users (Read-write, value type CFBooleanMBS).

If the resource is a hidden because its name starts with a period, setting this property to false will not change the property.

48.35.49 kCFURLIsMountTriggerKey as CFStringMBS

Notes:

true if this URL is a file system trigger directory. Traversing or opening a file system trigger will cause an attempt to mount a file system on the trigger directory. (Read-only, value type CFBooleanMBS) for macOS 10.7 or later.

48.35.50 kCFURLIsPackageKey as CFStringMBS

Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test")
dim c as CFURLMBS = NewCFURLMBSFile(f)

dim v as Variant
dim e as CFErrorMBS

if c.ResourcePropertyForKey(c.kCFURLIsPackageKey, v1, e) then
    dim p as CFBooleanMBS = v

    MsgBox "IsPackage: " + str(p.Value)
else
    MsgBox "Error: " + e.Description
end if

Notes:

True for packaged directories (Read-only 10.6 and 10.7, read-write 10.8, value type CFBooleanMBS).

You can only set or clear this property on directories; if you try to set this property on non-directory objects, the property is ignored. If the directory is a package for some other reason (extension type, etc), setting this
property to false will have no effect.

48.35.51 kCFURLIsReadableKey as CFStringMBS

Notes: true if this process (as determined by EUID) can read the resource. (Read-only, value type CFBooleanMBS) for macOS 10.7 or later.

48.35.52 kCFURLIsRegularFileKey as CFStringMBS

Notes: True for regular files (Read-only, value type CFBooleanMBS)

48.35.53 kCFURLIsSymbolicLinkKey as CFStringMBS

Notes: True for symlinks (Read-only, value type CFBooleanMBS)

48.35.54 kCFURLIsSystemImmutableKey as CFStringMBS

Notes: True for system-immutable resources (Read-write, value type CFBooleanMBS)

48.35.55 kCFURLIsUbiquitousItemKey as CFStringMBS

Notes: true if this item is synced to the cloud, false if it is only a local file. (Read-only, value type CFBooleanMBS) for macOS 10.7 or newer.
48.35.56 kCFURLIsUserImmutableKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:** True for user-immutable resources (Read-write, value type CFBooleanMBS)

48.35.57 kCFURLIsVolumeKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:** True for the root directory of a volume (Read-only, value type CFBooleanMBS)

48.35.58 kCFURLIsWritableKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:** true if this process (as determined by EUID) can write to the resource. (Read-only, value type CFBooleanMBS) for mac OS 10.7 or later.

48.35.59 kCFURLLabelNumberKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:** The label number assigned to the resource (Read-write, value type CFNumberMBS)

48.35.60 kCFURLLinkCountKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:** Number of hard links to the resource (Read-only, value type CFNumberMBS)

48.35.61 kCFURLLocalizedLabelKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
Notes: The user-visible label text (Read-only, value type CFStringMBS)

48.35.62 kCFURLLocalizedNameKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the resource keys. Notes: Localized or extension-hidden name as displayed to users (Read-only, value type CFStringMBS)

48.35.63 kCFURLLocalizedTypeDescriptionKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the resource keys. Notes: User-visible type or "kind" description (Read-only, value type CFStringMBS)

48.35.64 kCFURLNameKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the resource keys. Notes: The resource name provided by the file system (Read-write, value type CFStringMBS)

48.35.65 kCFURLParentDirectoryURLKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the resource keys. Notes: The resource’s parent directory, if any (Read-only, value type CFURLMBS)

48.35.66 kCFURLPathKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the resource keys. Notes: the URL’s path as a file system path (Read-only, value type CFStringMBS) for macOS 10.8 or later.
48.35.67 kCFURLPreferredIOBlockSizeKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** The optimal block size when reading or writing this file's data, or NULL if not available. (Read-only, value type CFNumberMBS)

48.35.68 kCFURLQuarantinePropertiesKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:**
The quarantine properties as defined in LSQuarantine.h. To remove quarantine information from a file, pass kCFNull as the value when setting this property. (Read-write, value type CFDictionaryMBS) for macOS 10.10 or later.

48.35.69 kCFURLTagNamesKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:**
The array of Tag names (Read-write, value type CFArrayMBS of CFStringMBS) for macOS 10.9 or later.

48.35.70 kCFURLTotalFileAllocatedSizeKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** Total allocated size of the file in bytes (this may include space used by metadata), or nil if not available. This can be less than the value returned by kCFURLTotalFileSizeKey if the resource is compressed. (Read-only, value type CFNumberMBS)

48.35.71 kCFURLTotalFileSizeKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** Total displayable size of the file in bytes (this may include space used by metadata), or NULL if not
48.35.72 kCFURLTypeIdentifierKey as CFStringMBS

Notes: Uniform type identifier (UTI) for the resource (Read-only, value type CFStringMBS)

48.35.73 kCFURLUbiquitousItemDownloadingErrorKey as CFStringMBS

Notes: returns the error when downloading the item from iCloud failed. See the NSUbiquitousFile section in FoundationErrors.h. (Read-only, value type CFErrorMBS) for macOS 10.9 or later.

48.35.74 kCFURLUbiquitousItemDownloadingStatusCurrent as CFStringMBS

Notes: there is a local version of this item and it is the most up-to-date version known to this device. for macOS 10.9 or later.

48.35.75 kCFURLUbiquitousItemDownloadingStatusDownloaded as CFStringMBS

Notes: there is a local version of this item available. The most current version will get downloaded as soon as possible. for macOS 10.9 or later.
48.35. **CLASS CFURLMBS**

**48.35.76 kCFURLUbiquitousItemDownloadingStatusKey as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:**
Returns the download status of this item. (Read-only, value type CFStringMBS).
for macOS 10.9 or later.

**48.35.77 kCFURLUbiquitousItemDownloadingStatusNotDownloaded as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the download status values.
**Notes:**
this item has not been downloaded yet. Use NSFileManager’s startDownloadingUbiquitousItemAtURL:erro-
error: to download it.
for macOS 10.9 or later.

**48.35.78 kCFURLUbiquitousItemHasUnresolvedConflictsKey as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** true if this item has conflicts outstanding. (Read-only, value type CFBooleanMBS)

**48.35.79 kCFURLUbiquitousItemIsDownloadedKey as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** Equivalent to NSURLUbiquitousItemDownloadingStatusKey = NSURLUbiquitousItemDownload-
ingStatusCurrent. Has never behaved as documented in earlier releases, hence deprecated. (Read-only, value
type CFBooleanMBS)

**48.35.80 kCFURLUbiquitousItemIsDownloadingKey as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** true if data is being downloaded for this item. (Read-only, value type CFBooleanMBS)
48.35.81  kCFURLUbiquitousItemIsUploadedKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
One of the resource keys.
**Notes:** true if there is data present in the cloud for this item. (Read-only, value type CFBooleanMBS)

48.35.82  kCFURLUbiquitousItemIsUploadingKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
One of the resource keys.
**Notes:** true if data is being uploaded for this item. (Read-only, value type CFBooleanMBS)

48.35.83  kCFURLUbiquitousItemPercentDownloadedKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
One of the resource keys.
**Notes:**
Percent downloaded.
Use NSMetadataQuery and NSMetadataUbiquitousItemPercentDownloadedKey on NSMetadataItem instead.

48.35.84  kCFURLUbiquitousItemPercentUploadedKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
One of the resource keys.
**Notes:**
Percent uploaded.
Use NSMetadataQuery and NSMetadataUbiquitousItemPercentUploadedKey on NSMetadataItem instead

48.35.85  kCFURLUbiquitousItemUploadingErrorKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
One of the resource keys.
**Notes:**
returns the error when uploading the item to iCloud failed. See the NSUbiquitousFile section in FoundationErrors.h. (Read-only, value type CFErrorMBS) for macOS 10.9 or later.
48.35. **CLASS CFURLMBS**

48.35.86 **kCFURLVolumeAvailableCapacityKey** as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** Total free space in bytes (Read-only, value type CFNumberMBS)

48.35.87 **kCFURLVolumeCreationDateKey** as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** The volume’s creation date, or nil if this cannot be determined. (Read-only, value type CFDateMBS)

48.35.88 **kCFURLVolumeIdentifierKey** as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** An identifier that can be used to identify the volume the file system object is on. Other objects on the same volume will have the same volume identifier and can be compared using for equality using CFObjectMBS.Equal. This identifier is not persistent across system restarts. (Read-only, value type CFObjec-tMBS)

48.35.89 **kCFURLVolumeIsAutomountedKey** as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** true if the volume is automounted. Note: do not mistake this with the functionality provided by kCFURLVolumeSupportsBrowsingKey. (Read-only, value type CFBooleanMBS)

48.35.90 **kCFURLVolumeIsBrowsableKey** as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** true if the volume should be visible via the GUI (i.e., appear on the Desktop as a separate volume). (Read-only, value type CFBooleanMBS)
48.35.91 kCFURLVolumeIsEjectableKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:** true if the volume’s media is ejectable from the drive mechanism under software control. (Read-only, value type CFBooleanMBS)

48.35.92 kCFURLVolumeIsEncryptedKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:**
true if the volume is encrypted. (Read-only, value type CFBooleanMBS)
for macOS 10.12 or later.

48.35.93 kCFURLVolumeIsInternalKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:** true if the volume’s device is connected to an internal bus, false if connected to an external bus, or nil if not available. (Read-only, value type CFBooleanMBS)

48.35.94 kCFURLVolumeIsJournalingKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:** true if the volume is currently using a journal for speedy recovery after an unplanned restart. (Read-only, value type CFBooleanMBS)

48.35.95 kCFURLVolumeIsLocalKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:** true if the volume is stored on a local device. (Read-only, value type CFBooleanMBS)
48.35. CLASS CFURLMBS

48.35.96 kCFURLVolumeIsReadOnlyKey as CFStringMBS

Notes: true if the volume is read-only. (Read-only, value type CFBooleanMBS)

48.35.97 kCFURLVolumeIsRemovableKey as CFStringMBS

Notes: true if the volume’s media is removable from the drive mechanism. (Read-only, value type CFBooleanMBS)

48.35.98 kCFURLVolumeIsRootFileSystemKey as CFStringMBS

Notes: true if the volume is the root filesystem. (Read-only, value type CFBooleanMBS) for macOS 10.12 or later.

48.35.99 kCFURLVolumeLocalizedFormatDescriptionKey as CFStringMBS

Notes: The user-visible volume format (Read-only, value type CFStringMBS)

48.35.100 kCFURLVolumeLocalizedNameKey as CFStringMBS

Notes: The user-presentable name of the volume (Read-only, value type CFStringMBS)

48.35.101 kCFURLVolumeMaximumFileSizeKey as CFStringMBS

Notes: The largest file size (in bytes) supported by this file system, or nil if this cannot be determined. (Read-only, value type CFNumberMBS)

48.35.102  kCFURLVolumeNameKey as CFStringRefMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the resource keys. Notes: The name of the volume (Read-write, settable if kCFURLVolumeSupportsRenamingKey is true and permissions allow, value type CFStringRefMBS)
48.35.103  kCFURLVolumeResourceCountKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.  
**Notes:** Total number of resources on the volume (Read-only, value type CFNumberMBS)

48.35.104  kCFURLVolumeSupportsAdvisoryFileLockingKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.  
**Notes:** true if the volume implements whole-file flock(2) style advisory locks, and the O_EXLOCK and O_SHLOCK flags of the open(2) call. (Read-only, value type CFBooleanMBS)

48.35.105  kCFURLVolumeSupportsCasePreservedNamesKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.  
**Notes:** true if the volume format preserves the case of file and directory names. Otherwise the volume may change the case of some characters (typically making them all upper or all lower case). (Read-only, value type CFBooleanMBS)

48.35.106  kCFURLVolumeSupportsCaseSensitiveNamesKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.  
**Notes:** true if the volume format treats upper and lower case characters in file and directory names as different. Otherwise an upper case character is equivalent to a lower case character, and you can’t have two names that differ solely in the case of the characters. (Read-only, value type CFBooleanMBS)

48.35.107  kCFURLVolumeSupportsCompressionKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.  
**Notes:** true if the volume supports transparent decompression of compressed files using decmpfs. (Read-only, value type CFBooleanMBS)  
for macOS 10.12.
48.35.108  kCFURLVolumeSupportsExclusiveRenamingKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:**
true if the volume supports renamex_np(2)’s RENAME_EXCL option (Read-only, value type CFBooleanMBS)
for macOS 10.12 or later.

48.35.109  kCFURLVolumeSupportsExtendedSecurityKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** true if the volume implements extended security (ACLs). (Read-only, value type CFBooleanMBS)

48.35.110  kCFURLVolumeSupportsFileCloningKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:**
true if the volume supports clonefile(2) (Read-only, value type CFBooleanMBS)
for macOS 10.12 or later.

48.35.111  kCFURLVolumeSupportsHardLinksKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** true if the volume format supports hard links (Read-only, value type CFBooleanMBS)

48.35.112  kCFURLVolumeSupportsJournalingKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the resource keys.
**Notes:** true if the volume format supports a journal used to speed recovery in case of unplanned restart
(such as a power outage or crash). This does not necessarily mean the volume is actively using a journal.
(Read-only, value type CFBooleanMBS)
48.35. **CLASS CFURLMBS**

48.35.113  **kCFURLVolumeSupportsPersistentIDsKey as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:** true if the volume format supports persistent object identifiers and can look up file system objects by their IDs (Read-only, value type CFBooleanMBS)

48.35.114  **kCFURLVolumeSupportsRenamingKey as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:** true if the volume can be renamed. (Read-only, value type CFBooleanMBS)

48.35.115  **kCFURLVolumeSupportsRootDirectoryDatesKey as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:** true if the volume supports reliable storage of times for the root directory. (Read-only, value type CFBooleanMBS)
for macOS 10.7 or later.

48.35.116  **kCFURLVolumeSupportsSparseFilesKey as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:** true if the volume format supports sparse files, that is, files which can have 'holes' that have never been written to, and thus do not consume space on disk. A sparse file may have an allocated size on disk that is less than its logical length. (Read-only, value type CFBooleanMBS)

48.35.117  **kCFURLVolumeSupportsSwapRenamingKey as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.
**Notes:** true if the volume supports rename.x_up(2)’s RENAME_SWAP option (Read-only, value type CFBooleanMBS)
for macOS 10.12 or later.

48.35.118 kCFURLVolumeSupportsSymbolicLinksKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:** true if the volume format supports symbolic links (Read-only, value type CFBooleanMBS)

48.35.119 kCFURLVolumeSupportsVolumeSizesKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:** true if the volume supports returning volume size values (kCFURLVolumeTotalCapacityKey and kCFURLVolumeAvailableCapacityKey). (Read-only, value type CFBooleanMBS)

48.35.120 kCFURLVolumeSupportsZeroRunsKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:** For security reasons, parts of a file (runs) that have never been written to must appear to contain zeroes. true if the volume keeps track of allocated but unwritten runs of a file so that it can substitute zeroes without actually writing zeroes to the media. (Read-only, value type CFBooleanMBS)

48.35.121 kCFURLVolumeTotalCapacityKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:** Total volume capacity in bytes (Read-only, value type CFNumberMBS)

48.35.122 kCFURLVolumeURLForRemountingKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys. **Notes:** The CFURLMBS needed to remount a network volume, or nil if not available. (Read-only, value type CFURLMBS)
48.35. **CLASS CFURLMBS**

### 48.35.123 kCFURLVolumeURLKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.  
**Notes:** URL of the volume on which the resource is stored (Read-only, value type CFURLMBS)

### 48.35.124 kCFURLVolumeUUIDStringKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the resource keys.  
**Notes:** The volume’s persistent UUID as a string, or nil if a persistent UUID is not available for the volume. (Read-only, value type CFStringMBS)

### 48.35.125 Kind as CFStringMBS

MBS MacCF Plugin, Plugin Version: 2.9, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the kind string for the file.

### 48.35.126 LastPathComponent as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the LastPathComponent part of this URL.

### 48.35.127 Launch as Integer

MBS MacCF Plugin, Plugin Version: 2.9, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Launches a file.  
**Notes:** Returns a Mac OS error string or -1 if the function is not available.

### 48.35.128 NetLocation as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the NetLocation part of this URL.
48.35.129 ParameterString(charactersToLeaveEscaped as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ParameterString part of this URL.

48.35.130 Password as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Password part of this URL.

48.35.131 Path as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Path part of this URL.
See also:

- 48.35.132 Path(resolveAgainstBase as boolean) as string

48.35.132 Path(resolveAgainstBase as boolean) as string

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the path of this URL.
See also:

- 48.35.131 Path as CFStringMBS

48.35.133 PathExtension as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the PathExtension part of this URL.

48.35.134 PortNumber as Integer

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the PortNumber part of this URL.
**Notes:** Returns -1 if no port specified and -2 on Windows and Mac OS Classic.
48.35. **CLASS CFURLMBS**

### 48.35.135 PosixFileSystemPath as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the URL as PosixFileSystemPath.

### 48.35.136 QueryString(charactersToLeaveEscaped as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the QueryString part of this URL.

### 48.35.137 ResourcePropertyForKey(key as CFStringMBS, byref value as Variant, byref error as CFErrorMBS) as boolean

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the resource value identified by a given resource key.

**Example:**

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("test")
dim c as CFURLMBS = NewCFURLMBSFile(f)

dim v as Variant
dim e as CFErrorMBS

if c.ResourcePropertyForKey(c.kCFURLIsPackageKey, v1, e) then
    dim p as CFBooleanMBS = v
    MsgBox "IsPackage: " + str(p.Value)
else
    MsgBox "Error: " + e.Description
end if
```

**Notes:**

- **key:** The resource key that identifies the resource property.
- **Value:** On output when the result is true, the resource value or nil.
- **error:** On output when the result is false, the error that occurred.

Returns true if value is successfully populated; false if an error occurs.

ResourcePropertyForKey first checks if the URL object already caches the resource value. If so, it returns the cached resource value to the caller. If not, then ResourcePropertyForKey synchronously obtains the resource value from the backing store, adds the resource value to the URL object’s cache, and returns the
resource value to the caller. The type of the resource value varies by resource property (see resource key
definitions). If this function returns true and value is populated with nil, it means the resource property
is not available for the specified resource and no errors occurred when determining the resource property
was not available. If this function returns false, the optional error is populated. This function is currently
applicable only to URLs for file system resources.

48.35.138  ResourceSpecifier as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Re-
sourceSpecifier part of this URL.

48.35.139  Scheme as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the scheme
part of this URL.

48.35.140  SetResourcePropertyForKey(key as CFStringMBS, value as Variant,
byref error as CFErrorMBS) as boolean

MBS MacCF Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the resource value identified by a given resource key.
**Example:**

Dim f As FolderItem = SpecialFolder.Desktop.Child("test")
Dim c As CFURLMBS = NewCFURLMBSFile(f)
Dim e As CFErrorMBS

If c.SetResourcePropertyForKey(c.kCFURLIsPackageKey, NewCFBooleanMBS(true), e) Then
MsgBox "OK"
Else
MsgBox "Error: " + e.Description
End If

**Notes:**
key: The resource key that identifies the resource property.
Value: The resource value.
error: On output when the result is false, the error that occurred.
48.35. **CLASS CFURLMBS**

Returns true if the attempt to set the resource value completed with no errors; otherwise, false.

CFURLSetResourcePropertyForKey writes the new resource value out to the backing store. Attempts to set a read-only resource property or to set a resource property not supported by the resource are ignored and are not considered errors. If this function returns false, the optional error is populated. This function is currently applicable only to URLs for file system resources.

### 48.35.141 Str as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the URL as binary data.

### 48.35.142 StrictPath as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Strict-Path part of this URL.

### 48.35.143 URLWithHandle(Handle as Integer) as CFURLMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new URL object based on a handle value. **Notes:** Will retain the reference.

### 48.35.144 UserName as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the UserName part of this URL.

### 48.35.145 WindowsFileSystemPath as CFStringMBS

MBS MacCF Plugin, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the URL as WindowsFileSystemPath.
48.35.146 Properties

48.35.147 AddedToDirectoryDate as CFDateMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The date the resource was created, or renamed into or within its parent directory.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("blog.html")
dim u as CFURLMBS = NewCFURLMBSFile(f)
dim d as CFDateMBS = u.AddedToDirectoryDate
dim t as CFTimeZoneMBS = SystemCFTimeZoneMBS
dim x as CFGregorianDateMBS = d.AbsoluteTime.GregorianDate(t)
dim y as new date(x.Year, x.Month, x.Day, x.Hour, x.Minute, x.Second)
MsgBox "AddedToDirectoryDate: " + y.SQLDateTime

Notes:
Note that inconsistent behavior may be observed when this attribute is requested on hard-linked items. This property is not supported by all volumes.
(Read only property)

48.35.148 AttributeModificationDate as CFDateMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The time the resource’s attributes were last modified.
Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("blog.html")
dim u as CFURLMBS = NewCFURLMBSFile(f)
dim d as CFDateMBS = u.AttributeModificationDate
dim t as CFTimeZoneMBS = SystemCFTimeZoneMBS
dim x as CFGregorianDateMBS = d.AbsoluteTime.GregorianDate(t)
dim y as new date(x.Year, x.Month, x.Day, x.Hour, x.Minute, x.Second)
MsgBox "AttributeModificationDate: " + y.SQLDateTime

Notes: (Read only property)
48.35. **CLASS CFURLMBS**

48.35.149 **ContentAccessDate as CFDateMBS**

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The date the resource was last accessed.

**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("blog.html")
dim u as CFURLMBS = NewCFURLMBSFile(f)
dim d as CFDateMBS = u.ContentAccessDate
dim t as CFTimeZoneMBS = SystemCFTimeZoneMBS
dim x as CFGregorianDateMBS = d.AbsoluteTime.GregorianDate(t)
dim y as new date(x.Year, x.Month, x.Day, x.Hour, x.Minute, x.Second)
MsgBox "ContentAccessDate: " + y.SQLDateTime
```

**Notes:** (Read only property)

48.35.150 **ContentModificationDate as CFDateMBS**

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The time the resource content was last modified.

**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("blog.html")
dim u as CFURLMBS = NewCFURLMBSFile(f)
dim d as CFDateMBS = u.ContentModificationDate
dim t as CFTimeZoneMBS = SystemCFTimeZoneMBS
dim x as CFGregorianDateMBS = d.AbsoluteTime.GregorianDate(t)
dim y as new date(x.Year, x.Month, x.Day, x.Hour, x.Minute, x.Second)
MsgBox "ContentModificationDate: " + y.SQLDateTime
```

**Notes:** (Read only property)

48.35.151 **CreationDate as CFDateMBS**

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The date the resource was created.

**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("blog.html")
dim u as CFURLMBS = NewCFURLMBSFile(f)
dim d as CFDateMBS = u.CreationDate
dim t as CFTimeZoneMBS = SystemCFTimeZoneMBS
```
dim x as CFGregorianDateMBS = d.AbsoluteTime.GregorianDate(t)
dim y as new date(x.Year, x.Month, x.Day, x.Hour, x.Minute, x.Second)
MsgBox "CreationDate: " + y.SQLDateTime

Notes: (Read only property)

48.35.152 HasHiddenExtension as CFBooleanMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
True for resources whose filename extension is removed from the localized name property.
**Notes:** (Read only property)

48.35.153 IsApplication as CFBooleanMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
True if resource is an application.
**Notes:** (Read only property)

48.35.154 IsDirectory as CFBooleanMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
True for directories.
**Notes:** (Read only property)

48.35.155 IsHidden as CFBooleanMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
True for resources normally not displayed to users.
**Example:**

dim f as FolderItem = SpecialFolder.Desktop.Child("blog.html")
dim u as CFURLMBS = NewCFURLMBSFile(f)
MsgBox "IsHidden: " + str(u.IsHidden.Value)

**Notes:**
If the resource is a hidden because its name starts with a period, setting this property to false will not change
the property.
(Read only property)

### 48.35.156  IsPackage as CFBooleanMBS

**Notes:**
Note: You can only set or clear this property on directories; if you try to set this property on non-directory objects, the property is ignored. If the directory is a package for some other reason (extension type, etc), setting this property to false will have no effect.
(Read only property)

### 48.35.157  IsRegularFile as CFBooleanMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True for regular files.
**Example:**
```vbs
dim f as FolderItem = SpecialFolder.Desktop.Child("blog.html")
dim u as CFURLMBS = NewCFURLMBSFile(f)
MsgBox "IsRegularFile: " +u.IsRegularFile.Value
```
**Notes:** (Read only property)

### 48.35.158  IsSymbolicLink as CFBooleanMBS

**Notes:** (Read only property)

### 48.35.159  IsSystemImmutable as CFBooleanMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True for system-immutable resources.
**Notes:** (Read only property)
48.35.160 .isUserImmutable as CFBooleanMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
True for user-immutable resources.
**Notes:** (Read only property)

48.35.161  IsVolume as CFBooleanMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
True for the root directory of a volume.
**Notes:** (Read only property)

48.35.162  LocalizedName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Localized or extension-hidden name as displayed to users.
**Example:**
```
dim f as FolderItem = SpecialFolder.Desktop.Child("blog.html")
```
```
dim u as CFURLMBS = NewCFURLMBSFile(f)
```
```
MsgBox u.LocalizedName
```

**Notes:** (Read only property)

48.35.163  Name as CFStringMBS

MBS MacCF Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The resource name provided by the file system.
**Example:**
```
dim f as FolderItem = SpecialFolder.Desktop.Child("blog.html")
```
```
dim u as CFURLMBS = NewCFURLMBSFile(f)
```
```
MsgBox u.Name
```

**Notes:** (Read only property)
48.36. CLASS CFUUIDMBS

48.36.1 class CFUUIDMBS

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The Core Foundation class for an unique identifier.

**Example:**

```
Dim u As New CFUUIDMBS
MsgBox u.StringValue
```

**Notes:**

CFUUID objects are used by plug-ins to uniquely identify types, interfaces, and factories. When creating a new type, host developers must generate UUIDs to identify the type as well as its interfaces and factories.

UUIDs (Universally Unique Identifiers), also known as GUIDs (Globally Unique Identifiers) or IID (Interface Identifiers), are 128-bit values guaranteed to be unique. A UUID is made unique over both space and time by combining a value unique to the computer on which it was generated (usually the Ethernet hardware address) and a value representing the number of 100-nanosecond intervals since October 15, 1582 at 00:00:00.

The standard format for UUIDs represented in ASCII is a string punctuated by hyphens, for example 68753A44-4D6F-1226-9C60-0050E4C00067. The hex representation looks, as you might expect, like a list of numerical values preceded by \& h. For example, \& hD7, \& h36, \& h95, \& h0A, \& h4D, \& h6E, \& h12, \& h26, \& h80, \& h3A, \& h00, \& h50, \& hE4, \& hC0, \& h00, \& h67. To use a UUID, you simply create it and then copy the resulting strings into your header and C language source files. Because a UUID is expressed simply as an array of bytes, there are no endianness considerations for different platforms.

You can create a CFUUID object, and thereby generate a UUID, using any one of the Constructors. Subclass of the CFObjectMBS class.

48.36.2 Methods

48.36.3 Bytes as Memoryblock

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the value of a UUID object as raw bytes.

**Example:**

```
// create new UUID
Dim u As New CFUUIDMBS
```
// get raw data

dim m as MemoryBlock = u.Bytes

// display

MsgBox EncodingToHexMBS(m)+EndOfLine+u.StringValue

**Notes:** Returns the value of uuid represented as raw bytes.

### 48.36.4 Constructor

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a Universally Unique Identifier (UUID) object.

**Example:**

```vba
dim u as new CFUUIDMBS
MsgBox u.StringValue
```

**Notes:** Returns a new CFUUID object or nil on any failure.
See also:

- 48.36.5 Constructor(Bytes as Memoryblock)  7884
- 48.36.6 Constructor(uuidStr as string)  7885

### 48.36.5 Constructor(Bytes as Memoryblock)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a CFUUID object from raw UUID bytes.

**Example:**

```vba
// create new UUID

dim u as new CFUUIDMBS

// get raw data

dim m as MemoryBlock = u.Bytes

// create new UUID with this bytes

dim v as new CFUUIDMBS(m)
```
// display UUIDs:
MsgBox u.StringValue + EndOfLine + v.StringValue

if u.Equal(v) then
    MsgBox "equal"
else
    MsgBox "not equal"
end if

Notes:
bytes: Raw UUID bytes to use to create the CFUUID object.

Returns a new CFUUID object or nil on any error.
See also:

• 48.36.4 Constructor
• 48.36.6 Constructor(uuidStr as string)

48.36.6 Constructor(uuidStr as string)

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a CFUUID object for a specified string.

**Example:**

// create new UUID

dim u as new CFUUIDMBS

// get string

dim s as string = u.StringValue

// create new UUID with this string

dim v as new CFUUIDMBS(s)

// display UUIDs:

MsgBox u.StringValue + EndOfLine + v.StringValue

if u.Equal(v) then
    MsgBox "equal"
else
MsgBox "not equal"
end if

Notes:

uuidStr: A string containing a UUID. The standard format for UUIDs represented in ASCII is a string punctuated by hyphens, for example 68753A44-4D6F-1226-9C60-0050E4C00067.

Returns a new CFUUID object, or if a CFUUID object of the same value already exists, the existing instance with its reference count incremented. Returns nil on any error.

If you need to validate a GUID or UUID, please check the IsGUID function in our FAQ.
See also:

- 48.36.4 Constructor
- 48.36.5 Constructor(Bytes as Memoryblock)

48.36.7 StringValue as string

MBS MacCF Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the string representation of a specified CFUUID object.

**Example:**

dim u as new CFUIDMBS
MsgBox u.StringValue
class CFXMLAttributeDeclarationInfoMBS

48.37.1 class CFXMLAttributeDeclarationInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class with data for a XML attribute declaration.

48.37.2 Properties

48.37.3 AttributeName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The name of the attribute. **Notes:** (Read and Write property)

48.37.4 DefaultString as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The default string for this attribute. **Notes:** (Read and Write property)

48.37.5 TypeString as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type string for this attribute. **Notes:** (Read and Write property)
class CFXMLAttributeListDeclarationInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
A class with data for a xml attribute list declaration.

Methods

Item(index as Integer) as CFXMLAttributeDeclarationInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the item with the given index.
Notes:
Index is from 0 to count-1.
Returns nil on any error.

Properties

Count as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The number of items in this list.
Notes: (Read and Write property)
48.39  CLASS CFXMLDOCUMENTINFOMBS

48.39  class CFXMLDocumentInfoMBS

48.39.1  class CFXMLDocumentInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for additional information about a xml document.

48.39.2  Properties

48.39.3  CFStringEncoding as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The encoding used for the xml source data string.

**Notes:**
Useful constants:

- kCFStringEncodingInvalidId & hFFFFFFFF Binary data
- kCFStringEncodingMacRoman 0 Mac OS Classic
- kCFStringEncodingWindowsLatin1 & h0500 ANSI codepage 1252
- kCFStringEncodingISOLatin1 & h0201 ISO 8859-1
- kCFStringEncodingNextStepLatin & h0B01 NextStep encoding
- kCFStringEncodingASCIIRaw & h0600 0..127
- kCFStringEncodingUnicode & h0100 kTextEncodingUnicodeDefault + kTextEncodingDefaultFormat (aka kUnicode16BitFormat)
- kCFStringEncodingUTF8 & h08000100 kTextEncodingUnicodeDefault + kUnicodeUTF8Format
- kCFStringEncodingNonLossyASCII & h0BFF 7bit Unicode variants used by YellowBox & Java

(same as RB’s internal encoding values)
(Read and Write property)

48.39.4  SourceURL as CFURLMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The source URL for this document.

**Notes:** (Read and Write property)
48.40 class CFXMLDocumentTypeInfoMBS

48.40.1 class CFXMLDocumentTypeInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for additional information for a xml document type.

48.40.2 Properties

48.40.3 ExternalID as CFXMLEXternalIDMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A reference to the document type.
**Notes:** (Read and Write property)
48.41. class CFXMLElementInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
A class with additional xml element info.

48.41.2 Properties

48.41.3 AttributeOrder as CFArrayMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The order of the attributes.
Notes: (Read and Write property)

48.41.4 IsEmpty as Boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Unkown.
Notes: (Read and Write property)

48.41.5 XMLAttributes as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The attributes of this element.
Notes:
Renamed Attributes parameter to XMLAttributes in plugin version 8.2.
(Read and Write property)
48.42 class CFXMLElementTypeDeclarationInfoMBS

48.42.1 class CFXMLElementTypeDeclarationInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class with additional information on a xml element type declaration.

48.42.2 Properties

48.42.3 ContentDescription as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The content description. **Notes:** (Read and Write property)
48.43.1 class CFXMLEntityInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for additional information on a xml entity.

48.43.2 Properties

48.43.3 EntityID as CFXMLExternalIDMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An external reference. **Notes:** EntityID.systemID will be NULL if entityType is internal. (Read and Write property)

48.43.4 EntityType as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of entity. **Notes:** Useful constants:

- kCFXMLEntityTypeParameter 0 Implies parsed, internal
- kCFXMLEntityTypeParsedInternal 1
- kCFXMLEntityTypeParsedExternal 2
- kCFXMLEntityTypeUnparsed 3
- kCFXMLEntityTypeCharacter 4

(Read and Write property)

48.43.5 NotationName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The notation name. **Notes:**
Nil if entityType is parsed.
(Read and Write property)

48.43.6 ReplacementText as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The replacement text.
**Notes:**
Nil if entityType is external or unparsed.
(Read and Write property)
48.44. CLASS CFXMLENTITYREFERENCEINFOMBS

48.44 class CFXMLEntityReferenceInfoMBS

48.44.1 class CFXMLEntityReferenceInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for additional information on a xml entity reference.

48.44.2 Properties

48.44.3 EntityType as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of entity.

**Notes:**

Useful constants:

- kCFXMLEntityTypeParameter 0 Implies parsed, internal
- kCFXMLEntityTypeParsedInternal 1
- kCFXMLEntityTypeParsedExternal 2
- kCFXMLEntityTypeUnparsed 3
- kCFXMLEntityTypeCharacter 4

(Read and Write property)
48.45 class CFXMLExternalIDMBS

48.45.1 class CFXMLExternalIDMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for an external xml ID.

48.45.2 Properties

48.45.3 PublicID as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The public ID.
**Notes:** (Read and Write property)

48.45.4 SystemID as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The system ID.
**Notes:** (Read and Write property)
class CFXMLNodeMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a xml node.

**Example:**

```plaintext
dim documentinfo as new CFXMLDocumentInfoMBS
dim docnode as new CFXMLNodeMBS
dim xmldocument as new CFTreeMBS
dim instructionNode as new CFXMLNodeMBS
dim instructionInfo as new CFXMLElementInfoMBS
dim personInfo as new CFXMLNodeMBS
dim personTree as new CFTreeMBS
dim nameInfo as new CFXMLNodeMBS
dim nameNode as new CFXMLNodeMBS
dim nameTree as new CFTreeMBS
dim nameTextNode as new CFXMLNodeMBS
dim nameTextTree as new CFTreeMBS
dim nameTextNode2 as new CFXMLNodeMBS
dim nameTextTree2 as new CFTreeMBS
dim person as CFStringMBS

const kCFStringEncodingUTF8=& h08000100

// create a document node
documentinfo.SourceURL=nil
documentinfo.CFStringEncoding=kCFStringEncodingUTF8
docnode.CreateDocument(documentinfo)
xmldocument.CreateWithXMLNode docNode

// Instruction Tag
instructionInfo.DataString=NewCFStringMBS("version=""1.0"" encoding=""utf-8"")
instructionNode.CreateProcessInstruction(NewCFStringMBS("xml"),instructionInfo)
instructionTree.CreateWithXMLNode(instructionNode)

// root element
personInfo.XMLAttributes=nil
personInfo.AttributeOrder=nil
personInfo.IsEmpty=false
```
person=NewCFStringMBS("person")
personNode.CreateElement person, personInfo
personTree.CreateWithXMLNode personNode

nameInfo.XMLAttributes=nil
nameInfo.AttributeOrder=nil
nameInfo.IsEmpty=false

namenode.CreateElement NewCFStringMBS("name"), nameInfo
nameTree.CreateWithXMLNode nameNode
personTree.AppendChild nameTree

nameTextNode.CreateText NewCFStringMBS("Apple")
nameTextTree.CreateWithXMLNode nameTextNode
nameTree.AppendChild nameTextTree

nameTextNode2.CreateText NewCFStringMBS("Orange")
nameTextTree2.CreateWithXMLNode nameTextNode2
nameTree.AppendChild nameTextTree2

CFShowMBS(xmldocument)

xmldocument.AppendChild instructionTree
xmldocument.AppendChild personTree

MsgBox xmldocument.XMLData.str

// shows "<?xml version="1.0" encoding="utf-8" ?>\n<person><name>AppleOrange</name></person>"

Notes:

An CFXMLNode describes an individual XML construct - like a tag, or a comment, or a string of character data. Each CFXMLNode contains 3 main pieces of information - the node’s type, the data string, and a pointer to an additional data structure. The node’s type ID is an enum value of type CFXMLNodeType-Code. The data string is always a CFStringRef; the meaning of the string is dependent on the node’s type ID. The format of the additional data is also dependent on the node’s type; in general, there is a custom structure for each type that requires additional data. See below for the mapping from type ID to meaning of the data string and structure of the additional data.

Type codes for the different possible XML nodes; this list may grow:

Subclass of the CFOBJECTMBS class.

### 48.46.2 Methods

#### 48.46.3 Copy as CFXMLNodeMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the xml node and any data inside.

#### 48.46.4 CreateAttribute

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an attribute based on the given data.  
**Notes:** If this function is successfull, the handle is set to a non zero value.

#### 48.46.5 CreateAttributeListDeclaration(TagName as CFStringMBS, data as CFXMLAttributeListDeclarationInfoMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an attribute list declaration based on the given data.  
**Notes:** If this function is successfull, the handle is set to a non zero value.

#### 48.46.6 CreateCDATASection(text as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a CData section based on the given data.  
**Notes:** If this function is successfull, the handle is set to a non zero value.
48.46.7 CreateComment(comment as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a comment based on the given data. **Notes:** If this function is successful, the handle is set to a non-zero value.

48.46.8 CreateDocument(documentinfo as CFXMLODocumentInfoMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a document based on the given data. **Notes:** If this function is successful, the handle is set to a non-zero value.

48.46.9 CreateDocumentFragment

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a document fragment based on the given data. **Notes:** If this function is successful, the handle is set to a non-zero value.

48.46.10 CreateDocumentType(Name as CFStringMBS, data as CFXMLODocumentTypeInfoMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a document type based on the given data. **Notes:** If this function is successful, the handle is set to a non-zero value.

48.46.11 CreateElement(TagName as CFStringMBS, data as CFXMLElementInfoMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an element based on the given data. **Notes:** If this function is successful, the handle is set to a non-zero value.

48.46.12 CreateElementTypeDeclaration(TagName as CFStringMBS, data as CFXMLElementTypeDeclarationInfoMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an element type based on the given data.
48.46. **CLASS CFXMLNODEMBS**

**Notes:** If this function is successfull, the handle is set to a non zero value.

### 48.46.13 CreateEntity(EntityName as CFStringMBS, data as CFXMLEntityInfoMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an entity based on the given data.

**Notes:** If this function is successfull, the handle is set to a non zero value.

### 48.46.14 CreateEntityReference(EntityReferenceName as CFStringMBS, data as CFXMLEntityReferenceInfoMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an entity reference based on the given data.

**Notes:** If this function is successfull, the handle is set to a non zero value.

### 48.46.15 CreateNotation(NotationName as CFStringMBS, data as CFXMLNotationInfoMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a notation based on the given data.

**Notes:** If this function is successfull, the handle is set to a non zero value.

### 48.46.16 CreateProcessInstruction(Target as CFStringMBS, data as CFXMLProcessingInstructionInfoMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a process instruction based on the given data.

**Notes:** If this function is successfull, the handle is set to a non zero value.

### 48.46.17 CreateText(text as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a text based on the given data.

**Notes:** If this function is successfull, the handle is set to a non zero value.
48.46.18  **CreateWhitespace(text as CFStringMBS)**

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates whitespace based on the given data.  
**Notes:** If this function is successful, the handle is set to a non-zero value.

48.46.19  **Data as CFStringMBS**

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The node’s data string.

48.46.20  **GetCFXMLAttributeListDeclarationInfo as CFXMLAttributeListDeclarationInfoMBS**

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the node has this type of additional data, the function will return it.  
**Notes:** Returns nil on any error.

48.46.21  **GetCFXMLDocumentInfo as CFXMLDocumentInfoMBS**

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the node has this type of additional data, the function will return it.  
**Notes:** Returns nil on any error.

48.46.22  **GetCFXMLDocumentTypeInfo as CFXMLDocumentTypeInfoMBS**

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the node has this type of additional data, the function will return it.  
**Notes:** Returns nil on any error.

48.46.23  **GetCFXMLElementInfo as CFXMLElementInfoMBS**

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the node has this type of additional data, the function will return it.  
**Notes:** Returns nil on any error.
48.46.24 GetCFXMLElementTypeDeclarationInfo as CFXMLElementTypeDeclarationInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

If the node has this type of additional data, the function will return it.

**Notes:** Returns nil on any error.

48.46.25 GetCFXMLEntityInfo as CFXMLEntityInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

If the node has this type of additional data, the function will return it.

**Notes:** Returns nil on any error.

48.46.26 GetCFXMLEntityReferenceInfo as CFXMLEntityReferenceInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

If the node has this type of additional data, the function will return it.

**Notes:** Returns nil on any error.

48.46.27 GetCFXMLNotationInfo as CFXMLNotationInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

If the node has this type of additional data, the function will return it.

**Notes:** Returns nil on any error.

48.46.28 GetCFXMLProcessingInstructionInfo as CFXMLProcessingInstructionInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

If the node has this type of additional data, the function will return it.

**Notes:** Returns nil on any error.

48.46.29 TypeCode as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

The type code of the XML node.
Notes: See the class description for a value list.
48.47. **CLASS CFXMLNOTATIONINFOMBS**

48.47  **class CFXMLNotationInfoMBS**

48.47.1  **class CFXMLNotationInfoMBS**

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for additional information on a xml notation.

48.47.2  **Properties**

48.47.3  **ExternalID as CFXMLExternalIDMBS**

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The external ID for this notation. **Notes:** (Read and Write property)
48.48 class CFXMLParserMBS

48.48.1 class CFXMLParserMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a CoreFoundation XML Parser. **Notes:** Subclass of the CFObjectMBS class.

48.48.2 Methods

48.48.3 Abort(ErrorCode as Integer, ErrorDescription as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Stops parsing from inside an event. **Notes:** Cause any in-progress parse to abort with the given error code and description. errorCode must be positive, and errorDescription may not be nil. Cannot be called asynchronously (i.e. must be called from within a parser events).

48.48.4 Create(data as CFBinaryDataMBS, url as CFURLMBS, options as Integer)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new data based parser. **Notes:** Creates a parser which will parse the given data with the given options. xmlData may not be nil. dataSource should be the URL from which the data came, and may be nil; it is used to resolve any relative references found in xmlData.

These are the various options you can configure the parser with. These are chosen such that an option flag of 0 (kCFXMLParserNoOptions) leaves the XML as ”intact” as possible (reports all structures; performs no replacements). Hence, to make the parser do the most work, returning only the pure element tree, set the option flag to kCFXMLParserAllOptions:

48.48.5 CreateWithURL(url as CFURLMBS, options as Integer)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a parser which will parse the given data with the given options.
## 48.48. CLASS CFXMLPARSERMBS

<table>
<thead>
<tr>
<th>Option</th>
<th>Bit Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kCFXMLParserValidateDocument</td>
<td>1</td>
<td>Validate the document against its grammar from the DTD, reporting any errors. Currently not supported.</td>
</tr>
<tr>
<td>kCFXMLParserSkipMetaData</td>
<td>2</td>
<td>Silently skip over metadata constructs (the DTD and comments)</td>
</tr>
<tr>
<td>kCFXMLParserReplacePhysicalEntities</td>
<td>4</td>
<td>Replace declared entities like &lt;. Note that other than the 5 predefined entities (lt, gt, quot, amp, apos), these must be defined in the DTD. Currently not supported.</td>
</tr>
<tr>
<td>kCFXMLParserSkipWhitespace</td>
<td>8</td>
<td>Skip over all whitespace that does not abut non-whitespace character data. In other words, given <code>&lt;foo&gt;</code> <code>&lt;bar&gt;</code> <code>blah</code> <code>&lt;/bar&gt;</code> <code>&lt;/foo&gt;</code>, the whitespace between foo's open tag and bar's open tag would be suppressed, but the whitespace around blah would be preserved.</td>
</tr>
<tr>
<td>kCFXMLParserResolveExternalEntities</td>
<td>16</td>
<td>Where the DTD specifies implied attribute-value pairs for a particular element, add those pairs to any occurrences of the element in the element tree. Currently not supported.</td>
</tr>
<tr>
<td>kCFXMLParserAddImpliedAttributes</td>
<td>32</td>
<td>When the DTD specifies implied attribute-value pairs for a particular element, add those pairs to any occurrences of the element in the element tree. Currently not supported.</td>
</tr>
<tr>
<td>kCFXMLParserAllOptions</td>
<td>&amp; hFFFFFF</td>
<td>All options enabled.</td>
</tr>
<tr>
<td>kCFXMLParserNoOptions</td>
<td>0</td>
<td>No options enabled.</td>
</tr>
</tbody>
</table>

### Notes:

The data to be parsed is loaded directly from dataSource. dataSource may not be nil.

These are the various options you can configure the parser with. These are chosen such that an option flag of 0 (kCFXMLParserNoOptions) leaves the XML as "intact" as possible (reports all structures; performs no replacements).

Hence, to make the parser do the most work, returning only the pure element tree, set the option flag to kCFXMLParserAllOptions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Bit Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kCFXMLParserValidateDocument</td>
<td>1</td>
<td>Validate the document against its grammar from the DTD, reporting any errors. Currently not supported.</td>
</tr>
<tr>
<td>kCFXMLParserSkipMetaData</td>
<td>2</td>
<td>Silently skip over metadata constructs (the DTD and comments)</td>

<tr>
<td>kCFXMLParserAddImpliedAttributes</td>
<td>32</td>
<td>When the DTD specifies implied attribute-value pairs for a particular element, add those pairs to any occurrences of the element in the element tree. Currently not supported.</td>
</tr>
<tr>
<td>kCFXMLParserAllOptions</td>
<td>&amp; hFFFFFF</td>
<td>All options enabled.</td>
</tr>
<tr>
<td>kCFXMLParserNoOptions</td>
<td>0</td>
<td>No options enabled.</td>
</tr>
</tbody>
</table>

### 48.48.6 Document as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the top-most object returned by the CreateXMLStructure event.

**Notes:** Returns nil on any error.
48.48.7  ErrorDescription as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an error description for the last error. **Notes:** Returns nil on any error.

48.48.8  LineNumber as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the line number of the current parse location.

48.48.9  Location as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the character index of the current parse location.

48.48.10  Parse as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Starts the parser. **Notes:** Starts a parse of the data the parser was created with; returns success (true) or failure (false). Upon success, use the Document function to get the product of the parse. Upon failure, use ErrorCode or ErrorDescription to get information about the error. It is an error to call Parse while a parse is already underway. Returns false on any error.

48.48.11  SourceURL as CFURLMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The currently used source url for this parser. **Notes:** Returns nil on any error.
48.48. CLASS CFXMLPARSERMBS

48.48.12 StatusCode as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last status code.

**Notes:**
Get the status code (or a user-readable description via ErrorDescription) of the last error that occurred in a parse.
If no error has occurred, a nil description string is returned by ErrorDescription.

- kCFXMLStatusParseNotBegun: -2
- kCFXMLStatusParseInProgress: -1
- kCFXMLStatusParseSuccessful: 0
- kCFXMLErrorUnexpectedEOF: 1
- kCFXMLErrorUnknownEncoding: 2
- kCFXMLErrorEncodingConversionFailure: 3
- kCFXMLErrorMalformedProcessingInstruction: 4
- kCFXMLErrorMalformedDTD: 5
- kCFXMLErrorMalformedName: 6
- kCFXMLErrorMalformedCDSSect: 7
- kCFXMLErrorMalformedCloseTag: 8
- kCFXMLErrorMalformedStartTag: 9
- kCFXMLErrorMalformedDocument: 10
- kCFXMLErrorElementlessDocument: 11
- kCFXMLErrorMalformedComment: 12
- kCFXMLErrorMalformedCharacterReference: 13
- kCFXMLErrorMalformedParsedCharacterData: 14
- kCFXMLErrorNoData: 15

48.48.13 Events

48.48.14 AddChild(parent as CFObjectMBS, child as CFObjectMBS)

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called as children are parsed and are ready to be added to the tree.

**Notes:** If CreateXMLStructure returns nil for a given structure, that structure is omitted entirely, and addChild will NOT be called for either a nil child or parent.

48.48.15 CreateXMLStructure(node as CFXMLNodeMBS) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called as new XML structures are encountered by the parser.

**Notes:** May return nil to indicate that the given structure should be skipped; if nil is returned for a given structure, only minimal parsing is done for that structure (enough to correctly determine its end, and to extract any
data necessary for the remainder of the parse, such as Entity definitions).
CreateXMLStructure (or indeed, any of the tree-creation callbacks) will not be called for any children of the skipped structure. The only exception is that the top-most element will always be reported even if nil was returned for the document as a whole.
NOTE: for performance reasons, the node passed to createXMLStructure cannot be safely retained by the client; the node as a whole must be copied (via CFXMLNode.Copy), or its contents must be extracted and copied.

Whatever value you return, you get it back in the parameters of the addChild and the endXMLStructure event.

48.48.16 EndXMLStructure(xmlType as CFObjectMBS)
MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Called once a structure (and all its children) are completely parsed.
Notes: As elements are encountered, CreateXMLStructure is called for them first, then AddChild to add the new structure to its parent, then AddChild (potentially several times) to add the new structure’s children to it, then finally EndXMLStructure to show that the structure has been fully parsed.

48.48.17 HandleError(StatusCode as Integer) as boolean
MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Called as errors/warnings are encountered in the data stream.
Notes: The handleError function may always return FALSE to force the parser to stop; if handleError returns TRUE, the parser will attempt to recover (fatal errors will still cause the parse to abort immediately).
(Defualt for an empty event is true.)

48.48.18 ResolveExternalEntity(externalID as CFXMLEntityMBS) as CFBinaryDataMBS
MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Called when external entities are referenced (NOT when they are simply defined).
Notes: If the function returns nil, a place holder for the external entity is inserted into the tree.
48.49. class CFXMLProcessingInstructionInfoMBS

48.49.1 class CFXMLProcessingInstructionInfoMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class with additional information for the processing instructions.

48.49.2 Properties

48.49.3 DataString as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The additional data. **Notes:** (Read and Write property)
Chapter 49

CoreFoundation Network

49.1 class CFHostMBS

49.1.1 class CFHostMBS

Notes:
You can asynchronously resolve hostnames to IPs and back.
IPv6 compatible.
Subclass of the CFObjectMBS class.

49.1.2 Methods

49.1.3 LookupAddress(address as string) as boolean

Notes:
Address must be an IPv4 or IPv6 address.
Returns true on success or false on failure.

49.1.4 LookupName(hostname as CFStringMBS) as boolean

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Starts an asynchronous lookup process to find the IP addresses for the given domain name.
Notes: Returns true on success and false on failure.

49.1.5 Events

49.1.6 Error(ErrorDomain as Integer, ErrorCode as Integer)

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An error occurred.

49.1.7 GotAddress(address as string, addressIndex as Integer, count as Integer)

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An IP address was found. **Notes:** As plugins can’t create arrays, the plugin will call this event count times with addressIndex going from 0 to count-1. Name is the IP address, e.g. "12.34.56.78".

49.1.8 GotName(name as CFStringMBS, nameIndex as Integer, count as Integer)

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A name was found. **Notes:** As plugins can’t create arrays, the plugin will call this event count times with nameIndex going from 0 to count-1. Name is the domain name, e.g. "apple.com".
49.2. **CLASS CFHTTPMESSAGEMBS**

49.2   **class CFHTTPMessageMBS**

49.2.1  **class CFHTTPMessageMBS**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a HTTP message. **Notes:** Subclass of the CFObjectMBS class.

49.2.2  **Methods**

49.2.3  **AddAuthentication(authenticationFailureResponse as CFHTTPMessageMBS, username as CFStringMBS, password as CFStringMBS, authentication-Scheme as CFStringMBS, forProxy as Boolean) as boolean**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds authentication details. **Notes:** Tries to modify request to contain the authentication information requested by authenticationFailureResponse (which presumably is a 401 or 407 response). Returns TRUE if successful; FALSE otherwise (leaving request unmodified). If authenticationScheme is NULL, the strongest supported scheme listed in failedResponse will be used.

49.2.4  **AppendBytes(s as string) as boolean**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds additional bytes to the message. **Notes:** The following function appends the given bytes to the message given (parsing out any control information if appropriate). Returns FALSE if a parsing error occurs while processing the new data.

49.2.5  **Copy as CFHTTPMessageMBS**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the HTTP message. **Notes:** Returns nil on any error.
CHAPTER 49. COREFOUNDATION NETWORK

49.2.6 HeaderFields as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
All header fields in one big CFDictionary.

49.2.7 IsHeaderComplete as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether further header data is expected by the message.

49.2.8 IsRequest as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether the message is a response or a request.

49.2.9 kCFHTTPAuthenticationSchemeBasic as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A possible value you can pass when creating a HTTPMessage.

49.2.10 kCFHTTPAuthenticationSchemeDigest as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A possible value you can pass when creating a HTTPMessage.

49.2.11 kCFHTTPVersion1_0 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A possible value you can pass when creating a HTTPMessage.

49.2.12 kCFHTTPVersion1_1 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A possible value you can pass when creating a HTTPMessage.
49.2. CLASS CFHTTPMESSAGEMBS

49.2.13  RequestMethod as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The request method.

49.2.14  RequestURL as CFURLMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The request URL.

49.2.15  ResponseStatusCode as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The response status code. **Notes:** See RFC 2616 for the codes.

49.2.16  ResponseStatusLine as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The response status line.

49.2.17  SerializedMessage as CFBinaryDataMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** This message with all data stored in one CFBinaryData object to store in e.g. a file.

49.2.18  Version as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The HTTP version of the message.
49.2.19 Properties

49.2.20 Body as CFBinaryDataMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The body of this message.
**Notes:** (Read and Write computed property)

49.2.21 HeaderField(headerfield as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Set or Get one of the header fields of the Message.
**Notes:** (Read and Write computed property)
49.3.1 **CFStreamCreatePairWithSocketMBS**(TheSocket as CFSocketMBS, readstream as CFReadStreamMBS, writestream as CFWriteStreamMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates two streams based on one socket.

**Notes:**

You need to pass in stream objects to get those objects filled.
If you forget one of this objects the stream will be readonly or writeonly.

49.3.2 **CFStreamCreatePairWithSocketToHostMBS**(host as CFStringMBS, port as Integer, readstream as CFReadStreamMBS, writestream as CFWriteStreamMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates a pair of streams based on a socket which connects to the given host.

49.3.3 **CFHTTPMessageCreateEmptyMBS**(isRequest as boolean) as CFHTTPMessageMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates a new empty http message.

**Notes:**

Returns nil on any error.

Creates an empty request or response, which you can then append bytes to via CFHTTPMessage.AppendBytes(). The HTTP header information will be parsed out as the bytes are appended.

49.3.4 **CFHTTPMessageCreateRequestMBS**(requestMethod as CFStringMBS, url as CFURLMBS, httpVersion as CFStringMBS) as CFHTTPMessageMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates a new HTTP message as a request.
49.3.5 CFHTTPMessageCreateResponseMBS(statusCode as Integer, statusDescription as CFStringMBS, httpVersion as CFStringMBS) as CFHTTPMessageMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new HTTP message as a response. **Notes:** Pass nil to use the standard description for the given status code, as found in RFC 2616.

49.3.6 kCFHostMBSGetTypeID as Integer

MBS MacCF Plugin, Plugin Version: 5.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFHostMBS object.

49.3.7 kCFHTTPMessageMBSGetTypeID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFHTTPMessageMBS object.

49.3.8 kCFReadStreamMBSGetTypeID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFReadStreamMBS object.

49.3.9 kCFSocketMBSGetTypeID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFSocketMBS object.

49.3.10 kCFWriteStreamMBSGetTypeID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Type ID of a CFWriteStreamMBS object.
49.4  CLASS CFPROXYMBS

49.4  class CFProxyMBS

49.4.1  class CFProxyMBS

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
The class for proxy queries.

**Notes:**
These APIs return arrays of dictionaries, where each dictionary describes a single proxy. The arrays represent the order in which the proxies should be tried - try to download the URL using the first entry in the array, and if that fails, try using the second entry, and so on.

The keys to the proxy dictionaries follow the function declarations; every proxy dictionary will have an entry for kCFProxyTypeKey. If the type is anything except kCFProxyTypeAutoConfigurationURL, the dictionary will also have entries for the proxy’s host and port (under kCFProxyHostKeyName and kCFProxyPortNumberKey respectively). If the type is kCFProxyTypeAutoConfigurationURL, it will have an entry for kCFProxyAutoConfigurationURLKey.

The keys for username and password are optional and will only be present if the username or password could be extracted from the information passed in (i.e. either the URL itself or the proxy dictionary supplied). These APIs do not consult any external credential stores (such as the Keychain).

All the class methods require Mac OS X 10.5 or newer.

49.4.2  Methods

49.4.3  ExecuteProxyAutoConfigurationScript(proxyAutoConfigurationScript as string, targetURL as string) as boolean

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Begins the process of executing proxyAutoConfigurationScript to determine the correct proxy to use to retrieve targetURL.

**Notes:**
When the results are found, the event will be called on the main thread, passing a valid proxyList and nil error upon success, or a nil proxyList and valid error on failure.

proxyAutoConfigurationScript: A string containing the code of the script to be executed.
targetURL: The URL that should be passed to the autoconfiguration script.

Returns true if the request was started.
49.4.4 **ExecuteProxyAutoConfigurationURL** (proxyAutoConfigURL as string, targetURL as string) as boolean

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Executes the proxy auto configuration URL and returns which proxy to use. **Notes:** As ExecuteProxyAutoConfigurationScript(), except that ExecuteProxyAutoConfigurationURL will additionally download the contents of proxyAutoConfigURL, convert it to a JavaScript string, and then execute that script.

49.4.5 **kCFNetworkProxiesExceptionsList** as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the list of host name patterns that should bypass the proxy. **Notes:** Value is an array of strings.

49.4.6 **kCFNetworkProxiesExcludeSimpleHostnames** as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key whose value indicates if simple hostnames will be excluded. **Notes:** Value is a number. Simple hostnames will be excluded if the key is present and has a non-zero value.

49.4.7 **kCFNetworkProxiesFTPEnable** as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the enabled status of the ftp proxy. **Notes:** Value is a number. The proxy is enabled if the key is present and has a non-zero value.

49.4.8 **kCFNetworkProxiesFTPPassive** as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the state of passive mode for the ftp proxy. **Notes:** Value is a Number. A value of one indicates that passive mode is enabled, a value of zero indicates that passive mode is not
49.4.9  **kCFNetworkProxiesFTPPort as string**

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the port number associated with the ftp proxy. **Notes:** Value is a number which is the port number.

49.4.10 **kCFNetworkProxiesFTPProxy as string**

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the host name associated with the ftp proxy. **Notes:** Value is a string which is the proxy host name.

49.4.11 **kCFNetworkProxiesHTTPPort as string**

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the port number associated with the HTTP proxy. **Notes:** Value is a number which is the port number.

49.4.12 **kCFNetworkProxiesHTTPProxy as string**

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the host name associated with the HTTP proxy. **Notes:** Value is a string which is the proxy host name.

49.4.13 **kCFNetworkProxiesHTTPSEnable as string**

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the enabled status of the HTTPS proxy; value is a number. **Notes:** The proxy is enabled if the key is present and has a non-zero value.

49.4.14 **kCFNetworkProxiesHTTPSPort as string**

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the port number associated with the HTTPS proxy.
Notes: Value is a Number which is the port number.

### 49.4.15 kCFNetworkProxiesHTTPSProxy as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the host name associated with the HTTPS proxy. **Notes:** Value is a string which is the proxy host name.

### 49.4.16 kCFNetworkProxiesProxyAutoConfigEnable as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the enabled status ProxyAutoConfig (PAC). **Notes:** Value is a number. ProxyAutoConfig is enabled if the key is present and has a non-zero value.

### 49.4.17 kCFNetworkProxiesProxyAutoConfigURLString as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the url which indicates the location of the ProxyAutoConfig (PAC) file. **Notes:** Value is a string which is url for the PAC file.

### 49.4.18 kCFNetworkProxiesProxyAutoDiscoveryEnable as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the enabled status of proxy auto discovery. **Notes:** Value is a number. Proxy auto discovery is enabled if the key is present and has a non-zero value.

### 49.4.19 kCFNetworkProxiesRTSPEnable as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the enabled status of the RTSP proxy. **Notes:**
Value is a Number. The proxy is enabled if the key is present and has a non-zero value.

### 49.4.20 kCFNetworkProxiesRTSPPort as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the port number associated with the RTSP proxy. **Notes:** Value is a Number which is the port number.

### 49.4.21 kCFNetworkProxiesRTSPProxy as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the host name associated with the RTSP proxy. **Notes:** Value is a string which is the proxy host name.

### 49.4.22 kCFNetworkProxiesSOCKSEnable as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the enabled status of the SOCKS proxy. **Notes:** Value is a number. The proxy is enabled if the key is present and has a non-zero value.

### 49.4.23 kCFNetworkProxiesSOCKSPort as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the port number associated with the SOCKS proxy. **Notes:** Value is a Number which is the port number.

### 49.4.24 kCFNetworkProxiesSOCKSProxy as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the host name associated with the SOCKS proxy. **Notes:** Value is a String which is the proxy host name.
49.4.25 **kCFProxyAutoConfigurationJavaScriptKey as string**

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the proxy’s PAC script.  
**Notes:** The value is a String that contains the full JavaScript source text for the PAC file.

49.4.26 **kCFProxyAutoConfigurationURLKey as string**

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the proxy’s PAC file location.  
**Notes:** This key is only present if the proxy’s type is kCFProxyTypeAutoConfigurationURL. Value is a string with URL specifying the location of a proxy auto-configuration file.

49.4.27 **kCFProxyHostNameKey as string**

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the proxy’s hostname; value is a string.  
**Notes:** Note that this may be an IPv4 or IPv6 dotted-IP string.

49.4.28 **kCFProxyPasswordKey as string**

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the password to be used with the proxy.  
**Notes:** Value is a String. Note that this key will only be present if the username could be extracted from the information passed in. No external credential stores (like the Keychain) are consulted.

49.4.29 **kCFProxyPortNumberKey as string**

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the proxy’s port number.  
**Notes:** Value is a CFNumber specifying the port on which to contact the proxy.

49.4.30 **kCFProxyTypeAutoConfigurationJavaScript as string**

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the proxy types.  
**Notes:** The proxy is specified by a proxy autoconfiguration (PAC) file content.
49.4. CLASS CFPROXYMBS

49.4.31 kCFProxyTypeAutoConfigurationURL as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the proxy types. **Notes:** The proxy is specified by a proxy autoconfiguration (PAC) file.

49.4.32 kCFProxyTypeFTP as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the proxy types. **Notes:** The proxy is an FTP proxy.

49.4.33 kCFProxyTypeHTTP as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the proxy types. **Notes:** The proxy is an HTTP proxy.

49.4.34 kCFProxyTypeHTTPS as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the proxy types. **Notes:** The proxy is a tunneling proxy as used for HTTPS.

49.4.35 kCFProxyTypeKey as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the type of proxy being represented. **Notes:** value will be one of the kCFProxyType* constants listed below.

49.4.36 kCFProxyTypeNone as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the proxy types. **Notes:** No proxy should be used; contact the origin server directly.
49.4.37 kCFProxyTypeSOCKS as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the proxy types.
**Notes:** The proxy is a SOCKS proxy.

49.4.38 kCFProxyUsernameKey as string

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Key for the username to be used with the proxy.
**Notes:** Value is a String. Note that this key will only be present if the username could be extracted from the information passed in. No external credential stores (like the Keychain) are consulted.

49.4.39 ProxiesForAutoConfigurationScript(proxyAutoConfigurationScript as string, URL as string, byref error as CFErrorMBS) as Dictionary()

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Synchronously executes the given proxy autoconfiguration script and returns a valid proxyList and nil error upon success or a nil proxyList and valid error on failure.
**Notes:**
proxyAutoConfigurationScript: A string containing the code of the script to be executed.
targetURL: The URL that should be input in to the autoconfiguration script.
error: A return argument that will contain a valid error in case of failure.

Returns an array of dictionaries describing the proxies returned by the script or nil on failure.

49.4.40 ProxiesForURL(URL as string, proxySettings as Dictionary = nil) as Dictionary()

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Given a URL and a proxy dictionary, determines the ordered list of proxies that should be used to download the given URL.
**Notes:**
url: The URL to be accessed
proxySettings: A dictionary describing the available proxy settings; the dictionary’s format should match the dictionary returned by SystemProxySettings described below. If you pass nil, the plugin queries SystemProxySettings functions for you.
49.4. CLASS CFPROXYMBS

Returns an array of dictionaries; each dictionary describes a single proxy. See the comment at the top of this file for how to interpret the returned dictionaries.

49.4.41 SystemProxySettings as Dictionary

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Dictionary containing the current system internet proxy settings.

**Example:**

```vba
dim d as Dictionary = CFProxyMBS.SystemProxySettings

dim k as string = CFProxyMBS.kCFProxyTypeKey
MsgBox "Type: " + d.lookup(k, "unknown")
```

**Notes:**

Returns a dictionary containing key-value pairs that represent the current internet proxy settings. Value is nil if no proxy settings have been defined or if an error was encountered.

49.4.42 Events

49.4.43 AutoConfigurationResult(error as CFErrorMBS, proxyList() as Dictionary)

MBS MacCF Plugin, Plugin Version: 14.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Event to be called when a PAC file computation has completed.

**Notes:**

Initiated by either ExecuteProxyAutoConfigurationScript or ExecuteProxyAutoConfigurationURL.

proxyList: Upon success, the list of proxies returned by the autoconfiguration script. The list has the same format as returned by ProxiesForURL, above, except that no entry may be of type kCFProxyTypeAutoConfigurationURL.

error: Upon failure, an error object explaining the failure.
49.5 class CFReadStreamMBS

49.5.1 class CFReadStreamMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a CoreFoundation write stream.
**Notes:**
You can read from a file, a memoryblock or using a socket over the network.
Subclass of the CFStreamMBS class.

49.5.2 Methods

49.5.3 close

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the stream.
**Notes:** Terminates the flow of bytes; releases any system resources required by the stream. The stream may not fail to close.

49.5.4 CreateForHTTPRequest(request as CFHTTPMessageMBS) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new read stream based on the given HTTP request.
**Notes:**
Creates a read stream for the response to the given request; when the stream is opened, it will begin transmitting the request. The bytes returned are the pure body bytes; the response header has been parsed off. To retrieve the response header, ask for kCFStreamPropertyHTTPResponseHeader any time after the first bytes arrive on the stream (or when stream end is reported, if there are no data bytes).

Returns true if successful.

49.5.5 CreateWithFile(fileurl as CFURLMBS) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new file based readstream.
**Notes:** Returns true if successful.
49.5. CLASS CFREADSTREAMMBS

49.5.6 CreateWithMemoryBlock(mem as memoryblock, len as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new readstream based on the data of the given memoryblock. **Notes:** Returns true if successful.

49.5.7 CreateWithString(s as string) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new readstream based on the data of the given string. **Notes:** Returns true if successful.

49.5.8 ErrorCode as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error code. **Notes:** Meaning depends on the ErrorDomain.

49.5.9 ErrorDomain as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The error domain of the last error code. **Notes:** Possible domains:

- kCFStreamErrorDomainCustom = -1 custom to the kind of stream in question
- kCFStreamErrorDomainPOSIX = 1 POSIX errno; interpret using <sys/errno.h>
- kCFStreamErrorDomainMacOSStatus = 2 OSStatus type from Carbon APIs; interpret using <MacTypes.h>

49.5.10 GetProperty(propertyName as CFStringMBS) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a property of the stream. **Notes:** Returns nil on any error. Particular streams can name properties and assign meanings to them; you access these properties through the GetProperty and SetProperty calls. A property is any interesting information about the stream other than the data being transmitted itself. Examples include the headers from an HTTP transmission, or the
expected number of bytes, or permission information, etc. Properties that can be set configure the behavior of the stream, and may only be settable at particular times (like before the stream has been opened). See the documentation for particular properties to determine their get- and set-ability.

49.5.11 HasBytesAvailable as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if you can read bytes. **Notes:** Whether there is data currently available for reading; Returns TRUE if it’s impossible to tell without trying.

49.5.12 InstallEvents

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Installs the event handler. **Notes:** You need to remove the event handler later to not leak memory! The event handler is needed to have the Callback event firing.

49.5.13 Open as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens the stream. **Notes:** Returns success/failure. Opening a stream causes it to reserve all the system resources it requires. If the stream can open non-blocking, this will always return TRUE; listen to the Callback to find out when the open completes and whether it was successful, or poll using the Status property, waiting for a status of kCFStreamStatusOpen or kCFStreamStatusError.

49.5.14 ReadMemory(maxBytesToRead as Integer, mem as memoryblock) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads some bytes from the stream. **Notes:** Returns the number of bytes read, or -1 if an error occurs preventing any bytes from being read, or 0 if the stream’s end was encountered. It is an error to try and read from a stream that hasn’t been opened first.
49.5. **CLASS CFREADSTREAMMBS**

This call will block until at least one byte is available; it will NOT block until the entire buffer can be filled. To avoid blocking, either poll using HasBytesAvailable or use the run loop and listen for the kCFStream-CanRead event for notification of data available.

### 49.5.15 **ReadString(maxBytesToRead as Integer) as string**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Reads some bytes from the stream.

**Notes:**
- Returns a string as long as the number of bytes read, or ”” if an error occurs preventing any bytes from being read or the stream’s end was encountered.
- It is an error to try and read from a stream that hasn’t been opened first.
- This call will block until at least one byte is available; it will NOT block until the entire buffer can be filled. To avoid blocking, either poll using HasBytesAvailable or use the run loop and listen for the kCFStream-CanRead event for notification of data available.

### 49.5.16 **RemoveEvents**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the event handler.

**Notes:** You should remove this event handler after you finished with the stream.

### 49.5.17 **SetProperty(propertyName as CFStringMBS, propertyValue as CFObj-jectMBS) as Boolean**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a property of the stream.

**Notes:** Returns true if successfull.

### 49.5.18 **Status as Integer**

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The status of the stream.

**Notes:**
- Possible values:
CHAPTER 49. COREFOUNDATION NETWORK

kCFStreamStatusNotOpen = 0
kCFStreamStatusOpening = 1 (open is in-progress)
kCFStreamStatusOpen = 2
kCFStreamStatusReading = 3
kCFStreamStatusWriting = 4
kCFStreamStatusAtEnd = 5 (no further bytes can be read/written)
kCFStreamStatusClosed = 6
kCFStreamStatusError = 7

49.5.19 Events

49.5.20 Callback(reason as Integer)

Notes:
Possible values for the reason:

kCFStreamEventNone = 0
kCFStreamEventOpenCompleted = 1
kCFStreamEventHasBytesAvailable = 2
kCFStreamEventCanAcceptBytes = 4
kCFStreamEventErrorOccurred = 8
kCFStreamEventEndEncountered = 16
49.6. class CFSocketMBS

49.6.1 class CFSocketMBS

A class for a CFSocket.

Notes:

A CFSocket contains a native socket within a structure that can be used to read from the socket in the background and make the data thus read available using a runloop source.

Addresses are stored as CFDatas containing a struct sockaddr appropriate for the protocol family; make sure that all fields are filled in properly when passing in an address.

Some error codes:

kCFSocketSuccess    = 0
kCFSocketError      = -1
kCFSocketTimeout    = -2

Subclass of the CFObjectMBS class.

49.6.2 Methods

49.6.3 ConnectToAddress(address as CFBinaryDataMBS, timeout as Double) as Integer

Connects the socket to the given address.

Notes:

Returns a socket error.

Some error codes:

kCFSocketSuccess    = 0
kCFSocketError      = -1
kCFSocketTimeout    = -2
49.6.4 Create as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new socket.

**Notes:**

Some error codes:

- kCFSocketSuccess = 0,
- kCFSocketError = -1,
- kCFSocketTimeout = -2

49.6.5 Invalidate

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Invalidates the socket.

49.6.6 IsValid as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Checks if the socket is valid.

49.6.7 NativeSocketHandle as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The native socket handle.

49.6.8 PeerAddress as CFBinaryDataMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The peer address of this socket.

**Notes:** Returns nil on any error.

49.6.9 SendData(data as CFBinaryDataMBS, timeout as Double) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sends data over the socket with a given timeout.
Notes:

For convenience, a function is provided to send data using the socket with a timeout. The timeout will be used only if the specified value is positive.

Some error codes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kCFSocketSuccess</td>
<td>0</td>
</tr>
<tr>
<td>kCFSocketError</td>
<td>-1</td>
</tr>
<tr>
<td>kCFSocketTimeout</td>
<td>-2</td>
</tr>
</tbody>
</table>

49.6.10 Properties

49.6.11 Address as CFBinaryDataMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The address of this socket.
**Notes:** (Read and Write computed property)

49.6.12 Events

49.6.13 Callback(reason as Integer, address as CFBinaryDataMBS, data as memoryblock)

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The callback event for this socket.
**Notes:**

Possible reasons:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kCFSocketNoCallBack</td>
<td>0</td>
</tr>
<tr>
<td>kCFSocketReadCallBack</td>
<td>1</td>
</tr>
<tr>
<td>kCFSocketAcceptCallBack</td>
<td>2</td>
</tr>
<tr>
<td>kCFSocketDataCallBack</td>
<td>3</td>
</tr>
<tr>
<td>kCFSocketConnectCallBack</td>
<td>4</td>
</tr>
<tr>
<td>kCFSocketWriteCallBack</td>
<td>8</td>
</tr>
</tbody>
</table>
CHAPTER 49. COREFOUNDATION NETWORK

49.7  class CFStreamMBS

49.7.1  class CFStreamMBS

Notes: (Only a place to store all those constants ;-)
Subclass of the CFObjectMBS class.

49.7.2  Methods

49.7.3  kCFHTTPAuthenticationSchemeBasic as CFStringMBS

49.7.4  kCFHTTPAuthenticationSchemeDigest as CFStringMBS

49.7.5  kCFHTTPVersion1_0 as CFStringMBS

49.7.6  kCFHTTPVersion1_1 as CFStringMBS

49.7.7  kCFStreamErrorDomainHTTP as Integer

Notes:
Possible error values:

- kCFStreamErrorHTTPParseFailure = -1
- kCFStreamErrorHTTPRedirectionLoop = -2
- kCFStreamErrorHTTPBadURL = -3

49.7.8 kCFStreamErrorDomainSOCKS as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** SOCKS proxy error domain.

49.7.9 kCFStreamErrorDomainSSL as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** An error domain used with the socket based streams. **Notes:** Secure stream support.

49.7.10 kCFStreamPropertyAppendToFile as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to append new bytes to an existing file. **Notes:** Property for file write streams; value should be a CFBoolean. Set to TRUE to append to a file, rather than to replace its contents. Requires Mac OS X 10.2

49.7.11 kCFStreamPropertyDataWritten as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A property name for use with the CFWriteStream class. **Example:**

dim writestream as CFWriteStreamMBS
dim c as CFObjectMBS
c=writestream.getproperty(writestream.kCFStreamPropertyDataWritten)
Notes: Value will be a CFData containing all bytes thusfar written; used to recover the data written to a memory write stream.

49.7.12 kCFStreamPropertyHTTPAttemptPersistentConnection as CFStringMBS

Notes: Value should be a CFBoolean. If this property is set to true, an HTTP stream will look for an appropriate extant persistent connection to use, and if it finds none, will try to create one.

49.7.13 kCFStreamPropertyHTTPFinalURL as CFStringMBS

Notes: Value is the CFURL from the final request; will only differ from the URL in the original request if an autoredirection has occurred.

49.7.14 kCFStreamPropertyHTTPProxy as CFStringMBS

Notes:
HTTP proxy information is set the same way as SOCKS proxies.
Call CFReadStream.SetProperty() passing an HTTP stream and the property kCFStreamPropertyHTTPProxy.
The value should be a CFDictionary that includes at least one Host/Port pair from the keys below.
The dictionary returned by SystemConfiguration.framework can also be passed directly as the value

Keys for the dictionary to use:
kCFStreamPropertyHTTPProxyHost
kCFStreamPropertyHTTPProxyPort
kCFStreamPropertyHTTPSProxyHost
kCFStreamPropertyHTTPSProxyPort

49.7.15 kCFStreamPropertyHTTPProxyHost as CFStringMBS

49.7.16 kCFStreamPropertyHTTPProxyPort as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the proxy CFDictionary for a socket based stream.

**Notes:**

49.7.17 kCFStreamPropertyHTTPResponseHeader as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a socket based stream.

**Notes:** Value is a CFHTTPMessage with 0 bytes data.

49.7.18 kCFStreamPropertyHTTPShouldAutoredirect as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a socket based stream.

**Notes:** Value should be a CFBoolean.

49.7.19 kCFStreamPropertyHTTPSProxyHost as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the proxy CFDictionary for a socket based stream.

49.7.20 kCFStreamPropertyHTTPSProxyPort as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the proxy CFDictionary for a socket based stream.

49.7.21 kCFStreamPropertyShouldCloseNativeSocket as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a socket based stream.

**Notes:**

Set the value to kCFBooleanTrue if the stream should close and release the underlying native socket when the stream is released. Set the value to kCFBooleanFalse to keep the native socket from closing and releasing when the stream is released.
If the stream was created with a native socket, the default property setting on the stream is kCFBooleanFalse.

The kCFStreamPropertyShouldCloseNativeSocket can be set through CFReadStream SetProperty or CFWriteStream SetProperty. The property can be copied through CFReadStreamGetProperty or CFWriteStreamGetProperty.

49.7.22 kCFStreamPropertySocketNativeHandle as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a socket based stream. **Notes:** Value will be a CFData containing the native handle.

49.7.23 kCFStreamPropertySocketRemoteHostName as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a socket based stream. **Notes:** Value will be a CFString, or nil if unknown.

49.7.24 kCFStreamPropertySocketRemotePortNumber as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a socket based stream. **Notes:** Value will be a CFNumber, or nil if unknown.

49.7.25 kCFStreamPropertySocketSecurityLevel as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a socket based stream. **Notes:** You set this property to one of the following values:
- kCFStreamSocketSecurityLevelSSLv3
- kCFStreamSocketSecurityLevelSSLv2
- kCFStreamSocketSecurityLevelNone
- kCFStreamSocketSecurityLevelNegotiatedSSL
- kCFStreamSocketSecurityLevelTLSv1

(this 5 properties return CFStrings which you pass to SetProperty)
49.7. CLASS CFSTREAMMBS

49.7.26 kCFStreamPropertySOCKSPassword as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a socket based stream.

49.7.27 kCFStreamPropertySOCKSProxy as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a socket based stream.

**Notes:**
SOCKS Proxy usage
To set a stream to use a SOCKS proxy, call CFReadStream.SetProperty or CFWriteStream.SetProperty with the property name set to kCFStreamPropertySOCKSProxy and the value being a CFDictionary with at least the following two keys: kCFStreamPropertySOCKSProxyHost and kCFStreamPropertySOCKSProxyPort. The dictionary returned by SystemConfiguration for SOCKS proxies will work without alteration. The key kCFStreamPropertySOCKSProxyHost should contain a CFStringRef value representing the SOCKS proxy host. The key kCFStreamPropertySOCKSProxyPort should contain a CFNumberRef which itself is of type kCFNumberSInt32Type. This value should represent the port on which the proxy is listening.

By default, SOCKS5 will be used unless there is a kCFStreamPropertySOCKSVersion key in the CFDictionary. Its value must be kCFStreamSocketSOCKSVersion4 or kCFStreamSocketSOCKSVersion5 to set SOCKS4 or SOCKS5, respectively.

To set a user name and/or password, if required, the dictionary must contain the key(s) kCFStreamPropertySOCKSUser and/or kCFStreamPropertySOCKSPassword with the value being the user’s name as a CFString and/or the user’s password as a CFString, respectively.

kCFStreamPropertySOCKSProxy can be set through CFReadStream.SetProperty or CFWriteStream.SetProperty. The property can be copied through CFReadStream.GetProperty or CFWriteStream.GetProperty.

49.7.28 kCFStreamPropertySOCKSProxyHost as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a socket based stream.

49.7.29 kCFStreamPropertySOCKSProxyPort as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property keys for a socket based stream.
49.7.30  kCFStreamPropertySOCKSUser as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the property keys for a socket based stream.

49.7.31  kCFStreamPropertySOCKSVersion as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the property keys for a socket based stream.

49.7.32  kCFStreamSocketSecurityLevelNegotiatedSSL as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the property values for a socket based stream. **Notes:** TLS or SSL with fallback to lower versions; this is what HTTPS does, for instance.

49.7.33  kCFStreamSocketSecurityLevelNone as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the property values for a socket based stream.

49.7.34  kCFStreamSocketSecurityLevelSSLv2 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the property values for a socket based stream.

49.7.35  kCFStreamSocketSecurityLevelSSLv3 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the property values for a socket based stream.
49.7.36 kCFStreamSocketSecurityLevelTLSv1 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the property values for a socket based stream.

49.7.37 kCFStreamSocketSOCKSVersion4 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values used with the kCFStreamPropertySOCKSVersion property for a socket based stream.

49.7.38 kCFStreamSocketSOCKSVersion5 as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the values used with the kCFStreamPropertySOCKSVersion property for a socket based stream.
49.8 class CFWriteStreamMBS

49.8.1 class CFWriteStreamMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a CoreFoundation write stream.  
**Notes:**  
You can write to a file, a memoryblock or using a socket over the network. Subclass of the CFStreamMBS class.

49.8.2 Methods

49.8.3 CanAcceptBytes as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether the stream can now accept data to write.  
**Notes:**  
Whether the stream can currently be written to without blocking; Returns TRUE if it’s impossible to tell without trying.

49.8.4 close

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the stream.  
**Notes:** Terminates the flow of bytes; releases any system resources required by the stream. The stream may not fail to close.

49.8.5 CreateWithFile(fileurl as CFURLMBS) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new WriteStream using the given file specification.  
**Notes:** Returns true if successfull.

49.8.6 CreateWithMemory as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new memory based stream.
Notes: New buffers are allocated as bytes are written to the stream. At any point, you can recover the
bytes thusfar written by asking for the property kCFStreamPropertyDataWritten (using GetProperty).

49.8.7 CreateWithMemoryBlock(mem as memoryblock, len as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Creates a new WriteStream which writes the data into the given memoryblock.
Notes:
The stream writes into the memoryblock given; when bufferCapacity is exhausted, the stream is exhausted
(status becomes kCFStreamStatusAtEnd).
Returns nil on any error.

49.8.8 ErrorCode as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The last error code.
Notes: Meaning depends on the ErrorDomain.

49.8.9 ErrorDomain as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The error domain of the last error code.
Notes:
Possible domains:

- kCFStreamErrorDomainCustom = -1 custom to the kind of stream in question
- kCFStreamErrorDomainPOSIX = 1 POSIX errno; interpret using <sys/errno.h>
- kCFStreamErrorDomainMacOSStatus = 2 OSStatus type from Carbon APIs; interpret using <MacTypes.h>

49.8.10 GetProperty(propertyName as CFStringMBS) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns a property of the stream.
Notes:
Returns nil on any error.
Particular streams can name properties and assign meanings to them; you access these properties through
the GetProperty and SetProperty calls. A property is any interesting information about the stream other
than the data being transmitted itself. Examples include the headers from an HTTP transmission, or the expected number of bytes, or permission information, etc. Properties that can be set configure the behavior of the stream, and may only be settable at particular times (like before the stream has been opened). See the documentation for particular properties to determine their get- and set-ability.

49.8.11 InstallEvents

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Installs the event handler.
**Notes:**
You need to remove the event handler later to not leak memory!
The event handler is needed to have the Callback event firing.

49.8.12 Open as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens the stream.
**Notes:** Returns success/failure. Opening a stream causes it to reserve all the system resources it requires. If the stream can open non-blocking, this will always return TRUE; listen to the Callback to find out when the open completes and whether it was successful, or poll using the Status property, waiting for a status of kCFStreamStatusOpen or kCFStreamStatusError.

49.8.13 RemoveEvents

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Removes the event handler.
**Notes:** You should remove this event handler after you finished with the stream.

49.8.14 SetProperty(propertyName as CFStringMBS, propertyValue as CFObjectMBS) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a property of the stream.
**Notes:** Returns true if successful.
49.8. CLASS CFWRITESTREAMMBS

49.8.15 Status as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The status of the stream. **Notes:** Possible values:

- kCFStreamStatusNotOpen = 0
- kCFStreamStatusOpening = 1 (open is in-progress)
- kCFStreamStatusOpen = 2
- kCFStreamStatusReading = 3
- kCFStreamStatusWriting = 4
- kCFStreamStatusAtEnd = 5 (no further bytes can be read/written)
- kCFStreamStatusClosed = 6
- kCFStreamStatusError = 7

49.8.16 WriteMemory(mem as memoryblock, len as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Write the data from inside the memoryblock to the stream. **Notes:** Returns the number of bytes successfully written, -1 if an error has occurred, or 0 if the stream has been filled to capacity (for fixed-length streams). If the stream is not full, this call will block until at least one byte is written. To avoid blocking, either poll via CanAcceptBytes or use the run loop and listen for the kCFStreamCanWrite event.

49.8.17 WriteString(buf as string) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Write the data from inside the string to the stream. **Notes:** Returns the number of bytes successfully written, -1 if an error has occurred, or 0 if the stream has been filled to capacity (for fixed-length streams). If the stream is not full, this call will block until at least one byte is written. To avoid blocking, either poll via CanAcceptBytes or use the run loop and listen for the kCFStreamCanWrite event.

49.8.18 Events

49.8.19 Callback(reason as Integer)

MBS MacCF Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when something happens.
**Notes:**

Possible values for the reason:

<table>
<thead>
<tr>
<th>CFStream Event Reason</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>kCFStreamEventNone</td>
<td>0</td>
</tr>
<tr>
<td>kCFStreamEventOpenCompleted</td>
<td>1</td>
</tr>
<tr>
<td>kCFStreamEventHasBytesAvailable</td>
<td>2</td>
</tr>
<tr>
<td>kCFStreamEventCanAcceptBytes</td>
<td>4</td>
</tr>
<tr>
<td>kCFStreamEventErrorOccurred</td>
<td>8</td>
</tr>
<tr>
<td>kCFStreamEventEndEncountered</td>
<td>16</td>
</tr>
</tbody>
</table>
Chapter 50

CoreGraphics

50.1  Globals

50.1.1  CGNewPDFDocumentMBS(file as folderitem, MediaBox as CGRectMBS, title as string, author as string, creator as string, subject as string, keywords as string, OwnerPassword as string, UserPassword as string, AllowsPrinting as boolean, AllowsCopy as boolean) as CGPDFContextMBS

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a PDF document.

**Notes:**

Title, Author, Creator, Subject and Keywords parameters can be empty.

If OwnerPassword and UserPassword are filled in the PDF is encrypted and AllowsPrinting/AllowsCopy define what the user can do after he entered his password.

The passwords must be a string which can be represented in ASCII encoding; only the first 32 bytes will be used for the password.

Requires Mac OS X to work.

See also:

- 50.1.2 CGNewPDFDocumentMBS(file as folderitem, MediaBox as CGRectMBS, title as string, author as string, creator as string, subject as string, keywords as string, OwnerPassword as string, UserPassword as string, AllowsPrinting as boolean, AllowsCopy as boolean, KeyLength as Integer) as CGPDFContextMBS
50.1.2 CGNewPDFDocumentMBS(file as folderitem, MediaBox as CGRectMBS, title as string, author as string, creator as string, subject as string, keywords as string, OwnerPassword as string, UserPassword as string, AllowsPrinting as boolean, AllowsCopy as boolean, KeyLength as Integer) as CGPDFContextMBS

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a PDF document.

**Notes:**
Title, Author, Creator, Subject and Keywords parameters can be empty.

If OwnerPassword and UserPassword are filled in the PDF is encrypted and AllowsPrinting/AllowsCopy define what the user can do after he entered his password. 

The passwords must be a string which can be represented in ASCII encoding; only the first 32 bytes will be used for the password.

Keylength must be a value between 48 bit and 128 bit in 8 bit steps. 0 uses default value.

Requires Mac OS X to work.
See also:

- 50.1.1 CGNewPDFDocumentMBS(file as folderitem, MediaBox as CGRectMBS, title as string, author as string, creator as string, subject as string, keywords as string, OwnerPassword as string, UserPassword as string, AllowsPrinting as boolean, AllowsCopy as boolean) as CGPDFContextMBS

50.1.3 GetCurrentCGContextMBS as CGContextMBS

MBS MacCG Plugin, Plugin Version: 9.8, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGContextMBS object for the current Cocoa graphics context.

**Notes:**
Requires Mac OS X to work.
Returns nil on any error.
50.1.4 CGBitmapContextCreateMBS(data as memoryblock, width as Integer, height as Integer, bitsPerComponent as Integer, bytesPerRow as Integer, colorspace as CGColorSpaceMBS, alphaInfo as Integer) as CGBitmapContextMBS

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create a bitmap context.

**Notes:**

The context draws into a bitmap which is ‘width’ pixels wide and ‘height’ pixels high. The number of components for each pixel is specified by ‘colorspace’, which also may specify a destination color profile. The number of bits for each component of a pixel is specified by ‘bitsPerComponent’, which must be 1, 2, 4, or 8. Each row of the bitmap consists of ‘bytesPerRow’ bytes, which must be at least ‘(width * bitsPerComponent * number of components + 7)/8’ bytes. ‘data’ points a block of memory at least ‘bytesPerRow * height’ bytes. ‘alphaInfo’ specifies whether the bitmap should contain an alpha channel, and how it’s to be generated.

Fails if data=nil or colorspace=nil.

The memoryblock is not referenced and not stored, so keep it alive while using the BitmapContext object.

Returns nil on any error.

**data**

A pointer to the destination in memory where the drawing is to be rendered. The size of this memoryblock should be at least ‘bytesPerRow*height’ bytes.

**width**

The width of the bitmap in pixels.

**height**

The height of the bitmap in pixels.

**bitsPerComponent**

The number of bits to use for each component of a pixel in memory. Allowable values are 4, 5, or 8. For example, for a 32-bit RGB(A) colorspace, you would specify a value of 8 bits per color component. In combination, the number of bits per component, the color space, and the alpha value determine which bitmap context formats Quartz supports.

**bytesPerRow**

The number of bytes of memory to use per row of the bitmap. This value must be at least the product of the width and bitsPerComponent parameters, times the number of components per pixel. The result should be divided by 8 and rounded up to the nearest whole number to obtain the number of bytes to use per row. That is, the value must be at least ‘((width)*(bits per component)*(number of components per pixel))+7)/8’ bytes. For a given row, Quartz stores bitmap data for the first width pixels and ignores any remaining bytes.
The colorspace value referenced by the colorspace parameter specifies the number of components for each pixel. 

**colorsace**
The color space to use for the bitmap context.

**alphaInfo**
A CGImageAlphaInfo constant specifying whether the bitmap should contain an alpha channel and how it is to be generated. The alpha value determines the opacity of a pixel when it is drawn.

### Supported pixel formats:

<table>
<thead>
<tr>
<th>Pixel format</th>
<th>Color space</th>
<th>Bits per pixel</th>
<th>Bits per component</th>
<th>Alpha option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gray_8</td>
<td>Grayscale</td>
<td>8</td>
<td>8</td>
<td>kCGImageAlphaNone</td>
</tr>
<tr>
<td>RGB55</td>
<td>RGB</td>
<td>16</td>
<td>5</td>
<td>kCGImageAlphaNoneSkipFirst</td>
</tr>
<tr>
<td>XRGB_32</td>
<td>RGB</td>
<td>32</td>
<td>8</td>
<td>kCGImageAlphaNoneSkipFirst</td>
</tr>

</tbody>
</table>

Quartz does not support the following formats in a bitmap context:

- 1-bit grayscale
- 24-bit RGB
- CMYK (any depth)

**CGImageAlphaInfo constants:**

- kCGImageAlphaNone 0
- kCGImageAlphaPremultipliedLast 1  For example, premultiplied RGBA
- kCGImageAlphaPremultipliedFirst 2  For example, premultiplied ARGB
- kCGImageAlphaLast 3  For example, non-premultiplied RGBA
- kCGImageAlphaFirst 4  For example, non-premultiplied ARGB
- kCGImageAlphaNoneSkipLast 5  Equivalent to kCGImageAlphaNone.
- kCGImageAlphaNoneSkipFirst 6

50.1.5 **CGOpenPDFDocumentMBS(dataprovider as CGDataProviderMBS) as CGPDFDocumentMBS**

MBS MacCG Plugin, Plugin Version: 5.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Opens a CG PDF Document from a data stream.

**Example:**
Sub Paint(g As Graphics)
    // window.paint event
    dim f as FolderItem
    dim b as BinaryStream
    dim s as string
    dim d as CGDataProviderMBS
    dim p as CGPDFDocumentMBS

    // get a folder item to a pdf file.
    f = SpecialFolder.Desktop.Child("notes.pdf")

    // load the content in a string variable
    b = f.OpenAsBinaryFile(false)
    s = b.Read(b.Length)
    b.Close

    // now make a CGDataProvider based on a string.
    d = CGDataProviderMBS.CreateWithData(s)

    // Open the PDF from the Data Provider
    p = CGOpenPDFDocumentMBS(d)

    // And play with it
    g.DrawCGPDFDocumentMBS p, p.MediaBox(1), 1

    Exception
    // trouble goes here.
End Sub

Notes: Returns nil on any error.

50.1.6 CGShadingCreateAxialMBS(colorspace as CGColorSpaceMBS, startPoint as CGPointMBS, endPoint as CGPointMBS, func as CGFunctionMBS, extendStart as boolean, extendEnd as boolean) as CGShadingMBS

MBS MacCG Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a Quartz axial shading. **Notes:**

Parameters:

colorspace: The color space in which color values are expressed. Quartz retains this object; upon return, you may safely release it.
startPoint: The starting point of the axis, in the shading’s target coordinate space.
endPoint: The ending point of the axis, in the shading’s target coordinate space.

function: A CGFunction object. This object refers to your function for creating an axial shading. Quartz retains this object; upon return, you may safely release it.

extendStart: A Boolean value that specifies whether to extend the shading beyond the starting point of the axis.

extendEnd: A Boolean value that specifies whether to extend the shading beyond the ending point of the axis.

Returns a new Quartz axial shading or nil on any error.

Discussion
An axial shading is a color blend that varies along a linear axis between two endpoints and extends indefinitely perpendicular to that axis. When you are ready to draw the shading, call the function CGContextMBS.DrawLineShading.

Available in Mac OS X version 10.2 and later.

50.1.7 CGShadingCreateRadialMBS(colorspace as CGColorSpaceMBS, startPoint as CGPointMBS, startRadius as Double, endPoint as CGPointMBS, endRadius as Double, func as CGFunctionMBS, extendStart as boolean, extendEnd as boolean) as CGShadingMBS

Notes:
Parameters
colorspace: The color space in which color values are expressed.
startPoint: The center of the starting circle, in the shading’s target coordinate space.
startRadius: The radius of the starting circle, in the shading’s target coordinate space.
endPoint: The center of the ending circle, in the shading’s target coordinate space.
endRadius: The radius of the ending circle, in the shading’s target coordinate space.
function: A CGFunction object. This object refers to your function for creating a radial shading.
extendStart: A Boolean value that specifies whether to extend the shading beyond the starting circle.
extendEnd: A Boolean value that specifies whether to extend the shading beyond the ending circle.

Returns a new Quartz radial shading or nil on any error.

A radial shading is a color blend that varies between two circles. To draw the shading, call the function CGContextDrawShading.

Available in Mac OS X version 10.2 and later.
50.1.8  CGCreateImageFromJPEGDataProviderMBS(dataprovider as Variant, decode as memoryblock, shouldInterpolate as boolean, intent as Integer) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGImage with JPEG data.

**Example:**

```vba
// Shows moon.jpg from the desktop folder
// shows in the window title if i,p or u is nil.

Sub Mainwindow.Paint(g As Graphics)
    Dim f As FolderItem
    Dim p As CGDataProviderMBS
    Dim i As CGImageMBS
    
    f = SpecialFolder.Desktop.Child(”moon.jpg”)  
p = CGDataProviderMBS.CreateWithFile(f)  
    If p = nil Then  
        Title = “p=nil”  
    Else  
        i = CGCreateImageFromJPEGDataProviderMBS(p, nil, true, 0)  
    End If
    If i = nil Then  
        Title = ”i=nil”  
    Else  
        window1.CGContextMBS.DrawPicture i, CGMakeRectMBS(0, 0, i.Width, i.Height)  
    End If
End Sub
```

**Notes:**

Dataprovider must be a CGDataProviderMBS object.

**Parameters:**

dataprovider:  
A reference to a data provider supplying JPEG-encoded data.

decode:  
Pass the decode array for the image. In the decode array, for each color component in the source color space, you provide a pair of values denoting the upper and lower limits of a range. For example, the decode array for a source image in the RGB color space would contain six entries total, consisting of one pair each
for red, green, and blue. When the image is rendered, Quartz uses a linear transform to map the original component value into a relative number within your designated range that is appropriate for the destination color space. If you do not want to allow remapping of the image’s color values, pass nil for the decode array. The memoryblock for the array needs to be filled with double values.

shouldInterpolate:
Pass true if interpolation should occur; otherwise, pass false. The interpolation setting specifies whether Quartz should apply a pixel-smoothing algorithm to the image. If you pass false, the image may appear jagged or pixelated when drawn on an output device with higher resolution than the image data.

intent:
Pass a CGColorRenderingIntent value specifying how Quartz should display colors in the image that are not located within the current color space of the graphics context. The rendering intent determines the exact method used to map colors from one color space to another.

50.1.9 CGCreateImageFromPNGDataProviderMBS(dataprovider as Variant, decode as memoryblock, shouldInterpolate as boolean, intent as Integer) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Creates a new CGImage with PNG data.
Notes:
Dataprovider must be a CGDataProviderMBS object.

Parameters:

dataprovider:
A reference to a data provider supplying JPEG-encoded data.

decode:
Pass the decode array for the image. In the decode array, for each color component in the source color space, you provide a pair of values denoting the upper and lower limits of a range. For example, the decode array for a source image in the RGB color space would contain six entries total, consisting of one pair each for red, green, and blue. When the image is rendered, Quartz uses a linear transform to map the original component value into a relative number within your designated range that is appropriate for the destination color space. If you do not want to allow remapping of the image’s color values, pass nil for the decode array. The memoryblock for the array needs to be filled with double values.

shouldInterpolate:
Pass true if interpolation should occur; otherwise, pass false. The interpolation setting specifies whether Quartz should apply a pixel-smoothing algorithm to the image. If you pass false, the image may appear
jagged or pixelated when drawn on an output device with higher resolution than the image data.

intent:
Pass a CGColorRenderingIntent value specifying how Quartz should display colors in the image that are not located within the current color space of the graphics context. The rendering intent determines the exact method used to map colors from one color space to another.

50.1.10 CGCreateImageMBS(pic as picture) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGImageMBS from the given images.

**Example:**
```
dim c as CGImageMBS
dim pic, mask as Picture
// get picture and mask

C=CGCreateImageMBS(pic)
if c<>Nil then
   // go on
end if
```

**Notes:** If the image has a mask, it is used.

See also:

- 50.1.11 CGCreateImageMBS(pic as picture, mask as picture) as CGImageMBS

50.1.11 CGCreateImageMBS(pic as picture, mask as picture) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGImageMBS from the given images.

**Example:**
```
dim c as CGImageMBS
dim pic, mask as Picture
// get picture and mask

C=CGCreateImageMBS(pic, mask)
if c<>Nil then
   // go on
end if
```
Notes:

The mask is taken from the second image. With 11.3 plugins we are deprecating to pass a mask. The plugin prefers to simply take the mask or alpha channel of the picture itself.

See also:

- 50.1.10 CGCreateImageMBS(pic as picture) as CGImageMBS

50.1.12 CGMakePointMBS(x as Double, y as Double) as CGPointMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a new CGPointMBS object.

50.1.13 CGMakeRectMBS(left as Double, top as Double, width as Double, height as Double) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a new CGRectMBS object with the given value.

50.1.14 CGMakeSizeMBS(width as Double, height as Double) as CGSizeMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a new CGSizeMBS object.

50.1.15 CGNewPDFDocumentMBS(consumer as CGDataConsumerMBS, MediaBox as CGRectMBS, title as string, author as string, creator as string) as CGPDFContextMBS

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a PDF document.

**Notes:**

Title, author and creator are all optional.
Requires Mac OS X to work.
Keep yourself a reference to the consumer object so RB does not release it resulting in a crash.
50.1.16  CGNewPDFDocumentMBS(file as folderitem, MediaBox as CGRectMBS, title as string, author as string, creator as string) as CGPDFContextMBS

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a PDF document. **Notes:**
Title, author and creator are all optional.
Requires Mac OS X to work.

50.1.17  CGOpenPDFDocumentMBS(file as folderitem) as CGPDFDocumentMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Opens a PDF document. **Notes:**
RB 4.5 should do this perfectly, but older RB versions may have problems with longer file names.
Requires Mac OS X to work.

50.1.18  CGSessionMBS as CGSessionMBS

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A function to return the current CoreGraphics session information. **Example:**
```
dim c as CGSessionMBS

c=CGSessionMBS

MsgBox C.UserName+" "+str(c.Userid)
```

**Notes:**
Returns nil on any error.

Returns nil if the caller is not within a GUI session, as when the caller is a UNIX daemon, or if a system is configured to not run a Quartz GUI (window server disabled).
50.2 class CGAffineTransformMBS

50.2.1 class CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for an affine transformation.

**Example:**

```vbscript
dim af as CGAffineTransformMBS = CGAffineTransformMBS.Identity
MsgBox str(af.A)+" " +str(af.b)+" " +str(af.c)+" " +str(af.d)+" " +str(af.tx)+" " +str(af.ty)
af = af.Scale( 1, -1 )
MsgBox str(af.A)+" " +str(af.b)+" " +str(af.c)+" " +str(af.d)+" " +str(af.tx)+" " +str(af.ty)
af = af.Translate( 0, 100 )
MsgBox str(af.A)+" " +str(af.b)+" " +str(af.c)+" " +str(af.d)+" " +str(af.tx)+" " +str(af.ty)
dim r1 as CGRectMBS
dim r2 as CGRectMBS
r1=CGMakeRectMBS(100,100,100,100)
r2=r1.ApplyAffineTransform(af)
MsgBox("" +str(r1.Left)+", " +str(r1.top)+", " +str(r1.width)+", " +str(r1.height)+") => ("" +str(r2.Left)+", " +str(r2.top)+", " +str(r2.width)+", " +str(r2.height)+")"
```

50.2.2 Methods

50.2.3 Binary as MemoryBlock

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the binary data of the object for toolbox calls.

50.2.4 Concat(t as CGAffineTransformMBS) as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Concatenate ‘t2’ to ‘t1’ and return the result: t’ = t1 * t2
50.2. CLASS CGAFFINETRANSFORMMBS

50.2.5 Constructor

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: This constructor creates the identity transform: \[ \begin{bmatrix} 1 & 0 & 0 & 1 & 0 & 0 \end{bmatrix} \]. See also:

- 50.2.6 Constructor(a as Double, b as Double, c as Double, d as Double, tx as Double, ty as Double)
- 50.2.7 Constructor(p as Ptr)

50.2.6 Constructor(a as Double, b as Double, c as Double, d as Double, tx as Double, ty as Double)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates the transformation with the given values. See also:

- 50.2.5 Constructor
- 50.2.7 Constructor(p as Ptr)

50.2.7 Constructor(p as Ptr)

MBS MacCG Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates a new instance using data at the pointer. Notes: Make sure the pointer is valid and has the right data and size. See also:

- 50.2.5 Constructor
- 50.2.6 Constructor(a as Double, b as Double, c as Double, d as Double, tx as Double, ty as Double)

50.2.8 EqualToTransform(t as CGAffineTransformMBS) as boolean

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Checks whether two affine transforms are equal. Notes:

Returns true if t1 and t2 are equal, false otherwise. Available in Mac OS X v10.4 and later.
50.2.9 Identity as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The identity transform: \[
\begin{bmatrix}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{bmatrix}
\].

50.2.10 Invert as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Invert 't' and return the result. If 't' has zero determinant, then 't' is returned unchanged.

50.2.11 IsIdentity as boolean

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Checks whether an affine transform is the identity transform.
**Notes:**
Returns true if t is the identity transform, false otherwise.
Available in Mac OS X v10.4 and later.

50.2.12 Make(a as Double, b as Double, c as Double, d as Double, tx as Double, ty as Double) as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return the transform \[
\begin{bmatrix}
a & b & c \\
b & d & 0 \\
c & d & 0
\end{bmatrix}
\].

50.2.13 MakeRotation(angle as Double) as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return a transform which rotates by 'angle' radians: \[
\begin{bmatrix}
\cos(\text{angle}) & \sin(\text{angle}) \\
-\sin(\text{angle}) & \cos(\text{angle})
\end{bmatrix}
\].

50.2.14 MakeScale(sx as Double, sy as Double) as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return a transform which scales by '(sx, sy)': \[
\begin{bmatrix}
sx & 0 & 0 \\
0 & sy & 0 \\
0 & 0 & 0
\end{bmatrix}
\].
50.2.15 MakeTranslation(tx as Double, ty as Double) as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return a transform which translates by ’(tx, ty)’: \( t' = \begin{bmatrix} 1 & 0 & 0 & 1 & tx & ty \end{bmatrix} \)

50.2.16 Rotate(angle as Double) as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Rotate ‘t’ by ‘angle’ radians and return the result: \( t' = \begin{bmatrix} \cos(\text{angle}) & \sin(\text{angle}) & -\sin(\text{angle}) & \cos(\text{angle}) & 0 & 0 \end{bmatrix} \ast t \)

50.2.17 Scale(sx as Double, sy as Double) as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Scale ‘t’ by ‘(sx, sy)’ and return the result: \( t' = \begin{bmatrix} sx & 0 & 0 & sy & 0 & 0 \end{bmatrix} \ast t \)

50.2.18 Translate(tx as Double, ty as Double) as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Translate ‘t’ by ‘(tx, ty)’ and return the result: \( t' = \begin{bmatrix} 1 & 0 & 0 & 1 & tx & ty \end{bmatrix} \ast t \)

**Example:**
```vba
dim t as new CGAffineTransformMBS(1,0,0,1,1,1)
t=t.Translate(2,3)
MsgBox str(T.A)+" "+str(t.B)+" "+str(t.C)+" "+str(t.D)+" "+str(t.TX)+" "+str(t.TY)

// shows 1 0 0 1 3 4
```

50.2.19 Properties

50.2.20 A as Double

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The A value.

**Notes:** (Read and Write property)
50.2.21  B as Double

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The B value.  
**Notes:** (Read and Write property)

50.2.22  C as Double

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The C value.  
**Notes:** (Read and Write property)

50.2.23  D as Double

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The D value.  
**Notes:** (Read and Write property)

50.2.24  TX as Double

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The TX value.  
**Notes:** (Read and Write property)

50.2.25  TY as Double

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The TY value.  
**Notes:** (Read and Write property)
50.3.  

50.3  class CGBitmapContextMBS

50.3.1  class CGBitmapContextMBS

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  

**Function:** A class to hold a CoreGraphics bitmap context.  

**Example:**

```vba
Sub Paint(g As Graphics)
    dim c as CGPictureContextMBS
    dim w as CGContextMBS ' of window
    dim p,m as Picture

    c=new CGPictureContextMBS(100,100)
    c.ClearRect CGMakeRectMBS(0,0,100,100)
    c.SetRGBFillColor 1,0,0,1
    c.FillRect CGMakeRectMBS(0,0,50,50)

    w=window1.CGContextMBS ' we are inside paint event!
    // Draw using CGImage
    w.DrawPicture c.CGImage(false,0),CGMakeRectMBS(0,0,c.BitmapWidth,c.BitmapHeight)
    w.Flush

    // Draw using RB picture, so we can see whether it looks equal.
    m=c.CopyPictureMask
    p=NewPicture(m.Width,m.Height,32)
    p.Graphics.DrawPicture c.CopyPicture,0,0
    p.Mask.Graphics.DrawPicture m,0,0
    g.DrawPicture p,0,0

End Sub
```

**Notes:**

If the RB graphics class is like a CGContext, the RB picture class (created using NewPicture) is something like a CGBitmapContext.  
Subclass of the CGContextMBS class.  
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.
### 50.3.2 Methods

#### 50.3.3 CGImage(shouldInterpolate as boolean = false, intent as Integer = 0) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a CGImageMBS object referencing the CGBitmapContext object.

**Example:**

```plaintext
dim c as CGPictureContextMBS
dim w as CGContextMBS // of window

c=new CGPictureContextMBS(100,100)

c.SetRGBFillColor 1,0,0,1
c.FillRect CGMakeRectMBS(0,0,50,50)

w=window1.CGContextMBS // we are inside paint event!
w.DrawPicture c.CGImage(false,0),CGMakeRectMBS(0,0,c.BitmapWidth,c.BitmapHeight)
w.Flush
```

**Notes:**

You will crash your application if you use this Image after the CGBitmapContext object was destroyed. Changes made to the connected CGBitmapContext will be seen in the CGImage.

Returns nil on low memory.

Constants for intent:

- kCGRenderingIntentDefault 0
- kCGRenderingIntentAbsoluteColorimetric 1
- kCGRenderingIntentRelativeColorimetric 2
- kCGRenderingIntentPerceptual 3
- kCGRenderingIntentSaturation 4

Set shouldInterpolate to true if the image should use interpolation.

### 50.3.4 Constructor

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.
50.3.5 Create(data as memoryblock, width as Integer, height as Integer, bitsPerComponent as Integer, bytesPerRow as Integer, colorspace as CGColorSpaceMBS, alphaInfo as Integer) as CGBitmapContextMBS

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Create a bitmap context.

**Notes:**
The context draws into a bitmap which is 'width' pixels wide and 'height' pixels high. The number of components for each pixel is specified by 'colorspace', which also may specify a destination color profile. The number of bits for each component of a pixel is specified by 'bitsPerComponent', which must be 1, 2, 4, or 8. Each row of the bitmap consists of 'bytesPerRow' bytes, which must be at least \((\text{width} \times \text{bitsPerComponent} \times \text{number of components} + 7)/8\) bytes. 'data' points a block of memory at least 'bytesPerRow \times \text{height}' bytes. 'alphaInfo' specifies whether the bitmap should contain an alpha channel, and how it's to be generated.

Fails if data=nil or colorspace=nil.
The memoryblock is not referenced and not stored, so keep it alive while using the BitmapContext object.

Returns nil on any error.

data
A pointer to the destination in memory where the drawing is to be rendered. The size of this memoryblock should be at least(bytesPerRow*height) bytes.

width
The width of the bitmap in pixels.

height
The height of the bitmap in pixels.

bitsPerComponent
The number of bits to use for each component of a pixel in memory. Allowable values are 4, 5, or 8. For example, for a 32-bit RGB(A) colorspace, you would specify a value of 8 bits per color component. In combination, the number of bits per component, the color space, and the alpha value determine which bitmap context formats Quartz supports.

bytesPerRow
The number of bytes of memory to use per row of the bitmap. This value must be at least the product of the width and bitsPerComponent parameters, times the number of components per pixel. The result should be divided by 8 and rounded up to the nearest whole number to obtain the number of bytes to use per row. That is, the value must be at least \(((\text{width})^\times(\text{bits per component})\times(\text{number of components per pixel}))+7)/8\) bytes. For a given row, Quartz stores bitmap data for the first width pixels and ignores any remaining bytes. The colorspace value referenced by the colorspace parameter specifies the number of components for each pixel.
CHAPTER 50. COREGRAPHICS

colorspace
The color space to use for the bitmap context.

alphaInfo
A CGImageAlphaInfo constant specifying whether the bitmap should contain an alpha channel and how it is to be generated. The alpha value determines the opacity of a pixel when it is drawn.

Supported pixel formats:

<table>
<thead>

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Quartz does not support the following formats in a bitmap context:

- 1-bit grayscale
- 24-bit RGB
- CMYK (any depth)

CGImageAlphaInfo constants:

- kCGImageAlphaNone 0
- kCGImageAlphaPremultipliedLast 1 For example, premultiplied RGBA
- kCGImageAlphaPremultipliedFirst 2 For example, premultiplied ARGB
- kCGImageAlphaLast 3 For example, non-premultiplied RGBA
- kCGImageAlphaFirst 4 For example, non-premultiplied ARGB
- kCGImageAlphaNoneSkipLast 5 Equivalent to kCGImageAlphaNone.
- kCGImageAlphaNoneSkipFirst 6

See also:

- 50.3.6 Create(Other as CGBitmapContextMBS, NewColorspace as CGColorSpaceMBS) as CGBitmapContextMBS
50.3.6 Create(Other as CGBitmapContextMBS, NewColorspace as CGColorSpaceMBS) as CGBitmapContextMBS

**Example:**

```vbnet
dim pic as new Picture(100,100) // some picture
dim ICCProfileData as memoryblock // get a ICC Profile somewhere

dim colorspace as CGColorSpaceMBS = CGColorSpaceMBS.CreateWithICCProfile(ICCProfileData)
dim bitmap as CGBitmapContextMBS = CGBitmapContextMBS.CreateWithPicture(pic)
dim zweiteBitmap as CGBitmapContextMBS = bitmap.Create(bitmap, colorspace)
```

**Notes:** The new bitmap object uses same data as existing object, just accesses the pixels using the new color space.

See also:

- 50.3.5 Create(data as memoryblock, width as Integer, height as Integer, bitsPerComponent as Integer, bytesPerRow as Integer, colorspace as CGColorSpaceMBS, alphaInfo as Integer) as CGBitmapContextMBS

50.3.7 CreateImage as CGImageMBS

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return an image containing a snapshot of the bitmap context.

**Example:**

```vbnet
// a new picture in RB
dim pic as new Picture(500, 500)

// and create CGBitmapContextMBS pointing to it
dim b as CGBitmapContextMBS = CGBitmapContextMBS.CreateWithPicture(pic)

// color set to full red
b.SetRGBFillColor 1.0, 0.0, 0.0, 1.0

// draw ellipse
dim r as CGRectMBS = CGRectMBS.Make(0, 0, 500, 500)
b.FillEllipseInRect r

// flush drawings
b.Flush

// now try CGImage creation
dim cgimage as CGImageMBS = b.CreateImage
```
// and display by converting to a new picture
Backdrop = cgimage.Picture

Notes:
If context is not a bitmap context, or if the image cannot be created for any reason, this function returns
NULL. This is a "copy" operation subsequent changes to context will not affect the contents of the returned
image.

Note that in some cases the copy will actually follow "copy-on-write" semantics, so that the actual physical
copy of the bits will only occur if the underlying data in the bitmap context is modified. As a consequence,
you may wish to use the resulting image and release it before performing more drawing into the bitmap
context; in this way, the actual physical copy of the data may be avoided.

50.3.8 CreateRGB(data as memoryblock, width as Integer, height as Integer,
bytesPerRow as Integer, colorspace as CGColorSpaceMBS = nil) as CG-
BitmapContextMBS

MBS MacCG Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Convenience function to handle RGB data.
Notes:
Same as Create method, but for RGB data.
Converts data from 3 byte/pixel to 4 byte/pixel and than creates CGBitmapContextMBS.
Colorspace is optional and defaults to Generic RGB.
Returns nil on error, raises OutOfBounds exception for invalid parameters.

50.3.9 CreateWithPicture(Pic as Picture) as CGBitmapContextMBS

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Creates a CGBitmapContext referencing the given picture.
Example:
// a new picture in RB
dim pic as new Picture(500, 500)

// and create CGBitmapContextMBS pointing to it
dim b as CGBitmapContextMBS = CGBitmapContextMBS.CreateWithPicture(pic)

// color set to full red
b.SetRGBFillColor 1.0, 0.0, 0.0, 1.0
// draw ellipse
dim r as CGRectMBS = CGRectMBS.Make(0, 0, 500, 500)
b.FillEllipseInRect r

// flush drawings
b.Flush

// and show
Backdrop = pic

Notes:

Only for Cocoa target.
The plugin will do a clear cache on the picture in the destructor.

50.3.10 Properties

50.3.11 BitmapAlphaInfo as Integer

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the alpha info of the bitmap.

**Example:**

// a new picture in RB
dim pic as new Picture(500, 500)

// and create CGBitmapContextMBS pointing to it
dim b as CGBitmapContextMBS = CGBitmapContextMBS.CreateWithPicture(pic)

// shows 2 for kCGImageAlphaPremultipliedFirst
MsgBox str(b.BitmapAlphaInfo)

Notes:

Returns 0 on any error.

CGImageAlphaInfo constants:

(Read only property)
50.3.12 BitmapBitsPerComponent as Integer

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bits per component of the bitmap. **Example:**

```vba
// a new picture in RB
dim pic as new Picture(500, 500)

// and create CGBitmapContextMBS pointing to it
dim b as CGBitmapContextMBS = CGBitmapContextMBS.CreateWithPicture(pic)

// shows 8
MsgBox str(b.BitmapBitsPerComponent)
```

**Notes:**

Returns 0 on any error.
(Read only property)

50.3.13 BitmapBitsPerPixel as Integer

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bits per pixel of the bitmap. **Example:**

```vba
// a new picture in RB
dim pic as new Picture(500, 500)

// and create CGBitmapContextMBS pointing to it
dim b as CGBitmapContextMBS = CGBitmapContextMBS.CreateWithPicture(pic)

// shows 32
MsgBox str(b.BitmapBitsPerPixel)
```
50.3. **CLASS CGBITMAPCONTEXTMBS**

Notes:
Returns 0 on any error.
(Read only property)

50.3.14 **BitmapBytesPerRow as Integer**

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bytes per row of the bitmap.

**Example:**
// a new picture in RB
dim pic as new Picture(500, 500)

// and create CGBitmapContextMBS pointing to it
dim b as CGBitmapContextMBS = CGBitmapContextMBS.CreateWithPicture(pic)

// shows 2000
MsgBox str(b.BitmapBytesPerRow)

Notes:
Returns 0 on any error.
(Read only property)

50.3.15 **BitmapColorSpace as CGColorSpaceMBS**

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the colorspace used for this bitmap.

**Notes:**
Returns nil on any error.
This is not the same RB object used when you created the bitmap, but it will contain the same handle.
(Read only property)

50.3.16 **BitmapData as MemoryBlock**

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a memoryblock for the data of the bitmap.

**Notes:**
Returns nil on any error.

This is not the same RB memoryblock object as you passed to the Create function, but it will point to the same bytes in memory. (Read only property)

### 50.3.17 BitmapHeight as Integer

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the height of the bitmap.

**Example:**

```vbnet
// a new picture in RB
dim pic as new Picture(500, 500)

// and create CGBitmapContextMBS pointing to it
dim b as CGBitmapContextMBS = CGBitmapContextMBS.CreateWithPicture(pic)

// shows 500
MsgBox str(b.BitmapHeight)
```

**Notes:**

Returns 0 on any error. (Read only property)

### 50.3.18 BitmapInfo as Integer

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Obtains the bitmap information associated with a bitmap graphics context.

**Example:**

```vbnet
// a new picture in RB
dim pic as new Picture(500, 500)

// and create CGBitmapContextMBS pointing to it
dim b as CGBitmapContextMBS = CGBitmapContextMBS.CreateWithPicture(pic)

// shows info: 2 for kCGImageAlphaPremultipliedFirst
MsgBox str(b.BitmapInfo)
```
The bitmap info of the bitmap graphics context or 0 if c is not a bitmap graphics context. See CGImage Reference for a description of the Image Bitmap Information constants that can be returned.

The CGBitmapInfo data returned by the function specifies whether the bitmap contains an alpha channel and how the alpha channel is generated, along with whether the components are floating-point or integer. (Read only property)

### 50.3.19 BitmapWidth as Integer

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the width of the bitmap.

**Example:**

```plaintext
// a new picture in RB
dim pic as new Picture(500, 500)

// and create CGBitmapContextMBS pointing to it
dim b as CGBitmapContextMBS = CGBitmapContextMBS.CreateWithPicture(pic)

// show info: 500
MsgBox str(b.BitmapWidth)
```

**Notes:**

Returns 0 on any error. (Read only property)
50.4 class CGColorMBS

50.4.1 class CGColorMBS

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a CoreGraphics color object.

50.4.2 Methods

50.4.3 Alpha as Double

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The alpha value of the color.

50.4.4 Black as CGColorMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The black color in the Generic gray color space.

50.4.6 ColorSpace as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The colorspace of this color.
**Notes:** May be nil if unknown.

50.4.7 Components as memoryblock

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The components of the color as a memoryblock.
**Notes:**
50.4. **CLASS CGCOLORMBS**

The memoryblock contains double properties.
m.double(0), m.double(4), etc.

50.4.8 **Copy as CGColorMBS**

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a copy of the color.
**Notes:** Returns nil on any error.

50.4.9 **CopyWithAlpha(alpha as Double) as CGColorMBS**

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Makes a new copy of the color with a different alpha value.
**Notes:** Returns nil on any error.

50.4.10 **Create(colorspace as CGColorSpaceMBS, components as memoryblock) as CGColorMBS**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new color with the given components.
**Example:**

```vbnet
dim c as color = & cFF0000
Dim m As MemoryBlock
m=NewMemoryBlock(16)
m.SingleValue(0)=c.Red/256
m.SingleValue(4)=c.Green/256
m.SingleValue(8)=c.Blue/256
m.SingleValue(12)=1.0

Dim colorspace as CGColorSpaceMBS
colorspace=CGColorSpaceMBS.CreateDeviceRGB
if colorspace=nil or colorspace.Handle=0 then
    MsgBox ”Failed to get RGB color space!”
    Return
end if

Dim col As CGColorMBS
```
col=CGColorMBS.Create(colorspace, m)

if col=nil or col.Handle=0 then
    MsgBox "Failed to create color."
    Return
end if

MsgBox str(Col.NumberOfComponents)

**Notes:** This method was called NewCGColorMBS in earlier MBS Plugins.
See also:

- 50.4.11 Create(colorspace as CGColorSpaceMBS, components() as Double) as CGColorMBS

**50.4.11 Create(colorspace as CGColorSpaceMBS, components() as Double) as CGColorMBS**

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new color with the given components.

**Notes:**
Supports up to 32 components.
Returns nil on any error.
See also:

- 50.4.10 Create(colorspace as CGColorSpaceMBS, components as memoryblock) as CGColorMBS

**50.4.12 CreateDeviceCMYK(cyan as Double, magenta as Double, yellow as Double, black as Double, alpha as Double = 1.0) as CGColorMBS**

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a color in the device CMYK color space.

**Notes:**
cyan: A cyan value (0.0 - 1.0).
magenta: A magenta value (0.0 - 1.0).
yellow: A yellow value (0.0 - 1.0).
black: A black value (0.0 - 1.0).
alpha: An alpha value (0.0 - 1.0).

Returns a color object.
50.4. CLASS CGCOLORMBS

50.4.13 CreateDeviceGray(gray as Double, alpha as Double = 1.0) as CGColorMBS

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a color in the device gray color space. 
**Notes:**
gray: A grayscale value (0.0 - 1.0).
alpha: An alpha value (0.0 - 1.0).

Returns a color object.

50.4.14 CreateDeviceRGB(red as Double, green as Double, blue as Double, alpha as Double = 1.0) as CGColorMBS

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a color in the device RGB color space. 
**Notes:**
red: A red component value (0.0 - 1.0).
green: A green component value (0.0 - 1.0).
blue: A blue component value (0.0 - 1.0).
alpha: An alpha value (0.0 - 1.0).

Returns a new color object.

50.4.15 CreateGenericCMYK(cyan as Double, magenta as Double, yellow as Double, black as Double, alpha as Double = 1.0) as CGColorMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a color in the Generic CMYK color space. 
**Notes:**
cyan: A cyan value (0.0 - 1.0).
magenta: A magenta value (0.0 - 1.0).
yellow: A yellow value (0.0 - 1.0).
black: A black value (0.0 - 1.0).
alpha: An alpha value (0.0 - 1.0).

Returns a color object. 
Available in Mac OS X v10.5 and later.
50.4.16  CreateGenericGray(gray as Double, alpha as Double = 1.0) as CGColorMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a color in the Generic gray color space.
**Notes:**
gray: A grayscale value (0.0 - 1.0).
alpha: An alpha value (0.0 - 1.0).

Returns a color object.
Available in Mac OS X v10.5 and later.

50.4.17  CreateGenericRGB(red as Double, green as Double, blue as Double, alpha as Double = 1.0) as CGColorMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a color in the Generic RGB color space.
**Notes:**
red: A red component value (0.0 - 1.0).
green: A green component value (0.0 - 1.0).
blue: A blue component value (0.0 - 1.0).
alpha: An alpha value (0.0 - 1.0).

Returns a new color object.
Available in Mac OS X v10.5 and later.

50.4.18  Equal(secondColor as CGColorMBS) as boolean

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
True if both colors have equal values.
**Notes:** False on any error.

50.4.19  NumberOfComponents as Integer

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The number of components.
**Notes:** Should be 3 for RGB and 4 for CMYK.
50.4. CLASS CGCOLORMBS

50.4.20 White as CGColorMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The white color in the Generic gray color space.

50.4.21 Properties

50.4.22 Handle as Integer

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The handle to the CGColorRef used internal.
**Notes:** (Read and Write property)
50.5 class CGColorSpaceMBS

50.5.1 class CGColorSpaceMBS

50.5.2 Methods

50.5.3 CreateCalibratedGray(whitePoint() as Double, blackPoint() as Double, gamma as Double) as CGColorSpaceMBS

Notes:
WhitePoint is an array of 3 numbers (type double) specifying the tristimulus value, in the CIE 1931 XYZ-space, of the diffuse white point.
BlackPoint is an array of 3 numbers (type double) specifying the tristimulus value, in CIE 1931 XYZ-space, of the diffuse black point.
Gamma defines the gamma for the gray component.
Returns nil on any error.

50.5.4 CreateCalibratedRGB(whitePoint() as Double, blackPoint() as Double, gamma() as Double, matrix() as Double) as CGColorSpaceMBS

Notes:
WhitePoint is an array of 3 numbers (type double) specifying the tristimulus value, in the CIE 1931 XYZ-space, of the diffuse white point.
BlackPoint is an array of 3 numbers (type double) specifying the tristimulus value, in CIE 1931 XYZ-space, of the diffuse black point.
Gamma is an array of 3 numbers (type double) specifying the gamma for the red, green, and blue components of the color space.
Matrix is an array of 9 numbers (type double) specifying the linear interpretation of the gamma-modified RGB values of the colorspace with respect to the final XYZ representation.
Returns nil on any error.
50.5.5 CreateDeviceCMYK as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a DeviceCMYK colorspace.
**Notes:** Returns nil on any error.

50.5.6 CreateDeviceGray as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a DeviceGray colorspace.
**Notes:** Returns nil on any error.

50.5.7 CreateDeviceRGB as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a DeviceRGB colorspace.
**Notes:**
Returns nil on any error.

Old name: CGColorSpaceCreateDeviceRGBMBS

50.5.8 CreateLab(whitePoint() as Double, blackPoint() as Double, range() as Double) as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates an L*a*b* colorspace.
**Notes:**
WhitePoint is an array of 3 numbers (type double) specifying the tristimulus value, in the CIE 1931 XYZ-space, of the diffuse white point.
BlackPoint is an array of 3 numbers (type double) specifying the tristimulus value, in CIE 1931 XYZ-space, of the diffuse black point.
Range is an array of four numbers (type double) specifying the range of valid values for the a* and b* components of the color space.
Returns nil on any error.
50.5.9 CreatePattern(baseSpace as CGColorSpaceMBS) as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a pattern colorspace.

**Notes:**
BaseSpace is the underlying colorspace of the pattern colorspace. For colored patterns, baseSpace should be nil; for uncolored patterns, baseSpace specifies the colorspace of colors which will be painted through the pattern.

Returns nil on any error.

50.5.10 CreateWithHandle(Handle as Integer) as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a CGColorSpace for a handle.

**Example:**
```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericCMYKColorSpace
dim c as CGColorSpaceMBS = CGColorSpaceMBS.CreateWithHandle(n.CGColorSpaceHandle)
MsgBox c.Name
```

**Notes:**
Sometimes you need to create CGColorSpaceMBS from NSColorSpaceMBS or some handle you got from an OS function and than you can use this function.
Returns nil on any error. Retains the handle.

50.5.11 CreateWithICCProfile(ICCProfileData as memoryblock) as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an ICC-based color space using the ICC profile contained in the specified data.

**Notes:**

- data: The data containing the ICC profile to set for the new color space.
- Returns a new color space based on the specified profile.
See also:

- 50.5.12 CreateWithICCProfile(ICCProfileData as string) as CGColorSpaceMBS
50.5.12  CreateWithICCProfile(ICCProfileData as string) as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an ICC-based color space using the ICC profile contained in the specified data. **Notes:**

data: The data containing the ICC profile to set for the new color space.
Returns a new color space based on the specified profile.
See also:

- 50.5.11 CreateWithICCProfile(ICCProfileData as memoryblock) as CGColorSpaceMBS

50.5.13  CreateWithName(name as string) as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create a color space using name as the identifier for the color space. **Notes:** Pass one of the kCGColorSpace* string constants.

50.5.14  CreateWithPlatformColorSpace(Handle as Integer) as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a CGColorSpace using a Colorsync Profile Handle. **Notes:** Returns nil on any error.

50.5.15  ICCProfile as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a copy of the ICC profile of the provided color space. **Notes:**
The ICC profile or "" if the color space does not have an ICC profile.

Available in Mac OS X v10.5 and later.

50.5.16  kCGColorSpaceACESCGLinear as string

MBS MacCG Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for color spaces. **Notes:**
The name of the ACEScg color space. For more information, see ACEScg A Working Space for CGI Render and Compositing, Version 1.0.1, Academy of Motion Picture Arts and Sciences (http://www.oscars.org/science-technology/sci-tech-projects/aces).

Available in OS X v10.11 and later.

### 50.5.17 kCGColorSpaceAdobeRGB1998 as string

MBS MacCG Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for color spaces.  

### 50.5.18 kCGColorSpaceDCIP3 as string

MBS MacCG Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for color spaces.  
**Notes:** The name of the DCI P3 color space, created by Digital Cinema Initiatives, LLC. This color space is the digital cinema standard.

Available in OS X v10.11 and later.

### 50.5.19 kCGColorSpaceDisplayP3 as string

MBS MacCG Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for color spaces.  
**Notes:** The name of the Display P3 color space, created by Apple Inc. This color space uses the DCI P3 primaries, a D65 white point, and the same gamma curve as the sRGB color space.

Available in OS X v10.10 and later.

### 50.5.20 kCGColorSpaceGenericCMYK as string

MBS MacCG Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for color spaces.
50.5. **CLASS CGCOLORSPACEMBS**

**Notes:** The name of the "Generic" CMYK color space.

50.5.21 **kCGColorSpaceGenericGray** as string

MBS MacCG Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for color spaces. **Notes:** The name of the "Generic" gray color space.

50.5.22 **kCGColorSpaceGenericGrayGamma2.2** as string

MBS MacCG Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for color spaces. **Notes:** The name of the generic gray color space with a gamma value of 2.2.

Available in OS X v10.6 and later.

50.5.23 **kCGColorSpaceGenericRGB** as string

MBS MacCG Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for color spaces. **Notes:** The name of the "Generic" RGB color space.

50.5.24 **kCGColorSpaceGenericRGBLinear** as string

MBS MacCG Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for color spaces. **Notes:** The name of the "Generic" linear RGB color space. This is the same as kCGColorSpaceGenericRGB but with a 1.0 gamma.

50.5.25 **kCGColorSpaceGenericXYZ** as string

MBS MacCG Plugin, Plugin Version: 16.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for color spaces. **Notes:**
The name of the generic XYZ color space.

Available in OS X v10.11 and later.

50.5.26 kCGColorSpaceITUR_2020 as string

Notes:

Available in OS X v10.11 and later.

50.5.27 kCGColorSpaceITUR_709 as string

Notes:

Available in OS X v10.11 and later.

50.5.28 kCGColorSpaceROMMRGB as string

Notes:

Available in OS X v10.11 and later.
50.5. CLASS CGCOLORSPACEMBS

50.5.29 kCGColorSpaceSRGB as string

MBS MacCG Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the names for color spaces. **Notes:** The name of the sRGB color space. The capitalization in the name, while strictly inaccurate, avoids interpretational ambiguity. For more information, see IEC 61966-2-1 (1999-10): "Multimedia systems and equipment - Colour measurement and management - Part 2-1: Colour management - Default RGB colour space - sRGB”.

50.5.30 Properties

50.5.31 BaseColorSpace as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the base color space of a pattern or indexed color space. **Notes:** The base color space if the space parameter is a pattern or indexed color space; otherwise, nil. Available in Mac OS X v10.5 and later. (Read only property)

50.5.32 ColorTableCount as Integer

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of entries in the color table of an indexed color space. **Notes:** The number of entries in the color table of the space parameter if the color space is an indexed color space; otherwise, returns 0. Available in Mac OS X v10.5 and later. (Read only property)

50.5.33 Description as String

MBS MacCG Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The description text. **Example:**

Example:
`dim c as CGColorSpaceMBS = window1.CGColorSpaceMBS
MsgBox c.description`  

**Notes:** (Read only property)

### 50.5.34 Handle as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the color space.

**Notes:**

(a CGColorSpaceRef)
(Read and Write property)

### 50.5.35 Model as Integer

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the color space model of the provided color space.

**Notes:**

Available in Mac OS X v10.5 and later.

Use this constants:
- CGColorSpaceMBS.kCGColorSpaceModelUnknown
- CGColorSpaceMBS.kCGColorSpaceModelCMYK
- CGColorSpaceMBS.kCGColorSpaceModelDeviceN
- CGColorSpaceMBS.kCGColorSpaceModelIndexed
- CGColorSpaceMBS.kCGColorSpaceModelLab
- CGColorSpaceMBS.kCGColorSpaceModelMonochrome
- CGColorSpaceMBS.kCGColorSpaceModelPattern
- CGColorSpaceMBS.kCGColorSpaceModelRGB
(Read only property)

### 50.5.36 ModelText as String

MBS MacCG Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The model as text.

**Notes:**

For viewing in debugger.
(Read only property)
50.5.37 Name as String

MBS MacCG Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries the name of the colorspace.

**Notes:**

Not all CGColorspace objects have names. Some have only ICC Profile and you can get name via Name property in LCMS2ProfileMBS if you open the profile with LCMS.

(Read only property)

50.5.38 NumberOfComponents as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of components.

**Notes:**

typical 1 for grayscale, 3 for RGB and 4 for CMYK.

(Read only property)

50.5.39 Constants

50.5.40 kCGColorSpaceModelCMYK=2

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the colorspace model constants.

**Notes:**

A CMYK color space model.

Available in Mac OS X v10.5 and later.

50.5.41 kCGColorSpaceModelDeviceN=4

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the colorspace model constants.

**Notes:**

A DeviceN color space model.

Available in Mac OS X v10.5 and later.
50.5.42 kCGColorSpaceModelIndexed=5

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the colorspace model constants.  
**Notes:**
An indexed color space model.

Available in Mac OS X v10.5 and later.

50.5.43 kCGColorSpaceModelLab=3

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the colorspace model constants.  
**Notes:**
A Lab color space model.

Available in Mac OS X v10.5 and later.

50.5.44 kCGColorSpaceModelMonochrome=0

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the colorspace model constants.  
**Notes:**
A monochrome color space model.

Available in Mac OS X v10.5 and later.

50.5.45 kCGColorSpaceModelPattern=6

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the colorspace model constants.  
**Notes:**
A pattern color space model.

Available in Mac OS X v10.5 and later.
50.5. **CLASS CGCOLORSPACEMBS**

50.5.46 **kCGColorSpaceModelRGB=1**

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the colorspace model constants.  
**Notes:**  
An RGB color space model.

Available in Mac OS X v10.5 and later.

50.5.47 **kCGColorSpaceModelUnknown=-1**

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the colorspace model constants.  
**Notes:**  
An unknown color space model.

Available in Mac OS X v10.5 and later.

50.5.48 **kCGRenderingIntentAbsoluteColorimetric=1**

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the color rendering intents constants.  
**Notes:** Map colors outside of the gamut of the output device to the closest possible match inside the gamut of the output device. This can produce a clipping effect, where two different color values in the gamut of the graphics context are mapped to the same color value in the output device’s gamut. Unlike the relative colorimetric, absolute colorimetric does not modify colors inside the gamut of the output device.

50.5.49 **kCGRenderingIntentDefault=0**

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the color rendering intents constants.  
**Notes:** The default rendering intent for the graphics context.

50.5.50 **kCGRenderingIntentPerceptual=3**

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the color rendering intents constants.  
**Notes:** Preserve the visual relationship between colors by compressing the gamut of the graphics context to fit inside the gamut of the output device. Perceptual intent is good for photographs and other complex, detailed images.
50.5.51 kCGRenderingIntentRelativeColorimetric=2

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the color rendering intents constants. **Notes:** Map colors outside of the gamut of the output device to the closest possible match inside the gamut of the output device. This can produce a clipping effect, where two different color values in the gamut of the graphics context are mapped to the same color value in the output device’s gamut. The relative colorimetric shifts all colors (including those within the gamut) to account for the difference between the white point of the graphics context and the white point of the output device.

50.5.52 kCGRenderingIntentSaturation=4

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the color rendering intents constants. **Notes:** Preserve the relative saturation value of the colors when converting into the gamut of the output device. The result is an image with bright, saturated colors. Saturation intent is good for reproducing images with low detail, such as presentation charts and graphs.
50.6. CLASS CGCONTEXTMBS

50.6. class CGContextMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core graphics context.

**Notes:**
If the handle property has a non zero value, the destructor of this class will release the context reference.

If you create this in a method based on a window, please release it within that method. e.g. in a paint event, create it and let RB delete the last reference on the end of the method. Else you may see crashes as the context is still being around while the graphics port has been released.

50.6.2 Methods

50.6.3 AddArc(x as Double, y as Double, radius as Double, startangle as Double, endangle as Double, clockwise as boolean)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Add an arc to the current path.

**Example:**

```plaintext
const r=100.0
dim c as CGContextMBS
// draws a circle with radius r
c.BeginPath
c.SetLineWidth 5
c.SetGrayStrokeColor 0,1
c.AddArc 250,150,r,0,360,false
c.StrokePath
```

**Notes:** Add an arc of a circle to the context’s path, possibly preceded by a straight line segment. `(x, y)` is the center of the arc; 'radius' is its radius; 'startAngle' is the angle to the first endpoint of the arc; 'endAngle' is the angle to the second endpoint of the arc; and 'clockwise' is true if the arc is to be drawn clockwise, false otherwise. 'startAngle' and 'endAngle' are measured in radians.
50.6.4 *addArcToPath(x as Double, y as Double, w as Double, h as Double, startAngle as Integer, arcAngle as Integer)*

MBS MacCG Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds an arc to the current path.

50.6.5 *AddArcToPoint(x1 as Double, y1 as Double, x2 as Double, y2 as Double, radius as Double)*

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Add an arc to the current path. **Notes:** Add an arc of a circle to the context’s path, possibly preceded by a straight line segment. 'radius' is the radius of the arc. The arc is tangent to the line from the current point to '(x1, y1)', and the line from '(x1, y1)' to '(x2, y2)'.

50.6.6 *AddCurveToPoint(cp1x as Double, cp1y as Double, cp2x as Double, cp2y as Double, x as Double, y as Double)*

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Append a cubic Bezier curve from the current point to (x,y), with control points (cp1x, cp1y) and (cp2x, cp2y).

50.6.7 *AddEllipseInRect(r as CGRectMBS)*

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Add an ellipse inside rect to the current path of context. **Notes:** See the function CGPathMBS.AddEllipseInRect for more information on how the path for the ellipse is constructed. Requires Mac OS X 10.4.

50.6.8 *AddLines(p() as CGPointMBS)*

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Add a set of lines to the context’s path. **Notes:** Currently this function is not available to RB versions before 3.5. Note that the p parameter is an array of CGPointMBS and not just one.
50.6.9  AddLineToPoint(x as Double, y as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Append a straight line segment from the current point to (x, y).

**Example:**

```vbnet
dim c as CGContextMBS

c=window1.CGContextMBS

c.SetRGBStrokeColor 1,0,0,1
c.BeginPath
c.MoveToPoint 0,0
c.AddLineToPoint 100,100
c.StrokePath
c.Flush
```

50.6.10  addOvalToPath(x as Double, y as Double, w as Double, h as Double)

MBS MacCG Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds an oval to the current path.

50.6.11  AddPath(path as CGPathMBS)

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Add path to the path of context.

**Notes:**

The points in path are transformed by the CTM of context before they are added.
Requires Mac OS X 10.2.

50.6.12  AddQuadCurveToPlane(cpx as Double, cpy as Double, x as Double, y as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Append a quadratic curve from the current point to (x, y), with control point (cpx, cpy).
50.6.13 AddRect(r as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Add a double rect to the context’s path.

50.6.14 AddRects(r() as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Add a set of rects to the context’s path.

**Notes:**
Currently this function is not available to RB versions before 3.5.
Note that the r parameter is an array of CGRectMBS and not just one.

50.6.15 addRoundedRectToPath(x as Double, y as Double, w as Double, h as Double, arcWidth as Double, arcHeight as Double)

MBS MacCG Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Adds a round rectangle to the current path.

50.6.16 BeginPage(mediabox as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Begin a new page.

50.6.17 BeginPath

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Begin a new path. The old path is discarded.

**Example:**
```dim c as CGContextMBS = CGContextMBS.contextWithCGContext(g.Handle(g.HandleTypeCGContextRef))
c.SetGrayStrokeColor(0,1)
c.SetGrayFillColor(0,1)
c.BeginPath
c.SetLineWidth 0.5
c.MoveToPoint 50, 550
c.AddLineToPoint 100, 600```
50.6. **CLASS CGCONTEXTMBS**

```c
.c.StrokePath
.c.Flush
.c = nil
```

**Notes:** Note that a context has a double path in use at any time: a path is not part of the graphics state.

### 50.6.18 BeginTransparencyLayer(auxiliaryInfo as Dictionary = nil)

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Begin a transparency layer in context. **Notes:**

All subsequent drawing operations until a corresponding EndTransparencyLayer are composited into a fully transparent backdrop (which is treated as a separate destination buffer from the context). After the transparency layer is ended, the result is composited into the context using the global alpha and shadow state of the context. This operation respects the clipping region of the context. After a call to this function, all of the parameters in the graphics state remain unchanged with the exception of the following:

- The global alpha is set to 1.
- The shadow is turned off.
- The blend mode is set to 'kCGBlendModeNormal'.

Ending the transparency layer restores these parameters to the values they had before BeginTransparencyLayer was called. Transparency layers may be nested.

### 50.6.19 BeginTransparencyLayerWithRect(r as CGRectMBS, auxiliaryInfo as Dictionary = nil)

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Begin a transparency layer in context. **Notes:** This function is identical to BeginTransparencyLayer except that the content of the transparency layer will be bounded by rect (specified in user space).

### 50.6.20 clearRect(rect as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clears the background. **Notes:** Remember that in CoreGraphics the position 0/0 is in the bottom left corner. In Realbasic 0/0 is in the top left corner.
50.6.21  **clip**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clips the current path.  
**Notes:** Intersect the context’s path with the current clip path and use the resulting path as the clip path for subsequent rendering operations. Use the winding-number fill rule for deciding what’s inside the path.

50.6.22  **ClipToMask(rect as CGRectMBS, mask as CGImageMBS)**

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Maps a mask into the specified rectangle and intersects it with the current clipping area of the graphics context.  
**Notes:**
- rect: The rectangle to map the mask parameter to.
- mask: An image or an image mask. If mask is an image, then it must be in the DeviceGray color space, may not have an alpha component, and may not be masked by an image mask or masking color.

If the mask parameter is an image mask, then Quartz clips in a manner identical to the behavior seen with the function `DrawImage` the mask indicates an area to be left unchanged when drawing. The source samples of the image mask determine which points of the clipping area are changed, acting as an "inverse alpha" value. If the value of a source sample in the image mask is S, then the corresponding point in the current clipping area is multiplied by an alpha value of (1S). For example, if S is 1 then the point in the clipping area becomes transparent. If S is 0, the point in the clipping area is unchanged.

If the mask parameter is an image, then mask acts like an alpha mask and is blended with the current clipping area. The source samples of mask determine which points of the clipping area are changed. If the value of the source sample in mask is S, then the corresponding point in the current clipping area is multiplied by an alpha of S. For example, if S is 0, then the point in the clipping area becomes transparent. If S is 1, the point in the clipping area is unchanged.

Available in Mac OS X v10.4 and later.

50.6.23  **clipToRect(rect as CGRectMBS)**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Clips the current path.  
**Notes:** Intersect the current clipping path with 'rect'. Note that this function resets the context’s path to the empty path.
50.6.24  Close

MBS MacCG Plugin, Plugin Version: 15.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes the context.
**Notes:** Same as destructor later, but running now when you call method.

50.6.25  closePath

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Close the current subpath of the context’s path.

50.6.26  ConcatCTM(transform as CGAffineTransformMBS)

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Concatenate the current graphics state’s transformation matrix (the CTM) with the affine transform 'transform'.

50.6.27  Constructor(handle as Integer)

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGContextMBS object based on a CGContextRef.
**Notes:** The CGContext is retained.

50.6.28  contextWithCGContext(handle as Integer) as CGContextMBS

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGContextMBS object based on a CGContextRef.
**Example:**
```java
// load a picture
dim f as FolderItem = SpecialFolder.Desktop.Child("ColorSpin.jpg")
dim pic as Picture = picture.Open(f)

// open printer
dim g as Graphics = OpenPrinterDialog
if g = nil then Return
```
// draw
g.DrawPicture pic, 0, 0

// now load again
dim ImageSource as new CGImageSourceMBS(f)
dim img as CGImageMBS = ImageSource.CreateImageAtIndex(0)
dim cs as CGColorSpaceMBS = CGColorSpaceMBS.CreateDeviceRGB

// copy with replacing colorspace
img = img.CopyWithColorSpace(cs)

// and draw
dim c as CGContextMBS = CGContextMBS.contextWithCGContext(g.Handle(g.HandleTypeCGContextRef))
dim r as CGRectMBS = CGMakeRectMBS(0, 0, img.Width, img.Height)
c.DrawPicture(img, r)
c.Flush

Notes:
The CGContext is retained.
Returns nil on any error.

50.6.29  contextWithCGraf(handle as Integer) as CGContextMBS

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGContextMBS object based on a QuickDraw CGraf. **Notes:** The CGraf must be kept alive as long as the CGContextMBS object exists. And please free the CGContextMBS by setting variable to nil before the CGraf is destroyed. This function is not available on 64 bit targets. Returns nil on any error.

Deprecated and only for QuickDraw stuff from a time long ago.

50.6.30  CopyPath as CGPathMBS

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Quartz path object built from the current path information in a graphics context. **Notes:** Available in Mac OS X v10.6 and later.
50.6.31 DrawCGPDFDocument(pdf as Variant, rect as CGRectMBS, page as Integer)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Draw 'page' in 'document' in the rectangular area specified by 'rect'.

**Example:**

'get a print session

// print this PDF
dim pathPrinted as FolderItem=GetFolderItem("test.pdf")

dim thePrintSession as CPMPrintSessionMBS = NewCPMPrintSessionMBS
if thePrintSession = nil then Return

'get default page format and print settings and attach it to the print settings
dim thePageFormat as CPMPageFormatMBS = NewCPMPageFormatMBS
dim thePrintSettings as CPMPrintSettingsMBS = NewCPMPrintSettingsMBS
thePrintSession.DefaultPageFormat thePageFormat
thePrintSession.DefaultPrintSettings thePrintSettings

'show the print dialog
if not thePrintSession.PrintDialog(thePrintSettings,thePageFormat) then return

'open the file which will be printed
dim thePdfDocument as CGPDFDocumentMBS = pathPrinted.OpenAsCGPDFDocumentMBS

' limit page counts to the one we have
dim LastPage as Integer = thePdfDocument.PageCount
if thePrintSettings.LastPage<lastpage then
lastpage=thePrintSettings.LastPage
end if

' you get better progress bar if you tell how many pages will come
thePrintSettings.LastPage=lastpage

'begin the printing
thePrintSession.BeginDocument(thePrintSettings, thePageFormat)

'loop over the number of copies
for currentCopy as Integer = 1 to thePrintSettings.Copies

'loop over the pages
for currentPage as Integer = thePrintSettings.FirstPage to LastPage
`prepage the page`

```plaintext
dim PrintRect as CPMRectMBS = thePageFormat.AdjustedPageSize
dim CGRect as CGRectMBS = CGMakeRectMBS(PrintRect.left, PrintRect.top, PrintRect.Width, PrintRect.Height)
thePrintSession.BeginPage(thePageFormat, nil)
dim thePrintContext as CGContextMBS = thePrintSession.PageContext
if thePrintContext = Nil then return

`print the page`
thePrintContext.DrawCGPDFDocument thePdfDocument, CGRect, currentPage

`end the page`
thePrintContext = nil
thePrintSession.EndPage
next
```

`end the printing`
thePrintSession.EndDocument

**Notes:**
Pass a CGPDFDocumentMBS object for the pdf argument.
The media box of the page is scaled, if necessary, to fit into 'rect'.

### 50.6.32 DrawLayerAtPoint(Point as CGPointMBS, layer as CGLayerMBS)

MBS MacCG Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: Yes. **Function:** Draws the contents of a CGLayer object at the specified point.

**Notes:**
context: The graphics context associated with the layer.
point: The location, in current user space coordinates, to use as the origin for the drawing.
layer: The layer whose contents you want to draw.

Calling the function DrawLayerAtPoint is equivalent to calling the function DrawLayerInRect with a rectangle that has its origin at point and its size equal to the size of the layer.

Available in Mac OS X version 10.4 and later.
50.6.33 **DrawLayerInRect** (rect as CGRectMBS, layer as CGLayerMBS)

MBS MacCG Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: Yes. **Function:** Draws the contents of a CGLayer object into the specified rectangle.

**Notes:**
- context: The graphics context associated with the layer.
- rect: The rectangle, in current user space coordinates, to draw to.
- layer: The layer whose contents you want to draw.

The contents are scaled, if necessary, to fit into the rectangle.
Available in Mac OS X version 10.4 and later.

50.6.34 **DrawLinearGradient** (gradient as CGGradientMBS, startPoint as CGPointMBS, endPoint as CGPointMBS, options as Integer)

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Paints a gradient fill that varies along the line defined by the provided starting and ending points.

**Notes:**
- gradient: A CGGradient object.
- startPoint: The coordinate that defines the starting point of the gradient.
- endPoint: The coordinate that defines the ending point of the gradient.
- options: Option flags (kCGGradientDrawsBeforeStartLocation or kCGGradientDrawsAfterEndLocation) that control whether the fill is extended beyond the starting or ending point.

The color at location 0 in the CGGradient object is mapped to the starting point. The color at location 1 in the CGGradient object is mapped to the ending point. Colors are linearly interpolated between these two points based on the location values of the gradient. The option flags control whether the gradient is drawn before the start point or after the end point.

Available in Mac OS X v10.5 and later.

50.6.35 **DrawPath** (mode as Integer)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draw the context’s path using drawing mode 'mode'.
50.6.36 DrawPicture(pic as CGImageMBS, rect as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws a CGImageMBS at the given position. **Example:**

```realbasic
// put inside window paint event

dim c as CGContextMBS
if TargetCocoa then
  c = GetCurrentCGContextMBS
else
  c = window1.CGContextMBS
end if

dim logo as Picture = logoMBS(500)
dim image as CGImageMBS = CGCreateImageMBS(logo)

dim r as CGRectMBS = CGMakeRectMBS(0,0,g.Width,g.Height)
c.DrawPicture image, r
```

**Notes:** Remember that in CoreGraphics the position 0/0 is in the bottom left corner. In Realbasic 0/0 is in the top left corner.

50.6.37 DrawRadialGradient(gradient as CGGradientMBS, startCenter as CGPointMBS, startRadius as Double, endCenter as CGPointMBS, endRadius as Double, options as Integer)

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Paints a gradient fill that varies along the area defined by the provided starting and ending circles. **Notes:**

- gradient: A CGGradient object.
- startCenter: The coordinate that defines the center of the starting circle.
- startRadius: The radius of the starting circle.
- endCenter: The coordinate that defines the center of the ending circle.
- endRadius: The radius of the ending circle.
- options: Option flags (kCGGradientDrawsBeforeStartLocation or kCGGradientDrawsAfterEndLocation) that control whether the gradient is drawn before the starting circle or after the ending circle.

The color at location 0 in the CGGradient object is mapped to the circle defined by startCenter and startRadius. The color at location 1 in the CGGradient object is mapped to the circle defined by endCenter and endRadius. Colors are linearly interpolated between the starting and ending circles based on the location
values of the gradient. The option flags control whether the gradient is drawn before the start point or after the end point.

Available in Mac OS X v10.5 and later.

50.6.38 DrawShading(shading as CGShadingMBS)

Notes:
shading: A Quartz shading. Quartz retains this object; upon return, you may safely release it.
Available in Mac OS X version 10.2 and later.

50.6.39 DrawTiledImage(pic as CGImageMBS, rect as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Repeatedly draws an image, scaled to the provided rectangle, to fill the current clip region.
Example:
// put inside window paint event

dim c as CGContextMBS
if TargetCocoa then
c = GetCurrentCGContextMBS
else
c = window1.CGContextMBS
end if

dim logo as Picture = logoMBS(50)
dim image as CGImageMBS = CGCreateImageMBS(logo)
dim r as CGRectMBS = CGMakeRectMBS(0,0,50,50)
c.DrawTiledImage image, r

Notes:
rect: A rectangle that specifies the origin and size of the destination tile. Quartz scales the image disproportionately, if necessary to fit the bounds specified by the rect parameter.
image: The image to draw.
Quartz draws the scaled image starting at the origin of the rectangle in user space, then moves to a new point (horizontally by the width of the tile and/or vertically by the height of the tile), draws the scaled image, moves again, draws again, and so on, until the current clip region is tiled with copies of the image. Unlike patterns, the image is tiled in user space, so transformations applied to the CTM affect the final result.

Available in Mac OS X v10.5 and later.

**50.6.40  EndPage**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
End the current page.

**50.6.41  EndTransparencyLayer**

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
End a transparency layer.

**50.6.42  EOClip**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Clips the current path.
**Notes:** Intersect the context’s path with the current clip path and use the resulting path as the clip path for subsequent rendering operations. Use the even-odd fill rule for deciding what’s inside the path.

**50.6.43  EOFillPath**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Fill the context’s path using the even-odd fill rule. Any open subpath of the path is implicitly closed.

**50.6.44  FillEllipseInRect(rect as CGRectMBS)**

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Fill an ellipse (an oval) inside rect.
**Example:**
50.6. CLASS CGCONTEXTMBS

// a new picture in RB
dim pic as new Picture(500, 500)

// and create CGBitmapContextMBS pointing to it
dim b as CGBitmapContextMBS = CGBitmapContextMBS.CreateWithPicture(pic)

// color set to full red
b.SetRGBFillColor 1.0, 0.0, 0.0, 1.0

// draw ellipse
dim r as CGRectMBS = CGRectMBS.Make(0, 0, 500, 500)
b.FillEllipseInRect r

// flush drawings
b.Flush

// and show
Backdrop = pic

Notes: Requires Mac OS X 10.4.

50.6.45 FillPath

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Fill the context’s path using the winding-number fill rule. Any open subpath of the path is implicitly closed.

50.6.46 FillRect(rect as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Fills the background with current fill color.
Example:
// put in window.paint event
dim c as CGContextMBS

        c=window1.CGContextMBS
        c.RotateCTM 0.1
        c.SetRGBFillColor 0.0,0.1,0.5
        c.FillRect CGMakeRectMBS(0,0,100,100)

        c.Flush
Notes: Remember that in CoreGraphics the position 0/0 is in the bottom left corner. In Realbasic 0/0 is in the top left corner.

50.6.47 fillRoundedRect(x as Double, y as Double, w as Double, h as Double, arcWidth as Double, arcHeight as Double)

Example:

```plaintext
dim c as CGContextMBS

c=window1.CGContextMBS

// fill in red
c.SetRGBFillColor 1,0,0,1
c.fillRoundedRect 100,100,100,100,20,20

// draw in green
c.SetRGBStrokeColor 0,1,0,1
c.strokeRoundedRect 100,100,100,100,20,20
```

50.6.48 Flush

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Updates the screen to show the current content.
Notes: Like UpdateNow in the RB window class.

50.6.49 frameArc(x as Double, y as Double, w as Double, h as Double, startAngle as Integer, arcAngle as Integer)

Example:

```plaintext
dim c as CGContextMBS

c=window1.CGContextMBS
```
50.6. CLASS CGCONTEXTMBS

// fill in red
c.SetRGBFillColor 1,0,0,1
c.paintArc 100,100,100,100,50,90

// draw in green
c.SetRGBStrokeColor 0,1,0,1
c.frameArc 100,100,100,100,50,90

Notes: angles are in degree.

50.6.50 frameOval(x as Double, y as Double, w as Double, h as Double)

Example:

dim c as CGContextMBS
c=window1.CGContextMBS

// fill in red
c.SetRGBFillColor 1,0,0,1
c.paintOval 100,100,100,100

// draw in green
c.SetRGBStrokeColor 0,1,0,1
c.frameOval 100,100,100,100

50.6.51 frameRect(x as Double, y as Double, w as Double, h as Double)

Example:

dim c as CGContextMBS
c=window1.CGContextMBS

// fill in red
c.SetRGBFillColor 1,0,0,1
c.paintRect 100,100,100,100
// draw in green
    c.SetRGBStrokeColor 0,1,0,1
    c.frameRect 100,100,100,100

50.6.52 GetClipBoundingBox as CGRectMBS

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bounding box of a clipping path.  
**Notes:** Returns the bounding box of the clipping path, specified in user space.  
The bounding box is the smallest rectangle completely enclosing all points in the clipping path, including control points for any Bezier curves in the path.  
Available in Mac OS X v10.3 and later.

50.6.53 GetCTM as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the current graphics state’s transformation matrix.  
**Notes:** Returns nil on any error.

50.6.54 GetPathBoundingBox as CGRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the bounding box of the context’s path.  
**Notes:** The bounding box is the smallest rectangle completely enclosing all points in the path, including control points for Bezier and quadratic curves.

50.6.55 GetPathCurrentPoint as CGPointMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the current point of the current subpath of the context’s path.
50.6.56  GetTextPosition as CGPointMBS

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return the current user-space point at which text will be drawn to (x,y).
**Notes:** Returns nil on any problem.

50.6.57  IsPathEmpty as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns true if the context’s path contains no elements.

50.6.58  MoveToPoint(x as Double, y as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Append a straight line segment from the current point to (x, y).

50.6.59  paintArc(x as Double, y as Double, w as Double, h as Double, startAngle as Integer, arcAngle as Integer)

MBS MacCG Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Fills an arc.
**Example:**

```pascal
dim c as CGContextMBS

c=window1.CGContextMBS

// fill in red
.c.SetRGBFillColor 1,0,0,1
.c.paintArc 100,100,100,100,50,90

// draw in green
.c.SetRGBStrokeColor 0,1,0,1
.c.frameArc 100,100,100,100,50,90
```

**Notes:** angles are in degree.
50.6.60  paintOval(x as Double, y as Double, w as Double, h as Double)

MBS MacCG Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Fills an oval.
**Example:**

dim c as CGContextMBS

c=window1.CGContextMBS

// fill in red
    c.SetRGBFillColor 1,0,0,1
c.paintOval 100,100,100,100

// draw in green
    c.SetRGBStrokeColor 0,1,0,1
c.frameOval 100,100,100,100

50.6.61  paintRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCG Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Fills the rectangle.
**Example:**

dim c as CGContextMBS

c=window1.CGContextMBS

// fill in red
    c.SetRGBFillColor 1,0,0,1
c.paintRect 100,100,100,100

// draw in green
    c.SetRGBStrokeColor 0,1,0,1
c.frameRect 100,100,100,100

50.6.62  PathContainsPoint(point as CGPointMBS, mode as Integer) as boolean

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return true if point is contained in the current path of context.
**Notes:**
A point is contained within a contexts path if it is inside the painted region when the path is stroked or
filled with opaque colors using the path drawing mode. point is specified is user space.

Requires Mac OS X 10.4.

### 50.6.63 ReplacePathWithStrokedPath

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Replace the path in context with the stroked version of the path, using the parameters of context to calculate the stroked path.

**Notes:**
The resulting path is created such that filling it with the appropriate color will produce the same results as stroking the original path. You can use this path in the same way you can use the path of any context; for example, you can clip to the stroked version of a path by calling this function followed by a call to "ClipPath".
Requires Mac OS X 10.4.

### 50.6.64 RestoreGState

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Restores the last saved graphics state.

### 50.6.65 RotateCTM(angle as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Rotate the current graphics state’s transformation matrix (the CTM) by ‘angle’ radians.

**Example:**

```javascript
// Rotate a picture not on the edge of the context:

dim c as CGImageMBS
dim f as FolderItem
dim d as CGDataProviderMBS
dim cg as CGContextMBS
dim r as CGRectMBS

f=SpecialFolder.Desktop.Child("IMAG0001.JPG")

d=CGDataProviderMBS.CreateWithFile(f)
c=CGCreateImageFromJPEGDataProviderMBS(d,nil,true,0)
cg=window1.CGContextMBS
```
r=CGMakeRectMBS(-c.Width/2,-c.Height/2,c.Width,c.Height)
cg.TranslateCTM Width/2,Height/2
cg.RotateCTM Slider1.Value/180.0*3.14
cg.DrawPicture c,r
cg.Flush

50.6.66 SaveGState

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Saves the current graphics state.

50.6.67 ScaleCTM(sx as Double, sy as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Scale the current graphics state’s transformation matrix (the CTM) by (sx, sy).

50.6.68 SelectFont(name as string, size as Double, fontencoding as Integer)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Attempts to find the font named ‘name’. If successful, scales it to ’size’ units in user space. **Notes:**

Name: string that contains the PostScript name of the font to set.

textEncoding’ specifies how to translate from bytes to glyphs.

<table>
<thead>
<tr>
<th>Encoding</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>kCGEncodingFontSpecific</td>
<td>0</td>
</tr>
<tr>
<td>kCGEncodingMacRoman</td>
<td>1</td>
</tr>
</tbody>
</table>

As "Comic Sans MS" works, but not ""Comic Sans ms" this functions seems to be case sensitive.

Matthias Buercher notes that sometimes a font is not selected if the RGBFillColor was not set before.

You may need to reset the textmatrix with some code like c.TextMatrix = CGAffineTransformMBS.Identity. If the text matrix is different, your text may be rotated, skewed or resized.
50.6.69  SetAllowsAntialiasing(allowAntialiasing as boolean)

MBS MacCG Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Whether to allow antialiasing.

**Notes:**
Allow antialiasing in context if allowAntialiasing is true; don’t allow it otherwise. This parameter is not part of the graphics state. A context will perform antialiasing if both allowAntialiasing and the graphics state parameter shouldAntialias are true.
Requires Mac OS X 10.4 to work.

50.6.70  SetAlpha(alpha as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Set the alpha value in the current graphics state to alpha.

50.6.71  SetBlendMode(BlendMode as Integer)

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Set the blend mode of context to mode.

**Notes:** Requires Mac OS X 10.4.

50.6.72  SetCharacterSpacing(spacing as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Set the current character spacing to ‘spacing’.

**Notes:** The character spacing is added to the displacement between the origin of one character and the origin of the next.

50.6.73  SetCMYKFillColor(cyan as Double, magenta as Double, yellow as Double, black as Double, alpha as Double = 1.0)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the fill color to a CMYK color.

**Notes:** colors are from 0 to 1 and alpha is from 0 (transparent) to 1 (solid).
50.6.74  SetCMYKStrokeColor(cyan as Double, magenta as Double, yellow as Double, black as Double, alpha as Double = 1.0)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the stroke color to a CMYK color.
**Notes:** colors are from 0 to 1 and alpha is from 0 (transparent) to 1 (solid).

50.6.75  SetFillColor(color as CGColorMBS)

MBS MacCG Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the given color as fill color.

50.6.76  SetFillColorSpace(colorspace as CGColorSpaceMBS)

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the colorspace used for the fill color of the graphics context.

50.6.77  SetFlatness(flatness as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Set the path flatness parameter in the current graphics state to flatness.

50.6.78  SetFont(font as CGFontMBS)

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the current font.

50.6.79  SetFontSize(size as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Set the current font size to 'size'.

50.6.80  SetGrayFillColor(gray as Double, alpha as Double = 1.0)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the fill color to a gray color.
50.6. CLASS CGCONTEXTMBS

**Notes:** gray is from 0 to 1 and alpha is from 0 (transparent) to 1 (solid).

### 50.6.81 SetGrayStrokeColor(gray as Double, alpha as Double = 1.0)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the stroke color to a gray color.
**Notes:** gray is from 0 to 1 and alpha is from 0 (transparent) to 1 (solid).

### 50.6.82 SetLineCap(cap as Integer)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Set the line cap in the current graphics state to cap.

### 50.6.83 SetLineDash(phase as Double, lengths as memoryblock, count as Integer)

MBS MacCG Plugin, Plugin Version: 7.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the pattern for dashed lines in a graphics context.
**Notes:**
- **phase:**
  A value that specifies how far into the dash pattern the line starts, in units of the user space. For example, passing a value of 3 means the line is drawn with the dash pattern starting at three units from its beginning. Passing a value of 0 draws a line starting with the beginning of a dash pattern.
- **lengths:**
  A memoryblock of float values that specify the lengths of the painted segments and unpainted segments, respectively, of the dash pattern or nil for no dash pattern.

For example, passing a memoryblock with the values [2.0, 3.0] sets a dash pattern that alternates between a 2-user-space-unit-long painted segment and a 3-user-space-unit-long unpainted segment. Passing the values [1.0, 3.0, 4.0, 2.0] sets the pattern to a 1-unit painted segment, a 3-unit unpainted segment, a 4-unit painted segment, and a 2-unit unpainted segment.

**count**
If the lengths parameter specifies a memoryblock, pass the number of elements in the memoryblock. Otherwise, pass 0.
50.6.84  SetLineJoin(join as Integer)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Set the line join in the current graphics state to join.

50.6.85  SetLineWidth(width as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Set the line width in the current graphics state to width.

**Example:**
```plaintext
dim c as CGContextMBS = CGContextMBS.contextWithCGContext(g.Handle(g.HandleTypeCGContex-
tRef))
c.SetGrayStrokeColor(0,1)
c.SetGrayFillColor(0,1)
c.BeginPath
c.SetLineWidth 0.5
c.MoveToPoint 50, 550
c.AddLineToPoint 100, 600
c.StrokePath
c.Flush
c = nil
```

50.6.86  SetMiterLimit(limit as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Set the miter limit in the current graphics state to limit.

50.6.87  SetRenderingIntent(intent as Integer)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Set the rendering intent in the graphics state to ‘intent’.

**Notes:**
Possible values for intent:
kCGRenderingIntentDefault   0
kCGRenderingIntentAbsoluteColorimetric   1
kCGRenderingIntentRelativeColorimetric   2
kCGRenderingIntentPerceptual   3
kCGRenderingIntentSaturation   4

50.6.88  SetRGBFillColor(red as Double, green as Double, blue as Double, alpha as Double = 1.0)
MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the fill color to a RGB color.
**Notes:** colors are from 0 to 1 and alpha is from 0 (transparent) to 1 (solid).

50.6.89  SetRGBStrokeColor(red as Double, green as Double, blue as Double, alpha as Double = 1.0)
MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the stroke color to a RGB color.
**Notes:** colors are from 0 to 1 and alpha is from 0 (transparent) to 1 (solid).

50.6.90  SetShadow(x as Double, y as Double, blur as Double)
MBS MacCG Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enables shadowing in a graphics context.
**Example:**
```
Sub Paint(g As Graphics)
    dim c as CGContextMBS
    c=window1.CGContextMBS
    c.SetShadow 5,5,0.5
    c.SetRGBFillColor 1,0,0,1
    c.FillRect CGMakeRectMBS(100,100,100,100)
    c.Flush
End Sub
```
**Notes:**
x/y: Specifies a translation of the context’s coordinate system, to establish an offset for the shadow ( { 0,0 } specifies a light source immediately above the screen).
blur: A non-negative number specifying the amount of blur.

Shadow parameters are part of the graphics state in a context. After shadowing is set, all objects drawn are shadowed using a black color with 1/3 alpha (i.e., RGBA = \{ 0, 0, 0, 1.0/3.0 \}) in the DeviceRGB color space.

To turn off shadowing:

- Use the standard save/restore mechanism for the graphics state.
- Use CGContextSetShadowWithColor to set the shadow color to a fully transparent color (or pass nil as the color).

50.6.91 SetShadowWithColor(x as Double, y as Double, blur as Double, colorvalue as CGColorMBS)

Notes:
- x/y: Specifies a translation in base-space.
- blur: A non-negative number specifying the amount of blur.
- colorvalue: Specifies the color of the shadow, which may contain a non-opaque alpha value. If nil, then shadowing is disabled.

See also SetShadow.

50.6.92 SetShouldAntialias(shouldAntialias as boolean)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Turn off antialiasing if 'shouldAntialias' is zero; turn it on otherwise.
Notes: This parameter is part of the graphics state.

50.6.93 SetShouldSmoothFonts(shouldSmoothFonts as boolean)

Notes:
- Turn on font smoothing if shouldSmoothFonts is true; turn it off otherwise. This parameter is part of the graphics state. Note that this doesn't guarantee that font smoothing will occur: not all destination contexts support font smoothing.
50.6.94  **SetStrokeColor(color as CGColorMBS)**

MBS MacCG Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the given color as stroke color.

50.6.95  **SetStrokeColorSpace(colorspace as CGColorSpaceMBS)**

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the colorspace used for the stroke color of the graphics context.

50.6.96  **SetTextDrawingMode(mode as Integer)**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Set the text drawing mode to 'mode'.

**Notes:**
Possible values:

- kCGTextFill 0
- kCGTextStroke 1
- kCGTextFillStroke 2
- kCGTextInvisible 3
- kCGTextFillClip 4
- kCGTextStrokeClip 5
- kCGTextFillStrokeClip 6
- kCGTextClip 7

50.6.97  **ShowText(text as string)**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draw 'string' at the point specified by the current text matrix.

**Notes:**
Each byte of the string is mapped through the encoding vector of the current font to obtain the glyph to display.
This function is more for quick and dirty text output, but not for serious drawing as it does not do most
unicode strings correctly. Use ATS for better drawing.

Some RB 5.x versions show a bug that the text is not displayed on a CGContext in while running the application in debug mode.

50.6.98  **ShowTextAtPoint**(text as string, x as Double, y as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Draw 'string' at the point '(x, y)', specified in user space.

**Notes:**
Each byte of the string is mapped through the encoding vector of the current font to obtain the glyph to display.
This function is more for quick and dirty text output, but not for serious drawing as it does not do most unicode strings correctly. Use ATS for better drawing.

Some RB 5.x versions show a bug that the text is not displayed on a CGContext in while running the application in debug mode.

50.6.99  **StrokeEllipseInRect**(rect as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Stroke an ellipse (an oval) inside rect.

**Notes:** Requires Mac OS X 10.4.

50.6.100  **StrokePath**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Stroke the context’s path.

**Example:**
```
    dim c as CGContextMBS

    c=window1.CGContextMBS

    c.SetRGBStrokeColor 1,0,0,1
    c.BeginPath
    c.MoveToPoint 0,0
    c.AddLineToPoint 100,100
    c.StrokePath
    c.Flush
```
50.6.101 StrokeRect(rect as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Stroke ‘rect’ with the current stroke color and the current linewidth.

50.6.102 StrokeRectWithWidth(rect as CGRectMBS, width as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Stroke ‘rect’ with the current stroke color, using ‘width’ as the line width.
50.6.103  strokeRoundedRect(x as Double, y as Double, w as Double, h as Double, arcWidth as Double, arcHeight as Double)

MBS MacCG Plugin, Plugin Version: 8.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Draws the frame for the round rectangle.
**Example:**

```vbscript
dim c as CGContextMBS

    c = window1.CGContextMBS

    // fill in red
    c.SetRGBFillColor 1,0,0,1
    c.fillRoundedRect 100,100,100,100,20,20

    // draw in green
    c.SetRGBStrokeColor 0,1,0,1
    c.strokeRoundedRect 100,100,100,100,20,20
```

50.6.104  Synchronize

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Synchronizes the context with the device.

50.6.105  TranslateCTM(tx as Double, ty as Double)

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Translate the current graphics state's transformation matrix (the CTM) by (tx,ty).
**Example:**

```vbscript
// Rotate a PDF page

// our files
    dim sourcefile as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
    dim destfile as FolderItem = SpecialFolder.Desktop.Child("rotated.pdf")

// open PDF
    dim pdf as CGPDFDocumentMBS = sourcefile.OpenAsCGPDFDocumentMBS

// query media size of first page
    dim r as CGRectMBS = pdf.MediaBox(1)
```
50.6. **CLASS CGCONTEXTMBS**

```csharp
// create new PDF
dim c as CGContextMBS = destfile.NewCGPDFDocumentMBS(r,"title","Author","Creator")

// create rotated rectangle
dim nr as new CGRectMBS(0,0,r.Height,r.Width)

// create new page
c.BeginPage nr
c.SaveGState

const pi = 3.14159265

// rotate by 90
c.RotateCTM pi*1.5

// fix origin
c.TranslateCTM -r.width,0

// draw PDF
c.DrawCGPDFDocument pdf,r,1

// cleanup
c.RestoreGState
c.EndPage

c = nil

// show in PDF viewer
destfile.Launch
```

50.6.106 **Properties**

50.6.107 **handle as Integer**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle for this context. **Notes:** Handle is a CGContextRef. (Read and Write property)
50.6.108 InterpolationQuality as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The interpolation quality for image rendering of this context.

**Notes:**
The interpolation quality is a gstate-parameter which controls the level of interpolation performed when an image is interpolated (for example, when scaling the image). Note that it is merely a hint to the context: not all contexts support all interpolation quality levels.

Possible values:

- `kCGInterpolationDefault` 0 Let the context decide.
- `kCGInterpolationNone` 1 Never interpolate.
- `kCGInterpolationLow` 2 Fast, low quality.
- `kCGInterpolationHigh` 3 Slow, high quality.

(Read and Write property)

50.6.109 RetainCount as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the reference counter of the object.

**Notes:**
If the retain count falls below 1, the object is destroyed.
(Read only property)

50.6.110 TextMatrix as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return the text matrix.

**Notes:**
Returns nil on any error.
(Read and Write computed property)

50.6.111 TextPosition as CGPointMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
User-space point at which text will be drawn to (x,y).
50.6. CLASS CGCONTEXTMBS

Notes: (Read and Write computed property)

50.6.112 Constants

50.6.113 kCGBlendModeClear=16

Notes:
R = 0
Available in Mac OS X v10.5 and later.

50.6.114 kCGBlendModeColor=14

MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.115 kCGBlendModeColorBurn=7

MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.116 kCGBlendModeColorDodge=6

MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.117 kCGBlendModeCopy=17

Notes:
R = S
Available in Mac OS X v10.5 and later.

50.6.118 kCGBlendModeDarken=4

MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.
50.6.119  kCGBlendModeDestinationAtop=24

MBS MacCG Plugin, Plugin Version: 11.2. **Function:** A constant for the Blend modes.  
**Notes:**
R = S*(1 - Da) + D*Sa  
Available in Mac OS X v10.5 and later.

50.6.120  kCGBlendModeDestinationIn=22

MBS MacCG Plugin, Plugin Version: 11.2. **Function:** A constant for the Blend modes.  
**Notes:**
R = D*Sa  
Available in Mac OS X v10.5 and later.

50.6.121  kCGBlendModeDestinationOut=23

MBS MacCG Plugin, Plugin Version: 11.2. **Function:** A constant for the Blend modes.  
**Notes:**
R = D*(1 - Sa)  
Available in Mac OS X v10.5 and later.

50.6.122  kCGBlendModeDestinationOver=21

MBS MacCG Plugin, Plugin Version: 11.2. **Function:** A constant for the Blend modes.  
**Notes:**
R = S*(1 - Da) + D  
Available in Mac OS X v10.5 and later.

50.6.123  kCGBlendModeDifference=10

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Blend modes.
50.6. CLASS CGCONTEXTMBS

50.6.124 kCGBlendModeExclusion=11
MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.125 kCGBlendModeHardLight=9
MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.126 kCGBlendModeHue=12
MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.127 kCGBlendModeLighten=5
MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.128 kCGBlendModeLuminosity=15
MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.129 kCGBlendModeMultiply=1
MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.130 kCGBlendModeNormal=0
MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.131 kCGBlendModeOverlay=3
MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.
50.6.132 kCGBlendModePlusDarker=26

Notes:
R = MAX(0, (1 - D) + (1 - S))
Available in Mac OS X v10.5 and later.

50.6.133 kCGBlendModePlusLighter=27

Notes:
R = MIN(1, S + D)
Available in Mac OS X v10.5 and later.

50.6.134 kCGBlendModeSaturation=13

MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.135 kCGBlendModeScreen=2

MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.136 kCGBlendModeSoftLight=8

MBS MacCG Plugin, Plugin Version: 8.0. Function: A constant for the Blend modes.

50.6.137 kCGBlendModeSourceAtop=20

Notes:
R = S*Da + D*(1 - Sa)
Available in Mac OS X v10.5 and later.
50.6.138  kCGBlendModeSourceIn=18

MBS MacCG Plugin, Plugin Version: 11.2. **Function:** A constant for the Blend modes.
**Notes:**

\[ R = S \times D_a \]
Available in Mac OS X v10.5 and later.

50.6.139  kCGBlendModeSourceOut=19

MBS MacCG Plugin, Plugin Version: 11.2. **Function:** A constant for the Blend modes.
**Notes:**

\[ R = S \times (1 - D_a) \]
Available in Mac OS X v10.5 and later.

50.6.140  kCGBlendModeXOR=25

MBS MacCG Plugin, Plugin Version: 11.2. **Function:** A constant for the Blend modes.
**Notes:**

\[ R = S \times (1 - D_a) + D \times (1 - S_a). \] This XOR mode is only nominally related to the classical bitmap XOR operation, which is not supported by Quartz 2D.
Available in Mac OS X v10.5 and later.

50.6.141  kCGEncodingFontSpecific=0

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Text encodings.

50.6.142  kCGEncodingMacRoman=1

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Text encodings.

50.6.143  kCGInterpolationDefault=0

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Interpolation quality.
**Notes:** Let the context decide.
50.6.144  kCGInterpolationHigh=3

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Interpolation quality.  
**Notes:** Slower, higher quality.

50.6.145  kCGInterpolationLow=2

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Interpolation quality.  
**Notes:** Faster, lower quality.

50.6.146  kCGInterpolationMedium=4

MBS MacCG Plugin, Plugin Version: 11.2. **Function:** A constant for the Interpolation quality.  
**Notes:** A medium level of interpolation quality. This setting is slower than the low setting but faster than the high setting. Available in Mac OS X v10.6 and later.

50.6.147  kCGInterpolationNone=1

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Interpolation quality.  
**Notes:** Never interpolate.

50.6.148  kCGLineCapButt=0

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Line cap styles.

50.6.149  kCGLineCapRound=1

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Line cap styles.

50.6.150  kCGLineCapSquare=2

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Line cap styles.
50.6. CLASS CGCONTEXTMBS

50.6.151 kCGLineJoinBevel=2

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Line join styles.

50.6.152 kCGLineJoinMiter=0

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Line join styles.

50.6.153 kCGLineJoinRound=1

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Line join styles.

50.6.154 kCGPathEOFill=1

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for paths.

50.6.155 kCGPathEOFillStroke=4

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for paths.

50.6.156 kCGPathFill=0

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for paths.

50.6.157 kCGPathFillStroke=3

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for paths.

50.6.158 kCGPathStroke=2

MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for paths.
50.6.159 kCGTextClip=7
MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for text.

50.6.160 kCGTextFill=0
MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for text.

50.6.161 kCGTextFillClip=4
MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for text.

50.6.162 kCGTextFillStroke=2
MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for text.

50.6.163 kCGTextFillStrokeClip=6
MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for text.

50.6.164 kCGTextInvisible=3
MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for text.

50.6.165 kCGTextStroke=1
MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for text.

50.6.166 kCGTextStrokeClip=5
MBS MacCG Plugin, Plugin Version: 8.0. **Function:** A constant for the Drawing modes for text.
50.7. CLASS CGDATACONSUMERMBS

50.7  class CGDataConsumerMBS

50.7.1  class CGDataConsumerMBS

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for CoreGraphics to write data.

50.7.2  Methods

50.7.3  Constructor

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new event based data consumer.
**Notes:** On failure the handle property is zero.
See also:

- 50.7.4 Constructor(file as folderitem)
- 50.7.5 Constructor(url as string)

50.7.4  Constructor(file as folderitem)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new CGDataConsumer to write data to the given file.
**Notes:** On failure the handle property is zero.
See also:

- 50.7.3 Constructor
- 50.7.5 Constructor(url as string)

50.7.5  Constructor(url as string)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new CGDataConsumer to write data to the given url.
**Notes:** On failure the handle property is zero.
See also:

- 50.7.3 Constructor
- 50.7.4 Constructor(file as folderitem)
50.7.6 CreateWithFile(file as folderitem) as CGDataConsumerMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGDataConsumer to write data to the given file. **Notes:** Returns nil on any error.

50.7.7 CreateWithURL(url as string) as CGDataConsumerMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGDataConsumer to write data to the given url. **Notes:** Returns nil on any error.

50.7.8 Properties

50.7.9 Handle as Integer

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the CGDataConsumer object. **Notes:** Data is a CGDataConsumerRef. (Read and Write property)

50.7.10 Events

50.7.11 CloseConsumer

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Event called when the consumer is no longer needed.

50.7.12 Put(data as string) as Integer

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Some data needs to be stored. **Notes:** Write the given data string into your backbuffer or file and return the number of bytes written. Return 0 if you can’t accept new input.
50.8. class CGDataProviderMBS

50.8.1 class CGDataProviderMBS

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a Coregraphics data provider.
**Notes:** Something like a textinputstream in RB, but for Coregraphics this stream provides binary data.

50.8.2 Methods

50.8.3 Constructor(data as string)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new data provider reading data from the given string.
**Notes:**
On failure the handle property is zero.
Available in Mac OS X v10.4 and later.
See also:

- 50.8.4 Constructor(file as folderitem)

50.8.4 Constructor(file as folderitem)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a data provider using a CFUrl.
**Notes:** On failure the handle property is zero.
See also:

- 50.8.3 Constructor(data as string)

50.8.5 CreateWithData(data as string) as CGDataProviderMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new data provider reading data from the given string.
**Notes:**
On failure the handle property is zero.
Available in Mac OS X v10.4 and later.
50.8.6 CreateWithFile(file as folderitem) as CGDataProviderMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a data provider using a file. **Notes:** Returns nil on any error.

50.8.7 CreateWithURL(url as string) as CGDataProviderMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a data provider using an URL. **Notes:** Returns nil on any error.

50.8.8 Data as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a copy of the provider’s data. **Notes:** Available in Mac OS X v10.5 and later.

50.8.9 Properties

50.8.10 Handle as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to CGDataProvider object. **Notes:** (a CGDataProviderRef) (Read and Write property)
50.9. class CGDisplayConfigMBS

50.9.1 class CGDisplayConfigMBS

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for a display configuration.

**Notes:**
The display reconfiguration process:

- Make all desired changes for all displays.
- Commit the changes using Complete(), or cancel with Cancel().

The resulting layout will be adjusted to remove gaps or overlaps from the requested layout, if needed. */

50.9.2 Methods

50.9.3 Cancel

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Cancel a set of display configuration changes.

**Notes:** On return, the configuration is cancelled and is no longer valid.

50.9.4 Complete(options as Integer)

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Complete a set of display configuration changes.

**Notes:**
On return, the configuration is no longer valid.

A configuration change can apply for the life of an application, the life of a login session, or permanently. If a request is made to make a change permanent, and the change cannot be supported by Mac OS X user interface, then the configuration change lasts only for the current login session.

A permanent configuration change also becomes the current session’s configuration. When the system reverts configurations at app termination, the configuration reverts to the session or permanent configuration setting. When the system reverts configurations at session termination, the configuration reverts to the permanent configuration setting.
This operation may fail if an unsupported display mode is requested, or if another app is running in full-screen mode.

### 50.9.5 DisplayMode(display as CGDisplayMBS, mode as CGDisplayModeMBS)

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Configure the display mode of a display.

**Notes:**

A display mode is a set of properties such as width, height, pixel depth, and refresh rate, and options such as stretched LCD panel filling.

If you use this function to change the mode of a display in a mirroring set, Quartz may adjust the bounds, resolutions, and depth of the other displays in the set to a safe mode, with matching depth and the smallest enclosing size.

### 50.9.6 MirrorOfDisplay(display as CGDisplayMBS, master as CGDisplayMBS)

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Make a display a mirror of a master display.

**Notes:**

Pass nil for the master display to disable mirroring.
Pass MainDisplay for the master display to mirror the main display.

Display mirroring and display matte generation are implemented either in hardware (preferred) or software, at the discretion of the device driver.

- **Hardware mirroring**

With hardware mirroring enabled, all drawing is directed to the primary display — see PrimaryDisplay.

If the device driver selects hardware matte generation, the display bounds and rowbytes values are adjusted to reflect the active drawable area.

- **Software mirroring**

In this form of mirroring, identical content is drawn into each display in the mirroring set. Applications that use the window system need not be concerned about mirroring, as the window system takes care of all
flushing of window content to the appropriate displays.

Applications that draw directly to the display, as with display capture, must make sure to draw the same content to all mirrored displays in a software mirror set. When drawing to software mirrored displays using a full screen OpenGL context (not drawing through a window), you should create shared OpenGL contexts for each display and re-render for each display.

You can use the function GetActiveDisplayList to determine which displays are active, or drawable. This automatically gives your application the correct view of the current displays.

50.9.7 Mode(display as CGDisplayMBS, mode as Dictionary)

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets the mode given the values in the dictionary.  
**Notes:** Deprecated with Mac OS X 10.6.

50.9.8 Origin(display as CGDisplayMBS, x as Integer, y as Integer)

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Configure the origin of a display in global display coordinates.  
**Notes:** The new origin of the display is placed as close as possible to the requested location, without overlapping or leaving a gap between displays.

Any display whose origin is not explicitly set in a reconfiguration will be repositioned to a location as close as possible to its current location without overlapping or leaving a gap between displays.

Note that setting the origin of a display which is mirroring another display will remove that display from any mirroring set.

50.9.9 RestorePermanentDisplayConfiguration

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Restore the permanent display configuration settings for the current user.
50.9.10 StereoOperation(display as CGDisplayMBS, stereo as Boolean, forceBlueLine as Boolean)

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Enable or disable stereo operation for a display.

**Notes:**

Note that the system normally detects the presence of a stereo window, and will automatically switch a display containing a stereo window to stereo operation. This function provides a mechanism to force a display to stereo operation, and to set options (such as blue line sync signal) when in stereo operation.

When in stereo operation, a display may need to generate a special stereo sync signal as part of the video output. The sync signal consists of a blue line which occupies the first 25% of the last scanline for the left eye view, and the first 75% of the last scanline for the right eye view. The remainder of the scanline is black. To force the display to generate this sync signal, pass true for forceBlueLine; otherwise, pass false.

Returns kCGErrorSuccess on success, or kCGErrorRangeCheck if the display does not support the stereo operation settings requested.

On success, the display resolution, mirroring mode, and available display modes may change due to hardware-specific capabilities and limitations. You should check these settings to verify that they are appropriate for your application.

50.9.11 Properties

50.9.12 Handle as Integer

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.

**Notes:** (Read only property)

50.9.13 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The last error value.

**Notes:** (Read only property)
50.9.14  Constants

50.9.15  kCGConfigureForAppOnly = 0

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the option constants for Complete method. **Notes:** For application only.

50.9.16  kCGConfigureForSession = 1

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the option constants for Complete method. **Notes:** For session only.

50.9.17  kCGConfigurePermanently = 2

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the option constants for Complete method. **Notes:** Permanently.
50.10 class CGDisplayMBS

50.10.1 class CGDisplayMBS

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a CoreGraphics Display object.  
**Example:**

```vbnet
dim c as new CGDisplayMBS
dim lines(-1) as string

dim DPIWidth as Double = c.PixelsWide/(c.ScreenSizeWidth/10.0/2.54)
dim DPIHeight as Double = c.PixelsHigh/(c.ScreenSizeHeight/10.0/2.54)

lines.append str(c.ScreenSizeWidth)+" x "+str(c.ScreenSizeHeight)+" Millimeter with"
lines.Append str(c.PixelsWide)+" x "+str(c.PixelsHigh)+" Pixel is"
lines.Append str(DPIWidth)+" x "+str(DPIHeight)+" DPI"

MsgBox Join(lines,EndOfLine)
```

50.10.2 Methods

50.10.3 AllDisplayModes as CGDisplayModeMBS()

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return an array of all modes for the specified display.  
**Example:**

```vbnet
dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay
dim modes(-1) as string

for each mode as CGDisplayModeMBS in d.AllDisplayModes
    modes.append str(mode.Width)+" x "+str(mode.Height)
next
MsgBox Join(modes,EndOfLine)
```

**Notes:**  
Returns an empty array on any error.  
Requires Mac OS X 10.6
50.10.4 AvailableModes as Dictionary()

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array filled with dictionaries (one for each mode).

**Example:**

```plaintext
// Display all available graphic modes:
Listbox1.DeleteAllRows
Listbox1.ColumnCount = 4

dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay

dim a(-1) as Dictionary = d.AvailableModes

for each di as Dictionary in a
    Listbox1.AddRow di.Value(d.kCGDisplayMode).stringValue
    Listbox1.cell(Listbox1.LastIndex,1) = di.Value(d.kCGDisplayWidth)+" "+di.Value(d.kCGDisplayHeight)
    Listbox1.cell(Listbox1.LastIndex,2) = di.Value(d.kCGDisplayRefreshRate)
    Listbox1.cell(Listbox1.LastIndex,3) = di.Value(d.kCGDisplayBitsPerPixel)
next
```

**Notes:** Returns empty error on any error.

50.10.5 BestModeForParameters(BitsPerPixel as Integer, Width as Integer, Height as Integer, byref ExactMatch as boolean) as Dictionary

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Dictionary with the best mode found for the given parameters.

**Notes:**

Returns nil on any error.

Try to find a display mode of specified depth with dimensions equal or greater than specified. If no depth match is found, try for the next larger depth with dimensions equal or greater than specified. If no luck, then just return the current mode.

exactmatch is set to 'true' if an exact match in width, height, and depth is found, and 'false' otherwise. Returns nil if display is invalid.
50.10.6  **BestModeForParametersAndRefreshRate** (BitsPerPixel as Integer, Width as Integer, Height as Integer, RefreshRate as Integer, byref ExactMatch as boolean) as Dictionary

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Dictionary with the best mode found for the given parameters.

**Notes:**

Returns nil on any error.

Try to find a display mode of specified depth with dimensions equal or greater than specified.
If no depth match is found, try for the next larger depth with dimensions equal or greater than specified. If no luck, then just return the current mode.

exactmatch is set to ‘true’ if an exact match in width, height, and depth is found, and ‘false’ otherwise. Returns nil if display is invalid.

50.10.7  **BestModeForParametersAndRefreshRateWithProperty** (BitsPerPixel as Integer, Width as Integer, Height as Integer, RefreshRate as Integer, propertyName as string, byref ExactMatch as boolean) as Dictionary

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Dictionary with the best mode found for the given parameters.

**Notes:**

Returns nil on any error.

Try to find a display mode of specified depth with dimensions equal or greater than specified.
If no depth match is found, try for the next larger depth with dimensions equal or greater than specified. If no luck, then just return the current mode.

exactmatch is set to ‘true’ if an exact match in width, height, and depth is found, and ‘false’ otherwise. Returns nil if display is invalid.

50.10.8  **Capture as Integer**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Captures this display for your use.

**Example:**

```vbnet
dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay
```
if d.Capture = 0 then

dim c as CGContextMBS = d.DrawingContext

// watch it drawing red
c.SetRGBFillColor 1.0, 0.0, 0.0, 1.0
c.FillRect CGMakeRectMBS(0,0,d.PixelsWide,d.PixelsHigh)

DelayMBS 3.0

call d.Release
else
MsgBox "Failed to capture displays."
end if

Notes:
Don’t forget to Release the display later.
Returns an error code.

50.10.9 CaptureAllDisplays as Integer

Example:

dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay

if d.CaptureAllDisplays = 0 then

dim c as CGContextMBS = d.DrawingContext

// watch it drawing red
c.SetRGBFillColor 1.0, 0.0, 0.0, 1.0
c.FillRect CGMakeRectMBS(0,0,d.PixelsWide,d.PixelsHigh)

DelayMBS 3.0

call d.ReleaseAllDisplays
else
MsgBox "Failed to capture displays."
end if
Notes:
This has the nice effect of providing an immersive environment, and preventing other apps from trying to adjust themselves to display changes only needed by your app.

Returns an error code.

50.10.10 CaptureAllDisplaysWithOptions(options as Integer) as Integer

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Capture all displays.

**Example:**

```vba
dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay

if d.CaptureAllDisplaysWithOptions(d.kCGCaptureNoOptions) = 0 then
    dim c as CGContextMBS = d.DrawingContext

    // watch it drawing red
    c.SetRGBFillColor 1.0, 0.0, 0.0, 1.0
    c.FillRect CGMakeRectMBS(0, 0, d.PixelsWide, d.PixelsHigh)

    DelayMBS 3.0

    call d.ReleaseAllDisplays
else
    MsgBox "Failed to capture displays."
end if
```

Notes:
This has the nice effect of providing an immersive environment, and preventing other apps from trying to adjust themselves to display changes only needed by your app.

Use kCGCaptureNoOptions and kCGCaptureNoFill for options parameter. Returns an error code.

50.10.11 CaptureWithOptions(options as Integer) as Integer

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Captures this display for your use.
Example:

dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay

if d.CaptureWithOptions(d.kCGCaptureNoOptions) = 0 then

dim c as CGContextMBS = d.DrawingContext

    // watch it drawing red
    c.SetRGBFillColor 1.0, 0.0, 0.0, 1.0
    c.FillRect CGMakeRectMBS(0,0,d.PixelsWide,d.PixelsHigh)

DelayMBS 3.0

call d.Release
else
    MsgBox "Failed to capture displays."
end if

Notes:

Don’t forget to Release the display later.
Returns an error code.
Use kCGCaptureNoOptions and kCGCaptureNoFill for options parameter.

50.10.12 CreateImage as CGImageMBS

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return an image containing the contents of the display.

**Example:**

dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay
dim img as CGImageMBS = d.CreateImage

Backdrop = img.Picture

**Notes:** Requires Mac OS X 10.6.
50.10.13  CreateImageAsync(receiverDelegate as CreateImageAsyncDelegateMBS, jpegQuality as Double = 0.9, tag as Variant = nil)

MBS MacCG Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Asynchronously creates an image with screenshot. **Notes:**

- If jpeg is $\geq 0$, we use it as quality for the jpeg compression and provide the JPEG data as memoryblock in the delegate.
- Tag is passed through as is.

*Delegate declaration:*
CreateImageAsyncDelegateMBS(img as CGImageMBS, JPEGData as MemoryBlock, Tag as Variant)

50.10.14  CreateImageForRect(rect as CGRectMBS) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return an image containing the contents of the rectangle rect, specified in display space, of the display identified by self. **Example:**

```vbnet
dim r as CGRectMBS = CGMakeRectMBS(100,100,500,500)
dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay
dim img as CGImageMBS = d.CreateImageForRect(r)
Backdrop = img.Picture
```

**Notes:**

- The actual rectangle used is the rectangle returned from CGRectIntegral(rect).
- Requires Mac OS X 10.6.

50.10.15  DrawingContext as CGContextMBS

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return a CGContext suitable for drawing to the captured display, or nil if display has not been captured. **Example:**

```vbnet
dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay
if d.Capture = 0 then
dim c as CGContextMBS = d.DrawingContext
```

50.10. CLASS CGDISPLAYMBS

// watch it drawing red
c.SetRGBFillColor 1.0, 0.0, 0.0, 1.0
c.FillRect CGMakeRectMBS(0,0,d.PixelsWide,d.PixelsHigh)

DelayMBS 3.0

call d.Release
else
MsgBox "Failed to capture displays."
end if

Notes:
The context is owned by the device and should not be released by the caller.

The context remains valid while the display is captured and while the display configuration is unchanged.
Releasing the captured display or reconfiguring the display invalidates the drawing context.

The determine when the display configuration is changing, use
CGDisplayReconfigurationEventMBS class.

50.10.16 GetActiveDisplayList as CGDisplayMBS()

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Returns an array with the active displays.
Example:

// List all displays in a 2 column listbox:

Listbox1.DeleteAllRows

for each d as CGDisplayMBS in CGDisplayMBS.GetActiveDisplayList
Listbox1.AddRow hex(d.Handle)
Listbox1.cell(Listbox1.LastIndex,1)=str(d.PixelsWide)+” x ”+str(d.PixelsHigh)
next

Notes:
Returns an empty array on any error.
The first display returned in the list is the main display, the one with the menu bar. When mirroring, this will be the largest display, or if all are the same size, the one with the deepest pixel depth.

This function was named CGGetActiveDisplayListMBS in older plugin versions.

50.10.17 GetDisplaysWithOpenGLOpenGLDisplayMask(mask as Integer) as CGDisplayMBS()

Notes: Returns an empty array on any error.

50.10.18 GetDisplaysWithPoint(cgpoint as CGPointMBS) as CGDisplayMBS()

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Returns an array of CGDisplayMBS objects who are visible at the point on the virtual screen.
Example:
// List all displays in a 2 column listbox which match the point:
Listbox1.DeleteAllRows
dim p as CGPointMBS = CGMakePointMBS(100,100)
for each d as CGDisplayMBS in CGDisplayMBS.GetDisplaysWithPoint(p)
Listbox1.AddRow hex(d.Handle)
Listbox1.cell(Listbox1.LastIndex,1)=str(d.PixelsWide)+" x "+str(d.PixelsHigh)
next

Notes:
Returns an empty array on any error.

This function was called CGGetDisplaysWithPointMBS in older plugin versions.
See also:
- 50.10.19 GetDisplaysWithPoint(x as Double, y as Double) as CGDisplayMBS()
50.10. CLASS CGDISPLAYMBS

50.10.19 GetDisplaysWithPoint(x as Double, y as Double) as CGDisplayMBS()

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of CGDisplayMBS objects who are visible at the point on the virtual screen.

**Example:**

// List all displays in a 2 column listbox which match the point:  
Listbox1.DeleteAllRows  
for each d as CGDisplayMBS in CGDisplayMBS.GetDisplaysWithPoint(100,100)  
Listbox1.AddRow hex(d.Handle)  
Listbox1.cell(Listbox1.LastIndex,1)=str(d.PixelsWide)+" x "+str(d.PixelsHigh)  
next

**Notes:**  
Returns an empty array on any error.

This function was called CGGetDisplaysWithPointMBS in older plugin versions. See also:

- 50.10.18 GetDisplaysWithPoint(cgpoint as CGPointMBS) as CGDisplayMBS()  

50.10.20 GetDisplaysWithRect(cgrect as CGRectMBS) as CGDisplayMBS()

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of CGDisplayMBS objects who are visible within the rectangle on the virtual screen.

**Example:**

// List all displays in a 2 column listbox which match the rectangle:  
Listbox1.DeleteAllRows  
dim p as CGRectMBS = CGMakeRectMBS(100,100,100,100)  
for each d as CGDisplayMBS in CGDisplayMBS.GetDisplaysWithRect(p)  
Listbox1.AddRow hex(d.Handle)  
Listbox1.cell(Listbox1.LastIndex,1)=str(d.PixelsWide)+" x "+str(d.PixelsHigh)  
next
Notes:

Returns an empty array on any error.
This function was called CGGetDisplaysWithRectMBS in older plugin versions.
See also:

- 50.10.21 GetDisplaysWithRect(x as Double, y as Double, w as Double, h as Double) as CGDisplayMBS()

50.10.21 GetDisplaysWithRect(x as Double, y as Double, w as Double, h as Double) as CGDisplayMBS()

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Returns an array of CGDisplayMBS objects who are visible within the rectangle on the virtual screen.
**Example:**

```
// List all displays in a 2 column listbox which match the rectangle:
Listbox1.DeleteAllRows
for each d as CGDisplayMBS in CGDisplayMBS.GetDisplaysWithRect(100,100,100,100)
Listbox1.AddRow hex(d.Handle)
Listbox1.cell(Listbox1.LastIndex,1)=str(d.PixelsWide)+" x "+str(d.PixelsHigh)
next
```

Notes:

Returns an empty array on any error.
This function was called CGGetDisplaysWithRectMBS in older plugin versions.
See also:

- 50.10.20 GetDisplaysWithRect(cgrect as CGRectMBS) as CGDisplayMBS()

50.10.22 GetDisplayTransferByTable(capacity as Integer, red as memoryblock, green as memoryblock, blue as memoryblock, byref samplecount as Integer) as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Get transfer tables.
**Notes:**
Capacity should contain the number of samples each array can hold, and sampleCount is filled in with the number of samples actually copied in.
You must pass in Memoryblocks with the given size (capacity*4 Bytes).
Returns an error code.

50.10.23  GetDisplayTransferFormula(byref formula as CGDisplayTransferFormulaMBS) as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Queries the display for the current gamma formula.
Notes: Returns an error code.

50.10.24  GetLastMouseDelta(byref deltax as Integer, byref deltay as Integer)

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Report the mouse position change associated with the last mouse move event received by this application.

50.10.25  GetOnlineDisplayList as CGDisplayMBS()

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Returns an array with the online displays.
Example:
// List all online displays in a 2 column listbox:
Listbox1.DeleteAllRows
for each d as CGDisplayMBS in CGDisplayMBS.GetOnlineDisplayList
Listbox1.AddRow hex(d.Handle)
Listbox1.cell(Listbox1.LastIndex,1)=str(d.PixelsWide)+" x "+str(d.PixelsHigh)
next

Notes:
Returns an empty array on any error.

The first display returned in the list is the main display, the one with the menu bar.
When mirroring, this will be the largest display, or if all are the same size, the one with the deepest pixel
With hardware mirroring, a display may be on-line, but not necessarily active, or drawable. Programs which manipulate display settings such as the palette or gamma tables need access to all displays in use, including hardware mirrors which are not drawable.

This function was named CGGetOnlineDisplayListMBS in older plugin versions.

### 50.10.26 HideCursor as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Hides the mouse cursor.
**Notes:**
Returns an error code.
Decrements hide cursor count.

### 50.10.27 Info as Dictionary

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the information CFDictionary about the display.
**Example:**
```vbnet
dim c as CGDisplayMBS = CGDisplayMBS.MainDisplay
dim d as Dictionary = c.Info
MsgBox d.Value("DisplaySerialNumber")
```

**Notes:**
On any error the return value is nil.
This function leaks around 4 to 16 KB of memory on Mac OS X 10.4. Not in the versions 10.3 or 10.5.

### 50.10.28 InfoAsCFDictionary as Variant

MBS MacCG Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the information CFDictionary about the display.
**Notes:**
On any error the return value is nil.
Returns a CFDictionaryMBS object. Returned as Variant to reduce plugin dependencies.
50.10.29  **IsCaptured as boolean**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if you captured this display.  
**Example:**

```vbnet
dim d as new CGDisplayMBS // pick main display
MsgBox str(d.IsCaptured)
```

50.10.30  **MainDisplay as CGDisplayMBS**

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Return the display object of the current main display.  
**Example:**

```vbnet
dim c as CGDisplayMBS = CGDisplayMBS.MainDisplay
MsgBox str(c.PixelsWide)+" x "+str(c.PixelsHigh)
```

50.10.31  **MoveCursorToPoint(x as Double, y as Double) as Integer**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Move the cursor to the specified point relative to the display origin (the upper left corner of the display).  
**Example:**

```vbnet
Function KeyDown(Key As String) As Boolean
// in a window keydown event:
if asc(key)=32 then
    dim c as new CGDisplayMBS
    dim error as Integer = c.MoveCursorToPoint(200,200)
    Title=str(error) // zero on success
end if
End Function
```
Notes:
Returns CGDisplayNoErr (0) on success.
No events are generated as a result of this move.
Points that would lie outside the desktop are clipped to the desktop.

50.10.32 OpenGLDisplayMask as Integer

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Return the OpenGL display mask for display, or 0 is display is an invalid display.

50.10.33 Release as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Releases the display.
Example:

```vbscript
dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay
if d.Capture = 0 then

dim c as CGContextMBS = d.DrawingContext

// watch it drawing red
c.SetRGBFillColor 1.0, 0.0, 0.0, 1.0
c.FillRect CGMakeRectMBS(0,0,d.PixelsWide,d.PixelsHigh)

DelayMBS 3.0

call d.Release
else
MsgBox "Failed to capture displays."
end if
```

Notes: Returns an error code.

50.10.34 ReleaseAllDisplays as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Release all captured displays.
Example:
50.10. **CLASS CGDISPLAYMBS**

```vbscript
dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay

if d.CaptureAllDisplays = 0 then

dim c as CGContextMBS = d.DrawingContext

// watch it drawing red

c.SetRGBFillColor 1.0, 0.0, 0.0, 1.0

c.FillRect CGMakeRectMBS(0,0,d.PixelsWide,d.PixelsHigh)

DelayMBS 3.0

call d.ReleaseAllDisplays
else
MsgBox "Failed to capture displays."
end if
```

**Notes:** Release all captured displays, and restore the display modes to the user’s preferences. May be used in conjunction with Capture or CaptureAllDisplays.

### 50.10.35 RestoreColorSyncSettings

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Restore gamma tables of system displays to the user’s ColorSync specified values.

### 50.10.36 SetDisplayMode(mode as CGDisplayModeMBS) as Integer

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Switch the display mode to mode.

**Notes:**
The selected display mode persists for the life of the program, and automatically reverts to the permanent setting when the program terminates.

When changing display modes of displays in a mirroring set, other displays in the mirroring set will be set to a display mode capable of mirroring the bounds of the largest display being explicitly set.

Note that after switching, display parameters and addresses may change.
50.10.37  SetDisplayTransferByByteTable(count as Integer, red as memoryblock, green as memoryblock, blue as memoryblock) as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Set a display gamma/transfer function using tables of data for each channel.
**Notes:**
As a convenience, allow setting of the gamma table by byte values.
Returns an error code.

50.10.38  SetDisplayTransferByTable(count as Integer, red as memoryblock, green as memoryblock, blue as memoryblock) as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Set a display gamma/transfer function.
**Notes:**
Set a display gamma/transfer function using tables of data for each channel.
Values within each table should have values in the range of 0.0 through 1.0.
The same table may be passed in for red, green, and blue channels. 'count' indicates the number of entries
in each table.
The tables are interpolated as needed to generate the number of samples needed by hardware.
Returns an error code.

50.10.39  SetDisplayTransferFormula(formula as CGDisplayTransferFormulaMBS) as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Set a display gamma/transfer function.
**Notes:**
Set a display gamma/transfer function from a formula specifying min and max values and a gamma for each channel.
Gamma values must be greater than 0.0.
To get an antigamma of 1.6, one would specify a value of (1.0 / 1.6)
Min values must be greater than or equal to 0.0 and less than 1.0.
Max values must be greater than 0.0 and less than or equal to 1.0.
Out of range values, or Max greater than or equal to Min result in a kCGSRangeCheck error.

Values are computed by sampling a function for a range of indices from 0 through 1: value = Min + ((Max
- Min) * pow(index, Gamma))
The resulting values are converted to a machine specific format and loaded into hardware.
Returns an error code.

50.10.40 SetRotation(angle as Integer) as Integer

MBS MacCG Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Rescans the bus of displays and changes the rotation of the display.
Example:

```vbnet
dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay
dim e as Integer = d.SetRotation(90)
```

if e<>0 then
  MsgBox "Error: " + str(e)
end if

Notes:
Returns IOKit error code. Zero means success.
Lasterror is set.

50.10.41 SetStereoOperation(stereo as boolean, forceBlueLine as boolean, option as Integer) as Integer

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Immediately enable or disable stereo operation for a display.
Notes:
Note that the system normally detects the presence of a stereo window, and will automatically switch a display containing a stereo window to stereo operation. This function provides a mechanism to force a display to stereo operation, and to set options (such as blue line sync signal) when in stereo operation.

When in stereo operation, a display may need to generate a special stereo sync signal as part of the video output. The sync signal consists of a blue line which occupies the first 25% of the last scanline for the left eye view, and the first 75% of the last scanline for the right eye view. The remainder of the scanline is black. To force the display to generate this sync signal, pass true for forceBlueLine; otherwise, pass false.

Lasterror is set to kCGErrorSuccess on success, or kCGErrorRangeCheck if the display does not support the stereo operation settings requested.
On success, the display resolution, mirroring mode, and available display modes may change due to hardware-specific capabilities and limitations. You should check these settings to verify that they are appropriate for your application.

Lasterror is set.

50.10.42 ShieldingWindowID as UInt32

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns window ID of the shield window for the captured display, or 0 if the display is not shielded.

50.10.43 ShieldingWindowLevel as Int32

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the window level of the shield window for the captured display.

50.10.44 ShowCursor as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Shows the mouse cursor.

**Notes:**
- Returns an error code.
- Increments hide cursor count.

50.10.45 SwitchToMode(Mode as Dictionary) as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Switch display mode.

**Notes:**
- Note that after switching, display parameters and addresses may change.
- The selected display mode persists for the life of the program, and automatically reverts to the permanent setting made by Preferences when the program terminates.
- The mode dictionary passed in must be a dictionary vended by other CGDirectDisplay APIs such as BestModeForParameters() and AvailableModes().
- Returns an error code.
50.10.46 **WaitForBeamPositionOutsideLines** (upperScanLine as UInt32, lowerScanLine as UInt32) as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Wait until the beam position is outside the range specified.

**Notes:**
Wait until the beam position is outside the range specified by upperScanLine and lowerScanLine.
Note that if upperScanLine and lowerScanLine encompass the entire display height, the function returns an error.
lowerScanLine must be greater than or equal to upperScanLine.

Some display systems may not conventional video vertical and horizontal sweep in painting.
These displays report a kCGDisplayRefreshRate of 0 in the CFDictionaryRef returned by CurrentMode().
On such displays, this function returns at once.

Some drivers may not implement support for this mechanism.
On such displays, this function returns at once.

Returns CGDisplayNoErr on success, and an error if display or upperScanLine and lowerScanLine are invalid.

The app should set the values of upperScanLine and lowerScanLine to allow enough lead time for the drawing operation to complete. A common strategy is to wait for the beam to pass the bottom of the drawing area, allowing almost a full vertical sweep period to perform drawing.

To do this, set upperScanLine to 0, and set lowerScanLine to the bottom of the bounding box:
lowerScanLine = (CGBeamPosition)(cgrect.origin.y + cgrect.size.height);

IOKit may implement this as a spin-loop on the beam position call used for BeamPosition().
On such system the function is CPU bound, and subject to all the usual scheduling pre-emption.
In particular, attempting to wait for the beam to hit a specific scanline may be an exercise in frustration.

These functions are advisary in nature, and depend on IOKit and hardware specific drivers to implement support. If you need extremely precise timing, or access to vertical blanking interrupts, you should consider writing a device driver to tie into hardware-specific capabilities.

Returns an error code.
50.10.47 Properties

50.10.48 BeamPosition as UInt32

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current beam position on the display.  
**Example:**

```bash
dim d as new CGDisplayMBS // pick main display
MsgBox str(d.BeamPosition)
```

**Notes:**
If display is invalid, or the display does not implement conventional video vertical and horizontal sweep in painting, or the driver does not implement this functionality, 0 is returned.  
(Read only property)

50.10.49 Bounds as CGRectMBS

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return screen size and origin in global coords.  
**Notes:**
Empty rect or nil if display is invalid.  
(Read only property)

50.10.50 Brightness as Double

MBS MacCG Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Get/Set brightness of display.  
**Notes:**
Returns -1 if not supported.  
Lasterror is set.  
(Read and Write property)

50.10.51 CanSetPalette as boolean

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the current display mode supports palettes.
50.10. CLASS CGDISPLAYMBS

Example:

dim d as new CGDisplayMBS // pick main display

MsgBox str(d.CanSetPalette)

Notes: (Read only property)

50.10.52 ColorSpace as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the color space for a display.
Example:

dim d as new CGDisplayMBS // pick main display

MsgBox str(d.ColorSpace.Model) // typical 1 = CGColorSpaceMBS.kCGColorSpaceModelRGB

Notes:
This function returns a display-dependent ICC-based color space. You can use this function when rendering
content for a specific display in order to produce color-matched output for that display.

Available in Mac OS X v10.5 and later.
(Read only property)

50.10.53 CurrentMode as Dictionary

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Return a Dictionary describing the current display mode.
Example:

dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay
dim dic as Dictionary = d.CurrentMode

MsgBox dic.Value(d.kCGDisplayWidth)+” x ”+dic.Value(d.kCGDisplayHeight)

Notes:
Returns nil on any error.
50.10.54 **DisplayMode as CGDisplayModeMBS**

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return the current mode of the specified display.

**Example:**
```
dim d as CGDisplayMBS = CGDisplayMBS.MainDisplay
MsgBox str(d.DisplayMode.Width)+" x "+str(d.DisplayMode.Height)
```

**Notes:**
- Returns nil on any error.
- Requires Mac OS X 10.6

(Read only property)

50.10.55 **DisplayProductNames as Dictionary**

MBS MacCG Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Queries product names for display in all available languages.

**Example:**
```
dim display as CGDisplayMBS = CGDisplayMBS.MainDisplay
dim names as Dictionary = display.DisplayProductNames
MsgBox names.Lookup("en_US", ",?")
```

**Notes:** (Read only property)

50.10.56 **Handle as Integer**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The handle to the current display.

**Notes:**
- Internally: The DisplayID.
- 0 is the main display (to keep it easier).

(Read only property)
50.10. **CLASS CGDISPLAYMBS**

50.10.57 **IOServicePort as Integer**

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return the IOKit service port of a display.
**Notes:** (Read only property)

50.10.58 **IsActive as boolean**

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a Boolean value indicating whether a display is active.
**Example:**
```vba
    dim d as new CGDisplayMBS // pick main display
    MsgBox str(d.IsActive)
```
**Notes:**
If true, the specified display is active; otherwise, false.
An active display is connected, awake, and available for drawing. In a hardware mirroring set, only the primary display is active.
(Read only property)

50.10.59 **IsAlwaysInMirrorSet as boolean**

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a Boolean value indicating whether a display is always in a mirroring set.
**Example:**
```vba
    dim d as new CGDisplayMBS // pick main display
    MsgBox str(d.IsAlwaysInMirrorSet)
```
**Notes:**
If true, the specified display is in a mirroring set and cannot be removed from this set.
Some hardware configurations support the connection of auxiliary displays that always mirror the main display, and therefore cannot be removed from the mirroring set to which they belong.
(Read only property)
50.10.60  IsAsleep as boolean

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether a display is sleeping (and is therefore not drawable.)

**Example:**

```plaintext
dim d as new CGDisplayMBS // pick main display

MsgBox str(d.IsAsleep)
```

**Notes:**

If true, the specified display is in sleep mode; otherwise, false.

A display is sleeping when its frame buffer and the attached monitor are in reduced power mode. A sleeping display is still considered to be a part of global display (desktop) space, but it is not drawable.

(Read only property)

---

50.10.61  IsBuiltin as boolean

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether a display is built-in, such as the internal display in portable systems.

**Example:**

```plaintext
dim d as new CGDisplayMBS // pick main display

MsgBox str(d.IsBuiltin)
```

**Notes:**

If true, the specified display is considered to be a built-in display; otherwise, false.

Portable systems typically identify the internal LCD panel as a built-in display.

Note that it is possible and reasonable for a system to have no displays marked as built-in. For example, a portable system running with the lid closed may report no built-in displays.

(Read only property)
50.10.62 IsInHWMirrorSet as boolean

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether a display is in a hardware mirroring set.  
**Example:**
```vbs
dim d as new CGDisplayMBS // pick main display
MsgBox str(d.IsInHWMirrorSet)
```

**Notes:**
If true, the specified display is a member of a hardware mirroring set; otherwise, false.

When hardware mirroring is enabled, the contents of a double frame buffer are rendered in all displays in the hardware mirroring set.  
(Read only property)

50.10.63 IsInMirrorSet as boolean

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether a display is in a mirroring set.  
**Example:**
```vbs
dim d as new CGDisplayMBS // pick main display
MsgBox str(d.IsInMirrorSet)
```

**Notes:** (Read only property)

50.10.64 IsMain as boolean

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a Boolean value indicating whether a display is the main display.  
**Example:**
```vbs
dim d as new CGDisplayMBS // pick main display
MsgBox str(d.IsMain)
```
CHAPTER 50. COREGRAPHICS

Notes:
If true, the specified display is currently the main display; otherwise, false.
(Read only property)

50.10.65  IsOnline as boolean

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns a Boolean value indicating whether a display is connected or online.
Example:

```dim d as new CGDisplayMBS // pick main display
MsgBox str(d.IsOnline)
```

Notes:
Returns true if the specified display is connected; otherwise, false.

A display is considered connected or online when the frame buffer hardware is connected to a monitor.

You can use this function to determine if someone has hot-plugged a display to the system. Note that
hot-plugging is a hardware feature that may not be present on all displays.
(Read only property)

50.10.66  IsStereo as boolean

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns a Boolean value indicating whether a display is running in a stereo graphics mode.
Example:

```dim d as new CGDisplayMBS // pick main display
MsgBox str(d.IsStereo)
```

Notes:
If true, the specified display is running in a stereo graphics mode; otherwise, false.

Available in Mac OS X v10.4 and later.
(Read only property)
50.10.67  **LastError as Integer**

MBS MacCG Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
The last error code.
**Notes:**
Only set for a few properties like brightness where we do have an error code.
(Read only property)

50.10.68  **MirrorsDisplay as CGDisplayMBS**

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
For a secondary display in a mirroring set, returns the primary display.
**Notes:**
Returns the primary display in the mirroring set. Returns kCGNullDirectDisplay if the specified display is actually the primary display or is not in a mirroring set.
(Read only property)

50.10.69  **ModelNumber as Integer**

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Returns the model number of a display monitor.
**Example:**
```dim d as new CGDisplayMBS  // pick main display```
```
MsgBox str(d.ModelNumber)
```
**Notes:**
A model number for the monitor associated with the specified display, or a constant to indicate an exceptionsee the discussion below.

This function uses I/O Kit to identify the monitor associated with the specified display. The return value depends on the following:

- If I/O Kit can identify the monitor, the product ID code for the monitor is returned.
- If I/O Kit can’t identify the monitor, kDisplayProductIDGeneric is returned.
- If no monitor is connected, a value of 0xFFFFFFFF is returned.
50.10.70  **PixelsHigh as Integer**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Height of the display in pixels.

**Notes:**

```
dim d as new CGDisplayMBS // pick main display
MsgBox str(D.PixelsHigh)
```

50.10.71  **PixelsWide as Integer**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Width of the display in pixels.

**Example:**

```
dim d as new CGDisplayMBS // pick main display
MsgBox str(D.PixelsWide)
```

**Notes:**  (Read only property)

50.10.72  **PrimaryDisplay as CGDisplayMBS**

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Returns the primary display in a hardware mirroring set.

**Notes:**

The primary display in the mirror set. If display is not hardware-mirrored, this function simply returns display.

In hardware mirroring, the contents of a double frame buffer are rendered in two or more displays simultaneously. The mirrored displays are said to be in a hardware mirroring set.

At the discretion of the device driver, one of the displays in a hardware mirroring set is designated as the primary display. The device driver binds the drawing engine, hardware accelerator, and 3D engine to the primary display, and directs all drawing operations to this display.
50.10.73  **RefreshRate as Integer**

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries refresh rate in Hz for this display.  
**Example:**

```vbnet
dim m as CGDisplayMBS = CGDisplayMBS.MainDisplay
MsgBox str(m.RefreshRate)+" Hz"
```

**Notes:**

Returns 60 for LCD displays.  
(Read only property)

50.10.74  **Rotation as Double**

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rotation angle of a display in degrees.  
**Example:**

```vbnet
dim d as new CGDisplayMBS  // pick main display
MsgBox str(d.Rotation)
```

**Notes:**

The rotation angle of the display in degrees, or 0 if the display is not valid.

This function returns the rotation angle of a display in a clockwise direction. For example, if the specified display is rotated clockwise 90 degrees then this function returns 90.0. After a 90 degree clockwise rotation, the physical bottom of the display is on the left side and the physical top is on the right side.

Available in Mac OS X v10.5 and later.  
(Read only property)
50.10.75 ScreenSizeHeight as Double

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the height of a display in millimeters.

**Example:**

```vba
dim c as new CGDisplayMBS
dim lines(-1) as string

dim DPIWidth as Double = c.PixelsWide/(c.ScreenSizeWidth/10.0/2.54)
dim DPIHeight as Double = c.PixelsHigh/(c.ScreenSizeHeight/10.0/2.54)

lines.append str(c.ScreenSizeWidth)+" x "+str(c.ScreenSizeHeight)+" Millimeter with"
lines.Append str(c.PixelsWide)+" x "+str(c.PixelsHigh)+" Pixel is"
lines.Append str(DPIWidth)+" x "+str(DPIHeight)+" DPI"

MsgBox Join(lines,EndOfLine)
```

**Notes:**

If Extended Display Identification Data (EDID) for the display device is not available, the size is estimated based on the device width and height in pixels from CGDisplayBounds, with an assumed resolution of 2.835 pixels/mm or 72 DPI, a reasonable guess for displays predating EDID support. (Read only property)

50.10.76 ScreenSizeWidth as Double

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the width of a display in millimeters.

**Example:**

```vba
dim d as new CGDisplayMBS // pick main display

MsgBox str(d.ScreenSizeHeight) // for example 400 on a 30" Apple Display
MsgBox str(d.ScreenSizeWidth) // for example 640 on a 30" Apple Display
```

**Notes:**

If Extended Display Identification Data (EDID) for the display device is not available, the size is estimated based on the device width and height in pixels from CGDisplayBounds, with an assumed resolution of 2.835 pixels/mm or 72 DPI, a reasonable guess for displays predating EDID support. (Read only property)
50.10.77 SerialNumber as Integer

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the serial number of a display monitor.

**Example:**

```
    dim d as new CGDisplayMBS // pick main display
    MsgBox str(D.SerialNumber)
```

**Notes:**

Returns the serial number for the monitor associated with the specified display, or a constant to indicate an exceptionsee the discussion below.

This function uses I/O Kit to identify the monitor associated with the specified display.

If I/O Kit can identify the monitor:

If the manufacturer has encoded a serial number for the monitor, the number is returned.
If there is no encoded serial number, 0x00000000 is returned.

If I/O Kit cannot identify the monitor:

If a monitor is connected to the display, 0x00000000 is returned.
If no monitor is connected to the display hardware, a value of 0xFFFFFFFF is returned.

Note that a serial number is meaningful only in conjunction with a specific vendor and product or model. (Read only property)

50.10.78 UnitNumber as Integer

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the logical unit number of a display.

**Example:**

```
    dim d as new CGDisplayMBS // pick main display
    MsgBox str(D.UnitNumber)
```
Notes:

A logical unit number for the specified display.

The logical unit number represents a particular node in the I/O Kit device tree associated with the display’s frame buffer. For a particular hardware configuration, this value will not change when the attached monitor is changed.

The unit number will change if the I/O Kit device tree changes, as when hardware is reconfigured, drivers are replaced, or significant changes occur to I/O Kit, so it should not be assumed to be invariant across login sessions.

For more information about I/O Kit, see the Apple publication "I/O Kit Fundamentals".
(Read only property)

50.10.79 UsesOpenGLAcceleration as boolean

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a Boolean value indicating whether Quartz is using OpenGL-based window acceleration (Quartz Extreme) to render in a display.

**Example:**

```plaintext
dim d as new CGDisplayMBS // pick main display
MsgBox str(D.UsesOpenGLAcceleration)
```

**Notes:**

Return value: If true, Quartz Extreme is used to render in the specified display; otherwise, false.

Quartz Extreme is an OpenGL-based, hardware-accelerated window compositor available in Mac OS X version 10.2 and later. Quartz Extreme requires a minimum hardware configuration to operate.

The information this function provides is typically used to adjust the demands of drawing operations to the capabilities of the display hardware. For example, an application running on an unaccelerated system could disable live window-resizing.
(Read only property)
50.10. CLASS CGDISPLAYMBS

50.10.80 VendorNumber as Integer

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the vendor number of the specified display’s monitor.

**Example:**

```vbnet
dim d as new CGDisplayMBS // pick main display

MsgBox str(D.VendorNumber)
// 1552 seems to be Apple
```

**Notes:**

A vendor number for the monitor associated with the specified display, or a constant to indicate an exception—see the discussion below.

This function uses I/O Kit to identify the monitor associated with the specified display.

There are three cases:

If I/O Kit can identify the monitor, the vendor ID is returned.
If I/O Kit cannot identify the monitor, kDisplayVendorIDUnknown is returned.
If there is no monitor associated with the display, 0xFFFFFFFF is returned.
*(Read only property)*

50.10.81 Constants

50.10.82 kCGCaptureNoFill = 1

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the capture option flags.  
**Notes:** Disables fill with black on capture.

50.10.83 kCGCaptureNoOptions = 0

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the capture option flags.  
**Notes:** Default behavior.
50.10.84 kCGDisplayBitsPerPixel = ”BitsPerPixel”

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the keys for mode dictionary
**Notes:**
The number of bits per pixel.
The value for this key is a number inside the dictionary.

50.10.85 kCGDisplayBitsPerSample = ”BitsPerSample”

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the keys for mode dictionary
**Notes:**
The number of bits per sample.
The value for this key is a number inside the dictionary.

50.10.86 kCGDisplayBytesPerRow = ”kCGDisplayBytesPerRow”

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the keys for mode dictionary

50.10.87 kCGDisplayHeight = ”Height”

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the keys for mode dictionary
**Notes:**
The display height.
The value for this key is a number inside the dictionary.

50.10.88 kCGDisplayIOFlags = ”IOFlags”

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the keys for mode dictionary
**Notes:** The value for this key is a number inside the dictionary.

50.10.89 kCGDisplayMode = ”Mode”

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the keys for mode dictionary
**Notes:** The value for this key is a number inside the dictionary.
50.10. CLASS CGDISPLAYMBS

50.10.90 kCGDisplayModeIsInterlaced = "kCGDisplayModeIsInterlaced"

MBS MacCG Plugin, Plugin Version: 11.1. Function: One of the keys for mode dictionary
Notes: This key reflects interesting bits of the IOKit display mode flags.

50.10.91 kCGDisplayModeIsSafeForHardware = "kCGDisplayModeIsSafeForHardware"

MBS MacCG Plugin, Plugin Version: 11.1. Function: One of the keys for mode dictionary
Notes: Set if display mode doesn’t need a confirmation dialog to be set.

50.10.92 kCGDisplayModeIsStretched = "kCGDisplayModeIsStretched"

MBS MacCG Plugin, Plugin Version: 11.1. Function: One of the keys for mode dictionary
Notes: This key reflects interesting bits of the IOKit display mode flags.

50.10.93 kCGDisplayModeIsTelevisionOutput = "kCGDisplayModeIsTelevisionOutput"

MBS MacCG Plugin, Plugin Version: 11.1. Function: One of the keys for mode dictionary
Notes: This key reflects interesting bits of the IOKit display mode flags.

50.10.94 kCGDisplayModeUsableForDesktopGUI = "UsableForDesktopGUI"

MBS MacCG Plugin, Plugin Version: 11.1. Function: One of the keys for mode dictionary
Notes: Whether this display can be used for desktop GUI.
The value for this key is a boolean inside the dictionary.

50.10.95 kCGDisplayRefreshRate = "RefreshRate"

MBS MacCG Plugin, Plugin Version: 11.1. Function: One of the keys for mode dictionary
Notes: The refresh rate.
The value for this key is a number inside the dictionary.
50.10.96 kCGDisplaySamplesPerPixel = ”SamplesPerPixel”

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the keys for mode dictionary

**Notes:**
The number of samples per pixel.
The value for this key is a number inside the dictionary.

50.10.97 kCGDisplayWidth = ”Width”

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the keys for mode dictionary

**Notes:**
The width of the display.
The value for this key is a number inside the dictionary.

50.10.98 kCGIODisplayModeID = ”IODisplayModeID”

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the keys for mode dictionary
50.11 class CGDisplayModeMBS

50.11.1 class CGDisplayModeMBS

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class for a display mode.

**Notes:**
Requires Mac OS X 10.6
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

50.11.2 Methods

50.11.3 Constructor

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.

50.11.4 Properties

50.11.5 Handle as Integer

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The internal object reference.

**Notes:** (Read only property)

50.11.6 Height as Integer

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the height in pixels of the specified display mode.

**Example:**
```vba
dim display as CGDisplayMBS = CGDisplayMBS.MainDisplay
dim mode as CGDisplayModeMBS = Display.DisplayMode
MsgBox str(mode.Height)+" Pixel"
```

**Notes:** (Read only property)
50.11.7  IODisplayModeID as Int32

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return the IOKit display mode ID of the specified display mode.
**Notes:** (Read only property)

50.11.8  IOFlags as UInt32

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return the IOKit flags of the specified display mode.
**Example:**
```dim display as CGDisplayMBS = CGDisplayMBS.MainDisplay
dim mode as CGDisplayModeMBS = Display.DisplayMode
```

**Notes:** (Read only property)

50.11.9  IsUsableForDesktopGUI as boolean

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return true if the specified mode is usable for displaying the desktop GUI; false otherwise.
**Notes:**
Requires Mac OS X 10.6 or newer.
(Read only property)

50.11.10  PixelEncoding as string

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return a string representing the pixel encoding of the specified display mode, expressed as a CFString containing an IOKit graphics mode.
**Example:**
```dim display as CGDisplayMBS = CGDisplayMBS.MainDisplay
dim mode as CGDisplayModeMBS = Display.DisplayMode
```

**Example:**
```
MsgBox mode.PixelEncoding // shows e.g. ——–RRRRRRGGGGGGGBBBBBBBB
```
50.11. **CLASS CGDISPLAYMODEMBS**

Notes: (Read only property)

### 50.11.11 PixelHeight as Integer

MBS MacCG Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the height in pixels of the specified display mode.

Notes:
On older Mac OS X versions without retina display support returns width in points.
(Read only property)

### 50.11.12 PixelWidth as Integer

MBS MacCG Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the width in pixels of the specified display mode.

Notes:
On older Mac OS X versions without retina display support returns height in points.
(Read only property)

### 50.11.13 RefreshRate as Double

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the refresh rate of the specified display mode.

**Example:**
```vbnet
dim display as CGDisplayMBS = CGDisplayMBS.MainDisplay
dim mode as CGDisplayModeMBS = Display.DisplayMode
MsgBox str(mode.RefreshRate)
```

Notes: (Read only property)

### 50.11.14 Width as Integer

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the width in pixels of the specified display mode.

**Example:**
dim display as CGDisplayMBS = CGDisplayMBS.MainDisplay
dim mode as CGDisplayModeMBS = Display.DisplayMode
MsgBox str(mode.Width) + "" Pixel"

Notes: (Read only property)
50.12 class CGDisplayReconfigurationEventMBS

50.12.1 class CGDisplayReconfigurationEventMBS

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class to listen for display configuration changes.

**Notes:**
In constructor the plugin registers for the event and in destructor unregisters. So keep the object reference alive to receive events.

Events are invoked when the app is listening for events, on the event processing thread, or from within the display reconfiguration function when in the program that is driving the reconfiguration.

Events should avoid changing display configurations, and should not raise exceptions or perform a non-local return such as calling longjmp.

Before display reconfiguration, a event fires to inform applications of a configuration change. The event runs once for each on-line display. The flag is set to kCGDisplayBeginConfigurationFlag. This event does not carry other per-display information, as details of how a reconfiguration affects a particular device rely on device-specific behaviors which may not be exposed by a device driver.

After display reconfiguration, at the time the event function is invoked, all display state reported by Core-Graphics, QuickDraw, and the Carbon Display Manager API will be up to date. This event runs after the Carbon Display Manager notification events. The event runs once for each added, removed, and currently on-line display. Note that in the case of removed displays, calls into the CoreGraphics API with the removed display ID will fail.

50.12.2 Events

50.12.3 DisplayReconfiguration(DisplayID as Integer, flags as Integer)

MBS MacCG Plugin, Plugin Version: 11.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is invoked whenever the configuration of a local display is changed.
50.12.4 Constants

50.12.5 kCGDisplayAddFlag = 16

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the possible flag values.  
**Notes:** Display Added

50.12.6 kCGDisplayBeginConfigurationFlag = 1

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the possible flag values.  
**Notes:** Begin Configuration for display.

50.12.7 kCGDisplayDesktopShapeChangedFlag = 4096

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the possible flag values.  
**Notes:** Desktop Shape Changed.

50.12.8 kCGDisplayDisabledFlag = 512

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the possible flag values.  
**Notes:** Display disabled.

50.12.9 kCGDisplayEnabledFlag = 256

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the possible flag values.  
**Notes:** Display enabled.

50.12.10 kCGDisplayMirrorFlag = 1024

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the possible flag values.  
**Notes:** Mirror enabled
50.12.11  kCGDisplayMovedFlag = 2

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the possible flag values.  
**Notes:** Display Moved

50.12.12  kCGDisplayRemoveFlag = 32

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the possible flag values.  
**Notes:** Display Removed

50.12.13  kCGDisplaySetMainFlag = 4

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the possible flag values.  
**Notes:** Set Main

50.12.14  kCGDisplaySetModeFlag = 8

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the possible flag values.  
**Notes:** Set Mode

50.12.15  kCGDisplayUnMirrorFlag = 2048

MBS MacCG Plugin, Plugin Version: 11.1. **Function:** One of the possible flag values.  
**Notes:** Mirror disabled
CHAPTER 50. COREGRAPHICS

50.13 class CGDisplayStreamEventMBS

50.13.1 class CGDisplayStreamEventMBS

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
CGDisplayStreamEventMBS provides a streaming API for capturing display updates in a realtime manner.

**Notes:**
It can also provide scaling and color space conversion services, as well as allow capturing sub regions of the
display.
Requires OS X 10.8.

50.13.2 Methods

50.13.3 Constructor(DisplayHandle as Integer, outputWidth as Integer, outputHeight as Integer, pixelFormat as Integer = 0, properties as dictionary = nil)

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new CGDisplayStream.

**Notes:**
This function creates a new CGDisplayStream that is to be used to get a stream of frame updates from a
particular display.

DisplayHandle: The CGDirectDisplayID to use as the source for generated frames. (Handle from CGDisplayMBS class)
outputWidth: The output width (in pixels, not points) of the frames to be generated. Must not be zero.
outputHeight: The output height (in pixels, not points) of the frames to be generated. Must not be zero.
pixelFormat: The desired CoreVideo/CoreMedia-style pixel format of the output IOSurfaces. If 0 the plugin
will use RGBA.
properties: Any optional properties of the CGDisplayStream.

50.13.4 kCGDisplayStreamColorSpace as String

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.

**Notes:**
Set the desired CGColorSpace of the output frames.
By default the color space will be that of the display.
50.13.5  kCGDisplayStreamDestinationRect as String

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary.

**Notes:**
This may be used to request where within the destination buffer the display updates should be placed. Use CGRectCreateDictionaryRepresentation to convert from a CGRect to the value used here.
Note: The coordinate system for the destination rectangle is always specified in output pixels to match the fact that the output buffer size is also specified in terms of pixels.
Defaults to entire buffer

50.13.6  kCGDisplayStreamMinimumFrameTime as String

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary.

**Notes:**
Request that the delta between frame updates be at least as much specified by this value.
Number in seconds, defaults to zero.

50.13.7  kCGDisplayStreamPreserveAspectRatio as String

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary.

**Notes:**
Enable/disable the work the Window Server will do to preserve the display aspect ratio. By default the Window Server will assume that it should preserve the original aspect ratio of the source display rect. If the aspect ratio of the source display and the display stream destination rect are not the same, black borders will be inserted at the top/bottom or right/left sides of the destination in order to preserve the source aspect ratio.
Boolean - defaults to true

50.13.8  kCGDisplayStreamQueueDepth as String

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary.

**Notes:**
Controls how many frames deep the frame queue will be.
Defaults to 3.
50.13.9 kCGDisplayStreamShowCursor as String

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Controls whether the cursor is embedded within the provided buffers or not.

50.13.10 kCGDisplayStreamSourceRect as String

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.
**Notes:**
This may be used to request a subregion of the display to be provided as the source of the display stream. Use CGRectCreateDictionaryRepresentation to convert from a CGRect to the value used here.
Note: The coordinate system for the source rectangle is specified in display logical coordinates and not in pixels, in order to match the normal convention on HiDPI displays. Defaults to entire display.

50.13.11 kCGDisplayStreamYCbCrMatrix as String

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.
**Notes:**
When outputting frames in 420v or 420f format, this key may be used to control which YCbCr matrix is used.
The value should be one of the three kCGDisplayStreamYCbCrMatrix values specified below:
kCGDisplayStreamYCbCrMatrix_SMPTE_240M_1995
kCGDisplayStreamYCbCrMatrix_ITU_R_709_2
kCGDisplayStreamYCbCrMatrix_ITU_R_601_4

50.13.12 kCGDisplayStreamYCbCrMatrix_ITU_R_601_4 as String

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A possible value for kCGDisplayStreamYCbCrMatrix key.

50.13.13 kCGDisplayStreamYCbCrMatrix_ITU_R_709_2 as String

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A possible value for kCGDisplayStreamYCbCrMatrix key.
50.13.14 kCGDisplayStreamYCbCrMatrix_SMPTE_240M_1995 as String

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A possible value for kCGDisplayStreamYCbCrMatrix key.

50.13.15 Start

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Begin delivering frame updates to the event.

50.13.16 Stop

**Notes:**
After this call returns, the CGDisplayStream callback function will eventually be called with a status of StatusStopped. After that point it is safe to release the object.
It is safe to call this function from within the event, but the previous caveat still applies.

50.13.17 Properties

50.13.18 Handle as Integer

**Notes:** (Read only property)

50.13.19 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The lasterror code.
**Notes:** (Read only property)
50.13.20 Events

50.13.21 FrameAvailable(Status as Integer, displayTime as UInt64, frameSurfaceHandle as Integer, Update as CGDisplayStreamUpdateMBS)

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** A new frame is available.

**Notes:**
The event used for new frame delivery by CGDisplayStream objects

For each frame that is generated by the WindowServer for a particular display, the user provided event is invoked and provides the user with an IOSurface handle (inside update object), that contains the pixel data for the new frame, as well as a CGDisplayStreamUpdateMBS that contains all of the metadata associated with that IOSurface.

frameSurfaceHandle: The IOSurfaceRef for the current frame. May be zero/nil in some cases. The plugin retains it as part of Update object to keeps it alive.
displayTime: The mach absolute time of when the corresponding frame was to be displayed by the WindowServer
Update: The CGDisplayStreamUpdateMBS for the current frame. will be nil in cases when status is not kCGDisplayStreamFrameStatusFrameComplete.

50.13.22 Constants

50.13.23 StatusFrameBlank = 2

MBS MacCG Plugin, Plugin Version: 16.1. **Function:** One of the frame status constants.

**Notes:** As of displayTime, the display is has gone blank

50.13.24 StatusFrameComplete = 0

MBS MacCG Plugin, Plugin Version: 16.1. **Function:** One of the frame status constants.

**Notes:** A new frame has been generated by the Window Server for a particular display at time displayTime.

50.13.25 StatusFrameIdle = 1

MBS MacCG Plugin, Plugin Version: 16.1. **Function:** One of the frame status constants.

**Notes:** The Window Server did not generate a new frame for displayTime
50.13.26  StatusStopped = 3

MBS MacCG Plugin, Plugin Version: 16.1. **Function:** One of the frame status constants.
**Notes:** The display stream has stopped and no more calls will be made to the handler until the stream is started.
50.14 class CGDisplayStreamUpdateMBS

50.14.1 class CGDisplayStreamUpdateMBS

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A single frame’s extra metadata that describes useful frame delta information. **Notes:** A CGDisplayStreamUpdate encapsulates information about what portions of a frame have changed relative to a previously delivered frame. This includes regions that were changed in any way, which ones were actually redrawn, and which regions were merely copied from one place to another.

50.14.2 Methods

50.14.3 getRects(type as Integer) as CGRectMBS()

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of CGRectMBS that describe what parts of the frame have changed relative to the previously delivered frame. **Notes:** This rectangle list encapsulates both the update rectangles and movement rectangles.

50.14.4 Properties

50.14.5 CIIImage as Variant

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries the IOSurface with frame as CIIImageMBS. **Notes:** Returns CIIImageMBS. (Read only property)

50.14.6 DeltaX as Double

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The x component of the movement delta. **Notes:** (Read only property)
50.14.7  DeltaY as Double

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The y component of the movement delta.
**Notes:** (Read only property)

50.14.8  DropCount as Integer

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return how many frames (if any) have been dropped since the last call to the event.
**Notes:**
This call is primarily useful for performance measurement to determine if the client is keeping up with all WindowServer updates.
(Read only property)

50.14.9  Handle as Integer

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The internal object reference.
**Notes:** (Read only property)

50.14.10  IOSurfaceHandle as Integer

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The internal object reference for the IOSurface.
**Notes:** (Read only property)

50.14.11  Constants

50.14.12  UpdateDirtyRects = 2

MBS MacCG Plugin, Plugin Version: 16.1. **Function:** One of the rectangle selector values for getRects function.
**Notes:** The union of both refreshed and moved rects.
50.14.13 UpdateMovedRects = 1

MBS MacCG Plugin, Plugin Version: 16.1. **Function:** One of the rectangle selector values for getRects function.
**Notes:** The rectangles that were simply moved from one part of the display to another

50.14.14 UpdateReducedDirtyRects = 3

MBS MacCG Plugin, Plugin Version: 16.1. **Function:** One of the rectangle selector values for getRects function.
**Notes:** A possibly simplified (but overstated) array of dirty rectangles.

50.14.15 UpdateRefreshedRects = 0

MBS MacCG Plugin, Plugin Version: 16.1. **Function:** One of the rectangle selector values for getRects function.
**Notes:** The rectangles that were refreshed on the display, not counting moved rectangles
50.15. **CLASS CGDISPLAYTRANSFERFORMULAMBS**

50.15 **class CGDisplayTransferFormulaMBS**

50.15.1 **class CGDisplayTransferFormulaMBS**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a transfer formula.

50.15.2 **Properties**

50.15.3 **BlueGamma as Double**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The blue gamma value.  
**Notes:** (Read and Write property)

50.15.4 **BlueMax as Double**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum blue value.  
**Notes:** (Read and Write property)

50.15.5 **BlueMin as Double**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum blue value.  
**Notes:** (Read and Write property)

50.15.6 **GreenGamma as Double**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The green gamma value.  
**Notes:** (Read and Write property)

50.15.7 **GreenMax as Double**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum green value.
50.15.8 **GreenMin as Double**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum green value. **Notes:** (Read and Write property)

50.15.9 **RedGamma as Double**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The red gamma value. **Notes:** (Read and Write property)

50.15.10 **RedMax as Double**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum red value. **Notes:** (Read and Write property)

50.15.11 **RedMin as Double**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The minimum red value. **Notes:** (Read and Write property)
50.16  class CGFontMBS

50.16.1  class CGFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function:  
The CoreGraphics class for a font.  
Notes:  
The CGFontRef opaque type encapsulates font information. A font is a set of shapes or glyphs associated  
with a character set. A glyph can represent a single character (such as b), more than one character (such as  
the "" ligature), or a special character such as a space. Quartz retrieves the glyphs for the font from ATS  
(Apple Type Services) and paints the glyphs based on the relevant parameters of the current graphics state.  
Quartz provides a limited, low-level interface for drawing text. For information on text-drawing functions,  
see CGContext Reference. For full Unicode and text-layout support, use the services provided by Core Text  
or ATSUI).

50.16.2  Methods

50.16.3  CreateWithDataProvider(CGDataProvider as Variant) as CGFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function:  
Creates a font object from data supplied from a data provider.  
Notes:  
Dataprovider must be a CGDataProviderMBS object.  
Returns the font object or nil if the font can’t be created.  
Before drawing text in a Quartz context, you must set the font in the current graphics state by calling the  
function CGContextMBS.SetFontSize.

50.16.4  CreateWithFontName(name as string) as CGFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  Function:  
Creates a font object corresponding to the font specified by a PostScript or full name.  
Example:  
dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Courier")  
MsgBox c.FullName  
Notes:
Returns the font object or nil if the font can’t be created.
Before drawing text in a Quartz context, you must set the font in the current graphics state by calling the function CGContextMBS.SetFont.

50.16.5 CreateWithPlatformFont(ATSFontHandle as Integer) as CGFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new font reference from an ATSFontRef.
**Notes:**
Create a CGFont using platformFontReference, a handle to a platform-specific font reference. For MacOS X, platformFontReference should be a handle to an ATSFontRef.

50.16.6 Properties

50.16.7 Ascent as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the ascent of a font.
**Example:**
```plaintext
dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Times")
MsgBox str(c.Ascent)
```
**Notes:**
The ascent is the maximum distance above the baseline of glyphs in a font. The value is specified in glyph space units.
(Read only property)

50.16.8 CapHeight as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the cap height of a font.
**Example:**
```plaintext
dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Times")
MsgBox str(c.CapHeight)
```
**Notes:**
The cap height is the distance above the baseline of the top of flat capital letters of glyphs in a font. The value is specified in glyph space units.
(Read only property)

## 50.16.9 Descent as Integer

**Example:**

```vbs
dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Times")
MsgBox str(c.Descent)
```

**Notes:**
The descent is the maximum distance below the baseline of glyphs in a font. The value is specified in glyph space units.
(Read only property)

## 50.16.10 FontBBox as CGRectMBS

**Example:**

```vbs
dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Times")
dim r as CGRectMBS = c.FontBBox
MsgBox str(r.Width)+" "+str(r.Height)
```

**Notes:**
The font bounding box is the union of all of the bounding boxes for all the glyphs in a font. The value is specified in glyph space units.
(Read only property)

## 50.16.11 FullName as String

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the full name associated with a font.

**Example:**
dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Courier")
MsgBox c.FullName

**Notes:** (Read only property)

### 50.16.12 Handle as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The internal object reference.
**Notes:** (Read and Write property)

### 50.16.13 ItalicAngle as Double

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the italic angle of a font.
**Example:**
```vba
dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Times")
MsgBox str(c.ItalicAngle)
```
**Notes:**
The italic angle of the font, measured in degrees counter-clockwise from the vertical.
(Read only property)

### 50.16.14 Leading as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the leading of a font.
**Example:**
```vba
dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Times")
MsgBox str(c.Leading)
```
**Notes:**
The leading is the spacing between consecutive lines of text in a font. The value is specified in glyph space units.
50.16. **CLASS CGFONTMBS**

(Read only property)

50.16.15  **NumberOfGlyphs as UInt64**

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the number of glyphs in a font.

**Example:**
```vba
    dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Times")
    MsgBox str(c.NumberOfGlyphs)
```

**Notes:** (Read only property)

50.16.16  **PostScriptName as String**

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Obtains the PostScript name of a font.

**Example:**
```vba
    dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Courier")
    MsgBox c.PostScriptName
```

**Notes:** (Read only property)

50.16.17  **StemV as Double**

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the thickness of the dominant vertical stems of glyphs in a font.

**Example:**
```vba
    dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Times")
    MsgBox str(c.StemV)
```

**Notes:**
The thickness of the dominant vertical stems of glyphs in a font.
(Read only property)
50.16.18 UnitsPerEm as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of glyph space units per em for the provided font.

**Example:**
```vbscript
dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Times")
MsgBox str(c.UnitsPerEm)
```

**Notes:**
The number of glyph space units per em for the provided font.
(Read only property)

50.16.19 XHeight as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the x-height of a font.

**Example:**
```vbscript
dim c as CGFontMBS = CGFontMBS.CreateWithFontName("Times")
MsgBox str(c.XHeight)
```

**Notes:**
The x-height is the distance above the baseline of the top of flat, non-ascending lowercase letters (such as x) of glyphs in a font. The value is specified in glyph space units.
(Read only property)

50.16.20 Constants

50.16.21 kCGFontIndexInvalid = 65535

MBS MacCG Plugin, Plugin Version: 14.2. **Function:** An invalid font index (a value which never represents a valid glyph).

50.16.22 kCGFontIndexMax = 65534

MBS MacCG Plugin, Plugin Version: 14.2. **Function:** The maximum allowed value for font index.
50.16.23  kCGFontPostScriptFormatType1 = 1

MBS MacCG Plugin, Plugin Version: 14.2. **Function:** One of the PostScript font subset formats.
**Notes:** This is documented in Adobe Type 1 Font Format, which is available from http://partners.adobe.com/.

50.16.24  kCGFontPostScriptFormatType3 = 3

MBS MacCG Plugin, Plugin Version: 14.2. **Function:** One of the PostScript font subset formats.
**Notes:** This is documented in PostScript Language Reference, 3rd edition, which is available from http://partners.adobe.com/.

50.16.25  kCGFontPostScriptFormatType42 = 42

MBS MacCG Plugin, Plugin Version: 14.2. **Function:** One of the PostScript font subset formats.
**Notes:** This is documented in Adobe Technical Note 5012, The Type 42 Font Format Specification, which is available from http://partners.adobe.com/.

50.16.26  kCGGlyphMax = 65534

MBS MacCG Plugin, Plugin Version: 14.2. **Function:** The maximum value for a glyph.
50.17 class CGFunctionMBS

50.17.1 class CGFunctionMBS

MBS MacCG Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
CGFunction provides a general facility for defining and using callback functions that take an arbitrary number
of floating-point input values, and pass back an arbitrary number of floating-point output values.

50.17.2 Methods

50.17.3 Create(domainDimension as Integer, domain as memoryblock, rangeDimension as Integer, range as memoryblock)

MBS MacCG Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a Quartz function.

**Notes:**
Parameters

domainDimension: The number of inputs.
domain: An array of (2*domainDimension) floats used to specify the valid intervals of input values. For each k from 0 to (domainDimension - 1), domain [ 2*k ] must be less than or equal to domain [ 2*k+1 ] , and the kth input value will be clipped to lie in the interval domain [ 2*k ] input [ k ] domain [ 2*k+1 ] . If this parameter is nil, then the input values are not clipped.
rangeDimension: The number of outputs.
range: An array of (2*rangeDimension) floats that specifies the valid intervals of output values. For each k from 0 to (rangeDimension - 1), range [ 2*k ] must be less than or equal to range [ 2*k+1 ] , and the kth output value will be clipped to lie in the interval range [ 2*k ] output [ k ] range [ 2*k+1 ] . If this parameter is nil, then the output values are not clipped.

Returns the new Quartz function or nil on any error.

Available in Mac OS X version 10.2 and later.

50.17.4 Properties

50.17.5 Handle as Integer

MBS MacCG Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Handle to the CGFunctionRef.
50.17. CLASS CGFUNCTIONMBS

Notes: (Read and Write property)

50.17.6 Events

50.17.7 Evaluate(Input as memoryblock, Output as memoryblock)

MBS MacCG Plugin, Plugin Version: 6.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Asks the CGFunction to calculate the values. **Notes:** memoryblocks must be big enough.
50.18 class CGGradientMBS

50.18.1 class CGGradientMBS

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A gradient defines a smooth transition between colors across an area. **Notes:**

The CGGradientMBS class, and the functions that operate on it, make creating and using radial and axial gradient fills an easy task. A CGGradient object has a color space, two or more colors, and a location for each color. The color space cannot be a pattern or indexed color space, otherwise it can be any Quartz color space (CGColorSpaceMBS).

Colors can be provided as component values (such as red, green, blue) or as Quartz color objects (CGColorMBS). In Quartz, component can vary from 0.0 to 1.0, designating the proportion of the component present in the color.

A location is a normalized value. When it comes time to paint the gradient, Quartz maps the normalized location values to the points in coordinate space that you provide.

If you want more precise control over gradients, or if your application runs in versions of Mac OS X that are earlier than v10.5, see CGShadingMBS.

Requires Mac OS X 10.5.

50.18.2 Methods

50.18.3 CreateWithColorComponents(colorSpace as CGColorSpaceMBS, components() as Double) as CGGradientMBS

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a CGGradient object from a color space and the provided color components and locations. **Notes:**

space: The color space to use for the gradient. You cannot use a pattern or indexed color space.

components: The color components for each color that defines the gradient. The components should be in the color space specified by space. If you are unsure of the number of components, you can call the function CGColorSpaceMBS.NumberOfComponents.

The number of items in this array should be the product of count and the number of components in the color space. For example, if the color space is an RGBA color space and you want to use two colors in the gradient (one for a starting location and another for an ending location), then you need to provide 8 values.
in components: red, green, blue, and alpha values for the first color, followed by red, green, blue, and alpha values for the second color.

locations: Optional. The location for each color provided in components. Each location must be a CGFloat value in the range of 0 to 1, inclusive. If 0 and 1 are not in the locations array, Quartz uses the colors provided that are closest to 0 and 1 for those locations.

If locations is not passed, the first color in colors is assigned to location 0, the last color in colors is assigned to location 1, and intervening colors are assigned locations that are at equal intervals in between.

Available in Mac OS X v10.5 and later.

• 50.18.4 CreateWithColorComponents(colorSpace as CGColorSpaceMBS, components() as Double, locations() as Double) as CGGradientMBS

---

50.18.4  CreateWithColorComponents(colorSpace as CGColorSpaceMBS, components() as Double, locations() as Double) as CGGradientMBS

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Creates a CGGradient object from a color space and the provided color components and locations.

Example:

// put into paint event of window
dim c as CGContextMBS
if TargetCocoa then
c = GetCurrentCGContextMBS
else
c = window1.CGContextMBS
end if

dim locations() as Double = array(0.0, 0.6, 1.0)
dim components() as Double = array(1.0, 0.0, 0.0, 0.35, 0.0, 1.0, 0.0, 0.2, 0.0, 0.0, 1.0, 0.06) // Start color and End color

dim rgbColorspace as CGColorSpaceMBS = CGColorSpaceMBS.CreateDeviceRGB
dim glossGradient as CGGradientMBS = CGGradientMBS.CreateWithColorComponents(rgbColorspace, components, locations)
dim currentBounds as CGRectMBS = CGMakeRectMBS(0,0,g.Width,g.Height)
dim topCenter as CGPointMBS = CGMakePointMBS(g.width/2, 0.0)
dim midCenter as CGPointMBS = CGMakePointMBS(g.width/2, g.height)
c.SaveGState

// fill white
c.SetRGBFillColor 1.0, 1.0, 1.0, 1.0
c.FillRect currentBounds

// draw gradient
c.AddRect(currentBounds)
c.Clip
c.DrawLinearGradient(glossGradient, topCenter, midCenter, 0)
c.RestoreGState
c.Flush

Notes:

space: The color space to use for the gradient. You cannot use a pattern or indexed color space.
components: The color components for each color that defines the gradient. The components should be in the color space specified by space. If you are unsure of the number of components, you can call the function CGColorSpaceMBS.NumberOfComponents.

The number of items in this array should be the product of count and the number of components in the color space. For example, if the color space is an RGBA color space and you want to use two colors in the gradient (one for a starting location and another for an ending location), then you need to provide 8 values in components: red, green, blue, and alpha values for the first color, followed by red, green, blue, and alpha values for the second color.

locations: Optional. The location for each color provided in components. Each location must be a CGFloat value in the range of 0 to 1, inclusive. If 0 and 1 are not in the locations array, Quartz uses the colors provided that are closest to 0 and 1 for those locations.

If locations is not passed, the first color in colors is assigned to location 0, the last color in colors is assigned to location 1, and intervening colors are assigned locations that are at equal intervals in between.

Available in Mac OS X v10.5 and later.

50.18. CLASS CGGRADIENTMBS

50.18.5 CreateWithColors(colorSpace as CGColorSpaceMBS, colors() as CGColorMBS) as CGGradientMBS

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a CGGradient object from a color space and the provided color objects and locations.

**Example:**
```plaintext
// put into window paint event
dim c as CGContextMBS
if TargetCocoa then
c = GetCurrentCGContextMBS
else
c = window1.CGContextMBS
end if

dim colors(-1) as CGColorMBS

colors.Append CGColorMBS.CreateGenericRGB(1.0, 0.0, 0.0, 0.35)
colors.Append CGColorMBS.CreateGenericRGB(0.0, 1.0, 0.0, 0.2)
colors.Append CGColorMBS.CreateGenericRGB(0.0, 0.0, 1.0, 0.06)

dim glossGradient as CGGradientMBS = CGGradientMBS.CreateWithColors(nil, colors)

dim topCenter as CGPointMBS = CGMakePointMBS(g.width/2, 0.0)
dim midCenter as CGPointMBS = CGMakePointMBS(g.width/2, g.height)

// fill white
c.SetRGBFillColor 1.0, 1.0, 1.0, 1.0
c.FillRect CGMakeRectMBS(0,0,g.Width,g.Height)

// gradient
dim currentBounds as CGRectMBS = CGMakeRectMBS(0,0,g.Width,g.Height)
c.SaveGState
c.AddRect(currentBounds)
c.Clip
c.DrawLinearGradient(glossGradient, topCenter, midCenter, 0)
c.RestoreGState
c.Flush
```

**Notes:**
- **space:** The color space to use for the gradient. You cannot use a pattern or indexed color space. Can be nil.
- **colors:** A non-empty array of CGColorMBS objects that should be in the color space specified by space. If space is not nil, each color will be converted (if necessary) to that color space and the gradient will drawn in that color space. Otherwise, each color will be converted to and drawn in the GenericRGB color space.
- **locations:** Optional. The location for each color provided in colors; each location must be a CGFloat value.
in the range of 0 to 1, inclusive. If 0 and 1 are not in the locations array, Quartz uses the colors provided that are closest to 0 and 1 for those locations.

If locations is missing, the first color in colors is assigned to location 0, the last color in colors is assigned to location 1, and intervening colors are assigned locations that are at equal intervals in between. The locations array should contain the same number of items as the colors array.

Available in Mac OS X v10.5 and later.

50.18.6 CreateWithColors(colorSpace as CGColorSpaceMBS, colors() as CGColorMBS, locations() as Double) as CGGradientMBS

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a CGGradient object from a color space and the provided color objects and locations.

**Example:**

```plaintext
// put into window paint event
dim c as CGContextMBS
if TargetCocoa then
c = GetCurrentCGContextMBS
else
c = window1.CGContextMBS
end if

dim locations() as Double = array(0.0, 0.8, 1.0)

dim colors(-1) as CGColorMBS

colors.Append CGColorMBS.CreateGenericRGB(1.0, 0.0, 0.0, 0.35)
colors.Append CGColorMBS.CreateGenericRGB(0.0, 1.0, 0.0, 0.2)
colors.Append CGColorMBS.CreateGenericRGB(0.0, 0.0, 1.0, 0.06)

dim glossGradient as CGGradientMBS = CGGradientMBS.CreateWithColors(nil, colors, locations)

dim topCenter as CGPointMBS = CGMakePointMBS(g.width/2, 0.0)
dim midCenter as CGPointMBS = CGMakePointMBS(g.width/2, g.height)

// fill white
c.SetRGBFillColor 1.0, 1.0, 1.0, 1.0
c.FillRect CGMakeRectMBS(0,0,g.Width,g.Height)

// gradient
```
dim currentBounds as CGRectMBS = CGMakeRectMBS(0,0,g.Width,g.Height)
c.SaveGState
c.AddRect(currentBounds)
c.Clip
c.DrawLinearGradient(glossGradient, topCenter, midCenter, 0)
c.RestoreGState

c.Flush

Notes:

space: The color space to use for the gradient. You cannot use a pattern or indexed color space. Can be nil.
colors: A non-empty array of CGColorMBS objects that should be in the color space specified by space. If space is not nil, each color will be converted (if necessary) to that color space and the gradient will be drawn in that color space. Otherwise, each color will be converted to and drawn in the GenericRGB color space.
locations: Optional. The location for each color provided in colors; each location must be a CGFloat value in the range of 0 to 1, inclusive. If 0 and 1 are not in the locations array, Quartz uses the colors provided that are closest to 0 and 1 for those locations.

If locations is missing, the first color in colors is assigned to location 0, the last color in colors is assigned to location 1, and intervening colors are assigned locations that are at equal intervals in between. The locations array should contain the same number of items as the colors array.

Available in Mac OS X v10.5 and later.

• 50.18.5 CreateWithColors(colorSpace as CGColorSpaceMBS, colors() as CGColorMBS) as CGGradientMBS

50.18.7 Properties

50.18.8 Handle as Integer

Notes: (Read and Write property)
50.18.9 Constants

50.18.10 kCGGradientDrawsAfterEndLocation = 2

Notes:
The fill should extend beyond the ending location. The color that extends beyond the ending point is the solid color defined by the CGGradient object to be at location 1.
Available in Mac OS X v10.5 and later.

50.18.11 kCGGradientDrawsBeforeStartLocation = 1

Notes:
The fill should extend beyond the starting location. The color that extends beyond the starting point is the solid color defined by the CGGradient object to be at location 0.
Available in Mac OS X v10.5 and later.
50.19. class CGImageDestinationMBS

50.19.1 class CGImageDestinationMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class to write CGImages.

**Example:**
```vba
dim logo as Picture = LogoMBS(500)
dim image as CGImageMBS = CGCreateImageMBS(logo)

dim dic as new Dictionary

// 10%
dic.Value(CGImageDestinationMBS.kCGImageDestinationLossyCompressionQuality)=0.1

// 100%
dic.Value(CGImageDestinationMBS.kCGImageDestinationLossyCompressionQuality)=1.0

dim file as FolderItem = SpecialFolder.Desktop.Child("logo.jpg")
dim d as new CGImageDestinationMBS(file, "public.jpeg", 1)

d.AddImage(image, dic)

if d.Finalize then
    MsgBox "Saved"
else
    MsgBox "Failed to save."
end if
```

**Notes:**
CGImageDestination objects, available in Mac OS X v10.4 or later, abstract the data-writing task. An image destination can represent a single image or multiple images. It can contain thumbnail images as well as properties for each image.

The functions described in this reference can write data to three kinds of destinations: a file, an URL and a string. After creating a CGImageDestination object for the appropriate destination, you can add image data and set image properties. When you are finished adding data, call the function Finalize to write the image data and properties.
50.19.3 AddImage(image as CGImageMBS, properties as dictionary=nil)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Adds an image to an image destination.

**Example:**

```dim` inputfile as FolderItem = SpecialFolder.Desktop.Child("test.jpg")

// reading the picture
dim `c as new CGImageSourceMBS(inputfile)
dim `img as CGImageMBS = c.CreateImageAtIndex(0)
dim `propertiesGlobal as Dictionary = c.Properties
dim `propertiesImage as Dictionary = c.PropertiesAtIndex(0)

dim `outputFile as FolderItem = SpecialFolder.Desktop.Child("output.jpg")
dim `d as new CGImageDestinationMBS(outputFile, "public.jpeg", 1)

// writing the picture and include metadata
d.SetProperties(propertiesGlobal)
d.AddImage(img, propertiesImage)
if d.FinalizeMT then
  outputFile.Launch
else
  MsgBox "Failed to write jpeg."
end if
```

**Notes:**

- **image:** The image to add.
- **properties:** An optional dictionary that specifies the properties of the added image.

For properties you can use those in the CGImageSourceMBS class, kCGImageDestinationLossyCompressionQuality and kCGImageDestinationBackgroundColor.

The function logs an error if you add more images than what you specified when you created the image destination.
Available in Mac OS X version 10.4 and later.
50.19.4  AddImageCF(image as CGImageMBS, properties as Variant = nil)

MBS MacCG Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Adds an image to an image destination.

**Notes:**
- image: The image to add.
- properties: An optional dictionary or CFDictionaryMBS that specifies the properties of the added image.

For properties you can use those in the CGImageSourceMBS class, kCGImageDestinationLossyCompressionQuality and kCGImageDestinationBackgroundColor.

The function logs an error if you add more images than what you specified when you created the image destination.
Available in Mac OS X version 10.4 and later.

50.19.5  AddImageFromSource(source as CGImageSourceMBS, index as Integer, options as dictionary = nil)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Adds an image from an image source to an image destination.

**Notes:**
- source: An image source.
- index: An index that specifies the location of the image in the image source. The index is zero-based.
- properties: A dictionary that specifies properties to overwrite or add to the source image properties.

Available in Mac OS X version 10.4 and later.

50.19.6  AddImageFromSourceCF(source as CGImageSourceMBS, index as Integer, options as Variant = nil)

MBS MacCG Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Adds an image from an image source to an image destination.

**Notes:**
- source: An image source.
- index: An index that specifies the location of the image in the image source. The index is zero-based.
- properties: A dictionary or CFDictionaryMBS that specifies properties to overwrite or add to the source image properties.

Available in Mac OS X version 10.4 and later.
50.19.7 Constructor(file as folderitem, type as string, count as Integer = 1)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an image destination that writes to a location specified by a folderitem.

**Notes:**

- file: The file to write to. If the file already exists, the data at this location is overwritten.

- type: The UTI (uniform type identifier) of the resulting image file. See Uniform Type Identifiers Overview for a list of system-declared and third-party UTIs.

- count: The number of images (not including thumbnail images) that the image file will contain.

On success the handle value is not zero.

Available in Mac OS X version 10.4 and later. See also:

- 50.19.8 Constructor(type as string, count as Integer = 1)
- 50.19.9 Constructor(url as string, type as string, count as Integer = 1)

50.19.8 Constructor(type as string, count as Integer = 1)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an image destination that writes to a string.

**Notes:**

- type: The uniform type identifier (UTI) of the resulting image file. See Uniform Type Identifiers Overview for a list of system-declared and third-party UTIs.

- count: The number of images (not including thumbnail images) that the image file will contain.

On success the handle is not zero.

Available in Mac OS X version 10.4 and later. See also:

- 50.19.7 Constructor(file as folderitem, type as string, count as Integer = 1)
- 50.19.9 Constructor(url as string, type as string, count as Integer = 1)
50.19.9 Constructor(url as string, type as string, count as Integer = 1)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates an image destination that writes to a location specified by a URL.

**Notes:**

url: The URL to write to. If the URL already exists, the data at this location is overwritten.

type: The UTI (uniform type identifier) of the resulting image file. See Uniform Type Identifiers Overview for a list of system-declared and third-party UTIs.

count: The number of images (not including thumbnail images) that the image file will contain.

On success the handle value is not zero.

Available in Mac OS X version 10.4 and later.

See also:

- 50.19.7 Constructor(file as folderitem, type as string, count as Integer = 1)
- 50.19.8 Constructor(type as string, count as Integer = 1)

50.19.10 CreateWithData(type as string, count as Integer = 1) as CGImageDestinationMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates an image destination that writes to a string.

**Notes:**

type: The uniform type identifier (UTI) of the resulting image file. See Uniform Type Identifiers Overview for a list of system-declared and third-party UTIs.

count: The number of images (not including thumbnail images) that the image file will contain.

On error the function returns nil.

Available in Mac OS X version 10.4 and later.
### 50.19.11 CreateWithFile(file as folderitem, type as string, count as Integer = 1) as CGImageDestinationMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an image destination that writes to a location specified by a folderitem.  
**Notes:**  
file: The file to write to. If the file already exists, the data at this location is overwritten.  

type: The UTI (uniform type identifier) of the resulting image file. See Uniform Type Identifiers Overview for a list of system-declared and third-party UTIs.  

count: The number of images (not including thumbnail images) that the image file will contain.  

On failure the function returns nil.  

Available in Mac OS X version 10.4 and later.

### 50.19.12 CreateWithURL(url as string, type as string, count as Integer = 1) as CGImageDestinationMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an image destination that writes to a location specified by a URL.  
**Notes:**  
url: The URL to write to. If the URL already exists, the data at this location is overwritten.  

type: The UTI (uniform type identifier) of the resulting image file. See Uniform Type Identifiers Overview for a list of system-declared and third-party UTIs.  

count: The number of images (not including thumbnail images) that the image file will contain.  

On error nil is returned.  

Available in Mac OS X version 10.4 and later.
50.19.13 Data as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Makes a copy of the data.
**Notes:** The data is collected and after you called Finalize you can pick the data here.

50.19.14 Finalize as boolean

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Writes image data and properties to the data or URL associated with the image destination.
**Example:**
```vbscript
dim logo as Picture = LogoMBS(500)
dim image as CGImageMBS = CGCreateImageMBS(logo)

dim file as FolderItem = SpecialFolder.Desktop.Child("logo.png")
dim d as new CGImageDestinationMBS(file, "public.png", 1)

d.AddImage(image, nil)

if d.Finalize then
    MsgBox "Saved"
else
    MsgBox "Failed to save."
end if
```

**Notes:**
Returns true if the image is successfully written; false otherwise.
You must call this function or the output of the image destination will not be valid. After calling this function, no additional data can be added to the image destination.
Available in Mac OS X version 10.4 and later.

50.19.15 FinalizeMT as boolean

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Writes image data and properties to the data or URL associated with the image destination.
**Notes:**
Returns true if the image is successfully written; false otherwise.
You must call this function or the output of the image destination will not be valid. After calling this function, no additional data can be added to the image destination.

Available in Mac OS X version 10.4 and later.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.

**50.19.16 kCGImageDestinationBackgroundColor as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the constant for the image destination properties.

**Notes:**
The desired background color to composite against when writing an image that has an alpha component to a destination format that does not support alpha. If present, the value associated with this key must be a CGColorRef data type without an alpha component of its own. If not present, and if a background color is needed, a white color is used.

Available in Mac OS X v10.4 and later.

**50.19.17 kCGImageDestinationDateTime as string**

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Updates the DateTime parameters of the image metadata. Only values present in the original image will updated. If present, the value should be a String or a Date. If String, the value must be in Exif Date-Time or ISO 8601 DateTime format. This option is mutually exclusive with kCGImageDestinationMetadata.

**50.19.18 kCGImageDestinationLossyCompressionQuality as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the constant for the image destination properties.

**Notes:**
The desired compression quality to use when writing to an image destination. If present, the value associated with this key must be a double in the range 0.0 to 1.0. A value of 1.0 specifies to use lossless compression if destination format supports it. A value of 0.0 implies to use maximum compression.

Available in Mac OS X v10.4 and later.
50.19.19 kCGImageDestinationMergeMetadata as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function**: One of the constant for the image destination properties. **Example**:

```vbnet
// Change rotation in an image file

// files
dim dpath as folderitem = SpecialFolder.Desktop.Child("test.jpg")
dim opath as folderitem = dpath.parent.Child("output.jpg")

// open source
dim imageSource as new cgimagesourcembs(dpath)

// read image
dim img as cgimagembs = imageSource.createimageatindex(0)

// global properties
dim globalprop as dictionary = imageSource.properties

// per image properties
dim p as Dictionary = imageSource.PropertiesAtIndex(0)

dim imageDest as new CGImageDestinationMBS(opath,"public.jpeg",1)

'const orientation = 1 // top left
const orientation = 3 // bottom right

// set globals
imageDest.SetProperties(globalprop)

// now set new orientation
p.value(imageDest.kCGImageDestinationOrientation) = orientation
p.value(imageDest.kCGImageDestinationMergeMetadata) = true

// change tiff dictionary, if present
dim dTIFF as Dictionary = p.lookup(imageSource.kCGImagePropertyTIFFDictionary, nil)
if dTIFF <>nil then
dTIFF.value(imageSource.kCGImagePropertyTIFFOrientation) = orientation
end if

// change iptc dictionary, if present
dim dIPTC as Dictionary = p.lookup(imageSource.kCGImagePropertyIPTCDictionary, nil)
if dIPTC <>nil then
dIPTC.value(imageSource.kCGImagePropertyIPTCImageOrientation) = orientation
```
CHAPTER 50. COREGRAPHICS

end if

// write out image
imageDest.AddImage(img,p)
call imageDest.Finalize

Notes: If true, The metadata will be copied from the source and merged with the tags specified in kCGImageDestinationMetadata. If a tag does not exist in the source, it will be added. If the tag exists in the source, it will be updated. A metadata tag can be removed by setting the tag's value to nil. If present, the value of this key is a Boolean. The default is False.

50.19.20 kCGImageDestinationMetadata as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: One of the constant for the image destination properties. Notes: Set the metadata tags for the image destination. If present, the value of this key is a CGImageMetadata. By default, all EXIF, IPTC, and XMP tags will be replaced. Use kCGImageDestinationMergeMetadata to merge the tags with the existing tags in the image source.

50.19.21 kCGImageDestinationOrientation as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: One of the constant for the image destination properties. Example:

// Change rotation in an image file

// files
dim dpath as folderitem = SpecialFolder.Desktop.Child("test.jpg")
dim opath as folderitem = dpath.parent.Child("output.jpg")

// open source
dim imageSource as new cgimagesourcembs(dpath)

// read image
dim img as cgimagembs = imageSource.createimageatindex(0)

// global properties
dim globalprop as dictionary = imageSource.properties
// per image properties
dim p as Dictionary = imageSource.PropertiesAtIndex(0)

dim imageDest as new CGImageDestinationMBS(opath,"public.jpeg",1)
const orientation = 1 // top left
const orientation = 3 // bottom right

// set globals
imageDest.SetProperties(globalprop)

// now set new orientation
p.value(imageDest.kCGImageDestinationOrientation) = orientation
p.value(imageDest.kCGImageDestinationMergeMetadata) = true

// change tiff dictionary, if present
dim dTIFF as Dictionary = p.lookup(imageSource.kCGImagePropertyTIFFDictionary, nil)
if dTIFF <> nil then
dTIFF.value(imageSource.kCGImagePropertyTIFFOrientation) = orientation
end if

// change iptc dictionary, if present
dim dIPTC as Dictionary = p.lookup(imageSource.kCGImagePropertyIPTCDictionary, nil)
if dIPTC <> nil then
dIPTC.value(imageSource.kCGImagePropertyIPTCImageOrientation) = orientation
end if

// write out image
imageDest.AddImage(img, p)
call imageDest.Finalize

Notes: Updates the orientation in the image metadata. The image data itself will not be rotated. If present, the value should be a Integer from 1 to 8. This option is mutually exclusive with kCGImageDestination-Metadata.

50.19.22 kCGImageMetadataShouldExcludeXMP as string

Notes: XMP data will not be written to the destination. If used in conjunction with kCGImageDestinationMetadata, EXIF and/or IPTC tags will be preserved, but an XMP packet will not be written to the file. If present, the value for this key is a Boolean. The default is False.
50.19.23  SetProperties(options as dictionary = nil)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Applies one or more properties to all images in an image destination.

**Example:**

```vba
dim inputFile as FolderItem = SpecialFolder.Desktop.Child("test.jpg")

// reading the picture
dim c as new CGImageSourceMBS(inputFile)
dim img as CGImageMBS = c.CreateImageAtIndex(0)
dim propertiesGlobal as Dictionary = c.Properties
dim propertiesImage as Dictionary = c.PropertiesAtIndex(0)

dim outputFile as FolderItem = SpecialFolder.Desktop.Child("output.jpg")
dim d as new CGImageDestinationMBS(outputFile, "public.jpeg", 1)

// writing the picture and include metadata
d.SetProperties(propertiesGlobal)
d.AddImage(img, propertiesImage)
if d.FinalizeMT then
    outputFile.Launch
else
    MsgBox "Failed to write jpeg."
end if
```

**Notes:** Available in Mac OS X version 10.4 and later.

50.19.24  SetPropertiesCF(options as Variant)

MBS MacCG Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Applies one or more properties to all images in an image destination.

**Notes:**

Available in Mac OS X version 10.4 and later.
Options can be a Dictionary or CFDictionaryMBS.

50.19.25  TypeIdentifiers as string()

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns an array of the uniform type identifiers (UTIs) that are supported for image destinations.

**Example:**
50.19. CLASS CGIMAGEDESTINATIONMBS

```vbs
        dim s(-1) as string = CGImageDestinationMBS.TypeIdentifiers
        MsgBox Join(s,EndOfLine)
        // shows on Mac OS X 10.5:
        //
        // public.png
        // public.jpeg
        // com.compuserve.gif
        // public.jpeg-2000
        // public.tiff
        // com.adobe.photoshop-image
        // com.adobe.pdf
        // com.microsoft.bmp
        // com.apple.pict
        // com.truevision.tga-image
        // com.sgi.sgi-image
        // com.ilm.openexr-image
```

**Notes:**

Returns an array of the UTIs that are supported for image destinations. See Uniform Type Identifiers Overview for a list of system-declared and third-party UTIs that can be returned.

Available in Mac OS X version 10.4 and later.

50.19.26 Properties

50.19.27 Handle as Integer

**MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:**
The internal reference.

**Notes:** (Read and Write property)
50.20 class CGImageMBS

50.20.1 class CGImageMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a core graphics image.

**Notes:**
If the release property is true, the destructor of this class will release the image reference.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

50.20.2 Methods

50.20.3 Constructor

MBS MacCG Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The private constructor.

50.20.4 Copy as CGImageMBS

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a copy of a bitmap image.

See also:

- 50.20.5 Copy(r as CGRectMBS) as CGImageMBS

50.20.5 Copy(r as CGRectMBS) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a copy of a bitmap image.

See also:

- 50.20.4 Copy as CGImageMBS

50.20.6 CopyWithColorSpace(profile as CGColorSpaceMBS) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a copy of the image with the new Colorspace included.

**Example:**

```javascript
// load a picture
dim f as FolderItem = SpecialFolder.Desktop.Child("ColorSpin.jpg")
```
50.20. CLASS CGIMAGEMBS

```vbscript
50.20. CLASS CGIMAGEMBS

```dim pic as Picture = picture.Open(f)
```// open printer
dim g as Graphics = OpenPrinterDialog
if g = nil then Return
```// draw
g.DrawPicture pic, 0, 0
```
```// now load again
dim ImageSource as new CGImageSourceMBS(f)
dim img as CGImageMBS = ImageSource.CreateImageAtIndex(0)
dim cs as CGColorSpaceMBS = CGColorSpaceMBS.CreateDeviceRGB
```
```// copy with replacing colorspace
img = img.CopyWithColorSpace(cs)
```
```// and draw
dim c as CGContextMBS = CGContextMBS.contextWithCGContext(g.Handle(g.HandleTypeCGContextRef))
dim r as CGRectMBS = CGMakeRectMBS(0, 0, img.Width, img.Height)
c.DrawPicture(img, r)
c.Flush
```

Notes:

profile must be a CGColorSpaceMBS.
Requires Mac OS X 10.3.

50.20.7 CopyWithMask(mask as CGImageMBS) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
creates a bitmap image from an existing image and an image mask.

Notes:

Parameters:

self: The image to apply the mask parameter to. This image must not be an image mask and may not have an image mask or masking color associated with it.

mask: A mask. If the mask is an image, it must be in the DeviceGray color space, must not have an alpha component, and may not itself be masked by an image mask or a masking color. If the mask is not the same size as the image specified by the image parameter, then Quartz scales the mask to fit the image.
Return Value: An image created by masking image with mask. You are responsible for releasing this object by calling CGImageRelease.

The resulting image depends on whether the mask parameter is an image mask or an image. If the mask parameter is an image mask, then the source samples of the image mask act as an inverse alpha value. That is, if the value of a source sample in the image mask is \( S \), then the corresponding region in image is blended with the destination using an alpha value of \((1-S)\). For example, if \( S \) is 1, then the region is not painted, while if \( S \) is 0, the region is fully painted.

If the mask parameter is an image, then it serves as an alpha mask for blending the image onto the destination. The source samples of mask' act as an alpha value. If the value of the source sample in mask is \( S \), then the corresponding region in image is blended with the destination with an alpha of \( S \). For example, if \( S \) is 0, then the region is not painted, while if \( S \) is 1, the region is fully painted.

### 50.20.8 CreateImage(pic as picture) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 13.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGImageMBS from the given images.

**Example:**

```plaintext
dim c as CGImageMBS
dim pic, mask as Picture
// get picture and mask

c = CGImageMBS.CreateImage(pic)
if c<>Nil then
  // go on
end if
```

**Notes:** If the image has a mask, it is used.

See also:

- 50.20.9 CreateImage(pic as picture, mask as picture) as CGImageMBS

### 50.20.9 CreateImage(pic as picture, mask as picture) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 13.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGImageMBS from the given images.

**Example:**

```plaintext
50.20. CLASS CGIMAGEMBS

dim c as CGImageMBS
dim pic, mask as Picture
// get picture and mask

c = CGImageMBS.CreateImage(pic, mask)
if c<>Nil then
  // go on
end if

Notes:
The mask is taken from the second image.
With 11.3 plugins we are deprecating to pass a mask. The plugin prefers to simply take the mask or alpha channel of the picture itself.
See also:

• 50.20.8 CreateImage(pic as picture) as CGImageMBS

50.20.10 CreateImageFromJPEGDataProvider(dataprovider as Variant, decode as memoryblock, shouldInterpolate as boolean, intent as Integer) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new CGImage with JPEG data.
**Example:**

// Shows moon.jpg from the desktop folder
// shows in the window title if i,p or u is nil.

Sub Mainwindow.Paint(g As Graphics)
dim f as FolderItem
dim p as CGDataProviderMBS
dim i as CGImageMBS

f=SpecialFolder.Desktop.Child("moon.jpg")
p=CGDataProviderMBS.CreateWithFile(f)
if p=nil then
  Title="p=nil"
else
  i = CGImageMBS.CreateImageFromJPEGDataProvider(p,nil,true,0)
  if i=nil then
    Title="i=nil"
  else
    window1.CGContextMBS.DrawPicture i,CGMakeRectMBS(0,0,i.Width,i.Height)
  end if
end if
Notes:
Parameters:

dataprovider:
A reference to a data provider supplying JPEG-encoded data.

decode:
Pass the decode array for the image. In the decode array, for each color component in the source color space, you provide a pair of values denoting the upper and lower limits of a range. For example, the decode array for a source image in the RGB color space would contain six entries total, consisting of one pair each for red, green, and blue. When the image is rendered, Quartz uses a linear transform to map the original component value into a relative number within your designated range that is appropriate for the destination color space. If you do not want to allow remapping of the image’s color values, pass nil for the decode array. The memoryblock for the array needs to be filled with double values.

shouldInterpolate:
Pass true if interpolation should occur; otherwise, pass false . The interpolation setting specifies whether Quartz should apply a pixel-smoothing algorithm to the image. If you pass false , the image may appear jagged or pixelated when drawn on an output device with higher resolution than the image data.

intent:
Pass a CGColorRenderingIntent value specifying how Quartz should display colors in the image that are not located within the current color space of the graphics context. The rendering intent determines the exact method used to map colors from one color space to another.

50.20.11 CreateImageFromPNGDataProvider(dataprovider as Variant, decode as memoryblock, shouldInterpolate as boolean, intent as Integer) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Creates a new CGImage with PNG data.
Notes:
Parameters:

dataprovider:
A reference to a data provider supplying JPEG-encoded data.
decode:
Pass the decode array for the image. In the decode array, for each color component in the source color space, you provide a pair of values denoting the upper and lower limits of a range. For example, the decode array for a source image in the RGB color space would contain six entries total, consisting of one pair each for red, green, and blue. When the image is rendered, Quartz uses a linear transform to map the original component value into a relative number within your designated range that is appropriate for the destination color space. If you do not want to allow remapping of the image’s color values, pass nil for the decode array. The memoryblock for the array needs to be filled with double values.

shouldInterpolate:
Pass true if interpolation should occur; otherwise, pass false. The interpolation setting specifies whether Quartz should apply a pixel-smoothing algorithm to the image. If you pass false, the image may appear jagged or pixelated when drawn on an output device with higher resolution than the image data.

intent:
Pass a CGColorRenderingIntent value specifying how Quartz should display colors in the image that are not located within the current color space of the graphics context. The rendering intent determines the exact method used to map colors from one color space to another.

50.20.12 CreateImageWithFile(file as folderitem) as CGImageMBS
Notes: Returns nil on any error.

50.20.13 CreateImageWithHandle(handle as Integer) as CGImageMBS
Notes: Internally the CGImageMBS retains this reference and releases it in destructor.

50.20.14 DataProvider as Variant
Notes: Value is a CGDataProviderMBS object.
Returns nil on any error.
50.20.15DecodeArray as memoryblock

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The decode array used for the image.
**Notes:**
A memoryblock with an array of double variables.
Returns nil on any error.

50.20.16JPEGData(Compression as Integer = 90) as MemoryBlock

MBS MacCG Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns image compressed as JPEG file.
**Notes:**
Compression defines the compression level from 0 to 100.
Returns nil on any error.

50.20.17Picture(ColorSpace as CGColorSpaceMBS = nil) as Picture

MBS MacCG Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a copy of the CGImage as a picture.
**Example:**
```vbnet
// get CGImage
dim f as FolderItem = SpecialFolder.Desktop.Child("bild.jpg")
dim c as CGImageMBS = CGImageMBS.CreateInstanceWithFile(f)
// get picture
dim p as Picture = c.Picture
// save as jpeg
dim d as FolderItem = SpecialFolder.Desktop.Child("output.jpg")
p.Save(d, p.SaveAsJPEG, 80)
```

**Notes:**
Colorspace: the optional CoreGraphcis Colorspace to use for the bitmap conversion (CGColorSpaceMBS class).
Returns nil on any error.
50.20.18 PictureScaled(OutputWidth as Integer, OutputHeight as Integer, ColorSpace as CGColorSpaceMBS = nil) as Picture

MBS MacCG Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a copy of the CGImage as a picture scaled.

**Example:**

```plaintext
// get CGImage
dim f as FolderItem = SpecialFolder.Desktop.Child("bild.jpg")
dim c as CGImageMBS = CGImageMBS.CreateImageWithFile(f)

// get picture
dim p as Picture = c.PictureScaled(640,480)

// save as jpeg
dim d as FolderItem = SpecialFolder.Desktop.Child("output.jpg")
p.Save(d, p.SaveAsJPEG, 80)
```

**Notes:**

Colorsace: the optional CoreGraphcis Colorspace to use for the bitmap conversion (CGColorSpaceMBS class).

Returns nil on any error.

If output width and height are zero, we use the image sizes.

50.20.19 PNGData as MemoryBlock

**Notes:** Returns nil on any error.

50.20.20 ReleaseHandle

**Notes:**

Each retain must have a release. Too many releases and your app will crash, too many retains and it will leak memory.

Use only if you really know what you are doing.
50.20.21  RetainHandle

**Notes:**
Each retain must have a release. Too many releases and your app will crash, too many retains and it will leak memory. Use only if you really know what you are doing.

50.20.22  Properties

50.20.23  AlphaInfo as Integer

MBS MacCG Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the alpha channel information for a bitmap image.

**Notes:**
A CGImageAlphaInfo constant that specifies (1) whether the bitmap contains an alpha channel, (2) where the alpha bits are located in the image data, and (3) whether the alpha value is premultiplied. For possible values, see Constants. The function returns kCGImageAlphaNone if the image parameter refers to an image mask.
(Read only property)

50.20.24  BitmapInfo as Integer

MBS MacCG Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the bitmap information for a bitmap image.

**Notes:**
This function returns a constant that specifies:

The type of bitmap data floating point or integer. You use the constant kCGBitmapFloatComponents to extract this information.

Whether an alpha channel is in the data, and if so, how the alpha data is stored. You use the constant kCGBitmapAlphaInfoMask to extract the alpha information. Alpha information is specified as one of the constants listed in Alpha Information for Images.
(Read only property)
50.20.25 BitsPerComponent as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the number of bits/component of the image.
**Notes:** (Read only property)

50.20.26 BitsPerPixel as Integer

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the number of bits/pixel of image.
**Notes:** (Read only property)

50.20.27 BytesPerRow as Integer

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the number of bytes allocated for a double row of a bitmap image.
**Notes:** (Read only property)

50.20.28 ColorSpace as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The color space used for the image.
**Example:**
```plaintext
// get a picture file
dim file as FolderItem = SpecialFolder.Desktop.Child("sylwia.jpg")
// get image source
dim source as new CGImageSourceMBS(file)
// read image
dim image as CGImageMBS = source.CreateImageAtIndex(0)
// get Color space from image
dim profile as CGColorSpaceMBS = image.ColorSpace
// get ICC profile data
dim ICCProfile as string = profile.ICCProfile
// and parse it with LCMS and show name
dim LCMSProfile as LCMS2ProfileMBS = LCMS2ProfileMBS.OpenProfileFromString(ICCProfile)
MsgBox LCMSProfile.Name
```
**Notes:**
Value is a CGColorSpaceMBS.
Returns nil on any error.
(Read only property)

**50.20.29 handle as Integer**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The handle for this image.
**Notes:**
Handle is a CGImageRef.
(Read and Write property)

**50.20.30 height as Integer**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the image’s height.
**Notes:**
Returns 0 on error.
(Read only property)

**50.20.31 ImageIsMask as boolean**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns true if the image is an image mask, false otherwise.
**Notes:** (Read only property)

**50.20.32 RenderingIntent as Integer**

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the rendering intent of the image.
**Notes:**
Constants:

- kCGRenderingIntentDefault 0
- kCGRenderingIntentAbsoluteColorimetric 1
- kCGRenderingIntentRelativeColorimetric 2
- kCGRenderingIntentPerceptual 3
- kCGRenderingIntentSaturation 4
50.20.33 RetainCount as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the retain count of the CGImageRef.
**Notes:**
This is useful for debugging.
The retain count is for the CGImageRef, not the CGImageMBS object.
(Read only property)

50.20.34 ShouldInterpolate as boolean

MBS MacCG Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the interpolation parameter of image.
**Notes:**
True if the image should use interpolation.
(Read only property)

50.20.35 width as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the image's width.
**Notes:**
Returns 0 on error.
(Read only property)

50.20.36 Constants

50.20.37 kCGBitmapAlphaInfoMask = & h1F

MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the bitmap info values.
**Notes:** The alpha information mask. Use this to extract alpha information that specifies whether a bitmap contains an alpha channel and how the alpha channel is generated.
50.20.38  kCGBitmapByteOrder16Big = 12288
MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the bitmap info values. **Notes:** 16-bit, big endian format.

50.20.39  kCGBitmapByteOrder16Little = 4096
MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the bitmap info values. **Notes:** 16-bit, little endian format.

50.20.40  kCGBitmapByteOrder32Big = 16384
MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the bitmap info values. **Notes:** 32-bit, big endian format.

50.20.41  kCGBitmapByteOrder32Little = 8192
MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the bitmap info values. **Notes:** 32-bit, little endian format.

50.20.42  kCGBitmapByteOrderDefault = 0
MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the bitmap info values. **Notes:** The default byte order.

50.20.43  kCGBitmapByteOrderMask = & h7000
MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the bitmap info values. **Notes:** The byte ordering of pixel formats.

50.20.44  kCGBitmapFloatComponents = 256
MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the bitmap info values. **Notes:** The components of a bitmap are floating-point values.
50.20. CLASS CGIMAGEMBS

50.20.45 kCGImageAlphaFirst = 4

MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the alpha info values. 
**Notes:** The alpha component is stored in the most significant bits of each pixel. For example, non-premultiplied ARGB.

50.20.46 kCGImageAlphaLast = 3

MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the alpha info values. 
**Notes:** The alpha component is stored in the least significant bits of each pixel. For example, non-premultiplied RGBA.

50.20.47 kCGImageAlphaNone = 0

MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the alpha info values. 
**Notes:** There is no alpha channel. If the total size of the pixel is greater than the space required for the number of color components in the color space, the least significant bits are ignored. This value is equivalent to kCGImageAlphaNoneSkipLast.

50.20.48 kCGImageAlphaNoneSkipFirst = 6

MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the alpha info values. 
**Notes:** There is no alpha channel. If the total size of the pixel is greater than the space required for the number of color components in the color space, the most significant bits are ignored.

50.20.49 kCGImageAlphaNoneSkipLast = 5

MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the alpha info values. 
**Notes:** There is no alpha channel. If the total size of the pixel is greater than the space required for the number of color components in the color space, the least significant bits are ignored. This value is equivalent to kCGImageAlphaNone.

50.20.50 kCGImageAlphaOnly = 7

MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the alpha info values. 
**Notes:** There is no color data, only an alpha channel.
50.20.51  kCGImageAlphaPremultipliedFirst = 2

MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the alpha info values.  
**Notes:** The alpha component is stored in the most significant bits of each pixel and the color components have already been multiplied by this alpha value. For example, premultiplied ARGB.

50.20.52  kCGImageAlphaPremultipliedLast = 1

MBS MacCG Plugin, Plugin Version: 15.3. **Function:** One of the alpha info values.  
**Notes:** The alpha component is stored in the least significant bits of each pixel and the color components have already been multiplied by this alpha value. For example, premultiplied RGBA.
50.21. CLASS CGIMAGESOURCEMBS

50.21. class CGImageSourceMBS

50.21.1. class CGImageSourceMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The CoreGraphics class for image loading.  
**Example:**
```
    dim file as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
    dim c as new CGImageSourceMBS(file)
    dim img as CGImageMBS = c.CreateImageAtIndex(0)
```

Backdrop=img.Picture

**Notes:**
CGImageSource objects, available in Mac OS X v10.4 or later, abstract the data-reading task. An image source can read image data from a URL, a file or a string.

After creating a CGImageSource object for the appropriate source, you can obtain images, thumbnails, image properties, and other image information using CGImageSource functions.

50.21.2. Methods

50.21.3. Constructor(data as string, options as dictionary = nil)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an image source that reads from a string.  
**Notes:**
data: The data string to read from.  
options: A dictionary that specifies additional creation options. For example kCGImageSourceTypeIdentifierHint.

On success the handle value is not zero.  
Available in Mac OS X version 10.4 and later.  
See also:

- 50.21.4 Constructor(file as folderitem, options as dictionary = nil)
- 50.21.5 Constructor(options as dictionary = nil)
50.21.4 Constructor(file as folderitem, options as dictionary = nil)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates an image source that reads from a location specified by a file.

**Notes:**

- **url:** The URL to read from.

- **options:** A dictionary that specifies additional creation options. For example kCGImageSourceTypeIdenti-
  fierHint.

On success the handle value is not zero.

Available in Mac OS X version 10.4 and later.

See also:

- 50.21.3 Constructor(data as string, options as dictionary = nil) 8147
- 50.21.5 Constructor(options as dictionary = nil) 8148

50.21.5 Constructor(options as dictionary = nil)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Create an incremental image source.

**Notes:**

- **options:** A dictionary that specifies additional creation options. For example kCGImageSourceTypeIdenti-
  fierHint.

Returns an image source object.

The constructor creates an empty image source container to which you can add data later by calling the
function UpdateData. You don’t provide data when you call this function.

An incremental image is an image that is created in chunks, similar to the way large images viewed over the
web are loaded piece by piece.

Available in Mac OS X version 10.4 and later.

See also:

- 50.21.3 Constructor(data as string, options as dictionary = nil) 8147
- 50.21.4 Constructor(file as folderitem, options as dictionary = nil) 8148
50.21.6 CreateImageAtIndex(index as Integer, options as dictionary = nil) as CGImageMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a CGImage object for the image data associated with the specified index in an image source. **Example:**

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim c as new CGImageSourceMBS(file)
dim img as CGImageMBS = c.CreateImageAtIndex(0)
```

Backdrop=img.Picture

**Notes:**

- **index:** The index that specifies the location of the image. The index is zero-based.
- **options:** A dictionary that specifies additional creation options.

Returns a CGImage object.

Available in Mac OS X version 10.4 and later.

50.21.7 CreateIncremental(options as dictionary=nil) as CGImageSourceMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create an incremental image source. **Notes:**

- **options:** A dictionary that specifies additional creation options. For example kCGImageSourceTypeIdentifierHint.

The function CreateIncremental creates an empty image source container to which you can add data later by calling the function UpdateData. You don’t provide data when you call this function.

An incremental image is an image that is created in chunks, similar to the way large images viewed over the web are loaded piece by piece.

Available in Mac OS X version 10.4 and later.
50.21.8  CreateThumbnailAtIndex(index as Integer, options as dictionary = nil) as CGImageMBS

Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim c as new CGImageSourceMBS(file)

dim d as new Dictionary
  d.Value(c.kCGImageSourceThumbnailMaxPixelSize)=200
  d.Value(c.kCGImageSourceCreateThumbnailFromImageIfAbsent)=true

dim img as CGImageMBS = c.CreateThumbnailAtIndex(0,d)
```

Backdrop=img.Picture

Notes:

index: The index that specifies the location of the image. The index is zero-based.

options: A dictionary that specifies additional creation options.

Returns a CGImageMBS.

If the image source is a PDF, this function creates a 72 dpi image of the PDF page specified by the index that you pass. You must, however, pass an options dictionary that contains either the kCGImageSourceCreateThumbnailFromImageIfAbsent or kCGImageSourceCreateThumbnailFromImageAlways keys, with the value of the key set to TRUE.

Available in Mac OS X version 10.4 and later.

50.21.9  CreateWithData(data as string, options as dictionary=nil) as CGImageSourceMBS

Notes:

data: The data string to read from.

options: A dictionary that specifies additional creation options. For example kCGImageSourceTypeIdentifierHint.
50.21.10 CreateWithFile(file as folderitem, options as dictionary=nil) as CGImageSourceMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an image source that reads from a location specified by a file. **Example:**

```plaintext
// get a picture file
dim file as FolderItem = SpecialFolder.Desktop.Child(”sylwia.jpg”)  
// get image source
dim source as new CGImageSourceMBS(file)  
// read image
dim image as CGImageMBS = source.CreateImageAtIndex(0)  
// get Color space from image
dim profile as CGColorSpaceMBS = image.ColorSpace  
// get ICC profile data
dim ICCProfile as string = profile.ICCProfile  
// and parse it with LCMS and show name
dim LCMSProfile as LCMS2ProfileMBS = LCMS2ProfileMBS.OpenProfileFromString(ICCProfile)  
MsgBox LCMSProfile.Name
```

**Notes:**

- url: The URL to read from.
- options: A dictionary that specifies additional creation options. For example kCGImageSourceTypeIdentifierHint.

Returns an image source.

Available in Mac OS X version 10.4 and later.
50.21.11 CreateWithURL(url as string, options as dictionary=nil) as CGImageSourceMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates an image source that reads from a location specified by a URL.

**Notes:**

url: The URL to read from.

options: A dictionary that specifies additional creation options. For example kCGImageSourceTypeIdentifierHint.

On success the handle value is not zero.

Available in Mac OS X version 10.4 and later.

---

50.21.12 kCGImageProperty8BIMDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary.

**Notes:** A dictionary of key-value pairs for an Adobe Photoshop image.

---

50.21.13 kCGImageProperty8BIMLayerNames as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary.

**Notes:** The layer names for an Adobe Photoshop file.

---

50.21.14 kCGImagePropertyCIFFCameraSerialNumber as string

**Notes:** The camera serial number.

---

50.21.15 kCGImagePropertyCIFFContinuousDrive as string

Notes: The continuous drive mode.

50.21.16 kCGImagePropertyCIFFDescription as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Camera Image File Format (CIFF). **Notes:** The camera description.

50.21.17 kCGImagePropertyCIFFDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. **Notes:** A dictionary of key-value pairs for an image that uses Camera Image File Format (CIFF).

Available in Mac OS X v10.5 and later.

50.21.18 kCGImagePropertyCIFFFirmware as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Camera Image File Format (CIFF). **Notes:** The firmware version.

50.21.19 kCGImagePropertyCIFFFlashExposureComp as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Camera Image File Format (CIFF). **Notes:** The flash exposure compensation.

50.21.20 kCGImagePropertyCIFFFocusMode as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Camera Image File Format (CIFF). **Notes:** The focus mode.
50.21.21 kCGImagePropertyCIFFImageFileName as string

50.21.22 kCGImagePropertyCIFFImageName as string

50.21.23 kCGImagePropertyCIFFImageSerialNumber as string

50.21.24 kCGImagePropertyCIFFLensMaxMM as string

50.21.25 kCGImagePropertyCIFFLensMinMM as string

50.21.26 kCGImagePropertyCIFFLensModel as string

50.21.27  
*kCGImagePropertyCIFFMeasuredEV* as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Camera Image File Format (CIFF).
**Notes:** The measured EV.

50.21.28  
*kCGImagePropertyCIFFMeteringMode* as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Camera Image File Format (CIFF).
**Notes:** The metering mode.

50.21.29  
*kCGImagePropertyCIFFOwnerName* as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Camera Image File Format (CIFF).
**Notes:** The owner name.

50.21.30  
*kCGImagePropertyCIFFRecordID* as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Camera Image File Format (CIFF).
**Notes:** The record ID

50.21.31  
*kCGImagePropertyCIFFReleaseMethod* as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Camera Image File Format (CIFF).
**Notes:** The release method.

50.21.32  
*kCGImagePropertyCIFFReleaseTiming* as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Camera Image File Format (CIFF).
**Notes:** The release timing.
50.21.33 kCGImagePropertyCIFFSelfTimingTime as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Camera Image File Format (CIFF).
**Notes:** The self timing time.

50.21.34 kCGImagePropertyCIFFShootingMode as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Camera Image File Format (CIFF).
**Notes:** The shooting mode.

50.21.35 kCGImagePropertyCIFFWhiteBalanceIndex as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Camera Image File Format (CIFF).
**Notes:** The white balance index.

50.21.36 kCGImagePropertyColorModel as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.
**Notes:**
The color model of the image such as, "RGB", "CMYK", "Gray", or "Lab". The value of this key is CFStringRef.

A color model describes how color values are represented mathematically. A color space is a color model combined with a definition of how to interpret values within the model.

50.21.37 kCGImagePropertyColorModelCMYK as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Values for the color model property.
**Notes:** A CMYK color model.
50.21.38  kCGImagePropertyColorModelGray as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Values for the color model property. **Notes:** A Gray color model.

50.21.39  kCGImagePropertyColorModelLab as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Values for the color model property. **Notes:** A Lab color model.

50.21.40  kCGImagePropertyColorModelRGB as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Values for the color model property. **Notes:** An RGB color model.

50.21.41  kCGImagePropertyDepth as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. **Notes:** The number of bits in each color sample of each pixel. If present, this key is a CFNumber value.

50.21.42  kCGImagePropertyDNGBackwardVersion as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses the Digital Negative (DNG) archival format. **Notes:** The oldest version for which a file is compatible.

50.21.43  kCGImagePropertyDNGCameraSerialNumber as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses the DNG archival format. **Notes:** The camera serial number.
50.21.44 kCGImagePropertyDNGDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the keys for the properties dictionary.
Notes: A dictionary of key-value pairs for an image that uses the Digital Negative (DNG) archival format.

50.21.45 kCGImagePropertyDNGLensInfo as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Keys for an image that uses the Digital Negative (DNG) archival format.
Notes: Information about the lens used for the image.

50.21.46 kCGImagePropertyDNGLocalizedCameraModel as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Keys for an image that uses the Digital Negative (DNG) archival format.
Notes: The localized camera model name.

50.21.47 kCGImagePropertyDNGUniqueCameraModel as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Keys for an image that uses the Digital Negative (DNG) archival format.
Notes: A unique, nonlocalized name for the camera mode.

50.21.48 kCGImagePropertyDNGVersion as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Keys for an image that uses the Digital Negative (DNG) archival format.
Notes: An encoding of the four-tier version number.

50.21.49 kCGImagePropertyDPIHeight as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the keys for the properties dictionary.
Notes: The resolution, in dots per inch, in the x dimension. If present, this key is a CFNumber value.
50.21.50  kCGImagePropertyDPIWidth as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. **Notes:** The resolution, in dots per inch, in the y dimension. If present, this key is a CFNumber value.

50.21.51  kCGImagePropertyExifApertureValue as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The aperture value.

50.21.52  kCGImagePropertyExifAuxDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. **Notes:** An auxiliary dictionary of key-value pairs for an image that uses Exchangeable Image File Format (EXIF).

50.21.53  kCGImagePropertyExifAuxFirmware as string

50.21.54  kCGImagePropertyExifAuxFlashCompensation as string

50.21.55  kCGImagePropertyExifAuxImageNumber as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the Exif Auxiliary dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The image number.
**50.21.56 kCGImagePropertyExifAuxLensID as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the Exif Auxiliary dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The lens ID.

**50.21.57 kCGImagePropertyExifAuxLensInfo as string**

**50.21.58 kCGImagePropertyExifAuxLensModel as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the Exif Auxiliary dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The lens model.

**50.21.59 kCGImagePropertyExifAuxLensSerialNumber as string**

**50.21.60 kCGImagePropertyExifAuxOwnerName as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the Exif Auxiliary dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The owner name.

**50.21.61 kCGImagePropertyExifAuxSerialNumber as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the Exif Auxiliary dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The serial number.
50.21.62  kCGImagePropertyExifBrightnessValue as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The brightness value.

50.21.63  kCGImagePropertyExifCFAPattern as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The color filter array (CFA) pattern, which is the geometric pattern of the image sensor for a 1-chip color sensor area.

50.21.64  kCGImagePropertyExifColorSpace as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The color space.

50.21.65  kCGImagePropertyExifComponentsConfiguration as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The components configuration. For compressed data, specifies that the channels of each component are arranged in increasing numeric order (from first component to the fourth).

50.21.66  kCGImagePropertyExifCompressedBitsPerPixel as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The compressed bits per pixel.

50.21.67  kCGImagePropertyExifContrast as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The contrast applied to the image.
50.21.68  kCGImagePropertyExifCustomRendered as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** Special rendering performed on the image data.

50.21.69  kCGImagePropertyExifDateTimeDigitized as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The digitized date and time.

50.21.70  kCGImagePropertyExifDateTimeOriginal as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The original date and time.

50.21.71  kCGImagePropertyExifDeviceSettingDescription as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** For a particular camera mode, indicates the conditions for taking the picture.

50.21.72  kCGImagePropertyExifDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. **Notes:** A dictionary of key-value pairs for an image that uses Exchangeable Image File Format (EXIF).

50.21.73  kCGImagePropertyExifDigitalZoomRatio as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The digital zoom ratio.
50.21.74  kCGImagePropertyExifExposureBiasValue as string

50.21.75  kCGImagePropertyExifExposureIndex as string

50.21.76  kCGImagePropertyExifExposureMode as string

50.21.77  kCGImagePropertyExifExposureProgram as string

50.21.78  kCGImagePropertyExifExposureTime as string

50.21.79  kCGImagePropertyExifExifFileSource as string

50.21.80  kCGImagePropertyExifFlash as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The flash status when the image was shot.

50.21.81  kCGImagePropertyExifFlashEnergy as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The strobe energy when the image was captures, in beam candle power seconds.

50.21.82  kCGImagePropertyExifFlashPixVersion as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The FlashPix version supported by an FPXR file. FlashPix is a format for multi-resolution, tiled images, that facilitates fast onscreen viewing.

50.21.83  kCGImagePropertyExifFNumber as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The F number.

50.21.84  kCGImagePropertyExifFocalLength as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The focal length.

50.21.85  kCGImagePropertyExifFocalLenIn35mmFilm as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The equivalent focal length in 35 mm film.
50.21. **CLASS CGIMAGESOURCEMBS**

50.21.86  *kCGImagePropertyExifFocalPlaneResolutionUnit as string*

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The unit of measurement for the focal plane x and y tags.

50.21.87  *kCGImagePropertyExifFocalPlaneXResolution as string*

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The number of image-width pixels (x) per focal plane resolution unit.

50.21.88  *kCGImagePropertyExifFocalPlaneYResolution as string*

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The number of image-height pixels (y) per focal plane resolution unit.

50.21.89  *kCGImagePropertyExifGainControl as string*

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The gain adjustment applied to the image.

50.21.90  *kCGImagePropertyExifGamma as string*

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The gamma setting.

50.21.91  *kCGImagePropertyExifImageUniqueID as string*

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The unique ID of the image.
50.21.92 kCGImagePropertyExifISOSpeedRatings as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** ISO speed ratings.

50.21.93 kCGImagePropertyExifLightSource as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The light source.

50.21.94 kCGImagePropertyExifMakerNote as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** A maker note.

50.21.95 kCGImagePropertyExifMaxApertureValue as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The maximum aperture value.

50.21.96 kCGImagePropertyExifMeteringMode as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The metering mode.

50.21.97 kCGImagePropertyExifOECF as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF). **Notes:** The opto-electrical conversion function (OECF), which defines the relationship between the optical input of the camera and the image values.
50.21.98  kCGImagePropertyExifPixelXDimension as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The pixel x dimension.

50.21.99  kCGImagePropertyExifPixelYDimension as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The pixel y dimension.

50.21.100  kCGImagePropertyExifRelatedSoundFile as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** A related sound file.

50.21.101  kCGImagePropertyExifSaturation as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The saturation applied to the image.

50.21.102  kCGImagePropertyExifSceneCaptureType as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The scene capture type (standard, landscape, portrait, night).
50.21.103  kCGImagePropertyExifSceneType as string

**Notes:** The scene type.

50.21.104  kCGImagePropertyExifSensingMethod as string

**Notes:** The sensor type of the camera or input device.

50.21.105  kCGImagePropertyExifSharpness as string

**Notes:** The sharpness applied to the image.

50.21.106  kCGImagePropertyExifShutterSpeedValue as string

**Notes:** The shutter speed value.

50.21.107  kCGImagePropertyExifSpatialFrequencyResponse as string

**Notes:** The spatial frequency table and spatial frequency response values in the direction of image width, image height, and diagonal directions. See ISO 12233.

50.21.108  kCGImagePropertyExifSpectralSensitivity as string

**Notes:** The spectral sensitivity of each channel.
50.21. **CLASS CGIMAGESOURCEMBS**

50.21.109  **kCGImagePropertyExifSubjectArea as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The subject area.

50.21.110  **kCGImagePropertyExifSubjectDistance as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The distance to the subject, in meters.

50.21.111  **kCGImagePropertyExifSubjectDistRange as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The subject distance range.

50.21.112  **kCGImagePropertyExifSubjectLocation as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The location of the scene’s primary subject.

50.21.113  **kCGImagePropertyExifSubsecTime as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The fraction of seconds for the date and time tag.

50.21.114  **kCGImagePropertyExifSubsecTimeDigitized as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The fraction of seconds for the digitized time tag.
50.21.115 kCGImagePropertyExifSubsecTimeOriginal as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The fraction of seconds for the original date and time tag.

50.21.116 kCGImagePropertyExifUserComment as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** A user comment.

50.21.117 kCGImagePropertyExifVersion as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The version.

50.21.118 kCGImagePropertyExifWhiteBalance as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for the (EXIF) dictionary for an image that uses Exchangeable Image File Format (EXIF).
**Notes:** The white balance mode.

50.21.119 kCGImagePropertyFileSize as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.
**Notes:**
The size of the image file in bytes, if known. If present, this key is a CFNumber value.
Available in Mac OS X v10.4 and later.

This key is used in the image source properties.
50.21.  CLASS CGIMAGESOURCEMBS

50.21.120  kCGImagePropertyGIFDelayTime as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Graphics Interchange Format (GIF).
**Notes:** The delay time.

50.21.121  kCGImagePropertyGIFDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.
**Notes:** A dictionary of key-value pairs for an image that uses Graphics Interchange Format (GIF).

50.21.122  kCGImagePropertyGIFHasGlobalColorMap as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Graphics Interchange Format (GIF).
**Notes:** Whether or not the GIF has a global color map.

50.21.123  kCGImagePropertyGIFImageColorMap as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Graphics Interchange Format (GIF).
**Notes:** The image color map.

50.21.124  kCGImagePropertyGIFLoopCount as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Graphics Interchange Format (GIF).
**Notes:** The loop count.

50.21.125  kCGImagePropertyGIFUnclampedDelayTime as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the key names for the properties.
**Notes:**
The unclamped delay time.
Available in OS X v10.7 and later.
50.21.126  kCGImagePropertyGPSAltitude as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that has Global Positioning System (GPS) information.
**Notes:** The altitude.

50.21.127  kCGImagePropertyGPSAltitudeRef as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that has Global Positioning System (GPS) information.
**Notes:** The reference altitude.

50.21.128  kCGImagePropertyGPSAreaInformation as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that has Global Positioning System (GPS) information.
**Notes:** The name of the GPS area.

50.21.129  kCGImagePropertyGPSDateStamp as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that has Global Positioning System (GPS) information.
**Notes:** The data and time information relative to Coordinated Universal Time (UTC).

50.21.130  kCGImagePropertyGPSDestBearing as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that has Global Positioning System (GPS) information.
**Notes:** The bearing to the destination point.

50.21.131  kCGImagePropertyGPSDestBearingRef as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that has Global Positioning System (GPS) information.
Notes: The reference for giving the bearing to the destination point.

50.21.132  kCGImagePropertyGPSDestDistance as string

50.21.133  kCGImagePropertyGPSDestDistanceRef as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Keys for an image that has Global Positioning System (GPS) information. Notes: The units for expressing the distance to the destination point.

50.21.134  kCGImagePropertyGPSDestLatitude as string

50.21.135  kCGImagePropertyGPSDestLatitudeRef as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Keys for an image that has Global Positioning System (GPS) information. Notes: Whether the latitude of the destination point is northern or southern.

50.21.136  kCGImagePropertyGPSDestLongitude as string

50.21.137  kCGImagePropertyGPSDestLongitudeRef as string

Notes: Whether the longitude of the destination point is east or west.

50.21.138  kCGImagePropertyGPSDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.
**Notes:** A dictionary of key-value pairs for an image that has Global Positioning System (GPS) information.

50.21.139  kCGImagePropertyGPSDifferential as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that has Global Positioning System (GPS) information.
**Notes:** Whether differential correction is applied to the GPS receiver.

50.21.140  kCGImagePropertyGPSDOP as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that has Global Positioning System (GPS) information.
**Notes:** The data degree of precision (DOP).

50.21.141  kCGImagePropertyGPSImgDirection as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that has Global Positioning System (GPS) information.
**Notes:** The direction of the image.

50.21.142  kCGImagePropertyGPSImgDirectionRef as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that has Global Positioning System (GPS) information.
**Notes:** The reference for the direction of the image.

50.21.143  kCGImagePropertyGPSLatitude as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that has Global Positioning System (GPS) information.
50.21. **CLASS CGIMAGESOURCEMBS**

Notes: The latitude.

50.21.144 **kCGImagePropertyGPSLatitudeRef as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that has Global Positioning System (GPS) information. **Notes:** Whether the latitude is northern or southern.

50.21.145 **kCGImagePropertyGPSLongitude as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that has Global Positioning System (GPS) information. **Notes:** The longitude.

50.21.146 **kCGImagePropertyGPSLongitudeRef as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that has Global Positioning System (GPS) information. **Notes:** Whether the longitude is east or west.

50.21.147 **kCGImagePropertyGPSMapDatum as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that has Global Positioning System (GPS) information. **Notes:** The geodetic survey data used by the GPS receiver.

50.21.148 **kCGImagePropertyGPSMeasureMode as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that has Global Positioning System (GPS) information. **Notes:** The measurement mode.

50.21.149 **kCGImagePropertyGPSProcessingMethod as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that has Global Positioning System (GPS) information.
Notes: The name of the method used for finding a location.

50.21.150 kCGImagePropertyGPSSatellites as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Keys for an image that has Global Positioning System (GPS) information.
Notes: The satellites used for GPS measurements.

50.21.151 kCGImagePropertyGPSSpeed as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Keys for an image that has Global Positioning System (GPS) information.
Notes: The GPS receiver speed of movement.

50.21.152 kCGImagePropertyGPSSpeedRef as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Keys for an image that has Global Positioning System (GPS) information.
Notes: The unit for expressing the GPS receiver speed of movement.

50.21.153 kCGImagePropertyGPSStatus as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Keys for an image that has Global Positioning System (GPS) information.
Notes: The status of the GPS receiver.

50.21.154 kCGImagePropertyGPSTimeStamp as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Keys for an image that has Global Positioning System (GPS) information.
Notes: The time as UTC (Coordinated Universal Time).

50.21.155 kCGImagePropertyGPSTrack as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Keys for an image that has Global Positioning System (GPS) information.
50.21. **CLASS CGIMAGESOURCEMBS**

**Notes:** The direction of GPS receiver movement.

---

### 50.21.156 kCGImagePropertyGPSTrackRef as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that has Global Positioning System (GPS) information. **Notes:** The reference for the direction of GPS receiver movement.

---

### 50.21.157 kCGImagePropertyGPSVersion as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that has Global Positioning System (GPS) information. **Notes:** The version.

---

### 50.21.158 kCGImagePropertyHasAlpha as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. **Notes:** Whether or not the image has an alpha channel. The value of this key is kCFBooleanTrue if the image contains an alpha channel.

---

### 50.21.159 kCGImagePropertyIPTCAActionAdvised as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The advised action.

---

### 50.21.160 kCGImagePropertyIPTCBByline as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The byline.
50.21.161  kCGImagePropertyIPTCBylIneTitle as string

50.21.162  kCGImagePropertyIPTCCaptionAbstract as string

50.21.163  kCGImagePropertyIPTCCategory as string

50.21.164  kCGImagePropertyIPTCCity as string

50.21.165  kCGImagePropertyIPTCCContact as string

50.21.166  kCGImagePropertyIPTCCContactInfoAddress as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: One of the key names for the properties. Notes: The address portion of the contact information. Available in OS X v10.6 and later.
50.21.167 kCGImagePropertyIPTCContactInfoCity as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. **Notes:** The city portion of the contact information. Available in OS X v10.6 and later.

50.21.168 kCGImagePropertyIPTCContactInfoCountry as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. **Notes:** The country portion of the contact information. Available in OS X v10.6 and later.

50.21.169 kCGImagePropertyIPTCContactInfoEmails as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. **Notes:** Email addresses for the contact. Available in OS X v10.6 and later.

50.21.170 kCGImagePropertyIPTCContactInfoPhones as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. **Notes:** Phone numbers for the contact. Available in OS X v10.6 and later.
50.21.171 kCGImagePropertyIPTCContactInfoPostalCode as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties.  
**Notes:**  
The postal code portion of the contact information.  
Available in OS X v10.6 and later.

50.21.172 kCGImagePropertyIPTCContactInfoStateProvince as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties.  
**Notes:**  
The state or province for the contact.  
Available in OS X v10.6 and later.

50.21.173 kCGImagePropertyIPTCContactInfoWebURLs as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties.  
**Notes:**  
Web addresses for the contact.  
Available in OS X v10.6 and later.

50.21.174 kCGImagePropertyIPTCContentLocationCode as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.  
**Notes:** The content location code.

50.21.175 kCGImagePropertyIPTCContentLocationName as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.  
**Notes:** The content location name.
50.21. **kCGImagePropertyIPTCCopyrightNotice as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The copyright notice.

50.21. **kCGImagePropertyIPTCCountryPrimaryLocationCode as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The country primary location code.

50.21. **kCGImagePropertyIPTCCountryPrimaryLocationName as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The country primary location name.

50.21. **kCGImagePropertyIPTCCreatorContactInfo as string**

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. **Notes:** The creator’s contact info. See "IPTC Creator Contact Info Dictionary Keys." Available in OS X v10.6 and later.

50.21. **kCGImagePropertyIPTCCredit as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** Credit information.

50.21. **kCGImagePropertyIPTCDateCreated as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:**
50.21.182 kCGImagePropertyIPTCDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.

**Example:**

```vbnet
// Change rotation in an image file

// files
dim dpath as folderitem = SpecialFolder.Desktop.Child("test.jpg")
dim opath as folderitem = dpath.parent.Child("output.jpg")

// open source
dim imageSource as new cgimagesourcembs(dpath)

// read image
dim img as cgimagembs = imageSource.createimageatindex(0)

// global properties
dim globalprop as dictionary = imageSource.properties

// per image properties
dim p as Dictionary = imageSource.PropertiesAtIndex(0)

dim imageDest as new CGImageDestinationMBS(opath, "public.jpeg", 1)

const orientation = 1 // top left
const orientation = 3 // bottom right

// set globals
imageDest.SetProperties(globalprop)

// now set new orientation
p.value(imageDest.kCGImageDestinationOrientation) = orientation
p.value(imageDest.kCGImageDestinationMergeMetadata) = true

// change tiff dictionary, if present
dim dTIFF as Dictionary = p.lookup(imageSource.kCGImagePropertyTIFFDictionary, nil)
if dTIFF <> nil then
dTIFF.value(imageSource.kCGImagePropertyTIFFOrientation) = orientation
end if

// change iptc dictionary, if present
dim dIPTC as Dictionary = p.lookup(imageSource.kCGImagePropertyIPTCDictionary, nil)
if dIPTC <> nil then
```
diPTC.value(imageSource.kCGImagePropertyIPTCImageOrientation) = orientation
end if

// write out image
imageDest.AddImage(img,p)
call imageDest.Finalize

Notes:
A dictionary of key-value pairs for an image that uses International Press Telecommunications Council (IPTC) metadata.

IPTC constants are metadata elements of the Information Interchange Model (IIM) used to provide information about images. The IIM was developed by the Newspaper Association of America (NAA) and the International Press Telecommunications Council (IPTC).

50.21.183 kCGImagePropertyIPTCDigitalCreationDate as string
MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The digital creation date.

50.21.184 kCGImagePropertyIPTCDigitalCreationTime as string
MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The digital creation time.

50.21.185 kCGImagePropertyIPTCEditorialUpdate as string
MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** An editorial update.

50.21.186 kCGImagePropertyIPTCEditStatus as string
MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.
50.21.187 kCGImagePropertyIPTCExpirationDate as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.
**Notes:** The expiration date.

50.21.188 kCGImagePropertyIPTCExpirationTime as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.
**Notes:** The expiration time.

50.21.189 kCGImagePropertyIPTCFixtureIdentifier as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.
**Notes:** A fixture identifier.

50.21.190 kCGImagePropertyIPTCHeadline as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.
**Notes:** The headline.

50.21.191 kCGImagePropertyIPTCImageOrientation as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.
**Notes:** The image orientation.

50.21.192 kCGImagePropertyIPTCImageType as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.
50.21. CLASS CGIMAGESOURCEMBS

Notes: The image type.

50.21.193 kCGImagePropertyIPTCKeywords as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** Keywords

50.21.194 kCGImagePropertyIPTCLanguageIdentifier as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The language identifier.

50.21.195 kCGImagePropertyIPTCOBJECTAttributeReference as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The object attribute.

50.21.196 kCGImagePropertyIPTCOBJECTCycle as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The object cycle.

50.21.197 kCGImagePropertyIPTCOBJECTName as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The object name.

50.21.198 kCGImagePropertyIPTCOBJECTTypeReference as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.
50.21.199  

**kCGImagePropertyIPTCOriginalTransmissionReference as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The original transmission reference.

50.21.200  

**kCGImagePropertyIPTCOriginatingProgram as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The originating program.

50.21.201  

**kCGImagePropertyIPTCProgramVersion as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The program version.

50.21.202  

**kCGImagePropertyIPTCProvinceState as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The province or state.

50.21.203  

**kCGImagePropertyIPTCReferenceDate as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The reference date.

50.21.204  

**kCGImagePropertyIPTCReferenceNumber as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.
50.21.205 kCGImagePropertyIPTCReferenceService as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The reference service.

50.21.206 kCGImagePropertyIPTCReleaseDate as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The release date.

50.21.207 kCGImagePropertyIPTCReleaseTime as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. **Notes:** The release time.

50.21.208 kCGImagePropertyIPTCRightsUsageTerms as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. **Notes:** The usage rights for the image. Available in OS X v10.6 and later.

50.21.209 kCGImagePropertyIPTCScene as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. **Notes:** The scene codes for the image: a scene code is a six-digit string. Available in OS X v10.6 and later.
50.21.210  
**kCGImagePropertyIPTCSource as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. 
**Notes:** The source.

50.21.211  
**kCGImagePropertyIPTCSpecialInstructions as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. 
**Notes:** Special instructions.

50.21.212  
**kCGImagePropertyIPTCStarRating as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. 
**Notes:** The star rating.

50.21.213  
**kCGImagePropertyIPTCSubjectReference as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. 
**Notes:** The subject.

50.21.214  
**kCGImagePropertyIPTCSubLocation as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. 
**Notes:** The sublocation.

50.21.215  
**kCGImagePropertyIPTCSupplementalCategory as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses International Press Telecommunications Council (IPTC) metadata. 
**Notes:** A supplemental category.
50.21.216  kCGImagePropertyIPTCTimeCreated as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.
**Notes:** The time created.

50.21.217  kCGImagePropertyIPTCUrgency as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.
**Notes:** The urgency level.

50.21.218  kCGImagePropertyIPTCWriterEditor as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses International Press Telecommunications Council (IPTC) metadata.
**Notes:** The writer or editor.

50.21.219  kCGImagePropertyIsFloat as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.
**Notes:** Whether or not the image contains floating-point pixel samples. The value of this key is kCF-
BooleanTrue if the image contains them.

50.21.220  kCGImagePropertyIsIndexed as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.
**Notes:** Whether or not the image contains indexed pixel samples (sometimes called paletted samples). The value of this key is kCFBooleanTrue if the image contains them.

50.21.221  kCGImagePropertyJFIFDensityUnit as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses JPEG File Interchange Format (JFIF).
**Notes:** The density unit.
50.21.222  kCGImagePropertyJFIFDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.
**Notes:** A dictionary of key-value pairs for an image that uses JPEG File Interchange Format (JFIF).

50.21.223  kCGImagePropertyJFIFIsProgressive as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses JPEG File Interchange Format (JFIF).
**Notes:** Whether or not the image is progressive.

50.21.224  kCGImagePropertyJFIFVersion as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses JPEG File Interchange Format (JFIF).
**Notes:** The version.

50.21.225  kCGImagePropertyJFIFXDensity as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses JPEG File Interchange Format (JFIF).
**Notes:** The x density.

50.21.226  kCGImagePropertyJFIFYDensity as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses JPEG File Interchange Format (JFIF).
**Notes:** The y density.

50.21.227  kCGImagePropertyMakerCanonAspectRatioInfo as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.
**Notes:** The image aspect ratio.
50.21. CLASS CGIMAGESOURCEMBS

50.21.228  **kCGImagePropertyMakerCanonCameraSerialNumber** as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. **Notes:** The camera serial number.

50.21.229  **kCGImagePropertyMakerCanonContinuousDrive** as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. **Notes:** The presence of a continuous drive.

50.21.230  **kCGImagePropertyMakerCanonDictionary** as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. **Notes:** A dictionary of key-value pairs for an image from a Canon camera. Available in Mac OS X v10.5 and later.

50.21.231  **kCGImagePropertyMakerCanonFirmware** as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. **Notes:** The firmware version.

50.21.232  **kCGImagePropertyMakerCanonFlashExposureComp** as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. **Notes:** The flash exposure compensation.

50.21.233  **kCGImagePropertyMakerCanonImageSerialNumber** as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary.
Notes: The image serial number.

50.21.234 kCGImagePropertyMakerCanonLensModel as string

50.21.235 kCGImagePropertyMakerCanonOwnerName as string

50.21.236 kCGImagePropertyMakerFujiDictionary as string

50.21.237 kCGImagePropertyMakerMinoltaDictionary as string

50.21.238 kCGImagePropertyMakerNikonCameraSerialNumber as string

50.21.239  kCGImagePropertyMakerNikonColorMode as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image from a Nikon camera.
**Notes:** The color mode.

50.21.240  kCGImagePropertyMakerNikonDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.
**Notes:**
A dictionary of key-value pairs for an image from a Nikon camera.
Available in Mac OS X v10.5 and later.

50.21.241  kCGImagePropertyMakerNikonDigitalZoom as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image from a Nikon camera.
**Notes:** The digital zoom setting.

50.21.242  kCGImagePropertyMakerNikonFlashExposureComp as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image from a Nikon camera.
**Notes:** The flash exposure compensation.

50.21.243  kCGImagePropertyMakerNikonFlashSetting as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image from a Nikon camera.
**Notes:** The flash setting.

50.21.244  kCGImagePropertyMakerNikonFocusDistance as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image from a Nikon camera.
Notes: The focus distance.

50.21.245 kCGImagePropertyMakerNikonFocusMode as string
Notes: The focus mode.

50.21.246 kCGImagePropertyMakerNikonImageAdjustment as string
Notes: Image adjustment setting.

50.21.247 kCGImagePropertyMakerNikonISOSelection as string
Notes: The ISO selection.

50.21.248 kCGImagePropertyMakerNikonISOSetting as string
Notes: The ISO setting.

50.21.249 kCGImagePropertyMakerNikonLensAdapter as string
Notes: The lens adapter.

50.21.250 kCGImagePropertyMakerNikonLensInfo as string
50.21. **kCGImagePropertyMakerNikonLensType as string**

*Notes:* The lens type.

50.21.**252** kCGImagePropertyMakerNikonQuality as string

*Notes:* The quality setting.

50.21.**253** kCGImagePropertyMakerNikonSharpenMode as string

*Notes:* The sharpening mode.

50.21.**254** kCGImagePropertyMakerNikonShootingMode as string

*Notes:* The shooting mode.

50.21.**255** kCGImagePropertyMakerNikonShutterCount as string

*Notes:* The shutter count.

50.21.**256** kCGImagePropertyMakerNikonWhiteBalanceMode as string

Notes: The white balance mode.

50.21.257 kCGImagePropertyMakerOlympusDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.

Notes:
A dictionary of key-value pairs for an image from a Olympus camera.
Available in Mac OS X v10.5 and later.

50.21.258 kCGImagePropertyMakerPentaxDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.

Notes:
A dictionary of key-value pairs for an image from a Pentax camera.
Available in Mac OS X v10.5 and later.

50.21.259 kCGImagePropertyOrientation as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the keys for the properties dictionary.

Notes:
The intended display orientation of the image. If present, this key is a CFNumber value with the same value
as defined by the TIFF and EXIF specifications. The value specifies where the origin (0,0) of the image is
locates, as shown in Table 1. If not present, a value of 1 is assumed.

<table>
<thead>
<tr>
<th>Value</th>
<th>Location of the origin of the image</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Top, left</td>
</tr>
<tr>
<td>2</td>
<td>Top, right</td>
</tr>
<tr>
<td>3</td>
<td>Bottom, right</td>
</tr>
<tr>
<td>4</td>
<td>Bottom, left</td>

<td>Right, bottom</td>
</tr>
<tr>
<td>8</td>
<td>Left, bottom</td>
</tr>
</tbody>
</table>
50.21. CLASS CGIMAGESOURCEMBS

50.21.260 kCGImagePropertyPixelHeight as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary.

**Example:**

```vbs
// open an image file
dim path as string = "/Library/Desktop Pictures/Galaxy.jpg"
dim f as FolderItem = GetFolderItem(path, FolderItem.PathTypeNative)
Dim c As New CGImageSourceMBS(f)

// properties for first image
dim p as Dictionary = c.PropertiesAtIndex(0)
dim w as Integer = p.Value(c.kCGImagePropertyPixelWidth)
dim h as Integer = p.Value(c.kCGImagePropertyPixelHeight)

// show size
MsgBox str(w) + " x " + str(h)
```

**Notes:** The number of pixels in the y dimension. If present, this key is a CFNumber value.

---

50.21.261 kCGImagePropertyPixelWidth as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary.

**Example:**

```vbs
// open an image file
dim path as string = "/Library/Desktop Pictures/Galaxy.jpg"
dim f as FolderItem = GetFolderItem(path, FolderItem.PathTypeNative)
Dim c As New CGImageSourceMBS(f)

// properties for first image
dim p as Dictionary = c.PropertiesAtIndex(0)
dim w as Integer = p.Value(c.kCGImagePropertyPixelWidth)
dim h as Integer = p.Value(c.kCGImagePropertyPixelHeight)

// show size
MsgBox str(w) + " x " + str(h)
```

**Notes:** The number of pixels in the x dimension. If present, this key is a CFNumber value.
50.21.262  kCGImagePropertyPNGAuthor as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. **Notes:**
The content is a string that identifies the author of the image. Available in OS X v10.7 and later.

50.21.263  kCGImagePropertyPNGChromaticities as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Portable Network Graphics (PNG) format. **Notes:** The chromaticities.

50.21.264  kCGImagePropertyPNGCopyright as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. **Notes:**
The content is a string that identifies the copyright of the image. Available in OS X v10.7 and later.

50.21.265  kCGImagePropertyPNGCreationTime as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. **Notes:**
The content is a string that identifies the date and time the image was created. Available in OS X v10.7 and later.

50.21.266  kCGImagePropertyPNGDescription as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. **Notes:**
The content is a string that describes the image. Available in OS X v10.7 and later.
50.21.267  kCGImagePropertyPNGDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. 
**Notes:** A dictionary of key-value pairs for an image that uses Portable Network Graphics (PNG) format.

50.21.268  kCGImagePropertyPNGGamma as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Portable Network Graphics (PNG) format. 
**Notes:** The gamma value.

50.21.269  kCGImagePropertyPNGInterlaceType as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Portable Network Graphics (PNG) format. 
**Notes:** The interlace type.

50.21.270  kCGImagePropertyPNGModificationTime as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. 
**Notes:**
The content is a string that identifies the last date and time the image was modified. Available in OS X v10.7 and later.

50.21.271  kCGImagePropertyPNGSoftware as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. 
**Notes:**
The content is a string that identifies the software used to create the image. Available in OS X v10.7 and later.
50.21.272 kCGImagePropertyPNGsRGBIntent as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Portable Network Graphics (PNG) format. **Notes:** The sRGB intent.

50.21.273 kCGImagePropertyPNGTitle as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the key names for the properties. **Notes:** The content is a string that holds the image’s title. Available in OS X v10.7 and later.

50.21.274 kCGImagePropertyPNGXPixelsPerMeter as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Portable Network Graphics (PNG) format. **Notes:** The number of x pixels per meter.

50.21.275 kCGImagePropertyPNGYPixelsPerMeter as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Portable Network Graphics (PNG) format. **Notes:** The number of y pixels per meter.

50.21.276 kCGImagePropertyProfileName as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary. **Notes:** The name of the optional ICC profile embedded in the image, if known. If present, the value of this key is a CFStringRef.

50.21.277 kCGImagePropertyRawDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary.
50.21. CLASS CGIMAGESOURCEMBS

Notes: A dictionary of key-value pairs for an image that contains minimally processed, or raw, data.

50.21.278 kCGImagePropertyTIFFArtist as string

**Notes:** The artist.

50.21.279 kCGImagePropertyTIFFCompression as string

**Notes:** The compression scheme used on the image data.

50.21.280 kCGImagePropertyTIFFCopyright as string

**Notes:** Copyright information.

50.21.281 kCGImagePropertyTIFFDateTime as string

**Notes:** The date and time.

50.21.282 kCGImagePropertyTIFFDictionary as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the keys for the properties dictionary.
**Example:**
```
// Change rotation in an image file

// files
dim dpath as folderitem = SpecialFolder.Desktop.Child("test.jpg")
dim opath as folderitem = dpath.parent.Child("output.jpg")
```
// open source
dim imageSource as new cgimagesourcembs(dpath)

// read image
dim img as cgimagembs = imageSource.createimageatindex(0)

// global properties
dim globalprop as dictionary = imageSource.properties
// per image properties
dim p as Dictionary = imageSource.PropertiesAtIndex(0)

dim imageDest as new CGImageDestinationMBS(opath,"public.jpeg",1)

'const orientation = 1 // top left
const orientation = 3 // bottom right

// set globals
imageDest.SetProperties(globalprop)

// now set new orientation
p.value(imageDest.kCGImageDestinationOrientation) = orientation
p.value(imageDest.kCGImageDestinationMergeMetadata) = true

// change tiff dictionary, if present
dim dTIFF as Dictionary = p.lookup(imageSource.kCGImagePropertyTIFFDictionary, nil)
if dTIFF <>nil then
dTIFF.value(imageSource.kCGImagePropertyTIFFOrientation) = orientation
end if

// change iptc dictionary, if present
dim dIPTC as Dictionary = p.lookup(imageSource.kCGImagePropertyIPTCDictionary, nil)
if dIPTC <>nil then
dIPTC.value(imageSource.kCGImagePropertyIPTCImageOrientation) = orientation
end if

// write out image
imageDest.AddImage(img,p)
call imageDest.Finalize

Notes: A dictionary of key-value pairs for an image that uses Tagged Image File Format (TIFF).
50.21.283  kCGImagePropertyTIFFDocumentName as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Tagged Image File Format (TIFF). **Notes:** The document name.

50.21.284  kCGImagePropertyTIFFFHostComputer as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Tagged Image File Format (TIFF). **Notes:** The computer or operation system used when the image was created.

50.21.285  kCGImagePropertyTIFFImageDescription as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Tagged Image File Format (TIFF). **Notes:** The image description.

50.21.286  kCGImagePropertyTIFFMake as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Tagged Image File Format (TIFF). **Notes:** The camera or input device make.

50.21.287  kCGImagePropertyTIFFModel as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Tagged Image File Format (TIFF). **Notes:** A camera or input device model.

50.21.288  kCGImagePropertyTIFFOrientation as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Keys for an image that uses Tagged Image File Format (TIFF). **Example:**

    // Change rotation in an image file
// files
dim dpath as folderitem = SpecialFolder.Desktop.Child("test.jpg")
dim opath as folderitem = dpath.parent.Child("output.jpg")

// open source
dim imageSource as new cgimagesourcembs(dpath)

// read image
dim img as cgimagembs = imageSource.createimageatindex(0)

// global properties

// per image properties
dim p as Dictionary = imageSource.PropertiesAtIndex(0)

dim imageDest as new CGImageDestinationMBS(opath,"public.jpeg",1)

'const orientation = 1 // top left
const orientation = 3 // bottom right

// set globals
imageDest.SetProperties(globalprop)

// now set new orientation
p.value(imageDest.kCGImageDestinationOrientation) = orientation
p.value(imageDest.kCGImageDestinationMergeMetadata) = true

// change tiff dictionary, if present
dim dTIFF as Dictionary = p.lookup(imageSource.kCGImagePropertyTIFFDictionary, nil)
if dTIFF <> nil then
dTIFF.value(imageSource.kCGImagePropertyTIFFOrientation) = orientation
end if

// change iptc dictionary, if present
dim dIPTC as Dictionary = p.lookup(imageSource.kCGImagePropertyIPTCDictionary, nil)
if dIPTC <> nil then
dIPTC.value(imageSource.kCGImagePropertyIPTCImageOrientation) = orientation
end if

// write out image
imageDest.AddImage(img,p)
call imageDest.Finalize

Notes: The image orientation.
50.21.289  
**kCGImagePropertyTIFFPhotometricInterpretation as string**

**Function:** Keys for an image that uses Tagged Image File Format (TIFF).  
**Notes:** The color space of the image data.

50.21.290  
**kCGImagePropertyTIFFPrimaryChromaticities as string**

**Function:** Keys for an image that uses Tagged Image File Format (TIFF).  
**Notes:** The chromaticities of the primaries of the image.

50.21.291  
**kCGImagePropertyTIFFResolutionUnit as string**

**Function:** Keys for an image that uses Tagged Image File Format (TIFF).  
**Notes:** The units of resolution.

50.21.292  
**kCGImagePropertyTIFFSoftware as string**

**Function:** Keys for an image that uses Tagged Image File Format (TIFF).  
**Notes:** The name and version of the software used for image creation.

50.21.293  
**kCGImagePropertyTIFFTransferFunction as string**

**Function:** Keys for an image that uses Tagged Image File Format (TIFF).  
**Notes:** The transfer function, in tabular format, used to map pixel components from a nonlinear form into a linear form.

50.21.294  
**kCGImagePropertyTIFFWhitePoint as string**

**Function:** Keys for an image that uses Tagged Image File Format (TIFF).  
**Notes:** The white point.
50.21.295  kCGImagePropertyTIFFXResolution as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Tagged Image File Format (TIFF).
**Notes:** The number of pixels per resolution unit in the image width direction.

50.21.296  kCGImagePropertyTIFFYResolution as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Keys for an image that uses Tagged Image File Format (TIFF).
**Notes:** The number of pixels per resolution unit in the image height direction.

50.21.297  kCGImageSourceCreateThumbnailFromImageAlways as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the key names for the properties.
**Notes:** Specifies whether a thumbnail should be created from the full image even if a thumbnail is present in the image source file. The thumbnail will be created from the full image, subject to the limit specified by kCGImageSourceThumbnailMaxPixelSize — if a maximum pixel size isn’t specified, then the thumbnail will be the size of the full image, which probably isn’t what you want. The value of this key must be a Boolean; the default value of this key is False.

50.21.298  kCGImageSourceCreateThumbnailFromImageIfAbsent as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the key names for the properties.
**Notes:** Specifies whether a thumbnail should be automatically created for an image if a thumbnail isn’t present in the image source file. The thumbnail will be created from the full image, subject to the limit specified by kCGImageSourceThumbnailMaxPixelSize—if a maximum pixel size isn’t specified, then the thumbnail will be the size of the full image, which probably isn’t what you want. The value of this key must be a Boolean; the default value of this key is False.

50.21.299  kCGImageSourceCreateThumbnailWithTransform as string

MBS MacCG Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the key names for the properties.
**Notes:** Specifies whether the thumbnail should be rotated and scaled according to the orientation and pixel aspect ratio of the full image. The value of this key must be a Boolean; the default value of this key is False.
50.21.300  kCGImageSourceShouldAllowFloat as string

Notes: Specifies whether the image should be returned as a floating point CGImage if supported by the file format. Extended range floating point CGImage may require additional processing to render pleasingly. The value of this key must be a Boolean; the default value is False.

50.21.301  kCGImageSourceShouldCache as string

Notes: Specifies whether the image should be cached in a decoded form. The value of this key must be a Boolean; the default value is False.

50.21.302  kCGImageSourceShouldCacheImmediately as string

Notes: Specifies whether image decoding and caching should happen at image creation time. The value of this key must be a boolean. The default value is kCFBooleanFalse (image decoding will happen at rendering time).

50.21.303  kCGImageSourceThumbnailMaxPixelSize as string

Notes: Specifies the maximum width and height in pixels of a thumbnail. If this this key is not specified, the width and height of a thumbnail is not limited and thumbnails may be as big as the image itself. If present, this value of this key must be an Integer.

50.21.304  kCGImageSourceTypeIdentifierHint as string

Notes: Specifies the "best guess" of the type identifier for the format of the image source file. If specified, the value of this key must be a String. For more information about type identifiers, see "UTType.h" in the
CHAPTER 50. COREGRAPHICS

Application Services framework.

50.21.305  Properties(options as dictionary = nil) as dictionary

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the properties of the image source.

**Example:**

```vbnet
dim inputFile as FolderItem = SpecialFolder.Desktop.Child("test.jpg")

// reading the picture
dim c as new CGImageSourceMBS(inputFile)
dim img as CGImageMBS = c.CreateImageAtIndex(0)
dim propertiesGlobal as Dictionary = c.Properties
dim propertiesImage as Dictionary = c.PropertiesAtIndex(0)

dim outputFile as FolderItem = SpecialFolder.Desktop.Child("output.jpg")
dim d as new CGImageDestinationMBS(outputFile, "public.jpeg", 1)

// writing the picture and include metadata
d.SetProperties(propertiesGlobal)
d.AddImage(img, propertiesImage)
if d.FinalizeMT then
    outputFile.Launch
else
    MsgBox "Failed to write jpeg."
end if
```

**Notes:**

- **options:** A dictionary you can use to request additional options.
- Returns a dictionary that contains the properties associated with the image source container.
- These properties apply to the container in general but not necessarily to any individual image contained in the image source.
- Available in Mac OS X version 10.4 and later.

50.21.306  PropertiesAtIndex(index as Integer, options as dictionary = nil) as dictionary

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the properties of the image at a specified location in an image source.

**Example:**

```vbnet
```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim c as new CGImageSourceMBS(file)

dim e as Dictionary = c.PropertiesAtIndex(0)
dim d as Dictionary

e=d.Value(c.kCGImagePropertyExifDictionary)

if e<>Nil then
dim keys(-1) as Variant = e.Keys
dim lines(-1) as string

for each key as string in keys
lines.Append key+" : "+e.Value(key)
next

MsgBox "Exif: "+EndOfLine+EndOfLine+Join(lines,EndOfLine)
end if

e=d.Value(c.kCGImagePropertyGPSDictionary)

if e<>Nil then
dim keys(-1) as Variant = e.Keys
dim lines(-1) as string

for each key as string in keys
lines.Append key+" : "+e.Value(key)
next

MsgBox "GPS: "+EndOfLine+EndOfLine+Join(lines,EndOfLine)
end if

Notes:

index: The index of the image whose properties you want to obtain. The index is zero-based.
options: A dictionary you can use to request additional options.
Returns a dictionary that contains the properties associated with the image.
Available in Mac OS X version 10.4 and later.

50.21.307 PropertiesAtIndexCF(index as Integer, options as Variant = nil) as Variant

MBS MacCG Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the properties of the image at a specified location in an image source.
Notes:

index: The index of the image whose properties you want to obtain. The index is zero-based.
options: A dictionary or CFDictionaryMBS you can use to request additional options.
Returns a CFDictionaryMBS that contains the properties associated with the image.
Available in Mac OS X version 10.4 and later.

50.21.308 PropertiesCF(options as Variant = nil) as Variant

MBS MacCG Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the properties of the image source.

Notes:
options: A dictionary or CFDictionaryMBS you can use to request additional options.
Returns a CFDictionaryMBS that contains the properties associated with the image source container.
These properties apply to the container in general but not necessarily to any individual image contained in
the image source.
Available in Mac OS X version 10.4 and later.

50.21.309 StatusAtIndex(index as Integer) as Integer

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the current status of an image that is at a specified location in an image source.

Notes:

index: The index of the image whose status you want to obtain. The index is zero-based.

Returns the current status of the image.

The status is particularly informative for incremental image sources, but may also be used by clients that
provide non-incremental data.

Available in Mac OS X version 10.4 and later.

50.21.310 TypeIdentifiers as string()

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns an array of uniform type identifiers (UTIs) that are supported for image sources.

**Example:**

```dim s(-1) as string = CGImageSourceMBS.TypeIdentifiers```
MsgBox Join(s,EndOfLine)

// shows:
//
// public.png
// public.jpeg
// com.compusrve.gif
// public.jpeg-2000
// com.adobe.raw-image
// com.leafamerica.raw-image
// com.hasselblad.fff-raw-image
// com.hasselblad.3fr-raw-image
// com.nikon.raw-image
// com.nikon.urw-raw-image
// com.pentax.raw-image
// com.sony.sr2-raw-image
// com.sony.arw-raw-image
// com.epson.raw-image
// com.kodak.raw-image
// public.tiff
// com.apple.icns
// com.canon.tif-raw-image
// com.canon.cr2-raw-image
// com.canon.crw-raw-image
// com.fuji.raw-image
// com.panasonic.raw-image
// com.panasonic.rw2-raw-image
// com.panasonic.rwl-raw-image
// com.leica.pwl-raw-image
// com.konicaminolta.raw-image
// com.olympus.raw-image
// com.olympus.raw-image
// com.sony.raw-image
// com.adobe.photoshop-image
// com.adobe.pdf
// com.adobe.illustrator.ai-image
// com.microsoft.ico
// com.microsoft.bmp
// public.xbitmap-image
// com.microsoft.cur
// com.apple.pict
// com.truevision.tga-image
// com.sgi.sgi-image
// com.apple.quicktime-image
// com.kodak.flashpix-image
// com.apple.macpaint-image
// com.ilm.openexr-image
// public.radiance
Notes:
Returns an array of the UTIs that are supported for image sources.

See Uniform Type Identifiers Overview for a list of system-declared and third-party UTIs.

Available in Mac OS X version 10.4 and later.

50.21.311  UpdateData(data as string, final as boolean)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Updates an incremental image source with new data.

**Notes:**

data: The data to add to the image source. Each time you call the function UpdateData, the data parameter must contain all of the image file data accumulated so far.

final: A value that specifies whether the data is the final set. Pass true if it is, false otherwise.

Available in Mac OS X version 10.4 and later.

50.21.312  Properties

50.21.313  Count as Integer

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the number of images (not including thumbnails) in the image source.

**Example:**

dim file as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim c as new CGImageSourceMBS(file)

MsgBox str(c.Count)+" images in this file."

**Notes:**
The number of images. If the image source is a multilayered PSD file, the function returns 1.
This function does not extract the layers of a PSD file.

Available in Mac OS X version 10.4 and later.
(Read only property)

**50.21.314 Handle as Integer**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The internal reference.
**Notes:** (Read and Write property)

**50.21.315 Status as Integer**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return the status of an image source.
**Notes:**
Returns the current status of the image source.

The status is particularly informative for incremental image sources, but may also be used by clients that provide non-incremental data.

Available in Mac OS X version 10.4 and later.
(Read only property)

**50.21.316 Type as string**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the uniform type identifier of the source container.
**Notes:**
The uniform type identifier of the image.

The uniform type identifier (UTI) of the source container can be different from the type of the images in the container. For example, the .icns format supports embedded JPEG2000. The type of the source container is "com.apple.icns" but type of the images is JPEG2000.

Available in Mac OS X version 10.4 and later.
(Read only property)
50.21.317 Constants

50.21.318 kCGImageStatusComplete = 0
MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the status constants. **Notes:** The operation is complete.

50.21.319 kCGImageStatusIncomplete = -1
MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the status constants. **Notes:** The operation is not complete.

50.21.320 kCGImageStatusInvalidData = -4
MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the status constants. **Notes:** The data is not valid.

50.21.321 kCGImageStatusReadingHeader = -2
MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the status constants. **Notes:** In the process of reading the header.

50.21.322 kCGImageStatusUnexpectedEOF = -5
MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the status constants. **Notes:** The end of the file was encountered unexpectedly.

50.21.323 kCGImageStatusUnknownType = -3
MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the status constants. **Notes:** The image is an unknown type.
50.22. CLASS CGLAYERMBS

50.22 class CGLayerMBS

50.22.1 class CGLayerMBS

MBS MacCG Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: Yes. **Function:** The CoreGraphics layer class, similar to a template.

**Notes:**

CGLayer objects are useful for offscreen drawing and can be used in much the same way that a bitmap context can be used. In fact, a CGLayer object is a much better representation than a bitmap context.

Using CGLayer objects can improve performance, particularly when you need to capture a piece of drawing that you stamp repeatedly (using the same scale factor and orientation). Quartz can cache CGLayer objects to the video card, making drawing a CGLayer to a destination much faster than rendering the equivalent image constructed from a bitmap context.

A CGLayer object is created relative to a graphics context. Although layer uses this graphics context as a reference for initialization, you are not restricted to drawing the layer to this graphics context. You can draw the layer to other graphics contexts, although any limitations of the original context are imposed. For example, if you create a CGLayer object using a bitmap context, the layer is rendered as a bitmap when drawn to any other graphics context.

You can use a CGLayer when you want to apply a shadow to a group of objects (such as a group of circles) rather than to individual objects.

Use these layers in your code whenever you can, especially when:

- You need to reuse a filled or stroked shape.

- You are building a scene and at least some of it can be reused. Put the reusable drawing in its own CGLayer.

Any CG object that you draw repeatedly—including CGPath, CGShading, and CGPDFPage—benefit from improved performance if you draw it to a CGLayer object.

50.22.2 Methods

50.22.3 Constructor(context as CGContextMBS, size as CGSizeMBS, auxiliaryInfo as dictionary = nil)

MBS MacCG Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: Yes. **Function:** Creates a CGLayer object that is associated with a graphics context.

**Notes:**
context: The graphics context you want to create the layer relative to. The layer uses this graphics context as a reference for initialization.
size: The size, in default user space units, of the layer relative to the graphics context.
auxiliaryInfo: Reserved for future use. Pass nil.

On Success the handle property is not nil.

After you create a CGLayer object, you should reuse it whenever you can to facilitate the Quartz caching strategy. Quartz caches any objects that are reused, including CGLayer objects. Objects that are reused frequently remain in the cache. In contrast, objects that are used once in a while may be moved in and out of the cache according to their frequency of use. If you don’t reuse CGLayer objects, Quartz won’t cache them. This means that you lose an opportunity to improve the performance of your application.

Available in Mac OS X version 10.4 and later.

- 50.22.4 Constructor(context as CGContextMBS, width as Double, height as Double, auxiliaryInfo as dictionary = nil)

50.22.4 Constructor(context as CGContextMBS, width as Double, height as Double, auxiliaryInfo as dictionary = nil)

MBS MacCG Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: Yes. **Function:** Creates a CGLayer object that is associated with a graphics context.

**Notes:**
context: The graphics context you want to create the layer relative to. The layer uses this graphics context as a reference for initialization.
width/height: The size, in default user space units, of the layer relative to the graphics context.
auxiliaryInfo: Reserved for future use. Pass nil.

On Success the handle property is not nil.

After you create a CGLayer object, you should reuse it whenever you can to facilitate the Quartz caching strategy. Quartz caches any objects that are reused, including CGLayer objects. Objects that are reused
50.22. CLASS CGLAYERMBS

frequently remain in the cache. In contrast, objects that are used once in a while may be moved in and out of the cache according to their frequency of use. If you don’t reuse CGLayer objects, Quartz won’t cache them. This means that you lose an opportunity to improve the performance of your application.

Available in Mac OS X version 10.4 and later.
See also:

- 50.22.3 Constructor(context as CGContextMBS, size as CGSizeMBS, auxiliaryInfo as dictionary = nil)

50.22.5 Context as CGContextMBS

Notes: The context that’s returned is the context for the layer itself, not the context that you specified when you created the layer.

50.22.6 Size as CGSizeMBS

50.22.7 Properties

50.22.8 Handle as Integer

Notes: (Read and Write property)
50.23 class CGMutablePathMBS

50.23.1 class CGMutablePathMBS

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a CoreGraphics mutable path. **Notes:** Subclass of the CGPathMBS class.

50.23.2 Methods

50.23.3 AddArc(transform as CGAffineTransformMBS, x as Double, y as Double, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean)

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Add an arc of a circle to path, possibly preceded by a straight line segment. **Notes:** The arc is approximated by a sequence of cubic Bezier curves. \((x, y)\) is the center of the arc; radius is its radius; startAngle is the angle to the first endpoint of the arc; endAngle is the angle to the second endpoint of the arc; and clockwise is true if the arc is to be drawn clockwise, false otherwise. startAngle and endAngle are measured in radians. If \(m\) is not nil, then the constructed Bezier curves representing the arc will be transformed by the matrix before they are added to path.

50.23.4 AddArcToPoint(transform as CGAffineTransformMBS, x as Double, y as Double, x2 as Double, y2 as Double, radius as Double)

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Add an arc of a circle to path, possibly preceded by a straight line segment. **Notes:** The arc is approximated by a sequence of cubic Bezier curves. \((x, y)\) is the center of the arc; radius is its radius; startAngle is the angle to the first endpoint of the arc; endAngle is the angle to the second endpoint of the arc; and clockwise is true if the arc is to be drawn clockwise, false otherwise. startAngle and endAngle are measured in radians. If \(m\) is not nil, then the constructed Bezier curves representing the arc will be transformed by the matrix before they are added to path.

50.23.5 AddCurveToPoint(transform as CGAffineTransformMBS, cpx1 as Double, cpy1 as Double, cpx2 as Double, cpy2 as Double, x as Double, y as Double)

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Append a cubic Bezier curve from the current point to \((x, y)\) with control points \((cp1x, cp1y)\) and \((cp2x, cp2y)\) in path and move the current point to \((x, y)\).
50.23. **AddEllipseInRect** (transform as CGAffineTransformMBS, r as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Add an ellipse (an oval) inside rect to path.
**Notes:** The ellipse is approximated by a sequence of Bezier curves. The center of the ellipse is the midpoint of rect. If rect is square, then the ellipse will be circular with radius equal to one-half the width (equivalently, one-half the height) of rect. If rect is rectangular, then the major- and minor-axes will be the width and height of rect. The ellipse forms a complete subpath of path — that is, it begins with a "move to" and ends with a "close subpath" — oriented in the clockwise direction. If transform is not nil, then the constructed Bezier curves representing the ellipse will be transformed by m before they are added to path.

50.23. **AddLineToPoint** (transform as CGAffineTransformMBS, x as Double, y as Double)

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Append a straight line segment from the current point to (x, y) in the path and move the current point to (x, y).
**Notes:** If transform is not nil, then transform (x, y) by the matrix first.

50.23. **AddPath** (transform as CGAffineTransformMBS, path as CGPathMBS)

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Add a path to the path.
**Notes:** If m is not nil, then the points in the new path will be transformed by the matrix before they are added to path1.

50.23. **AddQuadCurveTo��** (transform as CGAffineTransformMBS, cp as Double, cpx as Double, cpy as Double, x as Double, y as Double)

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Append a quadratic curve from the current point to (x, y) with control point (cpx, cpy) in path and move the current point to (x, y').
**Notes:** If transform is not nil, then transform all points by the matrix first.
**50.23.10 AddRect(transform as CGAffineTransformMBS, r as CGRectMBS)**

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Add rect to path.  
**Notes:** If transform is not nil, then transform the rectangle by the matrix first.

**50.23.11 CloseSubpath**

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Append a line from the current point to the starting point of the current subpath of path and end the subpath.

**50.23.12 Constructor**

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create a mutable path.

**50.23.13 ContainsPoint(transform as CGAffineTransformMBS, point as CGPointMBS, eoFill as boolean) as boolean**

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return true if point is contained in path; false otherwise.  
**Notes:** A point is contained in a path if it is inside the painted region when the path is filled; if eoFill is true, then the even-odd fill rule is used to evaluate the painted region of the path, otherwise, the winding-number fill rule is used. If m is not nil, then the point is transformed by m before determining whether the path contains it.

**50.23.14 MoveToPoint(transform as CGAffineTransformMBS, x as Double, y as Double)**

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Move the current point to (x, y) in path and begin a new subpath.  
**Notes:** If transform is not nil, then transform (x, y) by the matrix first.
50.24. class CGPathElementMBS

50.24.1. class CGPathElementMBS

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The class for CGPath elements.
**Example:**
```pascal
dim m as new CGMutablePathMBS
m.MoveToPoint nil, 10, 10
m.AddLineToPoint nil, 20, 30

dim e() as CGPathElementMBS = m.Elements
Break // see in debugger
```

50.24.2. Methods

50.24.3. Point(Index as Integer) as CGPointMBS

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns point with given index.

50.24.4. PointX(Index as Integer) as Double

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns point x with given index.

50.24.5. PointY(Index as Integer) as Double

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns point y with given index.
50.24.6 Properties

50.24.7 PointCount as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns number of points in this element. **Notes:** (Read and Write property)

50.24.8 Type as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The type of this element. **Notes:** (Read and Write property)

50.24.9 Constants

50.24.10 kTypeAddCurveToPoint = 3

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the type constants. **Notes:** The path element that adds a cubic curve from the current point to the specified point. The element holds two control points and a destination point.

50.24.11 kTypeAddLineToPoint = 1

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the type constants. **Notes:** The path element that adds a line from the current point to a new point. The element holds a single point for the destination.

50.24.12 kTypeAddQuadCurveToPoint = 2

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the type constants. **Notes:** The path element that adds a quadratic curve from the current point to the specified point. The element holds a control point and a destination point.
50.24.13 kTypeCloseSubpath = 4

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the type constants.  
**Notes:** The path element that closes and completes a subpath. The element does not contain any points.

50.24.14 kTypeMoveToPoint = 0

MBS MacCG Plugin, Plugin Version: 15.1. **Function:** One of the type constants.  
**Notes:** The path element that starts a new subpath. The element holds a single point for the destination.
50.25 class CGPathMBS

50.25.1 class CGPathMBS

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
A class for a CoreGraphics path.

50.25.2 Methods

50.25.3 BoundingBox as CGRectMBS

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Return the bounding box of path.
Notes: The bounding box is the smallest rectangle completely enclosing all points in the path, including
control points for Bezier and quadratic curves. If the path is empty, then return (0,0,0,0).

50.25.4 Copy as CGPathMBS

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Creates a copy of the path.
Notes: Returns nil on any error.

50.25.5 CurrentPoint as CGPointMBS

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Return the current point of the current subpath of path.
Notes: If there is no current point, then return (0,0).

50.25.6 Elements as CGPathElementMBS()

MBS MacCG Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Queries all the elements in a CGPath.
Example:

dim m as new CGMutablePathMBS
m.MoveToPoint nil, 10, 10
m.AddLineToPoint nil, 20, 30
50.25. **CLASS CGPATHMBS**

```vbnet
dim e() as CGPathElementMBS = m.Elements
Break // see in debugger
```

### 50.25.7 **EqualToPath(path as CGPathMBS) as boolean**

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return true if the path self is equal to path; false otherwise. **Notes:** Returns false if the path is nil.

### 50.25.8 **IsEmpty as boolean**

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return true if path contains no elements, false otherwise.

### 50.25.9 **IsRect(byref rect as CGRectMBS) as boolean**

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return true if path represents a rectangle, false otherwise.

### 50.25.10 **MutableCopy as CGMutablePathMBS**

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create a mutable copy of path. **Notes:** Returns nil on any error.

### 50.25.11 **Properties**

#### 50.25.12 **Handle as Integer**

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle to the internal used object. **Notes:** (Read and Write property)
50.26  class CGPDFArrayMBS

50.26.1  class CGPDFArrayMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
A class for a pdf array.

50.26.2  Methods

50.26.3  ArrayValue(index as Integer, byref value as CGPDFArrayMBS) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
If the object with the given index is a pdf array, this function will return it.
Notes: Returns true on success and false on failure.

50.26.4  BooleanValue(index as Integer, byref value as boolean) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
If the object with the given index is a boolean value, this function will return it.
Notes: Returns true on success and false on failure.

50.26.5  Count as Integer

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
Returns the count of items in this array.

50.26.6  DictionaryValue(index as Integer, byref value as CGPDFDictionaryMBS) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
If the object with the given index is a pdf dictionary, this function will return it.
Notes: Returns true on success and false on failure.
50.26.7  **IntegerValue(index as Integer, byref value as Integer) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object with the given index is an integer value, this function will return it.
**Notes:**
Returns true on success and false on failure.
Is function will return double and integer values. Conversion is done automatically.

50.26.8  **NameValue(index as Integer, byref value as string) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object with the given index is a name string, this function will return it.
**Notes:** Returns true on success and false on failure.

50.26.9  **NullValue(index as Integer) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object with the given index is a nil value, this function will return it.
**Notes:** Returns true on success and false on failure.

50.26.10 **ObjectValue(index as Integer, byref value as CGPDFObjectMBS) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object with the given index is a pdf object, this function will return it.
**Notes:** Returns true on success and false on failure.

50.26.11 **SingleValue(index as Integer, byref value as Double) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object with the given index is a floating point value, this function will return it.
**Notes:**
Returns true on success and false on failure.
Is function will return double and integer values. Conversion is done automatically.
50.26.12 StreamValue(index as Integer, byref value as CGPDFStreamMBS) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the object with the given index is a pdf stream, this function will return it. **Notes:** Returns true on success and false on failure.

50.26.13 StringValue(index as Integer, byref value as CGPDFStringMBS) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the object with the given index is a pdf string, this function will return it. **Notes:** Returns true on success and false on failure.

50.26.14 Properties

50.26.15 Document as CGPDFDocumentMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The document this PDF Array belongs to. **Notes:** (Read only property)

50.26.16 Handle as Integer

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle of the pdf array. **Notes:** (Read and Write property)
50.27.  **CLASS CGPDFCONTEXTMBS**

## 50.27  class CGPDFContextMBS

### 50.27.1  class CGPDFContextMBS

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:**
A CoreGraphics context for PDF specific functions.

**Example:**
```plaintext
// create pdf
dim file as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim r as new CGRectMBS(0,0,500,500)
dim c as CGContextMBS = file.NewCGPDFDocumentMBS(r, "My Title", "My Author", "My Creator")
if c<>Nil then
    // create page
    c.BeginPage r

    // draw something
    c.SetRGBFillColor(1.0, 0.0, 0.0, 1.0)
    c.FillRect CGMakeRectMBS( 100,100,100,100)

    // close page
    c.EndPage

    // flush and show in PDF viewer
    c = nil
    file.Launch
end if
```

**Notes:**
This class defines functions to create and get information about a Quartz PDF context. A CGPDFContext object is a type of CGContext that is used for drawing PDF content. The functions in this reference operate only on Quartz PDF graphics contexts created using the functions CGPDFContextCreate or CGPDFContextCreateWithURL.

When you draw to the PDF context using CGContext functions the drawing operations are recorded in PDF format. The PDF commands that represent the drawing are written to the destination specified when you create the PDF graphics context.

Subclass of the CGContextMBS class.
50.27.2 Methods

50.27.3 AddDestinationAtPoint(name as string, x as Double, y as Double)

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Sets a destination to jump to when a point in the current page of a PDF graphics context is clicked.

**Notes:**
- name: A destination name.
- x/y: A location in the current page of the PDF graphics context.
- Available in Mac OS X v10.4 and later.

50.27.4 BeginPage(pageInfo as dictionary)

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Begins a new page in a PDF graphics context.

**Notes:**
- pageInfo: A dictionary that contains key-value pairs that define the page properties.
- You must call the function EndPage to signal the end of the page.
- Available in Mac OS X v10.4 and later.

50.27.5 Close

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes a PDF document.

**Notes:**
- After closing the context, all pending data is written to the context destination, and the PDF file is completed. No additional data can be written to the destination context after the PDF document is closed.

50.27.6 EndPage

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Ends the current page in the PDF graphics context.

**Notes:**
- You can call EndPage only after you call the function BeginPage.

50.27.7 kCGPDFContextAllowsCopying as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the Keys that used to set up a PDF context.
Notes:
Whether the document allows copying when unlocked with the user password. The value of this key must be a Boolean object. The default value of this key is true. Available in Mac OS X v10.4 and later.

50.27.8 kCGPDFContextAllowsPrinting as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the Keys that used to set up a PDF context.
Notes:
Whether the document allows printing when unlocked with the user password. The value of this key must be a boolean value. The default value of this key is true. Available in Mac OS X v10.4 and later.

50.27.9 kCGPDFContextArtBox as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the Keys that specify various PDF boxes.
Notes:
The art box for the document or for a given page. This key is optional. If present, the value of this key must be a CGRectMBS. Available in Mac OS X v10.4 and later.

50.27.10 kCGPDFContextAuthor as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the Keys that used to set up a PDF context.
Notes:
The corresponding value is a string that represents the name of the person who created the document. This key is optional. Available in Mac OS X v10.4 and later.

50.27.11 kCGPDFContextBleedBox as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
One of the Keys that specify various PDF boxes.
Notes:
The bleed box for the document or for a given page. This key is optional. If present, the value of this key must be a CGRectMBS object. Available in Mac OS X v10.4 and later.

50.27.12 kCGPDFContextCreator as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the Keys that used to set up a PDF context.  
**Notes:**  
The corresponding value is a string that represents the name of the application used to produce the document. This key is optional. Available in Mac OS X v10.4 and later.

50.27.13 kCGPDFContextCropBox as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the Keys that specify various PDF boxes.  
**Notes:**  
The crop box for the document or for a given page. This key is optional. If present, the value of this key must be a CGRect object. Available in Mac OS X v10.4 and later.

50.27.14 kCGPDFContextEncryptionKeyLength as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the Keys that used to set up a PDF context.  
**Notes:**  
The encryption key length in bits; see Table 3.18 "Entries common to all encryption dictionaries", PDF Reference: Adobe PDF version 1.5 (4th ed.) for more information. Optional; if present, the value of this key must be a number with value which is a multiple of 8 between 40 and 128, inclusive. If this key is absent or invalid, the encryption key length defaults to 40 bits. Available in Mac OS X v10.5 and later.

50.27.15 kCGPDFContextKeywords as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the Keys that used to set up a PDF context.  
**Notes:**
The keywords for this document. This key is optional. If the value of this key is a string, the /Keywords entry will be the specified string. If the value of this key is an array, then it must be an array of variants with strings. The /Keywords entry will, in this case, be the concatenation of the specified strings separated by commas (","). In addition, an entry with the key "/AAPL:Keywords" is stored in the document information dictionary; its value is an array consisting of each of the specified strings. The value of this key must be in one of the above forms; otherwise, this key is ignored.
Available in Mac OS X v10.5 and later.

50.27.16  kCGPDFContextMediaBox as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the Keys that specify various PDF boxes.
Notes:
The media box for the document or for a given page. This key is optional. If present, the value of this key must be a CGRectMBS object.
Available in Mac OS X v10.4 and later.

50.27.17  kCGPDFContextOutputIntent as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the Keys that used to set up a PDF context.
Notes:
The output intent PDF/X. This key is optional. If present, the value of this key must be a dictionary. The dictionary is added to the /OutputIntents entry in the PDF file document catalog. The keys and values contained in the dictionary must match those specified in section 9.10.4 of the PDF 1.4 specification, ISO/DIS 15930-3 document published by ISO/TC 130, and Adobe Technical Note # 5413.
Available in Mac OS X v10.4 and later.

50.27.18  kCGPDFContextOutputIntents as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: One of the Keys that used to set up a PDF context.
Notes:
Output intent dictionaries. This key is optional. If present, the value must be an array of one or more kCGPDFContextOutputIntent dictionaries. The array is added to the PDF document in the /OutputIntents entry in the PDF file’s document catalog. Each dictionary in the array must be of form specified for the kCGPDFContextOutputIntent key, except that only the first dictionary in the array is required to contain the "S" key with a value of GTS_PDFX. If both the kCGPDFContextOutputIntent and kCGPDFContextOutputIntents keys are specified, the former is ignored.
Available in Mac OS X v10.4 and later.

50.27.19 kCGPDFContextOwnerPassword as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the Keys that used to set up a PDF context. **Notes:**
The owner password of the PDF document. If this key is specified, the document is encrypted using the value as the owner password; otherwise, the document will not be encrypted. The value of this key must be a string that can be represented in ASCII encoding. Only the first 32 bytes are used for the password. There is no default value for this key. If the value of this key cannot be represented in ASCII, the document is not created and the creation function returns nil. Available in Mac OS X v10.4 and later.

50.27.20 kCGPDFContextSubject as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the Keys that used to set up a PDF context. **Notes:**
The subject of a document. Optional; if present, the value of this key must be a string. Available in Mac OS X v10.5 and later.

50.27.21 kCGPDFContextTitle as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the Keys that used to set up a PDF context. **Notes:**
The corresponding value is a string that represents the title of the document. This key is optional. Available in Mac OS X v10.4 and later.

50.27.22 kCGPDFContextTrimBox as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** One of the Keys that specify various PDF boxes. **Notes:**
The trim box for the document or for a given page. This key is optional. If present, the value of this key must be a memoryblock that contains a CGRect (stored by value, not by reference).
50.27. CLASS CGPDFCONTEXTMBS

Available in Mac OS X v10.4 and later.

50.27.23 kCGPDFContextUserPassword as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the Keys that used to set up a PDF context.

**Notes:**
The user password of the PDF document. If the document is encrypted, then the value of this key will be
the user password for the document. If not specified, the user password is the empty string. The value of
this key must be a string that can be represented in ASCII encoding; only the first 32 bytes will be used for
the password. If the value of this key cannot be represented in ASCII, the document is not created and the
creation function returns nil.
Available in Mac OS X v10.4 and later.

50.27.24 kCGPDFXDestinationOutputProfile as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the Output Intent Dictionary Keys.

**Notes:**
An ICC profile stream defining the transformation from the PDF document’s source colors to output device
colorants. This key is required if the value of kCGPDFXOutputConditionIdentifier does not specify a stan-
dard production condition. It is optional otherwise. If present, the value of this key must be an ICC-based
color space specified as a CGColorSpaceMBS object.
Available in Mac OS X v10.4 and later.

50.27.25 kCGPDFXInfo as string

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
One of the Output Intent Dictionary Keys.

**Notes:**
A human-readable text string containing additional information or comments about the intended target de-
vice or production condition. This key is required if the value of kCGPDFXOutputConditionIdentifier does
not specify a standard production condition. It is optional otherwise. If present, the value of this key must
be a string.
Available in Mac OS X v10.4 and later.
50.27.26  kCGPDFXOutputCondition as string

Notes:
A text string identifying the intended output device or production condition in a human-readable form. This key is optional. If present, the value of this key must be a string.
Available in Mac OS X v10.4 and later.

50.27.27  kCGPDFXOutputConditionIdentifier as string

Notes:
A string identifying the intended output device or production condition in a human- or machine-readable form. This key is required. The value of this key must be a string. For best results, the string should be restricted to characters in the ASCII character set.
Available in Mac OS X v10.4 and later.

50.27.28  kCGPDFXOutputIntentSubtype as string

50.27.29  kCGPDFXRegistryName as string

Notes:
The output intent subtype. This key is required. The value of this key must be a String object equal to "GTS_PDFX"; otherwise, the dictionary is ignored.
Available in Mac OS X v10.4 and later.

50.27.30  SetDestinationForRect(name as string, x as Double, y as Double, w as Double, h as Double)

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Sets a destination to jump to when a rectangle in the current PDF page is clicked.
50.27. **CLASS CGPDFCONTEXTMBS**

**Notes:**

name: A destination name.
x,y,w,h: A rectangle that specifies an area of the current page of a PDF graphics context. The rectangle is specified in default user space (not device space).
Available in Mac OS X v10.4 and later.

50.27.31 **SetURLForRect(url as string, x as Double, y as Double, w as Double, h as Double)**

MBS MacCG Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the URL associated with a rectangle in a PDF graphics context.

**Example:**

```pascal
dim c as CGPDFContextMBS // your pdf context
c.SetURLForRect("http://www.apple.com/", 100, 100, 100, 100)
```

**Notes:**

url: A string that specifies the destination of the contents associated with the rectangle.
rect: A rectangle specified in default user space (not device space).
Available in Mac OS X v10.4 and later.
50.28 class CGPDFDictionaryListMBS

50.28.1 class CGPDFDictionaryListMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a pdf dictionary list.

50.28.2 Methods

50.28.3 Close

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The destructor.
**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

50.28.4 Key(index as Integer) as string

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the key with the give index.
**Notes:** Returns "" on any error.

50.28.5 Value(index as Integer) as CGPDFObjectMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The value with the given index.
**Notes:** Returns nil on any error.

50.28.6 Properties

50.28.7 Count as Integer

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the number of key& value pairs.
**Notes:**
50.28. **CLASS CGPDFDICTIONARYLISTMBS**

Returns 0 on any error.
(Read only property)

---

**50.28.8 Document as CGPDFF/documentMBS**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The document this PDF Dictionary belongs to.
**Notes:** (Read only property)
50.29 class CGPDFDictionaryMBS

50.29.1 class CGPDFDictionaryMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
A class for a pdf dictionary.

50.29.2 Methods

50.29.3 ArrayValue(key as string, byref value as CGPDFArrayMBS) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
If the object with the given key is a pdf array, this function will return it.
Notes: Returns true on success and false on failure.

50.29.4 BooleanValue(key as string, byref value as boolean) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
If the object with the given key is a boolean value, this function will return it.
Notes: Returns true on success and false on failure.

50.29.5 Count as Integer

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The number of keys in this dictionary.

50.29.6 DictionaryValue(key as string, byref value as CGPDFDictionaryMBS) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
If the object with the given key is a pdf dictionary, this function will return it.
Notes: Returns true on success and false on failure.

50.29.7 IntegerValue(key as string, byref value as Integer) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
If the object with the given key is an integer value, this function will return it.
50.29. **CLASS CGPDFDICTIONARYMBS**

Notes:

Returns true on success and false on failure.
Is function will return double and integer values. Conversion is done automatically.

50.29.8 **List as CGPDFDictionaryListMBS**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a list of all key& value pairs in the dictionary.
**Notes:** Returns nil on any error.

50.29.9 **NameValue(key as string, byref value as string) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object with the given key is a name string, this function will return it.
**Notes:** Returns true on success and false on failure.

50.29.10 **ObjectValue(key as string, byref value as CGPDFObjectMBS) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object with the given key is a pdf object, this function will return it.
**Notes:** Returns true on success and false on failure.

50.29.11 **SingleValue(key as string, byref value as Double) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object with the given key is a floating point value, this function will return it.
**Notes:**
Returns true on success and false on failure.
Is function will return double and integer values. Conversion is done automatically.

50.29.12 **StreamValue(key as string, byref value as CGPDFStreamMBS) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object with the given key is a pdf stream, this function will return it.
Notes: Returns true on success and false on failure.

50.29.13 StringValue(key as string, byref value as CGPDFStringMBS) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: If the object with the given key is a pdf string, this function will return it.
Notes: Returns true on success and false on failure.

50.29.14 Properties

50.29.15 Document as CGPDFDocumentMBS

Notes: (Read only property)

50.29.16 Handle as Integer

Notes: (Read and Write property)
50.30  class CGPDFDocumentMBS

50.30.1  class CGPDFDocumentMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a core graphics pdf document.

**Example:**

```vbscript
dim f as FolderItem
dim input as CGPDFDocumentMBS
dim output as CGContextMBS
dim r,c as CGRectMBS

f=SpecialFolder.Desktop.Child("test.pdf")
input=f.OpenAsCGPDFDocumentMBS

r=CGMakeRectMBS(0,0,200,200) // 200 by 200 Pixel page

f=SpecialFolder.Desktop.Child("output.pdf")
output=f.NewCGPDFDocumentMBS(r,"SomeTitle","SomeAuthor","SomeCreator")

// Create a new page
output.BeginPage r

// get size of input page one
c=input.CropBox(1)

// clip to a part of the new page leaving a border
r=CGMakeRectMBS(20,20,160,160)
output.ClipToRect r

// draw old pdf on a different position
c.top=-100
c.left=-100

// do the drawing of page one of input at new new output
output.DrawCGPDFDocument(input,c,1)

// cleanup
output.EndPage
output.Flush
```

**Notes:** If the release property is true, the destructor of this class will release the pdfdocument reference.
50.30.2 Methods

50.30.3 ArtBox(page as Integer) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ArtBox of this page.  
**Notes:**  
Returns nil on any error.  
This function is deprecated by Apple in favor of using the CGPDFPageMBS class.

50.30.4 BleedBox(page as Integer) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the BleedBox of this page.  
**Notes:**  
Returns nil on any error.  
This function is deprecated by Apple in favor of using the CGPDFPageMBS class.

50.30.5 Catalog as CGPDFDictionaryMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the document catalog of 'document'.

50.30.6 Constructor(dataProvider as CGDataProviderMBS)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a Quartz PDF document using a data provider.  
**Notes:** Distributing individual pages of a PDF document to separate threads is not supported. If you want to use threads, consider creating a separate document for each thread and operating on a block of pages per thread.  
See also:

- 50.30.7 Constructor(file as folderitem) 8245
- 50.30.8 Constructor(Handle as Integer) 8245
- 50.30.9 Constructor(url as string) 8245
50.30. **CLASS CGPDFDOCUMENTMBS**

### 50.30.7 Constructor(file as folderitem)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a Quartz PDF document using data specified by a file. **Notes:** Distributing individual pages of a PDF document to separate threads is not supported. If you want to use threads, consider creating a separate document for each thread and operating on a block of pages per thread. See also:

- 50.30.6 Constructor(dataProvider as CGDataProviderMBS) 8244
- 50.30.8 Constructor(Handle as Integer) 8245
- 50.30.9 Constructor(url as string) 8245

### 50.30.8 Constructor(Handle as Integer)

MBS MacCG Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a Quartz PDF document object based on the given handle value. **Notes:** Handle must not be zero and should be a valid CGPDFDocumentRef casted to integer. See also:

- 50.30.6 Constructor(dataProvider as CGDataProviderMBS) 8244
- 50.30.7 Constructor(file as folderitem) 8245
- 50.30.9 Constructor(url as string) 8245

### 50.30.9 Constructor(url as string)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a Quartz PDF document using data specified by a URL. **Notes:** Distributing individual pages of a PDF document to separate threads is not supported. If you want to use threads, consider creating a separate document for each thread and operating on a block of pages per thread. See also:

- 50.30.6 Constructor(dataProvider as CGDataProviderMBS) 8244
- 50.30.7 Constructor(file as folderitem) 8245
- 50.30.8 Constructor(Handle as Integer) 8245

### 50.30.10 CreateWithData(data as Memoryblock) as CGPDFDocumentMBS

Notes: Distributing individual pages of a PDF document to separate threads is not supported. If you want to use threads, consider creating a separate document for each thread and operating on a block of pages per thread.
See also:

- 50.30.11 CreateWithData(data as string) as CGPDFDocumentMBS

50.30.11 CreateWithData(data as string) as CGPDFDocumentMBS

MBS MacCG Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a Quartz PDF document using data.
Notes: Distributing individual pages of a PDF document to separate threads is not supported. If you want to use threads, consider creating a separate document for each thread and operating on a block of pages per thread.
See also:

- 50.30.10 CreateWithData(data as Memoryblock) as CGPDFDocumentMBS

50.30.12 CreateWithFile(file as folderitem) as CGPDFDocumentMBS

Notes: Distributing individual pages of a PDF document to separate threads is not supported. If you want to use threads, consider creating a separate document for each thread and operating on a block of pages per thread.

50.30.13 CreateWithProvider(dataProvider as CGDataProviderMBS) as CGPDFDocumentMBS

MBS MacCG Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a Quartz PDF document using a data provider.
Notes: Distributing individual pages of a PDF document to separate threads is not supported. If you want to use threads, consider creating a separate document for each thread and operating on a block of pages per thread.

50.30.14 CreateWithURL(url as string) as CGPDFDocumentMBS

MBS MacCG Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a Quartz PDF document using data specified by a URL.
Notes: Distributing individual pages of a PDF document to separate threads is not supported. If you want to use threads, consider creating a separate document for each thread and operating on a block of pages per
50.30.15 CropBox(page as Integer) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the CropBox of this page.  
**Notes:**  
Returns nil on any error.  
This function is deprecated by Apple in favor of using the CGPDFPageMBS class.

50.30.16 GetID as CGPDFArrayMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Gets the file identifier for a PDF document.  
**Notes:**  
A PDF file identifier is defined in the PDF specification as an array of two strings, the first of which is a permanent identifier that doesn’t change even when the file is updated. The second string changes each time the file is updated. For more information, see PDF Reference: Version 1.3 (Second Edition), Adobe Systems Incorporated.  
Available in Mac OS X v10.4 and later.

50.30.17 GetInfo as CGPDFDictionaryMBS

MBS MacCG Plugin, Plugin Version: 8.6, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Queries the PDF info dictionary.  
**Example:**  
```
    dim f as FolderItem = SpecialFolder.Desktop.Child(“test.pdf”)  
    dim p as CGPDFDocumentMBS = f.Open As CGPDFDocumentMBS
    
    dim Co as CGPDFStringMBS  
    dim info as CGPDFDictionaryMBS = p.GetInfo  
    if info.StringValue(“Subject”, co) then  
        MsgBox co.Text  // shows subject  
    end if
```

**Notes:** Returns nil on any error.
50.30.18 MediaBox(page as Integer) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the MediaBox of this page.
Notes: Returns nil on any error.
This function is deprecated by Apple in favor of using the CGPDFPageMBS class.

50.30.19 Page(index as Integer) as CGPDFPageMBS

50.30.20 RotationAngle(page as Integer) as Integer

Notes: Returns 0 on any error.

50.30.21 TrimBox(page as Integer) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Returns the TrimBox of this page.
Notes: Returns nil on any error.
This function is deprecated by Apple in favor of using the CGPDFPageMBS class.

50.30.22 UnlockWithPassword(name as string) as boolean

Notes: A document is unlocked if it isn’t encrypted, or if it is encrypted and a valid password was previously specified with CGPDFDocumentUnlockWithPassword.
50.30.23 Properties

50.30.24 AllowsCopying as Boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return true if ’document’ allows copying; false otherwise.
**Notes:**
Typically, this function returns false only if the document is encrypted and the document’s current password doesn’t grant permission to perform copying.
(Read only property)

50.30.25 AllowsPrinting as Boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return true if ’document’ allows printing; false otherwise.
**Notes:**
Typically, this function returns false only if the document is encrypted and the document’s current password doesn’t grant permission to perform printing.
(Read only property)

50.30.26 handle as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle for this pdfdocument.
**Notes:**
Handle is a CGPDFDocumentRef.
(Read and Write property)

50.30.27 IsEncrypted as Boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return true if the PDF file associated with ’document’ is encrypted; false otherwise.
**Notes:**
If the PDF file is encrypted, then a password must be supplied before certain operations are enabled; different passwords may enable different operations.
(Read only property)
50.30.28  **IsUnlocked as Boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return true if 'document' is unlocked; false otherwise.

**Notes:**
A document is unlocked if it isn’t encrypted, or if it is encrypted and a valid password was previously specified with CGPDFDocumentUnlockWithPassword.
(Read only property)

50.30.29  **MajorVersion as Integer**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the major version of the pdf document.

**Notes:** (Read only property)

50.30.30  **MinorVersion as Integer**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the minor version of the pdf document.

**Notes:** (Read only property)

50.30.31  **PageCount as Integer**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Counts the pages inside the PDF document.

**Example:**
```dim f as FolderItem
dim d as CGPDFDocumentMBS
f=SpecialFolder.Desktop.Child("test.pdf")
d=f.OpenAsCGPDFDocumentMBS
MsgBox str(d.PageCount)
```

**Notes:**
Returns 0 on any error.
(Read only property)
50.31 class CGPDFObjectMBS

50.31.1 class CGPDFObjectMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a pdf object.

50.31.2 Methods

50.31.3 ArrayValue(byref value as CGPDFArrayMBS) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the object contains a pdf array, this function will return it. **Notes:** Returns true on success and false on failure.

50.31.4 BooleanValue(byref value as boolean) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the object contains a boolean, this function will return it. **Notes:** Returns true on success and false on failure.

50.31.5 DictionaryValue(byref value as CGPDFDictionaryMBS) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the object contains a pdf dictionary, this function will return it. **Notes:** Returns true on success and false on failure.

50.31.6 IntegerValue(byref value as Integer) as boolean

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** If the object contains an integer, this function will return it. **Notes:** Returns true on success and false on failure. Is function will return double and integer values. Conversion is done automatically.
**50.31.7 NameValue(byref value as string) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object contains a name string, this function will return it.
**Notes:** Returns true on success and false on failure.

**50.31.8 SingleValue(byref value as Double) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object contains a floating point number, this function will return it.
**Notes:**
Returns true on success and false on failure.
Is function will return double and integer values. Conversion is done automatically.

**50.31.9 StreamValue(byref value as CGPDFStreamMBS) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object contains a pdf stream, this function will return it.
**Notes:** Returns true on success and false on failure.

**50.31.10 StringValue(byref value as CGPDFStringMBS) as boolean**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
If the object contains a pdf string, this function will return it.
**Notes:** Returns true on success and false on failure.

**50.31.11 Type as Integer**

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the type of the object content.
**Notes:**
Some useful constants:

- kCGPDFObjectTypeNull = 1
- kCGPDFObjectTypeBoolean = 2
- kCGPDFObjectTypeInteger = 3
- kCGPDFObjectTypeReal = 4
- kCGPDFObjectTypeName = 5
50.31. CLASS CGPDFOBJECTMBS

kCGPDFObjectTypeString = 6
kCGPDFObjectTypeArray = 7
kCGPDFObjectTypeDictionary = 8
kCGPDFObjectTypeStream = 9

50.31.12 Properties

50.31.13 Document as CGPDFDocumentMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The document this PDF Object belongs to. **Notes:** (Read only property)

50.31.14 Handle as Integer

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle of the pdf object. **Notes:** (Read and Write property)

50.31.15 Constants

50.31.16 kCGPDFObjectTypeArray = 7

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the type constants for a PDF object type. **Notes:** Type for a PDF array.

50.31.17 kCGPDFObjectTypeBoolean = 2

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the type constants for a PDF object type. **Notes:** The type for a PDF Boolean.

50.31.18 kCGPDFObjectTypeDictionary = 8

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the type constants for a PDF object type. **Notes:** The type for a PDF dictionary.
50.31.19  kCGPDFObjectTypeInteger = 3

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the type constants for a PDF object type. **Notes:** The type for a PDF integer.

50.31.20  kCGPDFObjectTypeKeyName = 5

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the type constants for a PDF object type. **Notes:** Type for a PDF name.

50.31.21  kCGPDFObjectTypeNull = 1

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the type constants for a PDF object type. **Notes:** The type for a PDF null.

50.31.22  kCGPDFObjectTypeReal = 4

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the type constants for a PDF object type. **Notes:** The type for a PDF real.

50.31.23  kCGPDFObjectTypeStream = 9

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the type constants for a PDF object type. **Notes:** The type for a PDF stream.

50.31.24  kCGPDFObjectTypeString = 6

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the type constants for a PDF object type. **Notes:** The type for a PDF string.
50.32. CLASS CGPDFPAGEMBS

50.32.1 class CGPDFPageMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a pdf page.

50.32.2 Methods

50.32.3 ArtBox as CGRectMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the ArtBox of this page.

**Notes:**

Returns nil on any error.
This is the value of the corresponding entry in the page’s dictionary.

50.32.4 BleedBox as CGRectMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the BleedBox of this page.

**Notes:**

Returns nil on any error.
This is the value of the corresponding entry in the page’s dictionary.

50.32.5 CropBox as CGRectMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the BleedBox of this page.

**Notes:**

Returns nil on any error.
This is the value of the corresponding entry in the page’s dictionary.

50.32.6 Dictionary as CGPDFDictionaryMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The information dictionary of this page.
50.32.7 MediaBox as CGRectMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the MediaBox of this page.

**Notes:**
Returns nil on any error.
This is the value of the corresponding entry in the page’s dictionary.

50.32.8 PageNumber as Integer

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The page number of this page.

50.32.9 RotationAngle as Integer

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the rotation of a page in degrees.

**Notes:** This is the value of the /Rotate entry in the page’s dictionary.

50.32.10 TrimBox as CGRectMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the TrimBox of this page.

**Notes:**
Returns nil on any error.
This is the value of the corresponding entry in the page’s dictionary.

50.32.11 Properties

50.32.12 Document as CGPDFDocumentMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The document this PDF Page belongs to.
50.32. **CLASS CGPDFPAGEMBS**

**Notes:** (Read only property)

### 50.32.13 Handle as Integer

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The handle of the pdf page.
**Notes:** (Read and Write property)

### 50.32.14 Constants

#### 50.32.15 kCGPDFArtBox=4

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the box types for a PDF page.
**Notes:**
The page art box a rectangle, expressed in default user space units, defining the extent of the page’s meaningful content (including potential white space) as intended by the page’s creator.

Available in Mac OS X v10.3 and later.

#### 50.32.16 kCGPDFBleedBox=2

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the box types for a PDF page.
**Notes:**
The page bleed box a rectangle, expressed in default user space units, that defines the region to which the contents of the page should be clipped when output in a production environment

Available in Mac OS X v10.3 and later.

#### 50.32.17 kCGPDFCropBox=1

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the box types for a PDF page.
**Notes:**
The page crop box a rectangle, expressed in default user space units, that defines the visible region of default user space. When the page is displayed or printed, its contents are to be clipped to this rectangle.
CHAPTER 50. COREGRAPHICS

Available in Mac OS X v10.3 and later.

50.32.18 kCGPDFMediaBox=0

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the box types for a PDF page.  
**Notes:**

The page media box a rectangle, expressed in default user space units, that defines the boundaries of the physical medium on which the page is intended to be displayed or printed.

Available in Mac OS X v10.3 and later.

50.32.19 kCGPDFTrimBox=3

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the box types for a PDF page.  
**Notes:**

The page trim box a rectangle, expressed in default user space units, that defines the intended dimensions of the finished page after trimming.

Available in Mac OS X v10.3 and later.
class CGPDFStreamMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
A class for a pdf stream.

Methods

Data(byref format as Integer) as string

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The data of this pdf stream.
Notes:
Format is set to one of the following constants:

- CGPDFDataFormatRaw 0
- CGPDFDataFormatJPEGEncoded 1
- CGPDFDataFormatJPEG2000 2

Returns nil on any error.

Dictionary as CGPDFDictionaryMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The information dictionary for this stream.
Notes: Returns nil on any error.

Properties

Document as CGPDFDocumentMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The document this PDF Stream belongs to.
Notes: (Read only property)
50.33.7 Handle as Integer

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The handle of the pdf stream. **Notes:** (Read and Write property)

50.33.8 Constants

50.33.9 CGPDFDataFormatJPEG2000=2

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the data format constants.

50.33.10 CGPDFDataFormatJPEGEncoded=1

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the data format constants.

50.33.11 CGPDFDataFormatRaw=0

MBS MacCG Plugin, Plugin Version: 9.5. **Function:** One of the data format constants.
50.34.1 class CGPDFStringMBS

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a pdf string.

50.34.2 Methods

50.34.3 Bytes as MemoryBlock

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The bytes of this pdf string. **Notes:** Returns nil on any error. This memoryblock is not encoding safe!

50.34.4 Length as Integer

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The length of the text.

50.34.5 Text as string

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The text of the pdf string as a string. **Notes:** In contrast to the bytes in the memoryblock, this String is encoding safe. Returns nil on any error.

50.34.6 Properties

50.34.7 Document as CGPDFDocumentMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The document this PDF String belongs to.
50.34.8 Handle as Integer

MBS MacCG Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The handle of the pdf string.
**Notes:** (Read and Write property)
50.35. CLASS CGPICTURECONTEXTMBS

50.35  class CGPictureContextMBS

50.35.1  class CGPictureContextMBS

MBS MacCG Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A subclass of the CGBitmapContextMBS class to draw into a picture.

**Notes:**
This class creates a picture bitmap which can be copied into a RB picture. Only for Carbon!

You need to call CGPictureContextMBS or fill background with some color as there may be random bytes in the picture memory.
The image is not cleared in the constructor for you (to increase performance where it’s not needed). You may need to call ClearRect.
Subclass of the CGBitmapContextMBS class.

50.35.2  Methods

50.35.3  Constructor(width as Integer, height as Integer)

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The constructor: Creates a new picture.

**Notes:**
On success the handle property is not 0.

You need to call CGPictureContextMBS or fill background with some color as there may be random bytes in the picture memory.
For Cocoa apps, the picture will have a normal Xojo picture to draw inside and you get that picture back with CopyPicture. For 32-bit Carbon we use a GWorld which has Mask and picture part.
See also:

- 50.35.4 Constructor(width as Integer, height as Integer, ColorSpace as CGColorSpaceMBS)

50.35.4  Constructor(width as Integer, height as Integer, ColorSpace as CGColorSpaceMBS)

MBS MacCG Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The constructor: Creates a new picture.

**Notes:**
On success the handle property is not 0.
You need to call CGPictureContextMBS or fill background with some color as there may be random bytes in the picture memory. For 64-bit Cocoa apps, the picture will have a normal Xojo picture to draw inside and you get that picture back with CopyPicture. For 32-bit we use a GWorld which has Mask and picture part. See also:

- 50.35.3 Constructor(width as Integer, height as Integer)

### 50.35.5 CopyPicture as picture

MBS MacCG Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a copy of the picture as a Realbasic picture object. **Example:**

```basic
dim c as CGPictureContextMBS

c=new CGPictureContextMBS(100,100)

c.SetRGBFillColor 1,0,0,1

c.FillRect CGMakeRectMBS(0,0,50,50)

Backdrop=c.CopyPicture
```

**Notes:** Returns nil on any error.

### 50.35.6 CopyPictureMask as picture

MBS MacCG Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a copy of the picture’s mask as a Realbasic picture object. **Example:**

```basic
dim c as CGPictureContextMBS

c=new CGPictureContextMBS(100,100)

c.SetRGBFillColor 1,0,0,0.5

c.FillRect CGMakeRectMBS(0,0,50,50)

Backdrop=c.CopyPictureMask
```

**Notes:** Returns nil on any error.
**50.35.7  CopyPictureWithMask as picture**

MBS MacCG Plugin, Plugin Version: 13.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**

Returns copy of the current context content as a picture with mask.

**Example:**

Function GetIcon(f as folderitem, w as Integer, h as Integer, WantAlphaPicture as Boolean = false) As picture

const DrawNormal=0
const DrawNoImage=2
const DrawNoMask=4
const DrawSelected=& h8000

// get icon
dim i as new iconmbs(f)

if i.Valid then

if TargetCocoa and WantAlphaPicture then
   // Cocoa only: Make Picture with alpha channel
   dim p as new Picture(w, h)
   dim c as CGBitmapContextMBS = CGBitmapContextMBS.CreateWithPicture(p)
   c.ClearRect CGMakeRectMBS(0,0,w,h)
   // draw icon
   i.DrawIconCGContext(c.Handle, 0,0,w,h,0,0,DrawNormal,& c 000000)
   c.Flush
   Return p
else
   // Cocoa or Carbon: Make Picture with mask
   // make bitmap context
   dim c as new CGPictureContextMBS(w,h)
   c.ClearRect CGMakeRectMBS(0,0,w,h)
   // draw icon
   i.DrawIconCGContext(c.Handle, 0,0,w,h,0,0,DrawNormal,& c000000)
   c.Flush
   // and copy to picture
   Return c.CopyPictureWithMask
end if
Notes: Returns nil on out of memory.

50.35.8  SetMask(mask as picture) as boolean

MBS MacCG Plugin, Plugin Version: 4.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Draws the given picture in the mask of the CGPicture.
Notes:
The alpha value is taken from one of the color channels.
Use a greyscale image inside a 32bit bitmap picture for this.
Size of the mask picture and the CGPictureContext need not fit.
Returns true on success.

50.35.9  Properties

50.35.10  GWorldHandle as Integer

MBS MacCG Plugin, Plugin Version: 4.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function:
The handle of the used GWorld.
Notes:
Only useful for Toolbox calls.
(Read and Write property)
50.36   class CGPointMBS

50.36.1   class CGPointMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core graphics point.

50.36.2   Methods

50.36.3   ApplyAffineTransform(p as CGAffineTransformMBS) as CGPointMBS

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Transform 'point' by 't' and return the result: p’ = p * t where p = \[ x \ y \ 1 \].

50.36.4   Binary as MemoryBlock

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the internal data of the object as a CGPoint for use on Toolbox calls. **Example:**

```plaintext
dim c as CGPointMBS
dim m as MemoryBlock
c=CGMakePointMBS(10,20)
m=c.Binary
MsgBox str(m.Size) // 8
MsgBox str(m.doubleValue( 0)) // 10
MsgBox str(m.doubleValue( 4)) // 20
```

50.36.5   Constructor

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new point object with the given values. **See also:**

- 50.36.6 Constructor(p as Ptr)
- 50.36.7 Constructor(source as CGPointMBS)
50.36.6 Constructor(p as Ptr)

MBS MacCG Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new instance using data at the pointer. **Notes:** Make sure the pointer is valid and has the right data and size. **See also:**
- 50.36.5 Constructor
- 50.36.7 Constructor(source as CGPointMBS)
- 50.36.8 Constructor(x as Double, y as Double)

50.36.7 Constructor(source as CGPointMBS)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new point object with the given values. **See also:**
- 50.36.5 Constructor
- 50.36.6 Constructor(p as Ptr)
- 50.36.8 Constructor(x as Double, y as Double)

50.36.8 Constructor(x as Double, y as Double)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new point object with the given values. **See also:**
- 50.36.5 Constructor
- 50.36.6 Constructor(p as Ptr)
- 50.36.7 Constructor(source as CGPointMBS)

50.36.9 Equal(p as CGPointMBS) as boolean

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if both points are equal.
50.36. **CLASS CGPOINTMBS**

50.36.10 **Make(x as Double, y as Double) as CGPointMBS**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns a new CGPointMBS object.

50.36.11 **Zero as CGPointMBS**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the zero point.
**Notes:** The "zero" point – equivalent to CGMakePointMBS(0, 0).

50.36.12 **Properties**

50.36.13 **x as Double**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The X property of the point.
**Notes:** (Read and Write property)

50.36.14 **y as Double**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The Y property of the point.
**Notes:** (Read and Write property)
50.37  class CGPSConverterMBS

50.37.1  class CGPSConverterMBS

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class in CoreGraphics to convert Postscript code to PDF data.
**Notes:** Requires Mac OS X 10.3.

50.37.2  Methods

50.37.3  Abort as boolean

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Tell the converter to abort conversion at the next possible opportunity.
**Notes:** Returns false on any error and true on success.

50.37.4  Constructor(options as Dictionary = nil)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Create a CGPSConverter.
**Notes:**
Currently you should pass nil for options. (Mac OS X 10.3)
On failure the handle property is zero.

50.37.5  Convert(provider as CGDataProviderMBS, consumer as CGDataConsumerMBS, options as Dictionary = nil) as boolean

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Converts PostScript data to PDF data.
**Notes:**
The PostScript data is supplied by provider; the resulting PDF is written to consumer. Returns true if the conversion succeeded; false otherwise.

50.37.6  IsConverting as boolean

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the converter is currently converting data.
50.37. **CLASS CGPSCONVERTERMBS**

**Notes:** False on any error.

### 50.37.7 Properties

#### 50.37.8 Handle as Integer

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

The handle to the CGPSConverter object.

**Notes:**

Datatype is CGPSConverterRef.
(Read and Write property)

### 50.37.9 Events

#### 50.37.10 BeginDocument

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**

Is called at the beginning of the conversion of the PostScript document.

#### 50.37.11 BeginPage(PageNumber as Integer, PageInfo as Dictionary)

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**

Called at the start of the conversion of each page in the PostScript document.

#### 50.37.12 EndDocument(success as boolean)

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**

Called at the end of conversion of the PostScript document.

#### 50.37.13 EndPage(PageNumber as Integer, PageInfo as Dictionary)

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**

Called at the end of the conversion of each page in the PostScript document.
50.37.14 Finished

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called when the converter is no longer needed.

50.37.15 Message(message as string)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called to pass any messages that might result during the conversion.

50.37.16 Progress

MBS MacCG Plugin, Plugin Version: 4.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Called periodically during the conversion to indicate that conversion is proceeding.
50.38. **CLASS CGRectMBS**

50.38.1 **class CGRectMBS**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a core graphics rectangle.

50.38.2 **Methods**

50.38.3 **ApplyAffineTransform(a as CGAffineTransformMBS) as CGRectMBS**

MBS MacCG Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Applies an affine transform to the rectangle and returns the result. **Example:**

```vbscript
Dim af As CGAffineTransformMBS = CGAffineTransformMBS.Identity
MsgBox str(af.A) + " " + str(af.b) + " " + str(af.c) + " " + str(af.d) + " " + str(af.tx) + " " + str(af.ty)
af = af.Scale( 1, -1 )
MsgBox str(af.A) + " " + str(af.b) + " " + str(af.c) + " " + str(af.d) + " " + str(af.tx) + " " + str(af.ty)
af = af.Translate( 0, 100 )
MsgBox str(af.A) + " " + str(af.b) + " " + str(af.c) + " " + str(af.d) + " " + str(af.tx) + " " + str(af.ty)
Dim r1 As CGRectMBS
Dim r2 As CGRectMBS
r1 = CGRectMBS.MakeRectMBS(100,100,100,100)
r2 = r1.ApplyAffineTransform(af)
MsgBox "(" + str(r1.Left) + ", " + str(r1.top) + ", " + str(r1.width) + ", " + str(r1.height) + ") -> (" + str(r2.Left) + ", " + str(r2.top) + ", " + str(r2.width) + ", " + str(r2.height) + ")"
```

**Notes:** Returns nil on any error.
50.38.4 Binary as MemoryBlock

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the internal data of the object as a CGRect for use on Toolbox calls.

**Example:**
```pascal
dim c as CGRectMBS
dim m as MemoryBlock
c=CGMakeRectMBS(10,20,30,40)
m=c.Binary
```

```pascal
MsgBox str(m.Size) // 16
MsgBox str(m.doubleValue( 0)) // 10
MsgBox str(m.doubleValue( 4)) // 20
MsgBox str(m.doubleValue( 8)) // 30
MsgBox str(m.doubleValue(12)) // 40
```

50.38.5 Constructor

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The constructor to create a zero rectangle.

**See also:**
- 50.38.6 Constructor(p as Ptr)
- 50.38.7 Constructor(source as CGRectMBS)
- 50.38.8 Constructor(x as Double, y as Double, width as Double, height as Double)

50.38.6 Constructor(p as Ptr)

MBS MacCG Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates a new instance using data at the pointer.

**Notes:** Make sure the pointer is valid and has the right data and size.

**See also:**
- 50.38.5 Constructor
- 50.38.7 Constructor(source as CGRectMBS)
- 50.38.8 Constructor(x as Double, y as Double, width as Double, height as Double)
50.38. **CLASS CGRECTMBS**

### 50.38.7 Constructor(source as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates a new CGRectMBS object by copying the values.

See also:

- 50.38.5 Constructor
- 50.38.6 Constructor(p as Ptr)
- 50.38.8 Constructor(x as Double, y as Double, width as Double, height as Double)

### 50.38.8 Constructor(x as Double, y as Double, width as Double, height as Double)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Creates a new CGRectMBS object with the given values.

See also:

- 50.38.5 Constructor
- 50.38.6 Constructor(p as Ptr)
- 50.38.7 Constructor(source as CGRectMBS)

### 50.38.9 ContainsPoint(r as CGPointMBS) as boolean

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Return true if 'point' is contained in the rect, false otherwise.

### 50.38.10 ContainsRect(r as CGRectMBS) as boolean

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Return true if 'rect2' is contained in 'rect1', false otherwise.

**Notes:**

'rect2' is contained in 'rect1' if the union of 'rect1' and 'rect2' is equal to 'rect1'.
(rect1 is the current rect and rect2 the rect you pass to this function)

### 50.38.11 Divide(byref slice as CGRectMBS, byref remainder as CGRectMBS, amount as Double, edge as Integer)

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**

Divides the rectangle.
**Notes:** Make two new rectangles, 'slice' and 'remainder', by dividing the rect with a line that’s parallel to one of its sides, specified by 'edge' – either 'CGRectMinXEdge', 'CGRectMinYEdge', 'CGRectMaxXEdge', or 'CGRectMaxYEdge'. The size of 'slice' is determined by 'amount', which measures the distance from the specified edge.

### 50.38.12 Equal(r as CGRectMBS) as boolean

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if both rectangles are equal.

### 50.38.13 Infinite as CGRectMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A rectangle that has infinite extent. **Example:**
```dim r as CGRectMBS = CGRectMBS.Infinite
MsgBox str(r.Left)+" "+str(r.Top)+" "+str(r.Width)+" "+str(r.Height)```

**Notes:** Available in Mac OS X v10.4 and later.

### 50.38.14 Inset(dx as Double, dy as Double) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Inset the rect by '(dx, dy)' – i.e., offset its origin by '(dx, dy)', and decrease its size by '(2*dx, 2*dy)'

### 50.38.15 Integral as CGRectMBS

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Expand the rect to the smallest rect containing it with integral origin and size.

### 50.38.16 Intersection(r as CGRectMBS) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the intersection of both rectangles. **Notes:** This may return a null rect.
50.38.17 **IntersectsRect(r as CGRectMBS) as boolean**

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return true if 'rect1' intersects 'rect2', false otherwise.
**Notes:** 'rect1' intersect 'rect2' if the intersection of 'rect1' and 'rect2' is not the null rect.

50.38.18 **IsEmpty as boolean**

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return true if the rect is empty – i.e., if it has zero width or height.
**Notes:** A null rect is defined to be empty.

50.38.19 **IsInfinite as boolean**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns whether a rectangle is infinite.
**Notes:** Returns true if the specified rectangle is infinite, false otherwise.

An infinite rectangle is one that has no defined bounds. Infinite rectangles can be created as output from a tiling filter. For example, the Core Image framework perspective tile filter creates an image whose extent is described by an infinite rectangle.

50.38.20 **IsNull as boolean**

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return true if the rect is null – e.g., the result of intersecting two disjoint rectangles is a null rect.

50.38.21 **Make(x as Double, y as Double, width as Double, height as Double) as CGRectMBS**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new CGRectMBS object with the given values.
**Example:**

```dim r as CGRectMBS = CGRectMBS.Make(1,2,3,4)
MsgBox str(r.Left)+" "+str(R.Top)+" "+str(R.Width)+" "+str(r.Height)```
50.38.22 MaxX as Double

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the rightmost x-value of the rect.

**Example:**

```vba
dim r as CGRectMBS = CGMakeRectMBS(10, 20, 30, 40)
MsgBox str(r.MaxX) // 40
```

50.38.23 MaxY as Double

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the topmost y-value of the rect.

**Example:**

```vba
dim r as CGRectMBS = CGMakeRectMBS(10, 20, 30, 40)
MsgBox str(r.MaxY) // 60
```

50.38.24 MidX as Double

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the midpoint x-value of the rect.

**Example:**

```vba
dim r as CGRectMBS = CGMakeRectMBS(10, 20, 30, 40)
MsgBox str(r.MidX) // 25
```

50.38.25 MidY as Double

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the midpoint y-value of the rect.

**Example:**

```vba
dim r as CGRectMBS = CGMakeRectMBS(10, 20, 30, 40)
MsgBox str(r.MidY) // 40
```
50.38. **CLASS CGRECTMBS**

50.38.26 **MinX as Double**

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return the leftmost x-value of the rect.
**Example:**
```vba
dim r as CGRectMBS = CGMakeRectMBS(10, 20, 30, 40)
MsgBox str(r.MinX) // 10
```

50.38.27 **MinY as Double**

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Return the bottommost y-value of the rect.
**Example:**
```vba
dim r as CGRectMBS = CGMakeRectMBS(10, 20, 30, 40)
MsgBox str(r.MinY) // 20
```

50.38.28 **Null as CGRectMBS**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the null rect.
**Example:**
```vba
dim r as CGRectMBS = CGRectMBS.Null
MsgBox str(r.Left)+" "+str(r.Top)+" "+str(r.Width)+" "+str(r.Height)
```

**Notes:**
The "empty" rect. This is the rectangle returned when, for example, we intersect two disjoint rectangles. Note that the null rect is not the same as the zero rect.

50.38.29 **Offset(dx as Double, dy as Double) as CGRectMBS**

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Offset the rect by '(dx, dy)'.
50.38.30 **Standardize as CGRectMBS**

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Standardize the rect – i.e., convert it to an equivalent rect which has positive width and height.

**Example:**

```vbscript
dim r as CGRectMBS = CGRectMBS.Make(5, 6, -3, -2)
MsgBox str(r.Left)+" "+str(r.Top)+" "+str(r.Width)+" "+str(r.Height)
r = r.Standardize
MsgBox str(r.Left)+" "+str(r.Top)+" "+str(r.Width)+" "+str(r.Height)
```

50.38.31 **Union(r as CGRectMBS) as CGRectMBS**

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Return the union of both rectangles.

**Example:**

```vbscript
dim r as CGRectMBS = CGRectMBS.Infinite
MsgBox str(r.Left)+" "+str(r.Top)+" "+str(r.Width)+" "+str(r.Height)
```

50.38.32 **Zero as CGRectMBS**

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A rectangle constant with location (0,0), and width and height of 0.

**Example:**

```vbscript
dim r as CGRectMBS = CGRectMBS.Zero
MsgBox str(r.Left)+" "+str(r.Top)+" "+str(r.Width)+" "+str(r.Height)
```

**Notes:** The zero rectangle is equivalent to CGRectMBS.Make(0,0,0,0).

50.38.33 **Properties**

50.38.34 **height as Double**

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The height property of the rectangle.

**Example:**

```vbscript`
dim r as CGRectMBS = CGMakeRectMBS(10, 20, 30, 40)
MsgBox str(r.Left)+" " +str(r.Top)+" " +str(r.Width)+" " +str(r.Height)

Notes: (Read and Write property)

50.38.35  left as Double

Notes: (Read and Write property)

50.38.36  Origin as CGPointMBS

Example:

dim r as CGRectMBS = CGRectMBS.Make(5, 6, 3, 2)
dim s as CGPointMBS = r.Origin
MsgBox str(s.x)+" x " +str(s.y)

Notes: (Read and Write property)

50.38.37  Size as CGSizeMBS

Example:

dim r as CGRectMBS = CGRectMBS.Make(5, 6, 3, 2)
dim s as CGSizeMBS = r.Size
MsgBox str(s.Width)+" x " +str(s.Height)

Notes: (Read and Write property)
50.38.38  top as Double

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The top property of the rectangle.

**Example:**

```vba
dim r as CGRectMBS = CGMakeRectMBS(10, 20, 30, 40)
MsgBox str(r.Left) + " " + str(R.Top) + " " + str(R.Width) + " " + str(r.Height)
```

**Notes:** (Read and Write property)

---

50.38.39  width as Double

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The width property of the rectangle.

**Example:**

```vba
dim r as CGRectMBS = CGMakeRectMBS(10, 20, 30, 40)
MsgBox str(r.Left) + " " + str(R.Top) + " " + str(R.Width) + " " + str(r.Height)
```

**Notes:** (Read and Write property)
50.39. **CLASS CGSCONNECTIONMBS**

### 50.39 class CGSCConnectionMBS

#### 50.39.1 class CGSCConnectionMBS

MBS MacCG Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a connection to the CoreGraphics System.

**Example:**

```vba
Dim c As New CGSCConnectionMBS
Dim list As CGSCWindowListMBS = c.GetWindowList

Dim names() As String
Dim u As Integer = List.Count - 1
For i As Integer = 0 To u
    Dim w As CGSCWindowMBS = List.Item(i)
    names.Append w.Title
Next

MsgBox Str(List.Count) & " windows: " + Join(names, ", ")
```

**Notes:**

Requires Mac OS X 10.4.
All functions used by the CGS classes are private APIs, so Apple does not guarantee that they work in future Mac OS X versions.

#### 50.39.2 Methods

##### 50.39.3 CGSCWindow(w as window) as CGSCWindowMBS

MBS MacCG Plugin, Plugin Version: 7.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a CGSCWindow reference to a normal RB window.

**Notes:** Can be used for the CGSTransitionRequestMBS.Win property.

##### 50.39.4 CGSCWindowbyHandle(windowhandle as Integer) as CGSCWindowMBS

MBS MacCG Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a CGSCWindow reference to any window where you can have a handle.

**Notes:**
WindowHandle must be of C type WindowRef. Not a CGS Window Handle.
Can be used for the handle from an OverlayWindowMBS.
50.39.5 FlushAllWindows

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Flushes all windows.
**Notes:** Walks over the window list (of the current process) and does a flush on each window. Lasterror is set.

50.39.6 FlushAllWindowsForAllOtherProcesses

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Flushes all windows.
**Notes:** Walks over the list of processes asking each for its window list and doing a flush on each window. The own process is ignored. Lasterror is set.

50.39.7 FlushAllWindowsForAllProcesses

MBS MacCG Plugin, Plugin Version: 8.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Flushes all windows.
**Notes:** Walks over the list of processes asking each for its window list and doing a flush on each window. Lasterror is set.

50.39.8 GetOnScreenWindowList as CGSWindowListMBS

MBS MacCG Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the list of windows on screen for the current process.
**Notes:** Returns nil on any error.

50.39.9 GetOnScreenWindowListForProcess(PID as Integer) as CGSWindowListMBS

MBS MacCG Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the list of windows on screen for the process with the given Process ID.
50.39. **CLASS CGSCONNECTIONMBS**

Notes: Returns nil on any error.

50.39.10 **GetWindowList as CGSWindowListMBS**

MBS MacCG Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the list of windows for the current process. **Notes:** Returns nil on any error.

50.39.11 **GetWindowListForProcess(PID as Integer) as CGSWindowListMBS**

MBS MacCG Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the list of windows for the process with the given Process ID. **Notes:** Returns nil on any error.

50.39.12 **NewTransition(request as CGSTransitionRequestMBS) as CGSTransitionMBS**

MBS MacCG Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new transition. **Notes:**

Lasterror is set.
Request must be a valid object reference.
Transitions seem not to work in Carbon PEF builds. MachO works.

50.39.13 **RunTransition(request as CGSTransitionRequestMBS, duration as single)**

MBS MacCG Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A method to run a transition for the given request and given time. **Example:**

```plaintext
dim r as CGSTransitionRequestMBS
dim co as CGSConnecitonMBS // global property
dim cw as CGSWindowMBS

c=co=CSCConnectionMBS

cw=co.CGSWindow(window1)
```
8286

CHAPTER 50. COREGRAPHICS

```plaintext
r=new CGSTransitionRequestMBS
r.TransitionType=r.CGSFlip
r.TransitionOption=r.CGSLeft
r.HasBackGround=false
r.HasBackColor=false
r.Win=cw
co.RunTransition(r,2)
```

Notes:

Lasterror is set.
Transitions seem not to work in Carbon PEF builds. MachO works.

50.39.14 SetWorkspaceWithTransition(workspace as CGSWorkspaceMBS, transition as Integer, type as Integer, time as single)

MBS MacCG Plugin, Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Performs a transition with a workspace specified by the workspace object.

**Notes:**
The values for the parameters are not documented on the web except that the transition and type property may use the same transition constants as for the other transitions.
Lasterror is set.
See also:

- 50.39.15 SetWorkspaceWithTransition(workspace as Integer, transition as Integer, type as Integer, time as single)

50.39.15 SetWorkspaceWithTransition(workspace as Integer, transition as Integer, type as Integer, time as single)

MBS MacCG Plugin, Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Performs a transition with a workspace specified by the workspace number.

**Example:**
```plaintext
dim c as new CGSConnectionMBS
dim t as new CGSTransitionRequestMBS

// from space 1 to 2
c.SetWorkspaceWithTransition(2,t.CGSFade, t.CGSInOut, 5)

// but transition and time are ignored on testing Mac.
MsgBox str(c.Lasterror)
```
Notes:
The values for the parameters are not documented on the web except that the transition and type property may use the same transition constants as for the other transitions.
Lasterror is set.
See also:

- 50.39.14 SetWorkspaceWithTransition(workspace as CGSWorkspaceMBS, transition as Integer, type as Integer, time as single)

50.39.16 Properties

50.39.17 Handle as Integer

MBS MacCG Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The internal handle for this connection.
**Notes:** (Read and Write property)

50.39.18 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Last error code reported.
**Notes:**
The list of CoreGraphics error (from Mac OS X 10.4)
(Read and Write property)

50.39.19 Workspace as CGSWorkspaceMBS

MBS MacCG Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The workspace this connection is pointing to.
**Notes:** (Read and Write computed property)

</tbody>
</table>
50.40. class CGScreenRefreshEventMBS

50.40.1 class CGScreenRefreshEventMBS

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The class to receive events for screen updates.

50.40.2 Properties

50.40.3 Initialized as Boolean

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether object is initialized correctly.
**Notes:**
Should be true on OS X if initializing was done.
(Read only property)

50.40.4 Events

50.40.5 ScreenRefresh(rectCount as Integer, rects() as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The event to inform you about a screen refresh.
**Notes:**
When an area of the display is modified or refreshed, this event function will be invoked with a count of
the number of rectangles in the refreshed areas, and a list of the refreshed rectangles. The rectangles are in
global coordinates.

Quartz invokes this event when operations such as drawing, window movement, scrolling, or display recon-
figuration occur on local displays.

Note that a single rectangle may occupy multiple displays, either by overlapping the displays or by residing
on coincident displays when mirroring is active. You can use the function CGDisplayMBS.GetDisplaysWith-
Rect to determine the displays a rectangle occupies.
CHAPTER 50. COREGRAPHICS

50.41 class CGScreenUpdateMoveEventMBS

50.41.1 class CGScreenUpdateMoveEventMBS

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The class to get event when something on screen changes.

50.41.2 Properties

50.41.3 Initialized as Boolean

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Whether object is initialized correctly.
**Notes:**
This should be true on Mac after calling constructor.
(Read only property)

50.41.4 Events

50.41.5 ScreenMove(deltaX as Integer, deltaY as Integer, rectCount as Integer, rects() as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 16.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The event invoked when an area of the display is moved.
**Notes:**
When an area of the display is moved, your callback function will be invoked with a count of the number of rectangles in the moved area, and a list of the moved rectangles. The rectangles are in global coordinates, and describe the area prior to the move operation.

A single rectangle may occupy multiple displays, either by overlapping the displays or by residing on coincident displays when mirroring is active. Use CGDisplayMBS.GetDisplaysWithRect to determine the displays a rectangle occupies.

DeltaX/DeltaY: The distance a region on the screen moves in pixel units.

The fields deltaX and deltaY describe the direction of movement. Positive values of deltaX indicate movement to the right; negative values indicate movement to the left. Positive values of deltaY indicate movement downward; negative values indicate movement upward.
50.42. CLASS CGSESSIONMBS

50.42  class CGSessionMBS

50.42.1  class CGSessionMBS

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class to hold some values about the current CoreGraphics session.

**Example:**

```vbs
dim c as CGSessionMBS = CGSessionMBS
MsgBox c.UserName
```

**Notes:** You need to call the CGSessionMBS global method to get a valid object of this class (with values).

50.42.2  Properties

50.42.3  ConsoleSet as Integer

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Value is a 32 bit unsigned integer value representing a set of hardware composing a console.

**Example:**

```vbs
dim c as CGSessionMBS = CGSessionMBS
MsgBox str(c.ConsoleSet)
```

**Notes:** (Read and Write property)

50.42.4  LoginDone as Boolean

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if login operation has been done, otherwise False.

**Example:**

```vbs
dim c as CGSessionMBS = CGSessionMBS
MsgBox str(c.LoginDone)
```

**Notes:** (Read and Write property)
50.42.5 OnConsole as Boolean

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** True if the session is on a console, otherwise False.
**Example:**
```vba
dim c as CGSessionMBS = CGSessionMBS
MsgBox str(c.OnConsole)
```
**Notes:** (Read and Write property)

50.42.6 UserID as Integer

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The user id for the session’s current user.
**Example:**
```vba
dim c as CGSessionMBS = CGSessionMBS
MsgBox str(c.UserID)
```
**Notes:** (Read and Write property)

50.42.7 UserName as String

MBS MacOSX Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The session’s short user name as set by loginwindow.
**Example:**
```vba
dim usr as CGSessionMBS
usr=CGSessionMBS
msgbox usr.UserName
```
**Notes:** (Read and Write property)
50.43  class CGShadingMBS

50.43.1  class CGShadingMBS

MBS MacCG Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** To shade means to fill using a smooth transition between colors across an area. Quartz shadings simplify several common shading operations. Quartz shadings currently support radial and axial gradient fills. **Notes:** To paint with a Quartz shading, you call CGContextMBS.DrawShading. This function fills the current clipping path using the specified color gradient, calling your parametric function repeatedly as it draws.

50.43.2  Properties

50.43.3  Handle as Integer

MBS MacCG Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Handle to the CGShadingRef. **Notes:** (Read and Write property)
50.44 class CGSizeMBS

50.44.1 class CGSizeMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
A class for a core graphics size.

50.44.2 Methods

50.44.3 ApplyAffineTransform(p as CGAffineTransformMBS) as CGSizeMBS

MBS MacCG Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Transform 'size' by 't' and return the result: s' = s * t where s = [ width height 0 ] .

50.44.4 Binary as MemoryBlock

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the internal data of the object as a CGSize for use on Toolbox calls.
**Example:**
```pascal
dim c as CGSizeMBS
dim m as MemoryBlock

c=CGMakeSizeMBS(10,20)
m=c.Binary

MsgBox str(m.Size) // 8
MsgBox str(m.doubleValue(0)) // 10
MsgBox str(m.doubleValue(4)) // 20
```

50.44.5 Constructor

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Creates an zero size object.
See also:
- 50.44.6 Constructor(p as Ptr) 8295
- 50.44.7 Constructor(source as CGSizeMBS) 8295
50.44. CLASS CGSIZEMBS

- 50.44.8 Constructor(width as Double, height as Double)

50.44.6 Constructor(p as Ptr)

MBS MacCG Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new instance using data at the pointer. **Notes:** Make sure the pointer is valid and has the right data and size. See also:

- 50.44.5 Constructor
- 50.44.7 Constructor(source as CGSizeMBS)
- 50.44.8 Constructor(width as Double, height as Double)

50.44.7 Constructor(source as CGSizeMBS)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The constructor which copies the values from the other size object. See also:

- 50.44.5 Constructor
- 50.44.6 Constructor(p as Ptr)
- 50.44.8 Constructor(width as Double, height as Double)

50.44.8 Constructor(width as Double, height as Double)

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates a size object with the given values. See also:

- 50.44.5 Constructor
- 50.44.6 Constructor(p as Ptr)
- 50.44.7 Constructor(source as CGSizeMBS)

50.44.9 Equal(p as CGSizeMBS) as boolean

MBS MacCG Plugin, Plugin Version: 3.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if two CGSize objects are equal.
50.44.10 Make(width as Double, height as Double) as CGSizeMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns a new CGSizeMBS object with the given values.

50.44.11 Zero as CGSizeMBS

MBS MacCG Plugin, Plugin Version: 9.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the zero size. **Notes:** The "zero" size – equivalent to CGSizeMBS.Make(0, 0).

50.44.12 Properties

50.44.13 height as Double

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The height property of the point. **Notes:** (Read and Write property)

50.44.14 width as Double

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The width property of the point. **Notes:** (Read and Write property)
50.45. **CLASS CGSTRANSITIONMBS**

50.45  **class CGSTransitionMBS**

50.45.1  **class CGSTransitionMBS**

MBS MacCG Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a transition to the CoreGraphics System.  
**Notes:** 
Requires Mac OS X 10.4. 
All functions used by the CGS classes are private APIs, so Apple does not guarantee that they work in future Mac OS X versions.

50.45.2  **Methods**

50.45.3  **Invoke(duration as single)**

MBS MacCG Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Performs the transition.  
**Example:**
```
// cube transition for the whole screen
dim r as CGSTransitionRequestMBS
dim co as CGSConnectionMBS // global property
dim ct as CGSTransitionMBS // global property
co=new CGSConnectionMBS
r=new CGSTransitionRequestMBS
r.TransitionType=r.CGSCube
r.TransitionOption=r.CGSLLeft
r.HasBackGround=true
r.HasBackColor=false
ct=co.NewTransition(r)
if ct<>Nil then
    window1.refresh // draw new screen
    ct.invoke 5
    ct.wait 5
    ct.release
else
    MsgBox "Error creating the transition."
end if
```
Notes:

duration is the time in seconds the duration will need to complete.
Lasterror is set.

50.45.4 Release

MBS MacCG Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Releases the transaction.

**Example:**

```vbnet
dim r as CGSTransitionRequestMBS
dim co as CGSConnectionMBS // global property
dim ct as CGSTransitionMBS // global property
dim cw as CGSWindowMBS

c=CGSConnectionMBS()
cw=co.CGSWindow(window1)

r=CGSTransitionRequestMBS()
r.TransitionType=r.CGSCube
r.TransitionOption=r.CGSLft
r.HasBackGround=false
r.HasBackColor=false
r.Win=cw

c=co.NewTransition(r)
if c<>Nil then
    window1.refresh // draw new screen
    c.invoke 5
    c.wait 5
    c.release
else
    MsgBox "Error creating the transition."
end if
```

Notes:

Lasterror is set.
