MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The private constructor.  
**Notes:**  
This constructor makes sure you don’t create useless MacUSBDeviceMBS objects by error. The only way to create an object is to use the root method to get the object hierarchy.  
This constructor is private to make sure you don’t create an object from this class by error. Please use designated functions to create objects.

167.16.5 root as MacUSBDeviceMBS

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The root of the device tree.  
**Example:**

```vbscript
// display devices with serialnumbers.  
dim devices(-1) as MacUSBDeviceMBS  
devices.Append MacUSBDeviceMBS.root

dim lines(-1) as string

while UBound(devices) >= 0  
dim dev as MacUSBDeviceMBS = devices.Pop

if len(dev.SerialNumber) > 0 then  
lines.Append dev.name +": " + dev.serialnumber
end if

for each child as MacUSBDeviceMBS in dev.children  
devices.Append child
next
wend

MsgBox Join(lines, EndOfLine)
```

**Notes:** Root is the Mac itself. Below root you find the built in USB hubs.
167.16.6 Properties

167.16.7 Address as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device address number.  
**Notes:** (Read and Write property)

167.16.8 BusPowerAvailable as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The available bus power.  
**Notes:**  
Value is in milli ampere.  
(Read and Write property)

167.16.9 ClassName as String

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The class name for this device.  
**Notes:**  
Basicly this is what driver Apple uses.  
(Read and Write property)

167.16.10 DeviceClass as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device class.  
**Notes:**  
See kUSB*Class constants.  

And read here:  
http://www.usb.org/developers/defined_class  
(Read and Write property)
167.16. CLASS MACUSBDEVICEMBS

167.16.11 DeviceMaxPacketSize as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The maximum device packet size. **Notes:** (Read and Write property)

167.16.12 DeviceNumConfigs as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of configurations for this device. **Notes:** (Read and Write property)

167.16.13 DeviceProtocol as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device protocol. **Notes:** (Read and Write property)

167.16.14 DeviceReleaseNumber as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device release number. **Notes:** (Read and Write property)

167.16.15 DeviceSpeed as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device speed. **Notes:** (Read and Write property)

167.16.16 DeviceSubClass as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device sub class. **Notes:** See kUSB*SubClass constants. (Read and Write property)
167.16.17  ExtraPowerForPorts as Integer

Notes:
Value is in milli ampere.
(Read and Write property)

167.16.18  Name as String

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: The name of this device node.
Example:

```vbnet
// show all names of all devices in a msgbox
dim names(-1) as string

// iterate over all devices without recursion
dim devices(-1) as MacUSBDeviceMBS

devices.Append MacUSBDeviceMBS.root

while UBound(devices)>0
dim dev as MacUSBDeviceMBS = devices.Pop
names.Append dev.name

for each child as MacUSBDeviceMBS in dev.children
devices.Append child
next
wend

MsgBox Join(names,"",""
```

Notes: (Read and Write property)

167.16.19  NumEndpoints as Integer

**167.16. CLASS MACUSBDEVICEMBS**

**Notes:** (Read and Write property)

---

### 167.16.20 Path as String

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The object path.

**Notes:**

This is internally used by the kernel.

(Read and Write property)

---

### 167.16.21 Ports as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The number of ports on an USB hub.

**Notes:** (Read and Write property)

---

### 167.16.22 ProductID as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The product ID

**Notes:** (Read and Write property)

---

### 167.16.23 ProductName as String

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The product name.

**Notes:** (Read and Write property)

---

### 167.16.24 Properties as Dictionary

MBS MacOSX Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Creates dictionary with all the properties associated for this USB device in IORegistry.

**Notes:** (Read and Write property)
167.16.25  RequestedPower as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Requested power.  
**Notes:**  
Value is in milli ampere.  
(Read and Write property)

167.16.26  SerialNumber as String

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The device serial number.  
**Notes:** (Read and Write property)

167.16.27  VendorID as Integer

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The vendor ID.  
**Notes:**  
Assigned by USB Org.  
(Read and Write property)

167.16.28  VendorName as String

MBS MacOSX Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The vendor name.  
**Notes:** (Read and Write property)

167.16.29  Constants

167.16.30  kUSBApplicationSpecificClass = 254

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.
167.16. **CLASS MACUSBDEVICEMBS**

167.16.31 **kUSBATMNetworkingSubClass = 7**

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. 
**Notes:** For kUSBCommunicationDataInterfaceClass.

167.16.32 **kUSBAudioControlSubClass = 1**

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. 
**Notes:** For kUSBAudioInterfaceClass.

167.16.33 **kUSBAudioStreamingSubClass = 2**

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. 
**Notes:** For kUSBAudioInterfaceClass.

167.16.34 **kUSBCommAbstractSubClass = 2**

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. 
**Notes:** For kUSBCommunicationDataInterfaceClass.

167.16.35 **kUSBCommCAPISubClass = 5**

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. 
**Notes:** For kUSBCommunicationDataInterfaceClass.

167.16.36 **kUSBCommDirectLineSubClass = 1**

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. 
**Notes:** For kUSBCommunicationDataInterfaceClass.

167.16.37 **kUSBCommEthernetNetworkingSubClass = 6**

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. 
**Notes:** For kUSBCommunicationDataInterfaceClass.
167.16.38  kUSBCommMultiChannelSubClass = 4

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBCommunicationDataInterfaceClass.

167.16.39  kUSBCommonClassSubClass = 2

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBMiscellaneousClass.

167.16.40  kUSBCommTelephoneSubClass = 3

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBCommunicationDataInterfaceClass.

167.16.41  kUSBCommunicationClass = 2

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

167.16.42  kUSBCompositeClass = 0

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

167.16.43  kUSBCompositeSubClass = 0

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.

167.16.44  kUSBDataClass = 10

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.
167.16.45 kUSBDFUSubClass = 1

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.  
**Notes:** For kUSBApplicationSpecificInterfaceClass.

167.16.46 kUSBDiagnosticClass = 220

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

167.16.47 kUSBHIDBootInterfaceSubClass = 1

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.  
**Notes:** For kUSBHIDBootInterfaceSubClass.

167.16.48 kUSBHubClass = 9

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

167.16.49 kUSBHubSubClass = 0

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.

167.16.50 kUSBIrDABridgeSubClass = 2

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.  
**Notes:** For kUSBApplicationSpecificInterfaceClass.

167.16.51 kUSBMassStorageATAPISubClass = 2

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.  
**Notes:** For kUSBMassStorageInterfaceClass.
167.16.52  kUSBMassStorageQIC157SubClass = 3

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.  
**Notes:** For kUSBMassStorageInterfaceClass.

167.16.53  kUSBMassStorageRBCSubClass = 1

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.  
**Notes:** For kUSBMassStorageInterfaceClass.

167.16.54  kUSBMassStorageSCSISubClass = 6

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.  
**Notes:** For kUSBMassStorageInterfaceClass.

167.16.55  kUSBMassStorageSFF8070iSubClass = 5

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.  
**Notes:** For kUSBMassStorageInterfaceClass.

167.16.56  kUSBMassStorageUFISubClass = 4

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.  
**Notes:** For kUSBMassStorageInterfaceClass.

167.16.57  kUSBMIDISTreamingSubClass = 3

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.  
**Notes:** For kUSBAudioInterfaceClass.

167.16.58  kUSBMiscellaneousClass = 239

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.
167.16. CLASS MACUSBDEVICEMBS

167.16.59  kUSBPersonalHealthcareClass = 15
MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

167.16.60  kUSBReprogrammableDiagnosticSubClass = 1
MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBDiagnosticDeviceInterfaceClass.

167.16.61  kUSBRFControllerSubClass = 1
MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBWirelessControllerInterfaceClass.

167.16.62  kUSBTestMeasurementSubClass = 3
MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants. **Notes:** For kUSBApplicationSpecificInterfaceClass.

167.16.63  kUSBVendorSpecificClass = 255
MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.

167.16.64  kUSBVideoControlSubClass = 1
MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.

167.16.65  kUSBVideoInterfaceCollectionSubClass = 3
MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.
167.16.66  kUSBVideoStreamingSubClass = 2

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device sub class constants.

167.16.67  kUSBWirelessControllerClass = 224

MBS MacOSX Plugin, Plugin Version: 10.4. **Function:** One of the USB device class constants.
167.17  class MacUSBMBS

Function: A class to talk to an USB device.
Notes: Written for a client and probably not yet universally useable, so it may not work with your device.

167.17.2  Methods

167.17.3  AbortPipe(PipeRef as Integer) as boolean

Function: Aborts any outstanding transactions on the pipe with status kIOReturnAborted.
Notes: If there are outstanding asynchronous transactions on the pipe, the callbacks will happen.
Note that this command will also clear the halted bit on the endpoint in the controller, but will NOT clear 
the data toggle bit. If you want to clear the data toggle bit as well, see ClearPipeStall or ClearPipeStall- 
BothEnds for more information. The interface must be open for the pipe to exist.
pipeRef: Index for the desired pipe (1 - GetNumEndpoints).
LastError is set to kIOReturnSuccess if successful, kIOReturnNoDevice if there is no connection to an IOSer-
vice, or kIOReturnNotOpen if the interface is not open for exclusive access.

167.17.4  ClearPipeStall(PipeRef as Integer) as boolean

Function: Clears the halted bit and the data toggle bit on the pipe's endpoint in the controller.
Notes: This function also returns any outstanding transactions on the pipe with status kIOUSBTransactionRe-
turned.
If there are outstanding asynchronous transactions on the pipe, the callbacks will happen. The data toggle 
may need to be resynchronized. The driver may handle this by sending a ClearFeature(ENDPOINT_HALT) 
to the default control pipe, specifying the device's endpoint for this pipe.
pipeRef: Index for the desired pipe (1 - NumEndpoints).
LastError is set to kIOReturnSuccess if successful, kIOReturnNoDevice if there is no connection to an IOSer-
vice, or kIOReturnNotOpen if the interface is not open for exclusive access.
167.17.5  **Close**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Closes connection to the device.

167.17.6  **ConfigurationValue as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the current configuration value set in the device (the interface will be part of that configuration.)

**Notes:**
The interface does not have to be open to use this function. Lasterror is set.

167.17.7  **Connect as boolean**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Connects to the first device matching product and vendor IDs.

**Notes:** Returns true on success.

167.17.8  **DeviceProduct as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the USB Product ID (idProduct) of the device.

**Notes:**
The device does not have to be open to use this function. Lasterror is set. Returns the actual product ID of the device.

167.17.9  **DeviceReleaseNumber as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Returns the Device Release Number (bcdDevice) of the device.

**Notes:**
The device does not have to be open to use this function. Lasterror is set.
**167.17. DeviceVendor as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the USB Vendor ID (idVendor) of the device.
**Notes:**
The device does not have to be open to use this function.
Lasterror is set. Returns the actual vendor ID of the device.

**167.17.11 InterfaceClass as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the USB Class of the interface.
**Notes:** Lasterror is set.

**167.17.12 InterfaceNumber as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the interface number (zero-based index) of this interface within the current configuration of the device.
**Notes:** Lasterror is set.

**167.17.13 InterfaceProtocol as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the USB Protocol of the interface.
**Notes:** Lasterror is set.

**167.17.14 InterfaceSubClass as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the USB Subclass of the interface.
**Notes:** Lasterror is set.

**167.17.15 LocationID as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Returns the location ID.
Notes:

The location ID is a 32 bit number which is unique among all USB devices in the system, and which will not change on a system reboot unless the topology of the bus itself changes. The interface does not have to be open to use this function. Lasterror is set.

167.17.16  NumEndpoints as Integer

Notes: The interface does not have to be open to use this function. Lasterror is set.

167.17.17  ReadPacket(PipeRef as Integer, MaxSize as Integer = 1024) as Memoryblock

Notes: We developed this function for a client, so it’s probably useless for everyone else.

167.17.18  ReadRaw(PipeRef as Integer, MaxSize as Integer = 1024) as Memoryblock

Notes: Reads up to MaxSize bytes from the given pipe. Pipe is in range 1 to GetNumEndpoints.

167.17.19  ResetPipe(PipeRef as Integer) as boolean

Notes: The interface must be open for the pipe to exist.

pipeRef: Index for the desired pipe (1 - GetNumEndpoints).
Lasterror is set to kIOReturnSuccess if successful, kIOReturnNoDevice if there is no connection to an IOService, or kIOReturnNotOpen if the interface is not open for exclusive access.
167.17.20  **WritePacket(PipeRef as Integer, Data as Memoryblock) as boolean**

**Notes:**  
We developed this function for a client, so it’s probably useless for everyone else. Lasterror is set.  
See also:

- 167.17.21 WritePacket(PipeRef as Integer, Data as string) as boolean

167.17.21  **WritePacket(PipeRef as Integer, Data as string) as boolean**

**Notes:**  
We developed this function for a client, so it’s probably useless for everyone else. Lasterror is set.  
See also:

- 167.17.20 WritePacket(PipeRef as Integer, Data as Memoryblock) as boolean

167.17.22  **WriteRaw(PipeRef as Integer, Data as Memoryblock) as boolean**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes data on a BULK OUT or INTERRUPT OUT pipe.  
**Notes:**  
The interface must be open for the pipe to exist.  
PipeRef: Index for the desired pipe (1 - GetNumEndpoints).  
Data: the buffer of data to send.  
Lasterror is set.  
See also:

- 167.17.23 WriteRaw(PipeRef as Integer, Data as string) as boolean

167.17.23  **WriteRaw(PipeRef as Integer, Data as string) as boolean**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Writes data on a BULK OUT or INTERRUPT OUT pipe.  
**Notes:**  
The interface must be open for the pipe to exist.  
PipeRef: Index for the desired pipe (1 - GetNumEndpoints).
Data: the buffer of data to send.
LastError is set.
See also:

- 167.17.22 WriteRaw(PipeRef as Integer, Data as Memoryblock) as boolean

**167.17.24 Properties**

**167.17.25 completionTimeout as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The completion timeout.
**Notes:**
Specifies a time value in milliseconds. Once the request is queued on the bus, if the entire request is not completed in this amount of time, the request will be aborted and returned.
Default is 1000.
(Read and Write property)

**167.17.26 LastError as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The last error code.
**Notes:**  (Read and Write property)

**167.17.27 noDataTimeout as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The timeout for no data.
**Notes:**
Specifies a time value in milliseconds. Once the request is queued on the bus, if no data is transferred in this amount of time, the request will be aborted and returned.
Default is 1000.
(Read and Write property)

**167.17.28 ProductID as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The product ID for connecting to the device.
167.17.29  **VendorID as Integer**

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** The vendor ID for connecting to the device.
**Notes:** (Read and Write property)

167.17.30  **Constants**

167.17.31  **kIOReturnSuccess = 0**

MBS USB Plugin, Plugin Version: 12.5. **Function:** The error constant for no error.

167.17.32  **kIOUSBConfigNotFound = & he0004056**

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants. **Notes:** Configuration Not found.

167.17.33  **kIOUSBDeviceNotHighSpeed = & he0004049**

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants. **Notes:** The device is not a high speed device, so the EHCI driver returns an error.

167.17.34  **kIOUSBDevicePortWasNotSuspended = & he0004050**

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants. **Notes:** Port was not suspended.

167.17.35  **kIOUSBEndpointNotFound = & he0004057**

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants. **Notes:** Endpoint Not found.
167.17.36  kIOUSBHighSpeedSplitError = & he000404b

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** Error to hub on high speed bus trying to do split transaction.

167.17.37  kIOUSBInterfaceNotFound = & he000404e

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** Interface ref not recognized.

167.17.38  kIOUSBLowLatencyBufferNotPreviouslyAllocated = & he000404d

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** Attempted to use user land low latency isoc calls w/out calling PrepareBuffer (on the data buffer) first.

167.17.39  kIOUSBLowLatencyFrameListNotPreviouslyAllocated = & he000404c

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** Attempted to use user land low latency isoc calls w/out calling PrepareBuffer (on the frame list) first.

167.17.40  kIOUSBNoAsyncPortErr = & he000405f

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** No async port.

167.17.41  kIOUSBNotEnoughPipesErr = & he000405e

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** Not enough pipes in interface.

167.17.42  kIOUSBNotEnoughPowerErr = & he000405d

MBS USB Plugin, Plugin Version: 13.5. **Function:** One of the error constants.  
**Notes:** Not enough power for selected configuration.
167.17. CLASS MACUSBMBS

167.17.43  kIOUSBPipeStalled = & he000404f

MBS USB Plugin, Plugin Version: 13.5. Function: One of the error constants. Notes: Pipe has stalled, error needs to be cleared.

167.17.44  kIOUSBSyncRequestOnWLThread = & he000404a

MBS USB Plugin, Plugin Version: 13.5. Function: One of the error constants. Notes: A synchronous USB request was made on the workloop thread (from a callback?). Only async requests are permitted in that case.

167.17.45  kIOUSBTooManyPipesErr = & he0004060

167.17.46  kIOUSBTransactionReturned = & he0004050

MBS USB Plugin, Plugin Version: 13.5. Function: One of the error constants. Notes: The transaction has been returned to the caller.

167.17.47  kIOUSBTransactionTimeout = & he0004051

167.17.48  kIOUSBUnknownPipeErr = & he0004061

MBS USB Plugin, Plugin Version: 13.5. Function: One of the error constants. Notes: Pipe ref not recognized.
167.18 class MacUSBNotificationMBS

167.18.1 class MacUSBNotificationMBS

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
The class for receiving notifications if an USB device has been attached or removed.
**Notes:**
Please make a subclass so you can put your own code in the events.

Use WinUSBNotificationMBS for Windows.

167.18.2 Methods

167.18.3 Constructor(vendor as Integer = 0, product as Integer = 0)

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Setup the notification system so you are informed about USB devices being attached or removed.
**Example:**

```vba
// look only for device with this vendor/product ID
dim m as new MyMacUSBNotificationMBS(& h5AC, & h263)
```

**Notes:**
You can use vendor and product IDs to limit the class to look only for devices with matching IDs.
Lasterror is set.

167.18.4 GetUSBDeviceInfo(DeviceHandle as Integer, byref Vendor as string, byref Product as string, byref SerialNumber as string, byref Revision as Integer) as boolean

MBS USB Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:**
Queries USB details for a given handle.
**Notes:**
This is a convenience function to query details on the devices found within the events.
Returns true on success.
167.18.5  **QueryBSDName(DeviceHandle as Integer) as string**

MBS USB Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Function to query BSDName of a given device.

**Notes:**
If the device is a disk or USB stick and has been mounted, this would give the bsd name of the disk. Returns "" on any error.

167.18.6  **Release(DeviceHandle as Integer)**

MBS USB Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Releases an object reference when you don’t need it any longer.

**Notes:**
Please call Retain and Release in pairs.
Does nothing if handle is zero or when called on Linux/Windows.

167.18.7  **Retain(DeviceHandle as Integer)**

MBS USB Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: No, Linux: No.  **Function:** Retains an object reference so it is available later.

**Notes:**
Please call Retain and Release in pairs.
Does nothing if handle is zero or when called on Linux/Windows.

167.18.8  **Properties**

167.18.9  **LastError as Integer**

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  **Function:** The last error code.

**Notes:**
Zero is no error while other values are Mac OS error codes.
(Read and Write property)
167.18.10 Events

167.18.11 DeviceAdded(properties as dictionary, NewDevice as boolean, ClassName as string, DeviceName as string, DeviceHandle as Integer)

MBS USB Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called when the device is added.

**Notes:**
You find properties like product and vendor in the dictionary. This event can be called from the constructor for existing devices with NewDevice = false. Later events have NewDevice = true so you see that this is a new device.

DeviceName and ClassName give details on the USB item found. DeviceHandle is the internal object reference which can be used with other helper functions in this class (io_service_t).

167.18.12 DeviceRemoved(properties as dictionary, NewDevice as boolean, ClassName as string, DeviceName as string, DeviceHandle as Integer)

MBS USB Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This event is called when the device is removed.

**Notes:**
You find properties like product and vendor in the dictionary. This event can be called from the constructor for existing devices with NewDevice = false. Later events have NewDevice = true so you see that this is a new device.

DeviceName and ClassName give details on the USB item found. DeviceHandle is the internal object reference which can be used with other helper functions in this class (io_service_t).
167.19. class WinHIDMBS

167.19.1 class WinHIDMBS

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to work with HID devices on Windows.

**Example:**

```vbnet
dim m as new WinHIDMBS
dim s as string

# if not TargetWin32
MsgBox "This example requires Windows."
# endif

if m.FindFirstDevice then

do
ListBox1.AddRow ""

ListBox1.Cell(ListBox1.LastIndex,0)=hex(m.ProductID)
ListBox1.Cell(ListBox1.LastIndex,1)=hex(m.VendorID)
ListBox1.Cell(ListBox1.LastIndex,2)=m.Product
ListBox1.Cell(ListBox1.LastIndex,3)=m.Manufacturer
ListBox1.Cell(ListBox1.LastIndex,4)=m.SerialNumber
ListBox1.Cell(ListBox1.LastIndex,5)=hex(m.VersionNumber)

if left(m.Product,3)="RF1" then // my test device

if m.Connect then
    // write 9 bytes report
    // first byte is report ID plus 8 byte data
    s=chr(0)+"P"+chr(0)+chr(0)+chr(0)+chr(0)+chr(0)+chr(0)+chr(0) + chr(0)
    MsgBox "Send bytes: "+str(m.SendMessage(s))

    do
s=m.ReadMessage(17)
loop until lenb(s)>0 // until we got something
MsgBox midb(s,2) // shows result. First byte is ReportID again

m.Disconnect
end if
end if

loop until not m.FindNextDevice

end if
```
Notes:
For newer development, please use our HIDAPIMBS class.

Updated in version 10.4 of plugins to ignore devices which you don’t have permissions to access them. So you will now see devices with VendorID=0 and ProductID=0.

This class can be used in three different ways. First normal with Connect and ReadMessage/SendMessage. Second with InstallListener and SendMessage/Poll functions. Third low level via GetInputReport and SetOutputReport.

167.19.2 Methods

167.19.3 Close

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Closes the active connection.

167.19.4 Connect as boolean

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Creates a connection to the current device.

**Example:**

```vba
Function OpenUSBDevice() As boolean
    dim i as Integer
    dim h as WinHIDMBS

    h=FindDevice // see FindFirst example

    if h=nil then
        MsgBox "No XYZ device found."
        Return false
    end if

    call h.Connect

    if h.Lasterror<>0 then
        MsgBox "Failed to connect to USB Device."
    end if

    return true
End Function
```
Return false
end if

Return true

End Function

Notes:
Lasterror is set.
Returns true on success and false on failure.

The plugin tries to open a read and a write connection. If both fail, connect returns false. If one is okay, it returns true.

Some devices don’t allow read or write because of missing permissions.

167.19.5 DevicePath as string

MBS USB Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal path used by Windows to identify the device.
**Notes:** Only for debugging.

167.19.6 Disconnect

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Disconnects current USB device.
**Notes:** Lasterror is set.

167.19.7 FindFirstDevice as boolean

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Finds the first device and loads the properties.
**Example:**

```vbnet
Function FindDevice() As MyWinHIDMBS
    dim h as MyWinHIDMBS
    dim p as string

    h=new MyWinHIDMBS 'your own subclass of MacHIDMBS so you can get events
```
if h.FindFirstDevice then

p=h.Product
if p="MyProduct" then
Return h
end if

while h.FindNextDevice

p=h.Product
if p="MyProduct" then
Return h
end if
wend

end if
End Function

Notes:
Returns true on success and false on failure.
On Windows finds only devices which can be opened for Read/Write.

167.19.8 FindNextDevice as boolean

167.19.9 GetInputReport(data as MemoryBlock, Offset as Integer = 0, Length as Integer = 0) as boolean

MBS USB Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Returns an input reports from a top-level collection. Notes: This is very low level. First byte of data block is report ID. If Length is 0, we use size of memoryblock. Returns true on success.
167.19. **CLASS WINHIDMBS**

see also:

167.19.10  **InstallListener(PollSize as Integer) as boolean**

MBS USB Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Installs a second thread which performs Read.  
**Example:**

dim h as new WinHIDMBS

call h.InstallListener 9 // 8 bytes + Report ID

**Notes:**
Use PollString or PollMemory in a timer or a loop to get the data.  
This is an alternative way compared to ReadMessage functions.

167.19.11  **Manufacturer as string**

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The manufacturer name.  
**Notes:**
On any error an empty string is returned.  
Lasterror is set.

167.19.12  **PollMemory as memoryblock**

MBS USB Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a message from the device.  
**Notes:**
A connection must be open and InstallListener must be used.  
Lasterror is set.  
You may want to try this function in a loop or a timer till you get data.
167.19.13 PollString as string

MBS USB Plugin, Plugin Version: 7.8, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Reads a message from the device.

**Example:**
```
dim m as WinHIDMBS // your WinHIDMBS object
dim s as string

do
s=m.PollString
loop until lenb(s)>0 // until we got something
MsgBox midb(s,2) // shows result. First byte is ReportID again
```

**Notes:**
A connection must be open and InstallListener must be used.
Lasterror is set.
You may want to try this function in a loop or a timer till you get data.

167.19.14 Product as string

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The product string of the selected device.

**Notes:**
Lasterror is set.

167.19.15 ProductID as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The product ID of the selected device.

**Notes:**
Lasterror is set.

167.19.16 ReadMessage(length as Integer, timeOut as Integer = 0) as string

MBS USB Plugin, Plugin Version: 13.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Reads a message from the device.

**Example:**
```
dim m as WinHIDMBS
dim s as string
```
do
s=m.ReadMessage(48)
loop until lenb(s)>0 // until we got something
MsgBox midb(s,2) // shows result. First byte is ReportID again

Notes:
Length is the length of the receive buffer you want to use.
The string returned is 0 to length bytes long.
A connection must be open.
LastError is set.
You may want to try this function in a loop till you get data.
Timeout is a timeout value in milliseconds.

167.19.17  ReadMessageMemory(length as Integer, timeOut as Integer = 0) as memoryblock

MBS USB Plugin, Plugin Version: 13.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Reads a message from the device.
Example:

    dim m as WinHIDMBS
    dim s as memoryblock

    do
        s=m.ReadMessageMemory(48)
        loop until s<>nil // until we got something
        MsgBox midb(s,2) // shows result. First byte is ReportID again
    
Notes:
Length is the length of the receive buffer you want to use.
The memoryblock returned has a size of 0 to length bytes.
A connection must be open.
LastError is set.
You may want to try this function in a loop till you get data.
Timeout is a timeout value in milliseconds.

167.19.18  SendMessage(data as string) as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Sends a message to the USB device.
Example:

```vbs
dim m as WinHIDMBS // your hid object
dim s as string
// write 9 bytes report
// first byte is report ID plus 8 byte data
s=chr(0)+"P"+chr(0)+chr(0)+chr(0)+chr(0)+chr(0)+chr(0)+chr(0)
MsgBox "Send bytes: " +str(m.SendMessage(s))
```

Notes:

A connection must be open.
Returns number of bytes sent.

The first byte must be the Report ID which seems to be zero for most devices.

167.19.19  **SendMessageMemory** (data as memoryblock, Offset as Integer = 0, length as Integer = 0) as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends a message to the USB device. **Notes:**

A connection must be open.
Lasterror is set.
Returns number of bytes sent.

While writing a crossplatform application we saw the following thing: The data buffer for the SendMessageMemory call must be 8 bytes long on Mac for our device (with MacHIDMBS) and 61 bytes long for Windows (with WinHIDMBS) for our HID device. We have 1 byte for the ReportID and 60 data bytes where the first 8 are set like on the Mac. So if the calls fail on Windows, try with a higher length and check the WinHIDMBS.OutputReportByteLength property.

The first byte must be the Report ID which seems to be zero for most devices.
If length is zero, we use the length of memoryblock.

167.19.20  **SerialNumber** as string

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The serial number of the current selected device. **Notes:** Lasterror is set.
167.19.21 SetOutputReport(data as MemoryBlock, Offset as Integer = 0, Length as Integer = 0) as boolean

MBS USB Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends an output report.  
**Notes:**  
This is very low level.  
First byte of data block is report ID.  
If Length is 0, we use size of memoryblock.  
Returns true on success.

see also  

167.19.22 VendorID as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The vendor ID of the selected device.  
**Notes:** Lasterror is set.

167.19.23 VersionNumber as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device specific version number.  
**Notes:**  
Value can be anything.  
On any error, 0 is returned.  
Lasterror is set.

167.19.24 Properties

167.19.25 FeatureReportByteLength as Integer

MBS USB Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Maximum length, in bytes, of all the feature reports, including the report identifier, if report identifiers are used, which is added to the beginning of the report data.
CHAPTER 167. USB

167.19.26 HidHandle as Integer

MBS USB Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The handle for the HID device.
**Notes:** (Read and Write property)

167.19.27 InputReportByteLength as Integer

MBS USB Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Maximum size, in bytes, of the input reports, including the report identifier, if report identifiers are used,
which is added to the beginning of the report data.
**Notes:** (Read and Write property)

167.19.28 Lasterror as Integer

MBS USB Plugin, Plugin Version: 7.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Last error code.
**Notes:**
0 is success.
-1 means that the function is not available.
else Windows error codes like 5 for Access Denied.
(Read and Write property)

167.19.29 LasterrorString as String

MBS USB Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code in a formatted and localized string.
**Notes:**
This does not work for plugin error codes.
Like -1 if the function is not available.
(Read only property)
167.19.30  **OutputReportByteLength as Integer**

MBS USB Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Maximum size, in bytes, of all the output reports, including the report identifier, if report identifiers are used, which is added to the beginning of the report data.
**Notes:** (Read and Write property)

167.19.31  **PnPHandle as Integer**

MBS USB Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The handle for Plug and Play.
**Notes:** (Read and Write property)

167.19.32  **ReadHandle as Integer**

MBS USB Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The handle of the stream for reading data from the USB device.
**Notes:** (Read and Write property)

167.19.33  **ThreadHandle as Integer**

MBS USB Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The handle for the thread which waits in the background for new data.
**Notes:** (Read and Write property)

167.19.34  **WriteHandle as Integer**

MBS USB Plugin, Plugin Version: 9.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The handle of the stream for writing data to the USB device.
**Notes:** (Read and Write property)
167.20 class WinUSBDeviceMBS

167.20.1 class WinUSBDeviceMBS

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class to query USB devices.
**Example:**
```vba
    dim devices(-1) as WinUSBDeviceMBS = WinUSBDeviceMBS.Devices

    for each d as WinUSBDeviceMBS in devices
        MsgBox d.Vendor + " - " + d.Product
        next
```

167.20.2 Methods

167.20.3 Devices as WinUSBDeviceMBS()

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Queries a list of all USB Devices.
**Example:**
```vba
    dim devices() as WinUSBDeviceMBS = WinUSBDeviceMBS.devices

    for each d as WinUSBDeviceMBS in devices
        msgbox d.vendor + " " + d.product + " " + d.serialnumber
        next
```

**Notes:** Returns an empty array on errors.

167.20.4 Properties

167.20.5 cdUSB as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The device USB version.
**Notes:**
USB Specification Number which device complies too.

The cdUSB field reports the highest version of USB the device supports. The value is in binary coded
decimal with a format of 0xJJMN where JJ is the major version number, M is the minor version number and N is the sub minor version number. e.g. USB 2.0 is reported as &h0200, USB 1.1 as 0x0110 and USB 1.0 as &h0100.
(Read and Write property)

167.20.6 DescriptorType as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The device descriptor type.
**Notes:**
Device Descriptor (0x01)
(Read and Write property)

167.20.7 DeviceClass as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The device class.
**Notes:**
See constants in MacUSBDeviceMBS class.
Assigned by USB Org
(Read and Write property)

167.20.8 DeviceID as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The device ID.
**Notes:** (Read and Write property)

167.20.9 DeviceProtocol as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The device protocol.
**Notes:**
Assigned by USB Org
(Read and Write property)
167.20.10  DeviceSubClass as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The device sub class.
**Notes:**
See constants in MacUSBDeviceMBS class.
Assigned by USB Org
(Read and Write property)

167.20.11  MaxEP0Size as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Maximum Packet Size for Zero Endpoint.
**Notes:**
Valid Sizes are 8, 16, 32, 64
(Read and Write property)

167.20.12  Product as String

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The product name.
**Notes:** (Read and Write property)

167.20.13  ProductID as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The product ID of the device.
**Notes:** (Read and Write property)

167.20.14  SerialNumber as String

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The serial number of the USB device.
**Example:**
```vbnet
dim devices(-1) as WinUSBDeviceMBS = WinUSBDeviceMBS.Devices
for each d as WinUSBDeviceMBS in devices
    MsgBox d.Vendor+" - " + d.Product+": " + d.SerialNumber
```
167.20. CLASS WINUSBDEVICEMBS

Notes:
Not all vendors save the serial number in the device. (Read and Write property)

167.20.15 Vendor as String

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The vendor name of the USB device. **Notes:** (Read and Write property)

167.20.16 VendorID as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The vendor ID of the USB device. **Notes:** Assigned by USB Org. (Read and Write property)
167.21 class WinUSBInterfaceDescriptionMBS

167.21.1 class WinUSBInterfaceDescriptionMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
This class is used by USB clients to retrieve a USB-defined interface descriptor.

167.21.2 Properties

167.21.3 AlternateSetting as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The index number of the alternate setting of the interface.
**Notes:** (Read and Write property)

167.21.4 DescriptorType as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The descriptor type.
**Notes:**
Descriptor must be set to USB_INTERFACE_DESCRIPTOR_TYPE.
(Read and Write property)

167.21.5 InterfaceClass as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class code of the device that the USB specification group assigned.
**Notes:** (Read and Write property)

167.21.6 InterfaceIndex as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The index of a string descriptor that describes the interface.
**Notes:**
For information about this field, see section 9.6.5 in the "Universal Serial Bus Revision 2.0" specification at USB Technology.
(Read and Write property)
167.21.7 InterfaceNumber as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The index number of the interface.  
**Notes:** (Read and Write property)

167.21.8 InterfaceProtocol as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The protocol code of the device that the USB specification group assigned.  
**Notes:** (Read and Write property)

167.21.9 InterfaceSubClass as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The subclass code of the device that the USB specification group assigned.  
**Notes:** (Read and Write property)

167.21.10 Length as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The length, in bytes, of the descriptor.  
**Notes:** (Read and Write property)

167.21.11 NumEndpoints as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of endpoints that are used by the interface, excluding the default status endpoint.  
**Notes:** (Read and Write property)
167.22 class WinUSBMBS

167.22.1 class WinUSBMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Provides access to any USB device on Windows.

**Notes:**

This class provides functions exposed by Winusb.dll, which user-mode client drivers and applications can use to communicate with USB devices. WinUSB functions require Windows XP or later.

For PipeIDs, please use 1, 2, 3... for output pipe IDs and & h81, & h82, & h83... for input pipes.

167.22.2 Methods

167.22.3 AbortPipe(PipeID as Integer)

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Aborts all of the pending transfers for a pipe. This is a synchronous operation.

**Notes:**

To reset a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

PipeID: The identifier (ID) of the control pipe. The PipeID parameter is an 8-bit value that consists in a 7-bit address and a direction bit. This parameter corresponds to the EndpointAddress field in the endpoint descriptor.

Lasterror is zero on success and false on failure.

167.22.4 Available as boolean

MBS USB Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if winusb.dll has been found and loaded.
167.22. CLASS WINUSBMBS

Notes: Always false on Linux and Mac OS X.

167.22.5 Constructor(path as string)

Notes: Use WindowsDeviceMBS class to find USB devices and their device paths.
Lasterror is set.
On success DeviceHandle and Handle properties are not nil.

When Constructor is called, the policy settings of the interface are reset to the default values. The Constructor call queries the underlying USB stack for various descriptors and allocates enough memory to store the retrieved descriptor data. Constructor first retrieves the device descriptor and then gets the associated configuration descriptor. From the configuration descriptor, the call derives the associated interface descriptors and stores them in an array. The interfaces in the array are identified by zero-based indexes. An index value of 0 indicates the first interface (the default interface), a value of 1 indicates the second associated interface, and so on. Constructor parses the default interface descriptor for the endpoint descriptors and caches information such as the associated pipes or state specific data. The handle received in the InterfaceHandle parameter is a pointer to the memory block allocated for the first interface in the array.

If an application wants to use another interface on the device, it must call GetAssociatedInterface, specify the index of the interface, and retrieve a handle to the memory block allocated for the specified interface.

167.22.6 ControlTransfer(SetupPacket as WinUSBSetupPacketMBS, Buffer as MemoryBlock) as Integer

Notes: To send a control request to the entire device or the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

SetupPacket: The 8-byte setup packet of type WinUSBSetupPacketMBS.
Buffer: A buffer that contains the data to transfer. Can be empty.

Returns the actual number of transferred bytes.
Lasterror property is set.
167.22.7  **ControlTransfer(SetupPacket as WinUSBSsetupPacketMBS, Buffer as String) as Integer**

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Transmits control data over a default control endpoint.

**Notes:**
To send a control request to the entire device or the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

SetupPacket: The 8-byte setup packet of type WinUSBSsetupPacketMBS.
Buffer: A buffer that contains the data to transfer. Can be empty.

Returns the actual number of transferred bytes.
Lastererror property is set.

See also:

- 167.22.6 ControlTransfer(SetupPacket as WinUSBSsetupPacketMBS, Buffer as MemoryBlock) as Integer

167.22.8  **DeviceSpeed as Integer**

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries device speed.

**Notes:**
Lastererror is set.
Use constants LowSpeed, HighSpeed and FullSpeed.

167.22.9  **FlushPipe(PipeID as Integer)**

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Discards any data that is cached in a pipe. This is a synchronous operation.

**Notes:**
To reset a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.
PipeID: The identifier (ID) of the control pipe. The PipeID parameter is an 8-bit value that consists in a 7-bit address and a direction bit. This parameter corresponds to the EndpointAddress field in the endpoint descriptor.

Lasterror is zero on success and false on failure.

167.22.10 GetAssociatedInterface(index as Integer) as WinUSBMBS

**Notes:**  
This is a synchronous operation.

AssociatedInterfaceIndex: An index that specifies the associated interface to retrieve. A value of 0 indicates the first associated interface, a value of 1 indicates the second associated interface, and so on.

Returns new WinUSBMBS object.

The first associated interface is the interface that immediately follows the interface whose handle the WinUsbInitialize routine retrieves.

Callers of GetAssociatedInterface can retrieve only one handle for each interface. If a caller attempts to retrieve more than one handle for the same interface, the routine will fail with an error of ERROR_ALREADY_EXISTS.

167.22.11 QueryInterfaceSettings(index as Integer) as WinUSBInterfaceDescriptionMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the interface descriptor for the specified alternate interface settings for a particular interface handle.  
**Notes:**  
To retrieve the settings of the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

AlternateSettingNumber: A value that indicates which alternate settings to return. A value of 0 indicates the first alternate setting, a value of 1 indicates the second alternate setting, and so on.

Returns WinUSBInterfaceDescriptionMBS object on success or nil on any error.
CHAPTER 167. USB

167.22.12 QueryPipe(AlternateInterfaceNumber as Integer, PipeIndex as Integer) as WinUSBPipeInformationMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves information about the specified endpoint and the associated pipe for an interface. **Notes:**

To query a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

AlternateInterfaceNumber: A value that specifies the alternate interface to return the information for.
PipeIndex: A value that specifies the pipe to return information about. This value is not the same as the bEndpointAddress field in the endpoint descriptor. A PipeIndex value of 0 signifies the first endpoint that is associated with the interface, a value of 1 signifies the second endpoint, and so on. PipeIndex must be less than the value in the NumEndpoints field of the interface descriptor.

Returns pipe information or nil on error. Also sets Lasterror property.

The QueryPipe function does not retrieve information about the control pipe.

Each interface on the USB device can have multiple endpoints. To communicate with each of these endpoints, the bus driver creates pipes for each endpoint on the interface. The pipe indices are zero-based. Therefore for n number of endpoints, the pipes’ indices are set from n-1. WinUsb_QueryPipe parses the configuration descriptor to get the interface specified by the caller. It searches the interface descriptor for the endpoint descriptor associated with the caller-specified pipe. If the endpoint is found, the function populates a WinUSBPipeInformationMBS object with information from the endpoint descriptor.

167.22.13 ReadPipeMemory(PipeID as Integer, BufferLength as Integer) as Memoryblock

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads data from the specified pipe. **Notes:**

To read a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

PipeID: PipeID corresponds to the EndpointAddress field in the endpoint descriptor. For information about the layout of this field, see Table 9-13 in “Universal Serial Bus Specification Revision 2.0” at USB Technology. In the EndpointAddress field, Bit 7 indicates the direction of the endpoint: 0 for OUT; 1 for IN.
BufferLength: The maximum number of bytes to read.
Returns memory block with the data read. This may be shorter than BufferLength. Lasterror is set.

LastError is 0 if the operation succeeds. Otherwise, lasterror has the Windows error code.

If the data returned by the device is greater than a maximum transfer length, WinUSB divides the request into smaller requests of maximum transfer length and submits them serially. If the transfer length is not a multiple of the endpoint’s maximum packet size (retrievable through the WinUSBPipeInformationMBS class's MaximumPacketSize member), WinUSB increases the size of the transfer to the next multiple of MaximumPacketSize.

USB packet size does not factor into the transfer for a read request. If the device responds with a packet that is too large for the client buffer, the behavior of the read request corresponds to the type of policy set on the pipe. If policy type for the pipe is ALLOW_PARTIAL_READS, WinUSB adds the remaining data to the beginning of the next transfer. If ALLOW_PARTIAL_READS is not set, the read request fails. For more information about policy types, see WinUSB Functions for Pipe Policy Modification.

When no data is available in the endpoint (pipe is empty), ReadPipe does not return until there is data in the pipe. If an error condition occurs or the application-specified timeout expires, ReadPipe always returns false. To determine the actual reason for that return value, always check LastError. For example, in these cases the GetLastError error value indicates the actual reason:

- If the application specified a timeout value in the pipe policy and that timeout expires, ReadPipe returns false and LastError is ERROR_SEM_TIMEOUT.
- If an error condition occurs while reading data from the pipe, ReadPipe returns false and LastError is ERROR_GEN_FAILURE.

### 167.22.14 ReadPipePacket(PipeID as Integer, MaxSize as Integer = 1024) as Memoryblock

MBS USB Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a data packet. **Notes:** We developed this function for a client, so it’s probably useless for everyone else.

### 167.22.15 ReadPipeString(PipeID as Integer, BufferLength as Integer) as string

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads data from the specified pipe. **Notes:** To read a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.
PipeID: PipeID corresponds to the EndpointAddress field in the endpoint descriptor. For information about the layout of this field, see Table 9-13 in “Universal Serial Bus Specification Revision 2.0” at USB Technology. In the EndpointAddress field, Bit 7 indicates the direction of the endpoint: 0 for OUT; 1 for IN.

BufferLength: The maximum number of bytes to read.

Returns string with the data read. This may be shorter than BufferLength. Lasterror is set.

Lasterror is 0 if the operation succeeds. Otherwise, lasterror has the Windows error code.

If the data returned by the device is greater than a maximum transfer length, WinUSB divides the request into smaller requests of maximum transfer length and submits them serially. If the transfer length is not a multiple of the endpoint’s maximum packet size (retrievable through the WinUSBPipeInformationMBS class’s MaximumPacketSize member), WinUSB increases the size of the transfer to the next multiple of MaximumPacketSize.

USB packet size does not factor into the transfer for a read request. If the device responds with a packet that is too large for the client buffer, the behavior of the read request corresponds to the type of policy set on the pipe. If policy type for the pipe is ALLOW_PARTIAL_READS, WinUSB adds the remaining data to the beginning of the next transfer. If ALLOW_PARTIAL_READS is not set, the read request fails. For more information about policy types, see WinUSB Functions for Pipe Policy Modification.

When no data is available in the endpoint (pipe is empty), ReadPipe does not return until there is data in the pipe. If an error condition occurs or the application-specified timeout expires, ReadPipe always returns false. To determine the actual reason for that return value, always check LastError. For example, in these cases the GetLastError error value indicates the actual reason:
- If the application specified a timeout value in the pipe policy and that timeout expires, ReadPipe returns false and LastError is ERROR_SEM_TIMEOUT.
- If an error condition occurs while reading data from the pipe, ReadPipe returns false and LastError is ERROR_GEN_FAILURE.

167.22.16 ResetPipe(PipeID as Integer)

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Resets the data toggle and clears the stall condition on a pipe.

**Notes:**

To reset a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

PipeID: The identifier (ID) of the control pipe. The PipeID parameter is an 8-bit value that consists in a 7-bit address and a direction bit. This parameter corresponds to the EndpointAddress field in the endpoint
Lasterror is zero on success and false on failure.

167.22.17 WritePipe(PipeID as Integer, Buffer as MemoryBlock) as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes data to a pipe.

**Notes:**

To write to a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

PipeID: PipeID corresponds to the EndpointAddress field in the endpoint descriptor. For information about the layout of this field, see Table 9-13 in “Universal Serial Bus Specification Revision 2.0” at USB Technology. In the bEndpointAddress field, Bit 7 indicates the direction of the endpoint: 0 for OUT; 1 for IN.

Buffer: A buffer that contains the data to write.

Returns the actual number of bytes that were written to the pipe.

Lasterror is set. Zero for success.

To create a write request, your the application must allocate a buffer, fill it with the data that you want to write to the device, and send the buffer to the host controller by calling WritePipe.

The following restrictions apply to the size of the buffer if RAW_IO is set:

- The buffer length must be a multiple of the maximum endpoint packet size.
- The length must be less than or equal to the value of MAXIMUM_TRANSFER_SIZE retrieved by GetPipePolicy.

There are no restrictions on the size of the buffer if RAW_IO is not set as the pipe’s policy type. If the size of the buffer is greater than the maximum transfer length reported by MAXIMUM_TRANSFER_SIZE, WinUSB divides the request into smaller requests and submits them serially to the host controller.

A write request that contains zero-length data is forwarded down the USB stack.

See also:

- 167.22.18 WritePipe(PipeID as Integer, Buffer as String) as Integer

167.22.18 WritePipe(PipeID as Integer, Buffer as String) as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes data to a pipe.
Notes:

To write to a pipe associated with an endpoint in the first interface, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.

PipeID: PipeID corresponds to the EndpointAddress field in the endpoint descriptor. For information about the layout of this field, see Table 9-13 in "Universal Serial Bus Specification Revision 2.0" at USB Technology. In the bEndpointAddress field, Bit 7 indicates the direction of the endpoint: 0 for OUT; 1 for IN.

Buffer: A buffer that contains the data to write.

Returns the actual number of bytes that were written to the pipe. Lasterror is set. Zero for success.

To create a write request, your the application must allocate a buffer, fill it with the data that you want to write to the device, and send the buffer to the host controller by calling WritePipe.

The following restrictions apply to the size of the buffer if RAW_IO is set:

- The buffer length must be a multiple of the maximum endpoint packet size.
- The length must be less than or equal to the value of MAXIMUM_TRANSFER_SIZE retrieved by GetPipePolicy.

There are no restrictions on the size of the buffer if RAW_IO is not set as the pipe’s policy type. If the size of the buffer is greater than the maximum transfer length reported by MAXIMUM_TRANSFER_SIZE, WinUSB divides the request into smaller requests and submits them serially to the host controller. A write request that contains zero-length data is forwarded down the USB stack.

167.22. **CLASS WINUSBMBS**

### 167.22.20 WritePipePacket(PipeID as Integer, Buffer as String) as Integer

**Notes:** We developed this function for a client, so it’s probably useless for everyone else.  
See also:

- 167.22.19 WritePipePacket(PipeID as Integer, Buffer as MemoryBlock) as Integer

### 167.22.21 Properties

#### 167.22.22 DeviceHandle as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal handle to the device.  
**Notes:** (Read and Write property)

#### 167.22.23 Lasterror as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.  
**Notes:** (Read and Write property)

#### 167.22.24 LasterrorMessage as String

MBS USB Plugin, Plugin Version: 16.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error message.  
**Notes:** (Read and Write property)

#### 167.22.25 Parent as WinUSBMBS

**Notes:** Objects created with GetAssociatedInterface have here the parent object, so you can go back to main interface.  
(Read and Write property)
167.22.26 Tag as Variant

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The attached value.  
**Notes:**  
You can use this property as you like.  
(Read and Write property)

167.22.27 USBHandle as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal handle to the USB device.  
**Notes:** (Read and Write property)

167.22.28 CurrentAlternateSetting as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current alternate interface setting for an interface.  
**Notes:**  
To get the current alternate setting in the first (default) interface on the device, use the WinUSBMBS object created with constructor. For all other interfaces, use the WinUSBMBS objects to the target interface, retrieved by GetAssociatedInterface.  
Lasterror is set. You can set and get the value.  
(Read and Write computed property)

167.22.29 PipePolicyAllowPartialReads(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to allow partial reads.  
**Notes:**  
The default value is true. To disable set to false.  
Disabling AllowPartialReads causes the read requests to fail whenever the device returns more data (on bulk and interrupt IN endpoints) than the caller requested.  
Enabling AllowPartialReads causes WinUSB to save or discard the extra data when the device returns more data (on bulk and interrupt IN endpoints) than the caller requested. This behavior is defined by setting the auto flush value.  
Lasterror is set.
167.22.30  PipePolicyAutoClearStall(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether WinUSB resets the pipe in order to automatically clear the stall condition.  
**Notes:**  
Data continues to flow on the bulk and interrupt IN endpoints again as soon as a new or a queued transfer arrives on the endpoint. This policy parameter does not affect control pipes. Disabling AutoClearStall causes all transfers (that arrive to the endpoint after the stalled transfer) to fail until the caller manually resets the endpoint’s pipe by calling ResetPipe.  
LastError is set.  
(Read and Write computed property)

167.22.31  PipePolicyAutoFlush(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to use auto flush.  
**Notes:**  
The default value is false (zero). To enable auto flush set to true. auto flush must be used with AllowPartialReads enabled. If AllowPartialReads is TRUE, the value of auto flush determines the action taken by WinUSB when the device returns more data than the caller requested. Disabling AllowPartialReads causes WinUSB to ignore the auto flush value. Disabling auto flush with AllowPartialReads enabled causes WinUSB to save the extra data, add the data to the beginning of the caller’s next read request, and send it to the caller in the next read operation. Enabling auto flush with AllowPartialReads enabled causes WinUSB to discard the extra data remaining from the read request.  
LastError is set.  
(Read and Write computed property)

167.22.32  PipePolicyIgnoreShortPackets(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Enabling IgnoreShortPackets causes the host controller to not complete a read operation after it receives a short packet.  
**Notes:**  
Instead, the host controller completes the operation only after the host has read the specified number of bytes. Disabling IgnoreShortPackets causes the host controller to complete a read operation when either the host has read the specified number of bytes or the host has received a short packet.
The default value is false. To enable set to true. Lasterror is set.
(Read and Write computed property)

167.22.33 PipePolicyMaximumTransferSize(PipeID as Integer) as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Gets the maximum size of a USB transfer supported by WinUSB.
Notes:
This is a read-only policy.
Lasterror is set.
(Read and Write computed property)

167.22.34 PipePolicyPipeTransferTimeout(PipeID as Integer) as UInt32

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Specifies the time-out interval.
Notes:
The default value is zero.
The PipeTransferTimeout value specifies the time-out interval, in milliseconds. The host controller cancels
transfers that do not complete within the specified time-out interval.
A value of zero (default) indicates that transfers do not time out because the host controller never cancels
the transfer.
Lasterror is set.
(Read and Write computed property)

167.22.35 PipePolicyRawIO(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Whether to use Raw IO.
Notes:
The default value is false.
Enabling raw IO causes WinUSB to send data directly to the USB driver stack, bypassing WinUSB’s queuing
and error handling mechanism.
The buffers that are passed to ReadPipe must be configured by the caller as follows:

- The buffer length must be a multiple of the maximum endpoint packet size.
- The length must be less than or equal to the value of PipePolicyMaximumTransferSize.
Disabling raw IO (false) does not impose any restriction on the buffers that are passed to ReadPipe. Lasterror is set. (Read and Write computed property)

167.22.36   PipePolicyResetPipeOnResume(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to reset pipe on resume. **Notes:** True indicates that on resume from suspend, WinUSB resets the endpoint before it allows the caller to send new requests to the endpoint. Lasterror is set. (Read and Write computed property)

167.22.37   PipePolicyShortPacketTerminate(PipeID as Integer) as boolean

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the driver sends a zero-length packet at the end of every write request to the host controller. **Notes:** Lasterror is set. (Read and Write computed property)

167.22.38   Constants

167.22.39   AutoSuspend = & h81

MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the power policy type constants.

167.22.40   FullSpeed = 2

MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the Device Speed Constants **Notes:** Full Speed
167.22.41  HighSpeed = 3
MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the Device Speed Constants  
**Notes:** High Speed

167.22.42  LowSpeed = 1
MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the Device Speed Constants  
**Notes:** Low Speed

167.22.43  SuspendDelay = & h83
MBS USB Plugin, Plugin Version: 12.2. **Function:** One of the power policy type constants.
167.23. **CLASS WINUSBNOTIFICATIONMBS**

167.23. class **WinUSBNotificationMBS**

167.23.1 class **WinUSBNotificationMBS**

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for getting notifications about USB devices being connected or removed. **Notes:** Use MacUSBNotificationMBS for Mac OS X.

167.23.2 Methods

167.23.3 Constructor

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor initializes the notification engine. **Notes:** On success WindowHandle and NotifyHandle is not zero.

167.23.4 Properties

167.23.5 NotifyHandle as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Internal handle to the notification system. **Notes:** (Read and Write property)

167.23.6 WindowHandle as Integer

MBS USB Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Internal handle to the dummy window for receiving notification. **Notes:** (Read only property)

167.23.7 Events

167.23.8 DeviceAdded(Name as string)

MBS USB Plugin, Plugin Version: 11.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** This event is called when a device has been attached. **Notes:**
Name is typically for an USB device: \\?\USB# Vid_05ac& Pid_8403# 00000009833# { a5dcbf10-6530-11d2-901f-00c04fb951ed } ".
That means you can get Vendor ID and Product ID from this string. Also the unique ID and finally the class GUID.

167.23.9 DeviceRemoved(Name as string)

MBS USB Plugin, Plugin Version: 11.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: This event is called when a device has been removed.
Notes: Name is typically for an USB device: \\?\USB# Vid_05ac& Pid_8403# 00000009833# { a5dcbf10-6530-11d2-901f-00c04fb951ed } ".
That means you can get Vendor ID and Product ID from this string. Also the unique ID and finally the class GUID.
167.24 class WinUSBPipeInformationMBS

167.24.1 class WinUSBPipeInformationMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for pipe details.

167.24.2 Properties

167.24.3 Interval as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The pipe interval.
**Notes:** (Read and Write property)

167.24.4 MaximumPacketSize as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The maximum size, in bytes, of the packets that are transmitted on the pipe.
**Notes:** (Read and Write property)

167.24.5 PipeId as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The pipe identifier (ID).
**Notes:** (Read and Write property)

167.24.6 PipeType as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The pipe type.
**Notes:** (Read and Write property)
167.24.7 Constants

167.24.8 UsbdPipeTypeBulk = 2
MBS USB Plugin, Plugin Version: 12.2. **Function**: One of the pipe type constants. **Notes**: Indicates that the pipe is a bulk transfer pipe.

167.24.9 UsbdPipeTypeControl = 0
MBS USB Plugin, Plugin Version: 12.2. **Function**: One of the pipe type constants. **Notes**: Indicates that the pipe is a control pipe.

167.24.10 UsbdPipeTypeInterrupt = 3
MBS USB Plugin, Plugin Version: 12.2. **Function**: One of the pipe type constants. **Notes**: Indicates that the pipe is an interrupt pipe.

167.24.11 UsbdPipeTypeIsochronous = 1
MBS USB Plugin, Plugin Version: 12.2. **Function**: One of the pipe type constants. **Notes**: Indicates that the pipe is an isochronous transfer pipe.
167.25 class WinUSBSetupPacketMBS

167.25.1 class WinUSBSetupPacketMBS

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The metadata needed to create an USB packet.

167.25.2 Properties

167.25.3 Index as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The meaning of this member varies according to the request.
**Notes:**
For an explanation of this member, see the Universal Serial Bus (USB) specification.
(Read and Write property)

167.25.4 Length as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The number of bytes to transfer.
**Notes:** (Read and Write property)

167.25.5 Request as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The device request.
**Notes:**
The values that are assigned to this member are defined in Table 9.3 of section 9.4 of the Universal Serial Bus (USB) specification.
(Read and Write property)

167.25.6 RequestType as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The request type.
**Notes:**
The values that are assigned to this member are defined in Table 9.2 of section 9.3 of the Universal Serial Bus (USB) specification (www.usb.org).

(Read and Write property)

167.25.7  Value as Integer

MBS USB Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The meaning of this member varies according to the request.

**Notes:**

For an explanation of this member, see the Universal Serial Bus (USB) specification.

(Read and Write property)
Chapter 168

User Notifications

168.1 class NSUserNotificationActionMBS

168.1.1 class NSUserNotificationActionMBS

Function: An action shown to the user as part of a NSUserNotification in the additionalActions property.
Notes: Available on Mac OS X 10.10 and newer.

168.1.2 Methods

168.1.3 Available as boolean

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.10 or newer. False in all other cases.

168.1.4 Constructor(identifier as string, title as string)

Function: The constructor.
168.1.5  copy as NSUserNotificationActionMBS

Function: Creates a copy of this object.

168.1.6  Properties

168.1.7  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

168.1.8  Identifier as String

Function: The internal identifier for this action.
Notes: (Read only property)

168.1.9  Title as String

Function: The localized title of the action.
Notes: (Read only property)
168.2. CLASS NSUSERNOTIFICATIONCENTERDELEGATEMBS

168.2 class NSUserNotificationCenterDelegateMBS

168.2.1 class NSUserNotificationCenterDelegateMBS

Function: This class allows you to react to events from the user notification center.
Notes: This is for sending user notifications to the Mac your Real Studio application runs on. Not for remote notifications or notifications to iOS devices.

168.2.2 Methods

168.2.3 Constructor

Function: The constructor.
Notes: Must be called to have the class register itself.

168.2.4 Destructor

Function: The destructor.

168.2.5 Properties

168.2.6 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

168.2.7 Events

168.2.8 didActivateNotification(center as NSUserNotificationCenterMBS, notification as NSUserNotificationMBS)

Function: Sent to the delegate when a user clicks on a user notification presented by the user notification
center.

**Example:**

```vbscript
Sub applicationDidFinishLaunching(Notification as NSNotificationMBS)
    dim userInfo as Dictionary = Notification.userInfo
    dim key as string = NSApplicationMBS.NSApplicationLaunchUserNotificationKey
    dim UserNotification as NSUserNotificationMBS = userInfo.Lookup(key, nil)

    if UserNotification <> nil then
        MsgBox UserNotification.identifier + ": " + UserNotification.informativeText
    end if
End Sub
```

**Notes:**

- center: The user notification center.
- notification: The user notification object.

This would be a good time to take action in response to user interacting with a specific notification.

To take an action when your application is launched as a result of a user clicking on a notification, be sure to implement the `applicationDidFinishLaunching` method in the application class that implements the `NSApplicationDelegateMBS` class. The notification parameter to that method has a `userInfo` dictionary, and if that dictionary has the `NSApplicationLaunchUserNotificationKey` key. The value of that key is the `NSUserNotification` object that caused the application to launch. The `NSUserNotification` object is delivered to the `NSApplication` delegate because that message will be sent before your application has a chance to set a delegate for the `NSUserNotificationCenter`.

Available in OS X v10.8 and later.

### 168.2.9 `didDeliverNotification(center as NSUserNotificationCenterMBS, notification as NSUserNotificationMBS)`

**Function:** Sent to the delegate when a notification delivery date has arrived.

**Notes:**

- center: The user notification center.
- notification: The user notification object.

This method is always called, regardless of your application state and even if you deliver the user notification yourself using `deliverNotification:`.
This event is invoked before the `shouldPresentNotification` event. Available in OS X v10.8 and later.

168.2.10 `shouldPresentNotification(center as NSUserNotificationCenterMBS, notification as NSUserNotificationMBS) as boolean`

**Function:** Sent to the delegate when the user notification center has decided not to present your notification.

**Notes:**
- `center`: The user notification center.
- `notification`: The user notification object.

Return true if the user notification should be displayed regardless; false otherwise. Available in OS X v10.8 and later.
168.3  class NSUserNotificationCenterMBS

168.3.1  class NSUserNotificationCenterMBS

**Function:** The NSUserNotificationCenterMBS class delivers user notifications to the user from applications or helper applications.

**Example:**

```vbnet
dim u as new NSUserNotificationMBS
u.Title = "Hello World"
u.subtitle = "from Real Studio."
u.informativeText = "Our first Notification from Real Studio."

dim d as new date
d.Second = d.Second + 10
u.deliveryDate = d

dim c as new NSUserNotificationCenterMBS
 c.scheduleNotification u
```

**Notes:**

When a user notifications is delivery date has been reached, or it is manually delivered, the notification center it may display the notification to the user. The user notification center reserves the right to decide if a delivered user notification is presented to the user. For example, it may suppress the notification if the application is already frontmost (the delegate can override this action). The application can check the result of this decision by examining the presented property of a delivered user notification.

NSUserNotificationMBS instances the NSUserNotificationCenterMBS are tracking will be in one of two states: scheduled or delivered. A scheduled user notification has a deliveryDate. On that delivery date, the notification will move from being scheduled to being delivered. Note that the user notification may be displayed later than the delivery date depending on a number of factors.

A delivered user notification has an actualDeliveryDate. That is the date when it moved from being scheduled to delivered, or when it was manually delivered using the deliverNotification method.

The application and the user notification center are both ultimately subject to the user’s preferences. If the user decides to hide all alerts from your application, the presented property will still behave as above, but the user will not see any animation or hear any sound.

The NSUserNotificationCenterDelegateMBS class provides more information about the delivered user notification and allows forcing the display of a user notification even if the application is frontmost.
Note: It the user wakes more than 15 minutes after a scheduled notification is scheduled to fire, it is discarded. If the notification repeats with an interval less than 15 minutes, then it expires in 1 minute. Expired notifications are just discarded, unless they repeat, in which case, they stay in the scheduled list and just fire again later.

Important Many of the NSUserNotificationCenterMBS class's methods involve talking to a server process, so calling them repeatedly can have a negative effect on performance.

This is for sending user notifications to the Mac your Real Studio application runs on. Not for remote notifications or notifications to iOS devices.

The NSUserNotificationCenterMBS class and the NSUserNotificationMBS class are both thread safe.

### 168.3.2 Methods

#### 168.3.3 Available as boolean

Function: Whether user notification framework is available.

Notes: Returns true on Mac OS X 10.8 and false otherwise.

#### 168.3.4 Constructor

Function: The constructor.

Notes: Initializes this object to point to the default user notification center.

Available in OS X v10.8 and later.

#### 168.3.5 defaultUserNotificationCenter as NSUserNotificationCenterMBS

Function: Returns the default user notification center.

Notes: Available in OS X v10.8 and later.
CHAPTER 168. USER NOTIFICATIONS

168.3.6 deliveredNotifications as NSUserNotificationCenterMBS()

Function: An array of all user notifications delivered to the notification center.

Notes:

The number of notifications the user actually sees in the user interface may be less than the size of this array.

Note that these may or may not have been actually presented to the user. See the presented property in the NSUserNotificationCenterMBS class.

Note: A scheduled user notification that specifies a deliveryRepeatInterval remains in the scheduledNotifications list, even though it has been delivered. The item that goes into the deliveredNotifications list is a copy of the user notification item.

Available in OS X v10.8 and later.

168.3.7 deliverNotification(notification as NSUserNotificationCenterMBS)

Function: Deliver the specified user notification.

Example:

dim u as new NSUserNotificationCenterMBS

u.Title = "Hello World"
u.subtitle = "just a test"

dim c as new NSUserNotificationCenterMBS
c.deliverNotification u

Notes:

notification: The user notification.

The notification will be presented to the user (subject to the user’s preferences). The presented property of the NSUserNotificationCenter object will always be set to true if a notification is delivered using this method.

Available in OS X v10.8 and later.
### 168.3.8 removeAllDeliveredNotifications

**Function:** Remove all delivered user notifications from the user notification center.  
**Notes:** Available in OS X v10.8 and later.

### 168.3.9 removeDeliveredNotification(notification as NSUserNotificationMBS)

**Function:** Remove a delivered user notification from the user notification center.  
**Notes:**  
notification: The user notification.  
If the user notification is not in deliveredNotifications, nothing happens.  
Available in OS X v10.8 and later.

### 168.3.10 removeScheduledNotification(notification as NSUserNotificationMBS)

**Function:** Removes the specified user notification for the scheduled notifications.  
**Notes:**  
notification: The user notification.  
If the user notification’s deliveryDate occurs before the cancellation finishes, the notification may still be delivered.  
If the notification is not in the scheduled list, nothing happens.  
Available in OS X v10.8 and later.

### 168.3.11 scheduledNotifications as NSUserNotificationMBS()

**Function:** Specifies an array of scheduled user notifications that have not yet been delivered.  
**Notes:**  
Newly scheduled notifications are added to the end of the array. You may also bulk-schedule notifications by setting this array. Bulk setting new scheduled notifications unschedules existing notifications.
Note: The scheduled user notification could be changing to a delivered notification at the time you are calling this method. and if that case the user notification will still be delivered.

Available in OS X v10.8 and later.

168.3.12 scheduleNotification(notification as NSUserNotificationMBS)

Function: Schedules the specified user notification.
Notes:
notification: The user notification.

Scheduled notifications are added to the end of the notification queue.
Available in OS X v10.8 and later.

168.3.13 Properties

168.3.14 Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)
168.4.1 class NSUserNotificationCenterMBS

**Function:** The NSUserNotificationCenterMBS class is used to configure a notification that is scheduled for display by the NSUserNotificationCenterMBS class.  

**Example:**

```vbnet
dim u as new NSUserNotificationCenterMBS

u.Title = "Hello World"
u.subtitle = "from Real Studio."
u.informativeText = "Our first Notification from Real Studio."

dim d as new date
d.Second = d.Second + 10
u.deliveryDate = d

dim c as new NSUserNotificationCenterMBS
c.scheduleNotification u
```

**Notes:**

The NSUserNotificationCenterMBS object not only configures the notification, when the notification is delivered information about when the notification was actually presented to the user (if at all) and other details are provided in the notification object. User applications can create NSUserNotification objects and register them with the NSUserNotificationCenterMBS object to notify the user when an application requires attention.

See NSUserNotificationCenterMBS Class Reference for more information.

**Threading Information**  
The NSUserNotificationCenterMBS class and the NSUserNotificationCenterMBS class are both thread safe.

This is for sending user notifications to the Mac your Real Studio application runs on. Not for remote notifications or notifications to iOS devices.
168.4.2 Methods

168.4.3 additionalActions as NSUserNotificationActionMBS()

Function: Queries the array of additional actions.
Notes:
For Mac OS X 10.10 and newer. Will not cause exception if called on older versions, but simply return empty array.

An array of NSUserNotificationActionMBS objects that describe the different actions that can be taken on a notification in addition to the default action described by actionButtonTitle.

168.4.4 Available as boolean

Function: Whether this class is available.
Notes:
Returns true on Mac OS X 10.8 and newer.
Returns false on other operation systems, e.g. older OS X, Windows or Linux.

168.4.5 Constructor

Function: The constructor to create a new notification.

168.4.6 copy as NSUserNotificationMBS

Function: Creates a clone of the notification object.

168.4.7 NSUserNotificationDefaultSoundName as string

Function: The default sound played by the user notification center for this notification.
Notes:
The default notification sound.
Available in OS X v10.8 and later.

168.4.8 Print

Function: Prints description of notification object to console for debugging.

168.4.9 setAdditionalActions(additionalActions() as NSUserNotificationActionMBS)

Function: Sets the array of additional actions.
Notes:
For Mac OS X 10.10 and newer. Will not cause exception if called on older versions.
An array of NSUserNotificationActionMBS objects that describe the different actions that can be taken on a notification in addition to the default action described by actionButtonTitle.

168.4.10 Properties

168.4.11 actionButtonTitle as string

Function: Specifies the title of the action button displayed in the notification.
Notes:
This value should localized as it will be presented to the user. The string will be truncated to a length appropriate for display and the property will be modified to reflect the truncation.
Available in OS X v10.8 and later.
(Read and Write property)

168.4.12 activationType as Integer

Function: Specifies what caused a user notification to occur.
Notes:
This property specifies why the user notification was sent to the NSUserNotificationCenterDelegateMBS didActivateNotification event. The supported values are described in constants.

Available in OS X v10.8 and later.
(Read only property)

### 168.4.13 actualDeliveryDate as date

**Function:** The date this notification was actually delivered.
**Notes:**
The notification center will set this value if a notification is put in the scheduled list and the delivery time arrives.

If the notification is delivered directly using the deliverNotification: method of the NSUserNotificationCenterMBS class, this value will be set to the deliveryDate value. If the deliveryDate value nil this value is set to the current date.

This value is used to sort the list of notifications in the user interface.

Available in OS X v10.8 and later.
(Read only property)

### 168.4.14 additionalActivationAction as NSUserNotificationActionMBS

**Function:** Queries which additional action was selected.
**Notes:**
For Mac OS X 10.10 and newer. Will not cause exception if called on older versions, but always return nil.

When a user selects an additional action that action will be set on the notification’s additionalActivationAction property when passed into the delegate event didActivateNotification.
(Read only property)

### 168.4.15 contentImage as NSImageMBS

**Function:** Image shown in the content of the notification.
168.4.16  deliveryDate as date

Function: Specifies when the notification should be delivered.
Notes:
The delivery date is specified in an absolute time.
After a notification is delivered, it may be presented to the user.
Available in OS X v10.8 and later.
(Read and Write property)

168.4.17  deliveryRepeatInterval as NSDateComponentsMBS

Function: Specifies the date components that control how often a user notification is repeated.
Notes:
This value may be nil if the notification should not repeat.

The date component values are relative to the date the notification was delivered.

If the calendar value of the deliveryRepeatInterval is nil, the current calendar will be used to calculate the repeat interval. For example, if a notification should repeat every hour, set the hour property of the deliveryRepeatInterval to 1.

This value is ignored unless the user notification is scheduled with the NSUserNotificationCenterMBS object. Available in OS X v10.8 and later.
(Read and Write property)

168.4.18  deliveryTimeZone as NSTimeZoneMBS

Function: Specify the time zone to interpret the delivery date in.
Notes:
If this value is nil and the user switches time zones, the notification center will adjust the time of presentation to account for the time zone change.
If a notification should be delivered at a time in a specific time zone (regardless of whether the user switches time zones), set this value to the specific time zone, for example the current time zone.

Available in OS X v10.8 and later.
(Read and Write property)

168.4.19  description as string

Function: Description of notification object for debugging.
Notes: (Read only property)

168.4.20  Handle as Integer

Function: The internal object reference.
Notes: (Read and Write property)

168.4.21  hasActionButton as boolean

Function: Specifies whether the notification displays an action button.
Notes: Set to false if the notification has no action button. This will be the case for notifications that are purely for informational purposes and have no user action.

The default value is true.

Available in OS X v10.8 and later.
(Read and Write property)

168.4.22  hasReplyButton as boolean

Function: Set to true if the notification has a reply button.
Notes:
The default value is false. If both this and hasActionButton are true, the reply button will be shown. (Read and Write property)

168.4.23 identifier as string

Function: This identifier is used to uniquely identify a notification.
Notes:
A notification delivered with the same identifier as an existing notification will replace that notification, rather then display a new one.

Available in OS X 10.9 and newer. (Read and Write property)

168.4.24 informativeText as string

Function: The body text of the notification.
Notes:
This value should localized as it will be presented to the user. The string will be truncated to a length appropriate for display and the property will be modified to reflect the truncation.
Available in OS X v10.8 and later.
(Read and Write property)

168.4.25 otherButtonTitle as string

Function: Specifies a custom title for the close button in an alert-style notification.
Notes:
This value should localized as it will be presented to the user. The string will be truncated to a length appropriate for display and the property will be modified to reflect the truncation.
An empty string will cause the default localized text to be used.

Available in OS X v10.8 and later.
(Read and Write property)
168.4.26 Presented as boolean

Function: Specifies whether the user notification has been presented.
Notes:
In some cases, for example when your application is frontmost, the notification center may decide not to actually present a delivered notification. In that case, the value of this property will be false. It will be set to true if the notification was presented according to user preferences.

Available in OS X v10.8 and later.
(Read only property)

168.4.27 remote as boolean

Function: Specifies whether the remote was generated by a push notification.
Notes:
If this property is true then the user notification was generated by a push notification (that is, remotely); if false it was generated locally.
Available in OS X v10.8 and later.
(Read only property)

168.4.28 response as NSAttributedStringMBS

Function: The response text.
Notes:
When a notification has been responded to, the NSUserNotificationCenter event didActivateNotification will be called with the notification with the activationType set to NSUserNotificationCenterActivationTypeReplied and the response set on the response property.
(Read only property)

168.4.29 responsePlaceholder as string

Function: Optional placeholder for inline reply field.
Notes: (Read and Write property)
168.4.30 soundName as string

**Function:** Specifies the name of the sound to play when the notification is delivered.
**Notes:**
Passing the NSUserNotificationCenterDefaultSoundName constant causes the default notification center sound to be played.
A value of nil means no sound is played.
Available in OS X v10.8 and later.
(Read and Write property)

168.4.31 subtitle as string

**Function:** Specifies the subtitle of the notification.
**Notes:**
This value should localized as it will be presented to the user. The string will be truncated to a length appropriate for display and the property will be modified to reflect the truncation.
Available in OS X v10.8 and later.
(Read and Write property)

168.4.32 title as string

**Function:** Specifies the title of the notification.
**Notes:**
This value should localized as it will be presented to the user. The string will be truncated to a length appropriate for display and the property will be modified to reflect the truncation.
Available in OS X v10.8 and later.
(Read and Write property)

168.4.33 userInfo as dictionary

**Function:** Application-specific user info that can be attached to the notification.
**Example:**
```
dim u as new NSUserNotificationMBS
dim d as new dictionary
d.value("Key") = "Value"
```
CHAPTER 168. USER NOTIFICATIONS

19840

u.userinfo = d

Notes:
All items must be property list types or an exception will be thrown.
The userInfo content must be of reasonable serialized size (less than 1k) or an exception will be thrown.
Available in OS X v10.8 and later.
(Read and Write property)

168.4.34 Constants

168.4.35 NSUserNotificationCenterActivationTypeActionButtonClicked = 2

MBS MacFrameworks Plugin, Plugin Version: 12.3. Function: One of the activation type constants.
Notes:
The user clicked on the action button of the notification alert.
Available in OS X v10.8 and later.

168.4.36 NSUserNotificationCenterActivationTypeAdditionalActionClicked = 4

MBS MacFrameworks Plugin, Plugin Version: 14.3. Function: One of the activation type constants.
Notes:
The user did select an additional action.
Only for Mac OS X 10.10 and newer.

168.4.37 NSUserNotificationCenterActivationTypeContentsClicked = 1

MBS MacFrameworks Plugin, Plugin Version: 12.3. Function: One of the activation type constants.
Notes:
The user clicked on the contents of the notification alert.
Available in OS X v10.8 and later.

168.4.38 NSUserNotificationCenterActivationTypeNone = 0

MBS MacFrameworks Plugin, Plugin Version: 12.3. Function: One of the activation type constants.
Notes:
The user did not interact with the notification alert.
Available in OS X v10.8 and later.

168.4.39  NSUserNotificationCenterActivationTypeReplied = 3

MBS MacFrameworks Plugin, Plugin Version: 13.5. **Function:** The activation type for a notification which got a reply.
168.5 class WinUserNotificationCenterMBS

168.5.1 class WinUserNotificationCenterMBS

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for the window notification center.

168.5.2 Methods

168.5.3 Available as Boolean

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether this Windows version has required functions.
**Notes:** Returns true on Windows 8.1 and Windows 10.

168.5.4 `configureAUMI(Company as String, Name as String, SurName as String, VersionInfo as String) as String`

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Configures the AppUserModelID for Constructor.
**Notes:**
Concats strings with dot between,
Please be aware of maximum ID length of 128 characters.

168.5.5 `Constructor(appName as string, aumi as string)`

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The constructor.
**Notes:** Please pass your AppUserModelID and application name.

168.5.6 Destructor

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The destructor.
168.5.7  HideNotification(notification as WinUserNotificationMBS) as boolean

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Hides a notification.
**Notes:** Returns true on success.

168.5.8  ShowNotification(notification as WinUserNotificationMBS) as boolean

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Shows a notification.
**Notes:** Returns true on success.

168.5.9  Properties

168.5.10  appName as String

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The application name used.
**Notes:** (Read only property)

168.5.11  aumi as String

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The unique id.
**Notes:** (Read only property)

168.5.12  Handle as Integer

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The internal object handle.
**Notes:** (Read only property)
168.5.13 Events

168.5.14 Activated(Notification as WinUserNotificationMBS)

MBS Win Plugin, Plugin Version: 17.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: The notification was activated.

168.5.15 Dismissed(Notification as WinUserNotificationMBS, Reason as Integer)

168.5.16 Failed(Notification as WinUserNotificationMBS, ErrorCode as Integer)

168.5.17 Constants

168.5.18 DismissalReasonApplicationHidden = 1

168.5.19 DismissalReasonTimedOut = 2

MBS Win Plugin, Plugin Version: 17.2. Function: One of the dismissal reasons. Notes: The notification has expired.

168.5.20 DismissalReasonUserCanceled = 0

MBS Win Plugin, Plugin Version: 17.2. Function: One of the dismissal reasons. Notes: The user dismissed the notification.
168.6 class WinUserNotificationMBS

168.6.1 class WinUserNotificationMBS

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for the notification.

**Example:**

```vba
dim n as new WinUserNotificationMBS
n.Image = "C:\test.png"
n.text(0) = "Hello World"
n.text(1) = "Greetings from Xojo"
```

168.6.2 Properties

168.6.3 Image as String

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The image file path.

**Notes:**
Leave empty if you don’t need a picture.

May not be a network path as system needs to load it independent of your permissions.
Maybe better use image coming with application or put one in temp folder.
(Read and Write property)

168.6.4 Text as String

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The text to display.

**Notes:**
Same as text(0).
(Read and Write property)
See also:

- 168.6.6 Text(Index as Integer) as String
168.6.5 XMLUsed as String

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The XML template used.
**Notes:**
For debugging.
(Read only property)

168.6.6 Text(Index as Integer) as String

MBS Win Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The text lines to display.
**Notes:**
Index from 0 to 3.

Chapter 169

VLC

169.1 class VLCAudioOutputDeviceMBS

169.1.1 class VLCAudioOutputDeviceMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for details on audio output devices.

**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

169.1.2 Methods

169.1.3 Constructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.

169.1.4 Destructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The destructor.
169.1.5 Properties

169.1.6 Description as String

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The User-friendly device description. **Notes:** (Read and Write property)

169.1.7 Device as String

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The output device ID. **Notes:** (Read and Write property)

169.1.8 NextOutput as VLCAudioOutputDeviceMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The next entry in the list. **Notes:** You can loop over entries. Last one has nil in this property. (Read and Write property)
169.2. **CLASS VLCAUDIOOUTPUTMBS**

169.2  **class VLCAudioOutputMBS**

169.2.1  **class VLCAudioOutputMBS**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Description for audio output.
**Notes:**
It contains name, description and pointer to next record.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

169.2.2  **Methods**

169.2.3  **Constructor**

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The private constructor.

169.2.4  **Destructor**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor.

169.2.5  **Properties**

169.2.6  **Description as String**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The description for this audio output.
**Notes:** (Read and Write property)

169.2.7  **Name as String**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The name of this audio output.
**Notes:** (Read and Write property)
169.2.8 NextOutput as VLCAudioOutputMBS

**Notes:** (Read and Write property)
169.3. class VLCEqualizerMBS

169.3.1 class VLCEqualizerMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for equalizer in VLC.
**Notes:** Requires VLC 2.2.

169.3.2 Methods

169.3.3 BandFrequency(index as Integer) as Double

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get a particular equalizer band frequency.
**Notes:**
This value can be used, for example, to create a label for an equalizer band control in a user interface.

Index: index of the band, counting from zero
Returns equalizer band frequency (Hz), or -1 if there is no such band

Requires LibVLC 2.2.0 or later

169.3.4 Constructor(index as Integer, vlc as VLCInstanceMBS = nil)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Create a new equalizer, with initial frequency values copied from an existing preset.
**Notes:**
The new equalizer can subsequently be applied to a media player by invoking
VLCMediaPlayerMBS.SetEqualizer.

Index: index of the preset, counting from zero.

Requires VLC 2.2.
See also:

- 169.3.5 Constructor(vlc as VLCInstanceMBS = nil)
169.3.5 Constructor(vlc as VLCInstanceMBS = nil)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Create a new default equalizer, with all frequency values zeroed.
**Notes:**
The new equalizer can subsequently be applied to a media player by invoking VLCMediaPlayerMBS.SetE-
qualizer.
Requires VLC 2.2.
See also:

- 169.3.4 Constructor(index as Integer, vlc as VLCInstanceMBS = nil)

169.3.6 Destructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor.

169.3.7 PresetName(index as Integer) as string

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get the name of a particular equalizer preset.
**Notes:**
This name can be used, for example, to prepare a preset label or menu in a user interface.

index: index of the preset, counting from zero
Returns name, or "" if there is no such preset
Requires LibVLC 2.2.0 or later.

169.3.8 Properties

169.3.9 BandCount as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get the number of distinct frequency bands for an equalizer.
**Notes:**
Requires LibVLC 2.2.0 or later.
(Read only property)
169.3.10 Handle as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The internal object reference.
**Notes:** (Read and Write property)

169.3.11 Preamp as Single

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get/Set a new pre-amplification value for an equalizer.
**Notes:**
The new equalizer settings are subsequently applied to a media player by invoking
VLCMediaPlayer.SetEqualizer.
The supplied amplification value will be clamped to the -20.0 to +20.0 range.

preamp value (-20.0 to 20.0 Hz)
Returns zero on success, -1 on error.

Requires LibVLC 2.2.0 or later
(Read and Write property)

169.3.12 PresetCount as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get the number of equalizer presets.
**Notes:**
Requires LibVLC 2.2.0 or later
(Read only property)

169.3.13 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The reference to the parent VLC instance object.
**Notes:** (Read only property)
169.3.14 Map(Index as Integer) as Single

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set a new amplification value for a particular equalizer frequency band.

**Notes:**
The new equalizer settings are subsequently applied to a media player by invoking VLCMediaPlayerMBS.SetEqualizer.

The supplied amplification value will be clamped to the -20.0 to +20.0 range.

**Value:** amplification value (-20.0 to 20.0 Hz)
index, counting from zero, of the frequency band to set

Requires LibVLC 2.2.0 or later
(Read and Write computed property)
169.4. CLASS VLCEVENTMANAGERMBS

169.4 class VLCEventManagerMBS

169.4.1 class VLCEventManagerMBS

Notes:
Only the events which the parent object sends are delivered.
With 12.3pr5 and newer plugins, this function sends events to main thread as it should be.

169.4.2 Methods

169.4.3 Constructor(Media as VLCMediaMBS)

See also:

- 169.4.4 Constructor(MediaDiscoverer as VLCMediaDiscovererMBS)
- 169.4.5 Constructor(MediaList as VLCMediaListMBS)
- 169.4.6 Constructor(MediaListPlayer as VLCMediaListPlayerMBS)
- 169.4.7 Constructor(MediaPlayer as VLCMediaPlayerMBS)

169.4.4 Constructor(MediaDiscoverer as VLCMediaDiscovererMBS)

See also:

- 169.4.3 Constructor(Media as VLCMediaMBS)
- 169.4.5 Constructor(MediaList as VLCMediaListMBS)
- 169.4.6 Constructor(MediaListPlayer as VLCMediaListPlayerMBS)
- 169.4.7 Constructor(MediaPlayer as VLCMediaPlayerMBS)

169.4.5 Constructor(MediaList as VLCMediaListMBS)

See also:
169.4.6 Constructor(MediaListPlayer as VLCMediaListPlayerMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Initializes event manager for media list player.

See also:

- 169.4.3 Constructor(Media as VLCMediaMBS)
- 169.4.4 Constructor(MediaDiscoverer as VLCMediaDiscovererMBS)
- 169.4.5 Constructor(MediaList as VLCMediaListMBS)
- 169.4.7 Constructor(MediaPlayer as VLCMediaPlayerMBS)

169.4.7 Constructor(MediaPlayer as VLCMediaPlayerMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Initializes event manager for media player.

See also:

- 169.4.3 Constructor(Media as VLCMediaMBS)
- 169.4.4 Constructor(MediaDiscoverer as VLCMediaDiscovererMBS)
- 169.4.5 Constructor(MediaList as VLCMediaListMBS)
- 169.4.6 Constructor(MediaListPlayer as VLCMediaListPlayerMBS)

169.4.8 Destructor

169.4.9 Listen

MBS VLC Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Registers internally events.  
**Notes:**  
This is normally called in the constructor.  
If you add event handlers later via AddHandler command, you need to call this method to have those event handlers also registered.

169.4.10 Properties

169.4.11 Handle as Integer

**Notes:** (Read and Write property)

169.4.12 Parent as Variant

**Notes:** Just a reference back, so the target object is not released too early.  
(Read and Write property)

169.4.13 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to the VLC instance.  
**Notes:** (Read only property)

169.4.14 Events

169.4.15 Log(Message as String, level as Integer, Name as String, Header as String, ModuleName as String, FileName as String, Line as Integer)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A log message arrived.
Notes:
message: The message to log.
level: message level, e.g. kLogLevelError
Name: object name
Header: object header or empty.
ModuleName: module name
FileName: The source code file name.
Line: The source code line number.

Enable this event using VLCInstanceMBS.SetLogEvent method.

169.4.16 MediaDiscovererEnded

169.4.17 MediaDiscovererStarted
MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media discoverer started.

169.4.18 MediaDurationChanged(newDuration as Int64)
MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Duration of media changed.

169.4.19 MediaFreed(media as VLCMediaMBS)
MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media was released.

169.4.20 MediaListItemAdded(item as VLCMediaMBS, index as Integer)
MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media list item added.
169.4. CLASS VLCEVENTMANAGERMBS

169.4.21 MediaListItemDeleted(item as VLCMediaMBS, index as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media list item deleted.

169.4.22 MediaListPlayerNextItemSet(item as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

169.4.23 MediaListPlayerPlayed

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media list player played.

169.4.24 MediaListPlayerStopped

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media list player stopped.

169.4.25 MediaListWillAddItem(item as VLCMediaMBS, index as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media list will add item.

169.4.26 MediaListWillDeleteItem(item as VLCMediaMBS, index as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media list will delete item.

169.4.27 MediaMetaChanged(metatype as Integer)

169.4.28  **MediaPlayerParsedChanged(newStatus as Integer)**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Parsed status changed.

169.4.29  **MediaPlayerBackward**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Media player moved backwards.

169.4.30  **MediaPlayerBuffering**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the events.

169.4.31  **MediaPlayerEncounteredError**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the events.

169.4.32  **MediaPlayerEndReached**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Media player reached end of media.

169.4.33  **MediaPlayerForward**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Player moved forward.

169.4.34  **MediaPlayerLengthChanged(NewLength as Int64)**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The length of the media changed.
169.4. CLASS VLCEVENTMANAGERMBS

169.4.35 MediaPlayerMediaChanged(item as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The media changed in the media player.

169.4.36 MediaPlayerNothingSpecial

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

169.4.37 MediaPlayerOpening

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The Media player is opening.

169.4.38 MediaPlayerPausableChanged(pausable as boolean)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media player’s pausable state changed.

169.4.39 MediaPlayerPaused

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The player was paused.

169.4.40 MediaPlayerPlaying

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The player is playing.

169.4.41 MediaPlayerPositionChanged(newPosition as Double)

**Notes:** This event does not fire if you assigned new position. It is only to inform you that position changed.
due to playing video.

169.4.42 MediaPlayerScrambledChanged(newScrambled as Integer)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The scrambled property changed.

169.4.43 MediaPlayerSeekableChanged(seekable as boolean)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media Player’s seekable status changed.

169.4.44 MediaPlayerSnapshotTaken(filename as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A snapshot has been taken.

169.4.45 MediaPlayerStopped

169.4.46 MediaPlayerTimeChanged(newTime as Int64)

169.4.47 MediaPlayerTitleChanged(newTitle as Integer)

169.4.48 MediaPlayerVout(newCount as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the events.

169.4.49 MediaStateChanged(newState as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
State changed on media.

169.4.50 MediaSubItemAdded(media as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Media got a new subitem.

169.4.51 MediaSubItemTreeAdded(media as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
A media item got new sub items.

169.4.52 VlmMediaAdded(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the events.

169.4.53 VlmMediaChanged(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the events.

169.4.54 VlmMediaInstanceStarted(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
One of the events.
169.4.55  \texttt{VlmMediaInstanceStatusEnd(MediaName as string, InstanceName as string)}

169.4.56  \texttt{VlmMediaInstanceStatusError(MediaName as string, InstanceName as string)}

169.4.57  \texttt{VlmMediaInstanceStatusInit(MediaName as string, InstanceName as string)}

169.4.58  \texttt{VlmMediaInstanceStatusOpening(MediaName as string, InstanceName as string)}

169.4.59  \texttt{VlmMediaInstanceStatusPause(MediaName as string, InstanceName as string)}

169.4.60  \texttt{VlmMediaInstanceStatusPlaying(MediaName as string, InstanceName as string)}

169.4.61  VlmMediaInstanceStopped(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** One of the events.

169.4.62  VlmMediaRemoved(MediaName as string, InstanceName as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Media was removed.

169.4.63  Constants

169.4.64  kLogLevelDebug = 0

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the log levels. **Notes:** Debug message

169.4.65  kLogLevelError = 4

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the log levels. **Notes:** Error message.

169.4.66  kLogLevelNotice = 2

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the log levels. **Notes:** Important informational message

169.4.67  kLogLevelWarning = 3

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the log levels. **Notes:** Warning (potential error) message
class VLCExitHandlerMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A class to receive exit events from VLC user interface. **Notes:** As you probably use this plugin with your own user interface, you don’t need this class.

**Events**

**ExitEvent**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** An exit event was received from VLC user interface.
169.6. class VLCInstanceMBS

169.6.1 class VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The main VLC class.

**Notes:**
Keep the instance in memory as long as you use any other VLC classes.
Only one instance per app, please.

169.6.2 Methods

169.6.3 AddUserInterface(name as string) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Try to start a user interface for the libvlc instance.

**Notes:**
name: interface name, or nil for default.
Return true on success, false on error.

169.6.4 AudioOutputDevices(ModuleName as string) as VLCAudioOutputDeviceMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets a list of audio output devices for a given audio output module.

**Notes:**
Not all audio outputs support this. In particular, an empty (nil) list of devices does not imply that the specified audio output does not work.

The list might not be exhaustive.

Some audio output devices in the list might not actually work in some circumstances. By default, it is recommended to not specify any explicit audio device.

ModuleName: audio output name.

Returns a nil-terminated linked list of potential audio output devices.
CHAPTER 169. VLC

Requires VLC 2.1.

169.6.5 ClearError

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clears the LibVLC error status for the current thread.

**Notes:**
This is optional.
By default, the error status is automatically overridden when a new error occurs, and destroyed when the thread exits.

169.6.6 ClearLog

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Unsets the logging callback for a LibVLC instance.

**Notes:**
This is rarely needed: the callback is implicitly unset when the instance is destroyed.
This function will wait for any pending callbacks invocation to complete
(causing a deadlock if called from within the callback).

Requires VLC 2.1.

169.6.7 Clock as Int64

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Return the current time as defined by LibVLC.

**Notes:**
The unit is the microsecond.
Time increases monotonically (regardless of time zone changes and RTC adjustments).
The origin is arbitrary but consistent across the whole system (e.g. the system uptime, the time since the system was booted). On systems that support it, the POSIX monotonic clock is used.

169.6.8 Constructor(args() as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create and initialize a libvlc instance.

**Notes:**
This function accepts a list of "command line" arguments similar to the main(). These arguments affect the LibVLC instance default configuration.

Arguments are meant to be passed from the command line to LibVLC, just like VLC media player does. The list of valid arguments depends on the LibVLC version, the operating system and platform, and set of available LibVLC plugins. Invalid or unsupported arguments will cause the function to fail (i.e. return nil). Also, some arguments may alter the behaviour or otherwise interfere with other LibVLC functions.

There is absolutely no warranty or promise of forward, backward and cross-platform compatibility with regards to this Constructor() arguments. We recommend that you do not use them, other than when debugging.

On success handle property is not nil.

### 169.6.9 Destructor

### 169.6.10 ErrorMessage as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a human-readable error message for the last VLC error in the calling thread.

### 169.6.11 GetAudioFilterList as VLCModuleDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a list of audio filters that are available. **Notes:** Return a list of module descriptions.

### 169.6.12 GetAudioOutputDeviceCount(AudioOutputName as string) as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get count of devices for audio output, these devices are hardware oriented like analog or digital output of sound card. **Notes:** AudioOutputName: name of audio output.
Returns number of devices.

169.6.13 GetAudioOutputDeviceID(AudioOutputName as string, index as Integer) as string

169.6.14 GetAudioOutputDeviceLongName(AudioOutputName as string, index as Integer) as string

169.6.15 GetAudioOutputList as VLCAudioOutputMBS

169.6.16 GetChangeset as string

169.6. CLASS VLCINSTANCEMBS

169.6.17 GetCompiler as string

**Notes:**  
Example: "gcc version 4.2.3 (Ubuntu 4.2.3-2ubuntu6)"
Return a string containing the libvlc compiler version.

169.6.18 getenv(name as string) as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries the environment variable with given name.

169.6.19 GetLoadError as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns error string from LoadLibrary function.

169.6.20 GetVersion as string

**Notes:**  
Example: "1.1.0-git The Luggage"
Return a string containing the libvlc version.

169.6.21 GetVideoFilterList as VLCModuleDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a list of video filters that are available.  
**Notes:** Return a list of module descriptions.

169.6.22 LoadLibrary(path as folderitem) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads the vlc library.
CHAPTER 169. VLC

Notes:

Returns true on success and false on failure.
Please point to libVLC.dylib on Mac and libVLC.dll on Windows.
See also:

- 169.6.23 LoadLibrary(path as string) as boolean

169.6.23 LoadLibrary(path as string) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Loads the vlc library.
Notes:
Returns true on success and false on failure.
Please point to libVLC.dylib on Mac and libVLC.dll on Windows.
See also:

- 169.6.22 LoadLibrary(path as folderitem) as boolean

169.6.24 SetAppID(ID as string, Version as string, Icon as String)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Sets some meta-information about the application.
Notes:
See also SetUserAgent().

id: Java-style application identifier, e.g. "com.acme.foobar"
version: application version numbers, e.g. "1.2.3"
icon: application icon name, e.g. "foobar"

Requires VLC 2.1.

169.6.25 setlocale(category as Integer, locale as string) as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Sets the locale to use.
Notes:
The Setlocale function sets the C library’s notion of natural language formatting style for particular sets of routines. Each such style is called a 'locale' and is invoked using an appropriate name passed as a C string.
The setlocale() function recognizes several categories of routines. These are the categories and the sets of routines they select:

- **LocaleAll**: Set the entire locale generically.
- **LocaleCollate**: Set a locale for string collation routines. This controls alphabetic ordering in `strcoll()` and `strxfrm()`.
- **LocaleCType**: Set a locale for the `ctype` and multibyte functions. This controls recognition of upper and lower case, alphabetic or non-alphabetic characters, and so on.
- **LocaleMessages**: Set a locale for message catalogs, see `catopen` function.
- **LocaleMonetary**: Set a locale for formatting monetary values; this affects the `localeconv()` function.
- **LocaleNumeric**: Set a locale for formatting numbers. This controls the formatting of decimal points in input and output of floating point numbers in functions such as `printf()` and `scanf()`, as well as values returned by `localeconv()`.
- **LocaleTime**: Set a locale for formatting dates and times using the `strftime()` function.

Only three locales are defined by default: the empty string "" (which denotes the native environment) and the "C" and "POSIX" locales (which denote the C-language environment). By default, C programs start in the "C" locale.

### 169.6.26 SetLogEvent

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the logging callback for a LibVLC instance.  
**Notes:**
This function is thread-safe: it will wait for any pending callbacks invocation to complete.

Some log messages (especially debug) are emitted by LibVLC while is being initialized. These messages cannot be captured with this interface.

A deadlock may occur if this function is called from the event.

Requires VLC 2.1.

### 169.6.27 SetLogFile(File as FolderItem)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets up logging to a file.
CHAPTER 169. VLC

Notes: Requires VLC 2.1.

169.6.28 SetUserAgent(AppName as string, httpUserAgent as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Sets the application name.
Notes:
VLC passes this as the user agent string when a protocol requires it.

name: human-readable application name, e.g. "FooBar player 1.2.3"
http: HTTP User Agent, e.g. "FooBar/1.2.3 Python/2.6.0"

169.6.29 WaitUserInterface

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Waits until an interface causes the instance to exit.
Notes: You should start at least one interface first, using AddUserInterface.

169.6.30 Properties

169.6.31 Handle as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
The internal object reference.
Notes: (Read and Write property)

169.6.32 ExitHandler as VLCExitHandlerMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Registers a callback for the LibVLC exit event.
Notes:
This is mostly useful if you have started at least one interface with AddUserInterface. Typically, this function
will wake up your application main loop (from another thread).

This function and WaitUserInterface() cannot be used at the same time.
Use either or none of them but not both.
169.6. CLASS VLCINSTANCEMBS

(Read and Write computed property)
169.7 class VLCMediaDiscovererMBS

169.7.1 class VLCMediaDiscovererMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The plugin class for the VLC media discovery.
**Notes:**
LibVLC media discovery finds available media via various means.
This corresponds to the service discovery functionality in VLC media player.
Different plugins find potential medias locally (e.g. user media directory), from peripherals (e.g. video capture device), on the local network (e.g. SAP) or on the Internet (e.g. Internet radios).

169.7.2 Methods

169.7.3 Constructor(vlc as VLCInstanceMBS, name as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Discover media service by name.
**Notes:**
vlc: The VLC instance.
Name: service name.
Handle is not nil on success.

169.7.4 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor.

169.7.5 IsRunning as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Query if media service discover object is running.
**Notes:** Returns true if running, false if not.

169.7.6 LocalizedName as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get the localized name.
169.7.7 MediaList as VLCMediaListMBS

169.7.8 Properties

169.7.9 Handle as Integer

**Notes:** (Read and Write property)

169.7.10 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to the VLC instance.  
**Notes:** (Read only property)
169.8  class VLCMediaLibraryMBS

169.8.1  class VLCMediaLibraryMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for VLC media library.

169.8.2  Methods

169.8.3  Constructor(vlc as VLCInstanceMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Create an new Media Library object.
**Notes:** On success handle property is not nil.

169.8.4  Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor.

169.8.5  Load as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Load media library.
**Notes:** Return true on success, false on error.

169.8.6  MediaList as VLCMediaListMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get media library subitems.
169.8.7  Properties

169.8.8  Handle as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The internal object reference.
**Notes:** (Read and Write property)

169.8.9  VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The reference to the VLC instance.
**Notes:** (Read only property)
169.9 class VLCMediaListMBS

169.9.1 class VLCMediaListMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a media list.

169.9.2 Methods

169.9.3 AddMedia(item as VLCMediaMBS) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Add media instance to media list.
**Notes:**
item: a media instance
Return true on success, false if the media list is read-only.
The Lock should be held upon entering this function.

169.9.4 Constructor(vlc as VLCInstanceMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Create an empty media list.
**Notes:** On success the handle property is not zero.

169.9.5 Count as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get count on media list items.
**Notes:**
The Lock should be held upon entering this function.
Return number of items in media list.

169.9.6 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor.
169.9. **CLASS VLCMEDIALISTMBS**

### 169.9.7 GetMedia as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get media instance from this media list instance.  
**Notes:** The Lock should NOT be held upon entering this function. Returns media instance or nil.

### 169.9.8 IndexOfItem(item as VLCMediaMBS) as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Find index position of List media instance in media list.  
**Notes:** Warning: the function will return the first matched position. The Lock should be held upon entering this function.  
Returns position of media instance or -1 if media not found.

### 169.9.9 InsertMedia(item as VLCMediaMBS, index as Integer) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Insert media instance in media list on a position.  
**Notes:** The Lock should be held upon entering this function.  
item: a media instance  
index: position in array where to insert  
Return true on success, false if the media list is read-only.

### 169.9.10 isReadOnly as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether this media list is read-only from a user point of view.  
**Notes:** Returns true if readonly and false if read/write.
169.9.11 ItemAtIndex(index as Integer) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** List media instance in media list at a position.

**Notes:**
The Lock should be held upon entering this function.
index: position in array where to get item.
Returns instance at position index, or nil if not found.

169.9.12 Lock

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get lock on media list items.

169.9.13 Remove(index as Integer) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Remove media instance from media list on a position.

**Notes:**
The Lock should be held upon entering this function.
index: position in array where to insert
Returns true on success, false if the list is read-only or the item was not found.

169.9.14 SetMedia(item as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Associate media instance with this media list instance.

**Notes:**
If another media instance was present it will be released.
The Lock should NOT be held upon entering this function.

169.9.15 Unlock

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Release lock on media list items.

**Notes:** The Lock should be held upon entering this function.
169.9. CLASS VLCMEDIALISTMBS

169.9.16 Properties

169.9.17 Handle as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Internal object reference. **Notes:** (Read and Write property)

169.9.18 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to the VLC instance. **Notes:** (Read only property)
169.10 class VLCMediaListPlayerMBS

169.10.1 class VLCMediaListPlayerMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for a VLC media list player.
**Notes:**
This is required to especially support playlist files.
The normal media player can only play a single media, and does not handle playlist files properly.

169.10.2 Methods

169.10.3 Constructor(vlc as VLCInstanceMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create new media list player.

169.10.4 Destructor

169.10.5 IsPlaying as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Is media list playing?
**Notes:** Return true for playing and false for not playing.

169.10.6 MoveNext as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Play next item from media list.
**Notes:** Return true upon success false if there is no next item.
169.10. **CLASS VLCMEDIALISTPLAYERMBS**

169.10.7  **MovePrevious as Boolean**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Play previous item from media list.
**Notes:** Return true upon success false if there is no previous item.

169.10.8  **Pause**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Pause media list

169.10.9  **Play**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Play media list.

169.10.10  **PlayItem(item as VLCMediaMBS) as Boolean**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Play the given media item.
**Notes:** Return true upon success, false if the media is not part of the media list.

169.10.11  **PlayItemAtIndex(index as Integer) as Boolean**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Play media list item at position index.
**Notes:**
- index: index in media list to play.
  Return true upon success false if the item wasn’t found.

169.10.12  **SetMediaList(list as VLCMediaListMBS)**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Set the media list associated with the player.
169.10.13  **SetMediaPlayer(player as VLCMediaPlayerMBS)**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Replace media player in media list player with this instance.

169.10.14  **SetPlaybackMode(mode as Integer)**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the playback mode for the playlist.
**Notes:** See kPlaybackMode* constants.

169.10.15  **State as Integer**

169.10.16  **Stop**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Stop playing media list.

169.10.17  **Properties**

169.10.18  **Handle as Integer**

**Notes:** (Read and Write property)

169.10.19  **List as VLCMediaListMBS**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The list assigned to this media list player.
**Notes:** (Read and Write property)
169.10.20  Player as VLCMediaPlayerMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The player assigned to this media list player.  
**Notes:** (Read and Write property)

169.10.21  VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The reference to the VLC instance.  
**Notes:** (Read only property)

169.10.22  Constants

169.10.23  kPlaybackModeDefault = 0

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the playback mode constants.  
**Notes:** Default

169.10.24  kPlaybackModeLoop = 1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the playback mode constants.  
**Notes:** Loop

169.10.25  kPlaybackModeRepeat = 2

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the playback mode constants.  
**Notes:** Repeat
169.11  class VLCMediaMBS

169.11.1  class VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The VLC class for a media item.

169.11.2  Methods

169.11.3  AddOption(options as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Add an option to the media. **Notes:** This option will be used to determine how the media player will read the media. This allows to use VLC’s advanced reading/streaming options on a per-media basis.

The options are detailed in vlc --long-help, for instance "--sout-all"

169.11.4  AddOptionFlag(options as string, flags as UInt32)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Add an option to the media with configurable flags. **Notes:** This option will be used to determine how the media player will read the media. This allows to use VLC’s advanced reading/streaming options on a per-media basis.

The options are detailed in vlc --long-help, for instance "--sout-all"

169.11.5  Clone as VLCMediaMBS

169.11. CLASS VLCMEDIAMBS

169.11.6 Constructor(original as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a copy of the media object.
See also:

- 169.11.7 Constructor(vlc as VLCInstanceMBS, URL as string)

169.11.7 Constructor(vlc as VLCInstanceMBS, URL as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Create a media with a certain given media resource location, for instance a valid URL.
**Notes:**
Do not pass a file path here! This is for URLs.

URL: the media location

To refer to a local file with this function, the file://... URI syntax must be used (see IETF RFC3986).
We recommend using MediaWithPath() instead when dealing with local files.
See also:

- 169.11.6 Constructor(original as VLCMediaMBS)

169.11.8 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor to cleanup the media.

169.11.9 Duration as Int64

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get duration (in ms) of media descriptor object item.
**Notes:** Return duration of media item or -1 on error.

169.11.10 IsParsed as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get Parsed status for media descriptor object.
**Notes:** Returns true if media object has been parsed otherwise it returns false.
169.11.11 MediaWithData(vlc as VLCInstanceMBS, data as memoryblock) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Create a media for a certain data.
**Notes:**
Internally creates temp file for the data and opens the file.
File is later deleted when VLCMediaMBS goes out of scope.
Returns new media object or nil.
See also:

- 169.11.12 MediaWithData(vlc as VLCInstanceMBS, data as string) as VLCMediaMBS

169.11.12 MediaWithData(vlc as VLCInstanceMBS, data as string) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Create a media for a certain data.
**Notes:**
Internally creates temp file for the data and opens the file.
File is later deleted when VLCMediaMBS goes out of scope.
Returns new media object or nil.
See also:

- 169.11.11 MediaWithData(vlc as VLCInstanceMBS, data as memoryblock) as VLCMediaMBS

169.11.13 MediaWithFile(vlc as VLCInstanceMBS, file as folderitem) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Create a media for a certain file path.
**Notes:**
file: local filesystem path as folderitem.
Returns new media object or nil.

169.11.14 MediaWithFileDescriptor(vlc as VLCInstanceMBS, fd as Integer) as VLCMediaMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Create a media for an already open file descriptor.
**Notes:**
The file descriptor shall be open for reading (or reading and writing).

Regular file descriptors, pipe read descriptors and character device descriptors (including TTYs) are supported on all platforms. Block device descriptors are supported where available. Directory descriptors are supported on systems that provide `fdopendir()`. Sockets are supported on all platforms where they are file descriptors, i.e., all except Windows.

This library will not automatically close the file descriptor under any circumstance. Nevertheless, a file descriptor can usually only be rendered once in a media player. To render it a second time, the file descriptor should probably be rewound to the beginning with `lseek()`.

Returns new media object or nil.

169.11.15 MediaWithPath(vlc as VLCInstanceMBS, Path as string) as VLCMediaMBS

Function:
Create a media for a certain file path.

Notes:
- path: local filesystem path
Returns new media object or nil.

169.11.16 MediaWithURL(vlc as VLCInstanceMBS, URL as string) as VLCMediaMBS

Function:
Create a media with a certain given media resource location, for instance a valid URL.

Example:
```vbscript
dim v as VLCInstanceMBS // your vlc object
dim m as VLCMediaMBS

// load with URL
m = VLCMediaMBS.MediaWithURL(v, "http://www.mbsplugins.com/WriteInvoice-iPhone.m4v")

// or with file URL:
m = VLCMediaMBS.MediaWithURL(v, moviefile.URLPath)
```

Notes:
URL: the media location
Returns the new media object or nil.
To refer to a local file with this function, the file://... URI syntax must be used (see IETF RFC3986).
We recommend using MediaWithPath() instead when dealing with local files.

**169.11.17 Meta(type as Integer) as string**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Read the meta of the media.
**Notes:**
If the media has not yet been parsed this will return an empty string.
This methods automatically calls ParseAsync(), so after calling it you may receive a MediaMetaChanged event. If you prefer a synchronous version ensure that you call Parse() before get_meta().

**169.11.18 MRL as string**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get the media resource locator (mrl) from a media descriptor object.

**169.11.19 NewAsNode(vlc as VLCInstanceMBS, name as string) as VLCMediaMBS**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Create a media as an empty node with a given name.
**Notes:**
Name: The name of the new node.
Returns new media object or nil.

**169.11.20 Parse**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Parse a media.
**Notes:**
This fetches (local) meta data and tracks information.
The method is synchronous.
169.11.21 ParseAsync

**Notes:**
This fetches (local) meta data and tracks information.  
The method is the asynchronous of Parse.  
To track when this is over you can listen to MediaParsedChanged event. However if the media was already parsed you will not receive this event.

169.11.22 SaveMeta as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**  
Save the meta previously set.  
**Notes:** Return true if the write operation was successfull.

169.11.23 SetMeta(meta as Integer, value as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**  
Set the meta of the media  
**Notes:**
This function will not save the meta, call SaveMeta in order to save the meta.

meta: Which meta data. See kMeta* constants.  
Value: the media's meta

169.11.24 State as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**  
Get current state of media descriptor object.  
**Notes:** See kState* constants.

169.11.25 Stats as VLCMediaStatsMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**  
Get the current statistics about the media.  
**Notes:** Returns statistics for media.
169.11.26  **SubItems as VLCMediaListMBS**

169.11.27  **TrackInfos as VLCMediaTrackInfoMBS()**

**Notes:**
Note, you need to call Parse or play the media at least once before calling this function. 
Not doing this will result in an empty array.

169.11.28  **Tracks as VLCMediaTrackMBS()**

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get media descriptor’s elementary streams description.  
**Notes:**
Note, you need to call Parse or play the media at least once before calling this function. 
Not doing this will result in an empty array.

Requires LibVLC 2.1.0 and later.

Returns an array of track objects.

169.11.29  **Properties**

169.11.30  **Handle as Integer**

**Notes:** (Read and Write property)

169.11.31  **Tag as Integer**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The media descriptor’s user_data.
Notes:
This is a value you can use as you like.
This value survives even if the VLCMediaMBS object is destroyed and later recreated with the same VLC media object behind.
(Read and Write property)

169.11.32 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The reference to the VLC instance.
**Notes:** (Read only property)

169.11.33 Constants

169.11.34 kMetaActors = 22

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the Metadata Types Constants
**Notes:** Actors

169.11.35 kMetaAlbum = 4

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Metadata Types Constants
**Notes:** Album

169.11.36 kMetaAlbumArtist = 23

MBS VLC Plugin, Plugin Version: 18.2. **Function:** One of the Metadata Types Constants
**Notes:** Album artist

169.11.37 kMetaArtist = 1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Metadata Types Constants
**Notes:** Artist
169.11.38  kMetaArtworkURL = 15
MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Metadata Types Constants  
**Notes:** Artwork URL

169.11.39  kMetaCopyright = 3
MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Metadata Types Constants  
**Notes:** Copyright

MBS VLC Plugin, Plugin Version: 12.2. **Function**: One of the Metadata Types Constants
**Notes**: Track ID

169.11.57  kMetaTrackNumber = 5

MBS VLC Plugin, Plugin Version: 12.2. **Function**: One of the Metadata Types Constants
**Notes**: Track Number

169.11.58  kMetaTrackTotal = 17

MBS VLC Plugin, Plugin Version: 15.3. **Function**: One of the Metadata Types Constants
**Notes**: Total
MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the Metadata Types Constants
**Notes:** URL

**Function:** One of the media option constants.
**Notes:** Trusted

**Function:** One of the media option constants.
**Notes:** Unique

**Function:** One of the state constants.
**Notes:** Buffering

**Function:** One of the state constants.
**Notes:** Ended

**Function:** One of the state constants.
**Notes:** Error

**Function:** One of the state constants.
**Notes:** Nothing special. Video closed for example.
169.11.66  kStateOpening = 1

MBS VLC Plugin, Plugin Version: 12.2. Function: One of the state constants.
Notes: Opening

169.11.67  kStatePaused = 4

MBS VLC Plugin, Plugin Version: 12.2. Function: One of the state constants.
Notes: Paused

169.11.68  kStatePlaying = 3

MBS VLC Plugin, Plugin Version: 12.2. Function: One of the state constants.
Notes: Playing

169.11.69  kStateStopped = 5

MBS VLC Plugin, Plugin Version: 12.2. Function: One of the state constants.
Notes: Stopped

169.11.70  kTrackTypeAudio = 0

MBS VLC Plugin, Plugin Version: 12.2. Function: One of the track type constants.
Notes: Audio

169.11.71  kTrackTypeText = 2

MBS VLC Plugin, Plugin Version: 12.2. Function: One of the track type constants.
Notes: Text

169.11.72  kTrackTypeUnknown = -1

MBS VLC Plugin, Plugin Version: 12.2. Function: One of the track type constants.
Notes: Unknown type
169.11. CLASS VLCMEDIAMBS

169.11.73 kTrackTypeVideo = 1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the track type constants.  
**Notes:** Video
169.12 class VLCMediaPlayerMBS

169.12.1 class VLCMediaPlayerMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The VLC class for video playback.

169.12.2 Methods

169.12.3 Constructor(media as VLCMediaMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Create a Media Player object from a Media.
**Notes:** On success handle is not nil.
See also:
- 169.12.4 Constructor(VLCInstance as VLCInstanceMBS)

169.12.4 Constructor(VLCInstance as VLCInstanceMBS)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Create an empty Media Player object.
**Notes:** On success handle is not nil.
See also:
- 169.12.3 Constructor(media as VLCMediaMBS)

169.12.5 CopyMemory as memoryblock

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Covers current frame as memoryblock.
**Notes:**
This method set HasNewFrame to false.
The format depends on what you passed to VideoSetFormat.
Byte order usually is BGRA.

169.12.6 CopyPicture as Variant

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Copies current frame as picture.
Notes:
This method set HasNewFrame to false.
If using CGContext, this returns a CGImageMBS. Else a Picture.

169.12.7 CopyToMemory(dest as Ptr, offset as Integer, RowBytes as Integer) as boolean

MBS VLC Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies current frame into a given memory block.
**Notes:**
Offset: Position of first byte in memory block.
RowBytes: The row size in bytes of your memory block.

This way you can have your frame go into a buffer of bigger width/height representing an OpenGL texture for example.
Byte order usually is BGRA.

169.12.8 Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor.

169.12.9 GetChapterCountForTitle(title as Integer) as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get title chapter count.
**Notes:** Return number of chapters in title, or -1.

169.12.10 GetChapterDescription(index as Integer) as VLCTrackDescription-MBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get the description of available chapters for specific title.
**Notes:** Return list containing description of available chapter for title with index.
169.12.11 GetMemory as Ptr

MBS VLC Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns pointer to memory with current frame.  
**Notes:**  
This method set HasNewFrame to false.  
The format depends on what you passed to VideoSetFormat.

169.12.12 Navigate(Navigate as Integer)

169.12.13 NextChapter

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set next chapter (if applicable)

169.12.14 NextFrame

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Display the next frame (if supported)

169.12.15 Pause

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Toggle pause (no effect if there is no media)  
See also:

- 169.12.16 Pause(pause as boolean)

169.12.16 Pause(pause as boolean)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Pause or resume (no effect if there is no media)  
**Notes:** pause: play/resume if false, pause if true.  
See also:
169.12.17 Play as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Plays video. **Notes:** Return true if playback started (and was already started), or false on error.

169.12.18 PreviousChapter

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set previous chapter (if applicable)

169.12.19 SetAudioOutput(AudioOutputName as string) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set the audio output. **Notes:** Change will be applied after stop and play. Name: name of audio output. Return true on success.

169.12.20 SetAudioOutputDevice(AudioOutputName as string, deviceID as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set audio output device. Changes are only effective after stop and play. **Notes:** AudioOutputName: name of audio output. deviceID: device ID.

169.12.21 SetEqualizer(Equalizer as VLCEqualizerMBS = nil)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Apply new equalizer settings to a media player. **Notes:** It is possible to apply new equalizer settings to a media player whether the media player is currently playing media or not.
Invoking this method will immediately apply the new equalizer settings to the audio output of the currently playing media if there is any. If there is no currently playing media, the new equalizer settings will be applied later if and when new media is played.

Equalizer settings will automatically be applied to subsequently played media.

To disable the equalizer for a media player invoke this method passing nil for the equalizer parameter.

The media player does not keep a reference to the supplied equalizer so it is safe for an application to release the equalizer reference any time after this method returns.

Requires VLC 2.2.

169.12.22 SetSubtitleFile(filename as string) as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set new video subtitle file. **Notes:**

filename: new video subtitle file
Returns the success status.

169.12.23 SetVideoTitleDisplay(position as Integer, timeout as Integer)

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set if, and how, the video title will be shown when media is played. **Notes:**

position: position at which to display the title, or kVideoTitleDisplayPositionDisable to prevent the title from being displayed.
timeout: title display timeout in milliseconds (ignored if libvlc_position_disable)

Requires VLC 2.1.

169.12.24 Stop

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Stop (no effect if there is no media)
169.12.25  **ToggleFullScreen**

**Notes:** See also Fullscreen property.

169.12.26  **ToggleMute**

169.12.27  **ToggleTeletext**

169.12.28  **VideoGetCursor(num as Integer, byref px as Integer, byref py as Integer) as Boolean**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the mouse pointer coordinates over a video.  
**Notes:** Coordinates are expressed in terms of the decoded video resolution, not in terms of pixels on the screen/viewport (to get the latter, you can query your windowing system directly). Either of the coordinates may be negative or larger than the corresponding dimension of the video, if the cursor is outside the rendering area. The coordinates may be out-of-date if the pointer is not located on the video rendering area. LibVLC does not track the pointer if it is outside of the video widget. LibVLC does not support multiple pointers (it does of course support multiple input devices sharing the same pointer) at the moment.  

num: number of the video (starting from, and most commonly 0)  
px: get the abscissa.  
py: get the ordinate.  
Returns true on success, false if the specified video does not exist.
169.12.29  VideoGetSize(num as Integer, byref px as UInt32, byref py as UInt32) as Boolean

**Notes:**

- num: number of the video (starting from, and most commonly 0)
- px: get the pixel width [OUT]
- py: get the pixel height [OUT]

Return true on success, false if the specified video does not exist.

169.12.30  VideoSetCallback(width as Integer, height as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets video callbacks, so the plugin can provide current frame with CopyPicture method.

**Notes:**

You can use CopyPicture and CopyMemory methods to query new frame content.

The hasNewFrame property tells you whether a new frame is available.

See also:

- 169.12.31 VideoSetCallback(width as Integer, height as Integer, CGContextHandle as Integer)

169.12.31  VideoSetCallback(width as Integer, height as Integer, CGContextHandle as Integer)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets video callbacks, so the plugin can provide current frame with CopyPicture method.

**Notes:**

The plugin will draw the frames into the CGContext you provide.

You can use CopyPicture and CopyMemory methods to query new frame content.

The hasNewFrame property tells you whether a new frame is available.

See also:

- 169.12.30 VideoSetCallback(width as Integer, height as Integer)

169.12.32  VideoSetDeinterlace(Mode as string)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Enable or disable deinterlace filter.

**Notes:** Mode: Type of deinterlace filter, """" to disable.
169.12.33 VideoSetFormat(\text{chroma as string, width as UInt32, height as UInt32, pitch as UInt32})

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set decoded video chroma and dimensions. **Notes:**

This only works in combination with SetVideoCallbacks().

- chroma: a four-characters string identifying the chroma (e.g. "RV32" or "YUYV")
- width: pixel width
- height: pixel height
- pitch: line pitch (in bytes)

All pixel planes are expected to have the same pitch.

169.12.34 VideoSetKeyInput(on as boolean)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Enable or disable key press events handling, according to the LibVLC hotkeys configuration. **Notes:**

By default and for historical reasons, keyboard events are handled by the LibVLC video widget.

On X11, there can be only one subscriber for key press and mouse click events per window. If your application has subscribed to those events for the X window ID of the video widget, then LibVLC will not be able to handle key presses and mouse clicks in any case.

This function is only implemented for X11 and Win32 at the moment.

- on: true to handle key press events, false to ignore them.

169.12.35 VideoSetLogoString(option as Integer, logo as String)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set logo option as string. **Notes:** Options that take a different type value are ignored.
169.12.36 VideoSetMouseInput(on as boolean)

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Enable or disable mouse click events handling.  
**Notes:**  
By default, those events are handled. This is needed for DVD menus to work, as well as a few video filters such as "puzzle".

This function is only implemented for X11 and Win32 at the moment.

on: true to handle mouse click events, false to ignore them.

169.12.37 VideoTakeSnapshot(num as Integer, path as string, width as Integer, height as Integer) as boolean

**Notes:**  
If width AND height is 0, original size is used.  
If width XOR height is 0, original aspect-ratio is preserved. (e.g. width = 0 and height = -1)

num: number of video output (typically 0 for the first/only one)  
Path: the path where to save the screenshot to  
Width: the snapshot’s width  
Height: the snapshot’s height

Returns true on success, false if the video was not found

169.12.38 Properties

169.12.39 AGL as UInt32

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set the agl handler where the media player should render its video output.  
**Notes:**  
Returns the agl handler or 0 if none where set.  
(Read and Write property)
169.12. CLASS VLCMEDIAPLAYERMBS

169.12.40 AspectRatio as string

Notes: Set new video aspect-ratio or "" to reset to default. Invalid aspect ratios are ignored. Get the video aspect ratio or "" if unspecified.
The value must be something like "4:3", "16:9", "16:10", ...
(Read and Write property)

169.12.41 AudioChannel as Integer

Notes: (Read and Write property)

169.12.42 AudioDelay as Int64

Notes: The audio delay will be reset to zero each time the media changes.
(Read and Write property)

169.12.43 AudioOutputDevices as VLCAudioOutputDeviceMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Gets a list of potential audio output devices,
Notes: See also SetAudioOutputDevice method.
Not all audio outputs support enumerating devices.
The audio output may be functional even if the list is empty (nil).
The list may not be exhaustive.
Some audio output devices in the list might not actually work in some circumstances. By default, it is recommended to not specify any explicit audio device.

Returns a nil-terminated linked list of potential audio output devices. Requires LibVLC 2.2.0 or later. (Read only property)

169.12.44 AudioOutputDeviceType as Integer

**Notes:**
Device type describes something like character of output sound - stereo sound, 2.1, 5.1 etc. (Read and Write property)

169.12.45 AudioTrack as Integer

**Notes:**
Get or set current audio track. (Read and Write property)

169.12.46 AudioTrackCount as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get number of available audio tracks. 
**Notes:**
Returns the number of available audio tracks (int), or -1 if unavailable. (Read only property)

169.12.47 CanPause as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Can this media player be paused? 
**Notes:**
169.12. CLASS VLCMEDIAPLAYERMBS

Returns true if the media player can pause.
(Read only property)

169.12.48 Chapter as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get/set movie chapter.

**Notes:**
Returns chapter number currently playing, or -1 if there is no media.
Sets movie chapter (if applicable).
(Read and Write property)

169.12.49 ChapterCount as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get movie chapter count.

**Notes:**
Returns number of chapters in movie, or -1.
(Read only property)

169.12.50 CropGeometry as string

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get/Set current crop filter geometry.

**Notes:**
Returns the crop filter geometry or "" if unset.
Set with new crop filter geometry ("" to unset).

Seems to be broken in our tests inside libVLC.
(Read and Write property)

169.12.51 FPS as Double

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get movie fps rate

**Notes:**
Returns frames per second (fps) for this playing movie, or 0 if unspecified.
(Read only property)

169.12.52 FullScreen as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Enable or disable fullscreen.

**Notes:**
With most window managers, only a top-level windows can be in full-screen mode. Hence, this function will not operate properly if XWindow property was used to embed the video in a non-top-level window. In that case, the embedding window must be reparented to the root window before full-screen mode is enabled. You will want to reparent it back to its normal parent when disabling full-screen.
(Read and Write property)

169.12.53 GetAudioTrackDescription as VLCTrackDescriptionMBS

**Notes:**
Returns list with description of available audio tracks, or nil.
(Read only property)

169.12.54 GetSPUDescription as VLCTrackDescriptionMBS

**Notes:**
Return list containing description of available video subtitles or nil.
(Read only property)

169.12.55 GetVideoTitleDescription as VLCTrackDescriptionMBS

**Notes:**
Return list containing description of available titles.
(Read only property)
169.12.56 Handle as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference. **Notes:** (Read and Write property)

169.12.57 HasNewFrame as Boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether a new frame is available. **Notes:** (Read and Write property)

169.12.58 HasVOut as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** How many video outputs does this media player have? **Notes:** Return the number of video outputs. (Read only property)

169.12.59 Height as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get current video height. **Notes:** Returns the video pixel height or 0 if not applicable. (Read only property)

169.12.60 HWND as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set a Win32/Win64 API window handle (HWND) where the media player should render its video output. **Notes:**
If LibVLC was built without Win32/Win64 API output support, then this has no effects.

Get the Windows API window handle (HWND) previously set with this property. The handle will be returned even if LibVLC is not currently outputting any video to it. Currently not supported by our plugin.
(Read and Write property)

169.12.61  IsPlaying as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether player is playing.
**Notes:** (Read only property)

169.12.62  IsSeekable as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Is this media player seekable?
**Notes:**
Returns true if the media player can seek.
(Read only property)

169.12.63  Length as Int64

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the current movie length (in ms).
**Notes:**
Return the movie length (in ms), or -1 if there is no media.
(Read only property)

169.12.64  Media as VLCMediaMBS

**Notes:** (Read and Write property)
169.12.65  Mute as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Current mute status.
**Notes:**
If true then mute, otherwise unmute.
(Read and Write property)

169.12.66  NSObject as Ptr

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get/Set the NSView handler where the media player should render its video output.
**Notes:**
Currently not supported by our plugin.
(Read and Write property)

169.12.67  Position as Double

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get/Set movie position.
**Notes:**
Movie position as percentage between 0.0 and 1.0.
Returns movie position, or -1. in case of error.
Set movie position. This has no effect if playback is not enabled. This might not work depending on the underlying input format and protocol.
(Read and Write property)

169.12.68  ProgramScrambled as boolean

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Check if the current program is scrambled.
**Notes:**
ture if the current program is scrambled.
Requires VLC 2.2.
(Read only property)
169.12.69  Rate as Double

**Notes:**
Depending on the underlying media, the requested rate may be different from the real playback rate.
(Read and Write property)

169.12.70  Scale as Double

**Notes:**
That is the ratio of the number of pixels on screen to the number of pixels in the original decoded video in each dimension. Zero is a special value; it will adjust the video to the output window/drawable (in windowed mode) or the entire screen.

Note that not all video outputs support scaling.
(Read and Write property)

169.12.71  SPU as Integer

**Notes:**
Returns the video subtitle selected, or -1 if none.
(Read and Write property)

169.12.72  SPUCount as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get the number of available video subtitles.

**Notes:** (Read only property)
**169.12.73  SPUDelay as Int64**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set the current subtitle delay.

**Notes:**
This affects the timing of when the subtitle will be displayed. Positive values means subtitles are being displayed later, while negative values will result in subtitles being displayed earlier. The subtitle delay will be reset to zero each time the media changes. (Read and Write property)

**169.12.74  State as Integer**

**Notes:**
Returns the current state of the media player (playing, paused, ...)
(Read only property)

**169.12.75  Tag as Variant**

MBS VLC Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tag value.

**Notes:**
You can store whatever you like in this property.
(Read only property)

**169.12.76  Time as Int64**

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set the current movie time (in ms).

**Notes:**
Return the movie time (in ms), or -1 if there is no media. Set the movie time (in ms). This has no effect if no media is being played. Not all formats and protocols support this. (Read and Write property)
169.12.77  Title as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Set/Get movie title.
**Notes:**
Returns title number currently playing, or -1.
(Read and Write property)

169.12.78  TitleCount as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get movie title count.
**Notes:**
Returns title number count, or -1.
(Read only property)

169.12.79  VideoTeleText as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get/Set current teletext page requested.
**Notes:** (Read and Write property)

169.12.80  VideoTrack as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get/Set video track.
**Notes:** (Read and Write property)

169.12.81  VideoTrackCount as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get number of available video tracks.
**Notes:**
Returns the number of available video tracks.
(Read only property)
169.12.82 VideoTrackDescription as VLCTrackDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get the description of available video tracks.
**Notes:**
Returns list with description of available video tracks, or nil on error.
(Read only property)

169.12.83 VLC as VLCInstanceMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The reference to the VLC instance.
**Notes:** (Read only property)

169.12.84 Volume as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Current software audio volume.
**Notes:**
The volume in percents.
0 = mute, 100 = nominal / 0dB.
(Read and Write property)

169.12.85 Width as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get current video width.
**Notes:**
Returns the video pixel width or 0 if not applicable.
(Read only property)

169.12.86 WillPlay as boolean

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Is the player able to play.
**Notes:** (Read only property)
169.12.87  XWindow as UInt32

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get/Set an X Window System drawable where the media player should render its video output.

**Notes:**
If LibVLC was built without X11 output support, then this has no effects.

The specified identifier must correspond to an existing Input/Output class X11 window. Pixmaps are not
supported. The caller shall ensure that the X11 server is the same as the one the VLC instance has been
configured with. This function must be called before video playback is started; otherwise it will only take
effect after playback stop and restart.

Get the X Window System window identifier previously set with this property. Note that this will return
the identifier even if VLC is not currently using it (for instance if it is playing an audio-only input).
Currently not supported by our plugin.
(Read and Write property)

169.12.88  VideoAdjust(option as Integer) as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get/set adjust option as Integer.

**Notes:**
option: See kAdjust* constants.
Options that take a different type value are ignored.

Using kAdjustEnable with value 0 stops adjust filter. With other values you start adjust filter.
(Read and Write computed property)

169.12.89  VideoAdjustFloat(option as Integer) as single

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Get/set adjust option as float.

**Notes:**
option: See kAdjust* constants.
Options that take a different type value are ignored.
(Read and Write computed property)
169.12.90 VideoLogo(option as Integer) as Integer

**Notes:**
Options that take a different type value are ignored.
Passing kLogoEnable as option value has the side effect of starting (arg not 0) or stopping (arg 0) the logo filter.
(Read and Write computed property)

169.12.91 VideoMarquee(option as Integer) as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get, Enable, disable or set an integer marquee option.
**Notes:**
Setting kMarqueeEnable has the side effect of enabling (arg not 0) or disabling (arg 0) the marq filter.
(Read and Write computed property)

169.12.92 VideoMarqueeString(option as Integer) as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Get/Set a string marquee option value
**Notes:** (Read and Write computed property)

169.12.93 Constants

169.12.94 kAdjustBrightness = 2

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the adjust parameter constants.
**Notes:** Brightness

169.12.95 kAdjustContrast = 1

MBS VLC Plugin, Plugin Version: 12.2. **Function:** One of the adjust parameter constants.
**Notes:** Contrast

169.15. CLASS VLCMEDIATRACKMBS

169.15  class VLCMediaTrackMBS

169.15.1  class VLCMediaTrackMBS

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for the media track.
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

169.15.2  Methods

169.15.3  Constructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.

169.15.4  Destructor

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor.

169.15.5  Properties

169.15.6  Bitrate as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The bitrate.
**Notes:** (Read and Write property)

169.15.7  Channels as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The number of channels.
**Notes:** (Read and Write property)
169.15.8   Codec as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The codec ID.  
**Notes:** (Read and Write property)

169.15.9   CodecString as String

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The codec ID as 4 letter text. 
**Notes:** (Read and Write property)

169.15.10   Description as String

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The track description.  
**Notes:** (Read and Write property)

169.15.11   Encoding as String

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The text encoding for subtitles.  
**Notes:** (Read and Write property)

169.15.12   FrameRate as Double

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The framerate.  
**Notes:** (Read and Write property)

169.15.13   FrameRateDen as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The framerate.  
**Notes:** (Read and Write property)
169.15.14  FrameRateNum as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The framerate. **Notes:** (Read and Write property)

169.15.15  Height as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The height of a video track. **Notes:** (Read and Write property)

169.15.16  ID as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The ID of the track. **Notes:** (Read and Write property)

169.15.17  Language as String

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The language for this track. **Notes:** (Read and Write property)

169.15.18  Level as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The codec specific level value. **Notes:** (Read and Write property)

169.15.19  OriginalCode as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The original code for codec. **Notes:** (Read and Write property)
169.15.20 Profile as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Codec specific profile value.
**Notes:** (Read and Write property)

169.15.21 Rate as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The sound rate in Hz.
**Notes:** (Read and Write property)

169.15.22 Sar as Double

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The aspect ratio.
**Notes:** (Read and Write property)

169.15.23 SarDen as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The aspect ratio.
**Notes:** (Read and Write property)

169.15.24 SarNum as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The aspect ratio.
**Notes:** (Read and Write property)

169.15.25 Type as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The track type.
**Notes:** (Read and Write property)
169.15.26 Width as Integer

MBS VLC Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The width of a video track. **Notes:** (Read and Write property)

169.15.27 Constants

169.15.28 TrackAudio = 0

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the track types. **Notes:** Audio

169.15.29 TrackText = 2

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the track types. **Notes:** Text

169.15.30 TrackUnknown = -1

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the track types. **Notes:** Unknown type

169.15.31 TrackVideo = 1

MBS VLC Plugin, Plugin Version: 15.3. **Function:** One of the track types. **Notes:** Video
class VLCMissingFunctionExceptionMBS

Function: The exception which is raised if you call a function which is not available.
Notes: Either your VLC shared library does not have the function or you did not yet load the library.
Subclass of the RuntimeException class.
169.17. class VLCModuleDescriptionMBS

169.17.1. class VLCModuleDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a module description.

169.17.2. Methods

169.17.3. Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor.

169.17.4. Properties

169.17.5. Help as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The help text.
**Notes:** (Read and Write property)

169.17.6. LongName as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The long name.
**Notes:** (Read and Write property)

169.17.7. Name as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The name of the module.
**Notes:** (Read and Write property)
169.17.8  NextModule as VLCModuleDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The link to the next module.  
**Notes:** (Read and Write property)

169.17.9  ShortName as String

**Notes:** (Read and Write property)
169.18.  class VLCNotInitializedExceptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
This exception is raised if you call a method on an uninitialized object.

**Notes:**
Should not happen. And if it happens, you have a bug in your code.
Subclass of the RuntimeException class.
169.19  class VLCTrackDescriptionMBS

169.19.1  class VLCTrackDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Description for video, audio tracks and subtitles.
**Notes:** It contains id, name (description string) and reference to next record.

169.19.2  Methods

169.19.3  Destructor

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor.

169.19.4  Properties

169.19.5  ID as Integer

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The track ID.
**Notes:** (Read and Write property)

169.19.6  Name as String

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The track name.
**Notes:** (Read and Write property)

169.19.7  NextTrack as VLCTrackDescriptionMBS

MBS VLC Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The next track in the list.
**Notes:** (Read and Write property)
Chapter 170

Window

170.1 class GrowIconMBS

170.1.1 class GrowIconMBS

MBS MacCG Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
A class to replace the growicon on a composite window on Mac OS X with your own growicon.
**Deprecated:** This item is deprecated and should no longer be used. **Notes:** The grow icon is the bottom right part of the window where users can change the window size.

170.1.2 Methods

170.1.3 Constructor(target as window)

MBS MacCG Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The constructor to link this class to the given window.
**Notes:** The class keeps a reference to this window.

170.1.4 Properties

170.1.5 ControlHandle as Integer

MBS MacCG Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The handle to the growicon control used.
**Notes:** (Read and Write property)
170.1.6  TargetWindow as Window

MBS MacCG Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The window being used.
**Notes:** (Read and Write property)

170.1.7  Events

170.1.8  Draw(context as CGContextMBS, x as Double, y as Double, width as Double, height as Double)

MBS MacCG Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The draw event where you can draw your own growicon.
**Example:**
```
Sub Draw(context as CGContextMBS, x as Double, y as Double, width as Double, height as Double)
Context.SetRGBFillColor 1,0,0,1
context.FillRect CGMakeRectMBS(x,y,width,height)
End Sub
```
170.2  class GTKWindowMBS

170.2.1  class GTKWindowMBS

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** The class to control a GTKWindow.
**Notes:**
We can directly modify a window on Linux using this class.
If you need methods to do something special, please do not hesitate to email us.

170.2.2  Methods

170.2.3  Constructor(win as window)

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Creates a new GTKWindow object pointing to a given window.
**Notes:** Raises exception on Mac/Win to prevent you from creating invalid object.

170.2.4  Deiconify

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to deiconify (i.e. unminimize) the specified window.
**Notes:** Note that you shouldn’t assume the window is definitely deiconified afterward, because other entities (e.g. the user or window manager) could iconify it again before your code which assumes deiconification gets to run.

170.2.5  Fullscreen

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to place window in the fullscreen state.
**Notes:** Note that you shouldn’t assume the window is definitely full screen afterward, because other entities (e.g. the user or window manager) could unfullscreen it again, and not all window managers honor requests to fullscreen windows. But normally the window will end up fullscreen. Just don’t write code that crashes if not.

170.2.6  Iconify

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to iconify (i.e. minimize) the specified window.
Notes:
Note that you shouldn’t assume the window is definitely iconified afterward, because other entities (e.g. the user or window manager) could deiconify it again, or there may not be a window manager in which case iconification isn’t possible, etc. But normally the window will end up iconified. Just don’t write code that crashes if not.

It’s permitted to call this function before showing a window, in which case the window will be iconified before it ever appears onscreen.

### 170.2.7 IsComposited as Boolean

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Whether this window can rely on having its alpha channel drawn correctly. **Notes:** On X11 this function returns whether a compositing manager is running for window’s screen.

### 170.2.8 Maximize

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to maximize window, so that it becomes full-screen. **Notes:**
Note that you shouldn’t assume the window is definitely maximized afterward, because other entities (e.g. the user or window manager) could unmaximize it again, and not all window managers support maximization. But normally the window will end up maximized. Just don’t write code that crashes if not.

It’s permitted to call this function before showing a window, in which case the window will be maximized when it appears onscreen initially.

### 170.2.9 SetIcon(pic as picture)

MBS Linux Plugin, Plugin Version: 14.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Assigns an icon to the picture. 
**Notes:**
The operation system will scale the picture to required size, so please use bigger images. Please use picture with alpha channel for best result.
170.2. **CLASS GTKWINDOWMBS**

### 170.2.10 SetKeepAbove(setting as boolean)

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to keep window above, so that it stays on top.

**Notes:**

Note that you shouldn’t assume the window is definitely above afterward, because other entities (e.g. the user or window manager) could not keep it above, and not all window managers support keeping windows above. But normally the window will end kept above. Just don’t write code that crashes if not.

It’s permitted to call this function before showing a window, in which case the window will be kept above when it appears onscreen initially.

Note that, according to the Extended Window Manager Hints specification, the above state is mainly meant for user preferences and should not be used by applications e.g. for drawing attention to their dialogs.

### 170.2.11 SetKeepBelow(setting as boolean)

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to keep window below, so that it stays in bottom.

**Notes:**

Note that you shouldn’t assume the window is definitely below afterward, because other entities (e.g. the user or window manager) could not keep it below, and not all window managers support putting windows below. But normally the window will be kept below. Just don’t write code that crashes if not.

It’s permitted to call this function before showing a window, in which case the window will be kept below when it appears onscreen initially.

Note that, according to the Extended Window Manager Hints specification, the above state is mainly meant for user preferences and should not be used by applications e.g. for drawing attention to their dialogs.

### 170.2.12 Stick

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Asks to stick window, which means that it will appear on all user desktops.

**Notes:**

Note that you shouldn’t assume the window is definitely stuck afterward, because other entities (e.g. the user or window manager) could unstick it again, and some window managers do not support sticking windows. But normally the window will end up stuck. Just don’t write code that crashes if not.
170.2.13 Unfullscreen

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Asks to toggle off the fullscreen state for window.
**Notes:** Note that you shouldn’t assume the window is definitely not full screen afterward, because other entities (e.g., the user or window manager) could fullscreen it again, and not all window managers honor requests to unfullscreen windows. But normally the window will end up restored to its normal state. Just don’t write code that crashes if not.

170.2.14 Unmaximize

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Asks to unmaximize window.
**Notes:** Note that you shouldn’t assume the window is definitely unmaximized afterward, because other entities (e.g., the user or window manager) could maximize it again, and not all window managers honor requests to unmaximize. But normally the window will end up unmaximized. Just don’t write code that crashes if not.

170.2.15 Unstick

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
Asks to unstick window, which means that it will appear on only one of the user’s desktops.
**Notes:** Note that you shouldn’t assume the window is definitely unstuck afterward, because other entities (e.g., the user or window manager) could stick it again. But normally the window will end up stuck. Just don’t write code that crashes if not.

170.2.16 Properties

170.2.17 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:**
The internal window handle.
**Notes:** (Read and Write property)
170.2. AcceptFocus as Boolean

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Get/Set whether window should receive focus.

**Notes:**
Windows may set a hint asking the desktop environment not to receive the input focus. This function sets this hint.
(Read and Write computed property)

170.2.19 Opacity as Double

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Get or set the Opacity of this window.

**Notes:**
Request the windowing system to make window partially transparent, with opacity 0 being fully transparent and 1 fully opaque. (Values of the opacity parameter are clamped to the [ 0,1 ] range.) On X11 this has any effect only on X screens with a compositing manager running. See isComposited.
(Read and Write computed property)

170.2.20 Resizable as Boolean

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Get or set whether the user can resize a window.

**Notes:** (Read and Write computed property)

170.2.21 Title as string

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Get or set the window title.

**Notes:**
The title of a window will be displayed in its title bar; on the X Window System, the title bar is rendered by the window manager, so exactly how the title appears to users may vary according to a user’s exact configuration. The title should help a user distinguish this window from other windows they may have open. A good title might include the application name and current document filename, for example.
(Read and Write computed property)
170.3 class MAAttachedWindowMBS

170.3.1 class MAAttachedWindowMBS

Function: A class for attached windows in Cocoa.

Notes:

For Mac OS X 10.7 you can use NSPopoverMBS. This class does something similar for Mac OS X 10.4 to 10.7.

Base on MAAttachedWindow code by Matt Gemmell.
See his website http://mattgemmell.com/

Below are the positions the attached window can be displayed at.

Note that these positions are relative to the point passed to the constructor, e.g. MAPositionBottomRight will put the window below the point and towards the right, MAPositionTop will horizontally center the window above the point, MAPositionRightTop will put the window to the right and above the point, and so on.

You can also pass MAPositionAutomatic and the attached window will try to position itself sensibly, based on available screen-space.

Notes regarding automatically-positioned attached windows:

(a) The window prefers to position itself horizontally centered below the specified point. This gives a certain enhanced visual sense of an attachment/relationship.

(b) The window will try to align itself with its parent window (if any); i.e. it will attempt to stay within its parent window’s frame if it can.

(c) The algorithm isn’t perfect. :) If in doubt, do your own calculations and then explicitly request that the window attach itself to a particular side.

Notes regarding accessor methods:

1. The border is drawn inside the viewMargin area, expanding inwards; it does not increase the width/height of the window. You can use the BorderWidth and ViewMargin methods together to achieve the exact look/geometry you want. (viewMargin is the distance between the edge of the view and the window edge.)

2. The specified setter methods are primarily intended to be used _before_ the window is first shown. If you use them while the window is already visible, be aware that they may cause the window to move and/or
170.3. CLASS MAATTACHEDWINDOWMBS

resize, in order to stay anchored to the point specified in the initializer. They may also cause the view to move within the window, in order to remain centered there.

Note that the HasArrow method can safely be used at any time, and will not cause moving/resizing of the window. This is for convenience, in case you want to add or remove the arrow in response to user interaction. For example, you could make the attached window movable by its background, and if the user dragged it away from its initial point, the arrow could be removed. This would duplicate how Aperture's attached windows behave.

3. drawsRoundCornerBesideArrow takes effect when the arrow is being drawn at a corner, i.e. when it's not at one of the four primary compass directions. In this situation, if drawsRoundCornerBesideArrow is true (the default), then that corner of the window will be rounded just like the other three corners, thus the arrow will be inset slightly from the edge of the window to allow room for the rounded corner. If this value is false, the corner beside the arrow will be a square corner, and the other three corners will be rounded.

This is useful when you want to attach a window very near the edge of another window, and don’t want the attached window’s edge to be visually outside the frame of the parent window.

4. Note that to retrieve the background color of the window, you should use the windowBackgroundColor method, instead of backgroundColor. This is because we draw the entire background of the window (rounded path, arrow, etc) in an NSColor pattern image, and set it as the backgroundColor of the window.

Subclass of the NSWindowMBS class.

170.3.2 Methods

170.3.3 attachedWindow(view as NSViewMBS, point as NSPointMBS = nil, window as NSWindowMBS = nil, onSide as Integer = 12, distance as Double = 0.0) as MAAttachedWindowMBS

Notes:

view: The view to display in the attached window. Must not be nil.
point: The point to which the attached window should be attached. If you are also specifying a parent window, the point should be in the coordinate system of that parent window. If you are not specifying a window, the point should be in the screen’s coordinate space. This value is required.
window: The parent window to attach this one to. Note that no actual relationship is created (particularly, this window is not made a childWindow of the parent window). Default: nil.
onSide: The side of the specified point on which to attach this window. Default: MAPositionAutomatic.
distance: How far from the specified point this window should be. Default: 0.

Returns a new attached window.
170.3.4 Constructor(view as NSViewMBS, point as NSPointMBS = nil, window as NSWindowMBS = nil, onSide as Integer = 12, distance as Double = 0.0)

view: The view to display in the attached window. Must not be nil.
point: The point to which the attached window should be attached. If you are also specifying a parent window, the point should be in the coordinate system of that parent window. If you are not specifying a window, the point should be in the screen’s coordinate space. This value is required.
window: The parent window to attach this one to. Note that no actual relationship is created (particularly, this window is not made a childWindow of the parent window). Default: nil.
onSide: The side of the specified point on which to attach this window. Default: MAPositionAutomatic.
distance: How far from the specified point this window should be. Default: 0.

170.3.5 setBackgroundImage(image as NSImageMBS)

170.3.6 setPoint(point as NSPointMBS, side as Integer)

170.3.7 side as Integer

MBS MacExtras Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. Function: Which side the attached window is showing at. Notes: If you passed automatic side mode to Constructor or attachedWindow method, you can query here which side was chosen.
170.3.8 Properties

170.3.9 arrowBaseWidth as Double

Function: The arrow base width.
Notes:
Default is 20.
(Read and Write computed property)

170.3.10 arrowHeight as Double

Function: The height of the arrow.
Notes:
Default is 16.
(Read and Write computed property)

170.3.11 borderColor as NSColorMBS

Function: The border color.
Notes:
Default is white.
(Read and Write computed property)

170.3.12 borderWidth as Double

Function: The border width.
Notes:
Default is 2.
(Read and Write computed property)
170.3.13  cornerRadius as Double

Function: The corner radius.
Notes: Default is 8.
(Read and Write computed property)

170.3.14  drawsRoundCornerBesideArrow as boolean

Function: Whether to draw round corners beside arrow.
Notes: Default is true.
(Read and Write computed property)

170.3.15  hasArrow as boolean

Function: Whether the window shows an arrow.
Notes: Default is true.
(Read and Write computed property)

170.3.16  viewMargin as Double

Function: The view margin.
Notes: Default is 2.
(Read and Write computed property)

170.3.17  windowBackgroundColor as NSColorMBS

Function: The window background color.
Notes:
170.3. CLASS MAATTACHEDWINDOWMBS

Default is 25% dark gray.
(Read and Write computed property)

170.3.18 Constants

170.3.19 MAPositionAutomatic = 12

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants.  
**Notes:** automatic

170.3.20 MAPositionBottom = 1

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants.  
**Notes:** bottom

170.3.21 MAPositionBottomLeft = 10

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants.  
**Notes:** bottom left

170.3.22 MAPositionBottomRight = 11

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants.  
**Notes:** bottom right

170.3.23 MAPositionLeft = 0

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants.  
**Notes:** left

170.3.24 MAPositionLeftBottom = 5

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants.  
**Notes:** left bottom
170.3.25 MAPositionLeftTop = 4

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** left top

170.3.26 MAPositionRight = 2

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** right

170.3.27 MAPositionRightBottom = 7

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** right bottom

170.3.28 MAPositionRightTop = 6

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** right top

170.3.29 MAPositionTop = 3

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** top

170.3.30 MAPositionTopLeft = 8

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** top left

170.3.31 MAPositionTopRight = 9

MBS MacExtras Plugin, Plugin Version: 11.2. **Function:** One of the position constants. **Notes:** top right
170.4  Globals

170.4.1  DisableScreenUpdatesMBS

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Temporarily disables redraw of the screen after changes to window geometry or window contents.

**Notes:**
It is appropriate to disable updates if you are moving or resizing multiple windows and you want all of the geometry changes to appear onscreen simultaneously. In most other cases, you should strive to avoid disabling screen updates. The window server will automatically re-enable updates (and print a message to the Console log) if you leave updates disabled for a sufficiently long period of time, currently about 1 second.

The window server records the number of calls to DisableScreenUpdates and does not re-enable updates until a matching number of calls to EnableScreenUpdates have been made.

170.4.2  EnableScreenUpdatesMBS

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** Re-enables redraw of the screen after changes to window geometry or window contents.

**Notes:** Screen redraw is not actually enabled until the number of calls to EnableScreenUpdatesMBS matches the number of calls to DisableScreenUpdatesMBS.

170.4.3  AreFloatingWindowsVisibleMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if floating windows are visible

**Example:**

```pascal
if not AreFloatingWindowsVisibleMBS then
  ShowAllFloatingWindowsMBS
end if
```

**Notes:** You should hide floating windows before showing a dialog.

170.4.4  CollapseAllWindowsMBS(collapse as boolean)

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Collapse all windows.

**Example:**
CollapseAllWindowsMBS true

Notes: Like pressing alt while you click on the collapse button with the mouse.

170.4.5 HideAllFloatingWindowsMBS

Example:
HideAllFloatingWindowsMBS

Notes: You should hide floating windows before showing a dialog.

170.4.6 ShowAllFloatingWindowsMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Shows all floating windows.
Example:
ShowAllFloatingWindowsMBS

Notes: You should hide floating windows before showing a dialog.

170.5 class OverlayMBS

170.5.1 class OverlayMBS

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. Function: This class gives you a window overlaying all other windows with an alpha channel.
Example:

dim o as OverlayMBS
dim p as Picture

o=new OverlayMBS(100,100,300,300)
170.5. CLASS OVERLAYMBS

p=NewPicture(300,300,32)
p.Graphics.ForeColor=&c000000
p.Graphics.FillRect 0,0,300,300

o.Pict=p

p=NewPicture(300,300,32)
p.Graphics.ForeColor=&c000000
p.Graphics.FillOval 0,0,300,300
p.Graphics.FillOval 100,100,100,100

o.Mask=p

o.UpdateShow

// wait 5 seconds to see the window
DelayMBS 5

Notes:
Requires Mac OS X 10.3.9 or Windows 2000 or newer.

Cocoa implementation added with Mac OS X 10.4 class.
To support high resolution mode on Mac OS X high resolution displays, please make the picture+mask exact the double width and height of the window.

170.5.2 Methods

170.5.3 Close

MBS Overlay Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Calls the destructor. **Notes:** Closes the window and releases all memory used from the overlay.

170.5.4 Constructor(left as Integer, top as Integer, width as Integer, height as Integer, MacAttributes as Integer, WinExStyle as Integer, WinStyle as Integer)

MBS Overlay Plugin, Plugin Version: 10.1, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The advanced constructor where you can pass flags for Mac and Windows directly.
Notes:

Windows ExStyle flags:

// fill the window mask with around 10% transparency
m.Graphics.ForeColor = RGB( 20,20,20 )
m.Graphics.FillRoundRect 0, 0, rect_width, rect_height, round_rect_int, round_rect_int

// write text into picture
p(Graphics.ForeColor)& cFFFFFF

// make the text not transparent
m.Graphics.ForeColor=& c000000
m.Graphics.DrawString "Hello",10,20
```
o=new OverlayMBS(200,200,rect.width, rect.height, true)
o.Pict=p
o.Mask=m
o.UpdateShow

Notes:
Requires Mac OS X 10.3.9 or Windows 2000 or newer.
On success the handle property is not zero.

If WindowsNoActivate the window is setup to not become the front window. This may be a better setup for a toolbar like window.
If WindowsTopMost is false the window is not floating in front of all other windows.

Seems like WindowsNoActivate on Windows works better if you call Show(4) right after the constructor.
See also:

- 170.5.4 Constructor(left as Integer, top as Integer, width as Integer, height as Integer, MacAttributes as Integer, WinExStyle as Integer, WinStyle as Integer)

170.5.6  Hide

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. Function:
Hides the window.

170.5.7  InvalidateShadow

MBS Overlay Plugin, Plugin Version: 11.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Invalidates the shadow of the window.
Notes:
As soon as possible the operation system will recalculate the shadow.
Works only on Mac OS X with Carbon or Cocoa window.

170.5.8  MacTransitionWindow(parent as window, effect as Integer, action as Integer) as Integer

MBS Overlay Plugin, Plugin Version: 9.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Runs window transition.
170.5  CLASS OVERLAYMBS

**Notes:** see other TransitionWindow method for details.

- 170.5.12 MacTransitionWindow(parentWindowHandle as Integer, effect as Integer, action as Integer) as Integer
- 170.5.13 MacTransitionWindow(parentWindowHandle as Integer, effect as Integer, action as Integer, Async as boolean, duration as Double) as Integer
- 170.5.14 MacTransitionWindow(parentWindowHandle as Integer, effect as Integer, action as Integer, left as Integer, top as Integer, width as Integer, height as Integer) as Integer
- 170.5.15 MacTransitionWindow(parentWindowHandle as Integer, effect as Integer, action as Integer, left as Integer, top as Integer, width as Integer, height as Integer, Async as boolean, duration as Double) as Integer

170.5.11 MacTransitionWindow(parent as window, effect as Integer, action as Integer, left as Integer, top as Integer, width as Integer, height as Integer, Async as boolean, duration as Double) as Integer

MBS Overlay Plugin, Plugin Version: 9.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Runs window transition with additional parameters and rectangle.
Notes:
Transitions a window from one state to another with appropriate animation and sound.

Returns Mac OS error code like 0 for success, -1 for parameter error in the plugin or -50 for parameter error.
self: The window that should be transitioned.
parent: For use with kWindowSheetTransitionEffect. This is the parent window of the sheet.
effect: The type of visual effect to use.
action: The action to take on the window.
left: The rectangle to be used.
top: The rectangle to be used.
width: The rectangle to be used.
height: The rectangle to be used.
async: Whether the transition should run synchronously or asynchronously. If Async is true, TransitionWindow will return immediately, and the transition will run using an event loop timer. You must run your event loop for the transition to occur. If Async is false, TransitionWindow will block until the transition is completed.
duration: The duration of the fade, in seconds. For use with the Sheet, Slide, Fade, and Genie transition effects; ignored for other effects. You may pass 0 to use the default duration. The effect is not guaranteed to last precisely this long, but should be a close approximation.

Visual effects that are provided by TransitionWindow:

- **kWindowZoomTransitionEffect** 1 Finder-like zoom rectangles. Use with TransitionWindow and Show or Hide transition actions
- **kWindowSheetTransitionEffect** 2 Zoom in/out from parent. Use with TransitionWindowAndParent and Show or Hide transition actions. Available in Mac OS X, and in CarbonLib 1.5 and later.
- **kWindowSlideTransitionEffect** 3 Slide the window into its new position. Use with TransitionWindow and Move or Resize transition actions. Available in Mac OS X, and in CarbonLib 1.5 and later.
- **kWindowFadeTransitionEffect** 4 Fade the window into or out of visibility. Use with the Show or Hide transition actions. Available in Mac OS X 10.3 and later.
- **kWindowGenieTransitionEffect** 5 Use the Genie effect that the Dock uses to minimize or maximize a window to show or hide the window. Use with the Show or Hide transition actions. Available in Mac OS X 10.3 and later.

**Actions:** Modifications to window state that are provided by TransitionWindow

This is only for Carbon, not for Cocoa!

See also:

- 170.5.9 MacTransitionWindow(parent as window, effect as Integer, action as Integer, Async as boolean,
CHAPTER 170. WINDOW

kWindowShowTransitionAction 1 Shows the window. Use with the Zoom, Sheet, Fade, or Genie transition effects. For the Zoom, Sheet, and Genie effects, the rectangle parameter is the global coordinates from which to start the animation; rectangle is optional for the Zoom and Sheet effects, and in that case, the animation begins at the center of the window. The Genie effect requires a rectangle parameter. The Fade effect does not use the inRect parameter.

kWindowHideTransitionAction 2 Hides the window. Use with the Zoom, Sheet, Fade, or Genie transition effects. For the Zoom, Sheet, and Genie effects, the rectangle parameter is the global coordinates at which to end the animation; Recangle is optional for the Zoom and Sheet effects, and in that case, the animation ends at the center of the window. The Genie effect requires a rectangle. The Fade effect does not use the inRect parameter.

kWindowMoveTransitionAction 3 Moves the window. Use with the Slide transition effect. The rectangle parameter is the global coordinates of the window’s new structure bounds; Rectangle must be provided. Available in Mac OS X, and in CarbonLib 1.5 and later.

kWindowResizeTransitionAction 4 Resizes the window. Use with the Slide transition effect. The rectangle parameter is the global coordinates of the window’s new structure bounds; Rectangle must be provided. Available in Mac OS X, and in CarbonLib 1.5 and later.

- SW_SHOWNA 8
- SW_RESTORE 9
- SW_SHOWDEFAULT 10
- SW_FORCEMINIMIZE 11

170.5.20 Update

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Updates the window. **Notes:** After you draw new content into the pict and mask pictures, you call this method to apply changes to the window. See also:

- 170.5.21 Update(NSImage as Variant)

170.5.21 Update(NSImage as Variant)

MBS Overlay Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Updates overlay window with given NSImage.
Notes:

Please pass NSImageMBS object.

Version 16.2 and newer also accepts CGImageMBS object here.
If you pass picture, we use it as CGImage or NSImage depending on what picture type you pass.
See also:

- 170.5.20 Update

170.5.22 UpdateShow

Notes: Runs Update and Show internally.

170.5.23 Properties

170.5.24 Alpha as Double

Notes:
0 is invisible and 1.0 is visible.
(Read and Write property)

170.5.25 AutoCaptureMouse as Boolean

Notes:
If you return true from MouseDown the mouse is caught. This way you can get the drag events even if the mouse moves out of the window.
On MouseUp the mouse is released.
(Read and Write property)
170.5.26 CurrentImage as Variant

MBS Overlay Plugin, Plugin Version: 14.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Last image drawn.  
**Notes:**  
For debugging only.  
CGImageMBS or NSImageMBS depending on what you set.  
(Read only property)

170.5.27 Height as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The height of the window.  
**Notes:**  
Using Resize method is more efficient than assigning width and height properties.  
(Read and Write property)

170.5.28 IgnoreMouseClicks as Boolean

MBS Overlay Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Whether this window should react to mouse clicks.  
**Notes:**  
In Mac OS X 10.7 and newer setting IgnoreMouseClicks = false does not give the same behavior as without setting this property before.  
(Read and Write property)

170.5.29 Left as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The position of the window.  
**Example:**

```
static o as OverlayMBS // keep the variable global somewhere. Static or part of a module or in app class.

o = new OverlayMBS(100,100,100,100)
o.Pict = LogoMBS(100)
o.mask = LogoMBS(100)
o.Left = 200
```
19982

CHAPTER 170. WINDOW

o.UpdateShow

Notes:
Using Move method is more efficient than assigning left and top properties.
(Read and Write property)

170.5.30 Mask as Picture

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. Function:
The mask for the window.
Notes:
You need to create and assign your own image.
If you assign nil for the mask, the plugin uses the mask or alpha channel of the picture.
(Read and Write property)

170.5.31 NSView as Variant

MBS Overlay Plugin, Plugin Version: 15.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
The NSView showing the content of the overlay.
Notes: (Read only property)

170.5.32 NSWindow as Variant

MBS Overlay Plugin, Plugin Version: 10.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:
Returns a reference to the NSWindowMBS object which you can use to make additional settings to the overlay
window.
Example:

```
dim o as OverlayMBS // your window

dim n as NSWindowMBS = o.NSWindow // this window should not hide if app hides
n.canHide = false
```

Notes:
Only for the Cocoa target in Real Studio.
170.5. CLASS OVERLAYMBS

(Read only property)

170.5.33  Pict as Picture

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The picture for the window content.
**Notes:**
You need to provide your own picture here.
Pict and Mask pictures must have the same size.

Alpha Channel Pictures are not really supported.
But for Mac OS X an alpha channel picture does currently work.
(Read and Write property)

170.5.34  Top as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The position of the window.
**Example:**

```plaintext
static o as OverlayMBS // keep the variable global somewhere. Static or part of a module or in app class.

o = new OverlayMBS(100,100,100,100)

o.Pict = LogoMBS(100)
o.mask = LogoMBS(100)

o.top = 200

o.UpdateShow
```

**Notes:**
Using Move method is more efficient than assigning left and top properties.
(Read and Write property)

170.5.35  Visible as Boolean

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** Whether the window is visible.
Example:

```plaintext
Dim o as OverlayMBS
// ....
o.visible=true
```

Notes:

True if visible, false if hidden.
(Read and Write property)

170.5.36 Width as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The width of the window.
**Notes:**
Using Resize method is more efficient than assigning width and height properties.
(Read and Write property)

170.5.37 WindowHandle as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The internal used window handle.
**Notes:**
On Mac OS a WindowRef and on Windows a HWND.
(Read and Write property)

170.5.38 WindowID as Integer

MBS Overlay Plugin, Plugin Version: 10.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries the CoreGraphics Window ID for the given window.
**Notes:**
Returns 0 on any error.
This ID can be used for CGWindowListCreateImageMBS.
(Read only property)
170.5. **CLASS OVERLAYMBS**

170.5.39 **hasShadow as boolean**

MBS Overlay Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the window has a shadow. **Notes:** (Read and Write computed property)

170.5.40 **Title as string**

MBS Overlay Plugin, Plugin Version: 11.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The title of the window. **Notes:** This name is not visible as the window has no title bar. But if you see the window in some window list, this title property will give your overlay window a name. (Read and Write computed property)

170.5.41 **WindowGroupHandle as Integer**

MBS Overlay Plugin, Plugin Version: 9.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The window group of that window. **Notes:** Keep the group reference when setting this value as the reference count is not retained. (Read and Write computed property)

170.5.42 **WinIsTopMost as boolean**

MBS Overlay Plugin, Plugin Version: 12.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Whether a window is staying on the top of the other windows. **Notes:** If true the window stays in front of other windows. Default is false for Real Studio windows and true for overlays. (Read and Write computed property)

170.5.43 **Events**

170.5.44 **GotFocus**

MBS Overlay Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The event called when focus is set on the overlay window.
CHAPTER 170. WINDOW

Notes: Works for Windows and macOS Cocoa.

170.5.45 **KeyDown(key as String, keyCode as Integer, modifiers as integer) as Boolean**

MBS Overlay Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The key down event. **Notes:** The plugin translates keycodes into key as text, but also provides keycode and modifier flags. Works for Windows and macOS Cocoa.

170.5.46 **KeyUp(key as String, keyCode as Integer, modifiers as integer) as Boolean**

MBS Overlay Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The key up event. **Notes:** The plugin translates keycodes into key as text, but also provides keycode and modifier flags. Works for Windows and macOS Cocoa.

170.5.47 **LostFocus**

MBS Overlay Plugin, Plugin Version: 17.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** The event called when focus is lost on the overlay window. **Notes:** Works for Windows and macOS Cocoa.

170.5.48 **menuForEvent(NSEvent as variant) as Variant**

MBS Overlay Plugin, Plugin Version: 17.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Provide a contextual menu for Cocoa Mac. **Notes:** NSEvent is an NSEventMBS object. Please return NSMenuMBS object. (and please keep a reference somewhere)
170.5. Class OverlayMBS

170.5.49 MouseDown(x as Integer, y as Integer, modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:**
This event is called when the user clicks with the mouse inside the window.
**Notes:**
Return true if you handled this event.
modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

170.5.50 MouseDragged(x as Integer, y as Integer, modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:**
This event is called when the user moves the mouse over the window while the mouse is pressed.
**Notes:**
Return true if you handled this event.
modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

170.5.51 MouseEnter(x as Integer, y as Integer, modifiers as Integer)

MBS Overlay Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:**
This is event is called when mouse enters window.
**Notes:**
modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

170.5.52 MouseExit(x as Integer, y as Integer, modifiers as Integer)

MBS Overlay Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:**
This is event is called when mouse leaves window.
**Notes:**
modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!
For Cocoa to set mouse cursor, please use NSCursorMBS class.

### 170.5.53 MouseMoved(x as Integer, y as Integer, modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called when the user moves the mouse over the window. **Notes:**
Return true if you handled this event.
modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

### 170.5.54 MouseUp(x as Integer, y as Integer, modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called when the user releases the mousebutton inside the window. **Notes:**
Return true if you handled this event.
modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

### 170.5.55 MouseWheel(x as Integer, y as Integer, dx as Double, dy as Double, modifiers as Integer)

MBS Overlay Plugin, Plugin Version: 13.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** This event is called when the user uses the mouse wheel inside the window. **Notes:**
modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.
170.5.56 WindowBoundsChanged

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called whenever the size of the window changes. **Notes:** Can also be called on position changes.

170.5.57 WindowClosed

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called when the window is closed.

170.5.58 WindowHidden

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called when the window is hidden. **Notes:** Cocoa support added for version 14.0.

170.5.59 WindowShown

MBS Overlay Plugin, Plugin Version: 8.6, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Function:** This event is called when the window is shown. **Notes:** Cocoa support added for version 14.0.

170.5.60 Constants

170.5.61 kModifierFlagCommand = 1048576

MBS Overlay Plugin, Plugin Version: 17.4. **Function:** One of the modifier constants. **Notes:**
The command key is pressed.
Use with BitwiseAnd(Modifiers, kModifierFlagCommand) <>0 to check if the flag is set in key events.

170.5.62 kModifierFlagControl = 262144

MBS Overlay Plugin, Plugin Version: 17.4. **Function:** One of the modifier constants. **Notes:**
The control key is pressed.
Use with BitwiseAnd(Modifiers, kModifierFlagControl) <>0 to check if the flag is set in key events.

170.5.63  kModifierFlagOption = 524288

MBS Overlay Plugin, Plugin Version: 17.4. **Function:** One of the modifier constants.
**Notes:**
The option (alt) key is pressed.
Use with BitwiseAnd(Modifiers, kModifierFlagOption) <>0 to check if the flag is set in key events.

170.5.64  kModifierFlagShift = 131072

MBS Overlay Plugin, Plugin Version: 17.4. **Function:** One of the modifier constants.
**Notes:**
The shift key is pressed.
Use with BitwiseAnd(Modifiers, kModifierFlagShift) <>0 to check if the flag is set in key events.
170.6. CLASS WINDOW

170.6 class Window

170.6.1 class Window

Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Extends Realbasic’s Window Class.

**Example:**

```
window1.HasNoTitleBarMBS = true
```

**Notes:** In Realbasic 2005 and newer you need to use `self` in front of the method as the property name alone is not accepted.

170.6.2 Methods

170.6.3 BackingScaleFactorMBS as Double

MBS Util Plugin, Plugin Version: 12.3, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the scale factor representing the number of backing store pixels corresponding to each linear unit in window space on this window.

**Notes:**
This is generally only necessary when building a bitmap context or image whose resolution needs to match that of a particular Window. Note that a Window’s backing scale factor can change over time, such as when the window moves from one display to another, or when a display’s resolution changes, so clients should not cache the value returned by this function.

If platform does not support scaling factor, we return 1.0. (on Windows, Linux and older Mac OS X) Supported for Carbon and Cocoa windows.

For apps which are not enabled for retina support, the function returns 1. So you only see 2 here if app is Cocoa, display is retina and info.plist has the NSHighResolutionCapable key.

170.6.4 CGContextMBS as CGContextMBS

MBS MacCG Plugin, Plugin Version: 2.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a new CGContextMBS object for the given Window.

**Example:**

```
dim CGContext as CGContextMBS
dim OverlayPic as Picture=LogoMBS(500)
dim contentpicture as CGImageMBS= CGCreateImageMBS(OverlayPic)
```
CGContext=window1.CGContextMBS

CGContext.ClearRect CGMakeRectMBS(0, 0, OverlayPic.width, OverlayPic.height)
CGContext.DrawPicture contentpicture, CGMakeRectMBS(0, 0, OverlayPic.width, OverlayPic.height)

Notes:
Requires Mac OS X to work.
Please make sure the CGContextMBS object is released in the paint event if you use it there, so all the drawings are flushed. Not releasing it may be visible in missing statictext or other strange graphics effects.

Version 9.8 adds support for Cocoa target.
But on a Cocoa window the context is not always available, so in the window paint event, you can use GetCurrentCGContextMBS.

170.6.5 CleanUpTransparentMBS(refValue as Integer)

MBS Util Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: Cleans up transparency support for a REALbasic window.
Example:
    dim p as Integer // property on Windows

    p = window1.MakeTransparentMBS

    // later in close event

    window1.CleanUpTransparentMBS p

Notes:
Call this in the close event of a window passing the value you got from the MakeTransparentMBS call. Linux supported added with 14.0, but works only with Linux desktop which support alpha channel.

170.6.6 ClearTransparencyMBS

170.6. CLASS WINDOW

170.6.7 CollapsibleMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if this window can be collapsed.
**Example:**
MsgBox str(window1.CollapsibleMBS)

**Notes:**
Collapseable windows are the normal document windows.
You can’t collapse dialogs or floating windows well.
In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.

170.6.8 ConstrainWindowToScreenMBS(animate as boolean)

MBS Util Plugin, Plugin Version: 10.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Makes sure the window is on one screen visible.
**Notes:** Implemented on Mac for both Carbon and Cocoa.

170.6.9 DrawIntoDockTileMBS(pic as CGImageMBS, clearbeforedrawing as boolean) as Integer

MBS MacCG Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Draws into a window’s dock tile.
**Notes:**
Returns a Mac OS error code (-1 for function not available and 0 for okay).
If clearbeforedrawing=true then the area is cleared before the image is drawn.

Not available on Cocoa.

170.6.10 GetWindowBoundsMBS(byref x as Integer, byref y as Integer, byref w as Integer, byref h as Integer) as Integer

MBS Util Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Queries the window structure size.
Example:

// a Finder like Zoom from the top left of the screen to the center

dim h as Integer
dim i as Integer
dim w as Integer
dim x as Integer
dim y as Integer
dim l as Integer
dim r as IntegerRectMBS
dim e as Integer
dim TheWindow as window // the window

e=TheWindow.GetWindowBoundsMBS(x,y,w,h)

x=(screen(0).Width-300)/2
y=(screen(0).Height-300)/2

w=300
h=300
e=TheWindow.SetWindowBoundsMBS(x,y,w,h)

TheWindow.top=y
TheWindow.left=x
TheWindow.height=h
TheWindow.width=w

//Center the window

x=0
y=0
w=0
h=0

call TheWindow.TransitionWindowMBS(nil,1,1,x,y,w,h,False,5.0)

Notes:

Returns -1 on Windows or Linux.
Returns a Mac OS error code.
170.6. CLASS WINDOW

170.6.11 GTKWindow as GTKWindowMBS

MBS Linux Plugin, Plugin Version: 13.0, Console & Web: No, Mac: No, Win: No, Linux: Yes. **Function:** Queries a GTKWindow object for this window. **Notes:**

Returns only a valid object on linux.
On other platforms, this function returns nil.

170.6.12 InvalidateShadowMBS

MBS MacOSX Plugin, Plugin Version: 8.7, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** This method causes a window’s shadow to be recalculated. **Notes:**

InvalidateShadowMBS is not typically used by applications. However, it may be useful for applications with customized window frames that change shape dynamically; in this case, after the application has drawn the new window shape, the window shadow must be recalculated to follow the new window shape.

This method causes the window shadow to be immediately recalculated and redrawn based on the current contents of the window’s back buffer. For best performance and visual appearance, you should follow these steps when invalidating a window shadow: disable updates with DisableScreenUpdatesMBS, draw, flush, invalidate the shadow, and enable updates. For a compositing window, after invalidating any views that should be redrawn, you will need to explicitly draw and flush using HIWindowFlush, rather than waiting for the event loop to draw and flush the window, because you cannot disable updates or invalidate the window shadow if drawing is done via the event loop.

Requires Mac OS X 10.4 and should do nothing on 10.3.

170.6.13 IsFullScreenMBS as Boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Queries whether window is fullscreen. **Notes:**

Indicates that a window has fullscreen appearance.
A fullscreen window does not draw its titlebar, and may have special handling for its toolbar. Available in Mac OS X v10.7 and later.
170.6.14  MakeTransparentMBS as Integer

MBS Util Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Installs transparency support to a REALbasic window.

**Example:**

```plaintext
dim p as Integer // property on Windows

p = window1.MakeTransparentMBS

// later in close event

window1.CleanUpTransparentMBS p
```

**Notes:**

Will return non zero value if successful.
The window doesn’t change if you don’t use the CGContextMBS property.

Requires Mac OS X, Windows 2000 or Windows XP to work. The window must be a document window.

Set MacProcID of the window to 1104 and you can make it transparent without a title bar. (on Mac OS X)

With plugin version 11.1, we now return a value which should store with the window. Later in the Close event, you call CleanUpTransparentMBS passing this value.

Added Cocoa support in 11.3 plugins.
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel. Calls to MakeTransparentMBS and CleanUpTransparentMBS are not required for Linux.

170.6.15  NSPanelMBS as NSPanelMBS

MBS MacBase Plugin, Plugin Version: 12.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Creates a NSPanel for the given Real Studio window.

**Example:**

```plaintext
MsgBox window1.NSPanelMBS.Title
```

**Notes:** Works only for Cocoa Windows in Cocoa target which are floating panels.
170.6. CLASS WINDOW

170.6.16 NSToolbarMBS as NSToolbarMBS

**Function:** The window’s toolbar.
**Notes:**
So you can get the toolbar without going over NSWindowMBS.
But there you can assign a new toolbar...

170.6.17 NSWindowMBS as NSWindowMBS

**Function:** Creates a NSWindow for the given REALbasic window.
**Example:**
MsgBox window1.NSWindowMBS.Title

**Notes:** Works only for Cocoa Windows in Cocoa target and for Carbon Windows in carbon targets.

170.6.18 RemoveWindowProxyIconMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No.
**Function:** Removes any Proxy Icon from the Window.
**Example:**
mainwindow.RemoveWindowProxyIconMBS

**Notes:**
Requires Mac OS 8.5 or newer.
In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

170.6.19 RootViewMBS as HIViewMBS

**Function:** Returns the root view for a window.
**Deprecated:** This item is deprecated and should no longer be used. You can use NSViewMBS instead.
**Notes:**
Nil on any error.
Note that composite windows and non-composite windows have different view hierarchies.
Requires Mac OS X 10.2 to work.

Returns nil on Cocoa Windows.

### 170.6.20 ScreenshotWindowMBS as picture

MBS MacOSX Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the content of the window buffer on Mac OS X.

**Example:**

```vbnet
dim p as Picture
p=mainwindow.screenshotWindowMBS
```

**Notes:**

Only for Mac OS X. Image is taken from window back buffer.
This will not capture overlay windows.

On Realbasic 2006, please add a `self.` on front of the method call in case you want to use the method on the current window.

### 170.6.21 ScreenshotWindowRectMBS(left as Integer, top as Integer, width as Integer, height as Integer) as picture

MBS MacOSX Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns a part of the content of the window buffer on Mac OS X.

**Example:**

```vbnet
dim p as picture
p=mainwindow.ScreenshotWindowRectMBS(100,100,200,200)
```

**Notes:**

Only for Mac OS X. Image is taken from window back buffer.
This will not capture overlay windows.

On Realbasic 2006, please add a `self.` on front of the method call in case you want to use the method on the current window.
170.6.22 SetContentBorderThicknessMBS(left as Double, top as Double, right as Double, bottom as Double) as boolean

MBS Util Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the thickness of the window border that extends into the content area of the window. **Deprecated:** This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Notes:**

In Mac OS X 10.5, windows can have a gradient on the top and bottom section of the window which have the appearance and behavior of being part of the window frame. The window frame gradient is drawn or extended into this border and the window is draggable from this area. Functionally, the area actually extends into the content of the window where the client can embed controls or print status messages a la iTunes. This can be set on all non-floating windows.

Requires Mac OS X 10.5 and a carbon composite window. For Cocoa, please use methods in NSWindowMBS class.

left/top/right/bottom: Values that indicates how much of the content area is used for the frame gradient drawing. Currently only the top and bottom fields are allowed. If any value other than 0 is used for the left or right fields, this function will return false.

Returns true on success and false on failure.

---

170.6.23 SetTransparencyMBS(value as Integer) as boolean

MBS Util Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Your window can have transparency on Mac OS X. **Example:**

```pascal
if window1.SetTransparencyMBS(127) then
  'fine
else
  'error
end if
```

**Notes:**

Use values between 0 and 255. Requires Mac OS X, Windows 2000 or Windows XP to work. May be limited to simple windows like normal document windows.
You need to call MakeTransparent before to install transparency. 
(this function was replaced in v4.4)
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel.

**170.6.24 SetWindowBoundsMBS(x as Integer, y as Integer, w as Integer, h as Integer) as Integer**

MBS Util Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the window structure size.

**Example:**

call window1.SetWindowBoundsMBS(100,100,100,100)

**Notes:**

Returns -1 on Windows or Linux.
Returns a Mac OS error code.

**170.6.25 SetWindowFeedbackSettingMBS(Feedback as Integer, value as Variant) as Boolean**

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Sets the feedback configuration for a window.

**Example:**

```
const FEEDBACK_TOUCH_CONTACTVISUALIZATION = 1
const FEEDBACK_PEN_BARRELVISUALIZATION = 2
const FEEDBACK_PEN_TAP = 3
const FEEDBACK_PEN_DOUBLETAP = 4
const FEEDBACK_PEN_PRESSANDHOLD = 5
const FEEDBACK_PEN_RIGHTTAP = 6
const FEEDBACK_TOUCH_TAP = 7
const FEEDBACK_TOUCH_DOUBLETAP = 8
const FEEDBACK_TOUCH_PRESSANDHOLD = 9
const FEEDBACK_TOUCH_RIGHTTAP = 10
const FEEDBACK_GESTURE_PRESSANDTAP = 11
```

```
dim r as Boolean = self.SetWindowFeedbackSettingMBS(FEEDBACK_TOUCH_TAP, true)
if r then
    dim value as Boolean
    dim b as Boolean = self.WindowFeedbackSettingMBS(FEEDBACK_TOUCH_TAP, value)
```
if b then
MsgBox "WindowFeedbackSettingMBS: \""+str(value)
end if
end if

Notes:
Returns true if successful; otherwise, returns false.
Value can be nil to reset value. Or true/false to set it.
Requires Windows 8 or Windows Server 2012 in desktop apps only.

170.6.26  SetWindowIconMBS(Type as Integer, File as FolderItem, IconID as Integer) as Boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sets the window icon using the icon in the file.
**Example:**

call window1.SetWindowIconMBS(0,getfolderitem("icon.ico"),1)

Notes:
Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.

Type is 0 for a small icon and 1 for a big icon.
See also:

• 170.6.27 SetWindowIconMBS(Type as Integer, Icon as Picture, Mask as Picture) as Boolean
170.6.27 SetWindowIconMBS(Type as Integer, Icon as Picture, Mask as Picture) as Boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Sets the window icon using the given picture with mask.

**Example:**

```vbnet
dim p as Picture
dim m as Picture

// random colored circle image
p=NewPicture(16,16,32)
p.Graphics.ForeColor=& c000000
p.Graphics.FillRect 0,0,16,16
p.Graphics.ForeColor=rgb(rnd*256,rnd*256,rnd*256)
p.Graphics.Filloval 0,0,16,16

// circle mask
m=NewPicture(16,16,32)
m.Graphics.ForeColor=& cFFFFFF // transparent
m.Graphics.FillRect 0,0,16,16
m.Graphics.ForeColor=& c000000 // color
m.Graphics.Filloval 0,0,16,16

Canvas1.Backdrop=p // show in canvas
Canvas2.Backdrop=m

call window1.SetWindowIconMBS(0,p,m)
```

**Notes:**
The mask picture is converted to black/white.
What image depths are used and supported depends on the Windows version.
Returns true on success and false on failure.

Possible values for type:

- **ICON_BIG = 1** Set the large icon for the window.
- **ICON_SMALL = 0** Set the small icon for the window.

See also:

- 170.6.26 SetWindowIconMBS(Type as Integer, File as FolderItem, IconID as Integer) as Boolean 20001
170.6. CLASS WINDOW

170.6.28 SetWindowMaskMBS(p as picture, redraw as Boolean, transparent-Color as color) as Boolean

MBS Win Plugin, Plugin Version: 3.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Sets the mask of a window.
**Notes:**
Redraw decides whether the window is redrawn after it has been changed.
Returns true if successful.

If you want to do the same on Mac OS X, check the example projects "transparent window" and the Photoshop Splash Screen example.

On Mac OS 9 you need a solution with a WDEF Resource which is not part of the plugin collection.

170.6.29 SetWindowProxyIconMBS(type as string,creator as string)

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** That's the icon to the window which belongs to the combination of type and creator codes.
**Example:**
mainwindow.SetWindowProxyIconMBS("RbBF","RBv2") // Add RB Doc Icon

**Deprecated:** This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Notes:**
Requires Mac OS 8.5 or newer.
In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

170.6.30 ShowHideToolbarMBS(animate as boolean, value as boolean)

MBS Util Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Shows or hides the toolbar.
**Notes:** Only working on Mac OS X.

170.6.31 SmoothResizeCenteredMBS(width as Integer,height as Integer)

MBS Util Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
Resizes the window smoothly to all directions.
Example:

```vbs
dim w, h as Integer

// get destination dimension
w = 300
h = 200

// Resize
window1.SmoothResizeCenteredMBS w, h

// Now resize via RB to make it permanent.
width = w
height = h
```

Notes:
You need to set the new size using REALbasic’s Windows properties, too. (no longer needed with Xojo)
In Realbasic 2005 and newer you need to use self. in front of the method as the property name alone is not accepted.

### 170.6.32 SmoothResizeMBS(width as Integer, height as Integer)

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Resizes the window smoothly.

Example:

```vbs
dim w, h as Integer

// get destination dimension
w = 300
h = 200

// Resize
window1.SmoothResizeMBS w, h

// Now resize via RB to make it permanent.
width = w
height = h
```
Notes:
You need to set the new size using REALbasic’s Windows properties, too. (no longer needed with Xojo)
In Realbasic 2005 and newer you need to use self. in front of the method as the propertynme alone is not
accepted.

Works on Cocoa on 10.4 and newer.

170.6.33  **ToggleFullScreenMBS as Boolean**

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Toggles fullscreen mode for this window.

Notes:
Returns true on success.
If an application supports fullscreen, it should add a menu item to the View menu with toggleFullScreen as
the action.
Available in Mac OS X v10.7 and later.
This method does not much if you don’t mark a window to be the primary fullscreen window.

170.6.34  **TransitionWindowMBS(parent as window, effect as Integer, action as Integer) as Integer**

MBS MacOSX Plugin, Plugin Version: 6.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Runs window transition.

Notes: see other TransitionWindow method for details.

170.6.37 TransitionWindowMBS(parent as window, effect as Integer, action as Integer, left as Integer, top as Integer, width as Integer, height as Integer, duration as Double) as Integer

MBS MacOSX Plugin, Plugin Version: 6.5, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Runs window transition with additional parameters and rectangle.

**Notes:**

Works only in Carbon, not in Cocoa. For Cocoa please use NSWindowMBS class.

Transitions a window from one state to another with appropriate animation and sound.

Returns Mac OS error code like 0 for success, -1 for parameter error in the plugin or -50 for parameter error.

Visual effects that are provided by TransitionWindow:

Actions: Modifications to window state that are provided by TransitionWindow

See also:

- 170.6.34 TransitionWindowMBS(parent as window, effect as Integer, action as Integer) as Integer

- 170.6.35 TransitionWindowMBS(parent as window, effect as Integer, action as Integer, Async as boolean, duration as Double) as Integer

- 170.6.36 TransitionWindowMBS(parent as window, effect as Integer, action as Integer, left as Integer, top as Integer, width as Integer, height as Integer) as Integer
self: The window that should be transitioned.
parent: For use with kWindowSheetTransitionEffect. This is the parent window of the sheet.
effect: The type of visual effect to use.
action: The action to take on the window.
left: The rectangle to be used.
top: The rectangle to be used.
width: The rectangle to be used.
height: The rectangle to be used.
async: Whether the transition should run synchronously or asynchronously. If Async is true, TransitionWindow will return immediately, and the transition will run using an event loop timer. You must run your event loop for the transition to occur. If Async is false, TransitionWindow will block until the transition is completed.
duration: The duration of the fade, in seconds. For use with the Sheet, Slide, Fade, and Genie transition effects; ignored for other effects. You may pass 0 to use the default duration. The effect is not guaranteed to last precisely this long, but should be a close approximation.

170.6. CLASS WINDOW

kWindowZoomTransitionEffect 1 Finder-like zoom rectangles. Use with TransitionWindow and Show or Hide transition actions.

kWindowSheetTransitionEffect 2 Zoom in/out from parent. Use with TransitionWindowAndParent and Show or Hide transition actions. Available in Mac OS X, and in CarbonLib 1.5 and later.

kWindowSlideTransitionEffect 3 Slide the window into its new position. Use with TransitionWindow and Move or Resize transition actions. Available in Mac OS X, and in CarbonLib 1.5 and later.

kWindowFadeTransitionEffect 4 Fade the window into or out of visibility. Use with the Show or Hide transition actions. Available in Mac OS X 10.3 and later.

kWindowGenieTransitionEffect 5 Use the Genie effect that the Dock uses to minimize or maximize a window to show or hide the window. Use with the Show or Hide transition actions. Available in Mac OS X 10.3 and later.

kWindowShowTransitionAction 1 Shows the window. Use with the Zoom, Sheet, Fade, or Genie transition effects. For the Zoom, Sheet, and Genie effects, the rectangle parameter is the global coordinates from which to start the animation; rectangle is optional for the Zoom and Sheet effects, and in that case, the animation begins at the center of the window. The Genie effect requires a rectangle parameter. The Fade effect does not use the inRect parameter.

kWindowHideTransitionAction 2 Hides the window. Use with the Zoom, Sheet, Fade, or Genie transition effects. For the Zoom, Sheet, and Genie effects, the rectangle parameter is the global coordinates at which to end the animation; Recangle is optional for the Zoom and Sheet effects, and in that case, the animation ends at the center of the window. The Genie effect requires a rectangle. The Fade effect does not use the inRect parameter.

kWindowMoveTransitionAction 3 Moves the window. Use with the Slide transition effect. The rectangle parameter is the global coordinates of the window’s new structure bounds; Rectangle must be provided. Available in Mac OS X, and in CarbonLib 1.5 and later.

kWindowResizeTransitionAction 4 Resizes the window. Use with the Slide transition effect. The rectangle parameter is the global coordinates of the window’s new structure bounds; Rectangle must be provided. Available in Mac OS X, and in CarbonLib 1.5 and later.

---

**update.**

**Example:**

Mainwindow.UpdateNowMBS

---

**170.6.44 UpdateNowRectMBS(left as Integer, top as Integer, width as Integer, height as Integer)**

MBS MacOSX Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** On Mac OS X all Windows are doublebuffered and the OS updates the screen from time to time. This method forces a screen update for a part of your window.

**Example:**
170.6.45 \textbf{WinAnimateWindowMBS(Flags as Integer, Time as Integer=200) as boolean}

MBS Win Plugin, Plugin Version: 9.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. \textbf{Function:} The AnimateWindow function enables you to produce special effects when showing or hiding windows. \textbf{Example:}

\begin{verbatim}
dim flags as Integer

const AW_SLIDE = & h040000 // Uses slide animation. By default, roll animation is used. This flag is ignored when used with AW_CENTER.
const AW_ACTIVATE = & h020000 // Activates the window. Do not use this value with AW_HIDE.
const AW_BLEND = & h080000 // Uses a fade effect. This flag can be used only if hwnd is a top-level window.
const AW_HIDE = & h010000 // Hides the window. By default, the window is shown.
const AW_CENTER = & h10 // Makes the window appear to collapse inward if AW_HIDE is used or expand outward if the AW_HIDE is not used. The various direction flags have no effect.
const AW_HOR_POSITIVE = 1 // Animates the window from left to right. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
const AW_HOR_NEGATIVE = 2 // Animates the window from right to left. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
const AW_VER_POSITIVE = 4 // Animates the window from top to bottom. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
const AW_VER_NEGATIVE = 8 // Animates the window from bottom to top. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.

window2.hide
flags=BitwiseOr(AW_SLIDE, AW_HOR_POSITIVE)

if window2.WinAnimateWindowMBS(flags, 1000) then
window2.show
else
MsgBox "Animatin failed."
end if
\end{verbatim}

\textbf{Notes:}
There are four types of animation: roll, slide, collapse or expand, and alpha-blended fade.
170.6. CLASS WINDOW

self: The window to animate. The calling thread must own this window.

Time: Specifies how long it takes to play the animation, in milliseconds. Typically, an animation takes 200 milliseconds to play.

Flags: Specifies the type of animation. This parameter can be one or more of the following values. Note that, by default, these flags take effect when showing a window. To take effect when hiding a window, use AW_HIDE and a bitwise or operator with the appropriate flags.

AW_SLIDE = &h040000 Uses slide animation. By default, roll animation is used. This flag is ignored when used with AW_CENTER.
AW_ACTIVATE = &h020000 Activates the window. Do not use this value with AW_HIDE.
AW_BLEND = &h080000 Uses a fade effect. This flag can be used only if hwnd is a top-level window.
AW_HIDE = &h010000 Hides the window. By default, the window is shown.
AW_CENTER = &h10 Makes the window appear to collapse inward if AW_HIDE is used or expand outward if the AW_HIDE is not used. The various direction flags have no effect.
AW_HOR_POSITIVE = 1 Animates the window from left to right. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
AW_HOR_NEGATIVE = 2 Animates the window from right to left. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
AW_VER_POSITIVE = 4 Animates the window from top to bottom. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
AW_VER_NEGATIVE = 8 Animates the window from bottom to top. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.

Return Value:
If the function succeeds, the return value is true.
If the function fails, the return value is false.

The function will fail in the following situations:

- If the window uses the window region. Windows XP: This does not cause the function to fail.
- If the window is already visible and you are trying to show the window.
- If the window is already hidden and you are trying to hide the window.
- If there is no direction specified for the slide or roll animation.
- When trying to animate a child window with AW_BLEND.
- If the thread does not own the window. Note that, in this case, AnimateWindow fails but GetLastError returns ERROR_SUCCESS. To get extended error information, call the GetLastError function.

To show or hide a window without special effects, use Show.

When using slide or roll animation, you must specify the direction. It can be either AW_HOR_POSITIVE, AW_HOR_NEGATIVE, AW_VER_POSITIVE, or AW_VER_NEGATIVE.

You can combine AW_HOR_POSITIVE or AW_HOR_NEGATIVE with AW_VER_POSITIVE or AW_VER_NEGATIVE to animate a window diagonally.

The window procedures for the window and its child windows should handle any WM_PRINT or WM_PRINTCLIENT messages. Dialog boxes, controls, and common controls already handle WM_PRINTCLIENT. The default
window procedure already handles WM_PRINT.
If a child window is displayed partially clipped, when it is animated it will have holes where it is clipped. AnimateWindow supports RTL windows. Avoid animating a window that has a drop shadow because it produces visually distracting, jerky animations.

170.6.46 WindowCloseBoxRectMBS as IntegerRectMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The size of the screen area your window uses for the close box. **Notes:** Carbon only. For Cocoa, check NSWindowMBS methods. May return nil on any error.

170.6.47 WindowCollapseBoxRectMBS as IntegerRectMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The size of the screen area your window uses for the collapse box. **Notes:** Carbon only. For Cocoa, check NSWindowMBS methods. May return nil on any error.

170.6.48 WindowContentRectMBS as IntegerRectMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The size of the screen area your window uses for the content of the window. **Notes:** Empty if the window is collapsed. Carbon only. For Cocoa, check NSWindowMBS methods. May return nil on any error.

170.6.49 WindowDragRectMBS as IntegerRectMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The size of the screen area your window uses for the drag box. **Notes:** Carbon only. For Cocoa, check NSWindowMBS methods. May return nil on any error.
170.6. CLASS WINDOW

170.6.50 WindowFeedbackSettingMBS(Feedback as Integer, byref value as boolean, IncludeAncestors as Boolean = false) as Boolean

Notes:
IncludeAncestors: Specifies that the parent window chain should be checked.

Returns true if the specified feedback setting is configured on the specified window. Otherwise, it returns false (and config won’t be modified).

Requires Windows 8 [ desktop apps only ] or Windows Server 2012 [ desktop apps only ].

170.6.51 WindowGrowRectMBS as IntegerRectMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The size of the screen area your window uses for the grow box.
Notes:
Carbon only. For Cocoa, check NSWindowMBS methods.
May return nil on any error.

170.6.52 WindowStructureRectMBS as IntegerRectMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: The size of the screen area your window uses for the structure of the whole window.
Notes:
May return nil on any error.

Carbon only. For Cocoa, check NSWindowMBS methods.

170.6.53 WindowTitleBarRectMBS as IntegerRectMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The size of the screen area your window uses for the title bar.

**Notes:**
Carbon only. For Cocoa, check NSWindowMBS methods (e.g. frameRectForContentRect).
May return nil on any error.

170.6.54 WindowTitleProxyIconRectMBS as IntegerRectMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The size of the screen area your window uses for the title proxy icon.

**Notes:**
Carbon only. For Cocoa, check NSWindowMBS methods.
May return nil on any error.

170.6.55 WindowTitleTextRectMBS as IntegerRectMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The size of the screen area your window uses for the title text.

**Notes:**
Carbon only. For Cocoa, check NSWindowMBS methods.
May return nil on any error.

170.6.56 WindowZoomBoxRectMBS as IntegerRectMBS

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The size of the screen area your window uses for the zoom box.

**Notes:**
Carbon only. For Cocoa, check NSWindowMBS methods.
May return nil on any error.
170.6. CLASS WINDOW

170.6.57 WinFlashWindowMBS(Invert as boolean)

MBS Util Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Flashes Window.

**Example:**

```plaintext
window1.WinFlashWindowMBS true
```

**Notes:**
Flashes the specified window one time. It does not change the active state of the window.

Invert: If this parameter is true, the window is flashed from one state to the other. If it is false, the window is returned to its original state (either active or inactive).

When an application is minimized and this parameter is true, the taskbar window button flashes active/inactive. If it is false, the taskbar window button flashes inactive, meaning that it does not change colors. It flashes, as if it were being redrawn, but it does not provide the visual invert clue to the user.

Flashing a window means changing the appearance of its caption bar as if the window were changing from inactive to active status, or vice versa. (An inactive caption bar changes to an active caption bar; an active caption bar changes to an inactive caption bar.)

Typically, a window is flashed to inform the user that the window requires attention but that it does not currently have the keyboard focus.

The FlashWindow function flashes the window only once; for repeated flashing, the application should create a system timer.

170.6.58 WinHideTooltipMBS as Integer

MBS Win Plugin, Plugin Version: 16.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Hides all tooltips.

**Notes:**
You can call that in window.deactivate event to hide tooltips which did not hide themselves.

Returns number of hidden tooltips.
170.6.59 Properties

170.6.60 AlternateTitleMBS as string

MBS MacOSX Plugin, Plugin Version: 3.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** An alternative title for a window on Mac OS X. **Notes:**

Used for the window menu.
You may use it for windows with the same name, but different entries in the standard window menu.
This property works only if CarbonLib 1.1 or newer is present.
(Read and Write computed property)

170.6.61 AsyncDragMBS as Boolean

MBS Util Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window uses asyncron dragging. **Example:**

window1.AsyncDragMBS = true

**Deprecated:** This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Notes:**

This window is marked so that the window server will drag the window automatically. Your application should not call DragWindow for this window, else it would confuse the heck out of the drag (it would fight with the window server for control). This attribute is ignored (async drag is not used) if your window is grouped with other windows in a window group that has the kWindowGroupAttrMoveTogether attribute. Available for all windows on Mac OS X 10.3 and later.

Seems to have no effect for RB 2008r2.
(Read and Write computed property)

170.6.62 CanBeVisibleWithoutLoginMBS as Boolean

MBS Util Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window can be visible before login. **Example:**

window1.CanBeVisibleWithoutLoginMBS = true
170.6. CLASS WINDOW

Notes:
This window can be made visible prior to user login. By default, in Mac OS X 10.5 and later no windows can be visible before a user logs into the system; this protects the user against certain types of malicious use of insecure applications. However, some software, such as input methods or other accessibility software, may need to deliberately make windows available prior to user login. Such software should add this window attribute to its windows. Available for all windows in Mac OS X 10.5 and later.
(Read and Write computed property)

170.6.63 CanLiveResizeMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Whether this window supports live resizing.
Example:
mainwindow.CanLiveResizeMBS=true

Deprecated: This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. Notes:
Available for all windows on Mac OS X.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

170.6.64 CGColorSpaceMBS as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 10.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Get or set the colorspace profile for this window.
Example:

dim c as CGColorSpaceMBS = window1.CGColorSpaceMBS

if c<>Nil then
    MsgBox str(c.NumberOfComponents)
else
    MsgBox "nil"
end if
Notes:
Requires Mac OS X 10.6.

On Cocoa, the NSColorSpace is queried and the matching CGColorspace is returned. For setting a NSColorSpace is created for the given CGColorspace.
In Carbon applications, the CoreGraphics color space is passed directly.
(Read and Write computed property)

170.6.65  collapsedMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Returns true if this window is collapsed. You can set it.
Example:
mainwindow.collapsedMBS=false 'show window

Notes:
Collapseable windows are the normal document windows.
You can‘t collapse dialogs or floating windows well.
In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

170.6.66  ExposeHiddenMBS as boolean

Example:
window1.ExposeHiddenMBS=CheckBox1.Value

if window1.ExposeHiddenMBS then
    StaticText1.text="yes"
else
    StaticText1.text="no"
end if
Notes:
Requires Mac OS X 10.4 to work.
Returns false on any error.
Default value is false for all document windows.
(Read and Write computed property)

170.6.67 FullScreenAuxiliaryMBS as Boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Whether this window is setup as being the auxiliary fullscreen window. Notes: (Read and Write computed property)

170.6.68 FullScreenPrimaryMBS as Boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Whether this window is setup as being the primary fullscreen window. Notes: If true, the window receives the fullscreen widget in the title bar. (Read and Write computed property)

170.6.69 GrowBoxTransparentMBS as boolean

MBS MacOSX Plugin, Plugin Version: 5.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Switches the transparent grow box on and off. Example:

if window1.Composite then
    window1.GrowBoxTransparentMBS = true
else
    MsgBox "Please turn on composite."
end if

Notes:
Only Mac OS X 10.2 and only on Composite windows.
Seems like RB 2010 has this on by default.
(Read and Write computed property)
170.6.70  HasborderMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Decides whether the window has a border.

**Example:**

mainwindow.HasborderMBS=false ' Remove border

**Notes:**

This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it). This option removes the title bar. HasCaptionMBS removes even more.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertynname alone is not accepted.

(Read and Write computed property)

170.6.71  HasCaptionMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Whether the window has a caption (a title bar)

**Example:**

Window1.HasCaptionMBS=false

**Notes:**

This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it).

In Realbasic 2005 and newer you need to use self. in front of the method as the propertynname alone is not accepted.

(Read and Write computed property)

170.6.72  HasCloseBoxMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window has a CloseBox.
170.6. CLASS WINDOW

Example:

mainwindow.HasCloseboxMBS=false 'remove closebox

Notes:

You can read the state on Mac Classic, but you can only change it on Mac Carbon. Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

170.6.73 HasCollapseBoxMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window has a Collapsebox.

Example:

mainwindow.HasCollapseBoxMBS=false 'remove Collapsebox

Notes:

You can read the state on Mac Classic, but you can only change it on Mac Carbon. Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

170.6.74 HasFullZoomButtonMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if this window can be resized horizontally and vertically.

Example:

mainwindow.HasFullZoomButtonMBS=false 'remove resizebox

**Deprecated:** This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead.

Notes:
You can read the state on Mac Classic, but you can only change it on Mac Carbon. Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted. (Read and Write computed property)

170.6.75 HasHorizontalZoomButtonMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Returns true if this window can be resized horizontally.
Example:
mainwindow.HasHorizontalZoomButtonMBS=false 'remove resizebox
mainwindow.HasVerticalZoomButtonMBS=false

Deprecated: This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. Notes:
You can read the state on Mac Classic, but you can only change it on Mac Carbon. Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted. (Read and Write computed property)

170.6.76 HasMaximizeBoxMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Returns true if this window has a Maximize Button.
Example:
mainwindow.HasMaximizeBoxMBS=false 'remove Maximize button

Notes:
This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it).

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not
170.6. CLASS WINDOW

accepted.
(Read and Write computed property)

170.6.77 HasMinimizeBoxMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if this window has a Minimize Button.

**Example:**
mainwindow.HasMinimizeBoxMBS=false 'remove Minimize button

**Notes:**
This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it).

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

170.6.78 HasNoShadowMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window has no shadow.

**Example:**
mainwindow.HasNoShadowMBS=true 'remove shadow

**Notes:**
Available for all windows on Mac OS X. This attribute is automatically given to windows of kOverlayWindowClass.

Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)
### 170.6.79 HasNoTitleBarMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** For Document, Floating, and Utility windows, this attribute allows you to hide the title bar of a window.  
**Example:**

```plaintext
window1.HasNoTitleBarMBS = true
```

// for Cocoa:
window1.HasCloseBoxMBS = false
window1.HasCollapseBoxMBS = false
window1.IsResizableMBS = false
window1.HasNoTitleBarMBS = true

**Deprecated:** This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Notes:**

For Mac OS X 10.4 or later.

You can read the state on Mac Classic, but you can only change it on Mac Carbon. Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in Plugin version 10.4.  
(Read and Write computed property)

### 170.6.80 HasRoundBottomBarCornersMBS as Boolean

MBS Util Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether a metal window has rounded corners.  
**Example:**

```plaintext
MsgBox str(window1.HasRoundBottomBarCornersMBS)
```

**Deprecated:** This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Notes:**
CLASS WINDOW

170.6. CLASS WINDOW

Indicates that this window will have rounded bottom corners. By default, a window has squared corners, and the assertion of this bit turns on rounded bottom corners for the window if the window has a bottom bar (set with HIWindowSetContentBorderThickness). If the window does not have a bottom bar, this bit is ignored. If the window is metal, the RoundBottomBarCornersMBS attribute will be ignored, as that type of window defaults to rounded corners and controls the squareness with the TexturedSquareCornersMBS attribute.
(Read and Write computed property)

170.6.81 HasSideTitlebarMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Whether this window has the title bar on the side.
Example:
mainwindow.HasSideTitlebarMBS=true 'moves titlebar to side

Deprecated: This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. Notes:
You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Only good for floating windows.
Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

170.6.82 HasSystemMenuMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Whether the window has a system menu inside the title bar.
Example:
Window1.HasSystemMenuMBS=false

Notes:
This property has only an effect on Windows. It will disable the system menu and also the minimize, maximize and close buttons. The window needs to be redrawn before the change is visible (for example move it).

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not
accepted.
(Read and Write computed property)

170.6.83 HasToolbarButtonMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window has a toolbar button.

**Example:**
mainwindow.HasToolbarButtonMBS=true 'shows Toolbar Button

**Notes:**
You can read the state on Mac Classic, but you can only change it on Mac Carbon. The Button is shown on next redraw of the window frame.

Use the CarbonWindowsEventsMBS class to receive events when the button is pressed.

Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

170.6.84 HasVerticalZoomButtonMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if this window can be resized vertically.

**Example:**
mainwindow.HasHorizontalZoomButtonMBS=false 'remove resizebox
mainwindow.HasVerticalZoomButtonMBS=false

**Deprecated:** This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Notes:**
You can read the state on Mac Classic, but you can only change it on Mac Carbon. Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not
170.6. CLASS WINDOW

accepted.
(Read and Write computed property)

170.6.85 HideOnFullScreenMBS as Boolean

MBS Util Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The window will hide itself if full screen mode is entered by an application or another window.
**Example:**
Window1.HideOnFullScreenMBS=true

**Notes:**
This window is automatically hidden during fullscreen mode (when the menubar is invisible) and shown afterwards. Available for all windows. This attribute is automatically given to utility windows.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

170.6.86 HideOnSuspendMBS as Boolean

MBS Util Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:**
The window will hide itself if the application goes to background.
**Example:**
Window1.HideOnSuspendMBS=false

**Notes:**
This window is automatically hidden on suspend and shown on resume. Available for all windows. This attribute is automatically given to floating windows.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not
170.6.87 IgnoreClicksMBS as Boolean

MBS Util Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Can be used to control whether mouse clicks are ignored for this window.

**Example:**

Window1.IgnoreClicksMBS=true

**Notes:**

Whether this window never receives mouse events, even in areas that are opaque. Instead, clicks on the window will be passed through to windows beneath it. Available for all windows on Mac OS X 10.2 and later.

You can read the state on Mac Classic, but you can only change it on Mac Carbon. Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.

(Read and Write computed property)

170.6.88 InWindowMenuMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Decides whether the window is inside the Window menu.

**Example:**

mainwindow.InWindowMenuMBS=false ‘remove from window menu

**Deprecated:** This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Notes:**

This window is added to the standard Window menu. Available for document windows.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
170.6. CLASS WINDOW

(Read and Write computed property)

170.6.89  IsIconicMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if this window is inside the taskbar.

**Example:**

MsgBox str(window1.IsIconicMBS)

**Notes:**

If you set IsIconic to true the window is minimized and if you set it to false the window size and position is restored.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

(Read and Write computed property)

170.6.90  IsMetalWindowMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window uses the Metal appearance.

**Example:**

if window1.Frame = window.FrameTypeMetal then
  MsgBox "Window is metal. " +str(window1.IsMetalWindowMBS)
else
  MsgBox "Window is not metal. " +str(window1.IsMetalWindowMBS)
end if

**Notes:**

Available for document windows on Mac OS X 10.2 and later, and for floating windows on Mac OS X 10.3 and later. Drawers can also be metal, but dynamically adjust their appearance based on their parent window’s appearance; it is not necessary to specify this attribute for a metal drawer.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.

Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
170.6.91 IsOpaqueForEventsMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window receives mouse events even for areas of the window that are transparent (have an alpha channel component of zero).

**Example:**

```plaintext
Window1.IsOpaqueForEventsMBS=false
```

**Deprecated:** This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Notes:**

Available for windows of kOverlayWindowClass on Mac OS X 10.0 and 10.1, and available for all windows on Mac OS X 10.2 and later.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.

Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the property name alone is not accepted.

(Read and Write computed property)

170.6.92 IsResizableMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window is resizeable.

**Example:**

```plaintext
Window1.IsResizableMBS=false
```

**Notes:**

You can read the state on Mac Classic, but you can only change it on Mac Carbon.

Returns false on any error.

Use GrowBoxTransparentMBS on Composite Mac OS X windows to enable the transparent grow box.

In Realbasic 2005 and newer you need to use self. in front of the method as the property name alone is not accepted.
accepted.

Works in Cocoa.
(Read and Write computed property)

170.6.93  IsZoomedMacMBS as boolean

MBS Util Plugin, Plugin Version: 3.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns true if the window is zoomed.
**Example:**
MsgBox str(window1.IsZoomedMacMBS)

**Notes:**
Requires Mac OS 8.5 or newer.
Seems not to work correctly on RB 5.5.
In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

170.6.94  IsZoomedMBS as boolean

MBS Util Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if this window has been maximized.
**Example:**
MsgBox str(window1.IsZoomedMBS)

**Notes:**
If you set IsZoomed to true the window is maximized and if you set it to false the window size and position is restored.
In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Works on Cocoa.
(Read and Write computed property)
170.6.95  **MetalNoContentSeparatorMBS as Boolean**

MBS Util Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether there should be a content separator on a metal window.

**Example:**

if window1.Frame = window.FrameTypeMetal then
  window1.MetalNoContentSeparatorMBS = true
end if

**Deprecated:** This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Notes:**

Indicates that no border should be drawn between the toolbar and window content. Relevant only in textured windows. Ignored in non-textured windows. Available in Mac OS X 10.4 and later for window classes that support the textured appearance.

(Read and Write computed property)

---

170.6.96  **ModifiedMBS as boolean**

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** You can set or get the value of the modified state.

**Example:**

mainwindow.modifiedMBS=true

**Notes:**

Requires Mac OS 8.5 or newer.

As long as you don’t set modified to false the window keeps to tell you that it’s modified. Not sure why, so just set modified to false early in creating the window.

Added Cocoa support in plugin version 10.0.

(Read and Write computed property)

---

170.6.97  **TexturedSquareCornersMBS as Boolean**

MBS Util Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether a metal window has square corners.
170.6. CLASS WINDOW

Example:

```plaintext
if window1.Frame = window.FrameTypeMetal then
    window1.TexturedSquareCornersMBS = true
else
    MsgBox "Please turn window into metal frame."
end if
```

**Deprecated:** This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Notes:**

Indicates that a textured window should have square corners. By default, a textured window has round corners. When this attribute is set on a window, the window frame view automatically makes the grow box view opaque, and when this attribute is cleared, the window frame view automatically makes the grow box view transparent. You can change the grow box view transparency after modifying this attribute with window.GrowBoxTransparentMBS. Relevant only for textured windows; ignored in non-textured windows. Available in Mac OS X 10.5 and later for window classes that support the textured appearance. (Read and Write computed property)

170.6.98 ToolbarVisibleMBS as boolean

MBS Util Plugin, Plugin Version: 4.0, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the toolbar is shown in this window or not. **Notes:**

Value is false on any error.
Only working on Mac OS X.
(Read and Write computed property)

170.6.99 TransparencyMBS as single

MBS Util Plugin, Plugin Version: 5.0, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The transparency of the window on Mac OS X, Windows 2000 and Windows XP. **Notes:**

1 for opaque, 0 for invisible.
Return 1 on any error. On Windows it returns always 1 as the current transparency value can’t be queried.
You need to call MakeTransparent before to install transparency.
(added Windows support in version 4.4)
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel.
(Read and Write computed property)
170.6.100 UnifiedTitleAndToolbarMBS as Boolean

MBS Util Plugin, Plugin Version: 8.1, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window has an unified title and toolbar look.  
**Example:**

```plaintext
window1.UnifiedTitleAndToolbarMBS = true
```

**Notes:**

This window draws its window title and toolbar using a unified appearance that has no separator between the two areas. A window may not have both UnifiedTitleAndToolbar and Metal appearance. If a window already has the metal attribute, attempting to set the Unified attribute will cause ChangeWindows to return an error, and vice versa. This constant was not added to this header file until Mac OS X 10.5, but it is actually available at runtime on Mac OS X 10.4 and later for windows of kDocumentWindowClass. However, on Mac OS X 10.5 and later, kHIWindowBitUnifiedTitleAndToolbar no longer has any effect, since all windows with toolbars now have a unified look.  
(Read and Write computed property)

170.6.101 WindowDoesNotCycleMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window will cycle.  
**Example:**

```plaintext
window1.WindowDoesNotCycleMBS=False
```

**Notes:**

If true, this window does not participate in window cycling invoked by cmd-textasciitilde or the ”Focus on Window” hotkey defined in the Keyboards preference pane. Available for all windows on Mac OS X 10.2 and later.

You can read the state on Mac Classic, but you can only change it on Mac Carbon. Returns false on any error.

In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.  
(Read and Write computed property)
170.6. CLASS WINDOW

170.6.102 WindowGroupMBS as WindowGroupMBS

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The window group of that window.
**Notes:**
Lasterror is set.
Keep the group reference when setting this value as the reference count is not retained.
(Read and Write computed property)

170.6.103 WindowMoveToActiveSpaceMBS as boolean

MBS MacOSX Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether this window should appear on the active space.
**Notes:**
When made visible, this window is always shown in the current Space, rather than the space in which it was last visible. When activated, this window moves to the active space, rather than forcing a switch to the Space on which it was previously located. This option is typically used with modeless dialog windows such as the Quick Search window in BBEdit. This flag and the WindowVisibleInAllSpacesMBS flag should not both be set.
For Carbon only. For Cocoa, please use NSWindowMBS.collectionBehavior.
(Read and Write computed property)
170.6.104  **WindowProxyIconFileMBS as folderitem**

MBS Util Plugin, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** That’s the icon to the window which belongs to the file.

**Example:**

```vba
dim f as folderItem

f=getopenFolderItem("special/any")
if f<>nil then
  window1.WindowProxyIconFileMBS=f
end if
```

**Notes:**

Requires Mac OS 8.5 or newer.
In Realbasic 2005 and newer you need to use self. in front of the method as the propertiname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

170.6.105  **WindowVisibleInAllSpacesMBS as boolean**

MBS MacOSX Plugin, Plugin Version: 8.4, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether a window is visible on all spaces.

**Notes:**

This window is visible in all window sets managed by Spaces. If this flag is not set, the window is only visible in the Space where it was created. This flag and the WindowMoveToActiveSpaceMBS flag should not both be set.
For Carbon only. For Cocoa, please use NSWindowMBS.collectionBehavior.
(Read and Write computed property)

170.6.106  **WinMenuHandleMBS as Integer**

MBS Util Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** A property to access the handle used for the menu of a Window.

**Example:**

```vba
dim menu as Integer // global

if menu=0 then
```

menu=Window1.WinMenuHandleMBS // read it on the first window
else
Window1.winmenuHandleMBS=menu // set it on the second window
end if

Notes:

Used in the example "Menu in every Window" to have a menubar in every window on Windows. But never forget to quit your app after all windows were closed.
In Realbasic 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

170.6.107 WinTopMostWindowMBS as boolean

MBS Win Plugin, Plugin Version: 9.6, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function:
Whether a window is staying on the top of the other windows.
Example:

window1.WinTopMostWindowMBS=true

Notes:

If true the window stays in front of other windows. Default is false for Real Studio windows and true for overlays.
(Read and Write computed property)
Chapter 171

Window Group

171.1 class WindowGroupMBS

171.1.1 class WindowGroupMBS

MBS Util Plugin, Plugin Version: 4.2, Console & Web: Yes, Mac: Yes, Win: No, Linux: No. **Function:** A class for a window group on Mac OS X.

**Example:**

// Creates a new group for two windows moving together:

```java
static WinGroup as WindowGroupMBS

const kCGNormalWindowLevelKey=4
WinGroup=new WindowGroupMBS
WinGroup.Create(16+8+2+1)
WinGroup.Level=WinGroup.LevelForKey(kCGNormalWindowLevelKey)
window1.show
window1.WindowGroupMBS=WinGroup
window2.show
window2.WindowGroupMBS=WinGroup
```

**Deprecated:** This item is deprecated and should no longer be used. **Notes:** This class is Carbon only and not supported on Cocoa. For Cocoa you can check NSWindowMBS.addChildWindow method for similar functionality.

20043
CHAPTER 171. WINDOW GROUP

171.1.2 Methods

171.1.3 ChangeAttributes(setTheseAttributes as Integer, clearTheseAttributes as Integer)

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Changes the attributes of a window group. **Notes:** Lasterror is set.

These are attributes that may be applied to a window group:

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kWindowGroupAttrSelectAsLayer</td>
<td>1</td>
<td>Makes the group behave somewhat as a layer of windows that move together. When any window in the group is brought to the front of the group, the entire group will also be brought to the front of the containing group's child hierarchy.</td>
</tr>
<tr>
<td>kWindowGroupAttrMoveTogether</td>
<td>2</td>
<td>The positions of the contents of this group with respect to each other cannot be changed. When one item moves, all other items are moved simultaneously.</td>
</tr>
<tr>
<td>kWindowGroupAttrLayerTogether</td>
<td>4</td>
<td>The z-order of the contents of this group with respect to each other cannot be changed. When one item changes z-order, all other items are moved simultaneously. For purposes of z-ordering, the group and all its subgroups are effectively treated as if they were a single window in the parent group of this group.</td>
</tr>
<tr>
<td>kWindowGroupAttrSharedActivation</td>
<td>8</td>
<td>The active state of the windows in this group is shared. The windows in the group are activated or deactivated according to the activation scope of the group, but when any window in the group changes activation, all other windows change to match.</td>
</tr>
<tr>
<td>kWindowGroupAttrHideOnCollapse</td>
<td>16</td>
<td>When any window in this group is collapsed, all other windows in this group are hidden. All subgroups of this group are also examined for the HideOnCollapse attribute, and any the windows of any subgroup with this attribute are also hidden. All windows will be shown again when the collapsed window is expanded.</td>
</tr>
</tbody>
</table>

171.1.4 Close

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The destructor. **Notes:** There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you. (e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)
171.1. CLASS WINDOWGROUPMBS

171.1.5 Create(attributes as Integer)

Notes:

Lasterror is set.

These are attributes that may be applied to a window group:

- **kWindowGroupAttrSelectAsLayer** 1  
  Makes the group behave somewhat as a layer of windows that move together. When any window in the group is brought to the front of the group, the entire group will also be brought to the front of the containing group's child hierarchy.

- **kWindowGroupAttrMoveTogether** 2  
  The positions of the contents of this group with respect to each other cannot be changed. When one item moves, all other items are moved simultaneously.

- **kWindowGroupAttrLayerTogether** 4  
  The z-order of the contents of this group with respect to each other cannot be changed. When one item changes z-order, all other items are moved simultaneously. For purposes of z-ordering, the group and all its subgroups are effectively treated as if they were a single window in the parent group of this group.

- **kWindowGroupAttrSharedActivation** 8  
  The active state of the windows in this group is shared. The windows in the group are activated or deactivated according to the activation scope of the group, but when any window in the group changes activation, all other windows change to match.

- **kWindowGroupAttrHideOnCollapse** 16  
  When any window in this group is collapsed, all other windows in this group are hidden. All subgroups of this group are also examined for the HideOnCollapse attribute, and any the windows of any subgroup with this attribute are also hidden. All windows will be shown again when the collapsed window is expanded.

171.1.6 IsWindowContained(win as window) as boolean

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function: Indicates whether a window is contained within a group or any of its subgroups.

Notes: True for success.

171.1.7 LevelForKey(levelkey as Integer) as Integer

Notes: Some constants for the level keys
171.1.8 NextGroup as WindowGroupMBS

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the next group of a window group.
**Notes:** Returns nil on any error (e.g. if no next group is in the same parent group)

171.1.9 PreviousGroup as WindowGroupMBS

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the previous or previous group of a window group.
**Notes:** Returns nil on any error (e.g. if no previous group is in the same parent group)

171.1.10 ReleaseObject

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Releases a refcount on a window group. If the refcount goes to zero, the group is destroyed, and a refcount is released from all contained objects.
**Notes:**
Lasterror is set.
Make sure you clear the handle so the destructor will not release it again.
171.1. **CLASS WINDOWGROUPMBS**

### 171.1.11 RetainCount as Integer

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Returns the refcount of a window group.

### 171.1.12 RetainObject

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Increments the refcount of a window group. **Notes:** Lasterror is set.

### 171.1.13 SendBehind(behind as WindowGroupMBS)

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Changes the z-order of a group, if the group does not have the kWindowGroupAttributeLayerTogether attribute set. **Notes:**

SendBehind currently requires that the group being moved and the behindGroup have the same parent group.

Parameter behind: The group behind which to position the specified group. Lasterror is set.

### 171.1.14 WindowGroupOfClass(classid as Integer)

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Like create, but looks up an existing window group instead of creating one. **Notes:**

see macwindows.h (part of DevTools) for details. Lasterror is set.

### 171.1.15 Properties

### 171.1.16 AttributeFlags as Integer

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The attributes for this window group. **Notes:**
These are attributes that may be applied to a window group:

- **kWindowGroupAttrSelectAsLayer**: 1
  Makes the group behave somewhat as a layer of windows that move together. When any window in the group is brought to the front of the group, the entire group will also be brought to the front of the containing group’s child hierarchy.

- **kWindowGroupAttrMoveTogether**: 2
  The positions of the contents of this group with respect to each other cannot be changed. When one item moves, all other items are moved simultaneously.

- **kWindowGroupAttrLayerTogether**: 4
  The z-order of the contents of this group with respect to each other cannot be changed. When one item changes z-order, all other items are moved simultaneously. For purposes of z-ordering, the group and all its subgroups are effectively treated as if they were a single window in the parent group of this group.

- **kWindowGroupAttrSharedActivation**: 8
  The active state of the windows in this group is shared. The windows in the group are activated or deactivated according to the activation scope of the group, but when any window in the group changes activation, all other windows change to match.

- **kWindowGroupAttrHideOnCollapse**: 16
  When any window in this group is collapsed, all other windows in this group are hidden. All subgroups of this group are also examined for the HideOnCollapse attribute, and any the windows of any subgroup with this attribute are also hidden. All windows will be shown again when the collapsed window is expanded.

Renamed Attributes parameter to AttributeFlags in plugin version 8.2.
(Read only property)

### 171.1.17 Count as Integer

**MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:**
Counts the windows or groups contained in a group.
**Notes:**
Returns 0 on any error.
(Read only property)

### 171.1.18 Handle as Integer

**MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. Function:**
The handle of the window group.
**Notes:**
Data type is WindowGroupRef.
(Read and Write property)
171.1. Level as Integer

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Sets the CoreGraphics window group level of windows in a group.

**Notes:**

CoreGraphics windows (used to implement all windows in Carbon and Cocoa applications on Mac OS X) are divided into layers specified by a window level. Standard window levels are listed in the LevelForKey function documentation. By default, a new window group has a window level of kCGNormalWindowLevel. When a window is placed into a window group, its window level is determined by the window level of its "base group". This is the containing group that is a child of the root group. For example, if group A is a child of the root group, and group B is a child of group A, and window C is in group B, then window C’s base group is group A, and group A’s window level determines the level of window C. Setting level is only allowed changing the window level of groups that are children of the root group. It returns paramErr for other groups, since a group that is not a child of the root group is not a base group and changing its level has no effect. Changing the level of a group also changes the level of all windows currently contained by the group.

You can get level values using the LevelForKey function.

Lasterror is set.

(Read and Write property)

171.1.20 Name as String

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The name of the group.

**Notes:** (Read and Write property)

171.1.21 Release as Boolean

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** Whether the destructor should release the handle.

**Notes:** (Read and Write property)

171.1.22 Parent as WindowGroupMBS

MBS Util Plugin, Plugin Version: 4.2, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Function:** The window group that contains a group.

**Notes:**

Returns nil on any error.

(Read and Write computed property)
Chapter 172

Windows

172.1 class MapiFileMBS

172.1.1 class MapiFileMBS

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class contain information about a file containing a message attachment stored as a temporary file.

**Notes:**

Important:
Simple MAPI is not installed by Exchange Server 2003 or later. However, Simple MAPI is supported for use with Exchange 2003. To function properly, the underlying Exchange or Microsoft Outlook MAPI subsystem must be properly installed on the client computer.

172.1.2 Properties

172.1.3 Filename as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The attachment filename seen by the recipient, which may differ from the filename in the PathName member if temporary files are being used.

**Notes:**

If the FileName member is empty, the filename from PathName is used.
(Read and Write property)
172.1.4 Flags as Integer

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The flags.  
**Notes:**  
Currently not used with the plugin.  
(Read and Write property)

172.1.5 Path as FolderItem

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The path of the attached file.  
**Notes:**  
When this property is set the PathName property is filled with the absolute path. If you query this property, you get the PathName property as a folderitem. So this property was made for your convenience.  
(Read and Write property)

172.1.6 PathName as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The fully qualified path of the attached file.  
**Notes:**  
This path should include the disk drive letter and directory name.  
(Read and Write property)

172.1.7 Position as Integer

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An integer used to indicate where in the message text to render the attachment.  
**Notes:**  
Attachments replace the character found at a certain position in the message text. That is, attachments replace the character in the MapiMessage NoteText property at offset nPosition (nPosition is zero based!). A value of -1 means the attachment position is not indicated; the client application will have to provide a way for the user to access the attachment.  
(Read and Write property)
172.2.  CLASS MAPIMESSAGEMBS

172.2 class MapiMessageMBS

172.2.1 class MapiMessageMBS

172.2.2 Methods

172.2.3 AddFile(file as MapiFileMBS)

172.2.4 AddRecipient(recipient as MapiRecipientMBS)

172.2.5 IsAvailable as boolean

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Whether MAPI is available. Notes: Checks whether the library was loaded and whether the MAPI Registry key exists, so this has been initialized.
(mail account may not exist)

Returns true if MAPI can be used.

172.2.6 IsUnicodeAvailable as boolean

MBS Win Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Whether MAPI is available with unicode. Notes:
Checks whether the library was loaded and whether the MAPI Registry key exists, so this has been initialized.
(mail account may not exist)

Returns true if MAPI can be used with unicode.

172.2.7 SendMail(DisplayDialog as boolean, DisplayLogonDialog as boolean) as Integer

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends an email.  
**Notes:** Same as the other SendMail function, but this one does not take the parent window handle and supports console applications.  
See also:

- 172.2.8 SendMail(parent as window, DisplayDialog as boolean, DisplayLogonDialog as boolean) as Integer

172.2.8 SendMail(parent as window, DisplayDialog as boolean, DisplayLogonDialog as boolean) as Integer

MBS Win Plugin, Plugin Version: 8.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sends an email.  
**Notes:**

Parameters:

parent:
The parent window for the dialogs used. If not nil the dialogs used will be modal.

DisplayDialog:
A dialog box should be displayed to prompt the user for recipients and other sending options. When Dialog is false, at least one recipient must be specified.

DisplayLogonDialog:
A dialog box should be displayed to prompt the user to log on if required. When the DisplayLogonDialog is false, the client application does not display a logon dialog box and returns an error value if the user is not logged on. SendMail ignores this flag if the MessageID parameter is empty.

Error codes:
const SUCCESS = 0 No error.
const MAPI_USER_ABORT = 1 The user canceled one of the dialog boxes. No message was sent.
const MAPI_FAILURE = 2 One or more unspecified errors occurred. No message was sent.
const MAPI_LOGON_FAILURE = 3 There was no default logon, and the user failed to log on successfully when the logon dialog box was displayed. No message was sent.
const MAPI_DISK_FULL = 4 There was insufficient memory to proceed. No message was sent.
const MAPI_INSUFFICIENT_MEMORY = 5 There were too many file attachments. No message was sent.
const MAPI_ACCESS_DENIED = 6 The specified attachment was not found. No message was sent.
const MAPI_TOO_MANY_SESSIONS = 8 The type of a recipient was not TypeTO, TypeCC, or TypeBCC. No message was sent.
const MAPI_TOO_MANY_FILES = 9 The text in the message was too large. No message was sent.
const MAPI_TOO_MANY_RECIPIENTS = 10 The text in the message was too large. No message was sent.
const MAPI_ATTACHMENT_NOT_FOUND = 11 The specified attachment could not be opened. No message was sent.
const MAPI_ATTACHMENT_OPEN_FAILURE = 12 A recipient matched more than one of the recipient descriptor structures and Dialog is false. No message was sent.
const MAPI_ATTACHMENT_WRITE_FAILURE = 13 One or more recipients were invalid or did not resolve to any address.
const MAPI_NO_MESSAGES = 16 The profile must be configured so that MAPISendMail can open the default service providers without requiring user interaction.
const MAPI_INVALID_MESSAGE = 17 Client applications can provide a full or partial list of recipient names, subject text, file attachments, or message text. If any information is missing, MAPISendMail can prompt the user for it. If no information is missing, either the message can be sent as is or the user can be prompted to verify the information, changing values if necessary.
const MAPI_TEXT_TOO_LARGE = 18 A successful return from MAPISendMail does not necessarily imply recipient validation. The message might not have been sent to all recipients. Depending on the transport provider, recipient validation can be a lengthy process.
const MAPI_NETWORK_FAILURE = 23 A "" value for the Subject indicates that there is no text for the subject of the message. A "" value for the NoteText member indicates that there is no message text. Some client applications can truncate subject lines that are too long or contain carriage returns, line feeds, or form feeds.
const MAPI_URL = 24 Each paragraph should be terminated with a CR (0x0d), an LF (0x0a), or a CRLF pair (0x0d0a). MAPISendMail wraps lines as appropriate. If the text exceeds system limits, the function returns the MAPI_E_TEXT_TOO_LARGE value.
const MAPI_INVALID_EDITFIELDS = 24
const MAPI_INVALID_RECIPS = 25
const MAPI_NOT_SUPPORTED = 26
The \texttt{MessageType} property is used only by non-IPM applications. Applications that handle IPM messages can set it to "".

The number of attachments per message can be limited in some messaging systems. If the limit is exceeded, the \texttt{MAPI\_TOO\_MANY\_FILES} value is returned. File attachments are copied to the message before \texttt{MAPISendMail} returns; therefore, later changes to the files do not affect the contents of the message. The files must be closed when they are copied. Do not attempt to display attachments outside the range of the message text.

Some messaging systems can limit the number of recipients per message. If the client application passes a non-nil value indicating a number of recipients exceeding the system limit, \texttt{MAPISendMail} returns the \texttt{MAPI\_TOO\_MANY\_RECIPIENTS} value. If the recipient array is empty, the \texttt{Dialog} parameter must be true in the call to \texttt{MAPISendMail}.

Note that the recipients can include either an entry identifier, the recipient’s name, an address, or a name and address pair. The following table shows how \texttt{MAPISendMail} handles the variety of information that can be specified:

\begin{center}
\begin{tabular}{|l|l|}
\hline
Information & Action \\
\hline
entry identifier & No name resolution; the name and address are ignored. \\
name & Name resolved using the Simple MAPI resolution rules. \\
address & No name resolution; address is used for both message delivery and for displaying the recipient name. \\
name and address & No name resolution; name used only for displaying the recipient name. \\
\hline
\end{tabular}
\end{center}

Client applications that send messages to custom recipients can avoid name resolution. Such clients should set the \texttt{Address} member of the recipient to the custom address.

\texttt{MAPISendMail} does not require an originator-type recipient to send a message.

Important Simple MAPI is not installed by Exchange Server 2003 or later. However, Simple MAPI is supported for use with Exchange 2003. To function properly, the underlying Exchange or Microsoft Outlook MAPI subsystem must be properly installed on the client computer.

\end{itemize}

\textbf{172.2.9 SendMailMT(DisplayDialog as boolean, DisplayLogonDialog as boolean) as Integer}

\texttt{MBS Win Plugin, Plugin Version: 15.1, Console \& Web: Yes, Mac: No, Win: Yes, Linux: No. \textbf{Function:} Sends an email.}
172.2. CLASS MAPIMESSAGEMBS

Notes:
Same as the other SendMail function, but threaded.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.
See also:

- 172.2.10 SendMailMT(parent as window, DisplayDialog as boolean, DisplayLogonDialog as boolean) as Integer

172.2.10 SendMailMT(parent as window, DisplayDialog as boolean, DisplayLogonDialog as boolean) as Integer

MBS Win Plugin, Plugin Version: 15.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Sends an email.
**Notes:**
Same as the other SendMail function, but threaded.
Must be called inside a Xojo (Real Studio) thread so time yields to main thread and you can keep the GUI running.
See also:

- 172.2.9 SendMailMT(DisplayDialog as boolean, DisplayLogonDialog as boolean) as Integer

172.2.11 Properties

172.2.12 ConversationID as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string identifying the conversation thread to which the message belongs.
**Notes:**
Some messaging systems can ignore and not return this member.
(Read and Write property)

172.2.13 DateReceived as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string indicating the date when the message was received.
**Notes:**
The format is YYYY/MM/DD HH:MM, using a 24-hour clock.
(Read and Write property)
172.2.14 Flags as Integer

**Notes:**
Can be a combination of kFlagsReceiptRequested, kFlagsSent and kFlagsUnread.
(Read and Write property)

172.2.15 MessageType as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string indicating a non-IPM type of message.
**Notes:**
Client applications can select message types for their non-IPM messages. Clients that only support IPM messages can ignore the MessageType member when reading messages and set it to empty when sending messages.
(Read and Write property)

172.2.16 NoteText as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string containing the message text.
**Notes:**
If this member is empty, there is no message text.
(Read and Write property)

172.2.17 Originator as MapiRecipientMBS

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The reference to the originator of this message.
**Notes:** (Read and Write property)

172.2.18 Subject as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The text string describing the message subject, typically limited to 256 characters or less.
**Notes:**
If this member is empty, the user has not entered subject text. (Read and Write property)

### 172.2.19 Constants

#### 172.2.20 kFlagsReceiptRequested=2

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the flags property.  
**Notes:**  
A receipt notification is requested. Client applications set this flag when sending a message.  

Note: Most email applications ignore the receipt notifications.

#### 172.2.21 kFlagsSent=4

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the flags property.  
**Notes:** The message has been sent.

#### 172.2.22 kFlagsUnread=1

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the flags property.  
**Notes:** The message has not been read.
172.3 class MapiRecipientMBS

172.3.1 class MapiRecipientMBS

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This class contains information about a message sender or recipient.

172.3.2 Properties

172.3.3 Address as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Optional the recipient or sender’s address. **Notes:** This address is provider-specific message delivery data. Generally, the messaging system provides such addresses for inbound messages. For outbound messages, the Address member can point to an address entered by the user for a recipient not in an address book (that is, a custom recipient). The format of an address pointed to by the Address member is [ address type ] [ e-mail address ]. Examples of valid addresses are FAX:206-555-1212 and SMTP:M@X.COM. (Read and Write property)

172.3.4 Name as String

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name of the recipient. **Notes:** (Read and Write property)

172.3.5 Type as Integer

MBS Win Plugin, Plugin Version: 8.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Contains a numeric value that indicates the type of recipient. **Notes:** Use one of the Type constants. (Read and Write property)
172.3.6 Constants

172.3.7 TypeBCC=3

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the type property. **Notes:** Indicates a recipient of a blind copy.

172.3.8 TypeCC=2

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the type property. **Notes:** Indicates a recipient of a message copy.

172.3.9 TypeOriginator=0

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the type property. **Notes:** Indicates the original sender of the message.

172.3.10 TypeTo=1

MBS Win Plugin, Plugin Version: 8.3. **Function:** One of the constants for the type property. **Notes:** Indicates a primary message recipient.
172.4  class TaskDialogButtonMBS

172.4.1  class TaskDialogButtonMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for a button.

172.4.2  Properties

172.4.3  Default as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether this is default button.
**Notes:**
Only one button can be default.
(Read and Write property)

172.4.4  Enabled as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether to enable this button.
**Notes:**
Default: true.
This is a live property. Setting it while dialog is open changes the button state.
(Read and Write property)

172.4.5  ID as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The unique ID for the button.
**Notes:**
The IDs should be unique for all buttons.
(Read and Write property)
172.4.6 Text as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The caption for the button.
**Notes:** (Read and Write property)

172.4.7 Visible as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether this button is visible.
**Notes:**
Default true.
(Read and Write property)
172.5 class TaskDialogMBS

172.5.1 class TaskDialogMBS

**Notes:**
This class function creates, displays, and operates a task dialog. The task dialog contains application-defined icons, messages, title, verification check box, command links, push buttons, and radio buttons.

Requires Windows Vista or newer.

172.5.2 Methods

172.5.3 AppendButton(button as TaskDialogButtonMBS)

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Adds a button.

**Example:**

```vba
dim td as TaskDialogMBS

dim b as new TaskDialogButtonMBS
b.Text = "Hello"
b.ID = 123

td.AppendButton b
```

172.5.4 AppendRadioButton(button as TaskDialogButtonMBS)

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Adds a radio button.

**Example:**

```vba
dim td as TaskDialogMBS

dim b as new TaskDialogButtonMBS
b.Text = "Hello"
b.ID = 123

td.AppendRadioButton b
```
172.5.5 CloseDialog

172.5.6 FindButtonByID(ID as Integer) as TaskDialogButtonMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Finds button by ID. **Notes:**
This searches buttons and radiobuttons for given ID.
It will not find common buttons.
Returns button if found or nil if not found.

172.5.7 ShowDialog as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Shows the dialog. **Example:**
```
dim td as new TaskDialogMBS

td.CommonButtons = BitwiseOr(td.kCommonButtonOK, td.kCommonButtonCancel)
td.Content = "Hello World"

if td.ShowDialog then
    if td.SelectedButton = td.kIDOK then
        MsgBox "OK"
    else
        MsgBox "Cancel"
    end if
else
    MsgBox "Failed"
end if
```

**Notes:**
Returns true if everything worked right.
Returns false if creation of dialog failed.

Requires Windows Vista or newer.

### 172.5.8 Properties

#### 172.5.9 AllowDialogCancellation as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to allow cancel.
**Notes:** Indicates that the dialog should be able to be closed using Alt-F4, Escape, and the title bar’s close button even if no cancel button is specified in either the CommonButtons or Buttons members.
(Read and Write property)

#### 172.5.10 CanBeMinimized as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the task dialog can be minimized.
**Notes:** (Read and Write property)

#### 172.5.11 CollapsedControlText as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used to label the button for expanding the expandable information.
**Notes:** This member is ignored when the ExpandedInformation member is empty. If this member is empty and the CollapsedControlText is specified, then the CollapsedControlText value will be used for this member as well.
(Read and Write property)

#### 172.5.12 CommonButtons as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies the push buttons displayed in the task dialog.
**Example:**
dim td as new TaskDialogMBS

td.CommonButtons = BitwiseOr(td.kCommonButtonOK, td.kCommonButtonCancel)
td.Content = "Hello World"

if td.ShowDialog then
    if td.SelectedButton = td.kIDOK then
        MsgBox "OK"
    else
        MsgBox "Cancel"
    end if
else
    MsgBox "Failed"
end if

Notes:
If no common buttons are specified and no custom buttons are specified through buttons array, the task
dialog will contain the OK button by default. This parameter may be a combination of flags from the
following group:

- kCommonButtonOK: The task dialog contains the push button: OK.
- kCommonButtonYes: The task dialog contains the push button: Yes.
- kCommonButtonNo: The task dialog contains the push button: No.
- kCommonButtonCancel: The task dialog contains the push button: Cancel. If this button is specified,
  the task dialog will respond to typical cancel actions (Alt-F4 and Escape).
- kCommonButtonRetry: The task dialog contains the push button: Retry.
- kCommonButtonClose: The task dialog contains the push button: Close.

(Read and Write property)

172.5.13 Content as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The string to be used for the dialog's primary content.

**Example:**

dim td as new TaskDialogMBS

td.CommonButtons = BitwiseOr(td.kCommonButtonOK, td.kCommonButtonCancel)
td.Content = "Hello World"
if td.ShowDialog then
  if td.SelectedButton = td.kIDOK then
    MsgBox "OK"
  else
    MsgBox "Cancel"
  end if
else
  MsgBox "Failed"
end if

Notes:
If the EnableHyperlinks flag is true, then this string may contain hyperlinks in the form: <A HREF="executablestring">Hyperlink Text</A>.
WARNING: Enabling hyperlinks when using content from an unsafe source may cause security vulnerabilities.
(Read and Write property)

172.5.14 DefaultButton as Integer

Notes:
This may be any of the values specified in ID of one of the buttons, or one of the IDs corresponding to the buttons specified in the CommonButtons property.

  kIDCancel Make the Cancel button the default.
  kIDNo Make the No button the default.
  kIDOk Make the OK button the default.
  kIDRetry Make the Retry button the default.
  kIDYes Make the Yes button the default.
  kIDClose Make the Close button the default.

You can also mark buttons default with their default flag.
(Read and Write property)
172.5.15 DefaultRadioButton as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The button ID of the radio button that is selected by default. **Notes:**
If this value does not correspond to a button ID, the first button in the array is selected by default.
You can also mark buttons default with their default flag. (Read and Write property)

172.5.16 DialogHandle as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The handle of the dialog. **Notes:**
This is only valid (and non zero) while dialog is visible. (Read only property)

172.5.17 EnableHyperlinks as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether to enable hyperlinks. **Notes:**
Enables hyperlink processing for the strings specified in the Content, ExpandedInformation and Footer members. When enabled, these members may point to strings that contain hyperlinks in the following form:

```
<A HREF="executablestring">Hyperlink Text</A>
```

Warning: Enabling hyperlinks when using content from an unsafe source may cause security vulnerabilities.

Note: Task Dialogs will not actually execute any hyperlinks. Hyperlink execution must be handled in the HyperlinkClicked event. (Read and Write property)

172.5.18 ExpandedByDefault as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Indicates that the string specified by the ExpandedInformation member is displayed when the dialog is
initially displayed.

Notes:
This flag is ignored if the ExpandedInformation member is empty.
(Read and Write property)

172.5.19 ExpandedControlText as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used to label the button for collapsing the expandable information.

Notes:
This member is ignored when the ExpandedInformation member is empty. If this member is empty and the CollapsedControlText is specified, then the CollapsedControlText value will be used for this member as well.
(Read and Write property)

172.5.20 ExpandedInformation as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used for displaying additional information.

Notes:
The additional information is displayed either immediately below the content or below the footer text depending on whether the ExpandFooterArea flag is true. If the EnableHyperlinks flag is true, then this string may contain hyperlinks in the form: `<A HREF="executablestring">Hyperlink Text</A>`.
WARNING: Enabling hyperlinks when using content from an unsafe source may cause security vulnerabilities.
(Read and Write property)

172.5.21 ExpandFooterArea as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether expand footer area is displayed at the bottom.

Notes:
Indicates that the string specified by the ExpandedInformation member is displayed at the bottom of the dialog’s footer area instead of immediately after the dialog’s content. This flag is ignored if the ExpandedInformation member is empty.
(Read and Write property)
172.5.22 Flags as Integer

**Notes:**
You should not need to set flags as we have properties for all relevant flags.
(Read and Write property)

172.5.23 Footer as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used in the footer area of the task dialog.
**Notes:**
If EnableHyperlinks is true, this can show clickable links.
(Read and Write property)

172.5.24 FooterIconPicture as Picture

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A picture to be used as Icon that is to be displayed in the footer of the task dialog.
**Notes:**
The picture must have a valid mask.
(Read and Write property)

172.5.25 Icon as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The icon to be displayed in the task dialog.
**Notes:**
Can be one of the kIcon* constants.
Or you set IconPicture property.
(Read and Write property)

172.5.26 IconPicture as Picture

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The icon to be displayed in the task dialog.
CHAPTER 172. WINDOWS

Notes:
The picture must have a valid mask.
(Read and Write property)

172.5.27  MainInstruction as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The string to be used for the main instruction.
**Notes:** (Read and Write property)

172.5.28  NoDefaultRadioButton as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Indicates that no default item will be selected.
**Notes:** (Read and Write property)

172.5.29  parent as Window

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Parent window.
**Notes:** (Read and Write property)

172.5.30  parentHandle as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Parent window handle.
**Notes:** (Read and Write property)

172.5.31  PositionRelativeToWindow as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Indicates that the task dialog is positioned (centered) relative to the window specified by parent.
**Notes:**
If the flag is not supplied (or no parent member is specified), the task dialog is positioned (centered) relative
to the monitor.
(Read and Write property)
172.5. **CLASS TASKDIALOGMBS**

### 172.5.32 ProgressbarMax as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The maximum of progress bar.

**Notes:**
Default is 100.
This is a live property. Setting it while dialog is open will change the control.
(Read and Write property)

### 172.5.33 ProgressbarMin as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The minimum value of the progress bar.

**Notes:**
This is a live property. Setting it while dialog is open will change the control.
(Read and Write property)

### 172.5.34 ProgressbarState as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The state of the progress bar.

**Notes:**
Default kProgressbarNone.
Can be set to other states to turn on progressbar.
(Read and Write property)

### 172.5.35 ProgressbarValue as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current value of the progress bar.

**Notes:**
This is a live property. Setting it while dialog is open will change the control.
(Read and Write property)
172.5.36 RightToLeftLayout as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that text is displayed reading right to left. **Notes:** (Read and Write property)

172.5.37 SelectedButton as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ID of the clicked button. **Example:**

```vbs
dim td as new TaskDialogMBS

td.CommonButtons = BitwiseOr(td.kCommonButtonOK, td.kCommonButtonCancel)
td.Content = "Hello World"

if td.ShowDialog then
    if td.SelectedButton = td.kIDOK then
        MsgBox "OK"
    else
        MsgBox "Cancel"
    end if
else
    MsgBox "Failed"
end if
```

**Notes:** (Read and Write property)

172.5.38 SelectedRadioButton as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ID of the selected radio button. **Notes:** (Read and Write property)
172.5. CLASS TASKDIALOGMBS

172.5.39 Showing as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether dialog is currently showing. **Notes:** (Read and Write property)

172.5.40 TimedOut as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether we got a timeout. **Notes:** (Read only property)

172.5.41 timeoutMS as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The timeout for the dialog. **Notes:** In Milliseconds. The dialog closes after given time. (Read and Write property)

172.5.42 VerificationChecked as Boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The state of the verification checkbox. **Example:**

```vbnet
dim td as new TaskDialogMBS

td.CommonButtons = td.kCommonButtonOK
td.Content = "Hello World"
'td.VerificationChecked = true
td.VerificationText = "Don’t show again"

call td.ShowDialog

if td.VerificationChecked then
    MsgBox "and we will not show again"
end if
```
**Notes:**

Before: Indicates whether the verification checkbox in the dialog is checked when the dialog is initially displayed.
After: True if the verification checkbox was checked when the dialog was dismissed.

This is a live property. Changing it while the dialog is open will change the checkbox.
(Read and Write property)

**172.5.43 VerificationEnabled as Boolean**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The enable state of the verification checkbox.
**Notes:**
Can be true to enable the checkbox or false to disable.
(Read and Write property)

**172.5.44 VerificationText as String**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The string to be used to label the verification checkbox.
**Example:**

```vbnet
dim td as new TaskDialogMBS

td.CommonButtons = td.kCommonButtonOK
td.Content = "Hello World"
'td.VerificationChecked = true
td.VerificationText = "Don’t show again"

call td.ShowDialog

if td.VerificationChecked then
    MsgBox "and we will not show again"
end if
```

**Notes:**
If this parameter is empty, the verification checkbox is not displayed in the task dialog. If the VerificationEnabled is false, the checkbox is not enabled.
(Read and Write property)
172.5.45 Width as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the task dialog’s client area, in dialog units.  
**Notes:**  
If 0, the task dialog manager will calculate the ideal width.  
(Read and Write property)

172.5.46 WindowTitle as String

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The string to be used for the task dialog title.  
**Notes:** (Read and Write property)

172.5.47 Yield as Boolean

**Notes:** Whether the plugin should yield time to other Xojo threads while dialog is open.  
(Read and Write property)

172.5.48 Button(index as Integer) as TaskDialogButtonMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Array of the custom buttons that are to be displayed in the task dialog.  
**Notes:** You can create TaskDialogButtonMBS objects and assign them to indexes in the array.  
(Read and Write computed property)

172.5.49 RadioButton(index as Integer) as TaskDialogButtonMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Array of the custom radio buttons that are to be displayed in the task dialog.  
**Notes:**
You can create TaskDialogButtonMBS objects and assign them to indexes in the array. (Read and Write computed property)

**172.5.50 Events**

**172.5.51 ButtonClicked(ID as Integer) as boolean**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that a button has been selected. **Notes:**

The command ID of the button is specified by ID.
To prevent the task dialog from closing, the application must return true, otherwise the task dialog is closed and the button ID is returned via the original application call.

**172.5.52 Close**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the Task Dialog has been destroyed.

**172.5.53 Constructed**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the Task Dialog has been created but has not been displayed yet. **Notes:** You can adjust here if you need.

**172.5.54 ExpandButtonClicked(Expanded as Boolean)**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the expand button has been selected.

**172.5.55 Help**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the F1 key has been pressed while the Task Dialog has focus.
172.5. **CLASS TASKDIALOGMBS**

172.5.56 **HyperlinkClicked(link as string)**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that a hyperlink has been selected.

172.5.57 **Navigated**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that navigation has occurred.

172.5.58 **Open**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the Task Dialog has been created.

172.5.59 **RadioButtonClicked(ID as Integer) as boolean**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that a radio button has been selected. **Notes:** The command ID of the radio button is specified by ID.

172.5.60 **Timer(Time as Integer)**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the Task Dialog timer has fired. **Notes:**

The total elapsed time is specified by Time. You can update the progress bar by setting ProgressbarValue.

This is called regularly so you can do background work. (or check time and dismiss dialog automatically)

172.5.61 **VerificationClicked(Checked as Boolean)**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Indicates that the Task Dialog verification check box has been selected.
172.5.62 Constants

172.5.63 kCommonButtonCancel = 8

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the common button constants.  
**Notes:** The task dialog contains the push button: Cancel. If this button is specified, the task dialog will respond to typical cancel actions (Alt-F4 and Escape).

172.5.64 kCommonButtonClose = 32

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the common button constants.  
**Notes:** The task dialog contains the push button: Close.

172.5.65 kCommonButtonNo = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the common button constants.  
**Notes:** The task dialog contains the push button: No.

172.5.66 kCommonButtonOK = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the common button constants.  
**Example:**

```vbs
dim td as new TaskDialogMBS

td.CommonButtons = td.kCommonButtonOK
td.Content = "Hello World"

' td.VerificationChecked = true
td.VerificationText = "Don’t show again"

call td.ShowDialog

if td.VerificationChecked then
    MsgBox "and we will not show again"
end if
```

**Notes:** The task dialog contains the push button: OK.
172.5.67  kCommonButtonRetry = 16

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the common button constants.  **Notes:** The task dialog contains the push button: Retry.

172.5.68  kCommonButtonYes = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the common button constants.  **Notes:** The task dialog contains the push button: Yes.

172.5.69  kIconApplication = 5

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the icon constants.  **Notes:** An application icon appears in the task dialog.

172.5.70  kIconError = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the icon constants.  **Notes:** A stop-sign icon appears in the task dialog.

172.5.71  kIconInformation = 3

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the icon constants.  **Notes:** An icon consisting of a lowercase letter i in a circle appears in the task dialog.

172.5.72  kIconNone = 0

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the icon constants.  **Notes:** No icon.

172.5.73  kIconShield = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the icon constants.  **Notes:** A shield icon appears in the task dialog.
172.5.74  kIconWarning = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the icon constants.  
**Notes:** An exclamation-point icon appears in the task dialog.

172.5.75  kIDAAbort = 3

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.  
**Notes:** Abort button

172.5.76  kIDCancel = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.  
**Notes:** Cancel button

172.5.77  kIDIgnore = 5

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.  
**Notes:** Ignore button

172.5.78  kIDNo = 7

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.  
**Notes:** No button

172.5.79  kIDOK = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.  
**Notes:** OK Button

172.5.80  kIDRetry = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the standard button IDs.  
**Notes:** Retry Button
172.5.81  kIDYes = 6

MBS Win Plugin, Plugin Version: 16.2. Function: One of the standard button IDs. Notes: Yes Button

172.5.82  kProgressBarError = 3

172.5.83  kProgressBarMarquee = 8

MBS Win Plugin, Plugin Version: 16.2. Function: One of the progressbar states. Notes: Marquee state

172.5.84  kProgressBarNone = 0

172.5.85  kProgressBarNormal = 1

MBS Win Plugin, Plugin Version: 16.2. Function: One of the progressbar states. Notes: Normal progressbar

172.5.86  kProgressBarPause = 2

MBS Win Plugin, Plugin Version: 16.2. Function: One of the progressbar states. Notes: Paused progress bar
172.6 class TimerMBS

172.6.1 class TimerMBS

MBS Win Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a timer.

**Notes:**

This timer can work with smaller periods than the normal Xojo timers on Windows.
Works on Mac OS X and Linux, too.

172.6.2 Methods

172.6.3 Constructor(Period as Integer)

MBS Win Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The constructor.

**Notes:**

Please pass a period between 1 and 999 Milliseconds.

The timer will try to be as exact as possible, but if main thread is busy, action events are delayed.

172.6.4 Destructor

MBS Win Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The destructor.

172.6.5 Properties

172.6.6 Period as Integer

MBS Win Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The period used.

**Notes:**

In milliseconds.
(Read only property)
172.6.7 Events

172.6.8 Action

MBS Win Plugin, Plugin Version: 14.3, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The action event.
**172.7 Globals**

### 172.7.1 GetWindowsErrorMessageMBS(ErrorCode as Integer) as String

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Formats a windows error message for the given error code.  
**Example:**  
```vbnet
EditField1.text = GetWindowsErrorMessageMBS(-2147352567)
```

**Notes:** Returns empty string for unknown error codes.

### 172.7.2 WindowsExecuteMBS(ApplicationName as string, CommandLine as string, CurrentDirectory as string, byref PID as Integer, Flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new process and its primary thread. The new process runs in the security context of the calling process.  
**Example:**  
```vbnet
dim error, pid as Integer

pid = 0
error = WindowsExecuteMBS(“”, ”explorer.exe”, “”, pid)
if error = 0 then
    MsgBox “Launched explorer with process id: ”+str(pid)
else
    MsgBox ”Error: ”+str(error)
end if

pid = 0
error = WindowsExecuteMBS(””, ”notepad.exe””C:\boot.ini””, “”, pid)
if error = 0 then
    MsgBox ”Launched Notepad with process id: ”+str(pid)
else
    MsgBox ”Error: ”+str(error)
end if
```

**Notes:**
172.7. **GLOBALS**

**ApplicationName:**
The name of the module to be executed. This module can be a Windows-based application. It can be some other type of module (for example, MS-DOS or OS/2) if the appropriate subsystem is available on the local computer.

The string can specify the full path and file name of the module to execute or it can specify a partial name. In the case of a partial name, the function uses the current drive and current directory to complete the specification. The function will not use the search path. This parameter must include the file name extension; no default extension is assumed.

The ApplicationName parameter can be empty. In that case, the module name must be the first white spacedelimited token in the CommandLine string. If you are using a long file name that contains a space, use quoted strings to indicate where the file name ends and the arguments begin; otherwise, the file name is ambiguous. For example, consider the string "c:\program files\sub dir\program name". This string can be interpreted in a number of ways. The system tries to interpret the possibilities in the following order:

- c:\program.exe files\sub dir\program name
- c:\program files\sub.exe dir\program name
- c:\program files\sub dir\program.exe name
- c:\program files\sub dir\program name.exe

If the executable module is a 16-bit application, ApplicationName should be empty, and the string pointed to by CommandLine should specify the executable module as well as its arguments.

To run a batch file, you must start the command interpreter; set ApplicationName to cmd.exe and set CommandLine to the following arguments: /c plus the name of the batch file.

**CommandLine:**
The command line to be executed. The maximum length of this string is 32,767 characters. If ApplicationName is empty, the module name portion of CommandLine is limited to MAX_PATH (256) characters.

The CommandLine parameter can be empty. In that case, the function uses the string pointed to by ApplicationName as the command line.

If both ApplicationName and CommandLine are non-empty, the ApplicationName string specifies the module to execute, and the CommandLine string specifies the command line. The new process can use GetCommandLine to retrieve the entire command line. Console processes written in C can use the argc and argv arguments to parse the command line. Because argv[0] is the module name, C programmers generally repeat the module name as the first token in the command line.
If ApplicationName is empty, the first white spacedelimited token of the command line specifies the module name. If you are using a long file name that contains a space, use quoted strings to indicate where the file name ends and the arguments begin (see the explanation for the ApplicationName parameter). If the file name does not contain an extension, .exe is appended. Therefore, if the file name extension is .com, this parameter must include the .com extension. If the file name ends in a period (.) with no extension, or if the file name contains a path, .exe is not appended. If the file name does not contain a directory path, the system searches for the executable file in the following sequence:

- The directory from which the application loaded.
- The current directory for the parent process.
- The 32-bit Windows system directory. Use the GetSystemDirectory function to get the path of this directory.
- The 16-bit Windows system directory. There is no function that obtains the path of this directory, but it is searched. The name of this directory is System.
- The Windows directory. Use the GetWindowsDirectory function to get the path of this directory.
- The directories that are listed in the PATH environment variable. Note that this function does not search the per-application path specified by the App Paths registry key. To include this per-application path in the search sequence, use the ShellExecute function.
- The system adds a terminating null character to the command-line string to separate the file name from the arguments. This divides the original string into two strings for internal processing.

CurrentDirectory:
The full path to the current directory for the process. The string can also specify a UNC path.

If this parameter is empty, the new process will have the same current drive and directory as the calling process. (This feature is provided primarily for shells that need to start an application and specify its initial drive and working directory.)

pid:
The variable to store the process ID of the new process.

Returns 0 for success or a windows error code for any error.

Note that the function returns before the process has finished initialization. If a required DLL cannot be located or fails to initialize, the process is terminated. To get the termination status of a process, call GetExitCodeProcess.

Possible Flags:
172.7.3  **WindowsRunAsMBS(Username as string, Domain as string, Password as string, LoginFlags as Integer, ApplicationName as string, CommandLine as string, CurrentDirectory as string, byref PID as Integer, Flags as Integer = -1) as Integer**

MBS Win Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Runs an application with a different user login.

**Notes:**
Please see Microsoft website for details:

The plugin passes parameters. If Flags is -1, we use CREATE_DEFAULT_ERROR_MODE Or CREATE_NEW_CONSOLE Or CREATE_NEW_PROCESS_GROUP.
The StartupInfo handles are closed and the PID is returned in the PID parameter.
Returns the Windows error code on failure. Else we return zero for success. On Mac and Linux the result is always -1.

172.7.4  **WinGetSysColorMBS(Index as Integer) as Color**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the current color of the specified display element.

**Notes:**
Display elements are the parts of a window and the display that appear on the system display screen.

Index: The display element whose color is to be retrieved. This parameter can be one of the following values.

- Specifies the left side color in the color gradient of an active window’s title bar if the gradient effect is enabled.
- Specifies the left side color in the color gradient of an inactive window’s title bar if the gradient effect is enabled.

Windows 2000: This value is not supported.

Windows 2000: This value is not supported.

The function returns the red, green, blue (RGB) color value of the given element.
172.7.5 WinOpenFolderAndSelectItemsMBS(folder as folderItem, files() as folderItem, ShowOnDesktop as Boolean = false, EditName as Boolean = false) as Integer

MBS Win Plugin, Plugin Version: 14.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Opens a Windows Explorer window with specified items in a particular folder selected.

**Example:**

dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim folder as FolderItem = file.Parent

dim r as Integer = WinOpenFolderAndSelectItemsMBS(folder, array(file))

if r = 0 then
    MsgBox "OK"
else
    MsgBox "Error: " + str(r)
end if

**Notes:**
Please pass a folder to open. Pass the files you want to select in that folder.

Under Windows XP the flag parameters are ignored. They work in Windows Vista and newer:

**Editname:** Pass true to select an item and put its name in edit mode. This flag can only be used when a single item is being selected. For multiple item selections, it is ignored.

**ShowOnDesktop:** Pass true to select the item or items on the desktop rather than in a Windows Explorer window. Note that if the desktop is obscured behind open windows, it will not be made visible.

For Mac, please use NSWorkspaceMBS.selectfile function.

172.7.6 WinSetSysColorMBS(Index as Integer, value as Color) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Sets the colors for the specified display elements.

**Notes:**
Display elements are the various parts of a window and the display that appear on the system display screen.
If the function succeeds, the return value is true.
For indexes, please check WinGetSysColorMBS.
172.7.7 WindowsShellExecuteMBS(\(\text{ParentWindowHandle as Integer, Operation as string, File as string, Parameters as string, Directory as string, ShowCmd as Integer}\) as Integer)

**Example:**

```vbnet
dim e as Integer
dim f as FolderItem

// show documents folder
f = SpecialFolder/Documents
e = WindowsShellExecuteMBS(0, "explore", f.AbsolutePath, ",", ",", 10)

// Launch Notepad application
e = WindowsShellExecuteMBS(0, ",", ",notepad.exe", ",", ",", 10)

// launch file, folder or application
f = SpecialFolder/Desktop/Child("Auto1.JPG")
e = WindowsShellExecuteMBS(0, ",", f.AbsolutePath, ",", ",", 10)
```

**Notes:**

Use ConsoleExecuteMBS on Mac OS X and Linux.

**ParentWindowHandle:**
A handle to the owner window used for displaying a UI or error messages. This value can be 0 if the operation is not associated with a window. You can pass `window.handle` from a REALbasic window.

**Operation:**
A string, referred to in this case as a verb, that specifies the action to be performed. The set of available verbs depends on the particular file or folder. Generally, the actions available from an object’s shortcut menu are available verbs. The following verbs are commonly used:

**File:**
A string that specifies the file or object on which to execute the specified verb. To specify a Shell namespace object, pass the fully qualified parse name. Note that not all verbs are supported on all objects. For example, not all document types support the ”print” verb. If a relative path is used for the Directory parameter do
not use a relative path for File.

Parameters:
If File specifies an executable file, this parameter is a string that specifies the parameters to be passed to the application. The format of this string is determined by the verb that is to be invoked. If File specifies a document file, Parameters should be "".

Directory:
A string that specifies the default (working) directory for the action. If this value is NULL, the current working directory is used. If a relative path is provided at File, do not use a relative path for Directory.

ShowCmd:
The flags that specify how an application is to be displayed when it is opened. If File specifies a document file, the flag is simply passed to the associated application. It is up to the application to decide how to handle it.

Return Value:
If the function succeeds, it returns a value greater than 32. If the function fails, it returns an error value that indicates the cause of the failure. The return value is cast as an HINSTANCE for backward compatibility with 16-bit Windows applications.

This method allows you to execute any commands in a folder's shortcut menu or stored in the registry.
To open a folder, use either of the following calls:

WindowsShellExecuteMBS(handle, "", <fully_qualified_path_to_folder>, "", "", SW_SHOWNORMAL);
or
WindowsShellExecuteMBS(handle, "open", <fully_qualified_path_to_folder>, "", "", SW_SHOWNORMAL);

To explore a folder, use the following call:
WindowsShellExecuteMBS(handle, "explore", <fully_qualified_path_to_folder>, "", "", SW_SHOWNORMAL);
To launch the Shell's Find utility for a directory, use the following call.

WindowsShellExecuteMBS(handle, "find", <fully_qualified_path_to_folder>, "", "", 0);

If Operation is empty, the function opens the file specified by File. If Operation is "open" or "explore", the function attempts to open or explore the folder.

Note The Launch folder windows in a separate process setting in Folder Options affects ShellExecute. If that option is disabled (the default setting), ShellExecute uses an open Explorer window rather than launch a new one. If no Explorer window is open, ShellExecute launches a new one.
172.7.8  DriveToUNCPathMBS(Driver as string) as string

MBS Win Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the system tables for which UNC network path belongs to a mapped drive.

**Example:**

```
msgbox DriveToUNCPathMBS("W:")
```

**Notes:**

Please pass the local drive name, which is drive letter and double colon.

Returns empty string on any error.

172.7.9  GetFullWindowsNameMBS(UserName as string, Domain as string) as string

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the full username of an user in a domain.

**Example:**

```
dim ShortName as string = "your short name"
dim Domain as string = "your domain"

MsgBox GetFullWindowsNameMBS(ShortName, Domain)
```

**Notes:**

Returns an empty string on any error.

Use a current Windows NT-style domain, and a username that exists on the PDC.

This will work with any NT-Style PDC (tested on XP bound to Mac OS X Server running SMB as PDC). Windows 2000/2003 and 2008 should also work.

172.8  module WindowsBitmapMBS

172.8.1  module WindowsBitmapMBS

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Windows bitmap handling module.
Notes:

In this module we collect a few useful conversion functions for handling bitmap in Xojo. Please contact us if you have idea for new function.

### 172.8.2 Methods

#### 172.8.3 BitmapToDIB(HBitmap as Ptr, HPalette as Ptr = nil) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Converts a HBitmap to a HDIB. **Notes:** HPalette is optional a color palette handle for images with 8 bit or less per pixel.

#### 172.8.4 DeleteBitmap(HBitmap as Ptr)

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Frees a HDIB or HBITMAP. **Notes:** You need to free the images you allocate to make sure memory is released.

#### 172.8.5 DIBToBitmap(HDIB as Ptr, HPalette as Ptr = nil) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Converts a HDIB to HBitmap. **Notes:** HPalette is optional a color palette handle for images with 8 bit or less per pixel.

#### 172.8.6 DuplicateHBitmap(HBitmap as Ptr, Width as Integer, Height as Integer) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Duplicates a bitmap handle. **Notes:** Please use DeleteBitmap later to free bitmap.
172.8.7  **HBitmapInfo(HBitmap as Ptr, byref Width as Integer, byref Height as Integer, byref WidthBytes as Integer, byref Planes as Integer, byref BitsPixel as Integer) as Boolean**

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries details about a bitmap handle. **Notes:** Returns true on success.

172.8.8  **HBitmapToPicture(HBitmap as Ptr, UsingDraw as boolean = false) as Picture**

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Converts a HBITMAP to Xojo picture. **Notes:**

- If UsingDraw is true, the plugin creates a new HBitmap and draws picture inside.
- Else if UsingDraw is false, the plugin copies picture and mask into a new picture.

UsingDraw with false works only for 24 or 32 bit images with one plane.
See also:

- 172.8.9  **HBitmapToPicture(HBitmap as Ptr, Width as Integer, Height as Integer) as Picture**

172.8.9  **HBitmapToPicture(HBitmap as Ptr, Width as Integer, Height as Integer) as Picture**

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Converts a HBITMAP to Xojo picture. **Notes:**

- Draws the HBitmap in a new picture of the given size.
- This method can be used to resize the bitmap on the fly while drawing.
See also:

- 172.8.8  **HBitmapToPicture(HBitmap as Ptr, UsingDraw as boolean = false) as Picture**

172.8.10  **PictureToHBitmap(Pic as Picture) as Ptr**

MBS Picture Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries HBitmap of a picture. **Notes:**

- As Xojo picture’s are internally HBitmaps, the plugin returns the handle of the picture.
No copy is made and you should not free the image. If you need a copy, please use DuplicateHBitmap function.
<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_BREAKAWAY_FROM_JOB</td>
<td>&amp; h01000000</td>
<td>The child processes of a process associated with a job are not associated with the job. If the calling process is not associated with a job, this constant has no effect. If the calling process is associated with a job, the job must set the JOB_OBJECT_LIMIT_BREAKAWAY_OK limit.</td>
</tr>
<tr>
<td>CREATE_DEFAULT_ERROR_MODE</td>
<td>&amp; h04000000</td>
<td>The new process does not inherit the error mode of the calling process. Instead, the new process gets the default error mode. This feature is particularly useful for multi-threaded shell applications that run with hard errors disabled. The default behavior is for the new process to inherit the error mode of the caller. Setting this flag changes that default behavior.</td>
</tr>
<tr>
<td>CREATE_NEW_CONSOLE</td>
<td>&amp; h0000010</td>
<td>The new process has a new console, instead of inheriting its parent's console (the default). For more information, see Creation of a Console. This flag cannot be used with DETACHED_PROCESS.</td>
</tr>
<tr>
<td>CREATE_NEW_PROCESSGROUP</td>
<td>&amp; h0000200</td>
<td>The new process is the root process of a new process group. The process group includes all processes that are descendants of this root process. The process identifier of the new process group is the same as the process identifier, which is returned in the lpProcessInformation parameter. Process groups are used by the GenerateConsoleCtrlEvent function to enable sending a CTRL+C signal to a group of console processes. If this flag is specified, CTRL+C signals will be disabled for all processes within the new process group. This flag is ignored if specified with CREATE_NEW_CONSOLE.</td>
</tr>
<tr>
<td>CREATE_NO_WINDOW</td>
<td>&amp; h08000000</td>
<td>The process is a console application that is being run without a console window. Therefore, the console handle for the application is not set. This flag is ignored if the application is not a console application, or if it is used with either CREATE_NEW_CONSOLE or DETACHED_PROCESS.</td>
</tr>
<tr>
<td>CREATE_PROTECTED_PROCESS</td>
<td>&amp; h00040000</td>
<td>The process is to be run as a protected process. The system restricts access to protected processes and the threads of protected processes. For more information on how processes can interact with protected processes, see Process Security and Access Rights. To activate a protected process, the binary must have a special signature. This signature is provided by Microsoft but not currently available for non-Microsoft binaries. There are currently four protected processes: media foundation, audio engine, Windows error reporting, and system. Components that load into these binaries must also be signed. Multimedia companies can leverage the first two protected processes. For more information, see Overview of the Protected Media Path. Windows Server 2003 and Windows XP/2000: This value is not supported.</td>
</tr>
<tr>
<td>CREATE_PRESERVE_CODE_AUTHZ_LEVEL</td>
<td>&amp; h02000000</td>
<td>Allows the caller to execute a child process that bypasses the process restrictions that would normally be applied automatically to the process. Windows 2000: This value is not supported.</td>
</tr>
<tr>
<td>CREATE_SEPARATOR_WOW_VDM</td>
<td>&amp; h00000800</td>
<td>This flag is valid only when starting a 16-bit Windows-based application. If set, the new process runs in a private Virtual DOS Machine (VDM). By default, all 16-bit Windows-based applications run as threads in a single, shared VDM. The advantage of running separately is that a crash only terminates the single VDM; any other programs running in distinct VDMs continue to function normally. Also, 16-bit Windows-based applications that are run in separate VDMs have separate input queues. That means that if one application stops responding momentarily, applications in separate VDMs continue to receive input. The disadvantage of running separately is that it takes significantly more memory to do so. You should use this flag only if the user requests that 16-bit applications should run in their own VDM.</td>
</tr>
<tr>
<td>CREATE_SHARED_WOW_VDM</td>
<td>&amp; h00001000</td>
<td>The flag is valid only when starting a 16-bit Windows-based application. If the DefaultSeparateVDM switch in the Windows section of WIN.INI is TRUE, this flag overrides the switch. The new process is run in the shared Virtual DOS Machine.</td>
</tr>
<tr>
<td>CREATE_SUSPENDED</td>
<td>&amp; h00000004</td>
<td>The primary thread of the new process is created in a suspended state, and does not run until the ResumeThread function is called.</td>
</tr>
<tr>
<td>CREATE_UNICODE_ENVIRONMENT</td>
<td>&amp; h00000400</td>
<td>If this flag is set, the environment block pointed to by lpEnvironment uses Unicode characters. Otherwise, the environment block uses ANSI characters.</td>
</tr>
<tr>
<td>DEBUG_ONLY_THIS_PROCESS</td>
<td>&amp; h00000002</td>
<td>The calling thread starts and debugging the new process. It can receive all related debug events using the WaitForDebugEvent function.</td>
</tr>
<tr>
<td>DEBUG_PROCESS</td>
<td>&amp; h00000004</td>
<td>The calling thread starts and debugging the new process and all child processes created by the new process. It can receive all related debug events using the WaitForDebugEvent function. A process that uses DEBUG_PROCESS becomes the root of a debugging chain. This continues until another process in the chain is created with DEBUG_PROCESS. If this flag is combined with DEBUG_ONLY_THIS_PROCESS, the caller debugs only the new process, not any child processes.</td>
</tr>
<tr>
<td>DETACHED_PROCESS</td>
<td>&amp; h00000008</td>
<td>For console processes, the new process does not inherit its parent's console (the default). The new process can call the AllocConsole function at a later time to create a console. For more information, see Creation of a Console. This value cannot be used with CREATE_NEW_CONSOLE.</td>
</tr>
<tr>
<td>EXTENDED_STARTUPINFO_PRESENT</td>
<td>&amp; h00080000</td>
<td>The process is created with extended startup information; the lpStartupInfo parameter specifies a STARTUPINFOEX structure. Windows Server 2003 and Windows XP/2000: This value is not supported.</td>
</tr>
<tr>
<td>INHERIT_PARENT_AFFINITY</td>
<td>&amp; h00010000</td>
<td>The process inherits its parent's affinity. If the parent process has threads in more than one processor group, the new process inherits the group-relative affinity of an arbitrary group in use by the parent. Windows Vista, Windows Server 2003, and Windows XP/2000: This value is not supported.</td>
</tr>
<tr>
<td>ABOVE_NORMAL_PRIORITY_CLASS</td>
<td>&amp; h00080000</td>
<td>Process that has priority above NORMAL_PRIORITY_CLASS but below HIGH_PRIORITY_CLASS.</td>
</tr>
<tr>
<td>BELOW_NORMAL_PRIORITY_CLASS</td>
<td>&amp; h00350000</td>
<td>Process that has priority below NORMAL_PRIORITY_CLASS but above LOW_PRIORITY_CLASS.</td>
</tr>
<tr>
<td>DEFAULT_PRIORITY_CLASS</td>
<td>&amp; h00000000</td>
<td>Process that has priority equal to the scheduler's default.</td>
</tr>
<tr>
<td>ERROR_A Affinlity</td>
<td>&amp; h00010000</td>
<td>Affinity for the process. The process's threads are scheduled to run on the most recently active virtual machine or partition that has the specified affinity.</td>
</tr>
<tr>
<td>HIGHER_PRIORITY_CLASS</td>
<td>&amp; h00000000</td>
<td>Process that has priority above the scheduler's default.</td>
</tr>
<tr>
<td>IDLE_PRIORITY_CLASS</td>
<td>&amp; h00000000</td>
<td>Process that has priority equal to the scheduler's default.</td>
</tr>
<tr>
<td>LOWEST_PRIORITY_CLASS</td>
<td>&amp; h00000000</td>
<td>Process that has priority below the scheduler's default.</td>
</tr>
<tr>
<td>NORMAL_PRIORITY_CLASS</td>
<td>&amp; h00000000</td>
<td>Process that has priority equal to the scheduler's default.</td>

<tr>
<td>COLOR_DESKTOP</td>
<td>1</td>
<td>Desktop.</td>
</tr>
<tr>
<td>COLOR_GRADIENTACTIVECAPTION</td>
<td>27</td>
<td>Right side color in the color gradient of an active window’s title bar. COLOR_ACTIVECAPTION specifies the left side color. Use SPI_GETGRADIENTCAPTIONS with the SystemParametersInfo function to determine whether the gradient effect is enabled.</td>
</tr>
<tr>
<td>COLOR_GRADIENTINACTIVECAPTION</td>
<td>28</td>
<td>Right side color in the color gradient of an inactive window’s title bar. COLOR_INACTIVECAPTION specifies the left side color.</td>
</tr>
<tr>
<td>COLOR_GRAYTEXT</td>
<td>17</td>
<td>Grayed (disabled) text. This color is set to 0 if the current display driver does not support a solid gray color.</td>
</tr>
<tr>
<td>COLOR_HIGHLIGHT</td>
<td>13</td>
<td>Item(s) selected in a control.</td>
</tr>
<tr>
<td>COLOR_HIGHLITTEXT</td>
<td>14</td>
<td>Text of item(s) selected in a control.</td>
</tr>
<tr>
<td>COLOR_HOTLIT</td>
<td>26</td>
<td>Color for a hyperlink or hot-tracked item.</td>
</tr>
<tr>
<td>COLOR_INACTIVEBORDER</td>
<td>11</td>
<td>Inactive window border.</td>
</tr>
<tr>
<td>COLOR_INACTIVECAPTION</td>
<td>3</td>
<td>Inactive window caption.</td>
</tr>
<tr>
<td>COLOR_INACTIVECAPTIONTEXT</td>
<td>19</td>
<td>Color of text in an inactive caption.</td>
</tr>
<tr>
<td>COLOR_INFOBK</td>
<td>24</td>
<td>Background color for tooltip controls.</td>
</tr>
<tr>
<td>COLOR_INFOTEXT</td>
<td>23</td>
<td>Text color for tooltip controls.</td>
</tr>
<tr>
<td>COLOR_MENU</td>
<td>4</td>
<td>Menu background.</td>
</tr>
<tr>
<td>COLOR_MENUSHILIGHT</td>
<td>29</td>
<td>The color used to highlight menu items when the menu appears as a flat menu (see SystemParametersInfo). The highlighted menu item is outlined with COLOR_HIGHLIGHT.</td>
</tr>
</tbody>
</table>

COLOR_MENUBAR 30 The background color for the menu bar when menus appear as flat menus (see SystemParametersInfo). However, COLOR_MENU continues to specify the background color of the menu popup.
COLOR_MENUTEXT 7 Text in menus.
COLOR_SCROLLBAR 0 Scroll bar gray area.
COLOR_WINDOW 5 Window background.
COLOR_WINDOWFRAME 6 Window frame.
COLOR_WINDOWTEXT 8 Text in windows.

edit Launches an editor and opens the document for editing. If File is not a document file, the function will fail.
explore Explores a folder specified by File.
find Initiates a search beginning in the directory specified by Directory.
open Opens the item specified by the File parameter. The item can be a file or folder.
print Prints the file specified by File. If File is not a document file, the function fails.

In systems prior to Windows 2000, the default verb is used if it is valid and available in the registry. If not, the "open" verb is used. In Windows 2000 and later, the default verb is used if available. If not, the "open" verb is used. If neither verb is available, the system uses the first verb listed in the registry.

SW_HIDE 0 Hides the window and activates another window.
SW_MAXIMIZE 3 Maximizes the specified window.
SW_MINIMIZE 6 Minimizes the specified window and activates the next top-level window in the z-order.
SW_RESTORE 9 Activates and displays the window. If the window is minimized or maximized, Windows restores it to its original size and position. An application should specify this flag when restoring a minimized window.
SW_SHOW 5 Activates the window and displays it in its current size and position.
SW_SHOWDEFAULT 10 Sets the show state based on the SW_ flag specified in the STARTUPINFO structure passed to the CreateProcess function by the program that started the application. An application should call ShowWindow with this flag to set the initial show state of its main window.
SW_SHOWMAXIMIZED 3 Activates the window and displays it as a maximized window.
SW_SHOWMINIMIZED 2 Activates the window and displays it as a minimized window.
SW_SHOWMINNOACTIVE 7 Displays the window as a minimized window. The active window remains active.
SW_SHOWNNA 8 Displays the window in its current state. The active window remains active.
SW_SHOWNOACTIVATE 4 Displays a window in its most recent size and position. The active window remains active.
SW_SHOWNORMAL 1 Activates and displays a window. If the window is minimized or maximized, Windows restores it to its original size and position. An application should specify this flag when displaying the window for the first time.
Return code | Description
--- | ---
0 | The operating system is out of memory or resources.
ERROR_FILE_NOT_FOUND = 2 | The specified file was not found.
ERROR_PATH_NOT_FOUND = 3 | The specified path was not found.
ERROR_BAD_FORMAT = 11 | The `.exe` file is invalid (non-Win32 `.exe` or error in `.exe` image).
SE_ERR_ACCESSDENIED = 5 | The operating system denied access to the specified file.
SE_ERR_ASSOCINCOMPLETE = 27 | The file name association is incomplete or invalid.
SE_ERR_DLLNOTFOUND = 32 | The DDE transaction could not be completed because other DDE transactions were being processed.
SE_ERR_DDEFAIL = 29 | The DDE transaction failed.
SE_ERR_DDETIMEOUT = 28 | The DDE transaction could not be completed because the request timed out.
SE_ERR_FNF = 2 | The specified DLL was not found.
SE_ERR_NOASSOC = 31 | The specified file was not found.
SE_ERR_OOM = 8 | There is no application associated with the given file name extension. This error will also be returned if you attempt to print a file that is not printable.
SE_ERR_PNF = 3 | There was not enough memory to complete the operation.
SE_ERR_SHARE = 26 | The specified path was not found.
| A sharing violation occurred.
172.9. **class WindowsClipboardMBS**

**172.9.1 class WindowsClipboardMBS**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The windows clipboard class.
**Notes:** Use it to access the clipboard on Windows.

**172.9.2 Methods**

**172.9.3 Clear**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Clears the contents of the clipboard.

**172.9.4 ClipboardFormats as Integer()**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns an array with all clipboard formats currently in the clipboard.

**172.9.5 ClipboardSequenceNumber as Integer**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the clipboard sequence number for the current window station.
**Notes:**

The return value is the clipboard sequence number. If you do not have WINSTA_ACCESSCLIPBOARD access to the window station, the function returns zero.

The system keeps a serial number for the clipboard for each window station. This number is incremented whenever the contents of the clipboard change or the clipboard is emptied. You can track this value to determine whether the clipboard contents have changed and optimize creating DataObjects. If clipboard rendering is delayed, the sequence number is not incremented until the changes are rendered.

**172.9.6 Constructor**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Connects to the clipboard.
Notes: As the clipboard has exclusive access, do not keep WindowsClipboardMBS objects around. Best you only use them within a method so once the method ends, everything is released.

172.9.7 CountClipboardFormats as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Retrieves the number of different data formats currently on the clipboard.
Notes:
If the function succeeds, the return value is the number of different data formats currently on the clipboard.
If the function fails, the return value is zero.

172.9.8 Destructor

172.9.9 EnumClipboardFormats(format as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Enumerates the data formats currently available on the clipboard.
Notes:
Clipboard data formats are stored in an ordered list. To perform an enumeration of clipboard data formats, you make a series of calls to the EnumClipboardFormats function. For each call, the format parameter specifies an available clipboard format, and the function returns the next available clipboard format.

format: A clipboard format that is known to be available.

To start an enumeration of clipboard formats, set format to zero. When format is zero, the function retrieves the first available clipboard format. For subsequent calls during an enumeration, set format to the result of the previous EnumClipboardFormats call.

If the function succeeds, the return value is the clipboard format that follows the specified format, namely the next available clipboard format.

If the function fails, the return value is zero.
If there are no more clipboard formats to enumerate, the return value is zero.
You must open the clipboard before enumerating its formats. Use the OpenClipboard function to open the clipboard. The EnumClipboardFormats function fails if the clipboard is not open.

The EnumClipboardFormats function enumerates formats in the order that they were placed on the clipboard. If you are copying information to the clipboard, add clipboard objects in order from the most descriptive clipboard format to the least descriptive clipboard format. If you are pasting information from the clipboard, retrieve the first clipboard format that you can handle. That will be the most descriptive clipboard format that you can handle.

The system provides automatic type conversions for certain clipboard formats. In the case of such a format, this function enumerates the specified format, then enumerates the formats to which it can be converted. For more information, see Standard Clipboard Formats and Synthesized Clipboard Formats.

**172.9.10 GetClipboardFormatName(format as Integer) as string**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves from the clipboard the name of the specified registered format. The function copies the name to the specified buffer.

**Example:**

```vbnet
// show items on clipboard

dim w as new WindowsClipboardMBS
dim types(-1) as integer = w.ClipboardFormats
dim names() as string

for each type as integer in types
dim n as string = w.GetClipboardFormatName(type)

n = str(type)+” ”+n

names.append n
next

MsgBox Join(names,EndOfLine)
```

**172.9.11 GetData(type as Integer) as string**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves data from the clipboard in a specified format.

**Notes:**
Format: A clipboard format.

If the function succeeds, the return value is the string with the clipboard data in the specified format.

If the function fails, the return value is "".

An application can enumerate the available formats in advance by using the EnumClipboardFormats function.

### 172.9.12 GetDIB as Picture

MBS Win Plugin, Plugin Version: 17.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries DIB picture on the clipboard. **Notes:** Returns nil on any error. This is using DIB type in database for a Device Independent Bitmap.

### 172.9.13 GetFiles as string()

MBS Win Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries list of file paths on the clipboard. **Notes:** This is for working with Explorers copy & paste feature.

### 172.9.14 GetPicture as Picture

MBS Win Plugin, Plugin Version: 14.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Queries bitmap on the clipboard. **Notes:** Returns nil on any error. This is using BITMAP type in database for a bitmap handle.

### 172.9.15 IsClipboardFormatAvailable(type as Integer) as boolean

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Determines whether the clipboard contains data in the specified format. **Notes:**
type: A standard or registered clipboard format.

If the clipboard format is available, the return value is true.
If the clipboard format is not available, the return value is false.

Typically, an application that recognizes only one clipboard format would call this function when processing the EnableMenuItems event. The application would then enable or disable the Paste menu item, depending on the return value.

### 172.9.16 RegisterClipboardFormat(type as string) as Integer

MBS Win Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Registers a new clipboard format. This format can then be used as a valid clipboard format.

**Example:**

```plaintext
dim TypeHTML as Integer
dim TypeRTF as Integer

TypeHTML = WindowsClipboardMBS.RegisterClipboardFormat("HTML Format")
TypeRTF = WindowsClipboardMBS.RegisterClipboardFormat("Rich Text Format")
```

**Notes:**

If the function succeeds, the return value identifies the registered clipboard format.
If the function fails, the return value is zero.

If a registered format with the specified name already exists, a new format is not registered and the return value identifies the existing format. This enables more than one application to copy and paste data using the same registered clipboard format. Note that the format name comparison is case-insensitive. Registered clipboard formats are identified by values in the range &hC000 through &hFFFF.

### 172.9.17 SetData(type as Integer, rawData as string) as boolean

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Places data on the clipboard in a specified clipboard format.

**Notes:**

Format: The clipboard format. This parameter can be a registered format or any of the standard clipboard formats.
rawData: A string with the data in the specified format.
If the function succeeds, the return value is true.
If the function fails, the return value is false.

The system performs implicit data format conversions between certain clipboard formats when an application calls the GetClipboardData function. For example, if the kTypeOEMTEXT format is on the clipboard, a window can retrieve data in the kTypeTEXT format. The format on the clipboard is converted to the requested format on demand. For more information, see Synthesized Clipboard Formats.

**172.9.18 SetDIB(pic as Picture) as boolean**

MBS Win Plugin, Plugin Version: 17.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Puts a DIB picture on the clipboard.  
**Notes:**  
Returns true on success.  
This is using DIB type in database for a Device Independent Bitmap.

**172.9.19 SetFiles(paths() as string) as boolean**

MBS Win Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Puts a list of file paths on the clipboard.  
**Notes:**  
This is for working with Explorers copy & paste feature.  
Returns true on success.  
Folder paths may work better if they have no training backslash.

**172.9.20 SetPicture(pic as Picture) as boolean**

MBS Win Plugin, Plugin Version: 14.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Puts a bitmap picture on the clipboard.  
**Notes:**  
Returns true on success.  
This is using BITMAP type in database for a bitmap handle.
172.9. **CLASS WINDOWSCLIPBOARDMBS**

172.9.21 **Properties**

**172.9.22 Valid as Boolean**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A flag whether the constructor got a clipboard connection. **Notes:** (Read and Write property)

172.9.23 **Constants**

**172.9.24 kTypeBitmap = 2**

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system. **Notes:** A handle to a bitmap (HBITMAP).

**172.9.25 kTypeDIB = 8**

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system. **Notes:** A memory object containing a BITMAPINFO structure followed by the bitmap bits.

**172.9.26 kTypeDIBV5 = 17**

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system. **Notes:** A memory object containing a BITMAPV5HEADER structure followed by the bitmap color space information and the bitmap bits.

**172.9.27 kTypeDIF = 5**

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system. **Notes:** Software Arts’ Data Interchange Format.
CHAPTER 172. WINDOWS

172.9.28 kTypeENHMETAFile = 14

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
**Notes:** A handle to an enhanced metafile (HENHMETAFILE).

172.9.29 kTypeHDROP = 15

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
**Notes:** A handle to type HDROP that identifies a list of files. An application can retrieve information about the files by passing the handle to the DragQueryFile function.

172.9.30 kTypeLocale = 16

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
**Notes:**
The data is a handle to the locale identifier associated with text in the clipboard. When you close the clipboard, if it contains kTypeText data but no kTypeLocale data, the system automatically sets the kTypeLocale format to the current input language. You can use the kTypeLocale format to associate a different locale with the clipboard text.

An application that pastes text from the clipboard can retrieve this format to determine which character set was used to generate the text.

Note that the clipboard does not support plain text in multiple character sets. To achieve this, use a formatted text data type such as RTF instead.

The system uses the code page associated with kTypeLocale to implicitly convert from kTypeText to kTypeUnicodeText. Therefore, the correct code page table is used for the conversion.

172.9.31 kTypeMetaFilePict = 3

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
**Notes:** Handle to a metafile picture format as defined by the METAFILEPICT structure. When passing a kTypeMetaFilePict handle by means of DDE, the application responsible for deleting hMem should also
free the metafile referred to by the kTypeMetaFilePict handle.

### 172.9.32 kTypeOEMText = 7

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
**Notes:** Text format containing characters in the OEM character set. Each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data.

### 172.9.33 kTypePalette = 9

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
**Notes:** Handle to a color palette. Whenever an application places data in the clipboard that depends on or assumes a color palette, it should place the palette on the clipboard as well.

If the clipboard contains data in the kTypePalette (logical color palette) format, the application should use the SelectPalette and RealizePalette functions to realize (compare) any other data in the clipboard against that logical palette.

When displaying clipboard data, the clipboard always uses as its current palette any object on the clipboard that is in the kTypePalette format.

### 172.9.34 kTypePenData = 10

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
**Notes:** Data for the pen extensions to the Microsoft Windows for Pen Computing.

### 172.9.35 kTypeRIFF = 11

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.
**Notes:** Represents audio data more complex than can be represented in a CF_WAVE standard wave format.
172.9.36  kTypeSylk = 4

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.  
**Notes:** Microsoft Symbolic Link (SYLK) format.

172.9.37  kTypeText = 1

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.  
**Notes:** Text format. Each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data. Use this format for ANSI text.

172.9.38  kTypeTIFF = 6

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.  
**Notes:** Tagged-image file format.

172.9.39  kTypeUnicodeText = 13

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.  
**Notes:** Unicode text format. Each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data.

172.9.40  kTypeWAVE = 12

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of standard clipboard formats defined by the system.  
**Notes:** Represents audio data in one of the standard wave formats, such as 11 kHz or 22 kHz PCM.
172.10. class WindowsDeviceMBS

172.10.1. class WindowsDeviceMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This class is for device

**Example:**
```
Dim devices(-1) As WindowsDeviceMBS = WindowsDeviceMBS.Devices
For Each device As WindowsDeviceMBS In devices
    MsgBox device.Description
Next
```

**Notes:** For Mac you can take a look on the MacUSBDeviceMBS class and the IORegistry classes.

172.10.2. Methods

172.10.3. CompatibleIDs as string()

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The list of compatible IDs for a device.

**Notes:** A device has only one device ID that is the most specific ID for a device. A device can also have less specific hardware IDs and compatible IDs. Windows first tries to find an INF file that matches the device ID. If it does not find such a match, Windows next tries to find a match to one of the less specific hardware IDs or compatible IDs.

172.10.4. Devices(ClassGUID as string, present as boolean = true) as WindowsDeviceMBS()

MBS Win Plugin, Plugin Version: 11.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries all devices on the system matching the given Class GUID.

**Example:**
```
Const PortsGUID = "\{4D36E978-E325-11CE-BFC1-08002BE10318\}"
Dim devices(-1) As WindowsDeviceMBS = WindowsDeviceMBS.Devices(PortsGUID)
```

**Notes:**
If present is true, only devices currently present on the system are returned.
The array is empty on any error.

### 172.10.5 Devices(present as boolean = true) as WindowsDeviceMBS()  

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries all devices on the system.  

**Notes:**  
If present is true, only devices currently present on the system are returned.  
The array is empty on any error.  
See also:

- 172.10.4 Devices(ClassGUID as string, present as boolean = true) as WindowsDeviceMBS()  

### 172.10.6 HardwareID as string()  

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The list of hardware IDs for a device.  

### 172.10.7 LocationPaths as string()  

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The location of the device in the device tree.  
**Notes:** Windows Server 2003 and later.
172.10.8  LowerFilters as string()

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The names of a device’s lower-filter drivers.

172.10.9  UpperFilters as string()

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The names of a device’s upper filter drivers.

172.10.10  Properties

172.10.11  Address as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device’s address.
Notes: (Read and Write property)

172.10.12  BusNumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device’s bus number.
Notes: (Read and Write property)

172.10.13  BusTypeID as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GUID for the device’s bus type.
Notes: (Read and Write property)

172.10.14  Capabilities as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device capabilities.
Notes:
A combination of the kDeviceCapability* constants. 
(Read and Write property)

### 172.10.15 Characteristics as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device characteristics.  
**Notes:** (Read and Write property)

### 172.10.16 ClassGUID as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GUID that represents the device setup class of a device.  
**Notes:** (Read and Write property)

### 172.10.17 ClassName as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device setup class of a device.  
**Notes:**  
(This property should be named Class, but was renamed ClassName as Class is a reserved word in Real Studio)  
(Read and Write property)

### 172.10.18 ConfigFlags as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device’s configuration flags.  
**Notes:** (Read and Write property)

### 172.10.19 Description as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The description of a device.  
**Notes:**
Maybe localized.
(Read and Write property)

172.10.20 DeviceID as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
If a device is associated with this device entry, here you have the ID string for this device.
Notes: (Read and Write property)

172.10.21 DevicePath as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
For devices with device ID, this is the device path.
Notes: (Read and Write property)

172.10.22 DeviceType as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
The device’s type.
Notes:
See kDeviceType* constants.
(Read and Write property)

172.10.23 Driver as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
A string that identifies the device’s software key (sometimes called the driver key).
Notes: (Read and Write property)

172.10.24 EnumeratorName as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
The string that contains the name of the device’s enumerator.
Notes: (Read and Write property)
172.10.25  **Exclusive as Boolean**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether a user can obtain exclusive use of the device.  
**Notes:** The value is true if exclusive use is allowed, or false otherwise.  
(Read and Write property)

172.10.26  **FriendlyName as String**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The friendly name of a device.  
**Notes:** (Read and Write property)

172.10.27  **HID as Boolean**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the plugin found additional HID details on the device.  
**Notes:** (Read and Write property)

172.10.28  **HIDAccessible as Boolean**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the plugin was able to access the device and query the properties.  
**Notes:**  
HIDAccessible is true if and only if HID is also true.  
(Read and Write property)

172.10.29  **HIDFeatureReportByteLength as Integer**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The length of the HID feature reports for this USB HID device.  
**Notes:**  
Only valid if HID and HIDAccessible are true.  
(Read and Write property)
172.10.30  HIDInputReportByteLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The length of the HID input reports for this USB HID device.
**Notes:**
Only valid if HID and HIDAccessible are true.
(Read and Write property)

172.10.31  HIDManufacturerName as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The manufacturer name for this device.
**Notes:**
Only valid if HID and HIDAccessible are true.
(Read and Write property)

172.10.32  HIDOutputReportByteLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The length of the HID output reports for this USB HID device.
**Notes:**
Only valid if HID and HIDAccessible are true.
(Read and Write property)

172.10.33  HIDProductID as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The product ID for this USB device.
**Notes:**
Only valid if HID and HIDAccessible are true.
(Read and Write property)

172.10.34  HIDProductName as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The product name for this HID Device.
**Notes:**
Only valid if HID and HIDAccessible are true.  
(Read and Write property)  

172.10.35  HIDSerialNumber as String  

Function:  
The serial number for this USB device.  
Notes:  
Only valid if HID and HIDAccessible are true.  
(Read and Write property)  

172.10.36  HIDVendorID as Integer  

Function:  
The vendor ID for this USB device.  
Notes:  
Only valid if HID and HIDAccessible are true.  
(Read and Write property)  

172.10.37  HIDVersionNumber as Integer  

Function:  
The version number for this HID Device.  
Notes:  
Only valid if HID and HIDAccessible are true.  
(Read and Write property)  

172.10.38  InstallState as Integer  

Function:  
The install state of this device.  
Notes:  
See kInstallState* constants.  
(Read and Write property)
172.10. **CLASS WINDOWSDEVICEMBS**

172.10.39 **LegacyBusType as Integer**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device’s legacy bus type. **Notes:** (Read and Write property)

172.10.40 **LocationInformation as String**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The hardware location of a device. **Notes:** (Read and Write property)

172.10.41 **Manufacturer as String**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name of the device manufacturer. **Notes:** (Read and Write property)

172.10.42 **PhysicalDeviceObjectName as String**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name that is associated with the device’s PDO. **Notes:** (Read and Write property)

172.10.43 **RemovalPolicy as Integer**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device’s current removal policy. **Notes:** Windows XP and later (Read and Write property)

172.10.44 **RemovalPolicyHWDefault as Integer**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device’s hardware-specified default removal policy. **Notes:**
172.10.45  RemovalPolicyOverride as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device’s override removal policy (if it exists) from the registry.

**Notes:**

Windows XP and later
(Read and Write property)

172.10.46  SecurityDescriptor as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device’s security descriptor.

**Notes:**

The format of security descriptor strings is described in Microsoft Windows SDK documentation.
(Read and Write property)

172.10.47  Service as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The service name for a device.

**Notes:** (Read and Write property)

172.10.48  UINumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The UINumber.

**Notes:**

Specifies a number associated with the device that can be displayed in the user interface.

This number is typically a user-perceived slot number, such as a number printed next to the slot on the board, or some other number that makes locating the physical device easier for the user. For buses with no such convention, or when the UINumber is unknown, the bus driver leaves this member at its default value of -1.

172.10.114 kDeviceTypeVideo = &h23

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the device type constants.

172.10.115 kDeviceTypeVirtualDisk = &h24

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the device type constants.

172.10.116 kDeviceTypeWaveIn = &h25

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the device type constants.

172.10.117 kDeviceTypeWaveOut = &h26

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the device type constants.

172.10.118 kInstallStateFailedInstall = 2

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the device's installation state. **Notes:** The device did not install properly.

172.10.119 kInstallStateFinishInstall = 3

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the device's installation state. **Notes:** The installation of this device is not yet complete.

172.10.120 kInstallStateInstalled = 0

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the device's installation state. **Notes:** The device is installed.
172.10.121  kInstallStateNeedsReinstall = 1

MBS Win Plugin, Plugin Version: 10.4. **Function:** One of the constants for the device's installation state. **Notes:** The system will try to reinstall the device on a later enumeration.
172.11 class WindowsDiscInfoMBS

172.11.1 class WindowsDiscInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class to query details on a disc drive on Windows. **Example:**

```plaintext
dim discs(-1) as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Devices
for each disc as WindowsDiscInfoMBS in discs
    MsgBox disc.ModelNumber
next
```

172.11.2 Methods

172.11.3 Device(file as folderitem) as WindowsDiscInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the device with the given path. **Example:**

```plaintext
// volume(0) is boot volume
dim disc as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Device(volume(0))
```

**Notes:**

Returns nil on any error (like missing permissions).
Seems like on Windows Vista/7 you need admin rights to query this.
The path of the folderitem must be something starting with a drive letter.
See also:

- 172.11.4 Device(path as string) as WindowsDiscInfoMBS

172.11.4 Device(path as string) as WindowsDiscInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the device with the given path. **Example:**

```plaintext
dim disc as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Device("C")
```
Notes:
Returns nil on any error (like missing permissions).
 Seems like on Windows Vista/7 you need admin rights to query this.
 Path must be something starting with a drive letter.
 See also:

- 172.11.3 Device(file as folderitem) as WindowsDiscInfoMBS

172.11.5 Devices() as WindowsDiscInfoMBS()

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Queries the device list.
**Example:**

```cpp
// enumerate all drives
dim discs(-1) as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Devices
```

Notes:
Returns empty array on error.
May get more information on Windows Vista/7 if application runs as administrator.

172.11.6 Properties

172.11.7 BufferSize as Int64

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The buffer size of the disc controller.
**Notes:**
This value is set if Mode contains 1.
(Read only property)

172.11.8 BytesPerSector as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The number of bytes per sector.
**Notes:**
This value is set if Mode contains 4.
Typically 512 bytes, but that can increase in the future.
172.11.9  Drive as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The drive number.
**Notes:** (Read and Write property)

172.11.10  Fixed as Boolean

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether this device is fixed.
**Notes:**
This value is set if Mode contains 1 or 4.
(Read and Write property)

172.11.11  Mode as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
This value shows which properties of the instance have been set with values.
**Notes:**
Mode is a bitwise or combination of values 1, 2 or 4. So value is 6 if mode 2 and 4 are set. You can test with bitwiseAnd(mode,mask). For example if bitwiseAnd(mode,4)=4 then BytesPerSector is valid.
(Read and Write property)

172.11.12  ModelNumber as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The model number string for this device.
**Example:**
```vbnet
dim discs(-1) as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Devices

for each disc as WindowsDiscInfoMBS in discs
    MsgBox disc.ModelNumber
next
```
172.11. CLASS WINDOWSDISCINFOMBS

Notes:
This string is not available for all discs.
This value is set if Mode contains 1 or 2.
(Read and Write property)

172.11.13 ProductRevision as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The product revision string.
**Notes:**
This string is not available for all discs.
This value is set if Mode contains 2.
(Read and Write property)

172.11.14 Removable as Boolean

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether this device is removable.
**Notes:**
This value is set if Mode contains 1 or 4.
(Read and Write property)

172.11.15 RevisionNumber as String

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The revision number of the disc.
**Notes:**
This string is not available for all discs.
This value is set if Mode contains 1.
(Read and Write property)

172.11.16 SectorsPerTrack as Integer

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The number of sectors per track.
**Notes:**
CHAPTER 172. WINDOWS

This value is set if Mode contains 4.
(Read and Write property)

172.11.17  SerialNumber as String

Notes:
This string is not available for all discs.
This value is set if Mode contains 1 or 2.
(Read and Write property)

172.11.18  Size as Int64

Notes:
This value is set if Mode contains 1 or 4.
(Read only property)

172.11.19  TracksPerCylinder as Integer

Notes:
This value is set if Mode contains 4.
(Read and Write property)

172.11.20  VendorId as String

Notes:
This value is set if Mode contains 2.
This string is not available for all discs.
(Read and Write property)
172.12. class WindowsDisplayMBS

172.12.1 class WindowsDisplayMBS

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for details on displays.

172.12.2 Methods

172.12.3 Displays as WindowsDisplayMBS()

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries list of displays. **Notes:** Returns nil in case of error.

172.12.4 Properties

172.12.5 DeviceInstanceID as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device instance ID in setup database. **Notes:** (Read only property)

172.12.6 DeviceName as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device name of display. **Notes:** (Read only property)

172.12.7 DisplayAdapterActive as Boolean

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether a monitor is presented as being "on" by the respective GDI view. **Notes:** (Read only property)
172.12.8  DisplayAdapterDeviceID as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The device ID for the display adapter.
**Notes:** (Read only property)

172.12.9  DisplayAdapterDeviceKey as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The display adapter device key.
**Notes:** (Read only property)

172.12.10  DisplayAdapterDeviceName as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The adapter device name.
**Notes:** (Read only property)

172.12.11  DisplayAdapterDeviceString as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The device context string.
**Notes:**
This is a description of the display adapter.
(Read only property)

172.12.12  DisplayAdapterRemovable as Boolean

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The device is removable; it cannot be the primary display.
**Notes:** (Read only property)

172.12.13  DisplayAdapterStateFlags as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The state flags.
172.12. **CLASS WINDOWS\DISPLAYMBS**

**Notes:** (Read only property)

### 172.12.14 DisplayMonitorActive as Boolean

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether a monitor is presented as being "on" by the respective GDI view. **Notes:** (Read only property)

### 172.12.15 DisplayMonitorDeviceID as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device ID for the display monitor. **Notes:** (Read only property)

### 172.12.16 DisplayMonitorDeviceKey as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The display monitor device key. **Notes:** (Read only property)

### 172.12.17 DisplayMonitorDeviceName as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The monitor device name. **Notes:** (Read only property)

### 172.12.18 DisplayMonitorDeviceString as String

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device context string. **Notes:** This is a description of the display monitor. (Read only property)
172.12.19 DisplayMonitorRemovable as Boolean

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The device is removable; it cannot be the primary display.
**Notes:** (Read only property)

172.12.20 DisplayMonitorStateFlags as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The state flags.
**Notes:** (Read only property)

172.12.21 Height as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The height of the display in pixels.
**Notes:** (Read only property)

172.12.22 HeightDPI as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The DPI for the display.
**Notes:**
Calculated based on HeightInch property.
(Read only property)

172.12.23 HeightInch as Double

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The physical height of the screen in inches.
**Notes:**
Value is zero if we don’t know.
(Read only property)
172.12. **CLASS WINDOWSDISPLAYMBS**

**172.12.24 HeightMM as Integer**

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The physical height of the screen in millimeters.

**Notes:**

Value is zero if we don’t know.

(Read only property)

**172.12.25 LogPixelsX as Integer**

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Number of pixels per logical inch along the screen width.

**Notes:**

In a system with multiple display monitors, this value is the same for all monitors.

(Read only property)

**172.12.26 LogPixelsY as Integer**

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Number of pixels per logical inch along the screen height.

**Notes:**

In a system with multiple display monitors, this value is the same for all monitors.

(Read only property)

**172.12.27 MonitorHandle as Integer**

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle for the monitor.

**Notes:** (Read only property)

**172.12.28 MonitorHeight as Integer**

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The monitor height.

**Notes:** (Read only property)
172.12.29 MonitorWidth as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The monitor width. **Notes:** (Read only property)

172.12.30 MonitorX as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The position of monitor. **Notes:** The display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values. (Read only property)

172.12.31 MonitorY as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The position of monitor. **Notes:** The display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values. (Read only property)

172.12.32 Primary as Boolean

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this is primary display. **Notes:** (Read only property)

172.12.33 Width as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the display in pixels. **Notes:** (Read only property)
172.12. **CLASS WINDOWS\mbs**

### 172.12.34 WidthDPI as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The DPI for the display. **Notes:** Calculated based on WidthInch property. (Read only property)

### 172.12.35 WidthInch as Double

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The physical width of the screen in inches. **Notes:** Value is zero if we don’t know. (Read only property)

### 172.12.36 WidthMM as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The physical width of the screen in millimeters. **Notes:** Value is zero if we don’t know. (Read only property)

### 172.12.37 WorkHeight as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The work area height in pixels. **Notes:** (Read only property)

### 172.12.38 WorkWidth as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The work area width in pixels. **Notes:** (Read only property)
172.12.39  WorkX as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The work area position.  
**Notes:**  
The work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area in rcMonitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values. 
(Read only property)

172.12.40  WorkY as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The work area position.  
**Notes:**  
The work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area in rcMonitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values. 
(Read only property)

172.12.41  X as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The position of the display in the virtual desktop space.  
**Notes:**  
Primary display is always at 0/0. 
(Read only property)

172.12.42  Y as Integer

MBS Win Plugin, Plugin Version: 18.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The position of the display in the virtual desktop space.  
**Notes:**  
Primary display is always at 0/0. 
(Read only property)
172.13. CLASS WINDOWSFILECOPYMBS

172.13 class WindowsFileCopyMBS

172.13.1 class WindowsFileCopyMBS

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to help you copying files on Windows using system functions.

172.13.2 Methods

172.13.3 CopyFileEx(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Copies an existing file to a new file, notifying the application of its progress through the progress event. **Notes:** Returns true on success and false on failure.

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
Flags: Flags that specify how the file is to be copied. This parameter can be a combination of the CopyFile* constants.
See also:

• 172.13.4 CopyFileEx(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean

172.13.4 CopyFileEx(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Copies an existing file to a new file, notifying the application of its progress through the progress event. **Notes:** Returns true on success and false on failure.

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
Flags: Flags that specify how the file is to be copied. This parameter can be a combination of the CopyFile* constants.
See also:

• 172.13.3 CopyFileEx(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer)
172.13.5 CopyFileSimple(ExistingFileName as folderitem, NewFileName as folderitem, FailIfExists as boolean=false) as boolean

**Notes:**

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
FailIfExists: If this parameter is true and the new file specified by NewFileName already exists, the function fails. If this parameter is false and the new file already exists, the function overwrites the existing file and succeeds.

Returns true on success and false on failure.

See also:

- 172.13.6 CopyFileSimple(ExistingFileName as String, NewFileName as String, FailIfExists as boolean=false) as boolean

172.13.6 CopyFileSimple(ExistingFileName as String, NewFileName as String, FailIfExists as boolean=false) as boolean

**Notes:**

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
FailIfExists: If this parameter is true and the new file specified by NewFileName already exists, the function fails. If this parameter is false and the new file already exists, the function overwrites the existing file and succeeds.

Returns true on success and false on failure.

See also:

- 172.13.5 CopyFileSimple(ExistingFileName as folderitem, NewFileName as folderitem, FailIfExists as boolean=false) as boolean
172.13. CLASS WINDOWSFILECOPYMBS

172.13.7 FileOperationCopy(source as folderitem, dest as folderitem, Flags as Integer, ProgressTitle as string="") as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Copy the files specified in the source parameter to the location specified in the dest parameter.

**Notes:**
This method has several variations so you can call it with a folderitem or a string to specify a file or folder. You can also pass an array of folderitems or strings to delete several files/folders in one operation.

**source:**
These names should be fully-qualified paths to prevent unexpected results.
Standard Microsoft MS-DOS wildcard characters, such as "*", are permitted only in the file-name position. Using a wildcard character elsewhere in the string will lead to unpredictable results.

**dest:**
The destination file or directory name. Wildcard characters are not allowed. Their use will lead to unpredictable results.

Copy and Move operations can specify destination directories that do not exist. In those cases, the system attempts to create them and normally displays a dialog box to ask the user if they want to create the new directory. To suppress this dialog box and have the directories created silently, set the FileOperationNoConfirmationMkDir flag in Flags.
For Copy and Move operations, the buffer can contain multiple destination file names if the fFlags member specifies FileOperationMultiDestFiles.
Use fully-qualified paths. Using relative paths is not prohibited, but can have unpredictable results.

Use the FileOperation* constants for the flags.
If a dialog is displayed, the window used in the parent property is used for the parent window.
If ProgressTitle is not empty, this string is used to specify the progress window title text.

Returns true on success and false on failure.

### 172.13.10 FileOperationCopy(source() as folderitem, dest as folderitem, Flags as Integer, ProgressTitle as string="") as boolean

**MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.**

**Function:**

Copy the files specified in the source parameter to the location specified in the dest parameter.

**Notes:**

This method has several variations so you can call it with a folderitem or a string to specify a file or folder. You can also pass an array of folderitems or strings to delete several files/folders in one operation.

**source:**

These names should be fully-qualified paths to prevent unexpected results. Standard Microsoft MS-DOS wildcard characters, such as "**", are permitted only in the file-name position. Using a wildcard character elsewhere in the string will lead to unpredictable results.

**dest:**

The destination file or directory name. Wildcard characters are not allowed. Their use will lead to unpredictable results.

Copy and Move operations can specify destination directories that do not exist. In those cases, the system attempts to create them and normally displays a dialog box to ask the user if they want to create the new
directory. To suppress this dialog box and have the directories created silently, set the FileOperationNoCon-
firmationMkDir flag in Flags.

For Copy and Move operations, the buffer can contain multiple destination file names if the fFlags member
specifies FileOperationMultiDestFiles.

Use fully-qualified paths. Using relative paths is not prohibited, but can have unpredictable results.

Use the FileOperation* constants for the flags.

If a dialog is displayed, the window used in the parent property is used for the parent window.

If ProgressTitle is not empty, this string is used to specify the progress window title text.

Returns true on success and false on failure.

The destination file or directory name. Wildcard characters are not allowed. Their use will lead to unpredictable results.
Copy and Move operations can specify destination directories that do not exist. In those cases, the system attempts to create them and normally displays a dialog box to ask the user if they want to create the new directory. To suppress this dialog box and have the directories created silently, set the FileOperationNoConfirmationMkDir flag in Flags.

For Copy and Move operations, the buffer can contain multiple destination file names if the fFlags member specifies FileOperationMultiDestFiles.

Use fully-qualified paths. Using relative paths is not prohibited, but can have unpredictable results.

Use the FileOperation* constants for the flags.

If a dialog is displayed, the window used in the parent property is used for the parent window.

If ProgressTitle is not empty, this string is used to specify the progress window title text.

Returns true on success and false on failure.

172.13.25 FileOperationMove(source() as string, dest as string, Flags as Integer, ProgressTitle as string=””) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Move the files specified in the source parameter to the location specified in the dest parameter.

Notes:
This method has several variations so you can call it with a folderitem or a string to specify a file or folder. You can also pass an array of folderitems or strings to delete several files/folders in one operation.

source:
These names should be fully-qualified paths to prevent unexpected results.
Standard Microsoft MS-DOS wildcard characters, such as "*", are permitted only in the file-name position. Using a wildcard character elsewhere in the string will lead to unpredictable results.

dest:
The destination file or directory name. Wildcard characters are not allowed. Their use will lead to unpredictable results.

Copy and Move operations can specify destination directories that do not exist. In those cases, the system attempts to create them and normally displays a dialog box to ask the user if they want to create the new directory. To suppress this dialog box and have the directories created silently, set the FileOperationNoConfirmationMkDir flag in Flags.
For Copy and Move operations, the buffer can contain multiple destination file names if the fFlags member specifies FileOperationMultiDestFiles.

172.13.27 MoveFileSimple(ExistingFileName as folderitem, NewFileName as folderitem) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Moves an existing file or a directory, including its children.

**Notes:**

ExistingFileName: The current name of the file or directory on the local computer.

NewFileName: The new name for the file or directory. The new name must not already exist. A new file may be on a different file system or drive. A new directory must be on the same drive.

Returns true on success and false on failure.

The MoveFile function will move (rename) either a file or a directory (including its children) either in the same directory or across directories. The one caveat is that the MoveFile function will fail on directory moves when the destination is on a different volume.

If a file is moved across volumes, MoveFile does not move the security descriptor with the file. The file will be assigned the default security descriptor in the destination directory.

The MoveFile function coordinates its operation with the link tracking service, so link sources can be tracked as they are moved.

- 172.13.27 MoveFileSimple(ExistingFileName as folderitem, NewFileName as folderitem) as boolean

172.13.29 MoveFileWithProgress(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Moves a file or directory, including its children.

**Notes:**
ExistingFileName: The name of the existing file or directory on the local computer.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT, the file cannot exist on a remote share because delayed operations are performed before the network is available.

NewFileName: The new name of the file or directory on the local computer.

When moving a file, NewFileName can be on a different file system or volume. If NewFileName is on another drive, you must set the MOVEFILE_COPY_ALLOWED flag in Flags.

When moving a directory, ExistingFileName and NewFileName must be on the same drive.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT and NewFileName is nil, MoveFileWithProgress
CHAPTER 172. WINDOWS

registers ExistingFileName to be deleted when the system restarts. The function fails if it cannot access the registry to store the information about the delete operation. If ExistingFileName refers to a directory, the system removes the directory at restart only if the directory is empty.

Flags: The move options. This parameter can be one or more of the following values: MoveFileCopyAllowed, MoveFileReplaceExisting, MoveFileCreateHardLink, MoveFileDelayUntilReboot and MoveFileWriteThrough.

Return Value: If the function succeeds, the return value is true. If the function fails, the return value is false.

When moving a file across volumes, if the Progress event returns PROGRESS_CANCEl due to the user canceling the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_Aborted. The existing file is left intact.

When moving a file across volumes, if the Progress event returns PROGRESS_STOP due to the user stopping the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_Aborted. The existing file is left intact.

- 172.13.30 MoveFileWithProgress(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean

172.13.30 MoveFileWithProgress(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Moves a file or directory, including its children.

**Notes:**

ExistingFileName: The name of the existing file or directory on the local computer.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT, the file cannot exist on a remote share because delayed operations are performed before the network is available.

NewFileName: The new name of the file or directory on the local computer.

When moving a file, NewFileName can be on a different file system or volume. If NewFileName is on another drive, you must set the MOVEFILE_COPY_ALLOWED flag in Flags.

When moving a directory, ExistingFileName and NewFileName must be on the same drive.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT and NewFileName is "", MoveFileWithProgress registers ExistingFileName to be deleted when the system restarts. The function fails if it cannot access the
registry to store the information about the delete operation. If ExistingFileName refers to a directory, the system removes the directory at restart only if the directory is empty.

Flags: The move options. This parameter can be one or more of the following values: MoveFileCopyAllowed, MoveFileReplaceExisting, MoveFileCreateHardLink, MoveFileDelayUntilReboot and MoveFileWriteThrough.

Return Value: If the function succeeds, the return value is true. If the function fails, the return value is false.

When moving a file across volumes, if the Progress event returns PROGRESSCANCEL due to the user canceling the operation, MoveFileWithProgress will return zero and GetLastError will return ERRORREQUESTABORTED. The existing file is left intact.

When moving a file across volumes, if the Progress event returns PROGRESSSTOP due to the user stopping the operation, MoveFileWithProgress will return zero and GetLastError will return ERRORREQUESTABORTED. The existing file is left intact.

See also:

- 172.13.29 MoveFileWithProgress(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean

172.13.31 Properties

172.13.32 Lasterror as Integer

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.

Notes:
This value is typically zero on success and -1 if the function is not supported by the plugin.

The FileOperation* functions have special error codes as following, but other methods have normal Windows Error codes:

(Read and Write property)

172.13.33 MultiThreaded as Boolean

MBS Win Plugin, Plugin Version: 12.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to use helper thread for better GUI responsiveness.

Notes:
This property allows you to call this method in a Thread. The plugin will perform the actual operation
on a helper thread, so it does not block Real Studio’s threading. Your GUI can continue to run this way. Progress event fires asynchronously. (Read and Write property)

### 172.13.34 OperationsAborted as Boolean

MBS Win Plugin, Plugin Version: 9.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
This flag is set by the FileOperation method to indicate whether the operation was aborted.
**Notes:** (Read and Write property)

### 172.13.35 Parent as Window

MBS Win Plugin, Plugin Version: 9.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The parent window for the FileOperation methods.
**Notes:** (Read and Write property)
172.13.36  Events

172.13.37  Progress(TotalFileSize as int64, TotalBytesTransferred as int64, StreamSize as int64, StreamBytesTransferred as Int64, StreamNumber as Integer, Reason as Integer) as Integer

MBS Win Plugin, Plugin Version: 9.2, Console & Web: No, Mac: No, Win: Yes, Linux: No.  **Function:** It is called when a portion of a copy or move operation is completed.

**Notes:**
This event is called by the CopyFileEx and the MoveFileWithProgress methods.

TotalFileSize: The total size of the file, in bytes.
TotalBytesTransferred: The total number of bytes transferred from the source file to the destination file since the copy operation began.
StreamSize: The total size of the current file stream, in bytes.
StreamBytesTransferred: The total number of bytes in the current stream that have been transferred from the source file to the destination file since the copy operation began.
StreamNumber: A handle to the current stream. The first time CopyProgressRoutine is called, the stream number is 1.
Reason: CallbackChunkFinished or CallbackStreamSwitched.

Return ProgressCancel, ProgressStop, ProgressContinue or ProgressQuiet.
If you use multithreading option, you may receive additional events after you cancelled or stopped the operation due to the events coming asynchronously.

172.13.38  Constants

172.13.39  CallbackChunkFinished=0

MBS Win Plugin, Plugin Version: 9.2.  **Function:** One of the reason constants for the Progress event.
**Notes:** Another part of the data file was copied.

172.13.40  CallbackStreamSwitched=1

MBS Win Plugin, Plugin Version: 9.2.  **Function:** One of the reason constants for the Progress event.
**Notes:** Another stream was created and is about to be copied. This is the callback reason given when the callback routine is first invoked.
172.13.41 CopyFileAllowDecryptedDestination=8

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants used with CopyFileEx. **Notes:** An attempt to copy an encrypted file will succeed even if the destination copy cannot be encrypted. Windows 2000: This value is not supported.

172.13.42 CopyFileCopySymLink=& h800

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants used with CopyFileEx. **Notes:** If the source file is a symbolic link, the destination file is also a symbolic link pointing to the same file that the source symbolic link is pointing to. Windows Server 2003 and Windows XP/2000: This value is not supported.

172.13.43 CopyFileFailIfExists=1

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants used with CopyFileEx. **Notes:** The copy operation fails immediately if the target file already exists.

172.13.44 CopyFileOpenSourceForWrite=4

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants used with CopyFileEx. **Notes:** The file is copied and the original file is opened for write access.

172.13.45 CopyFileRestartable=2

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants used with CopyFileEx. **Notes:** Progress of the copy is tracked in the target file in case the copy fails. The failed copy can be restarted at a later time by specifying the same values for source and dest as those used in the call that failed.

172.13.46 FileOperationAllowUndo=& h40

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Preserve undo information, if possible. Prior to Windows Vista, operations could be undone only from the same process that performed the original
operation.

In Windows Vista and later systems, the scope of the undo is a user session. Any process running in the user session can undo another operation. The undo state is held in the Explorer.exe process, and as long as that process is running, it can coordinate the undo functions.

If the source file parameter does not contain fully qualified path and file names, this flag is ignored.

172.13.47  FileOperationFilesOnly=& h80

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Perform the operation only on files (not on folders) if a wildcard file name (*.*) is specified.

172.13.48  FileOperationMultiDestFiles=1

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** The destination multiple destination files (one for each source file in from) rather than one directory where all source files are to be deposited.

172.13.49  FileOperationNoConfirmation=& h10

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Respond with Yes to All for any dialog box that is displayed.

172.13.50  FileOperationNoConfirmationMkDir=& h200

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Do not ask the user to confirm the creation of a new directory if the operation requires one to be created.

172.13.51  FileOperationNoConnectedElements=& H2000

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Do not move connected files as a group. Only move the specified files.
172.13.52  FileOperationNoCopySecurityAttributes=& h800

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Do not copy the security attributes of the file. The destination file receives the security attributes of its new folder.

172.13.53  FileOperationNoErrorUI=& h400

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Do not display a dialog to the user if an error occurs.

172.13.54  FileOperationNoRecursion=& h1000

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Only perform the operation in the local directory. Don’t operate recursively into subdirectories, which is the default behavior.

172.13.55  FileOperationRenameCollision=8

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Give the file being operated on a new name in a move, copy, or rename operation if a file with the target name already exists at the destination.

172.13.56  FileOperationSilent=4

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Do not display a progress dialog box.

172.13.57  FileOperationSimpleProgress=& h100

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:**

Display a progress dialog box but do not show individual file names as they are operated on.

The plugin activates this flag if you pass in a window title.
172.13.58  FileOperationWantNukeWarning=$H4000$

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the flag constants for the FileOperation methods. **Notes:** Send a warning if a file is being permanently destroyed during a delete operation rather than recycled. This flag partially overrides FileOperationNoConfirmation.

172.13.59  MoveFileCopyAllowed=2

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the MoveFileWithProgress method. **Notes:**

If the file is to be moved to a different volume, the function simulates the move by using the CopyFile and DeleteFile functions.
This value cannot be used with MoveFileDelayUntilReboot.

172.13.60  MoveFileCreateHardLink=16

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the MoveFileWithProgress method. **Notes:** Reserved for future use.

172.13.61  MoveFileDelayUntilReboot=4

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the MoveFileWithProgress method. **Notes:**

The system does not move the file until the operating system is restarted. The system moves the file immediately after AUTOCHK is executed, but before creating any paging files. Consequently, this parameter enables the function to delete paging files from previous startups.
This value can only be used if the process is in the context of a user who belongs to the administrators group or the LocalSystem account.
This value cannot be used with MoveFileCopyAllowed.

172.13.62  MoveFileReplaceExisting=1

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the MoveFileWithProgress method. **Notes:**
If a file named lpNewFileName exists, the function replaces its contents with the contents of the lpExistingFileName file. This value cannot be used if NewFileName or ExistingFileName names a directory.

**172.13.63** MoveFileWriteThrough=8

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the MoveFileWithProgress method.  
**Notes:**  
The function does not return until the file has actually been moved on the disk. Setting this value guarantees that a move performed as a copy and delete operation is flushed to disk before the function returns. The flush occurs at the end of the copy operation. This value has no effect if MoveFileDelayUntilReboot is set.

**172.13.64** ProgressCancel=1

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the Progress Event return value. **Notes:** Cancel the copy operation and delete the destination file.

**172.13.65** ProgressContinue=0

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the Progress Event return value. **Notes:** Continue the copy operation.

**172.13.66** ProgressQuiet=3

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the Progress Event return value. **Notes:** Continue the copy operation, but stop invoking the event to report progress.

**172.13.67** ProgressStop=2

MBS Win Plugin, Plugin Version: 9.2. **Function:** One of the constants for the Progress Event return value. **Notes:** Stop the copy operation. It can be restarted at a later time.
172.14. CLASS WINDOWSFILEINFOMBS

172.14 class WindowsFileInfoMBS

172.14.1 class WindowsFileInfoMBS

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The window file information class. **Example:**

```vba
dim f as FolderItem = SelectFolder
if f <> Nil then
dim w as new WindowsFileInfoMBS(f)
MsgBox str(w.FileIndex)
end if
```

**Notes:**

The identifier that is stored in the FileIndex members is called the file ID. Support for file IDs is file system-specific. File IDs are not guaranteed to be unique over time, because file systems are free to reuse them. In some cases, the file ID for a file can change over time.

In the FAT file system, the file ID is generated from the first cluster of the containing directory and the byte offset within the directory of the entry for the file. Some defragmentation products change this byte offset. (Windows in-box defragmentation does not.) Thus, a FAT file ID can change over time. Renaming a file in the FAT file system can also change the file ID, but only if the new file name is longer than the old one.

In the NTFS file system, a file keeps the same file ID until it is deleted. You can replace one file with another file without changing the file ID by using the ReplaceFile function. However, the file ID of the replacement file, not the replaced file, is retained as the file ID of the resulting file.

Not all file systems can record creation and last access time, and not all file systems record them in the same manner. For example, on a Windows FAT file system, create time has a resolution of 10 milliseconds, write time has a resolution of 2 seconds, and access time has a resolution of 1 day (the access date). On the NTFS file system, access time has a resolution of 1 hour. For more information, see File Times.

172.14.2 Methods

172.14.3 Constructor(file as folderitem)

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The constructor using a folderitem. **Notes:** On success the valid property is set to true.

172.14.7 Properties

172.14.8 CreationTime as UInt64

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** An UInt64 that specifies when a file or directory is created.

**Notes:**
If the underlying file system does not support creation time, this member is zero (0).
(Read only property)

172.14.9 FileAttributes as Integer

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The file attributes.

**Notes:**
For possible values and their descriptions, see kFileAttribute* constants.
(Read only property)

172.14.10 FileIndex as UInt64

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The unique identifier that is associated with a file.

**Notes:**
The identifier and the volume serial number uniquely identify a file on a single computer. To determine whether two open handles represent the same file, combine the identifier and the volume serial number for each file and compare them.
(Read only property)

172.14.11 FileSize as UInt64

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The file size.

**Notes:** (Read only property)

172.14.12 LastAccessTime as UInt64

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** For a file, the structure specifies the last time that a file is read from or written to.
Notes:
For a directory, the structure specifies when the directory is created. For both files and directories, the
specified date is correct, but the time of day is always set to midnight. If the underlying file system does
not support the last access time, this member is zero (0).
(Read only property)

172.14.13  LastWriteTime as UInt64

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
For a file, the structure specifies the last time that a file is written to.
**Notes:**
For a directory, the structure specifies when the directory is created. If the underlying file system does not
support the last write time, this member is zero (0).
(Read only property)

172.14.14  NumberOfLinks as Integer

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The number of links to this file.
**Notes:**
For the FAT file system this member is always 1. For the NTFS file system, it can be more than 1.
(Read only property)

172.14.15  Valid as Boolean

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether the constructor got the values.
**Notes:** (Read only property)

172.14.16  VolumeSerialNumber as Integer

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The serial number of the volume that contains a file.
**Notes:** (Read only property)
172.14.18 Constants

172.14.18 kFileAttributeArchive = 32

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.  
**Notes:** A file or directory that is an archive file or directory. Applications typically use this attribute to mark files for backup or removal.

172.14.19 kFileAttributeCompressed = 2048

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.  
**Notes:** A file or directory that is compressed. For a file, all of the data in the file is compressed. For a directory, compression is the default for newly created files and subdirectories.

172.14.20 kFileAttributeDevice = 64

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.  
**Notes:** This value is reserved for system use.

172.14.21 kFileAttributeDirectory = 16

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.  
**Notes:** The handle that identifies a directory.

172.14.22 kFileAttributeEncrypted = 16384

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.  
**Notes:** A file or directory that is encrypted. For a file, all data streams in the file are encrypted. For a directory, encryption is the default for newly created files and subdirectories.

172.14.23 kFileAttributeHidden = 2

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.  
**Notes:** The file or directory is hidden. It is not included in an ordinary directory listing.
172.14.24  kFileAttributeNormal = 128

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants. **Notes:** A file that does not have other attributes set. This attribute is valid only when used alone.

172.14.25  kFileAttributeNotContentIndexed = 8192

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants. **Notes:** The file or directory is not to be indexed by the content indexing service.

172.14.26  kFileAttributeOffline = 4096

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants. **Notes:** The data of a file is not available immediately. This attribute indicates that the file data is physically moved to offline storage. This attribute is used by Remote Storage, which is the hierarchical storage management software. Applications should not arbitrarily change this attribute.

172.14.27  kFileAttributeReadonly = 1

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants. **Notes:** A file that is read-only. Applications can read the file, but cannot write to it or delete it. This attribute is not honored on directories. For more information, see "You cannot view or change the Read-only or the System attributes of folders in Windows Server 2003, in Windows XP, or in Windows Vista".

172.14.28  kFileAttributeReparsePoint = 1024

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants. **Notes:** A file or directory that has an associated reparse point, or a file that is a symbolic link.

172.14.29  kFileAttributeSparseFile = 512

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants. **Notes:** A file that is a sparse file.
172.14.30  kFileAttributeSystem = 4

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.  
**Notes:** A file or directory that the operating system uses a part of, or uses exclusively.

172.14.31  kFileAttributeTemporary = 256

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.  
**Notes:** A file that is being used for temporary storage. File systems avoid writing data back to mass storage if sufficient cache memory is available, because typically, an application deletes a temporary file after the handle is closed. In that scenario, the system can entirely avoid writing the data. Otherwise, the data is written after the handle is closed.

172.14.32  kFileAttributeVirtual = 65536

MBS Win Plugin, Plugin Version: 10.1. **Function:** One of the file attribute constants.  
**Notes:** This value is reserved for system use.
172.15  class WindowsFileStreamMBS

172.15.1  class WindowsFileStreamMBS

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for file streams on Windows.

**Notes:**
Windows can store more than one data stream in a file.

(on Mac/Linux, please check the ExtendedAttributesMBS module)
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

172.15.2  Methods

172.15.3  Constructor

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The private constructor.

172.15.4  List(file as folderitem) as WindowsFileStreamMBS()

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Lists file streams in a file at given folderitem.

**Example:**

```dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")

dim w() as WindowsFileStreamMBS = WindowsFileStreamMBS.List(f)
```

**Notes:**
Returns nil in case of error.
Else returns an array with stream details.

Requires Windows Vista or newer. Raises exception on Windows XP.

See also:

- 172.15.5 List(Path as String) as WindowsFileStreamMBS()
172.15. CLASS WINDOWSFILESTREAMMBS

172.15.5 List(Path as String) as WindowsFileStreamMBS()

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Lists file streams in a file at given path.
**Notes:**
Returns nil in case of error.
Else returns an array with stream details.

Requires Windows Vista or newer. Raises exception on Windows XP.
See also:
- 172.15.4 List(file as folderitem) as WindowsFileStreamMBS()

172.15.6 Properties

172.15.7 Name as String

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The name of the stream.
**Notes:** (Read only property)

172.15.8 Size as UInt64

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The size in bytes.
**Notes:** (Read only property)
172.16  class WindowsFileVersionMBS

172.16.1  class WindowsFileVersionMBS

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to read Windows version information from a file.

**Example:**
```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox w.GetInternalName
end if
```

172.16.2  Methods

172.16.3  FileVersion as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The file version in an user readable string.

**Example:**
```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox wFileVersion
end if
```

**Notes:** format is "1.2.3.4".

172.16.4  GetCompanyName as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns value for key CompanyName.

**Example:**
```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox w.GetCompanyNamex
end if
```
172.16.5 GetFileDescription as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Returns value for key FileDescription.
**Example:**

dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox w.GetFileDescription
end if

172.16.6 GetFileVersion as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Returns value for key FileVersion.
**Example:**

dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox w.GetFileVersion
end if

172.16.7 GetInternalName as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Returns value for key InternalName.
**Example:**

dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox w.GetInternalName
end if
172.16.8 GetLegalCopyright as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns value for key LegalCopyright.

**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox w.GetLegalCopyright
end if
```

172.16.9 GetOriginalFilename as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns value for key OriginalFilename.

**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox w.GetOriginalFilename
end if
```

172.16.10 GetProductName as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns value for key ProductName.

**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox w.GetProductName
end if
```

172.16.11 GetProductVersion as string

Example:

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox w.GetProductVersion
end if
```

172.16.12 OpenFile(file as folderitem) as boolean

**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox w.GetCompanyName
end if
```

**Notes:** Returns true on success and false on failure.

172.16.13 ProductVersion as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The product version in an user readable string.

**Example:**

```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox w.ProductVersion
end if
```

**Notes:** format is "1.2.3.4"
172.16.14 QueryBinaryValue(key as string) as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Low level function to read a binary item from the information resource.

**Example:**
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    // we define encoding as UTF16 as we know the value for ProductName is an UTF16 string.
    MsgBox DefineEncoding(w.QueryBinaryValue("ProductName"), encodings.UTF16)
end if
```

**Notes:** Returns "" on any error.

172.16.15 QueryUnicodeValue(key as string) as string

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Low level function to read an unicode string item from the information resource.

**Example:**
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox str(w.QueryUnicodeValue("ProductName"))
end if
```

**Notes:** Returns "" on any error.

172.16.16 Properties

172.16.17 FileDateLS as Integer

**Example:**
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox str(w.FileDateLS)
```

end if

Notes:
Filedate is a 64 bit integer. This is the lower 32 bit part.

Specifies the least significant 32 bits of the file’s 64-bit binary creation date and time stamp. (Read and Write property)

172.16.18 FileDateMS as Integer

Example:
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox str(w.FileDateMS)
end if
```

Notes:
Filedate is a 64 bit integer. This is the higher 32 bit part.

Specifies the most significant 32 bits of the file’s 64-bit binary creation date and time stamp. (Read and Write property)

172.16.19 FileFlags as Integer

Example:
```vbnet
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox str(w.FileFlags)
end if
```
Notes:
Contains a bitmask that specifies the Boolean attributes of the file. This member can include one or more of the following values.

- **VS_FF_DEBUG** = 1 The file contains debugging information or is compiled with debugging features enabled.
- **VS_FF_INFOINFERRED** = 16 The file’s version structure was created dynamically; therefore, some of the members in this structure may be empty or incorrect. This flag should never be set in a file’s VS\_VERSIONINFO data.
- **VS_FF_PATCHED** = 4 The file has been modified and is not identical to the original shipping file of the same version number.
- **VS_FF_PRERELEASE** = 2 The file is a development version, not a commercially released product.
- **VS_FF_PRIVATEBUILD** = 8 The file was not built using standard release procedures. If this flag is set, the StringFileInfo structure should contain a PrivateBuild entry.
- **VS_FF_SPECIALBUILD** = 32 The file was built by the original company using standard release procedures but is a variation of the normal file of the same version number. If this flag is set, the StringFileInfo structure should contain a SpecialBuild entry.

(Read and Write property)

### 172.16.20 FileOS as Integer

**Example:**
```vba
    dim f as FolderItem = SpecialFolder.Desktop.Child(“dbgview.exe”)
    dim w as new WindowsFileVersionMBS
    if w.OpenFile(f) then
        MsgBox str(w.FileOS)
    end if
```

**Notes:**
Specifies the operating system for which this file was designed. This member can be one of the following values.

An application can combine these values to indicate that the file was designed for one operating system running on another. The following FileOS values are examples of this, but are not a complete list.

(Read and Write property)
172.16. CLASS WINDOWSFILEVERSIONMBS

| VOS_DOS        | & h00010000 | The file was designed for MS-DOS. |
| VOS_NT         | & h00040000 | The file was designed for Windows NT. |
| VOS_WINDOWS16  | & h00000001 | The file was designed for 16-bit Windows. |
| VOS_WINDOWS32  | & h00000004 | The file was designed for 32-bit Windows. |
| VOS_OS216      | & h00020000 | The file was designed for 16-bit OS/2. |
| VOS_OS232      | & h00030000 | The file was designed for 32-bit OS/2. |
| VOS_PM16       | & h00000002 | The file was designed for 16-bit Presentation Manager. |
| VOS_PM32       | & h00000003 | The file was designed for 32-bit Presentation Manager. |
| VOS_UNKNOWN    | & h00000000 | The operating system for which the file was designed is unknown to the system. |

VOS_DOS_WINDOWS16 = & h00010001 The file was designed for 16-bit Windows running on MS-DOS.
VOS_DOS_WINDOWS32 = & h00010004 The file was designed for 32-bit Windows running on MS-DOS.
VOS_NT_WINDOWS16 = ? The file was designed for Windows NT.
VOS_OS216_PM16  = & h00020002 The file was designed for 16-bit Presentation Manager running on 16-bit OS/2.
VOS_OS232_PM32  = & h00030003 The file was designed for 32-bit Presentation Manager running on 32-bit OS/2.

172.16.21 FileSubtype as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The Windows file subtype code.

**Example:**

```vbs
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox str(w.FileSubType)
end if
```

**Notes:**

Specifies the function of the file. The possible values depend on the value of FileType. For all values of FileType not described in the following list, FileSubtype is zero.

If FileType is VFT_DRV, FileSubtype can be one of the following values.

If FileType is VFT_FONT, FileSubtype can be one of the following values.

If FileType is VFT_VXD, FileSubtype contains the virtual device identifier included in the virtual device control block.
All FileSubtype values not listed here are reserved.
(Read and Write property)
20196

CHAPTER 172. WINDOWS

VFT2_UNKNOWN = 0 The driver type is unknown by the system.
VFT2_DRV_COMM = 10 The file contains a communications driver.
VFT2_DRV_PRINTER = 1 The file contains a printer driver.
VFT2_DRV_KEYBOARD = 2 The file contains a keyboard driver.
VFT2_DRV_LANGUAGE = 3 The file contains a language driver.
VFT2_DRV_DISPLAY = 4 The file contains a display driver.
VFT2_DRV_MOUSE = 5 The file contains a mouse driver.
VFT2_DRV_NETWORK = 6 The file contains a network driver.
VFT2_DRV_SYSTEM = 7 The file contains a system driver.
VFT2_DRV_INSTALLABLE = 8 The file contains an installable driver.
VFT2_DRV_SOUND = 9 The file contains a sound driver.
VFT2_DRV_VERSIONED_PRINTER = 10 The file contains a versioned printer driver.

VFT2_UNKNOWN = 0 The font type is unknown by the system.
VFT2_FONT_RASTER = 1 The file contains a raster font.
VFT2_FONT_VECTOR = 2 The file contains a vector font.
VFT2_FONT_TRUETYPE = 3 The file contains a TrueType font.

172.16.22 FileType as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The Windows file type code.

**Example:**

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox str(w.FileType)
end if
```

**Notes:**

Specifies the general type of file. This member can be one of the following values. All other values are reserved.

VFT.Unknown = 0 The file type is unknown to the system.
VFT.App = 1 The file contains an application.
VFT.DLL = 2 The file contains a DLL.
VFT_DRV = 3 The file contains a device driver. If dwFileType is VFT_DRV, FileSubtype contains a more specific description of the driver.
VFT.FONT = 4 The file contains a font. If dwFileType is VFT.FONT, FileSubtype contains a more specific description of the font file.
VFT.VXD = 5 The file contains a virtual device.
VFT_STATIC.Lib = 7 The file contains a static-link library.
172.16. CLASS WINDOWSFILEVERSIONMBS

(Read and Write property)

172.16.23  FileVersionLS as Integer

**Example:**
```vbscript
dim f as FolderItem = SpecialFolder/Desktop.Child(“dbgview.exe”) dim w as new WindowsFileVersionMBS if w.OpenFile(f) then MsgBox str(w.FileVersionLS) end if
```

**Notes:**
Fileversion is a 64 bit integer. This is the lower 32 bit part.

Specifies the least significant 32 bits of the file’s binary version number. This member is used with FileVersionMS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

172.16.24  FileVersionMS as Integer

**Example:**
```vbscript
dim f as FolderItem = SpecialFolder/Desktop.Child(“dbgview.exe”) dim w as new WindowsFileVersionMBS if w.OpenFile(f) then MsgBox str(w.FileVersionMS) end if
```

**Notes:**
Fileversion is a 64 bit integer. This is the higher 32 bit part.

Specifies the most significant 32 bits of the file’s binary version number. This member is used with FileVersionLS to form a 64-bit value used for numeric comparisons.
(Read and Write property)
172.16.25  LangCharset as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The language charset to use.
**Example:**

```vbs
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox str(w.LangCharset)
end if
```

**Notes:**
OpenFile sets this to the default value.
You can change it later.
Value is used on each call of GetOriginalFilename, GetFileVersion, GetCompanyName, GetProductName,
GetInternalName, GetProductVersion, GetFileVersion, GetFileDescription, GetLegalCopyright, QueryUnicodeValue and Query-
BinaryValue.
(Read and Write property)

172.16.26  Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.
**Notes:**
Lasterror means no error has happend.
Normally a Windows error code.
(Read and Write property)

172.16.27  ProductVersionLS as Integer

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Product version number. Lower part.
**Example:**

```vbs
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox str(w.ProductVersionLS)
end if
```
Notes:

Productversion is a 64 bit integer. This is the lower 32 bit part.

Specifies the least significant 32 bits of the binary version number of the product with which this file was distributed. This member is used with ProductVersionMS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

172.16.28 ProductVersionMS as Integer

**Example:**
```vbscript
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
    MsgBox str(w.ProductVersionMS)
end if
```

Notes:

Productversion is a 64 bit integer. This is the higher 32 bit part.

Specifies the most significant 32 bits of the binary version number of the product with which this file was distributed. This member is used with ProductVersionLS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

172.16.29 RawData as String

MBS Win Plugin, Plugin Version: 10.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the data of the file version record as string.
**Notes:** (Read only property)
172.16.30  **Success as Boolean**

MBS Win Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether last call to OpenFile was successful.

**Example:**
```vbs
Dim f As FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Dim w As New WindowsFileVersionMBS
If w.OpenFile(f) Then
    MsgBox str(w.Success)
End If
```

**Notes:** (Read and Write property)
172.17. class WindowsGUIResourcesMBS

172.17.1 class WindowsGUIResourcesMBS

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Class to retrieves the count of handles to graphical user interface (GUI) objects in use by the specified process.
**Notes:**
Allows you to monitor how many handles you use from GDI. As they are limited, your app will crash if it hits a limit.

172.17.2 Methods

172.17.3 Constructor

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The constructor.
**Notes:**
Examines current process and sets properties.

If the constructor succeeds, the properties are set to the count of handles to GUI objects in use by the process. If no GUI objects are in use, the return value is zero.

A process without a graphical user interface does not use GUI resources, therefore, GetGuiResources will return zero.

See also:

- 172.17.4 Constructor(ProcessID as integer)

172.17.4 Constructor(ProcessID as integer)

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The constructor.
**Notes:**
Examines given process and sets properties.

If the constructor succeeds, the properties are set to the count of handles to GUI objects in use by the process. If no GUI objects are in use, the return value is zero.
A process without a graphical user interface does not use GUI resources, therefore, GetGuiResources will return zero.

## 172.17.5 Properties

### 172.17.6 GDIOBJECTCOUNT as Integer

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The count of GDI objects.
**Notes:** (Read only property)

### 172.17.7 GDIOBJECTPEAK as Integer

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The peak count of GDI objects.
**Notes:** (Read only property)

### 172.17.8 LastError as Integer

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error from Windows.
**Notes:**
Should be zero on success.
But could give error code like permissions denied, if you want to examine another process.
(Read only property)

### 172.17.9 UserObjectCount as Integer

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The count of USER objects.
**Notes:** (Read only property)
172.17.10 UserObjectPeak as Integer

MBS Win Plugin, Plugin Version: 18.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The peak count of USER objects.
**Notes:** (Read only property)
172.18  class WindowsIniMBS

172.18.1  class WindowsIniMBS

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to handle INI files on Windows.

**Notes:**
Ini files are build by this:

```
[ Sectionname ]
key1=value1

[ Appname ]
key2=value2
```

An ini file contains one or more sections which are labeled with a name of a section or in the Win.ini file with the application name. Each section is filled with one or more key = value pairs.

172.18.2  Methods

172.18.3  GetPrivateProfileInt(appname as string, keyname as string, defaultValue as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads an integer value from the private ini file.

**Notes:** Returns the default value on any error.

172.18.4  GetPrivateProfileSection(appname as string) as string

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns a section from a private ini file.

**Notes:**
The string is built using CStrings (with ending chr(0)). Returns "" on any error.
172.18.5  GetPrivateProfileString(appname as string, keyname as string, defaultValue as string = "") as string

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a string from a private ini file.**Notes:** Returns the default value on any error.

172.18.6  GetPrivateProfileStruct(section as string, keyname as string, size as Integer) as memoryblock

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads a structure from a private ini file.**Notes:**
Size is the size of the memoryblock returned.
Returns nil on any error.
A checksum is checked to verify that the data is unchanged.

172.18.7  GetProfileInt(appname as string, keyname as string, defaultValue as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns an integer value of the Win.ini file.**Notes:** Returns the default value on any error.

172.18.8  GetProfileSection(appname as string) as string

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns a profile section of the Win.ini file.**Notes:**
The string is built using CStrings (with ending chr(0)).
Returns "" on any error.

172.18.9  GetProfileString(appname as string, keyname as string, defaultValue as string = ") as string

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns an integer value of the Win.ini file.**Notes:**
Searches for a string.
All three parameters are not allowed to be empty. And you must pass trimmed strings (no space on the left and/or right side)
Returns the default string on any error.

172.18.10 WritePrivateProfileSection(appname as string, value as string) as boolean

Notes: Value is an array of strings concated with chr(0) as the delimiter.
Returns true if successful.

172.18.11 WritePrivateProfileString(appname as string, keyname as string, value as string) as boolean

Example:

```vba
dim l as windowsIniMBS
l=new windowsIniMBS
l.filename="c:\test.ini"
if l.writePrivateProfileString("appname","keyname","value") then
    msgBox "ok"
end if
```

172.18.12 WritePrivateProfileStruct(section as string, keyname as string, mem as memoryblock, size as Integer) as boolean

Notes: Returns true if successful.
A checksum is stored to verify later whether the data was changed.
172.18.  CLASS WINDOWSINIMBS

172.18.13  Properties

172.18.14  BufferSize as Integer

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The size of the buffer used for reading strings from the INI files.

**Notes:**
Should not be bigger than 32767 bytes on Windows 95/98/ME.
Default size is 32000.
(Read and Write property)

172.18.15  Filename as String

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The file path of the private profile file to use.

**Notes:**
e.g. "C:\Test.ini" or just "myapp.ini".
(Read and Write property)
172.19  class WindowsKeyboardLayoutMBS

172.19.1  class WindowsKeyboardLayoutMBS

172.19.2  Methods

172.19.3  Constructor

Example:

dim w as new WindowsKeyboardLayoutMBS
MsgBox w.name

See also:

- 172.19.4 Constructor(SubLanguageID as Integer, PrimaryLanguageID as Integer)

172.19.4  Constructor(SubLanguageID as Integer, PrimaryLanguageID as Integer)

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Creates a new keyboard layout object with the given ID.
See also:

- 172.19.3 Constructor

172.19.5  KeyboardLayoutName as string

MBS Win Plugin, Plugin Version: 12.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: Returns the name of the current keyboard layout name.
Example:

msgbox WindowsKeyboardLayoutMBS.KeyboardLayoutName
172.19.6 List as WindowsKeyboardLayoutMBS()

MBS Win Plugin, Plugin Version: 12.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Returns a list of all keyboard layouts installed.

**Example:**

```vba
dim list() as WindowsKeyboardLayoutMBS = WindowsKeyboardLayoutMBS.List
MsgBox str(UBound(list)+1)+" keyboard layouts."
```

172.19.7 Properties

172.19.8 Handle as Integer

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal ID of the keyboard layout.

**Notes:** (Read only property)

172.19.9 Name as String

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the name of the keyboard layout.

**Example:**

```vba
dim w as new WindowsKeyboardLayoutMBS
MsgBox w.name
```

**Notes:** (Read only property)

172.19.10 PrimaryLanguageID as Integer

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The primary ID for this language.

**Notes:** (Read and Write property)

172.19.11 SubLanguageID as Integer

MBS Win Plugin, Plugin Version: 12.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The sub language ID.
Notes:
This is needed as there are for example 16 different English variants.
(Read and Write property)

172.19.12 Constants

172.19.13 LangAfrikaans = & h36
MBS Win Plugin, Plugin Version: 12.5. **Function:** One of the language constants.

172.19.14 LangAlbanian = & h1C
MBS Win Plugin, Plugin Version: 12.5. **Function:** One of the language constants.

172.19.15 LangAlsatian = & h84
MBS Win Plugin, Plugin Version: 12.5. **Function:** One of the language constants.

172.19.16 LangAmharic = & h5E

class WindowsKeyFilterMBS

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to filter several windows keyboard shortcuts with a low level event filter.

**Notes:**
There is no need to keep the instance as all internal data is stored in global variables.

Key codes for Windows:

**Methods**

**Install as boolean**

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Install the event filter.

**Notes:**
Returns true on success and false on failure.
Second call in an application will return false unless Uninstall was called between.

**Uninstall as boolean**

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Uninstalls the event filter.

**Notes:** You only call this after Install returned true.

**Properties**

**BlockAlt as Boolean**

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the alt key.

**Notes:** (Read and Write property)
172.20.7 BlockAltEscape as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the Alt-Escape key combination. **Notes:** (Read and Write property)

172.20.8 BlockAltF4 as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the ALT-F4 key combination. **Notes:** By default this one closes the application. (Read and Write property)

172.20.9 BlockAltTab as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the ALT-Tab key combination. **Notes:** This combination is for task switching. (Read and Write property)

172.20.10 BlockApplicationWindowsKey as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the application windows key. **Notes:** (Read and Write property)

172.20.11 BlockBack as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the back key. **Notes:** (Read and Write property)
172.20. CLASS WINDOWSKEYFILTERMBS

172.20.12 BlockCancel as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the Cancel key.
**Notes:** (Read and Write property)

172.20.13 BlockCapital as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the CapsLock key.
**Notes:** (Read and Write property)

172.20.14 BlockClear as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the Clear key.
**Notes:** (Read and Write property)

172.20.15 BlockControl as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the control key.
**Notes:** (Read and Write property)

172.20.16 BlockControlAltDelete as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the Control-Alt-Delete key combination.
**Notes:**
Sorry, does not have any effect as this key combination is processed earlier in event chain.
(Read and Write property)

172.20.17 BlockControlEscape as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the Control-Escape key combination.
172.20.18  **BlockDelete as Boolean**

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the delete key.

**Notes:** (Read and Write property)

172.20.19  **BlockDown as Boolean**

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the down key.

**Notes:** (Read and Write property)

172.20.20  **BlockEnd as Boolean**

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the end key.

**Notes:** (Read and Write property)

172.20.21  **BlockEscape as Boolean**

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the escape key.

**Notes:** (Read and Write property)

172.20.22  **BlockExecute as Boolean**

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the execute key.

**Notes:** (Read and Write property)

172.20.23  **BlockF1 as Boolean**

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F1 key.
172.20. CLASS WINDOWSKEYFILTERMBS

Notes: (Read and Write property)

172.20.24 BlockF10 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F10 key.
Notes: (Read and Write property)

172.20.25 BlockF11 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F11 key.
Notes: (Read and Write property)

172.20.26 BlockF12 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F12 key.
Notes: (Read and Write property)

172.20.27 BlockF13 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F13 key.
Notes: (Read and Write property)

172.20.28 BlockF14 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F14 key.
Notes: (Read and Write property)

172.20.29 BlockF15 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F15 key.
172.20.30 BlockF16 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F16 key. **Notes:** (Read and Write property)

172.20.31 BlockF17 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F17 key. **Notes:** (Read and Write property)

172.20.32 BlockF18 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F18 key. **Notes:** (Read and Write property)

172.20.33 BlockF19 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F19 key. **Notes:** (Read and Write property)

172.20.34 BlockF2 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F2 key. **Notes:** (Read and Write property)

172.20.35 BlockF20 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F20 key.
172.20. CLASS WINDOWSKEYFILTERMBS

Notes: (Read and Write property)

172.20.36  BlockF21 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Whether to filter the F21 key. Notes: (Read and Write property)

172.20.37  BlockF22 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Whether to filter the F22 key. Notes: (Read and Write property)

172.20.38  BlockF23 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Whether to filter the F23 key. Notes: (Read and Write property)

172.20.39  BlockF24 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Whether to filter the F24 key. Notes: (Read and Write property)

172.20.40  BlockF3 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Whether to filter the F3 key. Notes: (Read and Write property)

172.20.41  BlockF4 as Boolean

172.20.42  BlockF5 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F5 key.
**Notes:** (Read and Write property)

172.20.43  BlockF6 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F6 key.
**Notes:** (Read and Write property)

172.20.44  BlockF7 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F7 key.
**Notes:** (Read and Write property)

172.20.45  BlockF8 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F8 key.
**Notes:** (Read and Write property)

172.20.46  BlockF9 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the F9 key.
**Notes:** (Read and Write property)

172.20.47  BlockHelp as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the help key.
172.20. CLASS WINDOWSKEYFILTERMBS

Notes: (Read and Write property)

172.20.48  BlockHome as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the home key.
Notes: (Read and Write property)

172.20.49  BlockInsert as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the insert key.
Notes: (Read and Write property)

172.20.50  BlockLeft as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the left key.
Notes: (Read and Write property)

172.20.51  BlockLeftButton as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the left mouse button.
Notes: (Read and Write property)

172.20.52  BlockLeftWindowsKey as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the left windows key.
Notes: (Read and Write property)

172.20.53  BlockMiddleButton as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the middle mouse button.
172.20.54  BlockPause as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the pause key.

**Notes:** (Read and Write property)

172.20.55  BlockPrint as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the print key.

**Notes:**
BlockSnapshot is to block screenshots.
(Read and Write property)

172.20.56  BlockReturn as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the return key.

**Notes:** (Read and Write property)

172.20.57  BlockRight as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the right key.

**Notes:** (Read and Write property)

172.20.58  BlockRightButton as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether to filter the right mouse button.

**Notes:** (Read and Write property)
172.20.59  BlockRightWindowsKey as boolean

MBS Win Plugin, Plugin Version: 6.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:** Whether to filter the right windows key.
**Notes:** (Read and Write property)

172.20.60  BlockSelect as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:** Whether to filter the select key.
**Notes:** (Read and Write property)

172.20.61  BlockShift as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:** Whether to filter the shift key.
**Notes:** (Read and Write property)

172.20.62  BlockSleep as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:** Whether to filter the sleep key.
**Notes:** (Read and Write property)

172.20.63  BlockSnapshot as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:** Whether to filter the snapshot key.
**Notes:** This is the print key to do screenshots.
(Read and Write property)

172.20.64  BlockSpace as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:** Whether to filter the space key.
172.20.65 BlockTab as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether to filter the tab key.
**Notes:** (Read and Write property)

172.20.66 BlockUp as Boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether to filter the up key.
**Notes:** (Read and Write property)

172.20.67 BlockKey(virtualkeycode as Integer) as boolean

MBS Win Plugin, Plugin Version: 7.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether to block a key with a specific virtual key code.
**Notes:**
You can set this to true for all keys you want to block.
The virtual key codes are in the windows header files.
For most common keys this class has properties. More can be added.
(Read and Write computed property)

172.20.68 Events

172.20.69 KeyDown(vkCode as Integer, scanCode as Integer, flags as Integer, time as Integer) as Boolean

MBS Win Plugin, Plugin Version: 10.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The key down event.
**Notes:**
vkCode: Specifies a virtual-key code. The code must be a value in the range 1 to 254.
scanCode: Specifies a hardware scan code for the key.
flags: Specifies the extended-key flag, event-injected flag, context code, and transition-state flag. This member is specified as follows.
time: Specifies the time stamp for this message.
the flag bits are like this:

bit 0: Specifies whether the key is an extended key, such as a function key or a key on the numeric keypad. The value is 1 if the key is an extended key; otherwise, it is 0.
bit 4: Specifies whether the event was injected. The value is 1 if the event was injected; otherwise, it is 0.
bit 5: Specifies the context code. The value is 1 if the ALT key is pressed; otherwise, it is 0.
bit 7: Specifies the transition state. The value is 0 if the key is pressed and 1 if it is being released.
Other bits are reserved.

There can be only one WindowsKeyFilterMBS object in your application which receives this events.

We have currently no idea in what context this event is received. And you should return as soon as possible as this event may be called a lot of times and can block user input.

Return true if you handled the key and false if you did not handle it.
Please have this event being as fast as possible. Do not put msgbox there. Better detect a key shortcut and launch a timer to perform the action a millisecond later, so you don’t block the keyboard event system. Blocks only KeyUp or only KeyDown can lead to trouble if the internal counters for special keys get our of sync.

172.20.70 KeyUp(vkCode as Integer, scanCode as Integer, flags as Integer, time as Integer) as Boolean

Notes:
vkCode: Specifies a virtual-key code. The code must be a value in the range 1 to 254.
scanCode: Specifies a hardware scan code for the key.
flags: Specifies the extended-key flag, event-injected flag, context code, and transition-state flag. This member is specified as follows.
time: Specifies the time stamp for this message.

the flag bits are like this:

bit 0: Specifies whether the key is an extended key, such as a function key or a key on the numeric keypad. The value is 1 if the key is an extended key; otherwise, it is 0.
bit 4: Specifies whether the event was injected. The value is 1 if the event was injected; otherwise, it is 0.
bit 5: Specifies the context code. The value is 1 if the ALT key is pressed; otherwise, it is 0.
bit 7: Specifies the transition state. The value is 0 if the key is pressed and 1 if it is being released.
Other bits are reserved.

There can be only one WindowsKeyFilterMBS object in your application which receives this events.
We have currently no idea in what context this event is received. And you should return as soon as possible as this event may be called a lot of times and can block user input.

Return true if you handled the key and false if you did not handle it. Please have this event being as fast as possible. Do not put msgbox there. Better detect a key shortcut and launch a timer to perform the action a millisecond later, so you don’t block the keyboard event system. Blocks only KeyUp or only KeyDown can lead to trouble if the internal counters for special keys get our of sync.

172.21 class WindowsListMBS

172.21.1 class WindowsListMBS

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to list all the windows on a Windows system.

**Notes:**

To find all processes on Mac, use the ProcessMBS class.
To find all windows on Mac OS X, use the CGSWindowListMBS class.

172.21.2 Methods

172.21.3 Constructor

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor which queries the values.

**See also:**

- 172.21.4 Constructor(win as window) 20270
- 172.21.5 Constructor(WindowHandle as Integer) 20270

172.21.4 Constructor(win as window)

MBS Win Plugin, Plugin Version: 16.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The constructor which queries the values.

**Notes:** If win is not nil, we lookup child windows of this window.

**See also:**

- 172.21.3 Constructor 20270
- 172.21.5 Constructor(WindowHandle as Integer) 20270

172.21.5 Constructor(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor which queries the values.

**Notes:** If WindowHandle is not zero, we lookup child windows of this window.

**See also:**

- 172.21.3 Constructor 20270
- 172.21.4 Constructor(win as window) 20270
172.21.6 **Focus as Integer**

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the handle to the window that has the keyboard focus, if the window is attached to the calling thread’s message queue.  
**Notes:** If the calling thread’s message queue does not have an associated window with the keyboard focus, the return value is 0.

172.21.7 **ForegroundWindow as Integer**

MBS Win Plugin, Plugin Version: 13.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves a handle to the foreground window (the window with which the user is currently working).  
**Notes:**  
The system assigns a slightly higher priority to the thread that creates the foreground window than it does to other threads.  
The return value is a handle to the foreground window. The foreground window can be 0 in certain circumstances, such as when a window is losing activation.

172.21.8 **Update**

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the values and returns true on success.

172.21.9 **WindowClassName(index as Integer) as string**

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the window class name of the window with the given index.  
**Notes:** For example "SciCalc" for the calc.exe main window.

172.21.10 **WindowClassNameFromHandle(Handle as Integer) as String**

MBS Win Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the window class name of the window with the given handle.  
**Notes:** For example "SciCalc" for the calc.exe main window.
172.21.11  WindowHandle(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle of the window with the given index. **Notes:** This value is updated by the Constructor and the Update method.

172.21.12  WindowHeight(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height of the window with the given index. **Notes:** This value is updated by the Constructor and the Update method.

172.21.13  WindowIconic(index as Integer) as boolean

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the window with the given index is minimized.

172.21.14  WindowImageFileName(index as Integer) as string

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the path to the executable file of the process which owns the window with the given index. **Notes:** Requires Windows XP or newer. Returns an empty string on any error.

172.21.15  WindowLeft(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The x position of the window with the given index. **Notes:** This value is updated by the Constructor and the Update method.

172.21.16  WindowProcessID(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The process ID of the process which owns the window with the given index. **Notes:** This value is updated by the Constructor and the Update method.
WindowText(index as Integer) as string

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the title of the window with the given index.

WindowTextFromHandle(Handle as Integer) as String

MBS Win Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the title of the window with the given handle.

WindowThreadHandle(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The thread handle of the window with the given index. **Notes:** This value is updated by the Constructor and the Update method.

WindowTop(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Y position of the window with the given index. **Notes:** This value is updated by the Constructor and the Update method.

WindowVisible(index as Integer) as boolean

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the window with the given index is visible.

WindowWidth(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the window with the given index. **Notes:** This value is updated by the Constructor and the Update method.
172.21.23 WinPlugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Whether the window with the given index is zoomed.

172.21.24 Properties

172.21.25 CurrentProcessID as Integer

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The current process ID.
Notes:
This value is updated by the Constructor and the Update method.
(Read and Write property)

172.21.26 CurrentThreadID as Integer

Notes:
This value is updated by the Constructor and the Update method.
(Read and Write property)

172.21.27 DesktopWindowHandle as Integer

Notes:
This value is updated by the Constructor and the Update method.
(Read and Write property)

172.21.28 ForegroundWindowHandle as Integer

Notes:
172.21. **CLASS WINDOWSLISTMBS**

This value is updated by the Constructor and the Update method.
(Read and Write property)

172.21.29 **ParentWindowHandle as Integer**

MBS Win Plugin, Plugin Version: 16.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The handle of the parent window.
**Notes:**
This value is set by the Constructor.
(Read and Write property)

172.21.30 **WindowCount as Integer**

MBS Win Plugin, Plugin Version: 8.5, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The number of windows.
**Notes:**
This value is updated by the Constructor and the Update method.
(Read and Write property)
172.22 class WindowsMonitorMBS

172.22.1 class WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class to query monitor details on Windows.

**Example:**

```vbnet
define WindowsMonitorMBS
for each m as WindowsMonitorMBS in WindowsMonitorMBS.AllMonitors
    MsgBox m.DeviceName+" : " +str(m.Left)+"x"+str(m.top)+"x"+str(m.Width)+"x"+str(m.Height)
next
```

172.22.2 Methods

172.22.3 AllMonitors as WindowsMonitorMBS()

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries all monitors.

**Example:**

```vbnet
define WindowsMonitorMBS
for each m as WindowsMonitorMBS in WindowsMonitorMBS.AllMonitors
    MsgBox m.DeviceName+" : " +str(m.Left)+"x"+str(m.top)+"x"+str(m.Width)+"x"+str(m.Height)
next
```

**Notes:** Returns an array with an entry for each monitor connected to this computer.

See also:

- 172.22.4 AllMonitors(monitors() as WindowsMonitorMBS) as Integer

172.22.4 AllMonitors(monitors() as WindowsMonitorMBS) as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries all monitors.

**Notes:**

Returns the number of monitors found and sets the monitor objects in the array. If the array is too short, you get the first ubound(monitors)+1 fonts set there.

See also:

- 172.22.3 AllMonitors as WindowsMonitorMBS()
172.22. CLASS WindowsMonitorMBS

172.22.5 MonitorFromPoint(x as Integer, y as Integer, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The MonitorFromPoint function retrieves a handle to the display monitor that contains a specified point.

**Example:**

```vbs
Dim m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromPoint(1900, 1000)
if m = nil then
    MsgBox "Your display is smaller than 1900 x 1000"
else
    MsgBox m.DeviceName
end if
```

**Notes:**

x and y: The point of interest in virtual-screen coordinates.

Flags: Determines the function’s return value if the point is not contained within any display monitor.

This parameter can be one of the following values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>kDefaultToNearest</td>
<td>Returns a handle to the display monitor that is nearest to the point.</td>
</tr>
<tr>
<td>kDefaultToNull</td>
<td>Returns nil.</td>
</tr>
<tr>
<td>kDefaultToPrimary</td>
<td>Returns a handle to the primary display monitor.</td>
</tr>
</tbody>
</table>

If the point is contained by a display monitor, the return value is that display monitor.

If the point is not contained by a display monitor, the return value depends on the value of flags.

172.22.6 MonitorFromRect(left as Integer, top as Integer, width as Integer, height as Integer, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The MonitorFromRect function retrieves the display monitor that has the largest area of intersection with a specified rectangle.

**Example:**

```vbs
Dim m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromRect(0, 0, 100, 100)
MsgBox m.DeviceName
```
Notes:

left, top, width, height: The rectangle of interest in virtual-screen coordinates.
Flags: Determines the function’s return value if the rectangle does not intersect any display monitor.

This parameter can be one of the following values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>kDefaultToNearest</td>
<td>Returns a handle to the display monitor that is nearest to the rectangle.</td>
</tr>
<tr>
<td>kDefaultToNull</td>
<td>Returns nil.</td>
</tr>
<tr>
<td>kDefaultToPrimary</td>
<td>Returns a handle to the primary display monitor.</td>
</tr>
</tbody>
</table>

If the rectangle intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the rectangle.
If the rectangle does not intersect a display monitor, the return value depends on the value of Flags.

172.22.7 MonitorFromWindow(win as window, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The MonitorFromWindow function retrieves the display monitor that has the largest area of intersection with the bounding rectangle of a specified window.
**Example:**
```vbnet
dim m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromWindow(window1)
MsgBox m.DeviceName
```

Notes:

win: The window of interest.
Flags: Determines the function’s return value if the window does not intersect any display monitor.

This parameter can be one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>kDefaultToNearest</td>
<td>Returns the display monitor that is nearest to the window.</td>
</tr>
<tr>
<td>kDefaultToNull</td>
<td>Returns nil.</td>
</tr>
<tr>
<td>kDefaultToPrimary</td>
<td>Returns the primary display monitor.</td>
</tr>
</tbody>
</table>

If the window intersects one or more display monitor rectangles, the return value is the display monitor that
has the largest area of intersection with the window.

If the window does not intersect a display monitor, the return value depends on the value of Flags.
If the window is currently minimized, MonitorFromWindow uses the rectangle of the window before it was minimized.
See also:

- 172.22.8 MonitorFromWindow(WindowHandle as Integer, flags as Integer = 0) as WindowsMonitorMBS

172.22.8 MonitorFromWindow(WindowHandle as Integer, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The MonitorFromWindow function retrieves the display monitor that has the largest area of intersection with the bounding rectangle of a specified window.

**Example:**
```vbnet
dim m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromWindow(window1.handle)
MsgBox m.DeviceName
```

**Notes:**
WindowHandle: A handle to the window of interest.
Flags: Determines the function’s return value if the window does not intersect any display monitor.

This parameter can be one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>kDefaultToNearest</td>
<td>Returns the display monitor that is nearest to the window.</td>
</tr>
<tr>
<td>kDefaultToNull</td>
<td>Returns nil.</td>
</tr>
<tr>
<td>kDefaultToPrimary</td>
<td>Returns the primary display monitor.</td>
</tr>
</tbody>
</table>

If the window intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the window.

If the window does not intersect a display monitor, the return value depends on the value of Flags.
If the window is currently minimized, MonitorFromWindow uses the rectangle of the window before it was minimized.
See also:

- 172.22.7 MonitorFromWindow(win as window, flags as Integer = 0) as WindowsMonitorMBS
172.22.9  Properties

172.22.10  Bottom as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The bottom value of the display monitor.
**Notes:**
Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values.
(Read and Write property)

172.22.11  DeviceName as String

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string that specifies the device name of the monitor being used.
**Notes:** (Read and Write property)

172.22.12  Height as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height of the display monitor.
**Notes:**
Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values.
(Read and Write property)

172.22.13  HMonitor as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal window handle for this monitor.
**Notes:** (Read and Write property)

172.22.14  IsPrimary as Boolean

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this is the primary display monitor.
**Notes:** (Read and Write property)
172.22.15  Left as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The left position of the display monitor.

**Notes:**

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values.

(Read and Write property)

172.22.16  Right as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The right value of the display monitor.

**Notes:**

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values.

(Read and Write property)

172.22.17  Top as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The top position of the display monitor.

**Notes:**

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values.

(Read and Write property)

172.22.18  Width as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the display monitor.

**Notes:**

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values.

(Read and Write property)
172.22.19 WorkBottom as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The bottom value from useable screen area.
**Notes:**
Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values.
(Read and Write property)

172.22.20 WorkHeight as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The height value from useable screen area.
**Notes:**
Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values.
(Read and Write property)

172.22.21 WorkLeft as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The left value from useable screen area.
**Notes:**
Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values.
(Read and Write property)

172.22.22 WorkRight as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The right value from useable screen area.
**Notes:**
Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values.
(Read and Write property)
virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values. (Read and Write property)

172.22.23 WorkTop as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The top value from useable screen area.  
**Notes:**  
Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values. (Read and Write property)

172.22.24 WorkWidth as Integer

MBS Win Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width value from useable screen area.  
**Notes:**  
Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle’s coordinates may be negative values. (Read and Write property)

172.22.25 Constants

172.22.26 kDefaultToNearest = 2

MBS Win Plugin, Plugin Version: 11.3. **Function:** One of the flag constants.  
**Notes:** Return the display monitor that is nearest to the window, point or rectangle.

172.22.27 kDefaultToNull = 0

MBS Win Plugin, Plugin Version: 11.3. **Function:** One of the flag constants.  
**Notes:** Returns nil if no monitor matches is located at point, window or rectangle.
172.22.28  kDefaultToPrimary = 1

MBS Win Plugin, Plugin Version: 11.3. **Function:** One of the flag constants.  **Notes:** Returns the primary display monitor if point, rect or window does not point to a monitor.
172.23.  CLASS WINDOWS PREVIEW HANDLER MBS

172.23  class WindowsPreviewHandlerMBS

172.23.1  class WindowsPreviewHandlerMBS

Function: The class for showing previews on windows.  
Notes: This is like a control which you can put into a window to show a preview for a file.

172.23.2  Methods

172.23.3  Constructor (ClassID as string)

Function: Initializes the object with loading the class with the given classid.  
Notes: You find those ClassIDs in the registry (See example project).

172.23.4  DoPreview

Function: Directs the preview handler to load data from the source specified in an earlier Initialize method call, and to begin rendering to the previewer window.  
Notes:

Lasterror is set.

If the previewer window has not yet been created, then it must be created after this method has been called. The preview handler is responsible for painting the area specified in SetWindow or SetRect. If these methods are called while the preview handler is rendering, the window must be reparented/resized without stopping or restarting the rendering of the item. This method should be called only after SetWindow has been called. Additionally, this method should be called only after Constructor has been called.

172.23.5  InitWithData (data as MemoryBlock)

Function: Loads the given data.  
Notes: Lasterror is set.

See also:

- 172.23.6 InitWithData (data as string)
172.23.6  **InitWithData(data as string)**

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Loads the given data.  
**Notes:** Lasterror is set.  
See also:
- 172.23.5 InitWithData(data as MemoryBlock)

172.23.7  **InitWithFile(file as folderitem)**

**Notes:** Lasterror is set.  
If the preview handler does not support reading file, the plugin reads the file and passes as data.

172.23.8  **SetBackgroundColor(red as Integer, green as Integer, blue as Integer)**

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the background color of the preview handler.  
**Notes:** Lasterror is set.  
Not all preview handlers implement this method.

172.23.9  **SetFocus**

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Directs the preview handler to set focus to itself.  
**Notes:** Lasterror is set.

172.23.10  **SetFont(size as Integer, font as string)**

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the font attributes to be used for text within the preview handler.  
**Notes:** Lasterror is set.  
Not all preview handlers implement this method.
172.23.11 SetRect(left as Integer, top as Integer, width as Integer, height as Integer)

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Directs the preview handler to change the area within the parent hwnd that it draws into.
**Notes:**
Lasterror is set.

If called before the preview handler window has been created, the new rectangle replaces the rectangle previously received in the SetWindow call.
If called after the preview handler window has been created, the preview handler window must be resized.
If the preview handler is already rendering, then the preview must be resized without interrupting the render process.

172.23.12 SetTextColor(red as Integer, green as Integer, blue as Integer)

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Sets the color of the text within the preview handler.
**Notes:**
Lasterror is set.
Not all preview handlers implement this method.

172.23.13 SetWindow(win as window, left as Integer, top as Integer, width as Integer, height as Integer)

MBS Win Plugin, Plugin Version: 12.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Sets the parent window of the previewer window, as well as the area within the parent to be used for the previewer window.
**Notes:**
Pass the window and the area for the previewer.
Lasterror is set.

The preview handler is responsible for painting the entire area. If the previewer window has been created, the preview handler must associate the previewer window to the new parent hwnd and resize the previewer window to the area defined by the rectangle. If the previewer window has not yet been created, the preview handler must remember this information for when the previewer window is created in DoPreview. It is preferred that this information be stored prior to calling DoPreview. Doing so increases performance at setup time for any cases where the preview does not start.
172.23.14 Unload

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Directs the preview handler to cease rendering a preview and to release all resources that have been allocated based on the item passed in during the initialization.

**Notes:**
Lasterror is set.
When called, the preview window will be destroyed.

This method should be called only after Constructor has been called. All resources associated with this initialization will be released. Prior to calling DoPreview, this preview handler will be re-initialized with a call to one of the initialization interfaces and a call to SetWindow.

172.23.15 Properties

172.23.16 Handle as Integer

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The internal object reference.

**Notes:** (Read only property)

172.23.17 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.

**Notes:** (Read and Write property)

172.23.18 LasterrorString as String

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The error message for the error number in the lasterror property.

**Notes:** (Read only property)

172.23.19 SupportsDataLoading as Boolean

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Whether the preview handler supports loading data from a string or memoryblock.
Notes: (Read only property)

### 172.23. SupportsFileLoading as Boolean

MBS Win Plugin, Plugin Version: 12.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the preview handler supports loading files.  
**Notes:**  
As the plugin can also load file and pass as data if needed, this function also returns true if SupportsDataLoading is also true.  
(Read only property)

### 172.23.21 Window as Window

MBS Win Plugin, Plugin Version: 12.3, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The parent window.  
**Notes:** (Read only property)
172.24 class WindowsProcessMBS

172.24.1 class WindowsProcessMBS

Example:

```vbs
// run command
dim w as new WindowsProcessMBS

w.CommandLine = "cmd /c dir"
w.CurrentDirectory = "C:"

if not w.run then
    MsgBox w.LastErrorMessage
    Return
end if

// wait
while w.Running
    app.YieldToNextThread
wend

// show result
dim a as Integer = w.AvailableBytesOutput
dim r as string = w.ReadOutput(a)
MsgBox r
```

Notes:

Can be used like shell, but with more windows specific options.
For interactive shell, you need to run cmd.exe yourself.
This shell is asynchronously. For synchrones mode, please write yourself a loop waiting for process to finish.

Please read Microsoft documentation for more details:
172.24.2 Methods

172.24.3 Close

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Closes the process. **Notes:** Same as destructor.

172.24.4 PeekError(Length as Integer = 0) as String

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Peeks in stderr.

172.24.5 PeekOutput(Length as Integer = 0) as String

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Peeks in stdout.

172.24.6 ReadError(Length as Integer = 0) as String

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads data from stderr. **Notes:** Please pass maximum number of bytes to read.

172.24.7 ReadOutput(Length as Integer = 0) as String

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads data from stdout. **Notes:** Please pass maximum number of bytes to read.

172.24.8 Run as Boolean

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Starts the process. **Notes:** Returns true on success or false on failure.
172.24.9 Terminate(ExitCode as Integer) as Boolean

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Terminates the app with the given exit code. **Notes:** Returns true on success.

172.24.10 Write(Data as MemoryBlock) as Integer

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends data to stdin of the running process. **Notes:** Returns number of bytes written. See also:

- 172.24.11 Write(Data as String) as Integer

172.24.11 Write(Data as String) as Integer

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sends data to stdin of the running process. **Notes:** Returns number of bytes written.

See also:

- 172.24.10 Write(Data as MemoryBlock) as Integer

172.24.12 Properties

172.24.13 ApplicationName as String

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The path to the application. **Notes:** Can be empty when application is part of command line. (Read and Write property)

172.24.14 AvailableBytesError as Integer

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries number of available bytes on stderr. **Notes:** (Read only property)
172.24.15 AvailableBytesOutput as Integer

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries number of available bytes on stdout.  
**Notes:** (Read only property)

172.24.16 CommandLine as String

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The command line to run.  
**Notes:** If applicationName is set, this should only provide parameters.  
(Read and Write property)

172.24.17 CurrentDirectory as String

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current directory for the process.  
**Notes:**  
You can set this before calling Run to specify the start directory.  
If this parameter is """, the new process will have the same current drive and directory as the calling process.  
(Read and Write property)

172.24.18 Domain as String

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The domain name.  
**Notes:**  
You can set username and password to run app with different user. Domain is optional to specify network domain.  
(Read and Write property)

172.24.19 Environment as Dictionary

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The environment variables to use.  
**Example:**
// run command
dim w as new WindowsProcessMBS
w.CommandLine = "cmd /c echo % TEST% "

// set environment
dim env as new Dictionary
env.Value("TEST") = "Hello World"
w.Environment = env

if not w.run then
    MsgBox w.LastErrorMessage
    Return
end if

// wait
while w.Running
    app.YieldToNextThread
wend

// show result
dim a as Integer = w.AvailableBytesOutput
dim r as string = w.ReadOutput(a)
MsgBox r

Notes: (Read and Write property)

172.24.20 ExitCode as Integer

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the exit code of the terminated process.
**Notes:** (Read only property)

172.24.21 LastError as Integer

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Last windows error code.
**Notes:** (Read only property)
172.24.22  LastErrorMessage as String

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The message text for the last error.  
**Notes:** (Read only property)

172.24.23  Password as String

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The password.  
**Notes:** You can set username and password to run app with different user. Domain is optional to specify network domain.  
(Read and Write property)

172.24.24  ProcessID as Integer

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The process ID of the process.  
**Notes:** (Read only property)

172.24.25  Running as Boolean

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Checks whether process is running.  
**Notes:** Returns true if running or false if not.  
(Read only property)

172.24.26  ThreadID as Integer

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The thread ID of the main thread for the process.  
**Notes:** (Read only property)
172.24.27  UserName as String

MBS Win Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The user name.
**Notes:**
You can set username and password to run app with different user. Domain is optional to specify network domain.
(Read and Write property)

172.24.28  Events

172.24.29  DataAvailable(AvailableBytesOutput as Integer, AvailableBytesError as Integer)

MBS Win Plugin, Plugin Version: 17.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The event called when data is available for stdout or stderr.

172.24.30  Terminated(ExitCode as Integer)

MBS Win Plugin, Plugin Version: 17.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The event called when process terminated.
172.25.  **CLASS WINDOWSPROPERTIESMBS**

172.25  **class WindowsPropertiesMBS**

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No.  **Function:** The class for window properties.

**Example:**

```vbnet
dim w as new WindowsPropertiesMBS(self)

dim key as string = w.EdgeGestureDisableTouchWhenFullscreen

w.Value(key) = true

dim c as integer = w.count
for i as integer = 0 to c-1
    dim k as string = w.key(i)
    MsgBox k + " " + w.Value(k)
next
```

172.25.2  **Methods**

172.25.3  **Close**

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No.  **Function:** Closes properties.

**Notes:** Same as destructor.

172.25.4  **Commit**

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No.  **Function:** Commits values.

**Notes:**
Optional as window properties are set directly.
LastError and LastErrorMessage are set.

172.25.5  **Constructor(Win as Window)**

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No.  **Function:** Retrieves an object that represents a specific window’s collection of properties, which allows those properties
to be queried or set.

Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.

An application can use this function to obtain access to a window’s property store so that it can set an explicit Application User Model ID (AppUserModelID) in the System.AppUserModel.ID property.

Raises FunctionNotFoundException if function is not available, PlatformNotSupportedException if not running on Windows, NilObjectException if window is nil or invalid and UnsupportedOperationException if Window properties can’t be queried.

172.25.6 Count as Integer

Example:

```vbs
dim w as new WindowsPropertiesMBS(self)

// show all keys with values
dim c as integer = w.count
for i as integer = 0 to c-1
dim k as string = w.key(i)
MsgBox k + " "+w.Value(k)
next
```

Notes: LastError and LastErrorMessage are set.

172.25.7 EdgeGestureDisableTouchWhenFullscreen as String

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function: The property name used to disable touch gesture with full screen window.

Example:

```vbs
dim w as new WindowsPropertiesMBS(self)
dim key as string = w.EdgeGestureDisableTouchWhenFullscreen

w.Value(key) = true
```
172.25.8 **Key(Index as Integer) as String**

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The key with given index.  
**Notes:**  
Index from 0 to Count-1.  
Keys are passed as UUID followed by property ID.  
LastError and LastErrorMessage are set.

172.25.9 **Properties**

172.25.10 **Handle as Integer**

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The internal object reference.  
**Notes:** (Read and Write property)

172.25.11 **LastError as Integer**

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The last error code.  
**Notes:** (Read and Write property)

172.25.12 **LastErrorMessage as String**

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The last error message.  
**Notes:** (Read and Write property)

172.25.13 **Value(Key as String) as Variant**

MBS Win Plugin, Plugin Version: 17.5, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Set or query property value.  
**Example:**

```vbscript
dim w as new WindowsPropertiesMBS(self)

// show all keys with values
dim c as integer = w.count
```
for i as integer = 0 to c-1
dim k as string = w.key(i)
MsgBox k+” ”+w.Value(k)
next

Notes:

Keys are passed as UUID followed by property ID.
LastError and LastErrorMessage are set.
(Read and Write computed property)
172.26. **CLASS WindowsScriptErrorExceptionMBS**

172.26 class **WindowsScriptErrorExceptionMBS**

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The exception class raised when an error happens while executing a script.

**Example:**
```vbscript
dim w as new WindowsScriptMBS
w.Language = "VBScript"
w.AddCode "a = 1"
w.AddCode "b = 2"
w.AllowUI = false
w.ExecuteStatement "msgbox a+b" // shows exception with access denied
```

**Exception e as WindowsScriptErrorExceptionMBS**
MsgBox e.message

**Notes:** Subclass of the RuntimeException class.
172.27  class WindowsScriptErrorMBS

172.27.1  class WindowsScriptErrorMBS

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for error details.
**Example:**
```vba
dim w as new WindowsScriptMBS
w.Language = "JScript"

try
w.AddCode "function Test(a,b) { 1 return a+b; } " // 1 is there to make error

    dim p(-1) as string = array("Hello ", "World from JavaScript")
    dim x as string = w.Run("Test", p)
    catch e as WindowsScriptErrorExceptionMBS
        dim error as WindowsScriptErrorMBS = w.Error
        MsgBox error.Description+EndOfLine+"in "+str(error.Line)+":"+str(error.Column)
    end try
```

172.27.2  Properties

172.27.3  Column as Integer

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Source code column position where the error occurred.
**Notes:** (Read and Write property)

172.27.4  Description as String

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Friendly description of error.
**Notes:** (Read and Write property)

172.27.5  Line as Integer

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Source code line number where the error occurred.
172.27. CLASS WINDOWSSCRIPTERRORMBS

Notes: (Read and Write property)

172.27.6 Number as Integer

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Error number.
**Notes:** (Read and Write property)

172.27.7 Source as String

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Source of the error.
**Notes:** (Read and Write property)

172.27.8 Text as String

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Line of source code on which the error occurred.
**Notes:** (Read and Write property)
172.28 class WindowsScriptMBS

172.28.1 class WindowsScriptMBS

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class to run Windows Scripts.

**Example:**

```vbnet
dim w as new WindowsScriptMBS

w.Language = "JScript"
w.AddCode "function Test(a,b) { return a+b; } "

dim p(-1) as string = array("Hello ", "World from JavaScript")
dim x as string = w.Run("Test", p)

MsgBox x
```

**Notes:**
You may also read this MSDN page:

ScriptControl from Microsoft is 32-bit only. If you need 64-bit, please install a 64-bit alternative MSScript.ocx file:
http://www.eonet.ne.jp/
textasciitilde gakana/tablacruscriptcontrol_en.html

172.28.2 Methods

172.28.3 AddCode(code as string)

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Add code to the global module.

**Example:**

```vbnet
dim w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1" // define some global variables
w.AddCode "b = 2"
```
Notes: If you use VBScript, you don’t need "dim" keyword for defining variables.

172.28.4 ClearError

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Clears the current error.

172.28.5 Eval(code as string) as string

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Evaluate an expression within the context of the global module.

172.28.6 ExecuteStatement(statement as string)

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Execute a statement within the context of the global module.

**Example:**

```vbnet
dim w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1"
w.AddCode "b = 2"

w.AllowUI = true
w.ExecuteStatement "msgbox a+b" // shows 3

w.AllowUI = false
w.ExecuteStatement "msgbox a+b" // shows exception with access denied

Exception e as WindowsScriptErrorExceptionMBS
MsgBox e.message
```

172.28.7 Reset

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reset the scripting engine to a newly created state.
172.28.8 Run(functionName as string, parameters() as string) as string

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Call a procedure defined in the global module.

**Example:**

dim w as new WindowsScriptMBS

    // First try VBScript
    w.Language = "VBScript"

dim lines(-1) as string

    lines.append "Function Test(a,b)"
    lines.append "Test = a+b"
    lines.append "End Function"

    w.AddCode Join(lines, EndOfLine.Windows)

dim p(-1) as string = array("Hello ", "World from VBScript")

dim x as string = w.Run("Test", p)

    'MsgBox x

    // Second try JScript
    w.Language = "JScript"

    redim lines(-1)
    lines.append "function Test(a,b)"
    lines.Append " { 
    lines.append "return a+b;"
    lines.append " } "

    w.AddCode Join(lines, EndOfLine.Windows)

    p = array("Hello ", "World from JavaScript")
    x = w.Run("Test", p)

    MsgBox x

    **Exception e as WindowsScriptErrorExceptionMBS**
    MsgBox "Exception: " + e.message
172.28.9 Properties

172.28.10 AllowUI as Boolean

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Enable or disable display of the UI.

**Example:**

```vbscript
dim w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1"
w.AddCode "b = 2"

w.AllowUI = true
w.ExecuteStatement "msgbox a+b" // shows 3

w.AllowUI = false
w.ExecuteStatement "msgbox a+b" // shows exception with access denied

Exception e as WindowsScriptErrorExceptionMBS
MsgBox e.message
```

**Notes:** (Read and Write property)

172.28.11 Error as WindowsScriptErrorExceptionMBS

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current error status.

**Notes:** (Read only property)

172.28.12 Language as String

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Language engine to use.

**Example:**

```vbscript
dim w as new WindowsScriptMBS

w.Language = w.kLanguageJScript

MsgBox w.Language // shows "JScript"
```
w.Language = w.kLanguageVBScript

MsgBox w.Language // shows "VBScript"

Notes:
Use kLanguageVBScript or kLanguageJScript constants.
Setting this property calls reset internally.
(Read and Write property)

172.28.13 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The last error code.
**Notes:**
0 is no error. -1 is a parameter error on the plugin side. All other codes are from Windows.
(Read and Write property)

172.28.14 SiteWnd as Integer

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The window handle for the window being parent to any window the scripts create.
**Example:**

```vbnet
dim w as new WindowsScriptMBS
w.SiteWnd = window1.handle
```

**Notes:**
The window is used as the parent window for message boxes, alerts, etc.
(Read and Write property)

172.28.15 Timeout as Integer

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Length of time in milliseconds that a script can execute before being considered hung.
**Notes:** (Read and Write property)
172.28.16 UseSafeSubset as Boolean

MBS Win Plugin, Plugin Version: 10.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Force script to execute in safe mode and disallow potentially harmful actions. **Notes:** (Read and Write property)

172.28.17 Constants

172.28.18 kLanguageJScript = "JScript"

MBS Win Plugin, Plugin Version: 10.0. **Function:** One of the language constants. **Notes:** Using this constant you can switch to JavaScript.

172.28.19 kLanguageVBScript = "VBScript"

MBS Win Plugin, Plugin Version: 10.0. **Function:** One of the language constants. **Notes:** Using this constant you can switch to VBScript.
172.29 class WindowsSerialPortsMBS

172.29.1 class WindowsSerialPortsMBS

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
This is a class to query the serial ports on a Windows system.
**Notes:** This class was created in response to feedback report 8212: Serial Port Hangup on Windows.

172.29.2 Methods

172.29.3 Constructor(OnlyPresent as boolean = true)

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The constructor which builds the list of devices.

172.29.4 Description(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The description of this serial port.

172.29.5 DevicePath(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The device path of this serial port.

172.29.6 FriendlyName(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The display name of this serial port.

172.29.7 Location(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The location of this serial port.
172.29.8 Properties

172.29.9 Count as Integer

MBS Win Plugin, Plugin Version: 10.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The number of serial ports found.  
**Notes:** (Read and Write property)
172.30 class WindowsTaskbarListMBS

172.30.1 class WindowsTaskbarListMBS

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class for windows with methods that control the taskbar. **Notes:** It allows you to dynamically add, remove, and activate items on the taskbar.

172.30.2 Methods

172.30.3 ActivateTab(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Activates an item on the taskbar. **Notes:** The window is not actually activated; the window’s item on the taskbar is merely displayed as active. Lasterror is set.

172.30.4 AddTab(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Adds an item to the taskbar. **Notes:** Any type of window can be added to the taskbar, but it is recommended that the window at least have the WS_CAPTION style.

Any window added with this method must be removed with the DeleteTab method when the added window is destroyed.

Lasterror is set.

172.30.5 DeleteTab(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Deletes an item from the taskbar.
172.30.6  MarkFullscreenWindow(WindowHandle as Integer, Fullscreen as Boolean)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Marks a window as full-screen.
Notes:
Fullscreen: A Boolean value marking the desired full-screen status of the window.

Setting the value of fFullscreen to TRUE, the Shell treats this window as a full-screen window, and the
taskbar is moved to the bottom of the z-order when this window is active. Setting the value of fFullscreen
to FALSE removes the full-screen marking, but does not cause the Shell to treat the window as though it
were definitely not full-screen. With a FALSEfFullscreen value, the Shell depends on its automatic detection
facility to specify how the window should be treated, possibly still flagging the window as full-screen.

Requires Windows XP or Windows Server 2003 or newer.
Lasterror is set.

172.30.7  RegisterTab(TabWindowHandle as Integer, MDIWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Informs the taskbar that a new tab or document thumbnail has been provided for display in an application’s
taskbar group flyout.
Notes:
Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.
By itself, registering a tab thumbnail alone will not result in its being displayed. You must also call Set-
TabOrder to instruct the group where to display it.

172.30.8  SetActiveAlt(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Marks a taskbar item as active but does not visually activate it.
Notes: SetActiveAlt marks the item associated with hwnd as the currently active item for the window’s
process without changing the pressed state of any item. Any user action that would activate a different tab
in that process will activate the tab associated with hwnd instead. The active state of the window’s item
is not guaranteed to be preserved when the process associated with this window is not active. To ensure
that a given tab is always active, call SetActiveAlt whenever any of your windows are activated. Calling
SetActiveAlt with a nil window handle clears this state.
172.30.9 SetOverlayIcon(TabWindowHandle as Integer, IconHandle as Integer, Description as string)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Applies an overlay to a taskbar button to indicate application status or a notification to the user.

**Notes:**
Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

**TabWindowHandle:**
The handle of the window whose associated taskbar button receives the overlay. This handle must belong
to a calling process associated with the button’s application and must be a valid HWND or the call is ignored.

**IconHandle:**
The handle of an icon to use as the overlay. This should be a small icon, measuring 16x16 pixels at 96 dpi.
If an overlay icon is already applied to the taskbar button, that existing overlay is replaced.

This value can be 0. How a 0 value is handled depends on whether the taskbar button represents a single
window or a group of windows.

- If the taskbar button represents a single window, the overlay icon is removed from the display.
- If the taskbar button represents a group of windows and a previous overlay is still available (received
  earlier than the current overlay, but not yet freed by a 0 value), then that previous overlay is displayed
  in place of the current overlay.

It is the responsibility of the calling application to free hIcon when it is no longer needed. This can gen-
erally be done after you’ve called SetOverlayIcon because the taskbar makes and uses its own copy of the icon.

**Description:**
A string that provides an alt text version of the information conveyed by the overlay, for accessibility purposes.

In versions of Windows earlier than Windows 7, applications often used icons in the notification area of
the taskbar to display application status and notifications to the user. The Windows 7 taskbar allows an
application to provide that same sort of user feedback through its taskbar button, centralizing more of the
application information in one place. These overlays are similar to existing overlays used for shortcut icons
or security notifications, displayed at the lower-right corner of the button.

The following illustration shows an overlay (the small, green square that indicates the user status as "Available")
applied to the far-right taskbar button.
Windows Messenger taskbar button with an overlay to indicate an Available status.

Icon overlays serve as a contextual notification of status, and are intended to negate the need for a separate notification area status icon to communicate that information to the user. The application designer must decide during the development cycle which method: icon overlay or notification area status icon best serves that application. Overlay icons are intended to supply important, long-standing status or notifications such as network status, messenger status, or new mail. They should not be frequently changed, nor should they be animated.

To display an overlay icon, the taskbar must be in the default large icon mode. If the taskbar is configured through Taskbar and Start Menu Properties to show small icons, overlays cannot be applied and calls to this method are ignored.

Because a single overlay is applied to the taskbar button instead of to the individual window thumbnails, this is a per-group feature rather than per-window. Requests for overlay icons can be received from individual windows in a taskbar group, but they do not queue. The last overlay received is the overlay shown. If the last overlay received is removed, the overlay that it replaced is restored so long as it is still active. As an example, windows 1, 2, and 3 set, in order, overlays A, B, and C. Because overlay C was received last, it is shown on the taskbar button. Window 2 calls SetOverlayIcon with a 0 value to remove overlay B. Window 3 then does the same to remove overlay C. Because window 1’s overlay A is still active, that overlay is then displayed on the taskbar button.

If Windows Explorer shuts down unexpectedly, overlays are not restored when Windows Explorer is restored. The application should wait to receive the TaskbarButtonCreated message that indicates that Windows Explorer has restarted and the taskbar button has been re-created, and then call SetOverlayIcon again to reapply the overlay.

172.30.10 SetProgressState(WindowHandle as Integer, Flags as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Sets the type and state of the progress indicator displayed on a taskbar button.

Notes:
Use the ProgressStateFlag* constants. Flags that control the current state of the progress button. Specify only one of the following flags; all states are mutually exclusive of all others.

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

Progress bar information is not shown in high contrast color schemes to guarantee that no accessibility needs are compromised.
Developers accustomed to the existing progress bar control should find the taskbar button progress indicator to be a similar experience both in concept and visuals. Here, the taskbar button itself becomes a progress bar. A taskbar button’s progress indicator should be a reflection of a more detailed progress bar in the associated window. This allows the user to see specifics, such as the percentage number and the amount of time remaining, that cannot be shown in a taskbar button. Also, because a taskbar button can show the progress of only a single window in a group, it allows the user to check the progress of individual windows. It also provides progress information to the user when the taskbar button cannot, such as in a high-contrast color scheme.

Note that a taskbar button progress bar is not intended for use with normally peripheral actions such as the loading of a Web page or the printing of a document. That type of progress should continue to be shown in a window’s status bar.

The progress indicator is displayed between the taskbar button’s icon or text and the background. If progress is shown for both the active taskbar button and an inactive button, shading in the respective progress bars is such that the active button is still obvious to the user. Also, button functionality such as the display of thumbnails continues to work normally when the button is being used to display progress.

When exiting an error or paused state, call this method again with the ProgressStateFlagNormal or ProgressStateFlagIndeterminate flag to continue in the original state or TBPF_NOPROGRESS if the operation is cancelled.

How the Taskbar Button Chooses the Progress Indicator for a Group

The taskbar button can show a progress indicator for only one window at a time. This includes the situation where the taskbar button represents a group and more than one window in that group is broadcasting progress information. In that case, the taskbar button chooses its progress display based on state priority. State priority is shown in the following table with priority 1 being the highest.

<table>
<thead>
<tr>
<th>Priority</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ProgressStateFlagError</td>
</tr>
<tr>
<td>2</td>
<td>ProgressStateFlagPaused</td>
</tr>
<tr>
<td>3</td>
<td>ProgressStateFlagNormal</td>
</tr>
<tr>
<td>4</td>
<td>ProgressStateFlagIndeterminate</td>
</tr>
</tbody>
</table>

Changing a window’s state changes its priority in relation to other windows in the group which in turn might change which window in a group is used for the progress indicator in the taskbar button.

In the case of a priority collision between two windows that are broadcasting determinate progress, the window with the least progress is used.
Based on this priority, the indeterminate progress indicator can be displayed in the taskbar button only in these cases:

- The taskbar button does not represent a group and the single window that it represents has set ProgressStateFlagIndeterminate.
- The taskbar button represents a group, only one window in that group is broadcasting progress information, and that window has set ProgressStateFlagIndeterminate.
- The taskbar button represents a group, multiple windows in that group are broadcasting progress information, and all of those windows have set ProgressStateFlagIndeterminate.

A determinate progress indicator can be displayed in these cases:

- The taskbar button does not represent a group and the single window that it represents is broadcasting determinate progress information.
- The taskbar button represents a group, only one window in that group is broadcasting progress information, and that window is broadcasting determinate progress information.
- The taskbar button represents a group, multiple windows in that group are broadcasting progress information, at least one of those windows is broadcasting determinate progress information, and no window has set ProgressStateFlagError or ProgressStateFlagPaused.

Note that a call to SetProgressValue will switch a progress indicator currently in an indeterminate mode (ProgressStateFlagIndeterminate) to a normal (determinate) display and clear the ProgressStateFlagIndeterminate flag.

172.30.11 SetProgressValue(WindowHandle as Integer, Completed as UInt64, Total as UInt64)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Displays or updates a progress bar hosted in a taskbar button to show the specific percentage completed of the full operation.

**Notes:**

Completed: An application-defined value that indicates the proportion of the operation that has been completed at the time the method is called.
Total: An application-defined value that specifies the value ullCompleted will have when the operation is complete.

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.
Determinate Progress Bar Lifecycle

An application first calls SetProgressValue to begin the display of a determinate progress bar, and then calls it again as needed to update the bar as the progress changes. When progress is complete, the application must call SetProgressState with the TBPF_NOPROGRESS flag to dismiss the progress bar.

How the Taskbar Button Chooses the Progress Indicator for a Group

The taskbar button can show a progress indicator for only one window at a time. When the taskbar button represents a group and more than one of the windows in that group are broadcasting progress information, the taskbar button chooses its progress display based on the following state priority.

<table>
<thead>
<tr>
<th>Priority</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ProgressStateFlagError</td>
</tr>
<tr>
<td>2</td>
<td>ProgressStateFlagPaused</td>
</tr>
<tr>
<td>3</td>
<td>ProgressStateFlagNormal</td>
</tr>
<tr>
<td>4</td>
<td>ProgressStateFlagIndeterminate</td>
</tr>
</tbody>
</table>

Unless SetProgressState has set a blocking state (ProgressStateFlagError or ProgressStateFlagPaused) for the window, a call to SetProgressValue assumes the ProgressStateFlagNormal state even if it is not explicitly set. A call to SetProgressValue overrides and clears the ProgressStateFlagIndeterminate state.

In the case of a priority collision where two windows are broadcasting determinate progress, the window with the least progress is used.

Based on that priority, this determinate (specific percentage) progress indicator can be displayed in these cases:

- The taskbar button does not represent a group and the single window that it represents is broadcasting determinate progress information through this method.
- The taskbar button represents a group, only one window in that group is broadcasting progress information, and that window is broadcasting determinate progress information through this method.
- The taskbar button represents a group, multiple windows in that group are broadcasting progress information, at least one of those windows is broadcasting progress information through this method, and none of those windows has set the ProgressStateFlagError or ProgressStateFlagPaused state.

If a window in the group has set ProgressStateFlagError or ProgressStateFlagPaused, that state will be used for the button display. However, you can still make calls to SetProgressValue on other, unblocked windows in the group to update their progress in the background.
172.30. CLASS WINDOWSTASKBARLISTMBS

172.30.12 SetTabActive(TabWindowHandle as Integer, MDIWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Informs the taskbar that a tab or document window has been made the active window.

**Notes:**
Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

TabWindowHandle: Handle of the active tab window. This handle must already be registered through RegisterTab. This value can be 0 if no tab is active.

MDIWindowHandle: Handle of the application’s main window. This value tells the taskbar which group the thumbnail is a member of. This value is required and cannot be 0.

172.30.13 SetTabOrder(TabWindowHandle as Integer, InsertBeforeWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Inserts a new thumbnail into a tabbed-document interface (TDI) or multiple-document interface (MDI) application’s group flyout or moves an existing thumbnail to a new position in the application’s group.

**Notes:**
TabWindowHandle: The handle of the tab window whose thumbnail is being placed. This value is required, must already be registered through RegisterTab, and cannot be 0.
InsertBeforeWindowHandle: The handle of the tab window whose thumbnail that hwndTab is inserted to the left of. This handle must already be registered through RegisterTab. If this value is 0, the new thumbnail is added to the end of the list.

172.30.14 SetTabProperties(TabWindowHandle as Integer, flags as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Allows a tab to specify whether the main application frame window or the tab window should be used as a thumbnail or in the peek feature under certain circumstances.

**Notes:**
An application might want to use the thumbnail or peek representation of its associated parent window if the application cannot generate its own thumbnail for a tab or for its active tab content (such as an animation) to appear live.

flags: One of the TabPropertyFlag* constants.
Available on Windows 7 or Windows Server 2008 R2 or newer.
### 172.30.15 SetThumbnailClip(TabWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Selects a portion of a window's client area to display as that window's thumbnail in the taskbar. **Notes:** This variant of the method clears the clip that is already in place and return to the default display of the thumbnail. Requires Windows 7 or Windows Server 2008 R2 or newer. Lasterror is set. See also:

- 172.30.16 SetThumbnailClip(TabWindowHandle as Integer, x as Integer, y as Integer, w as Integer, h as Integer)

### 172.30.16 SetThumbnailClip(TabWindowHandle as Integer, x as Integer, y as Integer, w as Integer, h as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Selects a portion of a window’s client area to display as that window’s thumbnail in the taskbar. **Notes:** Requires Windows 7 or Windows Server 2008 R2 or newer. Lasterror is set. See also:

- 172.30.15 SetThumbnailClip(TabWindowHandle as Integer)

### 172.30.17 SetThumbnailTooltip(TabWindowHandle as Integer, tip as string)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Specifies or updates the text of the tooltip that is displayed when the mouse pointer rests on an individual preview thumbnail in a taskbar button flyout. **Notes:** Requires Windows 7 or Windows Server 2008 R2 or newer. Lasterror is set.

TabWindowHandle: The handle to the window whose thumbnail displays the tooltip. This handle must belong to the calling process.
tip: The text to be displayed in the tooltip. This value can be empty, in which case the title of the window specified by WindowHandle is used as the tooltip.

172.30.18 UnregisterTab(TabWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Removes a thumbnail from an application’s preview group when that tab or document is closed in the application.

**Notes:**

It is the responsibility of the calling application to free hwndTab through DestroyWindow. UnregisterTab must be called before the handle is freed.

Requires Windows 7 or Windows Server 2008 R2 or newer.

Lasterror is set.

172.30.19 Properties

172.30.20 Handle1 as Integer

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference for the ITaskbarList interface.

**Notes:**

The ITaskbarList interface is available on Windows 2000 Professional, Windows XP or Windows 2000 Server or newer.

(Read and Write property)

172.30.21 Handle2 as Integer

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference for the ITaskbarList2 interface.

**Notes:**

The ITaskbarList2 interface is available on Windows XP or Windows Server 2003 or newer.

(Read and Write property)

172.30.22 Handle3 as Integer

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference for the ITaskbarList3 interface.

**Notes:**
The ITaskbarList3 interface is available on Windows 7 or Windows Server 2008 R2 or newer.

172.30.23 Handle4 as Integer

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference for the ITaskbarList4 interface.
**Notes:**
- The ITaskbarList4 interface is available on Windows 7 or Windows Server 2008 R2 or newer.
  (Read and Write property)

172.30.24 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The last error code from one of the methods.
**Notes:**
- (Read and Write property)

172.30.25 Constants

172.30.26 ProgressStateFlagError = 4

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the progress state flag constants.
**Notes:**
- The progress indicator turns red to show that an error has occurred in one of the windows that is broadcasting progress. This is a determinate state. If the progress indicator is in the indeterminate state, it switches to a red determinate display of a generic percentage not indicative of actual progress.

172.30.27 ProgressStateFlagIndeterminate = 1

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the progress state flag constants.
**Notes:**
- The progress indicator does not grow in size, but cycles repeatedly along the length of the taskbar button. This indicates activity without specifying what proportion of the progress is complete. Progress is taking place, but there is no prediction as to how long the operation will take.
172.30.28  ProgressStateFlagNoProgress = 0

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the progress state flag constants.
**Notes:** Stops displaying progress and returns the button to its normal state. Call this method with this flag to dismiss the progress bar when the operation is complete or cancelled.

172.30.29  ProgressStateFlagNormal = 2

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the progress state flag constants.
**Notes:** The progress indicator grows in size from left to right in proportion to the estimated amount of the operation completed. This is a determinate progress indicator; a prediction is being made as to the duration of the operation.

172.30.30  ProgressStateFlagPaused = 8

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the progress state flag constants.
**Notes:** The progress indicator turns yellow to show that progress is currently stopped in one of the windows but can be resumed by the user. No error condition exists and nothing is preventing the progress from continuing. This is a determinate state. If the progress indicator is in the indeterminate state, it switches to a yellow determinate display of a generic percentage not indicative of actual progress.

172.30.31  TabPropertyFlagNone = 0

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the flag values you can use with SetTabProperties.
**Notes:** No specific property values are specified. The default behavior is used: the tab window provides a thumbnail and peek image, either live or static as appropriate.

172.30.32  TabPropertyFlagUseAppPeekAlways = 4

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the flag values you can use with SetTabProperties.
**Notes:** Always use the peek image provided by the main application frame window rather than a peek image provided by the individual tab window. Do not combine this value with TabPropertyFlagUseAppPeekWhenActive; doing so will result in an error.
**172.30.33 TabPropertyFlagUseAppPeekWhenActive = 8**

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the flag values you can use with SetTabProperties.

**Notes:** When the application tab is active and a live representation of its window is available, show the main application frame in the peek feature. At other times, use the tab window. Do not combine this value with TabPropertyFlagUseAppPeekAlways; doing so will result in an error.

---

**172.30.34 TabPropertyFlagUseAppThumbnailAlways = 1**

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the flag values you can use with SetTabProperties.

**Notes:** Always use the thumbnail provided by the main application frame window rather than a thumbnail provided by the individual tab window. Do not combine this value with TabPropertyFlagUseAppThumbnailWhenActive; doing so will result in an error.

---

**172.30.35 TabPropertyFlagUseAppThumbnailWhenActive = 2**

MBS Win Plugin, Plugin Version: 10.2. **Function:** One of the flag values you can use with SetTabProperties.

**Notes:** When the application tab is active and a live representation of its window is available, use the main application frame window thumbnail. At other times, use the tab window thumbnail. Do not combine this value with TabPropertyFlagUseAppThumbnailAlways; doing so will result in an error.
172.31. class WindowsVerticalBlankMBS

172.31.1. class WindowsVerticalBlankMBS

Function: A class for checking on Windows with the retrace of the display.
Notes: Sometimes you may want to draw only if the device is currently not touching the video memory.

172.31.2. Methods

172.31.3. Constructor

Function: Initializes the class.

172.31.4. GetMonitorFrequency as Integer

Function: Retrieves the frequency of the monitor that the DirectDraw object controls.
Notes: Returns the monitor frequency, in Hz. Lasterror is set.

172.31.5. GetScanLine as Integer

Function: This method retrieves the scan line that is currently being drawn on the monitor.
Notes: To synchronize with the vertical blank, use the WaitForVerticalBlank method. Lasterror is set.

Scan lines are reported as zero-based integers. The returned scan line value is between 0 and n, where scan line 0 is the first visible scan line on the screen and n is the last visible scan line, plus scan lines that occur during the vertical blank period. So, in a case where an application is running at 640x480, and there are 12 scan lines during the vertical blank period, the values returned by this method will range from 0 to 491.
172.31.6 GetVerticalBlankStatus as boolean

Function: Retrieves the status of the vertical blank.
Notes:
Returns the status of the vertical blank. True if a vertical blank is occurring, and false otherwise. Lasterror is set.

172.31.7 WaitForVerticalBlankBegin

Function: Helps the application synchronize itself with the vertical-blank interval.
Notes:
WaitForVerticalBlank returns when the vertical-blank interval begins. Lasterror is set.

172.31.8 WaitForVerticalBlankEnd

Function: Helps the application synchronize itself with the vertical-blank interval.
Notes:
WaitForVerticalBlank returns when the vertical-blank interval ends and the display begins. Lasterror is set.

172.31.9 Properties

172.31.10 Available as Boolean

Function: Whether this class will work.
Notes: (Read and Write property)

172.31.11 Lasterror as Integer

Function: The last windows error string.
Notes: (Read and Write property)
172.31. CLASS WINDOWS\textsc{VERTICALBLANKMBS}

172.31.12 Lasterror\textsc{String as String}

\textbf{Function:} The last windows error string.

\textbf{Notes:} (Read only property)
172.32  class WindowsWMIMBS

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to run queries in the Windows Management Interface.  
**Example:**

```vba
dim w as WindowsWMIMBS

w=new WindowsWMIMBS

if w.ConnectServer("root\cimv2") then
   MsgBox "ConnectServer: ok"

if w.query("WQL","SELECT * FROM Win32_Processor") then
   MsgBox "query: ok"

if w.NextItem then
   MsgBox "NextItem: ok"

MsgBox w.GetPropertyString("Name") // string
MsgBox str(w.GetPropertyInteger("MaxClockSpeed")) // uint32
MsgBox str(w.GetPropertyInteger("ProcessorType")) // uint16

else
   MsgBox "NextItem: fail"
end if
else
   MsgBox "query: fail"
end if

else
   MsgBox "ConnectServer: fail"
end if
```

**Notes:**

In Windows 8.1 it looks like WindowsWMIMBS.InitSecurity(false) must be called at app.open time as Xojo will do some things in background when opening first window which block our queries. 
Subclass of the WMIOBJECTMBS class.
172.32.2 Methods

172.32.3 CancelAsyncCall as boolean

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Stops events being delivered to this WindowsWMIMBS object. **Notes:** Lasterror is set.

172.32.4 ConnectServer(NetworkResource as string, Username as string="", Password as string="", Locale as string="", Authority as string="") as boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Connect to WMI server. **Example:**

```vbnet
dim w as WindowsWMIMBS // your WMI object
call w.ConnectServer("root\cimv2")
```

**Notes:**

Returns true on success and false on failure.
Authority parameter added in plugin version 12.2.

172.32.5 Constructor

MBS Win Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The constructor.

172.32.6 ExecNotificationQueryAsync(QueryLanguage as string, QueryText as string) as boolean

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ExecNotificationQueryAsync method executes a query to receive events. **Notes:**

The plugin receives events and enqueues them in a queue. You read objects from this queue in a timer and process them.
NextItem returns nil if the queue is empty.
Returns true on success and false on failure.
Lasterror is set. e.g. &h80041018 if you have syntax error in the query or &h80041058 if the query can’t be parsed.

172.32.7   InitAuthentication(User as string, Domain as string, Password as string)
as boolean

MBS Win Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Initializes authentication data.
Notes:
Call before ConnectServer.
This settings are passed to objects for authentication.

172.32.8   InitSecurity(AuthnLevel as Integer, ImpLevel as Integer) as boolean

MBS Win Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Registers security and sets the default security values for the process.
Notes:
You can call this method before creating WindowsWMIMBS object, you can prepare security settings for remote connections.

AuthnLevel:
The default authentication level for the process. Both servers and clients use this parameter when they call CoInitializeSecurity. COM will fail calls that arrive with a lower authentication level. By default, all proxies will use at least this authentication level. This value should contain one of the authentication level constants. By default, all calls to IUnknown are made at this level.

ImpLevel:
The default impersonation level for proxies. The value of this parameter is used only when the process is a client. It should be a value from the impersonation level constants, except for kImpersonationLevelDefault, which is not for use with CoInitializeSecurity.
Outgoing calls from the client always use the impersonation level as specified. (It is not negotiated.) Incoming calls to the client can be at any impersonation level. By default, all IUnknown calls are made with this impersonation level, so even security-aware applications should set this level carefully. To determine which impersonation levels each authentication service supports, see the description of the authentication services in COM and Security Packages. For more information about impersonation levels, see Impersonation.
See also:

•   172.32.9 InitSecurity(remote as boolean) as boolean
172.32.9  **InitSecurity(remote as boolean) as boolean**

**Notes:**  
You can call this method before creating WindowsWMIMBS object, you can prepare security settings for remote connections.  
Calling InitSecurity with remote=true will initialize security with kImpersonationLevelImpersonate. If remote=false, we use kImpersonationLevelIdentity which is the default.  
See also:  
- 172.32.8 InitSecurity(AuthnLevel as Integer, ImpLevel as Integer) as boolean

172.32.10  **NextItem as boolean**

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Moves to next item in the list.  
**Notes:**  
You need to call this at least once to move to the first item. Returns false if no more items are there.

172.32.11  **Query(QueryLanguage as string, QueryText as string) as boolean**

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Runs a query.  
**Example:**  
```vbnet
dim w as WindowsWMIMBS
call w.query("WQL","SELECT * FROM Win32_Processor")
```

**Notes:** Returns true on success and false on failure.

172.32.12  **Properties**

172.32.13  **EnumeratorHandle as Integer**

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The handle to the used IEnumWbemClassObject object.
172.32.14  LocatorHandle as Integer

Notes: (Read only property)

172.32.15  ServiceHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The handle to the used IWbemServices object.
Notes: (Read only property)

172.32.16  Constants

172.32.17  kAuthenticationLevelCall = 3

MBS Win Plugin, Plugin Version: 13.1. Function: One of the authentication level constants. Notes: Authenticates only at the beginning of each remote procedure call when the server receives the request. Datagram transports use kAuthenticationLevelPacket instead.

172.32.18  kAuthenticationLevelConnect = 2

MBS Win Plugin, Plugin Version: 13.1. Function: One of the authentication level constants. Notes: Authenticates the credentials of the client only when the client establishes a relationship with the server. Datagram transports always use kAuthenticationLevelPacket instead.

172.32.19  kAuthenticationLevelDefault = 0

172.32.20  kAuthenticationLevelNone = 1

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the authentication level constants.  
**Notes:** Performs no authentication.

172.32.21  kAuthenticationLevelPacket = 4

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the authentication level constants.  
**Notes:** Authenticates that all data received is from the expected client.

172.32.22  kAuthenticationLevelPacketIntegrity = 5

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the authentication level constants.  
**Notes:** Authenticates and verifies that none of the data transferred between client and server has been modified.

172.32.23  kAuthenticationLevelPacketPrivacy = 6

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the authentication level constants.  
**Notes:** Authenticates all previous levels and encrypts the argument value of each remote procedure call.

172.32.24  kImpersonationLevelAnonymous = 1

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the impersonation level constants.  
**Notes:** The client is anonymous to the server. The server process can impersonate the client, but the impersonation token will not contain any information and cannot be used.

172.32.25  kImpersonationLevelDefault = 0

MBS Win Plugin, Plugin Version: 13.1. **Function:** One of the impersonation level constants.  
**Notes:** DCOM can choose the impersonation level using its normal security blanket negotiation algorithm. For more information, see Security Blanket Negotiation.
172.32.26  kImpersonationLevelDelegate = 4

Notes: The server process can impersonate the client’s security context while acting on behalf of the client. The server process can also make outgoing calls to other servers while acting on behalf of the client, using cloaking. The server may use the client’s security context on other machines to access local and remote resources as the client. When impersonating at this level, the impersonation token can be passed across any number of computer boundaries.

172.32.27  kImpersonationLevelIdentity = 2

Notes: The server can obtain the client’s identity. The server can impersonate the client for ACL checking, but it cannot access system objects as the client.

172.32.28  kImpersonationLevelImpersonate = 3

Notes: The server process can impersonate the client’s security context while acting on behalf of the client. This level of impersonation can be used to access local resources such as files. When impersonating at this level, the impersonation token can only be passed across one machine boundary. The Schannel authentication service only supports this level of impersonation.
172.33. CLASS WINEXCEPTIONMBS

172.33 class WinExceptionMBS

172.33.1 class WinExceptionMBS

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class to catch windows system exceptions.

**Notes:**
This class was made to intercept crashes in a REALbasic application. Whenever the application crashes, this class will fire its event so you have a chance to report that crash to your user and maybe save a crash report.

Do not try to save data as this could overwrite good data with bad data. Remember your application already crashed. Maybe because of data corruption!

Only one instance can exist in your application.

172.33.2 Methods

172.33.3 Close

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Removes the exception handler from the system.

172.33.4 Properties

172.33.5 ExceptionAddress as Integer

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The address in memory where the exception was raised.

**Notes:** (Read only property)

172.33.6 ExceptionCode as Integer

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The code of this exception.

**Notes:**
Normally one of the kException* constants.
(Read only property)
172.33.7  ExceptionFlags as Integer

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The exception flags. **Notes:** (Read only property)

172.33.8  ExceptionIsNonContinuable as Boolean

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether this exception allows to continue in code. **Notes:** For example a division by zero can be continued. (Read only property)

172.33.9  ExceptionName as String

MBS Win Plugin, Plugin Version: 8.7, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The name of the exception. **Notes:** If ExceptionCode=kExceptionAccessViolation then returns "ExceptionAccessViolation". This is a convenience function which you can use to show the exception to the user. (Read only property)

172.33.10  Events

172.33.11  GotException() as Integer

MBS Win Plugin, Plugin Version: 8.7, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The event called when an exception was received. **Notes:** Your application has crashed on this point, but instead of seeing the Microsoft dialog to tell you that the application crashed, your application has the chance to report that problem.
Return one of the following constants: kExecuteHandler, kContinueCode, kNextHandler, kExecuteHandlerNoDialog.

The plugin already removed the crash callback from the system so if the code in this event crashes again, the system dialog shows.

172.33.12 Constants

172.33.13 kContinueCode = 2

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants you can use for the GotException event return value.  
**Notes:** This one is not recommended as it can raise the same exception again or crash your application.

172.33.14 kExceptionAccessViolation = & hC0000005

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.  
**Notes:** The thread attempts to read from or write to a virtual address for which it does not have access.

172.33.15 kExceptionArrayBoundsExceeded = & hC000008C

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.  
**Notes:** The thread attempts to access an array element that is out of bounds, and the underlying hardware supports bounds checking.

172.33.16 kExceptionBreakPoint = & h80000003

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.  
**Notes:** A breakpoint is encountered.

172.33.17 kExceptionDataTypeMisalignment = & h80000002

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.  
**Notes:** The thread attempts to read or write data that is misaligned on hardware that does not provide alignment. For example, 16-bit values must be aligned on 2-byte boundaries, 32-bit values on 4-byte boundaries, and so on.
172.33.18  \textbf{kExceptionFloatDenormalOperand} = \& \texttt{hC000008D}

MBS Win Plugin, Plugin Version: 8.7. \textbf{Function}: One of the constants for exception codes.
\textbf{Notes}: One of the operands in a floating point operation is denormal. A denormal value is one that is too small to represent as a standard floating point value.

172.33.19  \textbf{kExceptionFloatDivideByZero} = \& \texttt{hC000008E}

MBS Win Plugin, Plugin Version: 8.7. \textbf{Function}: One of the constants for exception codes.
\textbf{Notes}: The thread attempts to divide a floating point value by a floating point divisor of 0 (zero).

172.33.20  \textbf{kExceptionFloatInexactResult} = \& \texttt{hC000008F}

MBS Win Plugin, Plugin Version: 8.7. \textbf{Function}: One of the constants for exception codes.
\textbf{Notes}: The result of a floating point operation cannot be represented exactly as a decimal fraction.

172.33.21  \textbf{kExceptionFloatInvalidOperation} = \& \texttt{hC0000090}

MBS Win Plugin, Plugin Version: 8.7. \textbf{Function}: One of the constants for exception codes.
\textbf{Notes}: A floating point exception that is not included in this list.

172.33.22  \textbf{kExceptionFloatOverflow} = \& \texttt{hC0000091}

MBS Win Plugin, Plugin Version: 8.7. \textbf{Function}: One of the constants for exception codes.
\textbf{Notes}: The exponent of a floating point operation is greater than the magnitude allowed by the corresponding type.

172.33.23  \textbf{kExceptionFloatStackCheck} = \& \texttt{hC0000092}

MBS Win Plugin, Plugin Version: 8.7. \textbf{Function}: One of the constants for exception codes.
\textbf{Notes}: The stack has overflowed or underflowed, because of a floating point operation.

172.33.24  \textbf{kExceptionFloatUnderflow} = \& \texttt{hC0000093}

MBS Win Plugin, Plugin Version: 8.7. \textbf{Function}: One of the constants for exception codes.
\textbf{Notes}: The exponent of a floating point operation is less than the magnitude allowed by the corresponding
172.33.25  kExceptionIllegalInstruction = & hC000001D

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.  
**Notes:** The thread tries to execute an invalid instruction.

172.33.26  kExceptionInPageError = & hC0000006

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.  
**Notes:** The thread tries to access a page that is not present, and the system is unable to load the page. For example, this exception might occur if a network connection is lost while running a program over a network.

172.33.27  kExceptionIntegerDivideByZero = & hC0000094

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.  
**Notes:** The thread attempts to divide an integer value by an integer divisor of 0 (zero).

172.33.28  kExceptionIntegerOverflow = & hC0000095

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.  
**Notes:** The result of an integer operation causes a carry out of the most significant bit of the result.

172.33.29  kExceptionInvalidDisposition = & hC0000026

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.  
**Notes:** An exception handler returns an invalid disposition to the exception dispatcher. Programmers using a high-level language such as C should never encounter this exception.

172.33.30  kExceptionNonContinueableException = & hC0000025

MBS Win Plugin, Plugin Version: 8.7. **Function:** One of the constants for exception codes.  
**Notes:** The thread attempts to continue execution after a non-continuable exception occurs.
172.33.31 kExceptionPrivilegedInstruction = & hC0000096

MBS Win Plugin, Plugin Version: 8.7. Function: One of the constants for exception codes.
Notes: The thread attempts to execute an instruction with an operation that is not allowed in the current computer mode.

172.33.32 kExceptionSingleStep = & h80000004

MBS Win Plugin, Plugin Version: 8.7. Function: One of the constants for exception codes.
Notes: A trace trap or other single instruction mechanism signals that one instruction is executed.

172.33.33 kExceptionStackOverflow = & hC00000FD

MBS Win Plugin, Plugin Version: 8.7. Function: One of the constants for exception codes.
Notes: The thread uses up its stack.

172.33.34 kExecuteHandler = 1

MBS Win Plugin, Plugin Version: 8.7. Function: One of the constants you can use for the GotException event return value.
Notes:
Windows will execute the default handler for this exception.
This can show a Windows error dialog.

172.33.35 kExecuteHandlerNoDialog = 4

MBS Win Plugin, Plugin Version: 8.7. Function: One of the constants you can use for the GotException event return value.
Notes: Windows will execute the default handler for this exception, but not show a dialog.

172.33.36 kNextHandler = 3

MBS Win Plugin, Plugin Version: 8.7. Function: One of the constants you can use for the GotException event return value.
Notes: Windows will call the next exception handler.
172.34. **CLASS WINGESTURECONFIGMBS**

### 172.34.1 class WinGestureConfigMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**

sets and sets the configuration for enabling gesture messages and the type of this configuration. **Example:**

```vbs
// make a config for accepting pan/rotate gestures
dim c1 as new WinGestureConfigMBS
c1.ID = c1.kGestureIDPan
c1.Want = c1.kPan
c1.Block = 0

dim c2 as new WinGestureConfigMBS
c2.ID = c2.kGestureIDRotate
c2.Want = c2.kRotate
c2.Block = 0

dim configs() as WinGestureConfigMBS
configs.Append c1
configs.Append c2

// and add to window
if WinPointerEventsMBS.SetGestureConfig(window1, configs) then
    MsgBox "OK"
end if
```

**Notes:**

It is impossible to disable two-finger panning and keep single finger panning. You must set the want bits for GC_PAN and can then set GC_PAN_WITH_SINGLE_FINGER_HORIZONTALLY or GC_PAN_WITH_SINGLE_FINGER_VERTICALLY.

An inertia vector is included in the GID_PAN message with the GF_END flag if inertia was disabled by a call to SetGestureConfig.

When you pass this structure, the dwID member contains information for a set of gestures. This determines what the other flags will mean. If you set flags for pan messages, they will be different from those flags that are set for rotation messages.

The following table indicates the various identifiers for gestures that are supported by the dwID member of the GESTURECONFIG structure. Note that setting dwID to 0 indicates that global gesture configuration flags are set.

The following flags are used when dwID is set to 0.
<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GID_ZOOM</td>
<td>3</td>
<td>Indicates configuration settings for the zoom gesture.</td>
</tr>
<tr>
<td>GID_PAN</td>
<td>4</td>
<td>Indicates the pan gesture.</td>
</tr>
<tr>
<td>GID_ROTATE</td>
<td>5</td>
<td>Indicates the rotation gesture.</td>
</tr>
<tr>
<td>GID_TWOFINGERTAP</td>
<td>6</td>
<td>Indicates the two-finger tap gesture.</td>
</tr>
<tr>
<td>GID_PRESSANDTAP</td>
<td>7</td>
<td>Indicates the press and tap gesture.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GC_ALLGESTURES</td>
<td>0x00000001</td>
<td>Indicates all of the gestures.</td>
</tr>
</tbody>
</table>

The following flags are used when `dwID` is set to `GID_ZOOM`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GC_ZOOM</td>
<td>0x00000001</td>
<td>Indicates the zoom gesture.</td>
</tr>
</tbody>
</table>

The following flags are used when `dwID` is set to `GID_PAN`.

Note Setting the `GID_PAN` flags in `SetGestureConfig` will affect the default gesture handler for panning. You should not have both `dwWant` and `dwBlock` set for the same flags; this will result in unexpected behavior. See Windows Touch Gestures for more information on panning and legacy panning support; see `SetGestureConfig` for examples of enabling and blocking gestures.

The following flags are used when `dwID` is set to `GID_ROTATE`.

The following flags are used when `dwID` is set to `GID_TWOFINGERTAP`.

The following flags are used when `dwID` is set to `GID_PRESSANDTAP`.

### 172.34.2 Properties

### 172.34.3 Block as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The messages to disable.

**Example:**

```csharp
// make a config for accepting some pan gestures
dim c as new WinGestureConfigMBS

c.ID = kGestureIDPan
```
Name | Value | Description
--- | --- | ---
GC, PAN | 0x00000001 | Indicates all pan gestures.
GC, PAN, WITH, SINGLE, FINGER, VERTICALLY | 0x00000002 | Indicates vertical pans with one finger.
GC, PAN, WITH, SINGLE, FINGER, HORIZONTALLY | 0x00000004 | Indicates horizontal pans with one finger.
GC, PAN, WITH, GUTTER | 0x00000008 | Limits perpendicular movement to primary direction until a threshold is reached to break out of the gutter.
GC, PAN, WITH, INERTIA | 0x00000010 | Indicates panning with inertia to smoothly slow when pan gestures stop.

Name | Value | Description
--- | --- | ---
GC, ROTATE | 0x00000001 | Indicates the rotation gesture.

c. Want = c. kPanWithSingleFingerVertically + c. kPanWithGutter + c. kPanWithInteria

c. Block = c. kPanWithSingleFingerHorizontally

**Notes:** (Read and Write property)

### 172.34.4 ID as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The identifier for the type of configuration that will have messages enabled or disabled.

**Example:**

```vbnet
// make a config for accepting some pan/rotate gestures
dim c1 as new WinGestureConfigMBS

c1.ID = 0
c1.Want = c1.kAllGestures
c1.Block = 0

dim configs() as WinGestureConfigMBS
configs.Append c1

// and add to window
if WinPointerEventsMBS.SetGestureConfig(window1, configs) then
    MsgBox "OK"
end if
```

**Notes:** (Read and Write property)
<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GC_TWOFINGERTAP</td>
<td>0x00000001</td>
<td>Indicates the two-finger tap gesture.</td>
</tr>
<tr>
<td>GC_PRESSANDTAP</td>
<td>0x00000001</td>
<td>Indicates the press and tap gesture.</td>
</tr>
</tbody>
</table>

### 172.34.5 Want as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The messages to enable.

**Example:**

```aller
data m as new WinGestureConfigMBS

c.ID = 0 // catch all IDs
c.Want = c.kAllGestures
```

**Notes:** (Read and Write property)

### 172.34.6 Constants

#### 172.34.7 kAllGestures = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.

**Notes:** Indicates all of the gestures. (for ID = 0)

#### 172.34.8 kGestureIDBegin = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.

**Notes:** Begin of gesture.

#### 172.34.9 kGestureIDEnd = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.

**Notes:** End of a gesture
172.34. **CLASS WINGESTURECONFIGMBS**

172.34.10  **kGestureIDPan = 4**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
**Notes:** Pan gesture

172.34.11  **kGestureIDPressAndTap = 7**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
**Notes:** Press and Tap gesture

172.34.12  **kGestureIDRotate = 5**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
**Notes:** Rotate gesture

172.34.13  **kGestureIDTwoFingerTap = 6**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
**Notes:** Two-Finger Tap

172.34.14  **kGestureIDZoom = 3**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
**Notes:** Zoom gesture

172.34.15  **kPan = 1**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.
**Notes:** Indicates all pan gestures.

172.34.16  **kPanWithGutter = 8**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags.
**Notes:** Limits perpendicular movement to primary direction until a threshold is reached to break out of the gutter.
172.34.17 kPanWithInteria = 16

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags. **Notes:** Indicates panning with inertia to smoothly slow when pan gestures stop.

172.34.18 kPanWithSingleFingerHorizontally = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags. **Notes:** Indicates horizontal pans with one finger.

172.34.19 kPanWithSingleFingerVertically = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags. **Notes:** Indicates vertical pans with one finger.

172.34.20 kPressAndTap = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags. **Notes:** Indicates the press and tap gesture.

172.34.21 kRotate = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags. **Notes:** Indicates the rotation gesture.

172.34.22 kTwoFingerTap = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags. **Notes:** Indicates the two-finger tap gesture.

172.34.23 kZoom = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture option flags. **Notes:** Indicates the zoom gesture. (for ID = kGestureIDZoom)
172.35 class WinGestureInfoMBS

172.35.1 class WinGestureInfoMBS

**Notes:**
Parameters for touches:
If kFlagBegin flag is set, save Location so you have first point. And save argument to check later.

For Zoom, get second point from this class. Than you can calculate center point and zoom factor is OldArgumentsLower/NewArgumentsLower.

For Pan, check difference between last point and new point to know how much moved.

For Rotate, please check difference between old RotateAngle and new RotateAngle.  
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

172.35.2 Methods

172.35.3 Constructor

172.35.4 Properties

172.35.5 Arguments as Int64

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A 64-bit unsigned integer that contains the arguments for gestures that fit into 8 bytes.  
**Notes:** (Read only property)

172.35.6 ArgumentsHigher as UInt32

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The higher 32bits from Arguments.
CHAPTER 172. WINDOWS

Notes: (Read only property)

172.35.7 ArgumentsLower as UInt32

Notes: Most events just use lower bits.
(Read only property)

172.35.8 Flags as Integer

Notes: See kFlagBegin/kFlagInertia/kFlagEnd constants.
(Read only property)

172.35.9 ID as Integer

Notes: see kGestureID* constants.
(Read only property)

172.35.10 InstanceID as Integer

Notes: (Read only property)

172.35.11 LocationInWindowX as Integer

Notes:
This is LocationX relative to target window.
(Read only property)

172.35.12 LocationInWindowY as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A x coordinate associated with the gesture.
Notes:
This is LocationY relative to target window.
(Read only property)

172.35.13 LocationX as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A x coordinate associated with the gesture.
Notes:
These coordinates are always relative to the origin of the screen.
(Read only property)

172.35.14 LocationY as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A x coordinate associated with the gesture.
Notes:
These coordinates are always relative to the origin of the screen.
(Read only property)

172.35.15 RotateAngle as Double

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The argument as angle for rotate gesture.
Notes: (Read only property)
**172.35.16 SequenceID as Integer**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
An internally used identifier for the sequence.
**Notes:** (Read only property)

**172.35.17 TargetWindow as Integer**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A handle to the window that is targeted by this gesture.
**Notes:** (Read only property)

**172.35.18 Constants**

**172.35.19 kFlagBegin = 1**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag values.
**Notes:** A gesture is starting.

**172.35.20 kFlagEnd = 4**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag values.
**Notes:** A gesture has finished.

**172.35.21 kFlagInertia = 2**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag values.
**Notes:** A gesture has triggered inertia.

**172.35.22 kGestureIDBegin = 1**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.
**Notes:** Begin of a gesture
172.35.23  kGestureIDEnd = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.  
**Notes:** End of a gesture

172.35.24  kGestureIDPan = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.  
**Notes:** Pan gesture

172.35.25  kGestureIDPressAndTap = 7

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.  
**Notes:** Press and Tap gesture

172.35.26  kGestureIDRotate = 5

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.  
**Notes:** Rotate gesture

172.35.27  kGestureIDTwoFingerTap = 6

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.  
**Notes:** Two-Finger Tap

172.35.28  kGestureIDZoom = 3

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the gesture IDs.  
**Notes:** Zoom gesture
172.36   class WinPointerEventsMBS

172.36.1  class WinPointerEventsMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class to capture touch events on Windows.
**Notes:** The plugin can only deliver events the Xojo runtime doesn’t consume.

172.36.2  Methods

172.36.3  Close

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Cleans up.
**Notes:**
Optional and does same as destructor, but now.
You can call this in a window’s close event to shutdown the event handler class.

172.36.4  Constructor(control as RectControl)

MBS Win Plugin, Plugin Version: 17.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The constructor events to a control.
**Notes:** Call in a control’s open event to attach event listener to the control.
See also:

- 172.36.5 Constructor(win as window) 20352
- 172.36.6 Constructor(WindowHandle as Integer) 20353

172.36.5  Constructor(win as window)

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The constructor events to a window.
**Notes:** Call in a window’s open event to attach event listener to the window.
See also:

- 172.36.4 Constructor(control as RectControl) 20352
- 172.36.6 Constructor(WindowHandle as Integer) 20353
172.36. **CLASS WINPOINTEREVENTSMBS**

172.36.6 **Constructor** (WindowHandle as Integer)

**Notes:**
This method allows you to attach to any window.
So this works in console projects, too.
With any window, not just xojo windows.
See also:

- 172.36.4 Constructor(control as RectControl)
- 172.36.5 Constructor(win as window)

172.36.7 **EnableMouseInPointer** (enable as boolean) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Enables the mouse to act as a pointer input device and send pointer events.

**Notes:**
Requires Windows 8 or newer.

If the function succeeds, the return value is true.
If the function fails, the return value is false.
To get extended error information, call GetLastError.

This function can be called only once in the context of a process lifetime. Prior to the first call, Windows Store apps run with mouse-in-pointer enabled, as do any desktop applications that consume mshtml.dll. All other desktop applications run with mouse-in-pointer disabled.

On the first call in the process lifetime, the state is changed as specified and the call succeeds.
On subsequent calls, the state will not change. If the current state is not equal to the specified state, the call fails.

Call IsMouseInPointerEnabled to verify the mouse-in-pointer state.

172.36.8 **GetGestureConfig** (Control as RectControl, config() as WinGesture-ConfigMBS, flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 17.0, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the configuration for which Windows Touch gesture messages are sent from a window.
Notes: Same as other GetGestureConfig, but for a control, not a window.

See also:

- 172.36.9 GetGestureConfig(win as window, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

172.36.9 GetGestureConfig(win as window, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Retrieves the configuration for which Windows Touch gesture messages are sent from a window.

**Notes:**

win: The window to get the gesture configuration from.

Flags: A gesture command flag value indicating options for retrieving the gesture configuration. Can be 1 to return consolidated configuration for the specified window and its parent window chain.

Config: an array of gesture configuration structures that specify the gesture configuration.

Please pass an empty array and the plugin appends config objects.

Return function returns number of configs found.

Returns -1 in case of error.

See also:

- 172.36.8 GetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

172.36.10 IsMouseInPointerEnabled as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates whether EnableMouseInPointer is set for the mouse to act as a pointer input device and send pointer events.

**Notes:**

Requires Windows 8 or newer.

If EnableMouseInPointer is set, the return value is true.

If EnableMouseInPointer is not set, the return value is false.

EnableMouseInPointer can be called only once in the context of a process lifetime. Prior to the first call, Windows Store apps run with mouse-in-pointer enabled, as do any desktop applications that consume mshtml.dll. All other desktop applications run with mouse-in-pointer disabled.

On the first call to EnableMouseInPointer in the process lifetime, the state is changed as specified and the call succeeds.
On subsequent calls to EnableMouseInPointer, the state will not change. If the current state is not equal to the specified state, the call fails. Call IsMouseInPointerEnabled to verify the mouse-in-pointer state.

### 172.36.11 SetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS = nil) as boolean

MBS Win Plugin, Plugin Version: 17.0, Console & Web: No, Mac: No, Win: Yes, Linux: No.

**Function:** Configures the messages that are sent from a window for Windows Touch gestures.

**Notes:** Same as other SetGestureConfig, but for a control, not a window.

See also:
- 172.36.12 SetGestureConfig(win as window, config() as WinGestureConfigMBS = nil) as boolean

### 172.36.12 SetGestureConfig(win as window, config() as WinGestureConfigMBS = nil) as boolean

**Function:** Configures the messages that are sent from a window for Windows Touch gestures.

**Notes:**
- Win: The window to set the gesture configuration on.
- config: An array of gesture configuration structures that specify the gesture configuration.

If the function succeeds, the return value is true, else false.

If you don’t expect to change the gesture configuration, call SetGestureConfig at window creation time. If you want to dynamically change the gesture configuration, call SetGestureConfig in response to GestureNotify event.

See also:
- 172.36.11 SetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS = nil) as boolean

### 172.36.13 Properties

#### 172.36.14 WindowHandle as Integer

**Function:** The window handle.

**Notes:** (Read only property)
172.36.15  Events

172.36.16  Gesture(info as WinGestureInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Passes information about a gesture.
**Notes:** Return true, if you processed the message, else false.

172.36.17  GestureNotify

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Gives you a chance to set the gesture configuration.
**Notes:** When the GestureNotify event is received, the application can use SetGestureConfig to specify the
gestures to receive.

172.36.18  PointerDeviceChange(Change as Integer, Param as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Sent to a window when there is a change in the settings of a monitor that has a digitizer attached to it.
**Notes:**
This message contains information regarding the scaling of the display mode.
See kDeviceChange* constants.

172.36.19  PointerDeviceInRange(Param1 as Integer, Param2 as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Sent to a window when a pointer device is detected within range of an input digitizer.
**Notes:**
This message contains information regarding the device and its proximity.

If the application processes this message, it should return true, else false.
172.36.20  PointerDeviceOutOfRange(Param1 as Integer, Param2 as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Sent to a window when a pointer device has departed the range of an input digitizer.

**Notes:**
This message contains information regarding the device and its proximity.

If the application processes this message, it should return true, else false.

172.36.21  PointerDown(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Posted when a pointer makes contact over the client area of a window.

**Notes:**
This input message targets the window over which the pointer makes contact, and the pointer is implicitly captured to the window so that the window continues to receive input for the pointer until it breaks contact.

We provide pointer ID, flags, X and Y.

Note:
A hovering pointer has none of the button flags set. This is analogous to a mouse move with no mouse buttons down. An application can determine the buttons states of a hovering pen, for example, by calling GetPointerPenInfo and examining the flags that specify button states.

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

Important When a window loses capture of a pointer and it receives the PointerCaptureChanged notification, it typically will not receive any further notifications. For this reason, it is important that you not make any assumptions based on evenly paired PointerDown/PointerUp or PointerEnter/PointerLeave notifications.

Each pointer has a unique pointer identifier during its lifetime. The lifetime of a pointer begins when it is first detected.
A PointerEnter event is generated if a hovering pointer is detected. A PointerDown event followed by a
BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <> 0

A flag that indicates whether this message represents the first input generated by a new pointer.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <> 0

A flag that indicates whether this message was generated by a pointer during its lifetime. This flag is not set on messages that indicate that the pointer has left detection range.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRangeContact) <> 0

A flag that indicates whether this message was generated by a pointer that is in contact with the window surface. This flag is not set on messages that indicate a hovering pointer.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagPrimary) <> 0

Indicates that this pointer has been designated as primary.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagFirstButton) <> 0

A flag that indicates whether there is a primary action. This is analogous to a mouse left button down. A touch pointer will have this set when it is in contact with the digitizer surface. A pen pointer will have this set when it is in contact with the digitizer surface with no buttons pressed.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagSecondButton) <> 0

A flag that indicates whether there is a secondary action. This is analogous to a mouse right button down. A pen pointer will have this set when it is in contact with the digitizer surface with the pen barrel button pressed.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagThirdButton) <> 0

A flag that indicates whether there are one or more tertiary actions based on the pointer type; applications that wish to respond to tertiary actions must retrieve information specific to the pointer type to determine which tertiary buttons are pressed. For example, an application can determine the buttons states of a pen by calling GetPointerPenInfo and examining the flags that specify button states.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagFourthButton) <> 0

A flag that indicates whether the specified pointer took fourth action. Applications that wish to respond to fourth actions must retrieve information specific to the pointer type to determine if the first extended mouse (XButton1) button is pressed.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagFifthButton) <> 0

A flag that indicates whether the specified pointer took fifth action. Applications that wish to respond to fifth actions must retrieve information specific to the pointer type to determine if the second extended mouse (XButton2) button is pressed.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <> 0

PointerEnter event is generated if a non-hovering pointer is detected.

During its lifetime, a pointer may generate a series of PointerUpdate events while it is hovering or in contact. The lifetime of a pointer ends when it is no longer detected. This generates a PointerLeave event.

When a pointer is aborted, kFlagCanceled is set.

A WM_POINTERLEAVE message may also be generated when a non-captured pointer moves outside the bounds of a window.

To convert the lParam parameter to a POINTS structure, use the MAKEPOINTS macro.

To retrieve further information associated with the message, use the GetPointerInfo function.

To determine the keyboard modifier key states associated with this message, use the GetKeyState function. For example, to detect that the ALT key was pressed, check whether GetKeyState(VK_MENU) < 0.

Note that if the application does not process this message, DefWindowProc may generate one or more WM_GESTURE messages if the sequence of input from this and, possibly, other pointers is recognized as a gesture. If a gesture is not recognized, DefWindowProc may generate mouse input.

If an application selectively consumes some pointer input and passes the rest to DefWindowProc, the resulting behavior is undefined.

When a window loses capture of a pointer and receives the WM_POINTERCAPTURECHANGED notification, it will typically not receive any further notifications. Therefore, it is important that a window does not make any assumptions of its pointer status, regardless of whether it receives evenly paired DOWN / UP or ENTER / LEAVE notifications.
**172.36.22**  
**PointerEnter(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**  
Sent to a window when a new pointer enters detection range over the window (hover) or when an existing pointer moves within the boundaries of the window.  
**Notes:**  
We provide Pointer ID, Flags, X and Y.

- `BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <> 0`  
  Indicates whether this message is the first message generated by a new pointer entering detection range (hover).

- `BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <> 0`  
  Indicates whether this message was generated by a pointer that has not left detection range. This flag is always set for PointerEnter messages.

- `BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <> 0`  
  A flag that indicates whether this message was generated by a pointer that is in contact. This flag is not set for a pointer in detection range (hover).

Contains the point location of the pointer.  
**Note:**  
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

The PointerEnter notification can be used by a window to provide feedback to the user while the pointer is over its surface or to otherwise react to the presence of a pointer over its surface. This notification is only sent to the window that is receiving input for the pointer. The following table lists some of the situations in which this notification is sent.

<table>
<thead>
<tr>
<th>Action</th>
<th>Flags Set</th>
<th>Notifications Sent To</th>
</tr>
</thead>
<tbody>
<tr>
<td>A new pointer enters detection range (hover).</td>
<td>kFlagNew and kFlagInRange</td>
<td>Window over which the pointer enters detection range.</td>
</tr>
<tr>
<td>A hovering pointer crosses within the window boundaries.</td>
<td>kFlagInRange</td>
<td>Window within which the pointer has crossed.</td>
</tr>
</tbody>
</table>

**Important:**  
When a window loses capture of a pointer and it receives the PointerCaptureChange notification, it typically will not receive any further notifications. For this reason, it is important that you not make any assumptions based on evenly paired PointerDown/PointerUp or PointerEnter/PointerLeave notifications.

When inputs come from the mouse, as a result of mouse and pointer message integration, PointerEnter is not sent.
172.36.23  PointerHWheel(PointerID as Integer, Delta as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Posted to the window with foreground keyboard focus when a horizontal scroll wheel is rotated.

**Notes:**
We provide the pointer ID, the delta and x/y coordinate.
Info object provides pointer details.

To retrieve the wheel scroll units, use the inputData filed of the WinPointerInfoMBS object. This field contains a signed value and is expressed in a multiple of WHEEL_DELTA (120). A positive value indicates a rotation forward and a negative value indicates a rotation backward.
Note that the wheel inputs may be delivered even if the mouse cursor is located outside of applications window. The wheel messages are delivered in a way very similar to the keyboard inputs. The focus window of the foreground message queue receives the wheel messages.

172.36.24  PointerLeave(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Sent to a window when a pointer leaves detection range over the window (hover) or when a pointer moves outside the boundaries of the window.

**Notes:**
We provide the pointer ID, Flags, X and Y values.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0  Indicates whether this message was generated by a pointer that has not left detection range. This flag is not set when the pointer leaves the detection range of the window.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0  A flag that indicates whether this message was generated by a pointer that is in contact. This flag is not set for a pointer in detection range (hover).

**Note:**
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

The PointerLeave notification can be used by a window to change mode or stop any feedback to the user while the pointer is over the window surface.
This notification is only sent to the window that is receiving input for the pointer. The following table lists some of the situations in which this notification is sent.
Important:
When a window loses capture of a pointer and it receives the PointerCaptureChange notification, it typically will not receive any further notifications. For this reason, it is important that you not make any assumptions based on evenly paired PointerDown/PointerUp or PointerEnter/PointerLeave notifications.

If contact is maintained with the input digitizer and the pointer moves outside the window, PointerLeave is not generated. PointerLeave is generated only when a hovering pointer crosses window boundaries or contact is terminated. PointerLeave is posted to the posted message queue if the input is originated from a mouse device.

### 172.36.25  PointerUp(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Posted when a pointer that made contact over the client area of a window breaks contact.

**Notes:**
This input message targets the window over which the pointer makes contact and the pointer is, at that point, implicitly captured to the window so that the window continues to receive input messages including the WM_POINTERUP notification for the pointer until it breaks contact.

We provide pointer ID, flags, X and Y.

See Pointer Flags for more details.

**Note:**
A hovering pointer has none of the button flags set. This is analogous to a mouse move with no mouse buttons down. An application can determine the button states of a hovering pen, for example, by calling GetPointerPenInfo and examining the flags that specify button states.

**Note:**
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.
Each pointer has a unique pointer identifier during its lifetime. The lifetime of a pointer begins when it is first detected. A PointerEnter event is generated if a hovering pointer is detected. A PointerDown event followed by a PointerEnter event is generated if a non-hovering pointer is detected. During its lifetime, a pointer may generate a series of PointerUpdate event while it is hovering or in contact. The lifetime of a pointer ends when it is no longer detected. This generates a WM_POINTERLEAVE message.

When a pointer is aborted, kFlagCanceled is set. A PointerLeave event may also be generated when a non-captured pointer moves outside the bounds of a window. To obtain the horizontal and vertical position of a pointer, use the following:

If the application does not process this message, Windows may generate one or more Gesture event if the sequence of input from this and, possibly, other pointers is recognized as a gesture. If a gesture is not recognized, DefWindowProc may generate mouse input. If an application selectively consumes some pointer input and passes the rest back to Windows, the resulting behavior is undefined.
172.36.  CLASS WINPOINTEREVENTSMBS

172.36.26  PointerUpdate(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

**Function:**
Posted to provide an update on a pointer that made contact over the client area of a window or on a hovering uncaptured pointer over the client area of a window.

**Notes:**
While the pointer is hovering, the message targets whichever window the pointer happens to be over. While the pointer is in contact with the surface, the pointer is implicitly captured to the window over which the pointer made contact and that window continues to receive input for the pointer until it breaks contact.

We provide pointer ID, flags, X and Y.

\[
\text{BitwiseAnd(\text{flags}, \text{WinPointerInfoMBS.kFlagNew}) <> 0} \quad \text{A flag that indicates whether this message represents the first input generated by a new pointer.}
\]

\[
\text{BitwiseAnd(\text{flags}, \text{WinPointerInfoMBS.kFlagInRange}) <> 0} \quad \text{A flag that indicates whether this message was generated by a pointer during its lifetime. This flag is not set on messages that indicate that the pointer has left detection range.}
\]

\[
\text{BitwiseAnd(\text{flags}, \text{WinPointerInfoMBS.kFlagInContact}) <> 0} \quad \text{A flag that indicates whether this message was generated by a pointer that is in contact with the window surface. This flag is not set on messages that indicate a hovering pointer.}
\]

\[
\text{BitwiseAnd(\text{flags}, \text{WinPointerInfoMBS.kFlagPrimary}) <> 0} \quad \text{A flag that indicates whether there is a primary action. This is analogous to a mouse left button down. A touch pointer will have this set when it is in contact with the digitizer surface. A pen pointer will have this set when it is in contact with the digitizer surface with no buttons pressed.}
\]

\[
\text{BitwiseAnd(\text{flags}, \text{WinPointerInfoMBS.kFlagFirstButton}) <> 0} \quad \text{A flag that indicates whether there is a secondary action. This is analogous to a mouse right button down.}
\]

A pen pointer will have this set when it is in contact with the digitizer surface with the pen barrel button pressed.

\[
\text{BitwiseAnd(\text{flags}, \text{WinPointerInfoMBS.kFlagThirdButton}) <> 0} \quad \text{A flag that indicates whether there are one or more tertiary actions based on the pointer type; applications that wish to respond to tertiary actions must retrieve information specific to the pointer type to determine which tertiary buttons are pressed. \]

\[
\text{BitwiseAnd(\text{flags}, \text{WinPointerInfoMBS.kFlagFourthButton}) <> 0} \quad \text{A flag that indicates whether the specified pointer took fourth action. Applications that wish to respond to fourth actions must retrieve information specific to the pointer type to determine if the first extended mouse (XButton1) button is pressed.}
\]

\[
\text{BitwiseAnd(\text{flags}, \text{WinPointerInfoMBS.kFlagFifthButton}) <> 0} \quad \text{A flag that indicates whether the specified pointer took fifth action. Applications that wish to respond to fifth actions must retrieve information specific to the pointer type to determine if the second extended mouse (XButton2) button is pressed.}
\]

See Pointer Flags for more details.

**Note:**
A hovering pointer has none of the button flags set. This is analogous to a mouse move with no mouse
buttons down. An application can determine the buttons states of a hovering pen, for example, by calling GetPointerPenInfo and examining the flags that specify button states.

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

Each pointer has a unique pointer identifier during its lifetime. The lifetime of a pointer begins when it is first detected. A PointerEnter event is generated if a hovering pointer is detected. A PointerDown event followed by a PointerEnter event is generated if a non-hovering pointer is detected. During its lifetime, a pointer may generate a series of PointerUpdate events while it is hovering or in contact. The lifetime of a pointer ends when it is no longer detected. This generates a PointerLeave event. When a pointer is aborted, kFlagCanceled is set.
A PointerLeave event may also be generated when a non-captured pointer moves outside the bounds of a window.

If the application does not process this message, Windows may generate one or more Gesture event if the sequence of input from this and, possibly, other pointers is recognized as a gesture. If a gesture is not recognized, Windows may generate mouse input.
If an application selectively consumes some pointer input and passes the rest back to Windows, the resulting behavior is undefined.
If the application does not process these messages as fast as they are generated, some moves may be coalesced.
The history of inputs that were coalesced into this message can be retrieved using the GetPointerInfoHistory function.

172.36.27 PointerWheel(PointerID as Integer, Delta as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No. Function:
Posted to the window with foreground keyboard focus when a vertical scroll wheel is rotated.
Notes:
We provide, the pointer ID, the delta and x/y coordinate.
Info object provides pointer details.

To retrieve the wheel scroll units, use the inputData filed of the WinPointerInfoMBS object. This field contains a signed value and is expressed in a multiple of WHEEL_DELTA (120). A positive value indicates a rotation forward and a negative value indicates a rotation backward.
Note that the wheel inputs may be delivered even if the mouse cursor is located outside of applications.
window. The wheel messages are delivered in a way very similar to the keyboard inputs. The focus window of the foreground message queue receives the wheel messages.

172.36.28  Constants

172.36.29  kDeviceChangeArrival = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags. **Notes:** A new device is attached.

172.36.30  kDeviceChangeAspectRatioPreserved = 2048

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags. **Notes:** The display aspect ratio.

172.36.31  kDeviceChangeMapping = 256

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags. **Notes:** The change in display to digitizer mapping.

172.36.32  kDeviceChangeModeCentered = 128

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags. **Notes:** Centered display mode.

172.36.33  kDeviceChangeModeDefault = 64

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags. **Notes:** The default display mode.

172.36.34  kDeviceChangeOrientation0 = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the device change flags. **Notes:** Orientation of the device: 0
172.36.35  \texttt{kDeviceChangeOrientation180} = 16

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} One of the device change flags.  
\textbf{Notes:} Orientation of the device: 180

172.36.36  \texttt{kDeviceChangeOrientation270} = 32

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} One of the device change flags.  
\textbf{Notes:} Orientation of the device: 270

172.36.37  \texttt{kDeviceChangeOrientation90} = 8

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} One of the device change flags.  
\textbf{Notes:} Orientation of the device: 90

172.36.38  \texttt{kDeviceChangeOrigin} = 1024

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} One of the device change flags.  
\textbf{Notes:} The display origin.

172.36.39  \texttt{kDeviceChangeRemoval} = 2

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} One of the device change flags.  
\textbf{Notes:} A device has been detached.

172.36.40  \texttt{kDeviceChangeResolution} = 512

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} One of the device change flags.  
\textbf{Notes:} Display resolution.
172.37  class WinPointerInfoMBS

172.37.1  class WinPointerInfoMBS

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:**
The class for pointer input details.
**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

172.37.2  Methods

172.37.3  Constructor

MBS Win Plugin, Plugin Version: 16.2, Console & Web: No, Mac: No, Win: Yes, Linux: No.  **Function:**
The private constructor.

172.37.4  Properties

172.37.5  ButtonChangeType as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:**
Specifies the change in button state between this input and the previous input.
**Notes:**
See kPointerChange* constants.
(Read only property)

172.37.6  frameId as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:**
An identifier common to multiple pointers for which the source device reported an update in a single input frame.
**Notes:**
For example, a parallel-mode multi-touch digitizer may report the positions of multiple touch contacts in a single update to the system.
Note that frame identifier is assigned as input is reported to the system for all pointers across all devices. Therefore, this field may not contain strictly sequential values in a single series of messages that a window receives. However, this field will contain the same numerical value for all input updates that were reported in the same input frame by a single device.
172.37.7 HimetricLocationRawX as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The screen coordinates of the pointer, in HIMETRIC units.
**Notes:**
For adjusted screen coordinates, see HimetricLocation.
(Read only property)

172.37.8 HimetricLocationRawY as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The screen coordinates of the pointer, in HIMETRIC units.
**Notes:**
For adjusted screen coordinates, see HimetricLocation.
(Read only property)

172.37.9 HimetricLocationX as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The predicted screen coordinates of the pointer, in HIMETRIC units.
**Notes:**
The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptHimetricLocationRaw).
(Read only property)

172.37.10 HimetricLocationY as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The predicted screen coordinates of the pointer, in HIMETRIC units.
**Notes:**
The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted
value will be the same as the non-predicted value (see ptHimetricLocationRaw).
(Read only property)

172.37.11  historyCount as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Count of inputs that were coalesced into this message.
**Notes:**
This count matches the total count of entries that can be returned by a call to GetPointerInfoHistory. If no
coalescing occurred, this count is 1 for the single input represented by the message.
(Read only property)

172.37.12  hwndTarget as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Window to which this message was targeted.
**Notes:**
If the pointer is captured, either implicitly by virtue of having made contact over this window or explicitly
using the pointer capture API, this is the capture window. If the pointer is uncaptured, this is the window
over which the pointer was when this message was generated.
(Read only property)

172.37.13  InputData as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A value whose meaning depends on the nature of input.
**Notes:**
When flags indicate kFlagWheel, this value indicates the distance the wheel is rotated, expressed in multiples
or factors of WHEEL_DELTA. A positive value indicates that the wheel was rotated forward and a negative
value indicates that the wheel was rotated backward.
When flags indicate kFlagWheel, this value indicates the distance the wheel is rotated, expressed in multi-
plies or factors of WHEEL_DELTA. A positive value indicates that the wheel was rotated to the right and a
negative value indicates that the wheel was rotated to the left.
(Read only property)
**172.37.14 KeyStates as Integer**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates which keyboard modifier keys were pressed at the time the input was generated.

**Notes:**

May be zero or a combination of the following values:

- 8 A SHIFT key was pressed.
- 4 A CTRL key was pressed.

(Read only property)

**172.37.15 PerformanceCount as Int64**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The value of the high-resolution performance counter when the pointer message was received (high-precision, 64 bit alternative to Time).

**Notes:**

The value can be calibrated when the touch digitizer hardware supports the scan timestamp information in its input report.

(Read only property)

**172.37.16 PixelLocationRawX as Integer**

**Notes:**

For adjusted screen coordinates, see PixelLocation.

(Read only property)

**172.37.17 PixelLocationRawY as Integer**

**Notes:**

For adjusted screen coordinates, see PixelLocation.

(Read only property)
172.37.18  **PixelLocationX as Integer**

**Notes:**
The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptPixelLocationRaw).
(Read only property)

172.37.19  **PixelLocationY as Integer**

**Notes:**
The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptPixelLocationRaw).
(Read only property)

172.37.20  **pointerFlags as Integer**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** May be any reasonable combination of flags from the flags constants.

**Notes:**
See kFlag* constants.
(Read only property)

172.37.21  **pointerId as Integer**

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An identifier that uniquely identifies a pointer during its lifetime.

**Notes:**
A pointer comes into existence when it is first detected and ends its existence when it goes out of detection
range. Note that if a physical entity (finger or pen) goes out of detection range and then returns to be detected again, it is treated as a new pointer and may be assigned a new pointer identifier. (Read only property)

172.37.22 pointerType as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The pointer type. **Notes:** See kType* constants. (Read only property)

172.37.23 sourceDevice as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Handle to the source device that can be used in calls to the raw input device API and the digitizer device API. **Notes:** (Read only property)

172.37.24 Time as Integer

MBS Win Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The time of the event. **Notes:** Value is 0 or the time stamp of the message, based on the system tick count when the message was received. The application can specify the input time stamp in either Time or PerformanceCount. The value cannot be more recent than the current tick count or QueryPerformanceCount (QPC) value of the injection thread. Once a frame is injected with a time stamp, all subsequent frames must include a timestamp until all contacts in the frame go to an UP state. The custom timestamp value must also be provided for the first element in the contacts array. The time stamp values after the first element are ignored. The custom timestamp value must increment in every injection frame. When PerformanceCount is specified, the time stamp will be converted to the current time in .1 millisecond resolution upon actual injection. If a custom PerformanceCount resulted in the same .1 millisecond window from the previous injection, ERROR_NOT_READY is returned and injection will not occur. While injection will not be invalidated immediately by the error, the next successful injection must have a PerformanceCount value that is at least 0.1 millisecond from the previously successful injection. This is also true if Time is used. If both Time and PerformanceCount are specified in InjectTouchInput, ERROR_INVALID_PARAMETER is returned. InjectTouchInput cannot switch between Time and PerformanceCount once injection has started. If neither Time and PerformanceCount are specified, InjectTouchInput allocates the timestamp based on the
timing of the call. If InjectTouchInput calls are repeatedly less than 0.1 millisecond apart, ERROR_NOT_READY might be returned. The error will not invalidate the input immediately, but the injection application needs to retry the same frame again for injection to succeed.

(Read only property)

172.37.25  Constants

172.37.26  kFlagCanceled = & h8000

MBS Win Plugin, Plugin Version: 16.2. Function: One of the flag constants. Notes: Indicates that the pointer is departing in an abnormal manner, such as when the system receives invalid input for the pointer or when a device with active pointers departs abruptly. If the application receiving the input is in a position to do so, it should treat the interaction as not completed and reverse any effects of the concerned pointer.

172.37.27  kFlagCaptureChanged = & h200000

MBS Win Plugin, Plugin Version: 16.2. Function: One of the flag constants. Notes: Indicates that this pointer was captured by (associated with) another element and the original element has lost capture.

172.37.28  kFlagConfidence = & h4000

MBS Win Plugin, Plugin Version: 16.2. Function: One of the flag constants. Notes: Confidence is a suggestion from the source device about whether the pointer represents an intended or accidental interaction, which is especially relevant for touch pointers where an accidental interaction (such as with the palm of the hand) can trigger input. The presence of this flag indicates that the source device has high confidence that this input is part of an intended interaction.

172.37.29  kFlagDown = & h10000

MBS Win Plugin, Plugin Version: 16.2. Function: One of the flag constants. Notes: Indicates that this pointer transitioned to a down state; that is, it made contact with the digitizer surface.
172.37.30  kFlagFifthButton = &h100

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
**Notes:**
Analogous to a second extended mouse (XButton2) button down.
A touch pointer does not use this flag.
A pen pointer does not use this flag.
A mouse pointer has this flag set when the second extended mouse (XBUTTON2) button is down.

172.37.31  kFlagFirstButton = &h10

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
**Notes:**
Indicates a primary action, analogous to a left mouse button down.
A touch pointer has this flag set when it is in contact with the digitizer surface.
A pen pointer has this flag set when it is in contact with the digitizer surface with no buttons pressed.
A mouse pointer has this flag set when the left mouse button is down.

172.37.32  kFlagFourthButton = &h80

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
**Notes:**
Analogous to a first extended mouse (XButton1) button down.
A touch pointer does not use this flag.
A pen pointer does not use this flag.
A mouse pointer has this flag set when the first extended mouse (XBUTTON1) button is down.

172.37.33  kFlagHasTransform = &h400000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
**Notes:** Indicates that this pointer has an associated transform.

172.37.34  kFlagHWheel = &h100000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.
**Notes:** Indicates input associated with a pointer h-wheel. For mouse pointers, this is equivalent to the action of the mouse horizontal scroll wheel.
172.37.35 kFlagInContact = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.  
**Notes:**
Indicates that this pointer is in contact with the digitizer surface.  
When this flag is not set, it indicates a hovering pointer.

172.37.36 kFlagInRange = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.  
**Notes:**
Indicates that this pointer continues to exist.  When this flag is not set, it indicates the pointer has left detection range.  
This flag is typically not set only when a hovering pointer leaves detection range (kFlagUpdate is set) or when a pointer in contact with a window surface leaves detection range (kFlagUp is set).

172.37.37 kFlagNew = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.  
**Notes:** Indicates the arrival of a new pointer.

172.37.38 kFlagNone = 0

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.  
**Notes:** Default

172.37.39 kFlagPrimary = & h2000

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.  
**Notes:**
Indicates that this pointer has been designated as the primary pointer.  A primary pointer is a single pointer that can perform actions beyond those available to non-primary pointers.  For example, when a primary pointer makes contact with a windows surface, it may provide the window an opportunity to activate by sending it a PointerActivate event.  
The primary pointer is identified from all current user interactions on the system (mouse, touch, pen, and so on).  As such, the primary pointer might not be associated with your app.  The first contact in a multi-touch interaction is set as the primary pointer.  Once a primary pointer is identified, all contacts must be lifted before a new contact can be identified as a primary pointer.  For apps that don’t process pointer input, only
the primary pointer’s events are promoted to mouse events.

**172.37.40 kFlagSecondButton = & h20**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.  
**Notes:**
Indicates a secondary action, analogous to a right mouse button down.  
A touch pointer does not use this flag.  
A pen pointer has this flag set when it is in contact with the digitizer surface with the pen barrel button pressed.  
A mouse pointer has this flag set when the right mouse button is down.

**172.37.41 kFlagThirdButton = & h40**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.  
**Notes:**
Analogous to a mouse wheel button down.  
A touch pointer does not use this flag.  
A pen pointer does not use this flag.  
A mouse pointer has this flag set when the mouse wheel button is down.

**172.37.42 kFlagUp = & h40000**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.  
**Notes:** Indicates that this pointer transitioned to an up state; that is, contact with the digitizer surface ended.

**172.37.43 kFlagUpdate = & h20000**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.  
**Notes:** Indicates that this is a simple update that does not include pointer state changes.

**172.37.44 kFlagWheel = & h80000**

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the flag constants.  
**Notes:** Indicates input associated with a pointer wheel. For mouse pointers, this is equivalent to the action
of the mouse scroll wheel.

172.37.45  \text{\texttt{kPointerChangeFifthButtonDown = 9}}

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} The fifth button transitioned to a pressed state.

172.37.46  \text{\texttt{kPointerChangeFifthButtonUp = 10}}

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} The fifth button transitioned to a released state.

172.37.47  \text{\texttt{kPointerChangeFirstButtonDown = 1}}

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} The first button transitioned to a pressed state.

172.37.48  \text{\texttt{kPointerChangeFirstButtonUp = 2}}

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} The first button transitioned to a released state.

172.37.49  \text{\texttt{kPointerChangeFourthButtonDown = 7}}

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} The fourth button transitioned to a pressed state.

172.37.50  \text{\texttt{kPointerChangeFourthButtonUp = 8}}

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} The fourth button transitioned to a released state.

172.37.51  \text{\texttt{kPointerChangeNone = 0}}

MBS Win Plugin, Plugin Version: 16.2. \textbf{Function:} No change in button state.
172.37.52  kPointerChangeSecondButtonDown = 3

MBS Win Plugin, Plugin Version: 16.2. **Function:** The second button transitioned to a pressed state.

172.37.53  kPointerChangeSecondButtonUp = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** The second button transitioned to a released state.

172.37.54  kPointerChangeThirdButtonDown = 5

MBS Win Plugin, Plugin Version: 16.2. **Function:** The third button transitioned to a pressed state.

172.37.55  kPointerChangeThirdButtonUp = 6

MBS Win Plugin, Plugin Version: 16.2. **Function:** The third button transitioned to a released state.

172.37.56  kTypeMouse = 4

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the pointer types.
**Notes:** Mouse pointer type.

172.37.57  kTypePen = 3

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the pointer types.
**Notes:** Pen pointer type.

172.37.58  kTypePointer = 1

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the pointer types.
**Notes:**
Generic pointer type.
This type never appears in pointer messages or pointer data. Some data query functions allow the caller to restrict the query to specific pointer type. The kTypePointer type can be used in these functions to specify that the query is to include pointers of all types.
172.37. CLASS WINPOINTERINFOMBS

172.37.59  kTypeTouch = 2

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the pointer types.  
**Notes:** Touch pointer type.

172.37.60  kTypeTouchpad = 5

MBS Win Plugin, Plugin Version: 16.2. **Function:** One of the pointer types.  
**Notes:** Touchpad pointer type (Windows 8.1 and later).
172.38 class WMIOBJECTMBS

172.38.1 class WMIOBJECTMBS

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a WMI object.

172.38.2 Methods

172.38.3 GetNames as string()

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Queries the names of all properties in this object.

172.38.4 GetProperty(Name as string) as Variant

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a property as a variant.
**Notes:**
- Objects, booleans, strings and numbers are supported directly. Also string arrays in version 13.1.
- Other values are casted to string first.

172.38.5 GetPropertyBoolean(Name as string) as Boolean

MBS Win Plugin, Plugin Version: 13.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a value as an integer.
**Notes:** Value must be of a numeric type.

172.38.6 GetPropertyDouble(Name as string) as Double

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gets a value as a double.
**Notes:** Value must be of a numeric type.
172.38.7 GetPropertyInt64(Name as string) as Int64

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Gets a property as an integer value.

**Example:**
```
dim w as WindowsWMIMBS // your WMI object
MsgBox str(w.GetPropertyInt64("MaxClockSpeed")) // uint32
```

**Notes:** Value must be of a numeric type.

172.38.8 GetPropertyInteger(Name as string) as Integer

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Gets a value as an integer.
**Example:**
```
dim w as WindowsWMIMBS // your WMI object
MsgBox str(w.GetPropertyInteger("MaxClockSpeed")) // uint32
```

**Notes:** Value must be of a numeric type.

172.38.9 GetPropertyObject(Name as string) as WMIOBJECTMBS

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Gets a value as an object.
**Notes:** Value must be of an IUnknown type.

172.38.10 GetPropertyString(Name as string) as string

MBS Win Plugin, Plugin Version: 12.0, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Gets a property as a string.
**Example:**
```
dim w as WindowsWMIMBS
MsgBox w.GetPropertyString("Name") // string
```

172.38.11 GetPropertyStringArray(Name as string) as string()

MBS Win Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Gets a property as a string array.
**Example:**
**172.38.12 GetPropertyType(Name as string) as Integer**

**Function:** Gets the type of a property.  
**Notes:** You can send in the value you get here and the plugin can be changed to handle this type, too. Currently only numbers and strings are handled.

**172.38.13 GetPropertyTypeString(Name as string) as string**

**Function:** Gets the type of a property as a string.  
**Notes:** For example type 8 is returned as "string".

**172.38.14 Properties**

**172.38.15 Handle as Integer**

**Function:** Internal object reference.  
**Notes:** (Read and Write property)

**172.38.16 Lasterror as Integer**

**Function:** The last error code reported from one of the functions.  
**Notes:** -1 is the value used by the plugin if the function is not available. (Read and Write property)

**172.38.17 LasterrorMessage as String**

**Function:** The error message for the last error.
172.38.  CLASS WMOBJECTMBS

Notes:

This may help to debug the errors.
(Read only property)
Chapter 173

Windows Console

173.1  class ConsoleStateMBS

173.1.1  class ConsoleStateMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: A class for handling a console window state.

173.1.2  Properties

173.1.3  BackColor as Integer

Notes: Color codes can be build up from red, blue, green and highlight. red=1, blue=2, green=4 and highlight=8. (Read and Write property)

173.1.4  CursorX as Integer

Notes: (Read and Write property)
173.1.5 **CursorY as Integer**

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The vertical cursor position in characters.
**Notes:** (Read and Write property)

173.1.6 **Height as Integer**

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height of the window in characters.
**Notes:** (Read and Write property)

173.1.7 **MaxHeight as Integer**

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The maximum height of the window in characters.
**Notes:** (Read and Write property)

173.1.8 **MaxWidth as Integer**

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The maximum width of the window in characters.
**Notes:** (Read and Write property)

173.1.9 **TextColor as Integer**

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The colorcode of the text.
**Notes:**
Color codes can be build up from red, blue, green and highlight.
red=1, blue=2, green=4 and highlight=8.
(Read and Write property)

173.1.10 **Width as Integer**

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the window in characters.
173.1. CLASS CONSOLESTATEMBS

Notes: (Read and Write property)

173.1.11 WindowHeight as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height of the console window.

Notes: (Read and Write property)

173.1.12 WindowLeft as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The left position of the console window.

Notes: (Read and Write property)

173.1.13 WindowTop as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The top position of the console window.

Notes: (Read and Write property)

173.1.14 WindowWidth as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The width of the console window.

Notes: (Read and Write property)
173.2 class WindowsConsoleMBS

173.2.1 class WindowsConsoleMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class for handling a console window in Windows.

173.2.2 Methods

173.2.3 Close

MBS Win Plugin, Plugin Version: 4.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The destructor.
**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

173.2.4 FlushConsole

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The FlushConsole function flushes the console input buffer.
**Notes:** All input records currently in the input buffer are discarded.

173.2.5 ReadConsole(maxcount as Integer) as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reads maximum of maxcount characters from the input stream.

173.2.6 SetCursorPosition(x as Integer,y as Integer)

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the cursor position inside the console window.
173.2. CLASS-WINDOWS-CONSOLEMBS

173.2.7 SetWindowPosition(absolute as boolean, left as Integer, top as Integer, right as Integer, bottom as Integer)

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the window position and size.
**Notes:** If absolute=false, the coordinates are relative to the current one.

173.2.8 State as ConsoleStateMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The current state of the console window.

173.2.9 WriteConsole(message as string) as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes the message to the console.
**Notes:** Returns true if successful.

173.2.10 Properties

173.2.11 AutoScrollAtEOL as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Automatical scrolling at end of line?
**Notes:**
When writing with WriteConsole or echoing with ReadFile, the cursor moves to the beginning of the next row when it reaches the end of the current row. This causes the rows displayed in the console window to scroll up automatically when the cursor advances beyond the last row in the window. It also causes the contents of the screen buffer to scroll up (discarding the top row of the screen buffer) when the cursor advances beyond the last row in the screen buffer. If this mode is disabled, the last character in the row is overwritten with any subsequent characters.
(Read and Write property)

173.2.12 BackColor as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The text background color used.
**Notes:** (Read and Write property)
173.2.13 CursorSize as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The size of the cursor in percent (from 0 to 100).
**Notes:** (Read and Write property)

173.2.14 CursorVisible as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Is the cursor visible?
**Notes:** (Read and Write property)

173.2.15 EchoInput as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Echo the input on the screen?
**Notes:**
Characters read by the ReadFile function are written to the active screen buffer as they are read. This mode can be used only if the WaitForReturn mode is also enabled.
(Read and Write property)

173.2.16 GotConsole as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** whether the console was created inside the constructor.
**Notes:** (Read only property)

173.2.17 InputCodepage as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Codepage of the input stream.
**Notes:** (Read and Write property)

173.2.18 OutputCodepage as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Codepage of the output stream.
173.2.19 ProcessInput as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Process input before reading?

**Notes:**

Ctrl+c is processed by the system and is not placed in the input buffer. If the input buffer is being read by ReadConsole, other control keys are processed by the system and are not returned in the ReadConsole buffer. If the WaitForReturn mode is also enabled, backspace, carriage return, and linefeed characters are handled by the system.

(Read and Write property)

173.2.20 ProcessOutput as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Process output before reading?

**Notes:**

Characters written by the WriteConsole function or echoed by the ReadFile or ReadConsole function are parsed for ASCII control sequences, and the correct action is performed. Backspace, tab, bell, carriage return, and linefeed characters are processed.

(Read and Write property)

173.2.21 TextColor as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The text color used.

**Notes:** (Read and Write property)

173.2.22 Title as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The title bar of the console window.

**Notes:** (Read and Write property)
**173.2.23 WaitForReturn as boolean**

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Wait for return key on reading?

**Notes:**
The ReadConsole function returns only when a carriage return character is read. If this mode is disabled, the functions return when one or more characters are available.
(Read and Write property)

**173.2.24 Events**

**173.2.25 ConsoleClosed**

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Console was closed.

**173.2.26 ConsoleOpened**

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Console was opened.

**173.2.27 ControlBreak as boolean**

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Control-Break was pressed.

**Notes:**
Return true if you handled it yourself.
Return false for the default handler.

**173.2.28 ControlC as boolean**

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** Control-C was pressed.

**Notes:**
Return true if you handled it yourself.
Return false for the default handler.
173.2.29 Logoff as boolean

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The user is logging off.  
**Notes:**  
Return true if you handled it yourself.  
Return false for the default handler.

173.2.30 Shutdown as boolean

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The user is shutting down the computer.  
**Notes:**  
Return true if you handled it yourself.  
Return false for the default handler.

173.2.31 UserClose as boolean

MBS Win Plugin, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The user pressed the close button.  
**Notes:**  
Return true if you handled it yourself.  
Return false for the default handler.

173.2.32 Constants

173.2.33 Black = 0

MBS Win Plugin. **Function:** The color code for Black.  
**Notes:** Read only property with value 0.

173.2.34 Blue = 1

MBS Win Plugin. **Function:** The color code for Blue.  
**Notes:** Read only property with value 2.
173.2.35  Green = 2

MBS Win Plugin. Function: The color code for Green. 
Notes: Read only property with value 4.

173.2.36  Highlight = 8

MBS Win Plugin. Function: The color code for Highlight. 
Notes: Read only property with value 8.

173.2.37  Red = 4

MBS Win Plugin. Function: The color code for Red. 
Notes: Read only property with value 1.
Chapter 174

Windows ICM

174.1  class WindowsICMColorMBS

174.1.1  class WindowsICMColorMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The class for a color value.

**Notes:**
A variable of type color may be accessed as any of the supported color space colors by accessing the appropriate member of the union.

see also:

174.1.2  Properties

174.1.3  a as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The a color value of a Lab color.

**Notes:** (Read and Write property)

174.1.4  b as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The b color value of a Lab color.
174.1.5  **black as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The black color value of a CMYK color.  
**Notes:** (Read and Write property)

174.1.6  **blue as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The blue value.  
**Notes:**  
Range from 0 to 255.  
(Read and Write property)

174.1.7  **ch1 as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The first channel color value of a three channel color.  
**Notes:** (Read and Write property)

174.1.8  **ch2 as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The second channel color value of a three channel color.  
**Notes:** (Read and Write property)

174.1.9  **ch3 as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The third channel color value of a three channel color.  
**Notes:** (Read and Write property)
174.1.10  **cyan as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The cyan color value of a CMYK color. **Notes:** (Read and Write property)

174.1.11  **gray as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The gray color value. **Notes:** For grayscale color space. (Read and Write property)

174.1.12  **green as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The green value. **Notes:** Range from 0 to 255. (Read and Write property)

174.1.13  **Index as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The index value for an indexed color space. **Notes:** (Read and Write property)

174.1.14  **L as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The L color value of a Lab color. **Notes:** (Read and Write property)
174.1.15 **magenta as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The magenta color value of a CMYK color. **Notes:** (Read and Write property)

174.1.16 **red as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The red value. **Notes:** Range from 0 to 255. (Read and Write property)

174.1.17 **XYZ.X as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The X value of a XYZ color. **Notes:** (Read and Write property)

174.1.18 **XYZ.Y as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Y value of a XYZ color. **Notes:** (Read and Write property)

174.1.19 **XYZ.Z as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Z value of a XYZ color. **Notes:** (Read and Write property)

174.1.20 **yellow as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The yellow color value of a CMYK color.
174.1. CLASS WINDOWSICMCOLORMBS

**Notes:** (Read and Write property)

### 174.1.21 Yxy_x as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The x value of a Yxy color.

**Notes:** (Read and Write property)

### 174.1.22 Yxy_y as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The y value of a Yxy color.

**Notes:**

Yxy_Y is the first Y and Yxy_Y the second one in a Yxy color.

(Read and Write property)

### 174.1.23 Yxy_YY as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The y value of a Yxy color.

**Notes:**

Yxy_Y is the first Y and Yxy_Y the second one in a Yxy color.

(Read and Write property)

### 174.1.24 Channel(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The channel value of a colorspace with 3 to 8 channels.

**Notes:**

Index from 0 to 7.

(Read and Write computed property)
174.1.25 Constants

174.1.26 COLOR_3_CHANNEL = 6
MBS Win Plugin, Plugin Version: 11.1. Function: One of the color type constants. Notes: The COLOR is in the GENERIC3CHANNEL color space.

174.1.27 COLOR_5_CHANNEL = 8
MBS Win Plugin, Plugin Version: 11.1. Function: One of the color type constants. Notes: The COLOR is in a five channel color space.

174.1.28 COLOR_6_CHANNEL = 9
MBS Win Plugin, Plugin Version: 11.1. Function: One of the color type constants. Notes: The COLOR is in a six channel color space.

174.1.29 COLOR_7_CHANNEL = 10
MBS Win Plugin, Plugin Version: 11.1. Function: One of the color type constants. Notes: The COLOR is in a seven channel color space.

174.1.30 COLOR_8_CHANNEL = 11
MBS Win Plugin, Plugin Version: 11.1. Function: One of the color type constants. Notes: The COLOR is in an eight channel color space.

174.1.31 COLOR_CMYK = 7
MBS Win Plugin, Plugin Version: 11.1. Function: One of the color type constants. Notes: The COLOR is in the CMYKCOLOR color space.
### 174.1.32 COLOR_GRAY = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.  
**Notes:** The COLOR is in the GRAYCOLOR color space.

### 174.1.33 COLOR_Lab = 5

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.  
**Notes:** The COLOR is in the LabCOLOR color space.

### 174.1.34 COLOR_NAMED = 12

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.  
**Notes:** The COLOR is in a named color space.

### 174.1.35 COLOR_RGB = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.  
**Notes:** The COLOR is in the RGBCOLOR color space.

### 174.1.36 COLOR_XYZ = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.  
**Notes:** The COLOR is in the XYZCOLOR color space.

### 174.1.37 COLOR_Yxy = 4

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color type constants.  
**Notes:** The COLOR is in the YxyCOLOR color space.

### 174.1.38 MAX_COLOR_CHANNELS = 8

MBS Win Plugin, Plugin Version: 11.1. **Function:** The maximum number of supported color channels.
174.2 class WindowsICMEnumMBS

174.2.1 class WindowsICMEnumMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The WindowsICMEnumMBS class contains information that defines the profile enumeration constraints.
**Example:**

dim c as new WindowsICMEnumMBS // no options set

dim a(-1) as string = WindowsICMModuleMBS.EnumColorProfiles(c)

for each s as string in a
    MsgBox s
next

**Notes:**

see also

174.2.2 Properties

174.2.3 Attributes0 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Attributes of profile that can be any of the following values.
**Notes:**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTRIB_TRANSPARENCY</td>
<td>Turns transparency on. If this flag is not used, the attribute is reflective by default.</td>
</tr>
<tr>
<td>ATTRIB_MATTE</td>
<td>Turns matte display on. If this flag is not used, the attribute is glossy by default.</td>
</tr>
</tbody>
</table>

(Read and Write property)

174.2.4 Attributes1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Attributes of profile that can be any of the following values.
**Notes:**
## Constant Meaning

<table>
<thead>
<tr>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTRIB_TRANSPARENCY</td>
<td>Turns transparency on. If this flag is not used, the attribute is reflective by default.</td>
</tr>
<tr>
<td>ATTRIB_MATTE</td>
<td>Turns matte display on. If this flag is not used, the attribute is glossy by default.</td>
</tr>
</tbody>
</table>

(Read and Write property)

### 174.2.5 Classs as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the profile class.

**Notes:**

For a description of profile classes, see Using Device Profiles with WCS.

A profile class may have any of the following values.

<table>
<thead>
<tr>
<th>Profile Class</th>
<th>Signature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input Device Profile</td>
<td>CLASS_SCANNER</td>
</tr>
<tr>
<td>Display Device Profile</td>
<td>CLASS_MONITOR</td>
</tr>
<tr>
<td>Output Device Profile</td>
<td>CLASS_PRINTER</td>
</tr>
<tr>
<td>Device Link Profile</td>
<td>CLASS_LINK</td>
</tr>
<tr>
<td>Color Space Conversion Profile</td>
<td>CLASS_COLORSPACE</td>
</tr>
<tr>
<td>Abstract Profile</td>
<td>CLASS_ABSTRACT</td>
</tr>
<tr>
<td>Named Color Profile</td>
<td>CLASS_NAMED</td>
</tr>
<tr>
<td>Color Appearance Model Profile</td>
<td>CLASS_CAMP</td>
</tr>
<tr>
<td>Color Gamut Map Model Profile</td>
<td>CLASS_GMMP</td>
</tr>
</tbody>
</table>

(Read and Write property)

### 174.2.6 CMMType as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The identification number of the CMM that is used in the profile.

**Notes:**

Identification numbers are registered with the ICC.

(Read and Write property)
174.2.7 **ConnectionSpace as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A signature value that indicates the color space in which the profile connection space (PCS) is defined. **Notes:** Can be any of the following values: SPACE_XYZ or SPACE_Lab

When the Classs member is set to CLASS_LINK, the PCS is taken from the DataColorSpace member. (Read and Write property)

174.2.8 **Creator as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Signature of the software that created the profile. **Notes:** Signatures are registered with the ICC. (Read and Write property)

174.2.9 **DataColorSpace as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A signature value that indicates the color space in which the profile data is defined. **Notes:** Can be any value from the SPACE_* Constants. (Read and Write property)

174.2.10 **DeviceClass as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the device class. **Notes:** A device class may have one of the following values. (Read and Write property)
### 174.2.11 DeviceName as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** User friendly name of the device.  
**Notes:** (Read and Write property)

### 174.2.12 DitheringMode as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates the style of dithering that will be used when an image is displayed.  
**Notes:** (Read and Write property)

### 174.2.13 Fields as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates which fields in this class are being used.  
**Notes:**

Can be set to any combination of the following constant values:

- ET_DEVICENAME
- ET_MEDIATYPE
- ET_DITHERMODE
- ET_RESOLUTION
- ET_CMMTYPE
- ET_CLASS
- ET_DATACOLORSPACE
- ET_CONNECTIONSPACE
- ET_SIGNATURE
- ET_PLATFORM
- ET_PROFILEFLAGS
- ET_MANUFACTURER
- ET_MODEL
- ET_ATTRIBUTES
- ET_RENDERINGINTENT
- ET_CREATOR
- ET_DEVICECLASS
174.2.14 Manufacturer as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The identification number of the device profile manufacturer.

**Notes:**
All manufacturer identification numbers are registered with the ICC.
(Read and Write property)

174.2.15 MediaType as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Indicates which type of media is associated with the profile, such as a printer or screen.

**Notes:** (Read and Write property)

174.2.16 Model as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device manufacturer’s device model number.

**Notes:**
All model identification numbers are registered with the ICC.
(Read and Write property)

174.2.17 Platform as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The primary platform for which the profile was created.

**Notes:**
The member can be set to any of the following values.

(Read and Write property)
174.2. CLASS WINDOWSICMENUMMBS

<table>
<thead>
<tr>
<th>Platform</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apple Computer, Inc.</td>
<td>'APPL'</td>
</tr>
<tr>
<td>Microsoft Corp.</td>
<td>'MSFT'</td>
</tr>
<tr>
<td>Silicon Graphics, Inc.</td>
<td>'SGI'</td>
</tr>
<tr>
<td>Sun Microsystems, Inc.</td>
<td>'SUNW'</td>
</tr>
<tr>
<td>Taligent</td>
<td>'TGNT'</td>
</tr>
</tbody>
</table>

174.2.18 ProfileFlags as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Bit flags containing hints that the CMM uses to interpret the profile data and can be set to one of the following values.

**Notes:**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>FLAG_EMBEDDEDPROFILE</td>
<td>The profile is embedded in a bitmap file.</td>
</tr>
<tr>
<td>FLAG_DEPENDENTONDATA</td>
<td>The profile can't be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.</td>
</tr>
</tbody>
</table>

(Read and Write property)

174.2.19 RenderingIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The profile rendering intent.

**Notes:**

The member can be set to one of the following values:

```
INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE
COLORIMETRIC
INTENT_ABSOLUTE
```

For more information, see Rendering Intents.
(Read and Write property)

174.2.20 ResolutionX as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The horizontal resolution in pixels of the device on which the image will be displayed.

**Notes:** (Read and Write property)
174.2.21 ResolutionY as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The vertical resolution in pixels of the device on which the image will be displayed. **Notes:** (Read and Write property)

174.2.22 Signature as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reserved for internal use. **Notes:** (Read and Write property)

174.2.23 Constants

174.2.24 ATTRIB_MATTE = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the attribute constants. **Notes:** Turns matte display on. If this flag is not used, the attribute is glossy by default.

174.2.25 ATTRIB_TRANSPARENCY = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the attribute constants. **Notes:** Turns transparency on. If this flag is not used, the attribute is reflective by default.

174.2.26 CLASS_ABSTRACT = & h61627374

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.

174.2.27 CLASS_CAMP = & h6C616D70

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.
174.2.28  \textbf{CLASS\_COLORSPACE} = \& h73706163

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function:} One of the profile class constants.

174.2.29  \textbf{CLASS\_GMMP} = \& h676D6D70

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function:} One of the profile class constants.

174.2.30  \textbf{CLASS\_LINK} = \& h6C696E6B

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function:} One of the profile class constants.

174.2.31  \textbf{CLASS\_MONITOR} = \& h6D6E7472

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function:} One of the profile class constants.

174.2.32  \textbf{CLASS\_NAMED} = \& h6E6D636C

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function:} One of the profile class constants.

174.2.33  \textbf{CLASS\_PRINTER} = \& h70727472

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function:} One of the profile class constants.

174.2.34  \textbf{CLASS\_SCANNER} = \& h73636E72

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function:} One of the profile class constants.

174.2.35  \textbf{ET\_ATTRIBUTES} = \& h02000

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function:} One of the constants to specify which property in this class is used.
174.2.36  \textbf{ET\_CLASS} = & h00020

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function}: One of the constants to specify which property in this class is used.

174.2.37  \textbf{ET\_CMMTYPE} = & h00010

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function}: One of the constants to specify which property in this class is used.

174.2.38  \textbf{ET\_CONNECTIONSPACE} = & h00080

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function}: One of the constants to specify which property in this class is used.

174.2.39  \textbf{ET\_CREATOR} = & h08000

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function}: One of the constants to specify which property in this class is used.

174.2.40  \textbf{ET\_DATACOLORSPACE} = & h00040

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function}: One of the constants to specify which property in this class is used.

174.2.41  \textbf{ET\_DEVICECLASS} = & h10000

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function}: One of the constants to specify which property in this class is used.

174.2.42  \textbf{ET\_DEVICENAME} = & h00001

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function}: One of the constants to specify which property in this class is used.
174.2. CLASS WINDOWSICMENUMMBS

174.2.43 ET_DITHERMODE = & h00004

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the constants to specify which property in this class is used.

174.2.44 ET_MANUFACTURER = & h00800

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the constants to specify which property in this class is used.

174.2.45 ET_MEDIATYPE = & h00002

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the constants to specify which property in this class is used.

174.2.46 ET_MODEL = & h01000

MBS Win Plugin, Plugin Version: 11.1. Function: One of the platform signatures. Notes: TGNT = Taligent

174.2.60 SPACE_Lab = & h4C616220

MBS Win Plugin, Plugin Version: 11.1. Function: One of the color space constants. Notes: Lab

174.2.61 SPACE_XYZ = & h58595A20

MBS Win Plugin, Plugin Version: 11.1. Function: One of the color space constants. Notes: XYZ
174.3 class WindowsICMLLogColorSpaceMBS

174.3.1 class WindowsICMLLogColorSpaceMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
This class contains information that defines a logical color space.

**Notes:**
If the CSType member is set to LCS_sRGB or LCS_WINDOWS_COLOR_SPACE, the other members of
this structure are ignored, and WCS uses the sRGB color space. The Endpoints, GammaRed, Gamma-
Green, and GammaBlue members are used to describe the logical color space. The Endpoints member is a
CIEXYZTRIPLE that contains the x, y, and z values of the color space’s RGB endpoint.

The required DWORD bit format for the GammaRed, GammaGreen, and GammaBlue is an 8.8 fixed point
integer left-shifted by 8 bits. The plugin takes care about that detail.

Whenever the Filename member contains a file name and the CSType member is set to LCS_CALIBRATED_RGB,
WCS ignores the other members of this class. It uses the color space in the file as the color space to which
this LOGCOLORSPACE structure refers.

The relation between tri-stimulus values X,Y,Z and chromaticity values x,y,z is as follows:

\[
x = \frac{X}{X+Y+Z} \\
y = \frac{Y}{X+Y+Z} \\
z = \frac{Z}{X+Y+Z}
\]

If the CSType member is set to LCS_sRGB or LCS_WINDOWS_COLOR_SPACE, the other members of this
structure are ignored, and ICM uses the sRGB color space. Applications should still initialize the rest of the
structure since CreateProfileFromLogColorSpace ignores CSType member and uses Endpoints, GammaRed,
GammaGreen, GammaBlue members to create a profile, which may not be initialized in case of LCS_sRGB
or LCS_WINDOWS_COLOR_SPACE color spaces.

174.3.2 Properties

174.3.3 CSType as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Color space type.

**Notes:**
The member can be one of the following values.
### 174.3. CLASS WINDOWSICMLOGCOLORSPACEMBS

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCS, CALIBRATED_RGB</td>
<td>Color values are calibrated RGB values. The values are translated using the endpoints specified by the lcsEndpoints member before being passed to the device.</td>
</tr>
<tr>

<td>Color values are sRGB values.</td>
</tr>
<tr>
<td>LCS, WINDOWS_COLOR_SPACE</td>
<td>Color values are Windows default color space color values.</td>
</tr>
</tbody>
</table>

(Read and Write property)

#### 174.3.4 EndpointsBX as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The X value of the Blue Endpoint.  
**Notes:** (Read and Write property)

#### 174.3.5 EndpointsBY as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Y value of the Blue Endpoint.  
**Notes:** (Read and Write property)

#### 174.3.6 EndpointsBZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The Z value of the Blue Endpoint.  
**Notes:** (Read and Write property)

#### 174.3.7 EndpointsGX as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The X value of the Green Endpoint.  
**Notes:** (Read and Write property)

#### 174.3.8 EndpointsGY as Integer

CHAPTER 174. WINDOWS ICM

Notes: (Read and Write property)

174.3.9 EndpointsGZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The Z value of the Green Endpoint. Notes: (Read and Write property)

174.3.10 EndpointsRX as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The X value of the Red Endpoint. Notes: (Read and Write property)

174.3.11 EndpointsRY as Integer

174.3.12 EndpointsRZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The Z value of the Red Endpoint. Notes: (Read and Write property)

174.3.13 Filename as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: A string that names a color profile file. Notes: This member is typically set to "", but may be used to set the color space to be exactly as specified by the color profile. This is useful for devices that input color values for a specific printer, or when using an installable image color matcher. If a color profile is specified, all other members of this class should be set to reasonable values, even if the values are not completely accurate. (Read and Write property)
174.3.14 GammaBlue as Double

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Scale of the blue coordinate.  
**Notes:** (Read and Write property)

174.3.15 GammaGreen as Double

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Scale of the green coordinate.  
**Notes:** (Read and Write property)

174.3.16 GammaRed as Double

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Scale of the red coordinate.  
**Notes:** (Read and Write property)

174.3.17 Intent as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The gamut mapping method.  
**Notes:** This member can be one of the following values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Value</th>
<th>Intent</th>
<th>ICC Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCS_GM_BUSINESS</td>
<td>1</td>
<td>Graphic</td>
<td>Saturation</td>
<td>Maintain saturation. Used for business charts and other situations in which undithered colors are required.</td>
</tr>
<tr>
<td>LCS_GM_GRAPHICS</td>
<td>2</td>
<td>Proof</td>
<td>Relative Colorimetric</td>
<td>Maintain colorimetric match. Used for graphic designs and named colors.</td>
</tr>
<tr>
<td>LCS_GM_IMAGES</td>
<td>4</td>
<td>Picture</td>
<td>Perceptual</td>
<td>Maintain contrast. Used for photographs and natural images.</td>
</tr>
<tr>
<td>LCS_GMLABS_COLORIMETRIC</td>
<td>8</td>
<td>Match</td>
<td>Absolute Colorimetric</td>
<td>Maintain the white point. Match the colors to their nearest color in the destination gamut.</td>
</tr>
</tbody>
</table>

(Read and Write property)
174.3.18 Constants

174.3.19 INTENT_ABSOLUTE_COLORIMETRIC = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants. **Notes:** Maintain the white point. Match the colors to their nearest color in the destination gamut.

174.3.20 INTENT_PERCEPTUAL = 0

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants. **Notes:** Maintain contrast. Used for photographs and natural images.

174.3.21 INTENT_RELATIVE_COLORIMETRIC = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants. **Notes:** Maintain colorimetric match. Used for graphic designs and named colors.

174.3.22 INTENT_SATURATION = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants. **Notes:** Maintain saturation. Used for business charts and other situations in which undithered colors are required.

174.3.23 LCS_CALIBRATED_RGB = 0

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space type constants. **Notes:** Color values are calibrated RGB values. The values are translated using the endpoints specified by the Endpoints member before being passed to the device.

174.3.24 LCS_sRGB = & h73524742

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space type constants. **Notes:** Color values are values are sRGB values.
174.3. CLASS WINDOWSICMLOGCOLORSPACEMBS

174.3.25 LCS_WINDOWS_COLOR_SPACE = &h57696E20

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space type constants.
**Notes:** Color values are Windows default color space color values.
174.4 module WindowsICMModuleMBS

174.4.1 module WindowsICMModuleMBS

174.4.2 Methods

174.4.3 AssociateColorProfileWithDevice(ProfileName as string, DeviceName as string) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The AssociateColorProfileWithDevice function associates a specified color profile with a specified device. **Notes:**

ProfileName: The file name of the profile to associate.
DeviceName: The name of the device to associate.

Returns true on success and false on failure.

The AssociateColorProfileWithDevice function will fail if the profile has not been installed on the computer using the InstallColorProfile function.

Note that under Windows (Windows 95 or later), the PostScript device driver for printers assumes a CMYK color model. Therefore, all PostScript printers must use a CMYK color profile. Windows 2000 does not have this limitation.

If the specified device is a monitor, this function updates the default profile.

Several profiles are typically associated with printers, based on paper and ink types. There is no default. The GDI selects the best one from the associated profiles when your application creates a device context (DC).

Scanners also have no default profile. However, it is atypical to associate more than one profile with a scanner.

AssociateColorProfileWithDevice always adds the specified profile to the current user’s per-user profile association list for the specified device. Before adding the profile to the list, AssociateColorProfileWithDevice determines whether the user has previously expressed the desire to use a per-user profile association list for the device. If so, then AssociateColorProfileWithDevice simply adds the specified profile to the existing per-user profile association list for the device. If not, then AssociateColorProfileWithDevice creates a new per-user profile association list for the device by copying the system-wide association list for that device. It
then appends the specified profile to the per-user list. From that point on, the current user will be using a per-user profile association list for the specified device, as if SetUsePerUserProfiles had been called for Device with the usePerUserProfiles parameter set to TRUE.

174.4.4 DisassociateColorProfileFromDevice(ProfileName as string, DeviceName as string) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The DisassociateColorProfileFromDevice function disassociates a specified color profile with a specified device on a specified computer. **Notes:** Returns true on success and false on failure.

ProfileName: The file name of the profile to disassociate.
DeviceName: The name of the device to disassociate.

If more than one profile is associated with a device, WCS uses the last one associated as the default. That is, if your application sequentially associates three profiles with a device, WCS will use the last one associated as the default. If your application then calls the DisassociateColorProfileFromDevice function to disassociate the third profile (which is the default in this example), the WCS will use the second profile as the default.

If your application disassociates all profiles from a device, WCS uses the sRGB profile as the default.

DisassociateColorProfileFromDevice always removes the specified profile from the current user’s per-user profile association list for the specified device. Before removing the profile from the list, DisassociateColorProfileFromDevice determines whether the user has previously expressed the desire to use a per-user profile association list for the device. If so, then DisassociateColorProfileFromDevice simply removes the specified profile from the existing per-user profile association list for the device. If not, then DisassociateColorProfileFromDevice creates a new per-user profile association list for the device by copying the system-wide association list for that device. It then removes the specified profile from the per-user list. From that point on, the current user will be using a per-user profile association list for the specified device, as if SetUsePerUserProfiles had been called for Device with the usePerUserProfiles parameter set to TRUE.

174.4.5 EnumColorProfiles(criterias as WindowsICMEnumMBS) as string()

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The EnumColorProfiles function enumerates all the profiles satisfying the given enumeration criteria. **Example:**

`dim c as new WindowsICMEnumMBS // no options set`
dim a(-1) as string = WindowsICMModuleMBS.EnumColorProfiles(c)

for each s as string in a
    MsgBox s
next

Notes:

On success the function returns an array of profile names.

Several profiles are typically associated with printers, based on the paper and ink types. There is a default profile for each device. For International Color Consortium (ICC) profiles, GDI selects the best one from the ICC-associated profiles when your application creates a device context (DC).

Do not attempt to use EnumColorProfiles to determine the default profile for a device. Instead, create a device context for the device and then invoke the GetICMProfile function. On Windows Vista and Windows 7, the WcsGetDefaultColorProfile function can also be used to determine a device’s default color profile.

If the Fields member of WindowsICMEnumMBS that is pointed to by the criterias parameter is set to ET_DEVICENAME, this function will enumerate all of the color profiles associated with all types of devices attached to the user’s computer, regardless of the device class. If the Fields member is set to ET_DEVICENAME or ET_DEVICECLASS and a device class is specified in the DeviceClass member, this function will only enumerate the profiles associated with the specified device class. If the Fields member is set only to ETDEVICECLASS, the EnumColorProfiles function will enumerate all profiles that can be associated with that type of device.

Whenever EnumColorProfiles is examining the profiles associated with a specific device, the results depend on whether the user has chosen to use the system-wide list of profiles associated with that device, or his or her own (“per-user”) list. Calling SetUsePerUserProfiles with its usePerUserProfiles parameter set to TRUE causes future calls to EnumColorProfiles to look at only the current user’s per-user list of profile associations for the specified device. Calling WcsSetUsePerUserProfiles with its usePerUserProfiles parameter set to FALSE causes future calls to EnumColorProfiles to look at the system-wide list of profile associations for the specified device. If SetUsePerUserProfiles has never been called for the current user, EnumColorProfiles examines the system-wide list.

This function will provide the information for converting WCS-specific DMP information to the legacy EnumType record in enable consistent profile enumeration. The defaults will be the same as ICC if this information is not present.

Per-user/LUA support

The enumeration is specific to current user. Both system wide and current user device associations are
considered. For default profile configuration, current user settings override system wide ones.

174.4.6 GetColorDirectory as folderitem

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetColorDirectory function retrieves the path of the Windows COLOR directory on a specified machine.  
**Example:**

```vbs
dim f as FolderItem = WindowsICMModuleMBS.GetColorDirectory

if f=nil then
    MsgBox "No path?"
else
    MsgBox f.AbsolutePath
end if
```

**Notes:** On success returns folderitem for color directory. Returns nil on any error.

174.4.7 GetStandardColorSpaceProfile(ProfileID as Integer) as string

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetStandardColorSpaceProfile function retrieves the color profile registered for the specified standard color space.  
**Example:**

```vbs
MsgBox WindowsICMModuleMBS.GetStandardColorSpaceProfile(WindowsICMModuleMBS.LCS_WINDOWS_COLOR_SPACE)
```

**Notes:**

ProfileID: Specifies the ID value of the standard color space for which to retrieve the profile. The only valid values for this parameter are LCS_sRGB and LCS_WINDOWS_COLOR_SPACE.

This function supports Windows Color System (WCS) device model profiles (DMPs) in addition to International Color Consortium (ICC) profiles. It does not support WCS CAMP or GMMP profiles and will return an error if such profiles are used.

Overview of Windows Vista Specific Functionality

This will support WCS DMPs in addition to ICC profiles. It will not support WCS CAMP or GMMP profiles and will return an error if such profiles are used with this API.
Per-user/LUA support

This will retrieve the color profile registered for the given standard color space for current user. If there is no such setting for the current user, it retrieves the system wide setting.

This uses WcsGetDefaultColorProfile with WCS_PROFILE_MANAGEMENT_SCOPE_CURRENT_USER.

This is executable in LUA context.

174.4.8 InstallColorProfile(file as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The InstallColorProfile function installs a given profile for use on a specified machine.

**Notes:**
The profile is also copied to the COLOR directory.
Returns true on success and false on failure.

174.4.9 RegisterCMM(cmmID as Integer, file as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
RegisterCMM associates a specified identification value with the specified color management module dynamic link library (CMM DLL).

**Notes:**
When this ID appears in a color profile, Windows can then locate the corresponding CMM so as to create a transform.

cmmID: Specifies the ID signature of the CMM registered with the International Color Consortium (ICC).
file: Points to the CMM DLL.

Returns true on success and false on failure.
174.4. SelectCMM(cmmID as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** SelectCMM allows an application to select the preferred color management module (CMM) to use. **Notes:**
cmmID: Specifies the signature of the desired CMM as registered with the International Color Consortium (ICC).

Windows 2000 only: Setting this parameter to 0 causes the WCS system to select the default CMM.

Returns true on success and false on failure.

174.4.11 SetStandardColorSpaceProfile(ProfileID as Integer, ProfileName as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The SetStandardColorSpaceProfile function registers a specified profile for a given standard color space. **Notes:**
The profile can be queried using GetStandardColorSpaceProfile.

ProfileID: Specifies the ID value of the standard color space that the given profile represents.
ProfileName: path to the profile file.

Returns true on success and false on failure.

The profile must already be installed on the system before it can be registered for a standard color space.

This function supports Windows Color System (WCS) device model profiles (DMPs) in addition to International Color Consortium (ICC) profiles. It does not support WCS CAMP or GMMP profiles and will return an error if such profiles are used.

Per-user/LUA support

This will register a specified profile for a given standard color space only for current user.

This uses SetDefaultColorProfile with WCS_PROFILE_MANAGEMENT_SCOPE_CURRENT_USER.

This is executable in LUA context if the profile is already installed, fails otherwise with access denied since
install is system-wide and requires administrator privileges.

### 174.4.12 UninstallColorProfile(ProfileName as string, DeleteFile as boolean = true) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** UninstallColorProfile removes a specified color profile from a specified computer. Associated files are optionally deleted from the system.  
**Notes:**  
ProfileName: Points to the file name of the profile to uninstall.  
DeleteFile: If set to true, the function deletes the profile from the COLOR directory. If set to false, this function has no effect.  

Returns true on success and false on failure.

### 174.4.13 UnregisterCMM(cmmID as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The UnregisterCMM function dissociates a specified ID value from a given color management module dynamic-link library (CMM DLL).  
**Notes:**  
cmmID: Specifies the ID value identifying the CMM whose registration is to be removed. This is the signature of the CMM registered with the International Color Consortium (ICC).  

Returns true on success and false on failure.

### 174.4.14 Constants

### 174.4.15 CMM_DESCRIPTION = 5

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.  
**Notes:** A text string that describes the color management module.
**174.4.16 CMM_DLL_VERSION = 3**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.  
**Notes:** Version number of the CMM DLL.

**174.4.17 CMM_DRIVER_VERSION = 2**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.

**174.4.18 CMM_IDENT = 1**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.  
**Notes:** The CMM identification signature registered with the International Color Consortium (ICC).

**174.4.19 CMM_LOGOICON = 6**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.  
**Notes:** The logo icon for this CMM.

**174.4.20 CMM_VERSION = 4**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.  
**Notes:** Version of Windows supported.

**174.4.21 CMM_WIN_VERSION = 0**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.  
**Notes:** Backward compatibility with Windows 95.

**174.4.22 LCS_sRGB = & h73524742**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile IDs for GetStandardColorSpaceProfile.  
**Example:**
CHAPTER 174. WINDOWS ICM

MsgBox WindowsICMModuleMBS.GetStandardColorSpaceProfile(WindowsICMModuleMBS.LCS_sRGB)

174.4.23 **LCS_WINDOWS_COLOR_SPACE = & h57696E20**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile IDs for GetStandardColorSpaceProfile.  
**Example:**

MsgBox WindowsICMModuleMBS.GetStandardColorSpaceProfile(WindowsICMModuleMBS.LCS_WINDOWS_COLOR_SPACE)
174.5 $\text{class WindowsICMNamedProfileInfoMBS}$

174.5.1 $\text{class WindowsICMNamedProfileInfoMBS}$

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This class is used to store information about a named color profile.

174.5.2 **Properties**

174.5.3 **Count as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Total number of named colors in the profile. **Notes:** (Read and Write property)

174.5.4 **CountDevCoordinates as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Total number of device coordinates for each named color. **Notes:** (Read and Write property)

174.5.5 **Flags as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Flags for this information record. **Notes:** Not currently used by the default CMM. (Read and Write property)

174.5.6 **Prefix as String**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string containing the prefix for each color name. **Notes:** (Read and Write property)
174.5.7 Suffix as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string containing the suffix for each color name. **Notes:** (Read and Write property)
174.6.  **CLASS WINDOWSICMPROFILEHEADERMBS**

### 174.6.1  class WindowsICMProfileHeaderMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
This class contains information that describes the contents of a device profile file.
**Notes:** This header occurs at the beginning of a device profile file.

### 174.6.2  Properties

#### 174.6.3  Attributes0 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Attributes of profile.
**Notes:** (Read and Write property)

#### 174.6.4  Attributes1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Attributes of profile.
**Notes:** (Read and Write property)

#### 174.6.5  Classs as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Indicates the profile class.
**Example:**
```vbscript
// some profile file
dim file as FolderItem = SpecialFolder.Desktop.Child(“test.icc”)  
  // open profile read only
  dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)  
  // get headers
  dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader  
  // show color space name
  Select case h.Classs
    case WindowsICMProfileHeaderMBS.CLASS.MONITOR
```

**Example:**
```vbscript
// some profile file
dim file as FolderItem = SpecialFolder.Desktop.Child(“test.icc”)  
  // open profile read only
  dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)  
  // get headers
  dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader  
  // show color space name
  Select case h.Classs  
    case WindowsICMProfileHeaderMBS.CLASS.MONITOR
```
CHAPTER 174. WINDOWS ICM

```vbnet
msgbox "Monitor"
case WindowsICMProfileHeaderMBS.CLASS_PRINTER
msgbox "Printer"
case WindowsICMProfileHeaderMBS.CLASS_SCANNER
msgbox "Scanner"
case WindowsICMProfileHeaderMBS.CLASS_LINK
msgbox "Link"
case WindowsICMProfileHeaderMBS.CLASS_ABSTRACT
msgbox "Abstract"
case WindowsICMProfileHeaderMBS.CLASS_COLORSPACE
msgbox "Colorspace"
case WindowsICMProfileHeaderMBS.CLASS.Named
msgbox "Named"
case WindowsICMProfileHeaderMBS.CLASS_CAMP
msgbox "Camp"
case WindowsICMProfileHeaderMBS.CLASS_GMMP
msgbox "GMMP"
else
msgbox "Unknown: " +hex(h.Classs)
end Select
```

**Notes:**

For a description of profile classes, see Using Device Profiles with WCS:

A profile class may have any of the values from the CLASS_* constants.

Class is written with three s here as Class is a reserved word in Real Studio.
(Read and Write property)

174.6.6 CMMType as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The identification number of the CMM that is used in the profile.

**Notes:**

Identification numbers are registered with the ICC.
(Read and Write property)
174.6. CLASS WINDOWSICMPROFILEHEADERMBS

174.6.7 ConnectionSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A signature value that indicates the color space in which the profile connection space (PCS) is defined. **Notes:** The member can be any of the following values: SPACE_XYZ or SPACE_Lab. (Read and Write property)

174.6.8 Creator as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Signature of the software that created the profile. **Example:**
```vba
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)
dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader
MsgBox hex(h.Creator)
```
**Notes:** Signatures are registered with the ICC. (Read and Write property)

174.6.9 DataColorSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A signature value that indicates the color space in which the profile data is defined. **Example:**
```vba
function Name() as string
    dim w as WindowsICMProfileMBS // your profile
    dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader
    if h=nil then Return ":?"
    Select case h.DataColorSpace
        case WindowsICMProfileHeaderMBS.SPACE_XYZ
            Return "XYZ"
        case WindowsICMProfileHeaderMBS.SPACE_Lab
            Return "Lab"
    End Select
End function
```
case WindowsICMProfileHeaderMBS.SPACE_Luv
    Return "Luv"
case WindowsICMProfileHeaderMBS.SPACE_YCbCr
    Return "YCbCr"
case WindowsICMProfileHeaderMBS.SPACE_Yxy
    Return "Yxy"
case WindowsICMProfileHeaderMBS.SPACE_RGB
    Return "RGB"
case WindowsICMProfileHeaderMBS.SPACE_GRAY
    Return "GRAY"
case WindowsICMProfileHeaderMBS.SPACE_HSV
    Return "HSV"
case WindowsICMProfileHeaderMBS.SPACE_HLS
    Return "HLS"
case WindowsICMProfileHeaderMBS.SPACE_CMYK
    Return "CMYK"
case WindowsICMProfileHeaderMBS.SPACE_CMY
    Return "CMY"
case WindowsICMProfileHeaderMBS.SPACE_2_CHANNEL
    Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_3_CHANNEL
    Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_4_CHANNEL
    Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_5_CHANNEL
    Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_6_CHANNEL
    Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_7_CHANNEL
    Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_8_CHANNEL
    Return "2 Channel"
else
    Return "Unknown: " + hex(h.DataColorSpace)
end Select
end function

Notes:
The member can be any of value from the SPACE_.* Constants.
(Read and Write property)
174.6. CLASS WINDOWSICMPROFILEHEADERMBS

174.6.10  **DateTime0 as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The data and time that the profile was created.
**Notes:** (Read and Write property)

174.6.11  **DateTime1 as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The data and time that the profile was created.
**Notes:** (Read and Write property)

174.6.12  **DateTime2 as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The data and time that the profile was created.
**Notes:** (Read and Write property)

174.6.13  **IlluminantX as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
X value of the Profile illuminant.
**Notes:** (Read and Write property)

174.6.14  **IlluminantY as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Y value of the Profile illuminant.
**Notes:** (Read and Write property)

174.6.15  **IlluminantZ as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Z value of the Profile illuminant.
**Notes:** (Read and Write property)
174.6.16 Manufacturer as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The identification number of the device profile manufacturer.

**Notes:**
All manufacturer identification numbers are registered with the ICC. (Read and Write property)

174.6.17 Model as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The device manufacturer’s device model number.

**Notes:**
All model identification numbers are registered with the ICC. (Read and Write property)

174.6.18 Platform as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The primary platform for which the profile was created.

**Example:**
```vba
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)
dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader
MsgBox DecodingFromHexMBS(hex(h.Platform)) // shows platform, e.g. ”APPL”
```

**Notes:**
The primary platform can be set to any of the following values.

<table>
<thead>
<tr>
<th>Platform</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apple Computer, Inc.</td>
<td>'APPL'</td>
</tr>
<tr>
<td>Microsoft Corp.</td>
<td>'MSFT'</td>
</tr>
<tr>
<td>Silicon Graphics, Inc.</td>
<td>'SGI'</td>
</tr>
<tr>
<td>Sun Microsystems, Inc.</td>
<td>'SUNW'</td>
</tr>
<tr>
<td>Taligent</td>
<td>'TGNT'</td>
</tr>
</tbody>
</table>
174.6.19  **ProfileFlags as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Bit flags containing hints that the CMM uses to interpret the profile data.  
**Notes:**  
The member can be set to the following values.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>FLAG_EMBEDDEDPROFILE</td>
<td>The profile is embedded in a bitmap file.</td>
</tr>
<tr>
<td>FLAG_DEPENDENTONDATA</td>
<td>The profile can’t be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.</td>
</tr>
</tbody>
</table>

(Read and Write property)

174.6.20  **RenderingIntent as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The profile rendering intent.  
**Notes:**  
The member can be set to one of the following values:

INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE
COLORIMETRIC
INTENT.Absolute_COLORIMETRIC

For more information, see Rendering Intents.  
(Read and Write property)

174.6.21  **Signature as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Reserved for internal use.  
**Notes:** (Read and Write property)
**174.6.22 Version as Integer**

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The version number of the profile.  
**Notes:**  
The version number is determined by the ICC. The current major version number is & h02. The current minor version number is & h10. The major and minor version numbers are in binary coded decimal (BCD). They must be stored in the following format.

<table>
<thead>
<tr>
<th>Byte Number</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Major version number in BCD.</td>
</tr>
<tr>
<td>1</td>
<td>Minor version number in the most significant nibble of this byte. Bug fix version number in the least significant nibble.</td>
</tr>
<tr>
<td>2</td>
<td>Reserved. Must be set to 0.</td>
</tr>
<tr>
<td>3</td>
<td>Reserved. Must be set to 0.</td>
</tr>
</tbody>
</table>

(Read and Write property)

**174.6.23 Constants**

**174.6.24 ATTRIB_MATTE = 2**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the attribute constants.  
**Notes:** Turns matte display on. If this flag is not used, the attribute is glossy by default.

**174.6.25 ATTRIB_TRANSPARENCY = 1**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the attribute constants.  
**Notes:** Turns transparency on. If this flag is not used, the attribute is reflective by default.

**174.6.26 CLASS_ABSTRACT = & h61627374**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.  
**Notes:** Abstract Profile
174.6.27  CLASS_CAMP = & h6C616D70

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.  
**Notes:** Color Appearance Model Profile

174.6.28  CLASS_COLORSPACE = & h73706163

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.  
**Notes:** Color Space Conversion Profile

174.6.29  CLASS_GMMP = & h676D6D70

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.  
**Notes:** Color Gamut Map Model Profile

174.6.30  CLASS_LINK = & h6C696E6B

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.  
**Notes:** Device Link Profile

174.6.31  CLASS_MONITOR = & h6D6E7472

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.  
**Notes:** Display Device Profile

174.6.32  CLASS_NAMED = & h6E6D636C

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.  
**Notes:** Named Color Profile

174.6.33  CLASS_PRINTER = & h70727472

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.  
**Notes:** Output Device Profile
174.6.34  **CLASS.Scanner** = & h73636E72

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile class constants.  
**Notes:** Input Device Profile

174.6.35  **FLAG.DependentOnData** = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile flags.  
**Notes:** The profile can’t be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.

174.6.36  **FLAG.EmbeddedProfile** = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile flags.  
**Notes:** The profile is embedded in a bitmap file.

174.6.37  **FLAG.Enable.Chromatic.Adaptation** = & h02000000

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile flags.

174.6.38  **SPACE.2.Channel** = & h32434C52

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.  
**Notes:** Generic 2 channel

174.6.39  **SPACE.3.Channel** = & h33434C52

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.  
**Notes:** Generic 3 channel

174.6.40  **SPACE.4.Channel** = & h34434C52

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.  
**Notes:** Generic 4 channel

174.6.48 SPACE_HLS = & h484C5320

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.
**Notes:** HLS

174.6.49 SPACE_HSV = & h48535620

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.
**Notes:** HSV

174.6.50 SPACE_Lab = & h4C616220

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.
**Notes:** Lab

174.6.51 SPACE_Luv = & h4C757620

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.
**Notes:** Luv

174.6.52 SPACE_RGB = & h52474220

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.
**Notes:** RGB

174.6.53 SPACE_XYZ = & h58595A20

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.
**Notes:** XYZ

174.6.54 SPACE_YCbCr = & h59436272

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.
**Notes:** YCbCr
MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the color space constants.  
**Notes:** Yxy
174.7 class WindowsICMProfileMBS

174.7.1 class WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The class for a color profile.

174.7.2 Methods

174.7.3 ConvertColorNameToIndex(name as string) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The CMConvertColorNameToIndex function converts color names in a named color space to index numbers in a color profile.
**Notes:**
name: The name of the color.
Returns the color index.

This function is required in the default CMM. It is optional for all other CMMs.

174.7.4 ConvertIndexToColorName(index as Integer) as string

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The ConvertIndexToColorName transforms indices in a color space to an array of names in a named color space.
**Notes:** This function is required in the default CMM. It is optional for all other CMMs.

174.7.5 CountColorProfileElements as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The GetCountColorProfileElements function retrieves the number of tagged elements in a given color profile.
**Example:**
```vba
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)
MsgBox "CountColorProfileElements: " + str(w.CountColorProfileElements)
```
174.7. CLASS WINDOWSICMPROFILEMBS

Returns number of tagged elements in the profile or 0 on any error.
This function will fail if hProfile is not a valid ICC profile.
This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP.

174.7.6 CreateIccProfile(options as Integer = 0) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 14.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Converts a WCS profile into an International Color Consortium (ICC) profile.
**Notes:**
Options: A flag value that specifies the profile conversion options. By default, the original WCS profiles used for the conversion are embedded in the output ICC profile in a Microsoft private tag, ProfilesTag (with signature "MS000". This produces an ICC profile that is compatible with ICC software, yet retains the original WCS profile data available to code designed to parse it. The possible values of this parameter are as follows. Any bits not defined in this list are reserved and should be set to zero:

- **WCS_DEFAULT** specifies that the new ICC profile contains the original WCS profile in a private ProfilesTag.
- **WCS_ICCONLY** specifies that the new ICC profile does not contain either the ProfilesTag or the original WCS profile.

Returns new profile object.

see also

174.7.7 GetColorProfileElement(tag as Integer) as string

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The GetColorProfileElement function copies data from a specified tagged profile element of a specified color profile into a buffer.
**Example:**
```
Dim file As FolderItem = SpecialFolder.Desktop.Child("sRGB Profile.icc")
Dim w As WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)
MsgBox w.GetColorProfileElement(&h64657363) ' that's the code for desc, the description
```
CHAPTER 174. WINDOWS ICM

Notes:
tag: Identifies the tagged element from which to copy.

This function will fail if Profile is not a valid International Color Consortium (ICC) profile.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with, and hard coded to, ICC tag types and there exist many robust XML parsing libraries.

174.7.8 GetColorProfileElementTag(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The GetColorProfileElementTag function retrieves the tag name specified by dwIndex in the tag table of a given International Color Consortium (ICC) color profile, where Index is a one-based index into that table.

Example:

dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)
dim list(-1) as string
dim c as Integer = w.CountColorProfileElements - 1

for i as Integer = 0 to c
    list.Append DecodingFromHexMBS(hex(w.GetColorProfileElementTag(i)))
next

MsgBox ",Tags: " + Join(list, ", ", )

Notes:
Index: Specifies the one-based index of the tag to retrieve.

This function will fail if Profile is not a valid ICC profile.

GetColorProfileElementTag can be used to enumerate all tags in a profile after getting the number of tags in the profile using GetCountColorProfileElements.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with, and hard coded to, ICC tag types and there exist many robust
174.7.9 GetNamedProfileInfo as WindowsICMNamedProfileInfoMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The GetNamedProfileInfo function retrieves information about the International Color Consortium (ICC)
named color profile that is specified in the first parameter.

**Notes:**
This function will fail if hProfile is not a valid ICC profile.
This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because
named profiles are explicit ICC profile types.
Returns nil on any error.

174.7.10 GetProfileData as string

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
Given a handle to an open color profile, the GetColorProfileFromHandle function will copy the contents of
the profile into a buffer supplied by the application.

**Notes:**
If the handle is a Windows Color System (WCS) handle, then the DMP is returned and the CAMP and
GMMP associated with the HPROFILE are ignored.

Returns the data or an empty string on any error.

174.7.11 IsColorProfileTagPresent(tag as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The IsColorProfileTagPresent function reports whether a specified International Color Consortium (ICC)
tag is present in the specified color profile.

**Notes:**
tag: Specifies the ICC tag to check.

Returns true if the tag is valid and false if not.

This function will fail if Profile is not a valid ICC profile.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because
profile elements are implicitly associated with and hard coded to ICC tag types and there exist many robust
174.7.12 IsValid as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The IsValid function reports whether the given profile is a valid ICC profile that can be used for color management.

**Example:**
```vba
    dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
    dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)

    MsgBox "Valid: " + str(w.IsValid)
```

**Notes:**

Returns true if the profile is valid.

Only the Windows default CMM is required to export this function; it is optional for all other CMMs.

If a CMM does not support this function, Windows uses the default CMM to validate the profile.

174.7.13 OpenProfileData(data as string, DesiredAccess as Integer) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The OpenColorProfile function opens or create a color profile.

**Notes:**

- file: The file where to load profile from.
- DesiredAccess: Specifies how to access the given profile. This parameter must take one the following constant values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROFILE_READ</td>
<td>Opens the profile for read access.</td>
</tr>
<tr>
<td>PROFILE_READWRITE</td>
<td>Opens the profile for both read and write access. Has no effect for WCS XML profiles.</td>
</tr>
</tbody>
</table>

Returns the profile on success and nil on error.
For ICC and WCS profiles, a CAMP and GMMP are provided by the function based on the current default CAMP and GMMP in the registry.

When OpenColorProfile encounters an ICC profile with an embedded WCS profile, and if the dwType member within the Profile structure does not take the value DONT_USE_EMBEDDED_WCS_PROFILES, it should extract and use the WCS profile(s) contained in this WcsProfilesTag. The HPROFILE returned would be a WCS HPROFILE.

When the function opens the ICC profile, it will look for a WcsProfilesTag and, if there is one, it will extract and use the original WCS profiles contained therein. (See WcsCreateIccProfile.)

An profile with WCS profile information is derived from a DMP by acquiring the default CAMP and default GMMP from the registry. An HPROFILE is a composition of a DMP, CAMP and GMMP.

174.7.14 OpenProfileFile(file as folderitem, DesiredAccess as Integer, ShareMode as Integer, CreationMode as Integer) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The OpenColorProfile function opens or create a color profile.

**Notes:**

file: The file where to load profile from.
DesiredAccess: Specifies how to access the given profile. This parameter must take one the following constant values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROFILE_READ</td>
<td>Opens the profile for read access.</td>
</tr>
<tr>
<td>PROFILE_READWRITE</td>
<td>Opens the profile for both read and write access. Has no effect for WCS XML profiles.</td>
</tr>
</tbody>
</table>

ShareMode: Specifies how the profile should be shared, if the profile is contained in a file. A value of zero prevents the profile from being shared at all. The parameter can contain one or both of the following constants (combined by addition or logical OR).

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>FILE_SHARE_READ</td>
<td>Other open operations can be performed on the profile for read access.</td>
</tr>
<tr>
<td>FILE_SHARE_WRITE</td>
<td>Other open operations can be performed on the profile for write access. Has no effect for WCS XML profiles.</td>
</tr>
</tbody>
</table>

CreationMode: Specifies which actions to take on the profile while opening it, if it is contained in a file. This parameter must take one of the following constant values.
### CHAPTER 174. WINDOWS ICM

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_NEW</td>
<td>Creates a new profile. Fails if the profile already exists.</td>
</tr>
<tr>
<td>CREATE_ALWAYS</td>
<td>Creates a new profile. Overwrites the profile if it exists.</td>
</tr>
<tr>
<td>OPENEXISTING</td>
<td>Opens the profile. Fails if it does not exist.</td>
</tr>
<tr>
<td>OPEN_ALWAYS</td>
<td>Opens the profile if it exists. For ICC profiles, if the profile does not exist, creates the profile. For WCS XML profiles, if the profile does not exist, returns an error.</td>
</tr>
<tr>
<td>TRUNCATE_EXISTING</td>
<td>Opens the profile, and truncates it to zero bytes, returning a blank ICC profile. Fails if the profile doesn’t exist.</td>
</tr>
</tbody>
</table>

Returns the profile on success and nil on error.

For ICC and WCS profiles, a CAMP and GMMP are provided by the function based on the current default CAMP and GMMP in the registry.

When OpenColorProfile encounters an ICC profile with an embedded WCS profile, and if the dwType member within the Profile structure does not take the value DONT_USE_EMBEDDED_WCS_PROFILES, it should extract and use the WCS profile(s) contained in this WcsProfilesTag. The HPROFILE returned would be a WCS HPROFILE.

CreationMode flags CREATE_NEW, CREATE_ALWAYS, and TRUNCATE_EXISTING, will always return blank ICC HPROFILEs. If other CreationMode flags are present, InternalOpenColorProfile is called (using the flags as provided by the API) to determine whether the profile is ICC or WCS XML.

Within the ICC code path, an ICC Profile is returned using the requested sharing, access and creation flags as specified in the tables above.

Within the WCS path, the CreationMode flag OPEN_ALWAYS will fail if the profile doesn’t exist, since WCS profiles cannot be created or edited within the WCS architecture (they must be edited outside of it, using MSXML6). For the same reason, dwShareMode flag FILE_SHARE_WRITE, and dwDesiredAccess flag PROFILE_READWRITE are ignored within the WCS path.

When the function opens the ICC profile, it will look for a WcsProfilesTag and, if there is one, it will extract and use the original WCS profiles contained therein. (See WcsCreateIccProfile.)

An profile with WCS profile information is derived from a DMP by acquiring the default CAMP and default GMMP from the registry. An HPROFILE is a composition of a DMP, CAMP and GMMP.
174.7. CLASS WINDOWSICMPROFILEMBS

174.7.15 OpenProfilePath(path as string, DesiredAccess as Integer, ShareMode as Integer, CreationMode as Integer) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The OpenColorProfile function opens or create a color profile.

**Notes:**
file: The file where to load profile from.
DesiredAccess: Specifies how to access the given profile. This parameter must take one the following constant values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROFILE_READ</td>
<td>Opens the profile for read access.</td>
</tr>
<tr>
<td>PROFILE_READWRITE</td>
<td>Opens the profile for both read and write access. Has no effect for WCS XML profiles.</td>
</tr>
</tbody>
</table>

ShareMode: Specifies how the profile should be shared, if the profile is contained in a file. A value of zero prevents the profile from being shared at all. The parameter can contain one or both of the following constants (combined by addition or logical OR).

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>FILE_SHARE_READ</td>
<td>Other open operations can be performed on the profile for read access.</td>
</tr>
<tr>
<td>FILE_SHARE_WRITE</td>
<td>Other open operations can be performed on the profile for write access.</td>
</tr>
<tr>
<td></td>
<td>Has no effect for WCS XML profiles.</td>
</tr>
</tbody>
</table>

CreationMode: Specifies which actions to take on the profile while opening it, if it is contained in a file. This parameter must take one of the following constant values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_NEW</td>
<td>Creates a new profile. Fails if the profile already exists.</td>
</tr>
<tr>
<td>CREATE_ALWAYS</td>
<td>Creates a new profile. Overwrites the profile if it exists.</td>
</tr>
<tr>
<td>OPEN_EXISTING</td>
<td>Opens the profile. Fails if it does not exist</td>
</tr>
<tr>
<td>OPEN_ALWAYS</td>
<td>Opens the profile if it exists. For ICC profiles, if the profile does not exist, creates the profile. For WCS XML profiles, if the profile does not exist, returns an error.</td>
</tr>
<tr>
<td>TRUNCATE_EXISTING</td>
<td>Opens the profile, and truncates it to zero bytes, returning a blank ICC profile. Fails if the profile doesn’t exist.</td>
</tr>
</tbody>
</table>

Returns the profile on success and nil on error.

For ICC and WCS profiles, a CAMP and GMMP are provided by the function based on the current default CAMP and GMMP in the registry.
CHAPTER 174. WINDOWS ICM

When OpenColorProfile encounters an ICC profile with an embedded WCS profile, and if the dwType member within the Profile structure does not take the value DONT_USE_EMBEDDED_WCS_PROFILES, it should extract and use the WCS profile(s) contained in this WcsProfilesTag. The HPROFILE returned would be a WCS HPROFILE.

CreationMode flags CREATE_NEW, CREATE_ALWAYS, and TRUNCATE_EXISTING, will always return blank ICC HPROFILES. If other CreationMode flags are present, InternalOpenColorProfile is called (using the flags as provided by the API) to determine whether the profile is ICC or WCS XML.

Within the ICC code path, an ICC Profile is returned using the requested sharing, access and creation flags as specified in the tables above.

Within the WCS path, the CreationMode flag OPEN_ALWAYS will fail if the profile doesn’t exist, since WCS profiles cannot be created or edited within the WCS architecture (they must be edited outside of it, using MSXML6). For the same reason, dwShareMode flag FILE_SHARE_WRITE, and dwDesiredAccess flag PROFILE_READWRITE are ignored within the WCS path.

When the function opens the ICC profile, it will look for a WcsProfilesTag and, if there is one, it will extract and use the original WCS profiles contained therein. (See WcsCreateIccProfile.)

An profile with WCS profile information is derived from a DMP by acquiring the default CAMP and default GMMP from the registry. An HPROFILE is a composition of a DMP, CAMP and GMMP.

174.7.16 SetColorProfileHeader(header as WindowsICMProfileHeaderMBS) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The SetColorProfileHeader function sets the header data in a specified ICC color profile. **Notes:**

Header: the profile header data to write to the specified profile.

Returns true on success.

This function will fail if Profile is not a valid ICC profile.

If the color profile was not opened with read/write permission, SetColorProfileHeader fails.

SetColorProfileHeader overwrites the current header in the ICC profile.
This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with and hard coded to ICC tag types and there exist many robust XML parsing libraries.

### 174.7.17 Properties

#### 174.7.18 ColorProfileHeader as WindowsICMPProfileHeaderMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetColorProfileHeader function retrieves or derives ICC header structure from either ICC color profile or WCS XML profile. **Notes:** Drivers and applications should assume returning TRUE only indicates that a properly structured header is returned. Each tag will still need to be validated independently using either legacy ICM2 APIs or XML schema APIs.

To determine whether the header is derived from an ICC or DMP profile handle, check the header signature (header bytes 36-39). If the signature is "acsp" (big endian) then an ICC profile was used. If the signature is "cdmp" (big-endian) then a DMP was used.

The distinguishing features that identify a header as having been "synthesized" for a WCS DMP are:

- `WindowsICMPProfileHeaderMBS.Signature = 'pmdc'` (little endian = big endian 'cdmp')
- `WindowsICMPProfileHeaderMBS.CMMType = '1scw'` (little endian = big endian 'wes1')

(Read only property)

#### 174.7.19 Handle as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal reference to the object. **Notes:** Value is a HPROFILE. (Read and Write property)
174.7.20 Constants

174.7.21 CREATE_ALWAYS = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the creation mode constants. **Notes:** Creates a new profile. Overwrites the profile if it exists.

174.7.22 CREATE_NEW = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the creation mode constants. **Notes:** Creates a new profile. Fails if the profile already exists.

174.7.23 FILE_SHARE_READ = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile sharing flags. **Notes:** Other open operations can be performed on the profile for read access.

174.7.24 FILE_SHARE_WRITE = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile sharing flags. **Notes:** Other open operations can be performed on the profile for write access. Has no effect for WCS XML profiles.

174.7.25 OPEN_ALWAYS = 4

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the creation mode constants. **Notes:** Opens the profile if it exists. For ICC profiles, if the profile does not exist, creates the profile. For WCS XML profiles, if the profile does not exist, returns an error.

174.7.26 OPEN_EXISTING = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the creation mode constants. **Notes:** Opens the profile. Fails if it does not exist.
174.7.27PROFILE_READ = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile access flags. **Notes:** Opens the profile for read access.

174.7.28PROFILE_READWRITE = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the profile access flags. **Notes:** Opens the profile for both read and write access. Has no effect for WCS XML profiles.

174.7.29TRUNCATE_EXISTING = 5

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the creation mode constants. **Notes:** Opens the profile, and truncates it to zero bytes, returning a blank ICC profile. Fails if the profile doesn’t exist.

174.7.30WCS_DEFAULT = 0

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the flags for the CreateICCProfile. **Notes:** Specifies that the new ICC profile contains the original WCS profile in a private WcsProfilesTag.

174.7.31WCS_ICCONLY = & h00010000

MBS Win Plugin, Plugin Version: 14.1. **Function:** One of the flags for the CreateICCProfile. **Notes:** Specifies that the new ICC profile does not contain either the WcsProfilesTag or the original WCS profile.
174.8  class WindowsICMSetupMBS

174.8.1  class WindowsICMSetupMBS

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
This class is made to query color matching setup information from the user. **Notes:** This class contains information that the Setup function uses to initialize the ColorManagement dialog box. After the user closes the dialog box, Setup returns information about the user’s selection in this class.

174.8.2  Methods

174.8.3  Setup as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The Setup function creates a Color Management dialog box that lets the user choose whether to enable color management, and if so, provides control over the color profiles used and over the rendering intent. **Notes:** Returns true if the user clicked OK and false on any error or when dialog was cancelled.

174.8.4  Properties

174.8.5  DisplayName as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A string naming the monitor to be used for color management. **Notes:**
If this is not the name of a valid monitor, the first enumerated monitor is used. (Read and Write property)

174.8.6  Flags as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
A set of bit flags used to initialize the dialog box. **Notes:**
If set to 0 on entry, all controls assume their default states.
When the dialog box returns, these flags are set to indicate the user’s input.

See CMS_* flag constants.
174.8.7  MonitorProfile as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string in which to place the name of the user-selected monitor profile.

**Notes:**
If the CMS_SETMONITORPROFILE flag is used, this flag can also be used to select a profile other than the monitor default when the dialog is first displayed.

(Read and Write property)

174.8.8  Parent as Window

MBS Win Plugin, Plugin Version: 11.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The parent window.

**Notes:** (Read and Write property)

174.8.9  PrinterName as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string naming the printer on which the image is to be rendered.

**Notes:**
If this is not a valid printer name, the default printer is used and named in the dialog.
(Read and Write property)

174.8.10  PrinterProfile as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string in which to place the name of the user-selected printer profile.

**Notes:**
If the CMS_SETPRINTERPROFILE flag is used, this flag can also be used to select a profile other than the printer default when the dialog is first displayed.
(Read and Write property)
174.8.11 ProofingIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The type of color management desired for the proofed image.

**Notes:**
Valid values are:

INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE_COLORIMETRIC
INTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
(Read and Write property)

174.8.12 RenderIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The type of color management desired.

**Notes:**
Valid values are:

INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE_COLORIMETRIC
INTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
(Read and Write property)

174.8.13 SourceName as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An application-specified string which describes the source profile of the item for which color management is to be performed.

**Notes:**
If this is "", the Image Source control displays the name of the Windows default color profile.
174.8.14 TargetProfile as String

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A string in which to place the name of the user-selected target profile for proofing. **Notes:** If the CMS_SETTARGETPROFILE flag is used, this flag can also be used to select a profile other than the printer default when the dialog is first displayed. (Read and Write property)

174.8.15 Events

174.8.16 Apply

MBS Win Plugin, Plugin Version: 11.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** This event is invoked when the Apply button of the Color Management dialog box is selected.

174.8.17 Idle

MBS Win Plugin, Plugin Version: 11.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** This event is called regularly if the CMS_USEHOOK flag is used.

174.8.18 Constants

174.8.19 CMS_DISABLEICM = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants. **Notes:** If set on entry, this flag indicates that the "Enable Color Management" check box is cleared, disabling all other controls. If set on exit, it means that the user does not wish color management performed.

174.8.20 CMS_DISABLEINTENT = 1024

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.
174.8.21 CMS_DISABLE_RENDERINTENT = 2048

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.

174.8.22 CMS_ENABLE_PROOFING = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.  
**Notes:** If set on entry, this flag indicates that the Proofing controls are to be enabled, and the Proofing check box is checked. If set on exit, it means that the user wishes to perform color management for a different target device than the selected printer.

174.8.23 CMS_SET_MONITORPROFILE = 16

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.  
**Notes:** If set on entry, this flag indicates that the color management profile named in the MonitorProfile member is to be the initial selection in the monitor profile control. If the specified profile is not associated with the monitor, this flag is ignored, and the default profile for the monitor is used.

174.8.24 CMS_SET_PRINTERPROFILE = 32

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.  
**Notes:** If set on entry, this flag indicates that the color management profile named in the PrinterProfile member is to be the initial selection in the printer profile control. If the specified profile is not associated with the printer, this flag is ignored, and the default profile for the printer is used.

174.8.25 CMS_SET_PROOF_INTENT = 5

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.  
**Notes:** Ignored unless CMS_ENABLE_PROOFING is also set. If set on entry, and CMS_ENABLE_PROOFING is also set, this flag indicates that the ProofingIntent member is to be used to initialize the Target Rendering Intent control. Otherwise, the control defaults to Picture rendering. This flag is set on exit if proofing is enabled.

174.8.26 CMS_SET_RENDER_INTENT = 4

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.  
**Notes:** If set on entry, this flag indicates that the RenderIntent member contains the value to use to initialize
the Rendering Intent control. Otherwise, the control defaults to Picture rendering. This flag is set on exit if WCS is enabled.

174.8.27 CMS_SETTARGETPROFILE = 64

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.  
**Notes:** If set on entry, this flag indicates that the color profile named in the TargetProfile member is to be the initial selection in the target profile control. If the specified profile is not installed, this flag is ignored, and the default profile for the printer is used. If the printer has no default profile, then the first profile in alphabetical order will be displayed.

174.8.28 CMS_USEAPPLYCALLBACK = 256

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.  
**Notes:** If set on entry, this flag indicates that the SetupColorMatching function should call the Apply event.

174.8.29 CMS_USEDESCRIPTION = 512

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.  
**Notes:** If set on entry, this flag instructs the Setup function to retrieve the profile description contained in the profile description tags (See ICC Profile Format Specification v3.4). It will insert them into the Monitor Profile, Printer Profile, Emulated Device Profile edit boxes in the Color Management common dialog box.

174.8.30 CMS_USEHOOK = 128

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flag constants.  
**Notes:** The idle event is called regularly if this flag is set.

174.8.31 INTENT_ABSOLUTE_COLORIMETRIC = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants.  
**Notes:** Maintain the white point. Match the colors to their nearest color in the destination gamut.
174.8.32  INTENT_PERCEPTRUAL = 0

MBS Win Plugin, Plugin Version: 11.1. **Function**: One of the rendering intent constants.  
**Notes**: Maintain contrast. Used for photographs and natural images.

174.8.33  INTENT_RELATIVE_COLORIMETRIC = 1

MBS Win Plugin, Plugin Version: 11.1. **Function**: One of the rendering intent constants.  
**Notes**: Maintain colorimetric match. Used for graphic designs and named colors.

174.8.34  INTENT_SATURATION = 2

MBS Win Plugin, Plugin Version: 11.1. **Function**: One of the rendering intent constants.  
**Notes**: Maintain saturation. Used for business charts and other situations in which undithered colors are required.
174.9  class WindowsICMTransformMBS

174.9.1  class WindowsICMTransformMBS

174.9.2  Methods

174.9.3  CheckColors(InputColors() as WindowsICMColorMBS, ctInput as Integer, Results() as Integer) as boolean

Notes:

InputColors: an array of colors.
ctInput: Specifies the input color type.
Results: An array of nColors bytes that receives the results of the test.

If this function succeeds, the return value is TRUE.

If this function fails, the return value is FALSE. For extended error information, call GetLastError.

Remarks

If the input color type is not compatible with the color transform, CheckColors fails.

The function places results of the tests in the array pointed to by paResult. Each byte in the array corresponds to a COLOR element in the array pointed to by paInputColors and has an unsigned value between 0 and 255. The value 0 denotes that the color is in gamut, while a nonzero value denotes that it is out of gamut. For any integer n such that 0 < n < 255, a result value of n+1 indicates that the corresponding color is at least as far out of gamut as would be indicated by a result value of n.

The out-of-gamut information in the gamut tags created in WCS use the perceptual color distance in CIECAM02, which is the mean square root in CIECAM02 Jab space. The distance in the legacy ICC profile gamut tags is the mean square root in CIELAB space. We recommend that you use the CIECAM02 space when it is available because it provides more perceptually accurate distance metrics.
CHAPTER 174. WINDOWS ICM

174.9.4 Constructor(LogColorSpace as WindowsICMLogColorSpaceMBS, DestProfile as WindowsICMProfileMBS, TargetProfile as WindowsICMProfileMBS, Flags as Integer)

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The CreateColorTransform function creates a color transform that applications can use to perform color management.

**Notes:**

LogColorSpace: The input colorspace.

DestProfile: The profile of the destination device. The function determines whether the profile contains International Color Consortium (ICC) or Windows Color System (WCS) profile information.

TargetProfile: The profile of the target device. The function determines whether the profile contains ICC or WCS profile information.

Flags: Specifies flags to used control creation of the transform. See Remarks.

On success the handle property is not zero.

If the target profile is nil, the transform goes from the source logical color space to the destination profile.
If the target profile is given, the transform goes from the source logical color space to the target profile and then to the destination profile. This allows previewing output meant for the target device on the destination device.

The values in Flags are intended as hints only. The color management module must determine the best way to use them.

Windows Vista: Three new flags have been added that can be used with dwFlags:

**PRESERVEBLACK** If this bit is set, the transform engine inserts the appropriate black generation GMMP as the last GMMP in the transform sequence. This flag only works in a pure WCS transform.

**SEQUENTIAL_TRANSFORM** If this bit is set, each step in the WCS processing pipeline is performed for every pixel in the image and no optimized color transform is built. This flag only works in a pure WCS transform.

Restrictions: A transform created with the SEQUENTIAL_TRANSFORM flag set may only be used in the thread on which it was created and only for one color translation call at a time. COM must be initialized prior to creating the sequential transform and must remain initialized for the lifetime of the transform object.
WCS\_ALWAYS  If this bit is set, even all-ICC transforms will use the WCS code path.

For details, see CMM Transform Creation Flags. All of the flags mentioned there are supported for all types of transforms, except for FAST\_TRANSLATE, which only works in a pure ICC-to-ICC transform.

The CreateColorTransform function is used outside of a device context. Colors may shift when transforming from a color profile to the same color profile. This is due to precision errors. Therefore, a color transform should not be performed under these circumstances.

The B2Ax tags are required for any profile that is the target of a transform.

WCS transform support for ICC ColorSpace profiles is limited to RGB colorspace profiles. The following ICC profile types cannot be used in a CITE-processed transform, either a mixed WCS/ICC transform or an all-ICC transform with WCS\_ALWAYS set:

- Non-RGB ColorSpace profiles
- NamedColor profiles
- n-channel profiles (where n \( > 8 \))
- DeviceLink profiles
- Abstract profiles

See also:

- 174.9.5 Constructor(Profiles() as WindowsICMProfileMBS, Intents() as Integer, Flags as Integer, indexPreferredCMM as Integer)

### 174.9.5 Constructor(Profiles() as WindowsICMProfileMBS, Intents() as Integer, Flags as Integer, indexPreferredCMM as Integer)

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The CreateMultiProfileTransform function accepts an array of profiles or a single device link profile and creates a color transform that applications can use to perform color mapping. **Notes:**

Profiles: An array of profiles to be used. The function determines whether the HPROFILEs contain International Color Consortium (ICC) or Windows Color System (WCS) profile information and processes them appropriately. When valid WCS profiles are returned by OpenColorProfile, these profiles contain the combination of DMP, CAMP, and GMMP profiles.

Intent: An array of intents to use. Each intent is one of the following values:

- INTENT\_PERCEPTUAL
- INTENT\_SATURATION
- INTENT\_RELATIVE\_COLORIMETRIC
GMMPs are a generalization of intents. There are two possible sources of intents: the "destination" profile and the intent list parameter to CreateMultiProfileTransform. The term "destination" is not used since all but two of the profiles in the profile list parameter will serve as first destination and then source.

For more information, see Rendering Intents.

nIntents
Specifies the number of elements in the intents array: can either be 1 or the same value as nProfiles. For profile arrays that contain any WCS profiles, the first rendering intent is ignored and only nProfiles -1 elements are used for these profile arrays. The maximum number of nIntents is 10.

Flags: Specifies flags used to control creation of the transform.

indexPreferredCMM: Specifies the one-based index of the color profile that indicates what color management module (CMM) to use. The application developer may allow Windows to choose the CMM by setting this parameter to INDEX_DONT_CARE. See Using Color Management Modules (CMM) Third party CMMs are only available for ICC workflows. Profile arrays containing WCS profiles will ignore this flag. It is also ignored when only ICC profiles are used and when the WCS_ALWAY flag is used.

On success the handle property is not zero.

If a device link profile is being used, the function will fail if Profiles contains more than one value.

The array of intents specifies how profiles should be combined. The nth intent is used for combining the nth profile in the array. If only one intent is specified, it is used for the first profile, and all other profiles are combined using Match intent.

The values in Flags are intended as hints only. The color management module must determine the best way to use them.

Windows Vista: Three new flags have been added that can be used with dwFlags:

- PRESERVEBLACK If this bit is set, the transform engine inserts the appropriate black generation GMMP as the last GMMP in the transform sequence. This flag only works in a pure WCS transform.
- SEQUENTIAL_TRANSFORM If this bit is set, each step in the WCS processing pipeline is performed for every pixel in the image and no optimized color transform is built. This flag only works in a pure WCS transform.
Restrictions: A transform created with the \texttt{SEQUENTIAL\_TRANSFORM} flag set may only be used in the thread on which it was created and only for one color translation call at a time. COM must be initialized prior to creating the sequential transform and must remain initialized for the lifetime of the transform object.

\textbf{WCS\_ALWAYS} If this bit is set, even all-ICC transforms will use the WCS code path.

For details, see CMM Transform Creation Flags. All of the flags mentioned there are supported for all types of transforms, except for \texttt{FAST\_TRANSLATE} and \texttt{USE\_RELATIVE\_COLORIMETRIC}, which only work in a pure ICC-to-ICC transform.

The \texttt{CreateMultiProfileTransform} function is used outside of a device context. Colors may shift when transforming from a color profile to the same color profile. This is due to precision errors. Therefore, a color transform should not be performed under these circumstances.

We recommend that there be only one GMMP between a source and destination DMP. Gamut boundary descriptions (GBDs) are created from the DMP/CAMP combinations. The subsequent GMMPs use the GBDs prior to them in the processing chain until there exists a DMP/CAMP GBD next in the sequence to be used. For example, assume a sequence DMP1, CAMP1, GMMP1, GMMP2, GMMP3, DMP2, CAMP2, GMMP4, GMMP5, CAMP3, DMP3. Then GMMP1, GMMP2 use GBD1 as their source and destination. Then GMMP3 uses GBD1 as source and GBD2 as destination. Then GMMP4 uses GBD2 as source and destination. Finally GMMP5 uses GBD2 as source and GBD3 as destination. This assumes no GMMP is identical to one next to it.

For WCS profiles, we recommend that the rendering intents be set to DWORD\_MAX in order to use the GMMP within the WCS profile handle. This is because the array of rendering intents takes precedence over the rendering intents or gamut mapping models specified or contained in the profiles specified by the PROFILEs. The array of rendering intents references the default GMMP for those rendering intents. Ideally, only one gamut mapping is performed between a source and destination device by setting one or the other GMMP to NULL when creating the HPROFILE with WCS profile information. Any legacy application that uses a WCS DMP will invoke a sequence of GMMPs. GDBs are chosen based on DMPs and CAMPs. For intermediate GMMP gamut boundaries, the source and destination GBDs are used.

In summary, if $\text{ubound(Intents)}=0$, then the first GMM is set based on the GMMP that is set as default* for the padwIntent value, unless that value is DWORD\_MAX, in which case the embedded GMM information from the second profile is used (The embedded GMM information is either a GMMP or, in the case of an ICC profile, the baseline GMM corresponding to** the intent from the profile header). The remainder of the GMMs are set based on the GMMP that is set as default* for RelativeColorimetric.

If $\text{ubound(Intents)} = \text{ubound(Profiles)} - 1$, then each GMM is set based on the GMMP that is set as default* for the value in the padwIntent array at the corresponding index, except where padwIntent values are DWORD\_MAX. For values in the padwIntent array that are DWORD\_MAX, the GMMs at corresponding positions are set based on the embedded GMM information from the second of the two profiles whose gamuts are mapped by the GMM. (Again, the embedded GMM information is either a GMMP or, in the case of an
ICC profile, the baseline GMM corresponding to** the intent from the profile header).

If ubound(Intents) = ubound(Profiles), then first intent is ignored and function behaves as it does in the case when ubound(Intents) = ubound(Profiles) - 1.

Any other combination of padwIntents and nIntents will return an error.

- "set as default" means that the default GMMP is queried using WcsGetDefaultColorProfile with its profileManagementScope parameter set to WCS_PROFILE_MANAGEMENT_SCOPE_CURRENT_USER. This may return either current-user or system-wide defaults as described in the documentation for WcsGetDefaultColorProfile.

- "GMM corresponding to" does not mean "GMM from the GMMP set as default for". Instead it means "a constant association between ICC profile intents and baseline GMM algorithms."

WCS transform support for ICC ColorSpace profiles is limited to RGB colorspace profiles. The following ICC profile types cannot be used in a CITE-processed transform, either a mixed WCS/ICC transform or an all-ICC transform with WCS_ALWAYS set:

- Non-RGB ColorSpace profiles
- NamedColor profiles
- n-channel profiles (where n > 8)
- DeviceLink profiles
- Abstract profiles

See also:

- 174.9.4 Constructor(LogColorSpace as WindowsICMLogColorSpaceMBS, DestProfile as WindowsICMProfileMBS, TargetProfile as WindowsICMProfileMBS, Flags as Integer) 20464

### 174.9.6 GetCMMInfo(what as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The GetCMMInfo function retrieves various information about the color management module (CMM) that created the specified color transform.

**Notes:**

what: Specifies the information to be retrieved. This parameter can take one of the following constant values.
### 174.9. CLASS WINDOWSICMTRANSFORMMBS

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMM_WIN_VERSION</td>
<td>Retrieves the version of Windows targeted by the color management module (CMM).</td>
</tr>
<tr>
<td>CMM_DLL_VERSION</td>
<td>Retrieves the version number of the CMM.</td>
</tr>
<tr>
<td>CMM_IDENT</td>
<td>Retrieves the CMM signature registered with the International Color Consortium (ICC).</td>
</tr>
</tbody>
</table>

If this function succeeds, the return value is the information specified in What.
If this function fails, the return value is zero.

### 174.9.7 TranslateBitmapBits(SrcBits as memoryblock, InputType as Integer, Width as Integer, Height as Integer, InputRowBytes as Integer, DestBits as memoryblock, DestType as Integer, DestRowBytes as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The TranslateBitmapBits function translates the colors of a bitmap having a defined format so as to produce another bitmap in a requested format.

**Notes:**
- **SrcBits:** Pointer to the bitmap to translate.
- **InputType:** Specifies the format of the input bitmap. Use one of the BM_* constants.
- **Width:** Specifies the number of pixels per scan line in the input bitmap.
- **Height:** Specifies the number of scan lines in the input bitmap.
- **InputRowBytes:** Specifies the number of bytes from the beginning of one scan line to the beginning of the next in the input bitmap; if set to zero, the function assumes that scan lines are padded so as to be DWORD-aligned.
- **DestBits:** Pointer to the buffer in which to place the translated bitmap.
- **DestType:** Specifies the format of the output bitmap. Use one of the BM_* constants.
- **DestRowBytes:** Specifies the number of bytes from the beginning of one scan line to the beginning of the next in the output bitmap; if set to zero, the function assumes that scan lines should be padded to be DWORD-aligned.

If this function succeeds, the return value is TRUE.
If this function fails, the return value is FALSE.

**Remarks**

If the input and output formats are not compatible with the color transform, this function fails.

When either of the floating point BMFORMATs, BM_32b_scARGB or BM_32b_scRGB are used, the color data being translated should not contain NaN or infinity. NaN and infinity are not considered to represent...
legitimate color component values, and the result of translating pixels containing NaN or infinity is meaningless in color terms. NaN or infinity values in the color data being processed will be handled silently, and an error will not be returned.

174.9.8  TranslateColors(InputColors() as WindowsICMColorMBS, ctInput as Integer, OutputColors() as WindowsICMColorMBS, ctOutput as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The TranslateColors function translates an array of colors from the source color space to the destination color space as defined by a color transform.

Notes:
InputColors: The input color.
ctInput: Specifies the input color type.
OutputColors: The output color.
ctOutput: Specifies the output color type.

Returns true on success and false on failure.

174.9.9  TranslatePictures(InputPicture as picture, OutputPicture as picture) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: The TranslateBitmapBits function translates the colors of a bitmap having a defined format so as to produce another bitmap in a requested format.

Notes:
InputPicture: input picture
OutputPicture: output picture

If this function succeeds, the return value is TRUE.
If this function fails, the return value is FALSE.

Make sure the pictures have the same size.

If the input and output formats are not compatible with the color transform, this function fails.
174.9. CLASS WINDOWSICMTRANSFORMMBS

174.9.10 Properties

174.9.11 Handle as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The internal handle for the transformation. **Notes:** (Read and Write property)

174.9.12 Events

174.9.13 Progress(Maximum as Integer, Current as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The progress event for long operations.

174.9.14 Constants

174.9.15 BEST_MODE = 3

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation. **Notes:** Transform will be used for the display of the highest-quality image possible on the target device.

174.9.16 BM_10b_G3CH = & h0404

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants. **Notes:** 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

174.9.17 BM_10b_Lab = & h0403

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants. **Notes:** 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

174.9.18 BM_10b_RGB = 9

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants. **Notes:** 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.
174.9.19  BM_10b_XYZ = & h0401

MBS Win Plugin, Plugin Version: 11.1. Function: One of the bitmap format constants.
Notes: 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

174.9.20  BM_10b_Yxy = & h0402

MBS Win Plugin, Plugin Version: 11.1. Function: One of the bitmap format constants.
Notes: 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

174.9.21  BM_16b_G3CH = & h0504

MBS Win Plugin, Plugin Version: 11.1. Function: One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

174.9.22  BM_16b_GRAY = & h0505

MBS Win Plugin, Plugin Version: 11.1. Function: One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. All other bits are ignored.

174.9.23  BM_16b_Lab = & h0503

MBS Win Plugin, Plugin Version: 11.1. Function: One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

174.9.24  BM_16b_RGB = 10

MBS Win Plugin, Plugin Version: 11.1. Function: One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.
174.9. CLASS WINDOWSICMTRANSFORMMBS

174.9.25 BM_16b_XYZ = & h0501

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.  
**Notes:** 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

174.9.26 BM_16b_Yxy = & h0502

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.  
**Notes:** 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

174.9.27 BM_32b_scARGB = & h0602

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.  
**Notes:** 128 bits per pixel. 32 bits are used for each color channel, as defined by the IEEE 32-bit floating point standard.

174.9.28 BM_32b_scRGB = & h0601

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.  
**Notes:** 96 bits per pixel. 32 bits are used for each color channel, as defined by the IEEE 32-bit floating point standard.

174.9.29 BM_565RGB = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.  
**Notes:** 16 bits per pixel. 5 bits are used for red, 6 for green, and 5 for blue.

174.9.30 BM_5CHANNEL = & h0205

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.  
**Notes:** 40 bits per pixel. 8 bits apiece are used for each channel.
174.9.31 \( \text{BM\_6CHANNEL} = \& \text{h0206} \)

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
**Notes:** 48 bits per pixel. 8 bits apiece are used for each channel.

174.9.32 \( \text{BM\_7CHANNEL} = \& \text{h0207} \)

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
**Notes:** 56 bits per pixel. 8 bits apiece are used for each channel.

174.9.33 \( \text{BM\_8CHANNEL} = \& \text{h0208} \)

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
**Notes:** 64 bits per pixel. 8 bits apiece are used for each channel.

174.9.34 \( \text{BM\_BGRTRIPLETS} = 4 \)

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
**Notes:** 24 bits per pixel maximum. For three channel colors, such as red, green, and blue, the total size is 24 bits per pixel. For single channel colors, such as gray, the total size is 8 bits per pixel.

174.9.35 \( \text{BM\_CMYKQUADS} = \& \text{h0020} \)

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
**Notes:** 32 bits per pixel. 8 bits are used for each color channel.

174.9.36 \( \text{BM\_G3CHTRIPLETS} = \& \text{h0204} \)

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
**Notes:** 24 bits per pixel maximum. For three channel values, the total size is 24 bits per pixel. For single channel gray scale, the total size is 8 bits per pixel.

174.9.37 \( \text{BM\_GRAY} = \& \text{h0209} \)

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.
**Notes:** 32 bits per pixel. Only the 8 bit gray-scale value is used.
174.9.38 BM_KYMCQUADS = & h0305

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants. **Notes:** 32 bits per pixel. 8 bits are used for each color channel.

174.9.39 BM_LabTRIPLETS = & h0203

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants. **Notes:** 24 bits per pixel maximum. For three channel, L, a, and b values, the total size is 24 bits per pixel. For single channel gray scale, the total size is 8 bits per pixel.

174.9.40 BM_NAMED_INDEX = & h0405

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants. **Notes:** 32 bits per pixel. Named color indices. Index numbering begins at one.

174.9.41 BM_R10G10B10A2 = & h0701

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants. **Notes:** Only in Windows Vista.

174.9.42 BM_R10G10B10A2_XR = & h0702

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants. **Notes:** Only in Windows Vista.

174.9.43 BM_R16G16B16A16_FLOAT = & h0703

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants. **Notes:** Only in Windows Vista.
174.9.44  BM_RGBTRIPLETS = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants. 
**Notes:** 24 bits per pixel maximum. For three channel colors, such as red, green, and blue, the total size is 24 bits per pixel. For single channel colors, such as gray, the total size is 8 bits per pixel.

174.9.45  BM_S2DOT13FIXED_scARGB = & h0604

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants. 
**Notes:** 64 bits per pixel. Color data is stored as one 16-bit word per channel, with a fixed range of -4 to +4, inclusive. A signed format is used, with 1 bit for the sign, 2 bits for the integer portion, and 13 bits for the fractional portion.

174.9.46  BM_S2DOT13FIXED_scRGB = & h0603

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants. 
**Notes:** 48 bits per pixel. Color data is stored as one 16-bit word per channel, with a fixed range of -4 to +4, inclusive. A signed format is used, with 1 bit for the sign, 2 bits for the integer portion, and 13 bits for the fractional portion.

174.9.47  BM_x555G3CH = & h0104

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the bitmap format constants.

**Notes:** The logo icon for this CMM.

174.9.63  CMM_VERSION = 4

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.  
**Notes:** Version of Windows supported.
174.9.64  **CMM_WINDOWS_DEFAULT = & h57696E20**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the info selectors for GetInfo.

174.9.65  **CMM_WIN_VERSION = 0**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the values for the GetCMMInfo function. **Notes:** Retrieves the version of Windows targeted by the color management module (CMM).

174.9.66  **ENABLE_GAMUT_CHECKING = & h10000**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation. **Notes:** Use this transform for gamut checking.

174.9.67  **FAST_TRANSLATE = & h40000**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation. **Notes:** Look up color only. Do not interpolate the color.

174.9.68  **INDEX_DONT_CARE = 0**

MBS Win Plugin, Plugin Version: 11.1. **Function:** A special value for index in constructor. **Notes:** The application developer may allow Windows to choose the CMM by setting the indexPreferred-CMM parameter to INDEX_DONT_CARE for the constructor.

174.9.69  **INTENT_ABSOLUTE_COLORIMETRIC = 3**

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants. **Notes:** Maintain the white point. Match the colors to their nearest color in the destination gamut.
174.9.70  INTENT_PERCEPTUAL = 0

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants. 
**Notes:** Maintain contrast. Used for photographs and natural images.

174.9.71  INTENT_RELATIVE_COLORIMETRIC = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants. 
**Notes:** Maintain colorimetric match. Used for graphic designs and named colors.

174.9.72  INTENT_SATURATION = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the rendering intent constants. 
**Notes:** Maintain saturation. Used for business charts and other situations in which undithered colors are required.

174.9.73  NORMAL_MODE = 2

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation. 
**Notes:** Transform will be used for normal image display. Average image quality.

174.9.74  PRESERVEBLACK = & h100000

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation. 
**Notes:** If this bit is set, the transform engine inserts the appropriate black generation GMMP as the last GMMP in the transform sequence. This flag only works in a pure WCS transform.

174.9.75  PROOF_MODE = 1

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation. 
**Notes:** Transform will be used to preview the image. Low image quality.

174.9.76  SEQUENTIAL_TRANSFORM = & h80800000

MBS Win Plugin, Plugin Version: 11.1. **Function:** One of the flags passed when creating a transformation. 
**Notes:**
If this bit is set, each step in the WCS processing pipeline is performed for every pixel in the image and no optimized color transform is built. This flag only works in a pure WCS transform. Restrictions: A transform created with the SEQUENTIAL_TRANSFORM flag set may only be used in the thread on which it was created and only for one color translation call at a time. COM must be initialized prior to creating the sequential transform and must remain initialized for the lifetime of the transform object.

174.9.77 \textbf{USE\_RELATIVE\_COLORIMETRIC} = \& h20000

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function:} One of the flags passed when creating a transformation.

174.9.78 \textbf{WCS\_ALWAYS} = \& h200000

MBS Win Plugin, Plugin Version: 11.1. \textbf{Function:} One of the flags passed when creating a transformation. \textbf{Notes:} If this bit is set, even all-ICC transforms will use the WCS code path.
Chapter 175

Windows Mutex

175.1 class WindowsMutexMBS

175.1.1 class WindowsMutexMBS

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class for a mutex.

**Notes:**
As a mutex must have a unique name you can use this class to find out if an application is already running. Try to create a mutex with an unique name and if it already exists your application was launched twice.

175.1.2 Methods

175.1.3 close

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The destructor.

**Notes:**
There is no need to call this method except you want to free all resources of this object now without waiting for Realbasic to do it for you.
(e.g. some Realbasic versions crash on Windows if there are plugin objects not closed.)

175.1.4 Create(name as string)

MBS Win Plugin, Plugin Version: 3.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new mutex.
Notes:
The name must be unique and should not contain a backslash.
Use only ASCII strings for this.
LastError is set.

175.1.5 Open(name as string)

Function:
Trys to open a mutex with the given name.
Notes:
Fails if the mutex does not exist.
LastError is set.

175.1.6 Properties

175.1.7 Handle as Integer

Function:
The handle of the Mutex for use with Declares.
Notes: (Read and Write property)

175.1.8 Lasterror as Integer

Function:
The last error code reported.
Notes:
A Windows error code.
Or 0 for okay and -1 for "Function not available or parameters wrong."
(Read and Write property)

175.1.9 Name as String

Function:
The name used to create or open the mutex.
Notes: (Read only property)
Chapter 176

Windows Registry

176.1   class RegistryFileTypeMBS

176.1.1   class RegistryFileTypeMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** An easy way to register a document icon for Windows.

**Notes:**

You set up the properties of this class and than you call create.
I suggest that you do it like QuickTime or Winzip. Ask the user on first run if he want’s your application to register its file types.
And also provide two buttons in the Preferences dialog to register or unregister the types.

This class works on Windows 7 only if you run the app as administrator.

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.

176.1.2   Methods

176.1.3   Create as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates this file type.

**Example:**

20485
dim r as RegistryFileTypeMBS
' set properties for r
dim errorcode as Integer
errorcode=r.create

Notes:
Returns:

-1 - Run on Mac OS
0  - OK
1  - Failed to create main extension key.
2  - Failed to create the description key for file type.
3  - Failed to create the key for the icon.
4  - Failed to create the key for the open description.
5  - Required parameters not provided.

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.

176.1.4 Remove as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function: Removes this file type.
Example:

dim r as RegistryFileTypeMBS
dim errorcode as Integer

errorcode=r.remove

Notes:
Returns:

Note: The return values changed in MBS Plugin 3.2 to now return Windows error codes!

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps
-1  - Run on Mac OS or parameters bad.
  0   - OK
  x   - A Windows error code like 5 for permissions denied.

<table>
<thead>
<tr>
<th>Editing the real registry.</th>
</tr>
</thead>
</table>

### 176.1.5 Properties

### 176.1.6 AppFile as FolderItem

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The application to launch to open the file.

**Example:**

```
dim r as new RegistryFileTypeMBS
r.Appfile=app.applicationfilembs // it is my file ;-)```

**Notes:** (Read and Write property)

### 176.1.7 Description as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The description for this file type.

**Example:**

```
dim r as new RegistryFileTypeMBS
r.description="Monkeybread File"
```

**Notes:**

The text to show in the explorer in column view.
(Read and Write property)

### 176.1.8 Extension as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The extension for this file type.
Example:

```
Dim r As New RegistryFileTypeMBS
r.extension = ".MBS"
```

Notes:
The extension should start with a dot followed by 3 uppercase letters and it should be unique. But as there are more file types than combinations of 3 letters this may be difficult...
(Read and Write property)

### 176.1.9 FileType as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A internal unique signature for this file type.

Example:

```
Dim r As New RegistryFileTypeMBS
r.FileType = "MBSFile"
```

Notes:
May contain any character except chr(0) and should be ANSI encoded.
(Read and Write property)

### 176.1.10 Iconfile as Folderitem

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The file with the icon.

Example:

```
Dim r As New RegistryFileTypeMBS
r.iconfile = app.applicationfileMBS ' it is my file :-)'
```

Notes:
You can get the icon out of your application (ID 0 is the default icon). But you can also use DLL files like "Shell32.dll" for some nice icons.
Last but not least you can use an ICO file which Iconographer can create for you from your Mac Icons.
176.1.11 IconID as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ID of the Icon to use.

**Example:**
```vba
dim r as new RegistryFileTypeMBS
r.iconid=3
```

**Notes:**
Your icon file may contain more than one icon. Here you can specify which one to use. First is ID 0.

(Read and Write property)

176.1.12 OpenDescription as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The text to show in the context menu for Open.

**Example:**
```vba
dim r as new RegistryFileTypeMBS
r.OpenDescription="Open MBS file"
```

**Notes:**
If you don’t provide an OpenDescription you’ll get "Open". Here you can describe the default action. e.g. Stuffit Expander could say "Expand file".

(Read and Write property)
176.2 class RegistryKeyMBS

176.2.1 class RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you access to a Windows Registry Key.

176.2.2 Methods

176.2.3 CopyTree(keyname as string, Dest as RegistryKeyMBS) as boolean

MBS Win Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Copies the specified registry key, along with its values and subkeys, to the specified destination key. **Notes:** Returns true on success and false on failure.

176.2.4 CreateKey(name as string, Use64bitRegistry as boolean = false) as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a new subkey. **Notes:**

If the key is allready present it is just opened.
Returns a registry key or nil on any error.

Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

176.2.5 Delete(keyname as string) as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Deletes the specified subkey key. **Notes:**

Windows 95: The Delete function deletes a subkey and all its descendants.
Windows NT: The Delete function deletes the specified subkey. The subkey to be deleted must not have subkeys.

With plugin version 3.2 the NT behavior is worked around to match the Windows 95 behavior. So all sub keys are deleted!
176.2. CLASS REGISTRYKEYMBS

176.2.6 DeleteTree(keyname as string) as boolean

MBS Win Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Deletes the subkeys and values of the specified key recursively. **Example:**

dim t as RegistryKeyMBS = RegistryMBS.CurrentUser

    // create some keys
    dim n as RegistryKeyMBS = t.CreateKey("Hello")
    dim w as RegistryKeyMBS = n.CreateKey("World")

w.Value("Test").asString = "Hello"

break // see in regedit

    // delete it
    if t.DeleteTree("Hello") then
        MsgBox "deleted. ok"
    else
        MsgBox "delete failed"
    end if

**Notes:** Returns true on success and false on failure.

176.2.7 Flush

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Writes all the attributes of the specified open key into the RegistryMBS.

176.2.8 Item(index as Integer) as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the key at the specified index. **Notes:**

May return nil on any error like missing access rights. Some keys can’t be opened, but ItemName() may return the name of the key. See also:

- 176.2.9 Item(name as string) as RegistryKeyMBS

20492
176.2.9   **Item(name as string) as RegistryKeyMBS**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the key with the specified name.

**Notes:**
May return nil on any error like missing access rights.
Some keys can’t be opened, but ItemName() may return the name of the key.
See also:

- 176.2.8 Item(index as Integer) as RegistryKeyMBS

176.2.10 **ItemName(index as Integer) as string**

MBS Win Plugin, Plugin Version: 6.3, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the name of the key at the specified index.

**Notes:** May return "" on any error.

176.2.11 **Value(index as Integer) as RegistryValueMBS**

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value at the specified index.
See also:

- 176.2.12 Value(name as string) as RegistryValueMBS

176.2.12 **Value(name as string) as RegistryValueMBS**

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value item with the specified name.

**Notes:**
The value must not exists. So use this function to make a new key.
Use an empty name (e.g. "") for the default key value.

This method was named ValueItem in plugin version before 10.4.
See also:

- 176.2.11 Value(index as Integer) as RegistryValueMBS
176.2.13 **ValueName(index as Integer) as string**

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the name of the value with the given index. **Notes:** May return "" on any error.

176.2.14 **Properties**

176.2.15 **ItemCount as Integer**

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the count of subkeys. **Example:**

```
dim i,c as Integer
dim key as RegistryKeyMBS // the registry item

c=key.ItemCount-1
for i=0 to c
  // do something
next
```

**Notes:**
This property calls a System function to get the value. So save it in a local variable instead of calling it in a for loop. See the example. (Read only property)

176.2.16 **name as string**

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the name of the Key. **Notes:** (Read only property)

176.2.17 **ValueCount as Integer**

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the count of values. **Example:**
dim i,c as Integer
dim key as RegistryKeyMBS

c=key.ValueCount
for i=1 to c
    // do something
next

Notes:

This property calls a System function to get the value. So save it in a local variable instead of calling it in a for loop. See the example.
(Read only property)
176.3.  CLASS REGISTRYMBS

176.3  class RegistryMBS

176.3.1  class RegistryMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you access to the Windows Registry.  
**Notes:** Please send me an email if you need some functions which are now not included.

176.3.2  Methods

176.3.3  classesRoot as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the ClassesRoot Tree.

176.3.4  CurrentConfig as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the CurrentConfig Tree.

176.3.5  CurrentUser as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the CurrentUser Tree.

176.3.6  getBinaryValue(keypath as string,valuename as string, Use64bitRegistry as boolean = false) as Memoryblock

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you a Memoryblock of the value called valuename in the key found at keypath.  
**Example:**

```vbnet
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
dim r as new RegistryMBS
msgBox "This OS is: "+r.getBinaryValue(path, "ProductName").cstring(0)
```

**Notes:**
Returns nil on any error.
Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

176.3.7  getStringValue(keypath as string, valuename as string, Use64bitRegistry as boolean = false) as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you a String of the value called valuename in the key found at keypath.

**Example:**

```vba
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"

dim r as new RegistryMBS
msgBox "This OS is: "+r.getStringValue(path, "ProductName")
```

**Notes:**

Returns "" on any error.
Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

176.3.8  Key(keypath as string, Use64bitRegistry as boolean = false) as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the given path of a key.

**Example:**

```vba
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"

dim r as new RegistryMBS
msgBox r.Key(path).Name
```

**Notes:**

If you need you can recreate this function in Realbasic code to have some error checking. This function here will return nil on any error.

Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.
176.3. CLASS REGISTRYMBS

176.3.9 LocalMachine as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the LocalMachine Tree.

176.3.10 PerformanceData as RegistryKeyMBS

MBS Win Plugin, Plugin Version: 10.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the PerformanceData Tree.

176.3.11 Users as RegistryKeyMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you an RegistryKeyMBS object for the Users Tree.
176.4 class RegistryValueMBS

176.4.1 class RegistryValueMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Gives you access to a value of a RegistryMBS Key.

176.4.2 Methods

176.4.3 Delete as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Deletes this value. **Notes:** The RegistryValueMBS object should be destroyed after deleting.

176.4.4 SetBinaryMem(typ as Integer, data as Memoryblock)

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the value to the content of the memoryblock. **Notes:**

Type may be one of this values:

0  No value type
1  Nul terminated string
2  Nul terminated string (with environment variable references)
3  Free form binary
4  32-bit number (LittleEndian)
5  32-bit number (BigEndian)
6  Symbolic Link (unicode)
7  Multiple Unicode strings
8  Resource list in the resource map
9  Resource list in the hardware description
10 Resource requirements list
11 64-bit number
176.4.5  SetBinaryStr(typ as Integer, data as String)

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Sets the value to the content of the string.
**Notes:**
Type may be one of these values:

0  No value type
1  Nul terminated string
2  Nul terminated string (with environment variable references)
3  Free form binary
4  32-bit number (LittleEndian)
5  32-bit number (BigEndian)
6  Symbolic Link (unicode)
7  Multiple Unicode strings
8  Resource list in the resource map
9  Resource list in the hardware description
10 Resource requirements list
11 64-bit number

176.4.6  Properties

176.4.7  asBinary as Memoryblock

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value as a memoryblock.
**Notes:**
Can also be used to set the value.
(Read and Write property)

176.4.8  asBinaryString as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value as a string with binary content.
**Notes:**
This string may include chr(0).
Can also be used to set the value.
176.4.9  asLong32 as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value as a 32bit integer.
**Notes:**
Can also be used to set the value.
(Read and Write property)

176.4.10  asLong64 as Int64

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value as a 64bit integer.
**Example:**
```
dim v as RegistryValueMBS
v.aslong64=v.aslong64+1 // add one
```
**Notes:**
Can also be used to set the value.
(Read and Write property)

176.4.11  asString as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the value as a string.
**Notes:**
Can also be used to set the value.
(Read and Write property)

176.4.12  isBinary as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if the value is binary data.
**Notes:** (Read only property)
176.4. CLASS REGISTRYVALUEMBS

176.4.13 isLong32 as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if the value is a 32 bit integer.
**Notes:** (Read only property)

176.4.14 isLong64 as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if the value is a 64 bit Integer.
**Notes:** (Read only property)

176.4.15 isString as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns true if the value is a string.
**Notes:** (Read only property)

176.4.16 name as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the name of the Value.
**Notes:** (Read only property)

176.4.17 size as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the size of this value.
**Notes:** (Read only property)

176.4.18 type as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Returns the type of the value.
**Notes:**
Type may be one of this values:
0  No value type
1  Nul terminated string
2  Nul terminated string (with environment variable references)
3  Free form binary
4  32-bit number (LittleEndian)
5  32-bit number (BigEndian)
6  Symbolic Link (unicode)
7  Multiple Unicode strings
8  Resource list in the resource map
9  Resource list in the hardware description
10 Resource requirements list
11 64-bit number

(Read only property)
Chapter 177

Windows Shortcuts

177.1 class WindowsInternetShortcutMBS

177.1.1 class WindowsInternetShortcutMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to create internet shortcuts on Windows.

**Example:**

```vbscript
# if targetwin32
dim w as WindowsInternetShortcutMBS

w=new WindowsInternetShortcutMBS

w.URL="http://www.monkeybreadsoftware.de"
w.Command=3
w.Icon=windowsSystemFolder.child("shell32.dll")
w.iconID=41
w.Location=SpecialFolder.Desktop.child("A new link to explorer.lnk")
w.Working=volume(0)

if w.CreateInternetShortCut then
    if w.AddInternetShortcutIcon then
        msgBox "Shortcut created."
    else
        msgBox "Failed to add icon."
    end if
else
    msgBox "Failed to create shortcut."
end if
# endif
```

20503
177.1.2 Methods

177.1.3 CreateInternetShortCut as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Creates a shortcut on the specified location.  
**Notes:** Version 10.1: Now adds the icon, too.

177.1.4 Properties

177.1.5 Command as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The code for the showing of the application.  
**Notes:**  
Use e.g. 3 for full screen.  
(Read and Write property)

177.1.6 Icon as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The location of the icon file.  
**Notes:**  
(Changed from FolderItem to String in plugin version 3.4)  
(Read and Write property)

177.1.7 IconID as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ID of the icon inside the icon file.  
**Notes:** (Read and Write property)
177.1.8 Location as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The location where the shortcut is created or modified.
**Notes:**
(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)

177.1.9 url as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The URL where the shortcut will point to.
**Notes:** (Read and Write property)

177.1.10 WorkingDirectory as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The working directory for the browser.
**Notes:**
(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)
177.2  class WindowsShortCutMBS

177.2.1  class WindowsShortCutMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:** A class to create shortcuts on Windows.

**Example:**

```vba
dim w as WindowsShortCutMBS

w = new WindowsShortCutMBS

w.Arguments = ""
w.Command = 3
w.Icon = specialfolder.system.child("shell32.dll").absolutePath
w.IconID = 41
w.Location = SpecialFolder.Desktop.child("A new link to explorer.lnk").absolutePath
w.Target = SpecialFolder.Windows.child("explorer.exe").absolutePath
w.WorkingDirectory = volume(0).absolutePath

if w.CreateShortCut then
    msgBox "Shortcut created."
else
    msgBox "Failed to create shortcut."
end if
```

177.2.2  Methods

177.2.3  CreateShortCut as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:** Creates a shortcut on the specified location.

**Notes:**

Returns true on success and false on any error.
Version 10.1: Now adds the icon, too.

177.2.4  ResolveShortCut(DisableGUI as boolean=false, DisableSearch as boolean=false) as boolean

MBS Win Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No.  **Function:** Resolves the shortcut.
Notes:
Fills the properties target, description, Argument, WorkingDirectory, Icon and IconID.
Returns false on any error.

Parameters added in plugin version 7.4:

DisableGUI:
Do not display a dialog box if the link cannot be resolved. The time-out duration will be set to the default value of 3,000 milliseconds (3 seconds).

DisableSearch:
Do not execute the search heuristics.

For more details check this page in Microsoft’s documentation:

177.2.5 Properties

177.2.6 Arguments as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Arguments to the application which is linked to the shortcut.  
**Notes:** (Read and Write property)

177.2.7 Command as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The code for the showing of the application.  
**Notes:**
Constants which may be useful:

(Read and Write property)

177.2.8 Description as String

MBS Win Plugin, Plugin Version: 3.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**  
The description of the shortcut.
SW_HIDE = 0
SW_NORMAL = 1
SW_SHOWMINIMIZED = 2
SW_SHOWMAXIMIZED = 3
SW_MAXIMIZE = 3
SW_SHOWNOACTIVATE = 4
SW_SHOW = 5
SW_MINIMIZE = 6
SW_SHOWMINNOACTIVE = 7
SW_SHOWNA = 8
SW_RESTORE = 9
SW_SHOWDEFAULT = 10
SW_FORCEMINIMIZE = 11

Notes: (Read and Write property)

177.2.9 Icon as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The location of the icon file.
**Notes:**
(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)

177.2.10 IconID as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The ID of the icon inside the icon file.
**Notes:** (Read and Write property)

177.2.11 Location as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The location where the shortcut is created or modified.
**Notes:**
(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)
177.2.12 ParentWindow as Window

MBS Win Plugin, Plugin Version: 3.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The parent window used when a dialog must be opened.
**Notes:** (Read and Write property)

177.2.13 Target as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The target where the shortcut will point to.
**Notes:**
(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)

177.2.14 WorkingDirectory as String

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The working directory of this shortcut.
**Notes:**
(Changed from Folderitem to String in plugin version 3.4)
(Read and Write property)
Chapter 178

Windows System Tray

178.1  Globals

178.1.1  HIconFromFileMBS(IconFile as Folderitem, IconID as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Creates a Windows Icon Handle for an icon loaded from the given icon file.
Notes:
What image depths are used and supported depends on the Windows version.
IconID = 0 points to the first icon in the file.
Returns 0 on failure.

The icon file can be .ico, .exe, .dll or similar files with windows icon resource.
This function is useful for declares where you have to pass a HICON parameter.

178.1.2  HIconFromPicturesMBS(Icon as picture, Mask as picture) as Integer

MBS Win Plugin, Plugin Version: 11.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. Function:
Creates a Windows Icon Handle with the given pictures.
Notes:
What image depths are used and supported depends on the Windows version.
Returns 0 on failure.
This function is useful for declares where you have to pass a HICON parameter.
178.2  class WindowsSystemTrayMBS

178.2.1  class WindowsSystemTrayMBS

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class to create an item in the system tray.

178.2.2  Methods

178.2.3  Add as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Adds the item to the system tray.

**Example:**
```
    dim e as WindowsSystemTrayMBS // your system tray object

    if e.add then
        list.addrow "Added icon."
    else
        list.addrow "Failed to add icon."
    end if
```

**Notes:**
Returns true if successful.
You can change the Icon& Mask or the Tooltip string.

178.2.4  Available as boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the system tray functions are available.

**Notes:**
Returns true on Windows 95 and newer.
Returns false on Mac OS and Linux.
178.2. Modify as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Modifies the item to the system tray.

**Notes:**
Returns true if successful.
You can change the Icon & Mask or the Tooltip string.

178.2.6 Remove as boolean

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Removes the item from the system tray.

**Notes:** Returns true if successful.

178.2.7 SetFocus as boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** This method resets focus back to the system tray area.

**Notes:** May be useful to call as cleanup after some context menu was shown.

178.2.8 SetIconFile(IconFile as Folderitem, IconID as Integer) as boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Loads an icon from the given file.

**Example:**

```dcode
dim wst as WindowsSystemTrayMBS // your system tray
call wst.SetIconFile(file,1)
```

**Notes:**
Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.
IconID = 0 points to the first icon in the file.

The icon file can be .ico, .exe, .dll or similar files with windows icon resource.
178.2.9  SetIconPicture(Icon as picture, Mask as picture) as boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Loads the icon from the given picture with mask.

**Example:**

```plaintext
dim myicon as picture // your picture
dim mymask as picture // the mask for the picture
dim wst as WindowsSystemTrayMBS // your system tray

call wst.SetIconPicture(myicon, mymask)
```

**Notes:**

Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.

Type is 0 for a small icon and 1 for a big icon.

178.2.10  Properties

178.2.11  BalloonMode as Integer

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The balloon mode.

**Example:**

```plaintext
dim s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
```

**Notes:**

0 is Error, 1 is Info and 2 is warning.
(Read and Write property)
178.2. CLASS WINDOWSSYSTEMTRAYMBS

178.2.12 BalloonText as string

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The balloon text to show.

**Example:**

```
dim wst as WindowsSystemTrayMBS // your system tray object

wst.BalloonTitle="Warning"
wst.BalloonText="You have not clicked on me the last 10 minutes."
call wst.modify
```

**Notes:**
If BalloonTitle or BalloonText are not empty the balloon is shown when you call modify.
(Read and Write property)

178.2.13 BalloonTimeout as Integer

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The balloon timeout in milliseconds.

**Example:**

```
dim s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
s.BalloonTimeout = 30000
```

**Notes:**
A value between 10000 and 30000.
Note that Timeout is valid only in Windows 2000 and Windows XP.
(Read and Write property)
See also:

- 178.2.22 BalloonTimeout(id as Integer, MouseX as Integer, MouseY as Integer) 20518

178.2.14 BalloonTitle as string

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The title of the balloon tooltip.
Example:

```vba
dim s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 ' Error mode
```

Notes:

If BalloonTitle or BalloonText are not empty the balloon is shown when you call modify.
(Read and Write property)

178.2.15 IconHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The icon handle currently used for the tray object.
**Notes:**
zero if no handle is there.
(Read and Write property)

178.2.16 ID as Integer

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** If you have more than
one icon in the system tray, use this ID to see which one is referred to inside an event.
**Notes:** (Read and Write property)

178.2.17 Tooltip as string

MBS Win Plugin, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The help string for the
tooltip.
**Example:**

```vba
dim e as WindowsSystemTrayMBS // global

e=new WindowsSystemTrayMBS
e.ID=12345678
e.Tooltip="some text"
e.BalloonText="some text"
e.BalloonTitle="some text"
e.BalloonMode=0
```
Notes:
Limited to 63 characters.
(Read and Write property)

178.2.18 UsingNewEvents as Boolean

MBS Win Plugin, Plugin Version: 7.4, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** Whether the new events are enabled.
**Notes:**
The plugin tries to enable new events if possible. That will only work on Windows 2000 or newer.

New events are:
BalloonTimeout
PopupOpen
ContextMenu
BalloonHide
KeySelected
BalloonUserClick
BalloonShow
Selected
(Read only property)

178.2.19 Events

178.2.20 BalloonHide(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The balloon has been hidden.

178.2.21 BalloonShow(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:** The balloon was shown.
**Notes:** You will get one balloon event when it disappears: BalloonHide, BalloonUserClick or BalloonTimeout.
178.2.22  BalloonTimeout(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The balloon was removed because of a timeout.
See also:
  - 178.2.13 BalloonTimeout as Integer

178.2.23  BalloonUserClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The user clicked on the balloon to make it away.

178.2.24  ContextMenu(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
You should show a context menu.

178.2.25  KeySelected(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The system tray item was selected by the keyboard.

178.2.26  MouseLeftButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Called if the left mouse button is pressed for a double click on the system tray icon.

178.2.27  MouseLeftButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Called if the left mouse button is pressed on the system tray icon.
178.2.28 MouseLeftButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Called if the left mouse button is released on the system tray icon.

178.2.29 MouseMiddleButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Called if the middle mouse button is pressed for a double click on the system tray icon.

178.2.30 MouseMiddleButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Called if the middle mouse button is pressed on the system tray icon.

178.2.31 MouseMiddleButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Called if the middle mouse button is released on the system tray icon.

178.2.32 MouseMove(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Called if the mouse is moved over the system tray icon.

178.2.33 MouseRightButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Called if the right mouse button is pressed for a double click on the system tray icon.
178.2.34 MouseRightButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Called if the right mouse button is pressed on the system tray icon.

178.2.35 MouseRightButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
Called if the right mouse button is pressed on the system tray icon.

178.2.36 PopupOpen(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
You should show a popup menu on the mouse position.

178.2.37 Selected(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Function:**
The system tray item was selected.
Chapter 179

Windows Taskbar State

179.1 class WindowsTaskbarStateMBS

179.1.1 class WindowsTaskbarStateMBS

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** A class for information about the settings for the Windows taskbar.

179.1.2 Properties

179.1.3 AlwaysOnTop as Boolean

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** True if the taskbar should be always on the top.
**Notes:**
Value is false on any error.
Settable in plugin version 12.2 and newer.
(Read and Write property)

179.1.4 AutoHide as Boolean

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** True if the taskbar automatically hides itself.
**Notes:**
Value is false on any error.
Settable in plugin version 12.2 and newer.
CHAPTER 179. WINDOWS TASKBAR STATE

(Read and Write property)

179.1.5 Bottom as Integer

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The bottom value of the taskbar dimensions.

**Notes:**
Value is 0 on any error.
(Read and Write property)

179.1.6 Height as Integer

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The height value of the taskbar dimensions.

**Notes:**
Value is 0 on any error.
(Read and Write property)

179.1.7 Left as Integer

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The left value of the taskbar dimensions.

**Notes:**
Value is 0 on any error.
(Read and Write property)

179.1.8 Right as Integer

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:** The right value of the taskbar dimensions.

**Notes:**
Value is 0 on any error.
(Read and Write property)
179.1. Class WindowTaskBarStateMBS

179.1.9 Top as Integer

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The top value of the taskbar dimensions.

**Notes:**
Value is 0 on any error.
(Read and Write property)

179.1.10 Width as Integer

MBS Win Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: No, Win: Yes, Linux: No. **Function:**
The width value of the taskbar dimensions.

**Notes:**
Value is 0 on any error.
(Read and Write property)
Chapter 180

WiringPi

180.1  module WiringPiMBS

180.1.1  module WiringPiMBS

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The module to work with wiring pi library.

180.1.2  Methods

180.1.3  analogRead(pin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This returns the value read on the supplied analog input pin. **Notes:** You will need to register additional analog modules to enable this function for devices such as the Gertboard, quick2Wire analog board, etc.

180.1.4  analogWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This writes the given value to the supplied analog pin. **Notes:** You will need to register additional analog modules to enable this function for devices such as the Gertboard.
180.1.5 delay(HowLong as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This causes program execution to pause for at least howLong milliseconds.
**Notes:** Due to the multi-tasking nature of Linux it could be longer. Note that the maximum delay is an unsigned 32-bit integer or approximately 49 days.

180.1.6 delayMicroseconds(HowLong as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This causes program execution to pause for at least howLong microseconds.
**Notes:**
Due to the multi-tasking nature of Linux it could be longer. Note that the maximum delay is an unsigned 32-bit integer microseconds or approximately 71 minutes.

Delays under 100 microseconds are timed using a hard-coded loop continually polling the system time, Delays over 100 microseconds are done using the system nanosleep() function. You may need to consider the implications of very short delays on the overall performance of the system, especially if using threads.

180.1.7 digitalWrite(pin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This function returns the value read at the given pin.
**Notes:** It will be kHIGH or kLOW (1 or 0) depending on the logic level at the pin.

180.1.8 digitalWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Writes the value kHIGH or kLOW (1 or 0) to the given pin which must have been previously set as an output.
**Notes:** WiringPi treats any non-zero number as kHIGH, however 0 is the only representation of kLOW.

180.1.9 digitalWriteByte(value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This writes the 8-bit byte supplied to the first 8 GPIO pins.
**Notes:** It's the fastest way to set all 8 bits at once to a particular value, although it still takes two write
180.1. MODULE WIRING_PIMBS

operations to the Pi's GPIO hardware.

180.1.10  gpioClockSet(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Sets the clock.

180.1.11  I2CRead(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Simple device read.

**Notes:**

Some devices present data when you read them without having to do any register transactions. If the return value is negative then an error has happened and you should consult errno.

180.1.12  I2CReadReg16(fd as Integer, reg as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Simple device read.

**Notes:**

Some devices present data when you read them without having to do any register transactions. Read a 16-bit value from the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

180.1.13  I2CReadReg8(fd as Integer, reg as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Simple device read.

**Notes:**

Some devices present data when you read them without having to do any register transactions. Read an 8-bit value from the device register indicated.

If the return value is negative then an error has happened and you should consult errno.
180.1.14  **I2CSetup(devId as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This initialises the I2C system with your given device identifier.

**Notes:**
The ID is the I2C number of the device and you can use the i2cdetect program to find this out. `I2CSetup()` will work out which revision Raspberry Pi you have and open the appropriate device in `/dev`.

The return value is the standard Linux filehandle, or -1 if any error in which case, you can consult `errno` as usual.

E.g. the popular MCP23017 GPIO expander is usually device Id 0x20, so this is the number you would pass into `wiringPiI2CSetup()`.

180.1.15  **I2CSetupInterface(device as string, devId as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This initialises the I2C system with your given device identifier and name.

180.1.16  **I2CWrite(fd as Integer, Data as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Simple device write.

**Notes:**
Some devices accept data this way without needing to access any internal registers. If the return value is negative then an error has happened and you should consult `errno`.

180.1.17  **I2CWriteReg16(fd as Integer, reg as Integer, Data as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Simple device write.

**Notes:**
Some devices accept data this way without needing to access any internal registers. Write a 16-bit data value into the device register indicated.

If the return value is negative then an error has happened and you should consult `errno`. 
180.1. **MODULE WIRINGPIMBS**

180.1.18 **I2CWriteReg8(fd as Integer, reg as Integer, Data as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**

Simple device write.

**Notes:**

Some devices accept data this way without needing to access any internal registers.
Write a 8-bit data value into the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

180.1.19 **LoadLibrary(File as FolderItem) as boolean**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**

Loads the library.

**Notes:**

Returns true on success or false on failure.
LoadError is set in case of failure.
See also:

- 180.1.20 LoadLibrary(Path as string) as boolean

180.1.20 **LoadLibrary(Path as string) as boolean**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**

Loads the library.

**Notes:**

Returns true on success or false on failure.
LoadError is set in case of failure.
See also:

- 180.1.19 LoadLibrary(File as FolderItem) as boolean

180.1.21 **micros as UInt32**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**

This returns a number representing the number of microseconds since your program called one of the wiring-PiSetup functions.

**Notes:** It returns an unsigned 32-bit number which wraps after approximately 71 minutes.
180.1.22  **millis as UInt32**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This returns a number representing the number of milliseconds since your program called one of the wiring-PiSetup functions. **Notes:** It returns an unsigned 32-bit number which wraps after 49 days.

180.1.23  **physPinToGpio(physPin as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This returns the BCM_GPIO pin number of the supplied physical pin on the P1 connector.

180.1.24  **piBoardId(byref model as Integer, byref Rev as Integer, byref Mem as Integer, byref Maker as Integer, byref OverVolted as Integer)**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Queries board identifiers. **Notes:** Mem is memory in Megabytes. Maker, Model and Rev are value which match the constants in this module.

180.1.25  **piBoardRev as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This returns the board revision of the Raspberry Pi. **Notes:** It will be either 1 or 2. Some of the BCM_GPIO pins changed number and function when moving from board revision 1 to 2, so if you are using BCM_GPIO pin numbers, then you need to be aware of the differences.

180.1.26  **piHiPri(pri as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This attempts to shift your program (or thread in a multi-threaded program) to a higher priority and enables a real-time scheduling. **Notes:** The priority parameter should be from 0 (the default) to 99 (the maximum). This wont make your program go any faster, but it will give it a bigger slice of time when other programs are running. The priority parameter works relative to others so you can make one program priority 1 and another priority 2 and it will
have the same effect as setting one to 10 and the other to 90 (as long as no other programs are running with elevated priorities)

The return value is 0 for success and -1 for error. If an error is returned, the program should then consult the errno global variable, as per the usual conventions.

Note: Only programs running as root can change their priority. If called from a non-root program then nothing happens.

180.1.27 piLock(Key as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Locks a synchronization lock.

**Notes:**
These allow you to synchronise variable updates from your main program to any threads running in your program. keyNum is a number from 0 to 3 and represents a key. When another process tries to lock the same key, it will be stalled until the first process has unlocked the same key.

You may need to use these functions to ensure that you get valid data when exchanging data between your main program and a thread otherwise its possible that the thread could wake-up halfway during your data copy and change the data so the data you end up copying is incomplete, or invalid.

180.1.28 piMakerNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Maps maker numbers to names.

180.1.29 piModelNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Maps model numbers to names.

180.1.30 pinMode(pin as Integer, mode as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This sets the mode of a pin to either INPUT, OUTPUT, PWM_OUTPUT or GPIO_CLOCK.

**Notes:**
Note that only wiringPi pin 1 (BCM_GPIO 18) supports PWM output and only wiringPi pin 7 (BCM_GPIO 4) supports CLOCK output modes.

This function has no effect when in Sys mode. If you need to change the pin mode, then you can do it with the gpio program in a script before you start your program.

**180.1.31 piRevisionNames(index as Integer) as string**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Maps revision numbers to names.

**180.1.32 piUnlock(Key as Integer)**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Unlocks a synchronization lock. **Notes:**

These allow you to synchronise variable updates from your main program to any threads running in your program. keyNum is a number from 0 to 3 and represents a key. When another process tries to lock the same key, it will be stalled until the first process has unlocked the same key.

You may need to use these functions to ensure that you get valid data when exchanging data between your main program and a thread otherwise its possible that the thread could wake-up halfway during your data copy and change the data so the data you end up copying is incomplete, or invalid.

**180.1.33 pullUpDnControl(pin as Integer, pud as Integer)**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This sets the pull-up or pull-down resistor mode on the given pin, which should be set as an input. **Notes:**

Unlike the Arduino, the BCM2835 has both pull-up an down internal resistors. The parameter pud should be; kPUD_OFF, (no pull up/down), kPUD_DOWN (pull to ground) or kPUD_UP (pull to 3.3v) The internal pull up/down resistors have a value of approximately 50K on the Raspberry Pi.

This function has no effect on the Raspberry Pis GPIO pins when in Sys mode. If you need to activate a pull-up/pull-down, then you can do it with the gpio program in a script before you start your program.
180.1.34  pwmSetClock(divisor as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This sets the divisor for the PWM clock.

180.1.35  pwmSetMode(mode as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
The PWM generator can run in 2 modes balanced and mark:space. **Notes:** The mark:space mode is traditional, however the default mode in the Pi is balanced. You can switch modes by supplying the parameter: kPWM_MODE_BAL or kPWM_MODE_MS.

180.1.36  pwmSetRange(range as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This sets the range register in the PWM generator. **Notes:** The default is 1024.

180.1.37  pwmToneWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Writes a tone.

180.1.38  pwmWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Writes the value to the PWM register for the given pin. **Notes:**
The Raspberry Pi has one on-board PWM pin, pin 1 (BMC_GPIO 18, Phys 12) and the range is 0-1024. Other PWM devices may have other PWM ranges. This function is not able to control the Pis on-board PWM when in Sys mode.
180.1.39  **Read(fd as Integer, count as UInt64) as Memoryblock**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Read attempts to read count bytes of data from the object referenced by the descriptor fildes into a buffer.
**Notes:**
Returns the memoryblock on success (if we got more than zero bytes).
Errno is set in case of error.

180.1.40  **serialClose(fd as Integer)**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Closes the device identified by the file descriptor given.

180.1.41  **serialDataAvail(fd as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Returns the number of characters available for reading, or -1 for any error condition, in which case errno
will be set appropriately.

180.1.42  **serialFlush(fd as Integer)**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This discards all data received, or waiting to be send down the given device.

180.1.43  **serialGetchar(fd as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Returns the next character available on the serial device.
**Notes:** This call will block for up to 10 seconds if no data is available (when it will return -1)

180.1.44  **serialOpen(device as String, Baud as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This opens and initialises the serial device and sets the baud rate.
**Notes:** It sets the port into raw mode (character at a time and no translations), and sets the read timeout
to 10 seconds. The return value is the file descriptor or -1 for any error, in which case errno will be set as
appropriate.

180.1.45  **serialPutchar(fd as Integer, c as Integer)**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Sends the single byte to the serial device identified by the given file descriptor.

180.1.46  **serialPutData(fd as Integer, data as Memoryblock)**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Sends the nul-terminated string to the serial device identified by the given file descriptor. **Notes:** This sends text with any encoding.

180.1.47  **serialPuts(fd as Integer, text as string)**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Sends the nul-terminated string to the serial device identified by the given file descriptor. **Notes:** This sends text with UTF-8 encoding.

180.1.48  **setPadDrive(group as Integer, value as Integer)**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This sets the strength of the pad drivers for a particular group of pins. **Notes:** There are 3 groups of pins and the drive strength is from 0 to 7. Do not use this unless you know what you are doing.

180.1.49  **SPIDataRW(channel as Integer, data as Memoryblock) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** This performs a simultaneous write/read transaction over the selected SPI bus. **Notes:** Data that was in your buffer is overwritten by data returned from the SPI bus.

That's all there is in the helper library. It is possible to do simple read and writes over the SPI bus using the standard read() and write() system calls though write() may be better to use for sending data to chains of shift registers, or those LED strings where you send RGB triplets of data. Devices such as A/D and D/A
converters usually need to perform a concurrent write/read transaction to work.

---

**180.1.50 SPIGetFd(channel as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Queries the file descriptor for a channel.

---

**180.1.51 SPISetup(channel as Integer, speed as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This is the way to initialise a channel (The Pi has 2 channels: 0 and 1).
**Notes:**
The speed parameter is an integer in the range 500,000 through 32,000,000 and represents the SPI clock speed in Hz.

The returned value is the Linux file-descriptor for the device, or -1 on error. If an error has happened, you may use the standard errno global variable to see why.

---

**180.1.52 SPISetupMode(channel as Integer, speed as Integer, mode as Integer) as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This is the way to initialise a channel (The Pi has 2 channels: 0 and 1).
**Notes:**
The speed parameter is an integer in the range 500,000 through 32,000,000 and represents the SPI clock speed in Hz.

The returned value is the Linux file-descriptor for the device, or -1 on error. If an error has happened, you may use the standard errno global variable to see why.

---

**180.1.53 wiringPiSetup as Integer**

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Initializes the library.
**Notes:**
This initialises wiringPi and assumes that the calling program is going to be using the wiringPi pin numbering scheme. This is a simplified numbering scheme which provides a mapping from virtual pin numbers 0
through 16 to the real underlying Broadcom GPIO pin numbers. See the pins page for a table which maps
the wiringPi pin number to the Broadcom GPIO pin number to the physical location on the edge connector.

This function needs to be called with root privileges.

One of the setup functions must be called at the start of your program or your program will fail to work
correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

180.1.54  wiringPiSetupGpio as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. Function:
Initializes the library.
Notes:
This is identical to wiringPiSetup, however it allows the calling programs to use the Broadcom GPIO pin
numbers directly with no re-mapping.

As above, this function needs to be called with root privileges, and note that some pins are different from
revision 1 to revision 2 boards.

One of the setup functions must be called at the start of your program or your program will fail to work
correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

180.1.55  wiringPiSetupPhys as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. Function:
Initializes the library.
Notes:
Identical to wiringPiSetup, however it allows the calling programs to use the physical pin numbers on the
P1 connector only.

As above, this function needs to be called with root privileges.

One of the setup functions must be called at the start of your program or your program will fail to work
correctly. You may experience symptoms from it simply not working to segfaults and timing issues.
180.1.56  wiringPiSetupSys as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Initializes the library.
**Notes:**
This initialises wiringPi but uses the `/sys/class/gpio` interface rather than accessing the hardware directly. This can be called as a non-root user provided the GPIO pins have been exported before-hand using the gpio program. Pin numbering in this mode is the native Broadcom GPIO numbers the same as wiringPiSetupGpio() above, so be aware of the differences between Rev 1 and Rev 2 boards.

Note: In this mode you can only use the pins which have been exported via the `/sys/class/gpio` interface before you run your program. You can do this in a separate shell-script, or by using the system() function from inside your program to call the gpio program.

Also note that some functions have no effect when using this mode as they’re not currently possible to action unless called with root privileges. (although you can use system() to call gpio to set/change modes if needed)

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

180.1.57  wpiPinToGpio(wpiPin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
This returns the BCM_GPIO pin number of the supplied wiringPi pin.
**Notes:** It takes the board revision into account.

180.1.58  Write(fd as Integer, data as Memoryblock) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:**
Write to a file descriptor.
**Notes:**
Write attempts to write bytes to the object referenced by the descriptor fildes from the memoryblock pointed to by data.
Upon successful completion the number of bytes which were written is returned. Otherwise, a -1 is returned and the global variable errno is set to indicate the error.
180.1.59 Properties

180.1.60 ErrNo as Integer

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** The last error code from the underlaying linux functions.

**Notes:**
must be called directly after a function to have the result from that function.
Calling any other function including writing a debug log, may cause this value to be reset.
(Read only property)

180.1.61 LoadError as String

MBS Linux Plugin, Plugin Version: 15.3, Console & Web: Yes, Mac: No, Win: No, Linux: Yes. **Function:** Returns the last load error.

**Notes:** (Read only property)

180.1.62 Constants

180.1.63 kGPIO_CLOCK = 3

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pin mode constants.

**Notes:** GPIO Clock

180.1.64 kHIGH = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** The constant for high value.

180.1.65 kINPUT = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pin mode constants.

**Notes:** Input
180.1.66 kINT\_EDGE\_BOTH = 3

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the interrupt level constants. **Notes:** Both

180.1.67 kINT\_EDGE\_FALLING = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the interrupt level constants. **Notes:** Failing

180.1.68 kINT\_EDGE\_RISING = 2

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the interrupt level constants. **Notes:** Rising

180.1.69 kINT\_EDGE\_SETUP = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the interrupt level constants. **Notes:** Setup

180.1.70 kLOW = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** The constant for low value.

180.1.71 kOUTPUT = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the pin mode constants. **Notes:** Output

180.1.72 kPI\_MAKER\_EGOMAN = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the maker values. **Notes:** Egoman
180.1.73 kPI MAKER MBEST = 4

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the maker values.  
**Notes:** MBest

180.1.74 kPI MAKER QISDA = 3

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the maker values.  
**Notes:** QISDA

180.1.75 kPI MAKER SONY = 2

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the maker values.  
**Notes:** Sony

180.1.76 kPI MAKER UNKNOWN = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the maker values.  
**Notes:** Unknown

180.1.77 kPI MODEL 2 = 6

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.  
**Notes:** Model 2

180.1.78 kPI MODEL A = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.  
**Notes:** Model A

180.1.79 kPI MODEL AP = 5

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.  
**Notes:** Model AP
180.1.80  kPI\_MODEL\_B = 2

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.  
**Notes:** Model B

180.1.81  kPI\_MODEL\_BP = 3

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.  
**Notes:** Model BP

180.1.82  kPI\_MODEL\_CM = 4

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.  
**Notes:** Model CM

180.1.83  kPI\_MODEL\_UNKNOWN = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the model constants.  
**Notes:** unknown

180.1.84  kPI\_VERSION\_1 = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the version constants.  
**Notes:** Version 1

180.1.85  kPI\_VERSION\_1\_1 = 2

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the version constants.  
**Notes:** Version 1.1

180.1.86  kPI\_VERSION\_1\_2 = 3

MBS Linux Plugin, Plugin Version: 15.3. **Function:** One of the version constants.  
**Notes:** Version 1.2
180.1.87  kPI_VERSION_2 = 4

MBS Linux Plugin, Plugin Version: 15.3. **Function**: One of the version constants. **Notes**: Version 2

180.1.88  kPI_VERSIONUNKNOWN = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function**: One of the version constants. **Notes**: Unknown version

180.1.89  kPUD_DOWN = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function**: One of the pull up/down constants. **Notes**: pull to ground

180.1.90  kPUD_OFF = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function**: One of the pull up/down constants. **Notes**: no pull up/down

180.1.91  kPUD_UP = 2

MBS Linux Plugin, Plugin Version: 15.3. **Function**: One of the pull up/down constants. **Notes**: pull to 3.3v

180.1.92  kPWM_MODE_BAL = 1

MBS Linux Plugin, Plugin Version: 15.3. **Function**: One of the PWM generator modes. **Notes**: Balanced

180.1.93  kPWM_MODE_MS = 0

MBS Linux Plugin, Plugin Version: 15.3. **Function**: One of the PWM generator modes. **Notes**: Mark:Space
### 180.1.94 kPWM_OUTPUT = 2

MBS Linux Plugin, Plugin Version: 15.3. **Function**: One of the pin mode constants.  
**Notes**: PWM Output

### 180.1.95 kPWM_TONE_OUTPUT = 6

MBS Linux Plugin, Plugin Version: 15.3. **Function**: One of the pin mode constants.  
**Notes**: Tone Output

### 180.1.96 kSOFT_PWM_OUTPUT = 4

MBS Linux Plugin, Plugin Version: 15.3. **Function**: One of the pin mode constants.  
**Notes**: PWM Output

### 180.1.97 kSOFT_TONE_OUTPUT = 5

MBS Linux Plugin, Plugin Version: 15.3. **Function**: One of the pin mode constants.  
**Notes**: Tone Output
Chapter 181

Wordfile

181.1 class WordFileMBS

181.1.1 class WordFileMBS

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Word file editing.

**Example:**

```vba
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)
if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

**Notes:**

This is a class for reading word files and replacing text to customize document files. Works for xml and docx files. Does not support old doc file format.

Please report document files where plugin corrupted file or failed to replace text.
This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

181.1.2 Methods

181.1.3 Append(other as WordFileMBS) as Boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Appends one word file text to other.

**Notes:**
This function takes document part from other word file and copies its xml nodes to the current document. Please only copy from one document to other if they both are made from same template, so internal IDs for styles match. Returns true on success or false on failure.

181.1.4 AppendTableRow(tag as string) as Integer

MBS XL Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Duplicates a table row containing a placeholder.

**Notes:**
If you have tables in your template word file and you like to duplicate it, this function can do that and add the new row on the end of the table.

Returns Values

- 0 success
- 1 Tag not found.
- 2 Tag found, but not in a table.
- 3 Missing main document part.

181.1.5 Constructor

MBS XL Plugin, Plugin Version: 15.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The private constructor.
181.1.6  DuplicateTableRow(tag as string) as Integer

MBS XL Plugin, Plugin Version: 17.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Duplicates a table row containing a placeholder.

**Notes:**
If you have tables in your template word file and you like to duplicate it, this function can do that and add the new row on just after the row to copy.

Returns Values

0  success
1  Tag not found.
2  Tag found, but not in a table.
3  Missing main document part.

181.1.7  FieldNames as String()

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries field names in the file.

**Notes:** This looks for form fields in a word file.

181.1.8  GetFieldText(fieldName as string, byref text as String) as boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries field value.

**Notes:**
The plugin looks for the field with given name and queries it’s text.
Returns true if field was found.

181.1.9  HasTag(tag as string) as boolean

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks if a tag exists.

**Notes:**
The place holder in the document must start with and end with characters. The place holder you pass here, should not have those quotes.
Returns true on success or false on failure.

If you change font or style of the text within the marker, it will not be recognized. So please keep all text between and including the `and` markers (or whatever is configured) within the same font style.

### 181.1.10 MediaFiles as String()

MBS XL Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Lists the media files in the word document.
**Notes:** e.g. image1.png

### 181.1.11 OpenData(Data as MemoryBlock) as WordFileMBS

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Opens data as document.
**Notes:**
You can pass here XML or Docx file content.
Returns nil in case of an error.
See also:
- 181.1.12 OpenData(Data as String) as WordFileMBS

### 181.1.12 OpenData(Data as String) as WordFileMBS

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Opens data as document.
**Example:**

```vbs
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```
181.1. **CLASS WORDFILEMBS**

**Notes:**
You can pass here XML or Docx file content.
Returns nil in case of an error.
See also:

- 181.1.11 OpenData(Data as MemoryBlock) as WordFileMBS

181.1.13  **OpenXML(XML as String) as WordFileMBS**

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Opens XML file from text string.
**Notes:** Returns nil in case of error.

181.1.14  **Parts as String()**

MBS XL Plugin, Plugin Version: 16.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Queries names of the parts of the document.
**Example:**
```vba
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)
MsgBox w.XML("footer1")
```

**Notes:**
This may tell you how many headers/footers we found in a docx file.
e.g. "footer1", "header1", "document".

181.1.15  **RemoveTableRow(tag as string) as Integer**

MBS XL Plugin, Plugin Version: 17.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Removes a table row containing a placeholder.
**Notes:**
If you have tables in your template word file and you only fill some rows, you can remove superfluous rows using this function.
Returns Values

0 success
1 Tag not found.
2 Tag found, but not in a table.
3 Missing main document part.

181.1.16 ReplaceTag(tag as string, text as string = "", All as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Replaces a placeholder with text.

**Example:**

```vbs
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
    if w.ReplaceTag("LastName", "Miller") then

        f = GetFolderItem("output.docx")
        if w.WriteFile(f) then
            MsgBox "OK"
        end if
    end if
end if
```

**Notes:**

The place holder in the document must start with and end with characters. The place holder you pass here, should not have those quotes.

Returns true on success or false on failure.

If you need to replace multi line text like addresses, please use several placeholders, at least one per line.

Version 17.0 and newer can handle multi line text better for normal paragraphs. It creates for you new paragraphs for each line in the new text.

If you change font or style of the text within the marker, it will not be recognized. So please keep all text
between and including the  and  markers (or whatever is configured) within the same font style.

181.1.17  SetFieldText(fieldName as string, text as String) as boolean

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets field value.
**Notes:**
The plugin looks for the field with given name and sets it’s text. Returns true if field was found.

181.1.18  SetMarkers(openMarker as String, closeMarker as String) as boolean

MBS XL Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the markers to look for before/after a tag.
**Notes:**
Default are  and . Should be different and not empty. Returns true on success or false on failure.

181.1.19  WriteFile(path as folderItem) as boolean

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Writes a file to disk.
**Example:**
```vba
    dim f as FolderItem = GetFolderItem("test.docx")
    dim b as BinaryStream = BinaryStream.Open(f)
    dim d as string = b.Read(b.Length)
    dim w as WordFileMBS = WordFileMBS.OpenData(d)

    if w.ReplaceTag("FirstName", "Peter") then
      if w.ReplaceTag("LastName", "Miller") then
        f = GetFolderItem("output.docx")
        if w.WriteFile(f) then
          MsgBox "OK"
        end if
      end if
    end if
```

Notes: File extension should be correct, either docx or xml depending on what you loaded.

181.1.20 Properties

181.1.21 Caseless as Boolean

MBS XL Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether to compare tag names case insensitive.  
**Notes:**  
Set to true for case insensitive comparison of ASCII characters.  
Default is false.  
(Read and Write property)

181.1.22 CloseMarker as String

MBS XL Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The close marker text.  
**Notes:**  
Default value is ".".  
(Read only property)

181.1.23 OpenMarker as String

**Notes:**  
Default value is ".".  
(Read only property)

181.1.24 Text as String

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Extracts text of word file.  
**Notes:**  
Plugin inserts a few newline characters for detected line ends.
181.1. CLASS WORDFILEMBS

May not give all text. If you miss something, please send us test files.
(Read only property)

181.1.25 XML as String

MBS XL Plugin, Plugin Version: 15.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The XML found in the document.
**Notes:** (Read and Write property)
See also:

- 181.1.27 XML(part as String) as String

181.1.26 MediaFile(name as string) as String

MBS XL Plugin, Plugin Version: 16.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries or replaces the content of a media file.
**Notes:**
You can use this to extract images from word file.
Or to replace a placeholder image with the real image.
For replacement please make sure file type and dimensions match.
Raises KeyNotFoundException if media file with given name is not found.
(Read and Write computed property)

181.1.27 XML(part as String) as String

**Example:**
```vba
    dim f as FolderItem = GetFolderItem("test.docx")
    dim b as BinaryStream = BinaryStream.Open(f)
    dim d as string = b.Read(b.Length)
    dim w as WordFileMBS = WordFileMBS.OpenData(d)
    MsgBox Join(w.Parts, EndOfLine)
```
**Notes:**
See Parts array for possible parts.
(Read and Write computed property)

• 181.1.25 XML as String
Chapter 182

X-Face

182.1  Globals

182.1.1  PictureFromXFaceMemoryBlockMBS(xface as memoryblock) as picture

MBS Picture Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new picture from a X-Face string inside a memoryblock.

**Notes:**
- Returns nil on any error.
- The returned picture is 32 bit depth.

See also:
- 182.1.2 PictureFromXFaceMemoryBlockMBS(xface as memoryblock, size as Integer) as picture

182.1.2  PictureFromXFaceMemoryBlockMBS(xface as memoryblock, size as Integer) as picture

MBS Picture Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new picture from a X-Face string inside a memoryblock with the given size.

**Notes:**
- Returns nil on any error.
- The returned picture is 32 bit depth.

See also:
- 182.1.1 PictureFromXFaceMemoryBlockMBS(xface as memoryblock) as picture
182.1.3  PictureFromXFaceStringMBS(xface as string) as picture

MBS Picture Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a new picture from a X-Face string.

**Notes:**
Returns nil on any error.
The returned picture is 32 bit depth.

182.1.4  XFaceStringFromPictureMBS(pic as picture) as string

MBS Picture Plugin, Plugin Version: 3.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a X-Face encoded string with the picture as content.

**Notes:**
The picture is first converted to a 32 bit picture. Than it’s encoded. A Pixel like c=rgb(r,g,b) is white if
\[(r+g+b) \geq 3*128.\]

Returns "" on any error.
Chapter 183

XL

183.1 class XLAutoFilterMBS

183.1.1 class XLAutoFilterMBS

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: The class for auto filter. Notes: This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

183.1.2 Methods

183.1.3 Column(colId as Integer) as XLFilterColumnMBS

183.1.4 ColumnByIndex(colId as Integer) as XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Returns the specified AutoFilter column which have a filter information by index.
183.1.5 ColumnSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the number of specified AutoFilter columns which have a filter information.

183.1.6 Constructor

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The private constructor.

183.1.7 GetRef(byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the cell range of AutoFilter with header.
**Notes:** Returns false if error. Get error info with XLBookMBS.errorMessage.

183.1.8 GetSort(byref columnIndex as Integer, byref descending as Boolean) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the zero-based index of sorted column in AutoFilter and its sort order.
**Notes:** Returns false if error. Get error info with XLBookMBS.errorMessage.

183.1.9 GetSortRange(byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the whole range of data to sort.
**Notes:** Returns false if error. Get error info with XLBookMBS.errorMessage.

183.1.10 SetRef(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the cell range of AutoFilter with header.
183.1.11 **SetSort(columnIndex as Integer, descending as Boolean)**

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the sorted column in AutoFilter by zero-based index and its sort order.
**Notes:** Returns false if error. Get error info with XLBookMBS.errorMessage.

183.1.12 **Properties**

183.1.13 **Handle as Integer**

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The internal object reference.
**Notes:** (Read and Write property)

183.1.14 **Owner as Variant**

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The parent object.
**Notes:**
Usually the XLFilterColumnMBS object.
(Read only property)
183.2 class XLBookMBS

183.2.1 class XLBookMBS

Notes:
The MBS Xojo (Real Studio) XL Plugin is based on LibXL, a powerful library to handle Excel files.

You’ll need your own license for LibXL. For more information go here: https://www.bluesnap.com/jsp/redirect.jsp?contractId=2284940&referrer=983554

When you have obtained license file inside your XOJO project place XLBookMBS.SetKeyGlobal call with LibXL license in app.open.

183.2.2 Methods

183.2.3 AddCustomNumFormat(customNumFormat as string) as Integer

Notes: The format string customNumFormat indicates how to format and render the numeric value of a cell. See custom format strings guidelines (in FAQ). Returns the custom format identifier. It’s used in XLFormatMBS.NumFormat. Returns 0 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

183.2.4 AddFont(initFont as XLFontMBS = nil) as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Adds a new font to the workbook, initial parameters can be copied from other font.
Notes: Returns NULL if error occurs.

183.2.5 AddFormat(initFormat as XLFormatMBS = nil) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Adds a new format to the workbook, initial parameters can be copied from other format.
Notes: Returns NULL if error occurs.
183.2.6 AddPicture(path as folderitem) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Adds a picture to the workbook.
**Notes:** Returns a picture identifier. Supports BMP, DIB, PNG, JPG and WMF picture formats. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:
- 183.2.7 AddPicture(path as string) as Integer

183.2.7 AddPicture(path as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Adds a picture to the workbook.
**Notes:** Returns a picture identifier. Supports BMP, DIB, PNG, JPG and WMF picture formats. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:
- 183.2.6 AddPicture(path as folderitem) as Integer

183.2.8 AddPictureData(data as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Adds a picture to the workbook from memory buffer:
**Notes:** Returns a picture identifier. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

183.2.9 AddSheet(name as string = "", initSheet as XLSheetMBS = nil) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Adds a new sheet to this book, returns the sheet.
**Notes:**
Use initSheet parameter if you wish to copy an existing sheet.
Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.
183.2.10 available as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the library is available. **Notes:** Returns false on PPC targets.

183.2.11 BiffVersion as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns BIFF version of binary file. **Notes:** Used for xls format only.

183.2.12 BookVersion as Integer

MBS XL Plugin, Plugin Version: 13.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the version number of this book. **Example:**

```vbnet
dim b as new XLBookMBS
dim v as Integer = b.BookVersion

dim h as Integer = v \ 256 \ 256 \ 256

dim m as Integer = v \ 256 \ 256 mod 256

dim l as Integer = v \ 256 mod 256

MsgBox "libXL "+str(h)+"."+str(m)+"."+str(l)
```

**Notes:** Version number is encoded as hex number with major version, minor version and bugfix.

183.2.13 Constructor(xml as boolean = false)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a new XLBookMBS object. **Notes:** xml: If true, creates a book in xlsx format (xml), else one in xls format (binary).
### 183.2.14 CopyContent(dest as XLBookMBS)

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies all content from one book to other book.

**Notes:**
The plugin loops through all sheets and creates matching sheets on new book. Formats and fonts are created on the fly.

This allows you to convert from XLS to XLSX or back. Please report if something is not copied. Of course plugin can only copy what libXL supports, so stuff like movies or diagrams are not copied.

### 183.2.15 CustomNumFormat(fmt as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a custom format string for specified custom format identifier fmt.

**Notes:** See custom format string guidelines (in FAQ). Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

### 183.2.16 DefaultFont(byref fontSize as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a default font name and size for this workbook.

**Notes:** Returns "" if error occurs. Get error info with XLBookMBS.ErrorMessage property.

### 183.2.17 DelSheet(index as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Deletes a sheet with specified index.

**Notes:** Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

### 183.2.18 Font(index as Integer) as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a font with defined index.

**Notes:** Index must be less than return value of fontCount method.
183.2.19  FontCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Returns a number of fonts in this book.

183.2.20  Fonts as XLFontMBS()

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Returns array with all defined fonts.

183.2.21  Format(index as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Returns a format with defined index.
Notes: Index must be less than return value of formatCount method.

183.2.22  FormatCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Returns a number of formats in this book.

183.2.23  Formats as XLFormatMBS()

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Returns array with all defined formats.

183.2.24  InsertSheet(index as Integer, name as string = "", initSheet as XLSheetMBS = nil) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Inserts a new sheet to this book at position index, returns the sheet.
Notes: Use initSheet parameter if you wish to copy an existing sheet. Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.
183.2. **CLASS XLBOOKMBS**

183.2.25 **LibVersion as string**

**Example:**

MsgBox XLBookMBS.LibVersion

**Notes:**

Returns for example "3.8.0".  
With plugin version 17.4 or newer, this returns 4 numbers, so you may see another .0 on the end.

183.2.26 **LibVersionNumber as Integer**

MBS XL Plugin, Plugin Version: 17.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns version of library as number.  
**Example:**

MsgBox str(XLBookMBS.LibVersionNumber)

**Notes:** Returns for example 3 * 256^2 + 8 * 256 + 0.

183.2.27 **Load(path as folderitem) as boolean**

**Notes:**

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn’t match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.

See also:

- 183.2.28 Load(path as string) as boolean
183.2.28 Load(path as string) as boolean

**Notes:**
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn’t match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:
- 183.2.27 Load(path as folderitem) as boolean

183.2.29 Load2(path as folderitem) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a xls-file from file.
**Notes:**
Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:
- 183.2.30 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS
- 183.2.31 Load2(path as string) as XLBookMBS
- 183.2.32 Load2(path as string, byref ErrorMessage as String) as XLBookMBS

183.2.30 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a xls-file from file.
**Example:**
```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("XING contacts.xlsx")
dim e as string
```
183.2.  **CLASS XLBOOKMBS**

```vba
dim b as XLBookMBS = XLBookMBS.Load2(f,e)
if b = nil then
    MsgBox e
    Return
end if

dim s as XLSheetMBS = b.Sheet(0)
MsgBox s.ReadString(1,1)
```

**Notes:**

Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 183.2.29 Load2(path as folderitem) as XLBookMBS
- 183.2.31 Load2(path as string) as XLBookMBS
- 183.2.32 Load2(path as string, byref ErrorMessage as String) as XLBookMBS

### 183.2.31  **Load2(path as string) as XLBookMBS**

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Loads a xls-file from file.

**Example:**

```vba
dim f as FolderItem = SpecialFolder.Desktop.Child("XING contacts.xlsx")
dim b as XLBookMBS = XLBookMBS.Load2(f)
if b = nil then
    MsgBox e
    Return
end if

dim s as XLSheetMBS = b.Sheet(0)
MsgBox s.ReadString(1,1)
```

**Notes:**
Autodetects if format is old (binary) or new (xml). Returns nil if error occurs. On success returns a valid book. Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets. See also:

• 183.2.29 Load2(path as folderitem) as XLBookMBS
• 183.2.30 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS
• 183.2.32 Load2(path as string, byref ErrorMessage as String) as XLBookMBS

183.2.32  Load2(path as string, byref ErrorMessage as String) as XLBookMBS

Notes:
Autodetects if format is old (binary) or new (xml). Returns nil if error occurs. On success returns a valid book. Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets. See also:

• 183.2.29 Load2(path as folderitem) as XLBookMBS
• 183.2.30 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS
• 183.2.31 Load2(path as string) as XLBookMBS

183.2.33  LoadError as String

Example:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.dylib")

if XLBookMBS.LoadLibrary(f) then
  MsgBox "OK"
else
  MsgBox XLBookMBS.LoadError
183.2.34 LoadLibrary(File as FolderItem) as boolean

**Example:**

```vbnet
MsgBox "Version before: " + XLBookMBS.LibVersion

dim f as FolderItem = SpecialFolder.Desktop.Child("libxl.dylib")

if XLBookMBS.LoadLibrary(f) then
    MsgBox "Version after: " + XLBookMBS.LibVersion
else
    MsgBox XLBookMBS.LoadError
end if
```

**Notes:**

Returns true on success or false on failure.

While the plugin comes with an internal libXL library, you can use this method to load a different version of the library.

Packs red, green and blue components in color type. **See also:**

- 183.2.55 PackColor(ColorValue as color) as Integer

183.2.57  **PackDate(d as date) as Double**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Packs date and time information into double type. **See also:**

- 183.2.58 PackDate(year as Integer, month as Integer, day as Integer, hour as Integer = 0, min as Integer = 0, sec as Integer = 0, msec as Integer = 0) as Double
183.2. PackDate(year as Integer, month as Integer, day as Integer, hour as Integer = 0, min as Integer = 0, sec as Integer = 0, msec as Integer = 0) as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Packs date and time information into double type.

See also:
- 183.2.57 PackDate(d as date) as Double

183.2.59 Picture(index as Integer, byref data as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a picture at position index in memory buffer.

**Notes:**
Parameters:
index: position in the workbook
data: reference to buffer

Returns type of picture. See PictureType* constants.

183.2.60 PictureCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a number of pictures in this workbook.

183.2.61 Save(path as folderitem) as boolean

**Notes:** Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:
- 183.2.62 Save(path as folderitem, UseTempFile as Boolean) as boolean

- 183.2.68 SaveRaw(byref data as string) as boolean

183.2.68 SaveRaw(byref data as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Saves a xls-file to internal memory buffer.  
**Notes:** Returns false if error occurs. Get error info with errorMessage property.  
See also:  
- 183.2.67 SaveRaw(byref data as MemoryBlock) as boolean
183.2.69  **SaveRawMT(byref data as MemoryBlock) as boolean**

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Saves document to memoryblock.

**Notes:**
Same as the other method without MT in name, except:
The work is performed on a preemptive thread, so this function can yield time to other Xojo (Real Studio) threads. For best user experience run this command on a Xojo (Real Studio) thread, so your GUI stays responsive.

See also:
- 183.2.70 SaveRawMT(byref data as string) as boolean

183.2.70  **SaveRawMT(byref data as string) as boolean**

MBS XL Plugin, Plugin Version: 17.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Saves document to string.

**Notes:**
Same as the other method without MT in name, except:
The work is performed on a preemptive thread, so this function can yield time to other Xojo (Real Studio) threads. For best user experience run this command on a Xojo (Real Studio) thread, so your GUI stays responsive.

See also:
- 183.2.69 SaveRawMT(byref data as MemoryBlock) as boolean

183.2.71  **SetDefaultFont(fontName as string, fontSize as Integer)**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets a default font name and size for this workbook.

183.2.72  **SetKey(name as string, key as string)**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets customer’s license key.

**Notes:**
Call this once for each XLBookMBS object and before you read or write data.

If you have keys for more than one platform, please use # if condition to make sure you pass right key for current platform.
183.2.73 SetKeyGlobal(name as string, key as string)

MBS XL Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets customer’s license key.

**Example:**

```javascript
// add this to app.open

# if TargetMacOS then
// Mac license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
# elseif TargetLinux then
// Linux license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
# elseif TargetWin32 then
// Win license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
# else
// missing
# endif
```

**Notes:**

You can call this before using the other plugin functions to set key on application startup. Simply call it in app.open event.

If you have keys for more than one platform, please use # if condition to make sure you pass right key for current platform.

183.2.74 SetLocale(locale as string)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the locale.

**Example:**

```javascript
dim book as new XLBookMBS(false)
book.SetLocale "en_US.UTF-8"
```

**Notes:** Sets the locale for this library. It has no effect for unicode projects.
183.2.75  **Sheet(index as Integer) as XLSheetMBS**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the sheet with specified index.  
**Notes:** Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

183.2.76  **SheetCount as Integer**

183.2.77  **Sheets as XLSheetMBS()**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns array with all sheets.  
**Example:**

```vbs
Function SheetByName(book as XLBookMBS, name as string) As XLSheetMBS
    dim sheets() as XLSheetMBS = book.Sheets
    for each s as XLSheetMBS in sheets
        if s.Name = name then
            Return s
        end if
    next
End Function
```

183.2.78  **SheetType(index as Integer) as Integer**

MBS XL Plugin, Plugin Version: 13.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Queries type of the sheet.

183.2.79  **UnpackColor(ColorValue as Integer) as color**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Unpacks color type to red, green and blue components.  
**See also:**

- 183.2.80 UnpackColor(ColorValue as Integer, byref red as Integer, byref green as Integer, byref blue as Integer)
183.2. **CLASS XLBOOKMBS**

183.2.80 **UnpackColor(ColorValue as Integer, byref red as Integer, byref green as Integer, byref blue as Integer)**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Unpacks color type to red, green and blue components.
See also:
- 183.2.79 UnpackColor(ColorValue as Integer) as color

183.2.81 **UnpackDate(Value as Double) as date**

**Notes:** (Read and Write computed property)

183.2.89  **IsDate1904 as boolean**

MBS XL Plugin, Plugin Version: 13.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether dates are 1904 based.

**Notes:**

A boolean value that indicates whether the date systems used in the workbook starts in 1904. True indicates the date system starts in 1904, where January 1, 1904 is the first day in the system. False indicates the workbook uses the 1900 date system, where January 1, 1900 is the first day in the system. (Read and Write computed property)

183.2.90  **IsTemplate as boolean**

MBS XL Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the workbook is template.

**Notes:**

The template flag: true - workbook is template, false - workbook is not template (default). This flag must have a value "true" for template files (xlt and xltx). (Read and Write computed property)

183.2.91  **RefR1C1 as Integer**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the R1C1 reference mode is active.

**Notes:** (Read and Write computed property)
183.2.92  RgbMode as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the RGB mode is active. Used for xlsx format only.  
**Notes:**  
true - RGB mode, false - Index mode (default).  
In RGB mode use colorPack() and colorUnpack() methods for getting/setting colors. Used for xlsx format only.  
(Read and Write computed property)

183.2.93  Constants

183.2.94  PictureTypeDIB = 4

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants.  
**Notes:** DIB format

183.2.95  PictureTypeEMF = 5

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants.  
**Notes:** EMF format

183.2.96  PictureTypeError = & hFF

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants.  
**Notes:** Error. Check XLBookMBS.ErrorMessage method.

183.2.97  PictureTypeGIF = 2

MBS XL Plugin, Plugin Version: 15.3. **Function:** One of the picture format constants.  
**Notes:** GIF format.

183.2.98  PictureTypeJPEG = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants.  
**Notes:** JPEG format.
183.2.99  PictureTypePICT = 6

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants. **Notes:** Mac PICT format.

183.2.100  PictureTypePNG = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants. **Notes:** PNG format

183.2.101  PictureTypeTIFF = 7

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants. **Notes:** TIFF format

183.2.102  PictureTypeWMF = 3

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the picture format constants. **Notes:** WMF format

183.2.103  SheetTypeChart = 1

MBS XL Plugin, Plugin Version: 13.1. **Function:** One of the sheet type constants. **Notes:** Sheet is a chart.

183.2.104  SheetTypeSheet = 0

MBS XL Plugin, Plugin Version: 13.1. **Function:** One of the sheet type constants. **Notes:** This is a normal sheet.
CHAPTER 183. XL

183.2.105  SheetTypeUnknown = 2

MBS XL Plugin, Plugin Version: 13.1. **Function:** One of the sheet type constants. **Notes:** Type is unknown.
183.3. CLASS XLFILTERCOLUMNMBS

183.3  class XLFilterColumnMBS

183.3.1  class XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for filter column. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

183.3.2  Methods

183.3.3  AddFilter(Filter as String)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds the filter value.

183.3.4  Clear

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Clear the filter criteria.

183.3.5  Constructor

183.3.6  Filter(index as Integer) as String

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the filter value by index.

183.3.7  FilterSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of filter values.
CHAPTER 183. XL

183.3.8  FilterType as Integer

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the filter type of this AutoFilter column. **Notes:** can be constants FilterColor, FilterCustom, FilterDynamic, FilterExt, FilterIcon, FilterNotSet, FilterTop10 or FilterValue.

183.3.9  GetCustomFilterEx(byref Op1 as Integer, byref Value1 as String, byref Op2 as Integer, byref Value2 as String, byref andOp as Boolean) as boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the custom filter criteria: **Notes:**

   - op1 - operator used by the filter comparison in the first filter criteria;
   - Value1 - value used in the first filter criteria;
   - op2 - operator used by the filter comparison in the second filter criteria;
   - Value12 - value used in the second filter criteria;
   - andOp - flag indicating whether the two criterias have an "and" relationship. True indicates "and", false indicates "or".

Returns false if error. Get error info with XLBookMBS.errorMessage.

183.3.10  GetTop10(byref value as Double, byref top as boolean, byref percent as boolean) as boolean

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the number of top or bottom items: **Notes:**

   - value - number of items;
   - top - top items if true otherwise bottom items;
   - percent - using percent instead of number items.

Returns false if error. Get error info with XLBookMBS.errorMessage.

183.3.11  Index as Integer

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the zero-based index of this AutoFilter column.
183.3. **CLASS XLFILTERCOLUMNMBS**

183.3.12 **SetCustomFilter(Op as Integer, Value as String)**

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the custom filter criteria:
**Notes:**
- op - operator used by the filter comparison in the filter criteria;
- Value - value used in the filter criteria;

183.3.13 **SetCustomFilterEx(Op1 as Integer, Value1 as String, Op2 as Integer, Value2 as String, andOp as Boolean = false)**

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the custom filter criteria:
**Notes:**
- op1 - operator used by the filter comparison in the first filter criteria;
- Value1 - value used in the first filter criteria;
- op2 - operator used by the filter comparison in the second filter criteria;
- Value2 - value used in the second filter criteria;
- andOp - flag indicating whether the two criterias have an "and" relationship. True indicates "and", false indicates "or".

183.3.14 **SetTop10(value as Double, top as boolean = true, percent as boolean = false)**

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the number of top or bottom items:
**Notes:**
- value - number of items;
- top - top items if true otherwise bottom items;
- percent - using percent instead of number items.

183.3.15 **Properties**

183.3.16 **Handle as Integer**

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The internal object reference.
**Notes:** (Read and Write property)
183.3.17 Owner as Variant

183.3.18 Constants

183.3.19 FilterColor = 4

MBS XL Plugin, Plugin Version: 16.5. Function: One of the filter types. Notes: Specifies the color to filter by.

183.3.20 FilterCustom = 2

183.3.21 FilterDynamic = 3

183.3.22 FilterExt = 6

183.3.23 FilterIcon = 5

MBS XL Plugin, Plugin Version: 16.5. Function: One of the filter types. Notes: Specifies the icon to filter by.
183.3. **CLASS XLFILTERCOLUMNMBS**

183.3.24 **FilterNotSet = 7**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the filter types.  
**Notes:** No filter.

183.3.25 **FilterTop10 = 1**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the filter types.  
**Notes:** The top N (percent or number of items) to filter by.

183.3.26 **FilterValue = 0**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the filter types.  
**Notes:** Filter by specified values.

183.3.27 **OperatorEqual = 0**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the compare operators.  
**Notes:** Equal

183.3.28 **OperatorGreaterThan = 1**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the compare operators.  
**Notes:** Greater than

183.3.29 **OperatorGreaterThanOrEqual = 2**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the compare operators.  
**Notes:** Greater than or equal

183.3.30 **OperatorLessThan = 3**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the compare operators.  
**Notes:** Less than
183.3.31 OperatorLessThanOrEqual = 4

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the compare operators.
**Notes:** Less than or equal

183.3.32 OperatorNotEqual = 5

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the compare operators.
**Notes:** Not equal
183.4. CLASS XLFontMBS

183.4 class XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a font definition.

**Example:**
```vba
dim book as XLBookMBS // your book
dim textFont as XLFontMBS = book.addFont()
textFont.size = 8
textFont.name = "Century Gothic"
```

**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

183.4.2 Methods

183.4.3 Constructor

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The private constructor.

183.4.4 Properties

183.4.5 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The internal object reference.
**Notes:** (Read and Write property)

183.4.6 Owner as Variant

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The owner object.
**Notes:**
As a font is only valid with the owning book, we keep a back reference here.
(Read only property)
183.4.7 Bold as Boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the font is bold. **Notes:** (Read and Write computed property)

183.4.8 ColorValue as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The color of the font. **Example:**

```vbnet
dim book as XLBookMBS // your book
dim textFont as XLFontMBS = book.addFont()
textFont.size = 8
textFont.ColorValue = XLFontMBS.ColorGray25
```

**Notes:**
If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes. (Read and Write computed property)

183.4.9 Italic as Boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the font is italic. **Notes:** (Read and Write computed property)

183.4.10 Name as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The name of the font. **Notes:**
Default name is "Arial". (Read and Write computed property)
183.4. CLASS XLFONTMBS

183.4.11 Script as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The script style of the font.
**Notes:** (Read and Write computed property)

183.4.12 Size as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The size of the font in points.
**Notes:** (Read and Write computed property)

183.4.13 StrikeOut as Boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the font is strikeout.
**Notes:** (Read and Write computed property)

183.4.14 Underline as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The underline style of the font.
**Notes:**
- See Underline* constants.
- (Read and Write computed property)

183.4.15 Constants

183.4.16 ColorAqua = 49

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.17 ColorAuto = & h7Ff

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.
183.4.18  **ColorBlack = 8**
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.19  **ColorBlue = 12**
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.20  **ColorBlueCl = 39**
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.21  **ColorBluegray = 54**
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.22  **ColorBrightgreen = 11**
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.23  **ColorBrown = 60**
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.24  **ColorCoralCf = 29**
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.25  **ColorDarkblue = 18**
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.
183.4. CLASS XLFONTMBS

183.4.26 ColorDarkblueCl = 32

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.27 ColorDarkgreen = 58

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.28 ColorDarkpurpleCf = 28

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.29 ColorDarkred = 16

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.30 ColorDarkredCl = 37

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.31 ColorDarkteal = 56

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.32 ColorDarkyellow = 19

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.33 ColorDefaultBackground = 65

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

**Notes:** Auto
183.4.34  **ColorDefaultForeground = 64**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.  
**Notes:** Auto

183.4.35  **ColorGold = 51**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.36  **ColorGray25 = 22**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.37  **ColorGray40 = 55**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.38  **ColorGray50 = 23**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.39  **ColorGray80 = 63**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.40  **ColorGreen = 17**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.41  **ColorIceblueCf = 31**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.
183.4.42 ColorIndigo = 62
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.43 ColorIvoryCf = 26
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.44 ColorLavender = 46
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.45 ColorLightblue = 48
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.46 ColorLightgreen = 42
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.47 ColorLightorange = 52
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.48 ColorLightturquoise = 41
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.49 ColorLightturquoiseCf = 27
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.
183.4.50  **ColorLightyellow = 43**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.51  **ColorLime = 50**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.52  **ColorNone = & H7F**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the color constants. **Notes:** No color.

183.4.53  **ColorOceanblueCf = 30**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.54  **ColorOlivegreen = 59**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.55  **ColorOrange = 53**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.56  **ColorPaleblue = 44**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.57  **ColorPeriwinkleCf = 24**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.
183.4. CLASS XLFONTMBS

183.4.58  ColorPink = 14

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.59  ColorPinkCl = 33

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.60  ColorPlum = 61

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.61  ColorPlumCf = 25

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.62  ColorRed = 10

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.63  ColorRose = 45

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.64  ColorSeagreen = 57

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.65  ColorSkyblue = 40

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.
183.4.66  ColorTan = 47

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.67  ColorTeal = 21

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.68  ColorTealCl = 38

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.69  ColorTooltip = 81

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.70  ColorTurquoise = 15

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.71  ColorTurquoiseCl = 35

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.72  ColorViolet = 20

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.73  ColorVioletCl = 36

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.
183.4. CLASS XLFONTMBS

183.4.74 ColorWhite = 9
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.75 ColorYellow = 13
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.76 ColorYellowCl = 34
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the color constants.

183.4.77 ScriptNormal = 0
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the script style constants.

183.4.78 ScriptSub = 2
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the script style constants.

183.4.79 ScriptSuper = 1
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the script style constants.

183.4.80 UnderlineDouble = 2
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the underline style constants.

183.4.81 UnderlineDoubleacc = & H22
MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the underline style constants.
183.4.82 UnderlineNone = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the underline style constants.

183.4.83 UnderlineSingle = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the underline style constants.

183.4.84 UnderlineSingleacc = & H21

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the underline style constants.
183.5. CLASS XLFORMATMBS

183.5  class XLFormatMBS

183.5.1  class XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for a format.

**Example:**

```vba
dim book as XLBookMBS // your book
// add font
dim boldFont as XLFontMBS = book.addFont()
boldFont.StrikeOut = true

// add format
dim boldFormat as XLFormatMBS = book.addFormat
boldFormat.font = boldFont

// write on a cell in first sheet
sheet = book.Sheet(0)
call sheet.WriteString(1, 1, ”Sales Receipt”, boldFormat)
```

**Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

183.5.2  Methods

183.5.3  Constructor

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The private constructor.

183.5.4  Rotation as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the text rotation.

**Notes:**
Must be a value from the following table:
### 183.5.5 SetBorder(border as Integer = 1)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Sets the border style.

**Notes:** See BorderStyle* constants.

### 183.5.6 SetBorderColor(ColorValue as Integer)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Sets the border color.

**Notes:** If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.

### 183.5.7 SetFont(font as XLFontMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Sets the font for the format.

**Notes:** To create a new font use XLBookMBS.addFont(). Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

### 183.5.8 SetRotation(rotation as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Sets the text rotation.

**Notes:**

Must be a value from the following table:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

183.5.9 Properties

183.5.10 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference. **Notes:** (Read and Write property)

183.5.11 Owner as Variant

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The object owning this format object. **Notes:** As a format is only valid with the owning book, we keep a back reference here. (Read only property)

183.5.12 AlignH as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The horizontal alignment. **Notes:** See AlignH* constants. (Read and Write computed property)

183.5.13 AlignV as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The vertical alignment. **Notes:** See AlignV* constants. (Read and Write computed property)
183.5.14 BorderBottom as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The bottom border style.
**Notes:**
See BorderStyle* constants.
(Read and Write computed property)

183.5.15 BorderBottomColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The color of the bottom border.
**Notes:**
If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write computed property)

183.5.16 BorderDiagonal as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The diagonal border.
**Notes:**
see BorderDiagonal* constants.
(Read and Write computed property)

183.5.17 BorderDiagonalColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The color of the diagonal border.
**Notes:**
If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
183.5. **CLASS XLFORMATMBS**

(Read and Write computed property)

### 183.5.18 BorderDiagonalStyle as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The diagonal border style.
**Notes:**
See BorderDiagonal* constants.
(Read and Write computed property)

### 183.5.19 BorderLeft as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The left border style.
**Notes:**
See BorderStyle* constants.
(Read and Write computed property)

### 183.5.20 BorderLeftColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The color of the left border.
**Notes:**
If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write computed property)

### 183.5.21 BorderRight as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The right border style.
**Notes:**
See BorderStyle* constants.
(Read and Write computed property)
183.5.22 BorderRightColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The color of the right border.
**Notes:**
If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants). If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write computed property)

183.5.23 BorderTop as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The top border style.
**Notes:**
See BorderStyle* constants.
(Read and Write computed property)

183.5.24 BorderTopColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The color of the top border.
**Notes:**
If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants). If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write computed property)

183.5.25 FillPattern as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The fill pattern.
**Notes:**
183.5. CLASS XLFORMATMBS

See fill pattern constants.
(Read and Write computed property)

183.5.26 Font as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The font for the format.
**Example:**

```vba
' your book
dim book as XLBookMBS

' add font
dim StrikeOutFont as XLFontMBS = book.addFont()
StrikeOutFont.StrikeOut = true

' add format
dim StrikeOutFormat as XLFormatMBS = book.addFormat
StrikeOutFormat.font = StrikeOutFont

' write on a cell in first sheet
sheet = book.Sheet(0)
call sheet.WriteString(1, 1, "Sales Receipt", StrikeOutFormat)
```

**Notes:**
To create a new font use XLBookMBS.addFont(). Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
(Read and Write computed property)

183.5.27 Hidden as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether the hidden protection property is set to true.
**Notes:** (Read and Write computed property)

183.5.28 Indent as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The text indentation level.
**Notes:**
Must be less than or equal to 15.
(Read and Write computed property)

**183.5.29 Locked as boolean**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether the locked protection property is set to true.
**Notes:** (Read and Write computed property)

**183.5.30 NumFormat as Integer**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The number format identifier.
**Notes:**
The identifier must be a valid built-in number format identifier or the identifier of a custom number format.
To create a custom format use XLBookMBS.addCustomNumFormat(). Or use one of the NumFormat* constants.
(Read and Write computed property)

**183.5.31 PatternBackgroundColor as Integer**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The background color of the fill pattern.
**Notes:**
If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write computed property)

**183.5.32 PatternForegroundColor as Integer**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The foreground color of the fill pattern.
**Notes:**
If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes. (Read and Write computed property)

183.5.33  ShrinkToFit as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the cell is shrink-to-fit.  
**Notes:** (Read and Write computed property)

183.5.34  Wrap as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the cell text is wrapped.  
**Notes:** (Read and Write computed property)

183.5.35  Constants

183.5.36  AlignHCenter = 2

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.  
**Notes:** Center

183.5.37  AlignHDistributed = 7

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.  
**Notes:** Distributed

183.5.38  AlignHFill = 4

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.  
**Notes:** Fill
183.5.39  **AlignHGeneral = 0**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.  
**Notes:** Default

183.5.40  **AlignHJustify = 5**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.  
**Notes:** Justify

183.5.41  **AlignHLeft = 1**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.  
**Notes:** Left

183.5.42  **AlignHMerge = 6**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.  
**Notes:** Center over several cells.

183.5.43  **AlignHRight = 3**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the horizontal alignment constants.  
**Notes:** Right

183.5.44  **AlignVBottom = 2**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the vertical alignment constants.  
**Notes:** Bottom

183.5.45  **AlignVCenter = 1**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the vertical alignment constants.  
**Notes:** Center
183.5.46 AlignVDistributed = 4

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the vertical alignment constants. **Notes:** Distributed

183.5.47 AlignVJustify = 3

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the vertical alignment constants. **Notes:** Justify

183.5.48 AlignVTop = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the vertical alignment constants. **Notes:** Top

183.5.49 BorderDiagonalBoth = 3

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the diagonal border style constants.

183.5.50 BorderDiagonalDown = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the diagonal border style constants.

183.5.51 BorderDiagonalNone = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the diagonal border style constants.

183.5.52 BorderDiagonalUp = 2

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the diagonal border style constants.
183.5.53  **BorderStyleDashdot = 9**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.  
**Notes:** dash and dot

183.5.54  **BorderStyleDashdotdot = 11**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.  
**Notes:** dash and dots

183.5.55  **BorderStyleDashed = 3**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.  
**Notes:** dashed

183.5.56  **BorderStyleDotted = 4**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.  
**Notes:** dotted

183.5.57  **BorderStyleDouble = 6**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.  
**Notes:** double

183.5.58  **BorderStyleHair = 7**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.  
**Notes:** hair style

183.5.59  **BorderStyleMedium = 2**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the border style constants.  
**Notes:** medium
183.5. **CLASS XLFORMATMBS**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the number format constants.  
**Notes:** text value
183.6  class XLSheetMBS

183.6.1  class XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class for an Excel worksheet. **Notes:** This is an abstract class. You can’t create an instance, but you can get one from various plugin functions.

183.6.2  Methods

183.6.3  AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String)

MBS XL Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a data validation for the specified range (only for xlsx files). **Notes:**

type: the type of data validation.
op: the relational operator of data validation.
rowFirst: the first row of range;
rowLast: the last row of range;
colFirst: the first column of range;
colLast: the last column of range;
value1: the first value for relational operator;
value2: the second value for ValidationOpBetween or ValidationOpNotBetween operator;
See also:

- 183.6.4 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = "", prompt as String = "", errorTitle as string = "", error as string = "", errorStyle as integer = 0)
183.6.4 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = "", prompt as String = "", errorTitle as String = "", error as String = "", errorStyle as integer = 0)

MBS XL Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a data validation for the specified range (only for xlsx files).

**Notes:**

type: the type of data validation.
op: the relational operator of data validation.
rowFirst: the first row of range;
rowLast: the last row of range;
colFirst: the first column of range;
colLast: the last column of range;
value1: the first value for relational operator;
value2: the second value for ValidationOpBetween or ValidationOpNotBetween operator;
allowBlank: a boolean value indicating whether the data validation treats empty or blank entries as valid, 'true' means empty entries are OK and do not violate the validation constraints;
hideDropDown: a boolean value indicating whether to display the dropdown combo box for a list type data validation (ValidationTypeList);
showInputMessage: a boolean value indicating whether to display the input prompt message;
showErrorMessage: a boolean value indicating whether to display the error alert message when an invalid value has been entered, according to the criteria specified;
promptTitle: title bar text of input prompt;
prompt: message text of input prompt;
errorTitle: title bar text of error alert;
error: message text of error alert;
errorStyle: the style of error alert used for this data validation:

See also:

- 183.6.3 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String)

183.6.5 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double)

MBS XL Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a data validation for the specified range with double or date values for the relational operator (only for xlsx files).

**Notes:** See parameters in the addDataValidation() method.

See also:
183.6. CLASS XLSHEETMBS

- 183.6.6 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = "", prompt as String = "", errorTitle as string = "", error as string = "", errorStyle as integer = 0)

183.6.6 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = "", prompt as String = "", errorTitle as string = "", error as string = "", errorStyle as integer = 0)

MBS XL Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds a data validation for the specified range with double or date values for the relational operator (only for xlsx files).
**Notes:** See parameters in the addDataValidation() method.
See also:

- 183.6.5 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double)

183.6.7 AddHyperlink(hyperlink as string, rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

183.6.8 AddIgnoredError(rowFirst as Integer, colFirst as Integer, rowLast as Integer, colLast as Integer, iError as Integer)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Adds the ignored error for specified range.
**Notes:** It allows to hide green triangles on left sides of cells. For example, if a cell is formatted as text but contains a numeric value, this is considered to be a potential error because the number won’t be treated as a number, for example, in calculations. It is possible to combine a few IgnoredError values with operator | .
Returns false if error occurs. Get error info with XLBookMBS.errorMessage.
183.6.9 AddrToRowCol(addr as string, byref row as Integer, byref col as Integer, byref rowRelative as boolean, byref colRelative as boolean)

MBS XL Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Converts a cell reference to row and column. 

**Example:**

```vbnet
// create new xls file
dim book as new XLBookMBS(false)

// create sheet
dim sheet as XLSheetMBS = book.AddSheet("Sheet1")

dim row, col as Integer
dim rowRelative, colRelative as boolean

sheet.AddrToRowCol("F7", row, col, rowRelative, colRelative)
MsgBox str(row) + " " + str(col) // shows 6 5
```

183.6.10 ApplyFilter

183.6.11 AutoFilter as XLAutoFilterMBS

**Notes:**
Creates it if it doesn’t exist.
Only for xml based files.

183.6.12 CellType(row as Integer, col as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns cell’s type. 

**Notes:** See CellType constants.
183.6.13  Clear(rowFirst as Integer = 0, rowLast as Integer = 1048575, colFirst as Integer = 0, colLast as Integer = 16383)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Clears cells in specified area.

183.6.14  ClearPrintArea

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Clears the print area.

183.6.15  ClearPrintRepeats

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Clears repeated rows and columns on each page.

183.6.16  ColWidth(col as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns column width.

183.6.17  Constructor

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The private constructor.

183.6.18  CopyCell(rowSrc as Integer, colSrc as Integer, rowDst as Integer, colDst as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Copies cell with format from (rowSrc, colSrc) to (rowDst, colDst).
**Notes:** Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
183.6.19 CopyRow(dest as XLSheetMBS, SourceRow as Integer, DestRow as Integer)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies a row from one sheet to another. **Notes:**

Sheets can be in different books.
This copies most properties and all cells.
If something is missing, please let us know.

---

183.6.20 CopySheet(dest as XLBookMBS)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies a sheet to the other book. **Notes:**

This copies most properties and all cells.
If something is missing, please let us know.
See also:

- 183.6.21 CopySheet(dest as XLSheetMBS)

---

183.6.21 CopySheet(dest as XLSheetMBS)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Copies the sheet content to the other sheet. **Notes:**

This copies most properties and all cells.
If something is missing, please let us know.
See also:

- 183.6.20 CopySheet(dest as XLBookMBS)

---

183.6.22 DelHyperlink(index as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes hyperlink by index. **Notes:** Index: The index from 0 to HyperlinkSize.
183.6.23 DelMerge(row as Integer, col as Integer) as boolean

**Notes:** Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

183.6.24 DelMergeByIndex(index as Integer) as Boolean

**Notes:** Index: From 0 to MergeSize-1.

183.6.25 DelNamedRange(name as string, scopeId as Integer = -2) as boolean

MBS XL Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Deletes the named range by name.
**Notes:**
Returns false if error occurs. Get error info with XLBookMBS.errorMessage().
scopeId - index of sheet for local named range or ScopeWorkbook for global named range.

183.6.26 FirstCol as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the first column in the sheet that contains a used cell.

183.6.27 FirstRow as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the first row in the sheet that contains a used cell.

183.6.28 Footer as string

**Notes:**
The footer text appears at the bottom of every page when printed. The length of the text must be less than or equal to 255. The footer text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Margin is specified in inches.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&amp; L</td>
<td>specifies the beginning of the left section</td>
</tr>
<tr>
<td>&amp; P</td>
<td>specifies the current page number</td>
</tr>
<tr>
<td>&amp; N</td>
<td>specifies the total number of pages</td>
</tr>
<tr>
<td>&amp; \d {1,3}</td>
<td>specifies the text font size, where font size is measured in points, for example: &amp; 9 or &amp; 36</td>
</tr>
<tr>
<td>&amp; S</td>
<td>specifies whether the strikethrough text style is on or off</td>
</tr>
<tr>
<td>&amp; X</td>
<td>specifies whether the superscript text style is on or off</td>
</tr>
<tr>
<td>&amp; Y</td>
<td>specifies whether the subscript text style is on or off</td>
</tr>
<tr>
<td>&amp; C</td>
<td>specifies the beginning of the center section</td>
</tr>
<tr>
<td>&amp; D</td>
<td>specifies a date</td>
</tr>
<tr>
<td>&amp; T</td>
<td>specifies a time</td>
</tr>
<tr>
<td>&amp; G</td>
<td>specifies a picture</td>
</tr>
<tr>
<td>&amp; U</td>
<td>specifies whether the single underline text style is on or off</td>
</tr>
<tr>
<td>&amp; E</td>
<td>specifies whether the double underline text style is on or off</td>
</tr>
<tr>
<td>&amp; R</td>
<td>specifies the beginning of the right section</td>
</tr>
<tr>
<td>&amp; Z</td>
<td>specifies a workbook file path</td>
</tr>
<tr>
<td>&amp; F</td>
<td>specifies a workbook file name</td>
</tr>
<tr>
<td>&amp; A</td>
<td>specifies a sheet name</td>
</tr>
<tr>
<td>&amp; ”fontname”</td>
<td>specifies the text font, for example: &amp; ”Comic Sans MS”</td>
</tr>
<tr>
<td>&amp; B</td>
<td>specifies whether the bold text style is on or off</td>
</tr>
<tr>
<td>&amp; I</td>
<td>specifies whether the italic text style is on or off</td>
</tr>
<tr>
<td>&amp; &amp;</td>
<td>specifies an ampersand character (&amp; )</td>
</tr>
</tbody>
</table>

183.6.29 FooterMargin as Double

183.6.30 GetHorPageBreak(index as Integer) as Integer

183.6.31  GetHorPageBreakCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Returns a number of horizontal page breaks in the sheet.
Example:

```vbnet
// new document
dim x as new XLBookMBS

// add a sheet
dim s as XLSheetMBS = x.AddSheet

// write a cell
call s.WriteString(5,5, "Hello")

// now put a page break there
if s.SetHorPageBreak(5, true) then
    // and now we have one at row 5
    MsgBox str(s.GetHorPageBreakCount)+" "+str(s.GetHorPageBreak(0))
end if
```

183.6.32  GetMerge(row as Integer, col as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Gets merged cells for cell at row, col.
Notes:
Result is written in rowFirst, rowLast, colFirst, colLast.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

183.6.33  GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Gets the named range coordinates by name.
Notes: Returns false if specified named range isn’t found or error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 183.6.34 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer, ScopeID as Integer, byref Hidden as Integer) as boolean
183.6.34  GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer, ScopeID as Integer, byref Hidden as Integer) as boolean

MBS XL Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the named range coordinates by name.

**Notes:**
- `scopeId` - index of sheet for local named range or SCOPE_WORKBOOK for global named range.
- `hidden` - true if named range is hidden and false if isn’t.

Returns false if specified named range isn’t found or error occurs. Get error info with XLBookMBS.errorMessage.

See also:

- 183.6.33 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean

---

183.6.35  GetPicture(index as Integer, byref rowTop as Integer, byref colLeft as Integer, byref rowBottom as Integer, byref colRight as Integer, byref width as Integer, byref height as Integer, byref offsetX as Integer, byref offsetY as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a workbook picture index at position index in worksheet.

**Notes:**
- Output parameters:
  - `(rowTop, colLeft)` - top left position of picture;
  - `(rowBottom, colRight)` - bottom right position of picture;
  - `width` - width of picture in pixels;
  - `height` - height of picture in pixels;
  - `offset_x` - horizontal offset of picture in pixels;
  - `offset_y` - vertical offset of picture in pixels.

Use XLBookMBS.getPicture() for extracting binary data of picture by workbook picture index.

Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.
183.6.36 GetPrintArea(byref rowFirst as Integer, byref colFirst as Integer, byref rowLast as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the print area.
**Notes:** Returns false if print area isn’t found.

183.6.37 GetPrintFit(byref wPages as Integer, byref hPages as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns whether fit to page option is enabled.
**Notes:**
Output parameters:
wPages - number of pages the sheet width is fit to;
hPages - number of pages the sheet height is fit to.

183.6.38 GetPrintRepeatCols(byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets repeated columns on each page from colFirst to colLast.
**Notes:** Returns false if repeated columns aren’t found.

183.6.39 GetPrintRepeatRows(byref rowFirst as Integer, byref rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets repeated rows on each page from rowFirst to rowLast.
**Notes:** Returns false if repeated rows aren’t found.

183.6.40 GetTopLeftView(byref row as Integer, byref col as Integer)

MBS XL Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Extracts the first visible row and the leftmost visible column of the sheet.
**Example:**
```
// create new xls file
dim book as new XLBookMBS(false)
```
// create sheet
dim sheet as XLSheetMBS = book.AddSheet("Sheet1")

// set top left view
sheet.SetTopLeftView(2,3)

// read values
dim col, row as Integer
sheet.GetTopLeftView(row, col)

MsgBox str(Row)+", "+str(col) // shows 2, 3

183.6.41 GetVerPageBreak(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns column with vertical page break at position index.

183.6.42 GetVerPageBreakCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns a number of vertical page breaks in the sheet.

183.6.43 GroupCols(colFirst as Integer, colLast as Integer, collapsed as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Groups columns from colFirst to colLast.
**Notes:** Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

183.6.44 GroupRows(rowFirst as Integer, rowLast as Integer, collapsed as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Groups rows from rowFirst to rowLast.
**Notes:** Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
183.6.45 Header as string

**Notes:**
The text appears at the top of every page when printed. The length of the text must be less than or equal to 255. The header text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Special commands are represented by single letter with a leading ampersand ("& "). Margin is specified in inches.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&amp; L</td>
<td>specifies the beginning of the left section</td>
</tr>
<tr>
<td>&amp; P</td>
<td>specifies the current page number</td>
</tr>
<tr>
<td>&amp; N</td>
<td>specifies the total number of pages</td>
</tr>
<tr>
<td>&amp; \d { 1,3 }</td>
<td>specifies the text font size, where font size is measured in points, for example: &amp; 9 or &amp; 36</td>
</tr>
<tr>
<td>&amp; S</td>
<td>specifies whether the strikethrough text style is on or off</td>
</tr>
<tr>
<td>&amp; X</td>
<td>specifies whether the superscript text style is on or off</td>
</tr>
<tr>
<td>&amp; Y</td>
<td>specifies whether the subscript text style is on or off</td>
</tr>
<tr>
<td>&amp; C</td>
<td>specifies the beginning of the center section</td>
</tr>
<tr>
<td>&amp; D</td>
<td>specifies a date</td>
</tr>
<tr>
<td>&amp; T</td>
<td>specifies a time</td>
</tr>
<tr>
<td>&amp; G</td>
<td>specifies a picture</td>
</tr>
<tr>
<td>&amp; U</td>
<td>specifies whether the single underline text style is on or off</td>
</tr>
<tr>
<td>&amp; E</td>
<td>specifies whether the double underline text style is on or off</td>
</tr>
<tr>
<td>&amp; R</td>
<td>specifies the beginning of the right section</td>
</tr>
<tr>
<td>&amp; Z</td>
<td>specifies a workbook file path</td>
</tr>
<tr>
<td>&amp; F</td>
<td>specifies a workbook file name</td>
</tr>
<tr>
<td>&amp; A</td>
<td>specifies a sheet name</td>
</tr>
<tr>
<td>&amp; &quot;fontname&quot;</td>
<td>specifies the text font, for example: &amp; &quot;Comic Sans MS&quot;</td>
</tr>
<tr>
<td>&amp; B</td>
<td>specifies whether the bold text style is on or off</td>
</tr>
<tr>
<td>&amp; I</td>
<td>specifies whether the italic text style is on or off</td>
</tr>
<tr>
<td>&amp; &amp;</td>
<td>specifies an ampersand character (&amp; )</td>
</tr>
</tbody>
</table>

183.6.46 HeaderMargin as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The header margin in inches.
183.6.47  **Hyperlink(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as String**

183.6.48  **HyperlinkSize as Integer**

MBS XL Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of hyperlinks in the sheet.

183.6.49  **InsertCol(colFirst as Integer, colLast as Integer) as boolean**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Inserts columns from colFirst to colLast.  
**Notes:** Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

183.6.50  **InsertRow(rowFirst as Integer, rowLast as Integer) as boolean**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Inserts rows from rowFirst to rowLast.  
**Notes:** Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

183.6.51  **IsDate(row as Integer, col as Integer) as boolean**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks that cell contains a date or time value.

183.6.52  **IsFormula(row as Integer, col as Integer) as boolean**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Checks that cell contains a formula.
183.6. **CLASS XLSHEETMBS**

### 183.6.53 LastCol as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the zero-based index of the column after the last column in the sheet that contains a used cell. **Example:**

```vbs
dim book as XLBookMBS ' your book instance

// get first sheet
dim sheet as XLSheetMBS = book.Sheet(0)

// show index of last column
dim LastCol as Integer = sheet.LastCol

MsgBox "LastCol: " + str(LastCol)
```

### 183.6.54 LastRow as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the zero-based index of the row after the last row in the sheet that contains a used cell. **Example:**

```vbs
dim book as XLBookMBS ' your book instance

// get first sheet
dim sheet as XLSheetMBS = book.Sheet(0)

// show index of last row
dim LastRow as Integer = sheet.LastRow

MsgBox "LastRow: " + str(LastRow)
```

### 183.6.55 Merge(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the merged cells by index.
183.6.56 MergeSize as Integer

MBS XL Plugin, Plugin Version: 14.3. Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a number of merged cells in this worksheet.

183.6.57 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer) as string

MBS XL Plugin, Plugin Version: 11.3. Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the named range coordinates by index.

See also:

- 183.6.58 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref scopeId as Integer, byref Hidden as Boolean) as string

183.6.58 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref scopeId as Integer, byref Hidden as Boolean) as string

MBS XL Plugin, Plugin Version: 14.0. Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the named range coordinates by index.

**Notes:**

- scopeId - index of sheet for local named range or ScopeWorkbook for global named range.
- hidden - true if named range is hidden and false if isn’t.

See also:

- 183.6.57 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer) as string

183.6.59 NamedRangeCount as Integer

MBS XL Plugin, Plugin Version: 11.3. Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns the number of named ranges in the sheet.

183.6.60 PictureCount as Integer

MBS XL Plugin, Plugin Version: 11.3. Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Returns a number of pictures in this worksheet.
183.6. CLASS XLSHEETMBS

183.6.61 ReadBlank(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Reads format from blank cell.

**Notes:**
Returns false if specified cell isn’t blank or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 183.6.62 ReadBlank(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean

183.6.62 ReadBlank(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Reads format from blank cell.

**Notes:**
Returns false if specified cell isn’t blank or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 183.6.61 ReadBlank(row as Integer, col as Integer) as boolean

183.6.63 ReadBoolean(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Reads a boolean value and its format from cell.

**Notes:**
If nil format is returned then an error occurred. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

- 183.6.64 ReadBoolean(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean
183.6.64  **ReadBoolean** *(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean*

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a boolean value and its format from cell.  
**Notes:**  
If nil format is returned then an error occured. Get error info with XLBookMBS.ErrorMessage property.  
Col and Row are zero based.  
Please remember that Excel files have limits like 65536 rows and 256 columns.  
See also:  
- 183.6.63 ReadBoolean*(row as Integer, col as Integer)* as boolean

183.6.65  **ReadComment** *(row as Integer, col as Integer) as string*

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a comment from specified cell.  
**Notes:**  
Col and Row are zero based.  
Please remember that Excel files have limits like 65536 rows and 256 columns.

183.6.66  **ReadDate** *(row as Integer, col as Integer) as date*

MBS XL Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a date/time and its format from cell.  
**Notes:**  
Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.  
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.  
Col and Row are zero based.  
Please remember that Excel files have limits like 65536 rows and 256 columns.

MBS XL Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a date/time and its format from cell.  
**Notes:**
183.6. CLASS XLSHEETMBS

Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double. If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property. Col and Row are zero based. Please remember that Excel files have limits like 65536 rows and 256 columns. See also:

- 183.6.66 ReadDate(row as Integer, col as Integer) as date

183.6.68  ReadError(row as Integer, col as Integer) as Integer

See ErrorType* constants. Col and Row are zero based. Please remember that Excel files have limits like 65536 rows and 256 columns.

183.6.69  ReadFormula(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Reads a formula string and its format from cell. Notes:

Returns nil if specified cell doesn’t contain formula or error occurs. Get error info with XLBookMBS.ErrorMessage property. Col and Row are zero based. Please remember that Excel files have limits like 65536 rows and 256 columns. See also:

- 183.6.70 ReadFormula(row as Integer, col as Integer, byref format as XLFormatMBS) as string

183.6.70  ReadFormula(row as Integer, col as Integer, byref format as XLFormatMBS) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Reads a formula string and its format from cell. Notes:

Returns nil if specified cell doesn’t contain formula or error occurs. Get error info with XLBookMBS.ErrorMessage property. Col and Row are zero based. Please remember that Excel files have limits like 65536 rows and 256 columns. See also:
• 183.6.69 ReadFormula(row as Integer, col as Integer) as string

183.6.71 ReadNumber(row as Integer, col as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Reads a number or date/time and its format from cell. Notes:
Use XLBookMBS.dateUnpack() for extract date/time parts from double. If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property. Col and Row are zero based. Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:
• 183.6.72 ReadNumber(row as Integer, col as Integer, byref format as XLFormatMBS) as Double

183.6.72 ReadNumber(row as Integer, col as Integer, byref format as XLFormatMBS) as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Reads a number or date/time and its format from cell. Notes:
Use XLBookMBS.dateUnpack() for extract date/time parts from double. If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property. Col and Row are zero based. Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:
• 183.6.71 ReadNumber(row as Integer, col as Integer) as Double

183.6.73 ReadString(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Reads a string and its format from cell. Notes:
Returns "" if specified cell doesn’t contain string or error occurs. Get error info with XLBookMBS.ErrorMessage property. Col and Row are zero based. Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:
• 183.6.74 ReadString(row as Integer, col as Integer, byref format as XLFormatMBS) as string
183.6.74  **ReadString** (row as Integer, col as Integer, byref format as XLFormatMBS) as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Reads a string and its format from cell.

**Notes:**
- Returns "" if specified cell doesn’t contain string or error occurs. Get error info with XLBookMBS.ErrorMessage property.
- Col and Row are zero based.
- Please remember that Excel files have limits like 65536 rows and 256 columns.

See also:
- 183.6.73 **ReadString** (row as Integer, col as Integer) as string

183.6.75  **RemoveCol** (colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes columns from colFirst to colLast.

**Notes:** Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

183.6.76  **RemoveComment** (row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes a comment from the cell (only for xls format).

183.6.77  **RemoveDataValidations**

MBS XL Plugin, Plugin Version: 17.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Removes all data validations for the sheet (only for xlsx files).

183.6.78  **RemoveFilter**

183.6.79 RemoveRow(rowFirst as Integer, rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Removes rows from rowFirst to rowLast.
**Notes:** Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

183.6.80 RowColToAddr(row as Integer, col as Integer, rowRelative as boolean = true, colRelative as boolean = true) as string

MBS XL Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Converts row and column to a cell reference.
**Example:**
```vbscript
// create new xls file
dim book as new XLBookMBS(false)

// create sheet
dim sheet as XLSheetMBS = book.AddSheet("Sheet1")

MsgBox sheet.RowColToAddr(5,5) // shows F6
MsgBox sheet.RowColToAddr(5,5,false,false) // shows $ F$ 6
```

183.6.81 RowHeight(row as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns row height.

183.6.82 SetAutoFitArea(rowFirst as Integer = 0, colFirst as Integer = 0, rowLast as Integer = -1, colLast as Integer = -1)

MBS XL Plugin, Plugin Version: 15.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the borders for autofit column widths feature.
**Notes:** The method setCol with -1 width value will affect only to the specified limited area.

183.6.83 SetCol(colFirst as Integer, colLast as Integer, width as Double, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets column width and format for all columns from colFirst to colLast.
Notes:
If format is nil then format is ignored. Columns may be hidden. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Column width measured as the number of characters of the maximum digit width of the numbers 0, 1, 2, ..., 9 as rendered in the normal style’s font. Value -1 is used for autofit column widths. If format equals 0 then format is ignored. Columns may be hidden.

183.6.84 SetFooter(footer as string, margin as Double) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Sets the footer text for the sheet when printed.

Notes:
The footer text appears at the bottom of every page when printed. The length of the text must be less than or equal to 255. The footer text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. See setHeader for details. Margin is specified in inches.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&amp; L</td>
<td>specifies the beginning of the left section</td>
</tr>
<tr>
<td>&amp; P</td>
<td>specifies the current page number</td>
</tr>
<tr>
<td>&amp; N</td>
<td>specifies the total number of pages</td>
</tr>
<tr>
<td>&amp; \d { 1,3 }</td>

<td>specifies whether the bold text style is on or off</td>
</tr>
<tr>
<td>&amp; I</td>
<td>specifies whether the italic text style is on or off</td>
</tr>
<tr>
<td>&amp; &amp;</td>
<td>specifies an ampersand character (&amp; )</td>
</tr>
</tbody>
</table>
183.6.85  SetHeader(header as string, margin as Double) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the header text of the sheet when printed.
**Notes:**
The text appears at the top of every page when printed. The length of the text must be less than or equal to 255. The header text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Special commands are represented by single letter with a leading ampersand ("& "). Margin is specified in inches.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&amp; L</td>
<td>specifies the beginning of the left section</td>

<tr>
<td>&amp; &amp;</td>
<td>specifies an ampersand character ( &amp; )</td>
</tr>
</tbody>
</table>

183.6.86  SetHorPageBreak(row as Integer, pageBreak as boolean = true) as boolean

**Example:**
183.6. CLASS XLSHEETMBS

// new document
dim x as new XLBookMBS

// add a sheet
dim s as XLSheetMBS = x.AddSheet

// write a cell
call s.WriteString(5, 5, "Hello")

// now put a page break there
if s.SetHorPageBreak(5, true) then
  // and now we have one at row 5
  MsgBox str(s.GetHorPageBreakCount)+" "+str(s.GetHorPageBreak(0))
end if

Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

183.6.87 SetMerge(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Sets merged cells for range: rowFirst - rowLast, colFirst - colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

183.6.88 SetNamedRange(name as string, rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer, scopeId as Integer = -2) as boolean

MBS XL Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function:
Sets the named range.
Notes:
scopeId - index of sheet for local named range or ScopeWorkbook for global named range.
Returns false if error occurs. Get error info with XLBookMBS.errorMessage.
183.6.89  **SetPicture(row as Integer, col as Integer, PictureID as Integer, scale as Double = 1.0, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets a picture with pictureId identifier at position row and col with scale factor.  
**Notes:** Use XLBookMBS.addPicture() for getting picture identifier.  
See also:

- 183.6.90 **SetPicture(row as Integer, col as Integer, PictureID as Integer, width as Integer, height as Integer, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)**

183.6.90  **SetPicture(row as Integer, col as Integer, PictureID as Integer, width as Integer, height as Integer, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets a picture with pictureId identifier at position row and col with custom size.  
**Notes:** Use XLBookMBS.addPicture() for getting a picture identifier.  
See also:

- 183.6.89 **SetPicture(row as Integer, col as Integer, PictureID as Integer, scale as Double = 1.0, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)**

183.6.91  **SetPrintArea(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the print area.

183.6.92  **SetPrintFit(wPages as Integer, hPages as Integer)**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Fits sheet width and sheet height to wPages and hPages respectively.

183.6.93  **SetPrintRepeatCols(colFirst as Integer, colLast as Integer)**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets repeated columns on each page from colFirst to colLast.
183.6.94 SetPrintRepeatRows(rowFirst as Integer, rowLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets repeated rows on each page from rowFirst to rowLast.

183.6.95 SetProtectEx(protect as boolean = true, password as string = "", enhancedProtection as Integer = -1)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Protects/unprotects the sheet with password and enhanced parameters below. **Notes:** It is possible to combine a few EnhancedProtection values with operator BitwiseOr.

183.6.96 SetRow(row as Integer, height as Double, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets row height and format. **Notes:**

If format is nil then format is ignored. Row may be hidden. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Height is in points. If you want to convert from pixels to points you can use this calculation: `points = pixels * 72 / 96`. So for a height of 72 pixel, you pass 54 points.

183.6.97 SetTabColor(colorValue as Integer)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the color for the sheet’s tab.

183.6.98 SetTabRgbColor(red as Integer, green as Integer, blue as Integer)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the color for the sheet’s tab.
183.6.99  **SetTopLeftView(row as Integer, col as Integer)**

MBS XL Plugin, Plugin Version: 12.2, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sets the first visible row and the leftmost visible column of the sheet. **Example:**

```vba
' create new xls file
Dim book As New XLBookMBS(False)

' create sheet
Dim sheet As XLSheetMBS = book.AddSheet("Sheet1")

' set top left view
sheet.SetTopLeftView(2,3)

' read values
Dim col, row As Integer
sheet.GetTopLeftView(row, col)
MsgBox str(row) + "," + str(col) ' shows 2, 3
```

183.6.100  **SetVerPageBreak(row as Integer, pageBreak as boolean = true) as boolean**

183.6.101  **Split(row as Integer, col as Integer)**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Splits a sheet at position (row, col). **Notes:** Splits a sheet at position (row, col) or specifies the position of frozen pane. This function allows to freeze a header at top position or freeze some columns on the right.

183.6.102  **SplitInfo(byref row as Integer, byref col as Integer) as Boolean**

MBS XL Plugin, Plugin Version: 14.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Gets the split information (position of frozen pane) in the sheet. **Notes:**
183.6. CLASS XLSHEETMBS

row: vertical position of the split;
col: horizontal position of the split.
Returns true on success.
183.6.103 Table(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref headerRowCount as Integer, byref totalsRowCount as Integer) as string

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Gets the table parameters by index.

**Notes:**
- headerRowCount - the number of header rows showing at the top of the table. 0 means that the header row is not shown.
- totalsRowCount - the number of totals rows that shall be shown at the bottom of the table. 0 means that the totals row is not shown.

Returns a string representing the name of the table.

183.6.104 TableSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the number of tables in the sheet.

183.6.105 WriteBlank(row as Integer, col as Integer, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Writes blank cell with specified format.

**Notes:**
- Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
- Col and Row are zero based.
- Please remember that Excel files have limits like 65536 rows and 256 columns.

183.6.106 WriteBoolean(row as Integer, col as Integer, value as boolean, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Writes a bool value into cell with specified format.

**Notes:**
- If format is nil then format is ignored.
- Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
- Col and Row are zero based.
183.6. CLASS XLSHEETMBS

Please remember that Excel files have limits like 65536 rows and 256 columns.

183.6.107 WriteComment(row as Integer, col as Integer, value as string, author as string, width as Integer, height as Integer)

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a comment to the cell.

**Notes:**
- row and col: cell’s position
- value: comment string
- author: author string
- width: width of text box in pixels
- height: height of text box in pixels

Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

183.6.108 WriteDate(row as Integer, col as Integer, value as date, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a date/time into cell with specified format.

**Notes:**
- If format is nil then format is ignored. Internally uses XLBookMBS.datePack() for packing date/time parts to double.
- Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
- Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

183.6.109 WriteError(row as Integer, col as Integer, Error as Integer, format as XLFormatMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes error into the cell with specified format.

**Notes:** If format equals nil then format is ignored.
183.6.110 WriteFormula(row as Integer, col as Integer, value as string, format as XLFormatMBS = nil) as boolean

Notes:
If format is nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
As LibXL does not calculate the result of the formula, it will not encode the result in the Excel file. It does only store the formula, so an app opening the file will have to do the calculation. But QuickLook on Mac OS X does not calculate, so results do not show there.
Examples for formulas are: "TODAY()", "IF(C1>0;ABS(C1*D1);"""")", "SUM(E16:E38)" or "E39+E39*E40".

183.6.111 WriteFormulaBool(row as Integer, col as Integer, Expression as string, value as Boolean, format as XLFormatMBS = nil) as boolean

Notes:
If format equals nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

183.6.112 WriteFormulaNum(row as Integer, col as Integer, Expression as string, value as Double, format as XLFormatMBS = nil) as boolean

Notes: If format equals nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

183.6.113 WriteFormulaString(row as Integer, col as Integer, Expression as string, value as String, format as XLFormatMBS = nil) as boolean

Notes: If format equals nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.errorMessage.
183.6. **CLASS XLSHEETMBS**

### 183.6.114 WriteNumber(row as Integer, col as Integer, value as Double, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a number or date/time into cell with specified format. **Notes:**

If format is nil then format is ignored. Use XLBookMBS.datePack() for packing date/time parts to double. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property. Col and Row are zero based. Please remember that Excel files have limits like 65536 rows and 256 columns.

### 183.6.115 WriteString(row as Integer, col as Integer, value as string, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Writes a string into cell with specified format. **Notes:**

If format is nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property. Col and Row are zero based. Please remember that Excel files have limits like 65536 rows and 256 columns.

### 183.6.116 Properties

**183.6.117 Book as XLBookMBS**

MBS XL Plugin, Plugin Version: 15.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The parent book. **Notes:**

As a sheet is only valid with the owning book, we keep a back reference here. (Read only property)

**183.6.118 Handle as Integer**

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The internal object reference. **Notes:** (Read and Write property)
183.6.119  **CellFormat**(row as Integer, col as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The cell’s format.
**Notes:** (Read and Write computed property)

183.6.120  **ColHidden**(col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether column is hidden.
**Notes:** (Read and Write computed property)

183.6.121  **DisplayGridlines** as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether the gridlines are displayed.
**Notes:**
True if gridlines are displayed and false if aren’t.
(Assigning a value to this property calls setDisplayGridlines internally)
(Read and Write computed property)

183.6.122  **GroupSummaryBelow** as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether grouping rows summary is below.
**Notes:**
True if summary is below and false if isn’t.
(Read and Write computed property)

183.6.123  **GroupSummaryRight** as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether grouping columns summary is right.
**Notes:**
Returns true if summary is right and false if isn’t.
(Read and Write computed property)
183.6.124  HCenter as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether the sheet is centered horizontally when printed.
**Notes:** (Read and Write computed property)

183.6.125  Hidden as Integer

MBS XL Plugin, Plugin Version: 12.1, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Specifies the visible state of this sheet.
**Notes:**
(Read and Write computed property)

183.6.126  Landscape as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether to use landscape or portrait mode for printing.
**Notes:**
true - pages are printed using landscape mode, false - pages are printed using portrait mode.
(Read and Write computed property)

183.6.127  MarginBottom as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The bottom margin of the sheet in inches.
**Notes:** (Read and Write computed property)

183.6.128  MarginLeft as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The left margin of the sheet in inches.
**Notes:** (Read and Write computed property)
183.6.129 MarginRight as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The right margin of the sheet in inches.
**Notes:** (Read and Write computed property)

183.6.130 MarginTop as Double

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The top margin of the sheet in inches.
**Notes:** (Read and Write computed property)

183.6.131 Name as string

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The name of the sheet.
**Notes:** (Read and Write computed property)

183.6.132 Paper as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The paper size.
**Notes:**
See Paper* constants.
(Read and Write computed property)

183.6.133 PrintGridlines as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether the gridlines are printed.
**Notes:**
True if gridlines are printed and false if aren’t.
(Read and Write computed property)
183.6.134  PrintRowCol as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether the row and column headers are printed.
**Notes:** (Read and Write computed property)

183.6.135  PrintZoom as Integer

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Scaling factor for printing as a percentage.
**Notes:** (Read and Write computed property)

183.6.136  Protect as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether sheet is protected.
**Notes:** (Read and Write computed property)

183.6.137  RightToLeft as boolean

MBS XL Plugin, Plugin Version: 14.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether the text is displayed in right-to-left mode.
**Notes:**
true - the text is displayed in right-to-left mode,
false - the text is displayed in left-to-right mode.
(Read and Write computed property)

183.6.138  RowHidden(row as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether row is hidden.
**Notes:** (Read and Write computed property)

183.6.139  VCenter as boolean

MBS XL Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Whether the sheet is centered vertically when printed.
183.6.140  Zoom as Integer

Notes:
100 is a usual view.
(Read and Write computed property)

183.6.141  Constants

183.6.142  CellTypeBlank = 4

MBS XL Plugin, Plugin Version: 11.3. Function: One of the cell type constants.
Notes: blank

183.6.143  CellTypeBoolean = 3

MBS XL Plugin, Plugin Version: 11.3. Function: One of the cell type constants.
Notes: boolean value

183.6.144  CellTypeEmpty = 0

MBS XL Plugin, Plugin Version: 11.3. Function: One of the cell type constants.
Notes: empty

183.6.145  CellTypeError = 5

MBS XL Plugin, Plugin Version: 11.3. Function: One of the cell type constants.
Notes: error
183.6. CLASS XLSHEETMBS

183.6.146  CellTypeNumber = 1

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the cell type constants. **Notes:** number value

183.6.147  CellTypeString = 2

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the cell type constants. **Notes:** string value

183.6.148  ErrorTypeDiv0 = 7

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the error type constants. **Notes:** DIV/0!

183.6.149  ErrorTypeNA = & h2A

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the error type constants. **Notes:** N/A

183.6.150  ErrorTypeName = & h1D

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the error type constants. **Notes:** NAME?

183.6.151  ErrorTypeNoError = & hFF

MBS XL Plugin, Plugin Version: 14.3. **Function:** One of the error type constants. **Notes:** No Error.

183.6.152  ErrorTypeNull = 0

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the error type constants. **Notes:** NULL!
183.6.153  ErrorTypeNum = & h24

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the error type constants. 
**Notes:** NUM!

183.6.154  ErrorTypeRef = & h17

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the error type constants. 
**Notes:** REF!

183.6.155  ErrorTypeValue = & h0F

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the error type constants. 
**Notes:** VALUE!

183.6.156  IgnoreErrorDataValidation = 128

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the ignore error constants. 
**Notes:** Ignore errors when a cell’s value in a Table does not comply with the Data Validation rules specified.

183.6.157  IgnoreErrorEmptyCellref = 2

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the ignore error constants. 
**Notes:** Ignore errors when formulas refer to empty cells.

183.6.158  IgnoreErrorEvalError = 1

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the ignore error constants. 
**Notes:** Ignore errors when cells contain formulas that result in an error.

183.6.159  IgnoreErrorInconsistFormula = 16

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the ignore error constants. 
**Notes:** Ignore errors when a formula in a region of your worksheet differs from other formulas in the same region.
183.6. **CLASS XLSHEETMBS**

183.6.160 **IgnoreErrorInconsistRange = 8**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the ignore error constants.  
**Notes:** Ignore errors when formulas omit certain cells in a region.

183.6.161 **IgnoreErrorNoError = 0**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the ignore error constants.  
**Notes:** No error.

183.6.162 **IgnoreErrorNumberStoredAsText = 4**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the ignore error constants.  
**Notes:** Ignore errors when numbers are formatted as text or are preceded by an apostrophe.

183.6.163 **IgnoreErrorTwodiTextYear = 32**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the ignore error constants.  
**Notes:** Ignore errors when formulas contain text formatted cells with years represented as 2 digits.

183.6.164 **IgnoreErrorUnlockFormula = 64**

MBS XL Plugin, Plugin Version: 16.5. **Function:** One of the ignore error constants.  
**Notes:** Ignore errors when unlocked cells contain formulas.

183.6.165 **Paper10X11 = 45**

MBS XL Plugin, Plugin Version: 11.3. **Function:** One of the paper format constants.

183.6.166 **Paper10X14 = 16**

**Notes:** Data validation which checks if a value is less than a specified value.

183.6.312 **ValidationOpLessthanorequal = 5**

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the validation operations.  
**Notes:** Data validation which checks if a value is less than or equal to a specified value.

183.6.313 **ValidationOpNotbetween = 1**

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the validation operations.  
**Notes:** Data validation which checks if a value is not between two other values.

183.6.314 **ValidationOpNotequal = 3**

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the validation operations.  
**Notes:** Data validation which checks if a value is not equal to a specified value.

183.6.315 **ValidationTypeCustom = 7**

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.  
**Notes:** Data validation which uses a custom formula to check the cell value.

183.6.316 **ValidationTypeDate = 4**

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.  
**Notes:** Data validation which checks for date values satisfying the given condition.
183.6.317  ValidationTypeDecimal = 2

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.  
**Notes:** Data validation which checks for decimal values satisfying the given condition.

183.6.318  ValidationTypeList = 3

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.  
**Notes:** Data validation which checks for a value matching one of list of values.

183.6.319  ValidationTypeNone = 0

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.  
**Notes:** No data validation.

183.6.320  ValidationTypeTextLength = 6

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.  
**Notes:** Data validation which checks for text values, whose length satisfies the given condition.

183.6.321  ValidationTypeTime = 5

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.  
**Notes:** Data validation which checks for time values satisfying the given condition.

183.6.322  ValidationTypeWhole = 1

MBS XL Plugin, Plugin Version: 17.2. **Function:** One of the constants for the types of data validation.  
**Notes:** Data validation which checks for whole number values satisfying the given condition.
Chapter 184

XMP

184.1 class XMPAssertNotifyMBS

184.1.1 class XMPAssertNotifyMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: This class provides a way to get notified for Assertion. Notes: Only one instance can be registered at a given time.

184.1.2 Events

184.1.3 Assert(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: An assertion was reported. Example:

Sub Assert(text as string)
    MsgBox text
End Sub

Notes: Display it to the user or just log it for debugging.
184.2 class XMPDateTimeMBS

184.2.1 class XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The expanded type for a date and time.
**Notes:**
Dates and time in the serialized XMP are ISO 8601 strings. The XMPDateTimeMBS class allows easy conversion with other formats.

DateTime values are occasionally used in cases with only a date or only a time component. A date without a time has zeros in the XMPDateTimeMBS class for all time fields. A time without a date has zeros for all date fields (year, month, and day).

184.2.2 Methods

184.2.3 ClearTimeZone

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Resets the timezone by setting all time zone properties to zero.

184.2.4 Clone as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Creates a copy of this date.
**Notes:** Not just a new reference to the same object, but a real copy.

184.2.5 Compare(other as XMPDateTimeMBS) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Compare the order of two date/time values.
**Notes:**
Returns:
-1 if self is before other or other=nil
0 if self matches other
+1 if self is after other
184.2. CLASS XMPDATETIMEMBS

184.2.6 Constructor

Notes: The returned time is UTC, properly adjusted for the local time zone. The resolution of the time is not guaranteed to be finer than seconds.
See also:

- 184.2.7 Constructor(text as string)

184.2.7 Constructor(text as string)

See also:

- 184.2.6 Constructor

184.2.8 ConvertToLocalTime

Notes: If the time zone is not the local zone, the time is adjusted and the time zone set to be local.

184.2.9 ConvertToUTCTime

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Make sure a time is UTC.
Notes: If the time zone is not UTC, the time is adjusted and the time zone set to be UTC.

184.2.10 IsDateOnly as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Whether only the date is defined for this datetime object.

184.2.11 IsTimeOnly as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Whether only the time is defined for this datetime object.
184.2.12 Operator_Convert as string

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from date/time to string.
See also:

- 184.2.13 Operator_Convert(text as string)

184.2.13 Operator_Convert(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to date/time.
See also:

- 184.2.12 Operator_Convert as string

184.2.14 SetTimeZone

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Set the local time zone.
**Notes:** Any existing time zone value is replaced, the other date/time fields are not adjusted in any way.

184.2.15 Str as string

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from date/time to string.

184.2.16 Properties

184.2.17 Day as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The day of the month in the range 1..31.
**Notes:** (Read and Write property)

184.2.18 hasDate as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A property to tell if the date is defined in this object.
184.2. CLASS XMPDATETIMEMBS

Notes: (Read and Write property)

184.2.19 hasTime as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A property to tell if the time is defined in this object. **Notes:** (Read and Write property)

184.2.20 hasTimeZone as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Whether there is a time zone set. **Notes:** (Read and Write property)

184.2.21 Hour as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The hour in the range 0..23. **Notes:** (Read and Write property)

184.2.22 Minute as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The minute in the range 0..59. **Notes:** (Read and Write property)

184.2.23 Month as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The month in the range 1..12. **Notes:** (Read and Write property)

184.2.24 NanoSecond as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Nanoseconds within a second, often left as zero.
184.2.25 Second as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The second in the range 0..59. **Notes:** (Read and Write property)

184.2.26 TimezoneHour as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The time zone hour in the range 0..23. **Notes:** (Read and Write property)

184.2.27 TimezoneMinute as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The time zone minute in the range 0..59. **Notes:** (Read and Write property)

184.2.28 TimezoneSign as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The "sign" of the time zone, 0 means UTC, -1 is west, +1 is east. **Notes:** The "sign" of the time zone, kTimeIsUTC (0) means UTC, kTimeWestOfUTC (-1) is west, kTimeEastOfUTC (+1) is east. (Read and Write property)

184.2.29 Year as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The year, can be negative. **Notes:** (Read and Write property)
184.2.31  \texttt{kXMP\_TimeEastOfUTC} = 1

MBS XMP Plugin, Plugin Version: 9.4. \textbf{Function:} One of the constants for the TimezoneSign property. \textbf{Notes:} UTC time.

184.2.32  \texttt{kXMP\_TimeIsUTC} = 0

MBS XMP Plugin, Plugin Version: 9.4. \textbf{Function:} One of the constants for the TimezoneSign property. \textbf{Notes:} Time zone is east of UTC.

184.2.33  \texttt{kXMP\_TimeWestOfUTC} = -1

MBS XMP Plugin, Plugin Version: 9.4. \textbf{Function:} One of the constants for the TimezoneSign property. \textbf{Notes:} Time zone is west of UTC.
184.3 class XMPExceptionMBS

184.3.1 class XMPExceptionMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The exception class for the other XMP classes.

**Notes:**

For current plugins (6.4): Windows and MachO works, Carbon/Classic PEF crashes on an exception. Linux not tested.

Nearly every method or function may raise this exception, so catch it!
Subclass of the RuntimeException class.
184.4. CLASS XMPFILESMBS

184.4  class XMPFilesMBS

184.4.1  class XMPFilesMBS

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  **Function:**
The class for access to the main (document-level) metadata in a file.

**Notes:**
The Adobe XMP Toolkit’s file handling component, XMPFiles, is a front end to a set of format-specific file handlers that support file I/O for XMP. The file handlers implement smart, efficient support for those file formats for which the means to embed XMP is defined in the XMP Specification. Where possible, this support allows:

- Injection of XMP where none currently exists
- Expansion of XMP without regard to existing padding
- Reconciliation of the XMP and other legacy forms of metadata.

TXMPFiles is designed for use by clients interested in the metadata and not in the primary file content; the Adobe Bridge application is a typical example. TXMPFiles is not intended to be appropriate for files authored by an application; that is, those files for which the application has explicit knowledge of the file format.

Supported file formats:
PDF, PostScript, EPS, JPEG, JPEG2K, TIFF, GIF, PNG, SWF, FLA, FLV, MOV, AVI, CIN, WAV, MP3, SES, CEL, MPEG, MPEG2, MPEG4, WMAV, AIFF, P2, XDCAM_FAM, XDCAM_SAM, XDCAM_EX, AVCHD, SonyHDV, HTML, XML, Text, Photoshop, Illustrator, InDesign, AEProject, AEProjTemplate, AEFilterPreset, EncoreProject, PremiereProject, PremiereTitle and UCF.

Based on the XMP-Toolkit-SDK from Adobe.

This constructor crashes on Linux with 14.0 plugins and Real Studio 2011r1 and 2011r3. Some change in 2011r4 makes it work, so up to Xojo 2014 we don’t see the crash.

184.4.2  Methods

184.4.3  CanPutXMP(xmpPacket as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes.  **Function:**
CanPutXMP() reports whether this file can be updated with a specific XMP packet.

**Notes:** Use to determine if the file can probably be updated with a given set of XMP metadata. This
depends on the size of the packet, the options with which the file was opened, and the capabilities of the handler for the file format. The function obtains the length of the serialized packet for the provided XMP, but does not keep it or modify it, and does not cause the file to be written when closed.

See also:

- 184.4.4 CanPutXMP(xmpPacket as XMPMetaMBS) as boolean

### 184.4.4 CanPutXMP(xmpPacket as XMPMetaMBS) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

CanPutXMP() reports whether this file can be updated with a specific XMP packet, passed in a string object.

See also:

- 184.4.3 CanPutXMP(xmpPacket as string) as boolean

### 184.4.5 CheckFileFormat(path as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

CheckFileFormat() tries to determine the format of a file.

**Notes:**

CheckFileFormat tries to determine the format of a file, returning an format value. It uses the same logic as OpenFile will use to select a smart handler.

path: The path for the file, appropriate for the local operating system. Passed as a UTF-8 string. The path is the same as would be passed to OpenFile.

Returns the file’s format if a smart handler would be selected, otherwise kUnknownFile.

### 184.4.6 CheckPackageFormat(path as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

CheckPackageFormat() tries to determine the format of a "package" folder.

**Notes:**

CheckPackageFormat tries to determine the format of a "package" given the name of the top level folder, returning an XMP_FileFormat value. Examples of recognized packages include the video formats P2, XDCAM, or Sony HDV. These packages contain collections of "clips", stored as multiple files in specific subfolders.

Path: The path for the top level folder, appropriate for the local operating system. Passed as an UTF-8 string. The path is not the same as would be passed to OpenFile. For example
the path passed to CheckPackageFormat might be "/MyMovie", while the path passed to OpenFile would be "/MyMovie/SomeClip".

Returns the package’s format if a smart handler would be selected, otherwise kUnknownFile.

### 184.4.7 CloseFile(closeFlags as Integer)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

CloseFile() explicitly closes an opened file.

**Notes:**

Performs any necessary output to the file and closes it. Files that are opened for update are written to only when closing.

If the file is opened for read-only access (passing kOpenForRead), the disk file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.

If the file is opened for update (passing kOpenForUpdate), the disk file remains open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().

**closeFlags:** Option flags for optional closing actions. This bit-flag constant is defined:

- kUpdateSafely - Write into a temporary file then swap for crash safety.

### 184.4.8 Constructor

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

Default constructor initializes an object that is associated with no file.

**Notes:** The destructor does not call CloseFile(); pending updates are lost when the destructor is run.

See also:

- 184.4.9 Constructor(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0) 20702
- 184.4.10 Constructor(path as string, format as Integer=& h20202020, OpenFlags as Integer=0) 20703
184.4.9 Constructor(path as folderItem, format as Integer=& h20202020, Open-Flags as Integer=0)

MBS XMP Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Opens a file for metadata access.

**Notes:**

Opens a file for the requested forms of metadata access. Opening the file at a minimum causes the raw XMP packet to be read from the file. If the file handler supports legacy metadata reconciliation then legacy metadata is also read, unless kOpenOnlyXMP is passed. If the file handler supports native thumbnails and kOpenCacheTNail is passed, the native thumbnail is cached.

If the file is opened for read-only access (passing kOpenForRead), the disk file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.

If the file is opened for update (passing kOpenForUpdate), the disk file remains open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().

Typically, the XMP is not parsed and legacy reconciliation is not performed until GetXMP() is called, but this is not guaranteed. Specific file handlers might do earlier parsing of the XMP. Delayed parsing and early disk file close for read-only access are optimizations to help clients implementing file browsers, so that they can access the file briefly and possibly display a thumbnail, then postpone more expensive XMP processing until later.

**path:** The path for the file, appropriate for the local operating system.

**format:** The format of the file. If the format is unknown (kUnknownFile) the format is determined from the file content. The first handler to check is guessed from the file's extension. Passing a specific format value is generally just a hint about what file handler to try first (instead of the one based on the extension). If kOpenStrictly is set, then any format other than kUnknownFile requires that the file actually be that format; otherwise an exception is thrown.

**openFlags:** A set of option flags that describe the desired access. By default (zero) the file is opened for read-only access and the format handler decides on the level of reconciliation that will be performed. A logical OR of these bit-flag constants:

- kOpenForRead - Open for read-only access.
- kOpenForUpdate - Open for reading and writing.
- kOpenOnlyXMP - Only the XMP is wanted, no reconciliation.
- kOpenCacheTNail - Cache thumbnail if possible, GetThumbnail will be called.
- kOpenStrictly - Be strict about locating XMP and reconciling with other forms. By default, a best effort is made to locate the correct XMP and to reconcile XMP with other forms (if reconciliation is done). This option forces stricter rules, resulting in exceptions for errors. The definition of strictness is specific to each handler, there might be no difference.
184.4. CLASS XMPFILESMBS

- kOpenUseSmartHandler - Require the use of a smart handler.
- kOpenUsePacketScanning - Force packet scanning, do not use a smart handler.

Throws an exception for serious problems.

- 184.4.8 Constructor
- 184.4.10 Constructor(path as string, format as Integer=& h20202020, OpenFlags as Integer=0)

184.4.10 Constructor(path as string, format as Integer=& h20202020, OpenFlags as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Alternate constructor associates the new XMPFiles object with a specific file.

**Notes:**
Calls OpenFile() to open the specified file after performing a default construct.

path: The path for the file, specified as an UTF-8 string. (On MacOSX use UnixpathMBS)
format: A format hint for the file, if known.
openFlags: Options for how the file is to be opened (for read or read/write, for example). Use a logical OR of these bit-flag constants:

- kOpenForRead
- kOpenForUpdate
- kOpenOnlyXMP
- kOpenCacheTNail
- kOpenStrictly
- kOpenUseSmartHandler
- kOpenUsePacketScanning
- kOpenLimitedScanning
- kOpenInBackground

The destructor does not call CloseFile(); pending updates are lost when the destructor is run.

See also:

- 184.4.8 Constructor
- 184.4.9 Constructor(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0)
184.4.11 GetFileInfo(byref path as string, byref openFlags as UInt32, byref format as UInt32, byref handlerFlags as UInt32) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
GetFileInfo() retrieves basic information about an opened file.
**Notes:**
- path: A buffer in which to return the path passed to OpenFile(). Can be null if value is not wanted.
- openFlags: A variable in which to return the option flags passed to OpenFile.
- format: A variable in which to return the file format.
- handlerFlags: [ out ] A variable in which to return the handler’s capability flags.

Returns true if the file object is in the open state; that is, OpenFile() has been called but CloseFile() has not. False otherwise. Even if the file object is open, the actual disk file might be closed in the host file-system sense; see OpenFile().

184.4.12 GetFormatInfo(format as Integer, byref handlerFlags as UInt32) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
GetFormatInfo() reports what features are supported for a specific file format.
**Example:**
```vbscript
dim flags as UInt32
if XMPFilesMBS.GetFormatInfo(XMPFilesMBS.kJPEGFile, flags) then
    if BitwiseAnd(flags, XMPFilesMBS.kCanInjectXMP) <> 0 then
        MsgBox "Can inject first-time XMP into an existing file."
    end if

    if BitwiseAnd(flags, XMPFilesMBS.kCanExpand) <> 0 then
        MsgBox "Can expand XMP or other metadata in an existing file."
    end if

    if BitwiseAnd(flags, XMPFilesMBS.kCanRewrite) <> 0 then
        MsgBox "Can copy one file to another, writing new metadata (as in SaveAs)."
    end if

    if BitwiseAnd(flags, XMPFilesMBS.kCanReconcile) <> 0 then
        MsgBox "Supports reconciliation between XMP and other forms."
    end if
end if
```
if BitwiseAnd(flags, XMPFilesMBS.kAllowsOnlyXMP) <> 0 then
    MsgBox "Allows access to just the XMP, ignoring other forms."
end if

if BitwiseAnd(flags, XMPFilesMBS.kReturnsTNail) <> 0 then
    MsgBox "File handler returns native thumbnail information."
end if

if BitwiseAnd(flags, XMPFilesMBS.kReturnsRawPacket) <> 0 then
    MsgBox "File handler returns raw XMP packet information and string."
end if

end if

Notes:
The file handlers for different file formats vary considerably in what features they support. Support depends on both the general capabilities of the format and the implementation of the handler for that format.

format: The file format whose support flags are desired.
handlerFlags: A variable in which to return a logical OR of option bit flags.
The following constants are defined:

- kCanInjectXMP - Can inject first-time XMP into an existing file.
- kCanExpand - Can expand XMP or other metadata in an existing file.
- kCanRewrite - Can copy one file to another, writing new metadata (as in SaveAs)
- kCanReconcile - Supports reconciliation between XMP and other forms.
- kAllowsOnlyXMP - Allows access to just the XMP, ignoring other forms.

This is only meaningful if kCanReconcile is set.

- kReturnsTNail - File handler returns native thumbnail information.
- kReturnsRawPacket - File handler returns raw XMP packet information and string.

Even if kReturnsRawPacket is set, the returned packet information might have an offset of -1 to indicate an unknown offset. While all file handlers should be able to return the raw packet, some might not know the offset of the packet within the file. This is typical in cases where external libraries are used. These cases might not even allow return of the raw packet.
Returns true if the format has explicit "smart" support, false if the format is handled by the default packet scanning plus heuristics.

184.4.13 GetVersionInfo as XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
GetVersionInfo() retrieves version information for the XMPFiles component.

184.4.14 GetXMP(byref xmp as XMPMetaMBS, byref xmppacket as string, byref PacketInfo as XMPPacketInfoMBS) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
GetXMP() retrieves the XMP metadata from an open file.
**Notes:**
The function reports whether XMP is present in the file; you can choose to retrieve any or all of the parsed XMP, the raw XMP packet, or information about the raw XMP packet. The options provided when the file was opened determine if reconciliation is done with other forms of metadata.

- **xmp:** An XMP object in which to return the parsed XMP metadata.
- **xmppacket:** An string in which to return the raw XMP packet as stored in the file. The encoding of the packet is given in the packetInfo. Returns an empty string if the low level file handler does not provide the raw packet.
- **packetInfo:** A packetinfo object in which to return the location and form of the raw XMP in the file. PacketInfo.charForm and PacketInfo.writeable reflect the raw XMP in the file. The parsed XMP property values are always UTF-8. The writeable flag is taken from the packet trailer; it applies only to "format ignorant" writing. The PacketInfo object always reflects the state of the XMP in the file. The offset, length, and character form do not change as a result of calling PutXMP() unless the file is also written. Some file handlers might not return location or contents of the raw packet string. To determine whether one does, check the kReturnsRawPacket bit returned by GetFormatInfo(). If the low-level file handler does not provide the raw packet location, PacketInfo.offset and PacketInfo.length are both 0, PacketInfo.charForm is UTF-8, and PacketInfo.writeable is false.

184.4.15 OpenFile(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0) as boolean

MBS XMP Plugin, Plugin Version: 10.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Alternate constructor associates the new XMPFiles object with a specific file.
**Notes:**
Calls OpenFile() to open the specified file after performing a default construct.
path: The path for the file, specified as folderitem.
format: A format hint for the file, if known.
onOpenFlags: Options for how the file is to be opened (for read or read/write, for example). Use a logical OR of these bit-flag constants:

- kOpenForRead
- kOpenForUpdate
- kOpenOnlyXMP
- kOpenCacheTNail
- kOpenStrictly
- kOpenUseSmartHandler
- kOpenUsePacketScanning
- kOpenLimitedScanning
- kOpenInBackground

The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 184.4.16 OpenFile(path as string, format as Integer=& h20202020, OpenFlags as Integer=0) as boolean

184.4.16 OpenFile(path as string, format as Integer=& h20202020, OpenFlags as Integer=0) as boolean

Notes:

Opens a file for the requested forms of metadata access. Opening the file at a minimum causes the raw XMP packet to be read from the file. If the file handler supports legacy metadata reconciliation then legacy metadata is also read, unless kOpenOnlyXMP is passed. If the file handler supports native thumbnails and kOpenCacheTNail is passed, the native thumbnail is cached.
If the file is opened for read-only access (passing kOpenForRead), the disk file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.
If the file is opened for update (passing kOpenForUpdate), the disk file remains open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().
Typically, the XMP is not parsed and legacy reconciliation is not performed until GetXMP() is called, but this is not guaranteed. Specific file handlers might do earlier parsing of the XMP. Delayed parsing and early disk file close for read-only access are optimizations to help clients implementing file browsers, so that they can access the file briefly and possibly display a thumbnail, then postpone more expensive XMP processing until later.

path: The path for the file, specified as an UTF-8 string. (On MacOSX use UnixpathMBS)
format: The format of the file. If the format is unknown (kUnknownFile) the format is determined from the file content. The first handler to check is guessed from the file’s extension. Passing a specific format value is generally just a hint about what file handler to try first (instead of the one based on the extension). If kOpenStrictly is set, then any format other than kUnknownFile requires that the file actually be that format; otherwise an exception is thrown.
openFlags: A set of option flags that describe the desired access. By default (zero) the file is opened for read-only access and the format handler decides on the level of reconciliation that will be performed. A logical OR of these bit-flag constants:

- kOpenForRead - Open for read-only access.
- kOpenForUpdate - Open for reading and writing.
- kOpenOnlyXMP - Only the XMP is wanted, no reconciliation.
- kOpenCacheThumb - Cache thumbnail if possible, GetThumbnail will be called.
- kOpenStrictly - Be strict about locating XMP and reconciling with other forms. By default, a best effort is made to locate the correct XMP and to reconcile XMP with other forms (if reconciliation is done). This option forces stricter rules, resulting in exceptions for errors. The definition of strictness is specific to each handler, there might be no difference.
- kOpenUseSmartHandler - Require the use of a smart handler.
- kOpenUsePacketScanning - Force packet scanning, do not use a smart handler.

Returns true if the file is successfully opened and attached to a file handler. False for anticipated problems, such as passing kOpenUseSmartHandler but not having an appropriate smart handler. Throws an exception for serious problems.

- 184.4.15 OpenFile(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0) as boolean

184.4.17 PutXMP(xmpPacket as string)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: PutXMP() updates the XMP metadata in this object without writing out the file, Notes: Overloads the basic form of the function, allowing you to pass the metadata as a string object instead of an XMP object. It is otherwise identical; see details in the canonical form. See also:
184.4. CLASS XMPFILESMBS

- 184.4.18 PutXMP(xmpPacket as XMPMetaMBS)

184.4.18 PutXMP(xmpPacket as XMPMetaMBS)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: PutXMP() updates the XMP metadata in this object without writing out the file. Notes: This function supplies new XMP for the file. However, the disk file is not written until the object is closed with CloseFile(). The options provided when the file was opened determine if reconciliation is done with other forms of metadata. See also:

- 184.4.17 PutXMP(xmpPacket as string)

184.4.19 Events

184.4.20 Abort as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Function: This event is called periodically to allow a user to cancel time-consuming operations. Notes: The event should return true to signal an abort, which results in an exception being thrown.

184.4.21 Constants

184.4.22 kAEFilterPresetFile = & h46465820

**Notes:** Only the XMP is wanted, allows space/time optimizations.

184.4.71 kOpenRepairFile = & h00000100

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
**Notes:** Attempt to repair a file opened for update, default is to not open (throw an exception).

184.4.72 kOpenStrictly = & h00000100

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
**Notes:** Be strict about locating XMP and reconciling with other forms.

184.4.73 kOpenUsePacketScanning = & h00000040

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
**Notes:** Force packet scanning, do not use a smart handler.

184.4.74 kOpenUseSmartHandler = & h00000020

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for OpenFile().
**Notes:** Require the use of a smart handler.
184.4. CLASS XMPFILESMBS

184.4.75  k2File = & h50322020

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type. 
**Notes:** a collection not really a single file

184.4.76  kPDFFile = & h50444620

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

184.4.77  kPhotoshopFile = & h50534420

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

184.4.78  kPNGFile = & h504E4720

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

184.4.79  kPostScriptFile = & h50532020

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type. 
**Notes:** general PostScript following DSC conventions

184.4.80  kPrefersInPlace = 8

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for GetFormatInfo 
**Notes:** Can expand, but prefers in-place update.

184.4.81  kPremiereProjectFile = & h5052504A

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
184.4.82  kPremiereTitleFile = & h5052544C

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

184.4.83  kReturnsRawPacket = & h00000040

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for GetFormatInfo
**Notes:** File handler returns raw XMP packet information.

184.4.84  kReturnsT Nail = & h00000080

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for GetFormatInfo
**Notes:** File handler returns native thumbnail.

184.4.85  kSESFile = & h53455320

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
**Notes:** Audition session

184.4.86  kSonyHDVFile = & h53484456

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
**Notes:** a collection not really a single file

184.4.87  kSWFFile = & h53574620

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

184.4.88  kTextFile = & h74657874

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
184.4. CLASS XMPFILESMBS

184.4.89  kTIFFFile = & h54494646

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

184.4.90  kUCFFile = & h55434620

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
**Notes:** Universal Container Format

184.4.91  kUnknownFile = & h20202020

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
**Notes:** Unknown file format constant

184.4.92  kUnknownLength = -1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** Constant for an unknown packet length within a file.

184.4.93  kUnknownOffset = -1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** Constant for an unknown packet offset within a file.

184.4.94  kUpdateSafely = 1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for Close-File().
**Notes:** Write into a temporary file and swap for crash safety.

184.4.95  kUseNullTermination = 0

MBS XMP Plugin, Plugin Version: 9.4. **Function:** The length constants for a string to determine the length automatically.
184.4.96 kUsesSidecarXMP = \& h00000800

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for GetFormatInfo  
**Notes:** The file handler uses a "sidecar" file for the XMP.

184.4.97 kWAVFile = \& h57415620

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.

184.4.98 kWMAVFile = \& h574D4156

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.  
**Notes:** Windows Media Audio and Video

184.4.99 kXDCAM_EXFile = \& h58444358

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.  
**Notes:** a collection not really a single file

184.4.100 kXDCAM_FAMFile = \& h58444346

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.  
**Notes:** a collection not really a single file

184.4.101 kXDCAM_SAMFile = \& h58444353

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.  
**Notes:** a collection not really a single file

184.4.102 kXMLFile = \& h584D4C20

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants to specify a file type.
184.5. class XMPIteratorMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The XMPIteratorMBS class provides a uniform means to iterate over several XMP data structures, including the schema and properties within an XMP object plus global tables such as registered namespaces.

**Notes:**

Note: Only XMP object iteration is implemented at this time. There are no table iterators yet.

Iteration over the schema and properties within an XMP object is the most important and complex use of XMPIteratorMBS. It is helpful to have a thorough understanding of the XMP data tree. One way to learn this is to create some complex XMP and examine the output of XMPMetaMBS.DumpObject. This is also described in the XMP Specification, in the XMP Data Model chapter.

The top of the XMP data tree is a single root node. This does not explicitly appear in the dump and is never visited by an iterator (that is, it is never returned from XMPIteratorMBS.Next). Beneath the root are schema nodes. These are just collectors for top level properties in the same namespace. They are created and destroyed implicitly. Beneath the schema nodes are the property nodes. The nodes below a property node depend on its type (simple, struct, or array) and whether it has qualifiers.

A XMPIteratorMBS constructor defines a starting point for the iteration and options that control how it proceeds. By default the iteration starts at the root and visits all nodes beneath it in a depth first manner. The root node is not visited, the first visited node is a schema node. You can provide a schema name or property path to select a different starting node. By default this visits the named root node first then all nodes beneath it in a depth first manner.

The XMPIteratorMBS.Next method delivers the schema URI, path, and option flags for the node being visited. If the node is simple it also delivers the value. Qualifiers for this node are visited next. The fields of a struct or items of an array are visited after the qualifiers of the parent.

The options to control the iteration are:

- **kXMP_IterJustChildren** Visit just the immediate children of the root. Skip the root itself and all nodes below the immediate children. This omits the qualifiers of the immediate children, the qualifier nodes being below what they qualify.
- **kXMP_IterJustLeafNodes** Visit just the leaf property nodes and their qualifiers.
- **kXMP_IterJustLeafName** Return just the leaf component of the node names. The default is to return the full path name.
- **kXMP_IterIncludeAliases** Include aliases as part of the iteration. Since aliases are not actual nodes the default iteration does not visit them.
- **kXMP_IterOmitQualifiers** Do not visit the qualifiers of a node.
184.5.2 Methods

184.5.3 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Empty constructor which does nothing.

See also:

- 184.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0)
- 184.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0)
- 184.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0)
- 184.5.7 Constructor(schemaNS as string, propName as string, options as Integer)

184.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Construct an iterator for the global tables of the XMP toolkit.

**Notes:**

- options: Option flags to control the iteration.

The available option flags are:

- kXMP_IterJustChildren = & h100 Just visit the immediate children of the root, default is subtree.
- kXMP_IterJustLeafNodes = & h200 Just visit the leaf nodes, default visits all nodes.
- kXMP_IterJustLeafName = & h400 Return just the leaf part of the path, default is the full path.
- kXMP_IterOmitQualifiers = & h1000 Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.

See also:

- 184.5.3 Constructor
- 184.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0)

- 184.5.7 Constructor(schemaNS as string, propName as string, options as Integer)
### 184.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Construct an iterator for the global tables of the XMP toolkit.

**Notes:**

- *schemaNS:* Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
- *options:* Option flags to control the iteration.

The available option flags are:

- `kXMP_IterJustChildren = & h100` Just visit the immediate children of the root, default is subtree.
- `kXMP_IterJustLeafNodes = & h200` Just visit the leaf nodes, default visits all nodes.
- `kXMP_IterJustLeafName = & h400` Return just the leaf part of the path, default is the full path.
- `kXMP_IterOmitQualifiers = & h1000` Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.

See also:

- 184.5.3 Constructor
- 184.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0)
- 184.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0)
- 184.5.7 Constructor(schemaNS as string, propName as string, options as Integer)

### 184.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Construct an iterator for the global tables of the XMP toolkit.

**Notes:**

- *schemaNS:* Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
- *propName:* Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
- *options:* Option flags to control the iteration.

The available option flags are:
CHAPTER 184. XMP

kXMP_IterJustChildren = & h100  Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes = & h200  Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName = & h400  Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers = & h1000  Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.

- 184.5.3 Constructor
- 184.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0)
- 184.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0)
- 184.5.7 Constructor(schemaNS as string, propName as string, options as Integer)

184.5.7 Constructor(schemaNS as string, propName as string, options as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Construct an iterator for the properties within an XMP object.

**Notes:**

On success handle is not 0.

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing ""

propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.

options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren = & h100  Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes = & h200  Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName = & h400  Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers = & h1000  Omit all qualifiers.

184.5.8 **NextItem() as boolean**

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Visit the next node in the iteration.

See also:

- 184.5.9 NextItem(byref schemaNS as string) as boolean
- 184.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean
- 184.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean
- 184.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean

184.5.9 **NextItem(byref schemaNS as string) as boolean**

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Visit the next node in the iteration.

**Notes:**

**Parameters:**

- **schemaNS** A string that is assigned the schema namespace URI of the current property.
- **propPath** A string that is assigned the XPath name of the current property.
- **propValue** A string that is assigned the value of the current property.
- **options** An integer that is assigned the flags describing the current property.

See also:

- 184.5.8 NextItem() as boolean
- 184.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean

- 184.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean
184.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Visit the next node in the iteration.  
**Notes:**

**Parameters:**

- **schemaNS** A string that is assigned the schema namespace URI of the current property.  
- **propPath** A string that is assigned the XPath name of the current property.

See also:

- 184.5.8 NextItem() as boolean 20725  
- 184.5.9 NextItem(byref schemaNS as string) as boolean 20725

- 184.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 20727

184.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Visit the next node in the iteration.  
**Notes:**

**Parameters:**

- **schemaNS** A string that is assigned the schema namespace URI of the current property.  
- **propPath** A string that is assigned the XPath name of the current property.  
- **propValue** A string that is assigned the value of the current property.

See also:

- 184.5.8 NextItem() as boolean 20725  
- 184.5.9 NextItem(byref schemaNS as string) as boolean 20725  
- 184.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 20726
184.5.CLASS XMPITERATORMBS

- 184.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean

184.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Visit the next node in the iteration.  
**Notes:**

Parameters:

- schemaNS A string that is assigned the schema namespace URI of the current property.
- propPath A string that is assigned the XPath name of the current property.
- propValue A string that is assigned the value of the current property.
- options An integer that is assigned the flags describing the current property.

See also:

- 184.5.8 NextItem() as boolean
- 184.5.9 NextItem(byref schemaNS as string) as boolean
- 184.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean
- 184.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean

184.5.13 Skip(options as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Skip some portion of the remaining iterations.  
**Notes:**

The available option flags are:

- kXMP_IterSkipSubtree = 1 Skip the subtree below the current node.
- kXMP_IterSkipSiblings = 2 Skip the subtree below and remaining siblings of the current node.
184.6  class XMPMetaMBS

184.6.1  class XMPMetaMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The main class for the Adobe XMP SDK.

184.6.2  Methods

184.6.3  AppendArrayItem(schemaNS as string, arrayName as string, arrayOptions as Integer, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Appends an item to an array.
**Notes:**
AppendArrayItem simplifies construction of an array by not requiring that you pre-create an empty array.
The array that is assigned is created automatically if it does not yet exist. Each call to AppendArrayItem
appends an item to the array. The corresponding parameters have the same use as SetArrayItem. The arrayOptions parameter is used to specify what kind of array. If the array exists, it must have the specified form.

Parameters:

- **schemaNS** The namespace URI for the array. Has the same usage as in SetProperty.
- **arrayName** The name of the array. May be a general path expression, must not be null
  or the empty string. Has the same namespace prefix usage as propPath in
  SetProperty.
- **arrayOptions** Option flags describing the array form. The only valid bits are those that
  are part of kXMPPropArrayFormMask: kXMPPropValueIsArray (& h200),
  kXMPPropArrayIsOrdered (& h400), kXMPPropArrayIsAlternate (& h800),
  or kXMPPropArrayIsAltText (& h1000).
- **itemValue** An UTF-8 string that is the value of the array item, if the array item has a
  value. Has the same usage as propValue in SetProperty.
- **itemOptions** Option flags describing the item.

184.6.4  ApplyTemplate(WorkingXMP as XMPMetaMBS, template as XMPMetaMBS, actions as Integer)

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Applies an xmp template.
184.6.5  CatenateArrayItems(schemaNS as string, arrayName as string, separator as string, quotes as string, options as Integer) as string

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Create a single edit string from an array of strings.
**Notes:**

xmpObj  The XMP object containing the array to be catenated.
schemaNS  The schema namespace URI for the array. Must not be an empty string.
arrayName  The name of the array. May be a general path expression, must not be an empty string. Each item in the array must be a simple string value.
separator  The string to be used to separate the items in the catenated string. Defaults to "; ", ASCII semicolon and space (U+003B, U+0020).
quotes  The characters to be used as quotes around array items that contain a separator. Defaults to ",", ASCII quote (U+0022).
options  Option flags to control the catenation.

returns the string with the catenated array items.

184.6.6  Clone as XMPMetaMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Creates a copy of the XMPMeta Object.
**Notes:**

Deep copy, not just a new reference.
Returns nil on any error.

184.6.7  ComposeArrayItemPath(schemaNS as string, arrayName as string, itemIndex as Integer) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose the path expression for an item in an array.
**Notes:**

Returns the composed path. This will be of the form <tt>ns:arrayName [ i ] </tt>, where "ns" is the prefix for schemaNS and "i" is the decimal representation of itemIndex. If the value of itemIndex is kXMP_ArrayLastItem, the path is <tt>ns:arrayName [ last() ] </tt>. 

184.6.8 ComposeFieldSelector(schemaNS as string, arrayName as string, fieldNS as string, fieldName as string, fieldValue as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose the path expression to select an alternate item by a field’s value. **Notes:**

The path syntax allows two forms of "content addressing" that may be used to select an item in an array of alternatives. The form used in ComposeFieldSelector lets you select an item in an array of structs based on the value of one of the fields in the structs. The other form of content addressing is shown in Compose-LangSelector.

For example, consider a simple struct that has two fields, the name of a city and the URI of an FTP site in that city. Use this to create an array of download alternatives. You can show the user a popup built from the values of the city fields. You can then get the corresponding URI as follows:

```
path=ComposeFieldSelector ( schemaNS, "Downloads", fieldNS, "City", chosenCity)
eexists = GetStructField ( schemaNS, path, fieldNS, "URI", uri )
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schemaNS</td>
<td>The namespace URI for the array. Must not be null or the empty string.</td>
</tr>
<tr>
<td>arrayName</td>
<td>The name of the array. May be a general path expression, must not be an empty string.</td>
</tr>
<tr>
<td>fieldNS</td>
<td>The namespace URI for the field used as the selector. Must not be an empty string.</td>
</tr>
<tr>
<td>fieldName</td>
<td>The name of the field used as the selector. Must be a simple XML name, must not be an empty string. It must be the name of a field that is itself simple.</td>
</tr>
<tr>
<td>fieldValue</td>
<td>The desired value of the field.</td>
</tr>
</tbody>
</table>

Returns the string with the composed path. This will be of the form `<tt>${ns}:arrayName [ ${fNS}:fieldName='fieldValue' ]</tt>`, where "ns" is the prefix for schemaNS and "fNS" is the prefix for fieldNS.
184.6.9  ComposeLangSelector(schemaNS as string, arrayName as string, langName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose the path expression to select an alternate item by language.

**Notes:**
The path syntax allows two forms of "content addressing" that may be used to select an item in an array of alternatives. The form used in ComposeLangSelector lets you select an item in an alt-text array based on the value of its `<tt>xml:lang</tt>` qualifier. The other form of content addressing is shown in ComposeFieldSelector.

ComposeLangSelector does not supplant SetLocalizedText or GetLocalizedText. They should generally be used, as they provide extra logic to choose the appropriate language and maintain consistency with the 'x-default' value. ComposeLangSelector gives you an path expression that is explicitly and only for the language given in the langName parameter.

- schemaNS  The namespace URI for the array. Must not be null or the empty string.
- arrayName  The name of the array. May be a general path expression, must not be an empty string.
- langName   The RFC 3066 code for the desired language.

Returns the composed path. This will be of the form `<tt>ns:arrayName [ \@xml:lang='langName' ] </tt>`, where "ns" is the prefix for schemaNS.

184.6.10  ComposeQualifierPath(schemaNS as string, structName as string, qualNS as string, qualName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose the path expression for a qualifier.

**Notes:**
- schemaNS The namespace URI for the property to which the qualifier is attached. Must not be an empty string.
- propName  The name of the property to which the qualifier is attached. May be a general path expression, must not be an empty string.
- qualNS    The namespace URI for the qualifier. May be an empty string if the qualifier is in the XML empty namespace.
- qualName  The name of the qualifier. Must be a simple XML name, must not be an empty string.

Returns the composed path. This will be of the form `<tt>ns:propName/?qNS:qualName</tt>`, where "ns" is the prefix for schemaNS and "qNS" is the prefix for qualNS.
184.6.11  ComposeStructFieldPath(schemaNS as string, structName as string, fieldNS as string, fieldName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Compose the path expression for a field in a struct.

**Notes:**

- schemaNS: The namespace URI for the struct. Must not be null or the empty string.
- structName: The name of the struct. May be a general path expression, must not be an empty string.
- fieldNS: The namespace URI for the field. Must not be an empty string.
- fieldName: The name of the field. Must be a simple XML name, must not be an empty string.

Returns the composed path. This will be of the form `<ns:structName/fNS:fieldName</tt>`, where ”ns” is the prefix for schemaNS and ”fNS” is the prefix for fieldNS.

184.6.12  Constructor

See also:

- 184.6.13 Constructor(data as memoryblock, Offset as Integer, Size as Integer) 20732
- 184.6.14 Constructor(data as string) 20733

184.6.13  Constructor(data as memoryblock, Offset as Integer, Size as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Construct an object and parse one buffer of RDF into it.

**Notes:** This constructor creates a new TXMPMeta object and populates it with metadata from a buffer containing serialized RDF. This buffer must be a complete RDF parse stream. Pass ”” to construct an empty XMPMetaMBS object. The result of an actual parse is identical to creating an empty object then calling XMPMetaMBS.ParseFromBuffer. The RDF must be complete. If you need to parse with multiple buffers, create an empty object and use XMPMetaMBS.ParseFromBuffer.

See also:

- 184.6.12 Constructor 20732
- 184.6.14 Constructor(data as string) 20733
184.6. CLASS XMPMETAMBS

184.6.14 Constructor(data as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Construct an object and parse one buffer of RDF into it. **Notes:** This constructor creates a new TXMPMeta object and populates it with metadata from a buffer containing serialized RDF. This buffer must be a complete RDF parse stream. Pass "" to construct an empty XMPMetaMBS object. The result of an actual parse is identical to creating an empty object then calling XMPMetaMBS.ParseFromBuffer. The RDF must be complete. If you need to parse with multiple buffers, create an empty object and use XMPMetaMBS.ParseFromBuffer. See also:

- 184.6.12 Constructor
- 184.6.13 Constructor(data as memoryblock, Offset as Integer, Size as Integer)

184.6.15 ConvertFromBool(value as boolean) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from Boolean to string.

184.6.16 ConvertFromDate(value as XMPDateTimeMBS) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from date/time to string.

184.6.17 ConvertFromFloat(value as Double, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from floating point to string. **Notes:** format: Optional C sprintf format for the conversion. Defaults to "% f".

184.6.18 ConvertFromInt(value as Integer, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from integer to string. **Notes:** format: Optional C sprintf format for the conversion. Defaults to "% d".
184.6.19 ConvertFromInt64(value as Int64, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from integer to string.
**Notes:** format: Optional C sprintf format for the conversion. Defaults to "% d".

184.6.20 ConvertToBool(value as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to Boolean.

184.6.21 ConvertToDate(value as string) as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to date/time.

184.6.22 ConvertToFloat(value as string) as Double

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to floating point.

184.6.23 ConvertToInt(value as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to integer.

184.6.24 ConvertToInt64(value as string) as Int64

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Convert from string to 64 bit integer.

184.6.25 CountArrayItems(schemaNS as string, arrayName as string) as Integer

184.6. CLASS XMPMETAMBS

Notes: Returns 0 on any error.

184.6.26 CurrentDateTime as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Current date and time as a XMPDateTimeMBS object. **Notes:** Returns nil on any error.

184.6.27 DecodeFromBase64(text as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Decode from Base64 encoded string to raw data. **Example:**

```vba
dim x as XMPMetaMBS
x=new XMPMetaMBS
MsgBox x.DecodeFromBase64("dGVzdA==") // test
```

**Notes:** This is a global method which does not need a valid handle.

184.6.28 DeleteArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DeleteArrayItem deletes the given XMP subtree rooted at the given array item. **Notes:** It is not an error if the array item does not exist.

**Parameters:**

- `schemaNS`: The namespace URI for the array. Has the same usage as in GetProperty.
- `arrayName`: The name of the array. May be a general path expression, must not "". Has the same namespace prefix usage as propName in GetProperty.
- `itemIndex`: The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.
184.6.29 **DeleteLocalizedText** (schemaNS as string="", altTextName as string="",
genericLang as string="", specificLang as string="")

MBS XMP Plugin, Plugin Version: 11.0, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Deletes localized text.

184.6.30 **DeleteNamespace** (namespaceURI as string)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Deletes a namespace from the registry.
**Notes:**
Not implemented?

Does nothing if the URI is not registered, or if the parameter is null or the empty string.

namespaceURI: The URI for the namespace.

184.6.31 **DeleteProperty** (schemaNS as string, propName as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
DeleteProperty deletes the given XMP subtree rooted at the given property.
**Notes:**
It is not an error if the property does not exist.

**Parameters:**

- schemaNS  The namespace URI for the property. Has the same usage as in GetProperty.
- propName   The name of the property. Has the same usage as in GetProperty.

184.6.32 **DeleteQualifier** (schemaNS as string, structName as string, qualNS as string, qualName as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
DeleteQualifier deletes the given XMP subtree rooted at the given qualifier.
**Notes:**
184.6. CLASS XMPMETAMBS

It is not an error if the qualifier does not exist.

Parameters:

- **schemaNS**: The namespace URI for the struct. Has the same usage as in GetProperty.
- **propName**: The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
- **qualNS**: The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
- **qualName**: The name of the qualifier. Must be a single XML name, must not be "". Has the same namespace prefix usage as the propName parameter.

184.6.33 **DeleteStructField**(schemaNS as string, structName as string, fieldNS as string, fieldName as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
DeleteStructField deletes the given XMP subtree rooted at the given struct field.

**Notes:**
It is not an error if the field does not exist.

Parameters:

- **schemaNS**: The namespace URI for the struct. Has the same usage as in GetProperty.
- **structName**: The name of the struct. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
- **fieldNS**: The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
- **fieldName**: The name of the field. Must be a single XML name, must not be "". Has the same namespace prefix usage as the structName parameter.

184.6.34 **DoesArrayItemExist**(schemaNS as string, arrayName as string, itemIndex as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
DoesArrayItemExist tells if the array item exists.

**Notes:**
Returns true if the array item exists.

Parameters:

- `schemaNS` (The namespace URI for the array. Has the same usage as in GetProperty.)
- `arrayName` (The name of the array. May be a general path expression, must not be """. Has the same namespace prefix usage as propName in GetProperty.)
- `itemIndex` (The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.)

### 184.6.35 DoesPropertyExist(schemaNS as string, propName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DoesPropertyExist tells if the property exists.

**Notes:**

Returns true if the property exists.

Parameters:

- `schemaNS` (The namespace URI for the property. Has the same usage as in GetProperty.)
- `propName` (The name of the property. Has the same usage as in GetProperty.)

### 184.6.36 DoesQualifierExist(schemaNS as string, structName as string, qualNS as string, qualName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** DoesQualifierExist tells if the qualifier exists.

**Notes:**

Returns true if the qualifier exists.

Parameters:
184.6. CLASS XMPMETAMBS

- **schemaNS**: The namespace URI for the struct. Has the same usage as in GetProperty.
- **propName**: The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
- **qualNS**: The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
- **qualName**: The name of the qualifier. Must be a single XML name, must not be "". Has the same namespace prefix usage as the propName parameter.

184.6.37  **DoesStructFieldExist** (schemaNS as string, structName as string, fieldNS as string, fieldName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

DoesStructFieldExist tells if the struct field exists.

**Notes:**

Returns true if the field exists.

**Parameters:**

- **schemaNS**: The namespace URI for the struct. Has the same usage as in GetProperty.
- **structName**: The name of the struct. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
- **fieldNS**: The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
- **fieldName**: The name of the field. Must be a single XML name, must not be "". Has the same namespace prefix usage as the structName parameter.

184.6.38  **DumpNamespaces** (output as XMPTextOutputMBS) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**

DumpNamespaces dumps the list of registered namespace URIs and prefixes.

**Notes:**

This is a global method which does not need a valid handle.

Returns status code. (0=succes and -1=error)
184.6.39  **DumpObject(output as XMPTextOutputMBS) as Integer**

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
DumpObject dumps the content of an XMP object.
**Notes:** Returns status code. (0=success and -1=error)

184.6.40  **DuplicateSubtree(dest as XMPMetaMBS, sourceNS as string, sourceRoot as string, destNS as string=”, destRoot as string=”, options as Integer=0)**

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Replicate a subtree from one XMP object into another, possibly at a different location.
**Notes:**
Parameters:
- self: The source XMP object.
- dest: The destination XMP object.
- sourceNS: The schema namespace URI for the source subtree.
- sourceRoot: The root location for the source subtree. May be a general path expression, must not be null or the empty string.
- destNS: The schema namespace URI for the destination. Defaults to the source namespace.
- destRoot: The root location for the destination. May be a general path expression. Defaults to the source location.
- options: Option flags to control the separation.

184.6.41  **EncodeToBase64(text as string) as string**

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Convert from raw data to Base64 encoded string.
**Example:**
```vbnet
dim x as XMPMetaMBS
x=new XMPMetaMBS
MsgBox x.EncodeToBase64("test") // dGVzdA==
```

**Notes:** This is a global method which does not need a valid handle.
184.6.42 **Erase**

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Restores the object to a "just constructed" state.

184.6.43 **GetArrayItem**(schemaNS as string, arrayName as string, itemIndex as Integer, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
GetArrayItem provides access to items within an array.
**Notes:**
The index is passed as an integer, you need not worry about the path string syntax for array items, convert a loop index to a string, etc.

Returns true if the array item exists.

**Parameters:**

- **schemaNS** The namespace URI for the array. Has the same usage as in GetProperty.
- **arrayName** The name of the array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
- **itemIndex** The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.
- **itemValue** A string that is assigned the value of the array item, if the array item has a value. Arrays and non-leaf levels of structs do not have values.
- **options** An integer variable that is assigned option flags describing the array item.

184.6.44 **GetLocalizedText**(schemaNS as string, altTextName as string, genericLang as string, specificLang as string, byref actualLang as string, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
GetLocalizedText returns information about a selected item in an alt-text array.
**Notes:**
The array item is selected according to the rules given above.
CHAPTER 184. XMP

Returns true if an appropriate array item exists.

Parameters:

- `schemaNS`: The namespace URI for the alt-text array. Has the same usage as in `GetProperty`.
- `altTextName`: The name of the alt-text array. May be a general path expression, must not be "". Has the same namespace prefix usage as `propName` in `GetProperty`.
- `genericLang`: The name of the generic language as an RFC 3066 primary subtag. May be "" if no generic language is wanted.
- `specificLang`: The name of the specific language as an RFC 3066 tag. Must not be null or the empty string.
- `actualLang`: A string that is assigned the language of the selected array item, if an appropriate array item is found.
- `itemValue`: A string that is assigned the value of the array item, if an appropriate array item is found.
- `options`: An integer variable that is assigned option flags describing the array item.

184.6.45 `GetNamespacePrefix(namespaceURI as string, byref namespacePrefix as string) as boolean`

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Obtain the prefix for a registered namespace URI.

**Notes:**

It is not an error if the namespace URI is not registered. The output `namespacePrefix` string is "" if the namespace URI is not registered.

Parameters:

- `namespaceURI`: The URI for the namespace. Must not be null or the empty string.
- `namespacePrefix`: Returns the prefix registered for this URI, with a terminating ‘:’.

Returns true if the namespace URI is registered.

This is a global method which does not need a valid handle.
184.6.46 GetNamespaceURI(namespacePrefix as string, byref namespaceURI as string) as boolean

Notes:
It is not an error if the namespace prefix is not registered. The output namespaceURI string is "" if the namespace prefix is not registered.

Parameters:

namespacePrefix The prefix for the namespace. Must not be "".
namespaceURI Returns the URI registered for this prefix.

Returns true if the namespace prefix is registered.

This is a global method which does not need a valid handle.

184.6.47 GetProperty(schemaNS as string, propName as string, byref propValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: GetProperty is the simplest property getter, mainly for top level simple properties or after using the path composition functions.

Notes:
Returns true if the property exists.

Parameters:

184.6.48 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean) as boolean

Notes:
Returns true if the property exists.
schemaNS  The namespace URI for the property. May be an empty string if the first component of the propName path contains a namespace prefix. The URI must be for a registered namespace.

propName  The name of the property. May be a general path expression, must not be an empty string. Using a namespace prefix on the first component is optional. If present without a schemaNS value then the prefix specifies the namespace. The prefix must be for a registered namespace. If both a schemaNS URI and propName prefix are present, they must be corresponding parts of a registered namespace.

propValue  A string that is assigned the value of the property, if the property has a value. Arrays and non-leaf levels of structs do not have values.

options  An integer variable that is assigned option flags describing the property.

Parameters:

schemaNS  The namespace URI for the property. Has the same usage as in GetProperty.

propName  The name of the property. Has the same usage as in GetProperty.

propValue  A boolean variable that is assigned the value of the property.

options  Optional, an integer variable that is assigned option flags describing the property.

See also:

- 184.6.48 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean)

184.6.49  GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean, byref options as Integer) as boolean

Notes:

Returns true if the property exists.

Parameters:

See also:

- 184.6.48 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean)
184.6. **CLASS XMPMETAMBS**

- **schemaNS**: The namespace URI for the property. Has the same usage as in GetProperty.
- **propName**: The name of the property. Has the same usage as in GetProperty.
- **propValue**: A boolean variable that is assigned the value of the property.
- **options**: Optional, an integer variable that is assigned option flags describing the property.

### 184.6.50 GetPropertyDate(schemaNS as string, propName as string, byref propValue as XMPDateTimeMBS, byref options as Integer) as boolean

**MBS XMP Plugin, Plugin Version:** 6.4, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes. **Function:**
GetPropertyDate returns the value of a date/time property as an XMPDateTimeMBS object.

**Notes:**
Returns true if the property exists.

**Parameters:**

- **schemaNS**: The namespace URI for the property. Has the same usage as in GetProperty.
- **propName**: The name of the property. Has the same usage as in GetProperty.
- **propValue**: A XMPDateTimeMBS variable that is assigned the value of the property.
- **options**: An integer variable that is assigned option flags describing the property.

### 184.6.51 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double) as boolean

**MBS XMP Plugin, Plugin Version:** 11.3, **Console & Web:** Yes, **Mac:** Yes, **Win:** Yes, **Linux:** Yes. **Function:**
GetPropertyFloat returns the value of a floating point property as a double value.

**Notes:**
Returns true if the property exists.

**Parameters:**

**See also:**

- 184.6.52 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean
schemaNS  The namespace URI for the property. Has the same usage as in GetProperty.
propName  The name of the property. Has the same usage as in GetProperty.
propValue  A double variable that is assigned the value of the property.
options  Optional, an integer variable that is assigned option flags describing the property.

184.6.52 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetPropertyFloat returns the value of a floting point property as a double value.
**Notes:**
Returns true if the property exists.

Parameters:

- schemaNS  The namespace URI for the property. Has the same usage as in GetProperty.
- propName  The name of the property. Has the same usage as in GetProperty.
- propValue  A double variable that is assigned the value of the property.
- options  Optional, an integer variable that is assigned option flags describing the property.

See also:

- 184.6.51 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double) as boolean

184.6.53 GetPropertyInt64Double(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetPropertyInt64Double returns the value of a 64 bit integer property as a double value.
**Notes:**
Returns true if the property exists.

Parameters:
184.6. CLASS XMPMETAMBS

schemaNS  The namespace URI for the property. Has the same usage as in GetProperty.
propName  The name of the property. Has the same usage as in GetProperty.
propValue A double variable that is assigned the value of the property.
options  An integer variable that is assigned option flags describing the property.

184.6.54  GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer) as boolean

Function: GetPropertyInteger returns the value of an integer property as an integer.  
Notes:  
Returns true if the property exists.

Parameters:

schemaNS  The namespace URI for the property. Has the same usage as in GetProperty.  
propName  The name of the property. Has the same usage as in GetProperty.
propValue An integer variable that is assigned the value of the property.
options  Optional, an integer variable that is assigned option flags describing the property.

See also:

- 184.6.55 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer, 
   byref options as Integer) as boolean

184.6.55  GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer, byref options as Integer) as boolean

Function: GetPropertyInteger returns the value of an integer property as an integer.  
Notes:  
Returns true if the property exists.

Parameters:

See also:
schemaNS: The namespace URI for the property. Has the same usage as in GetProperty.

propName: The name of the property. Has the same usage as in GetProperty.

propValue: An integer variable that is assigned the value of the property.

options: Optional, an integer variable that is assigned option flags describing the property.

- 184.6.54 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer) as boolean

184.6.56 GetPropertyInteger64(schemaNS as string, propName as string, byref propValue as Int64, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Retrieves the value of an integer property as an Int64.

**Notes:**
Reports whether a property exists, and retrieves its binary value and property type information.

schemaNS: The namespace URI; see GetProperty().

propName: The name of the property. Can be a general path expression, must not be empty string; see GetProperty() for namespace prefix usage.

propValue: A variable in which to return the binary value.

options: A variable in which to return the option flags describing the property, a logical OR of allowed bit-flag constants; see kPropValueIsStruct and following.

Returns true if the property exists.

184.6.57 GetQualifier(schemaNS as string, propName as string, qualNS as string, qualName as string, byref qualValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetQualifier provides access to a qualifier attached to a property.

**Notes:**
The namespace for the qualifier is passed as a URI, you need not worry about the path string syntax. In many regards qualifiers are like struct fields.
The names of qualifiers should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix. This is unreliable since the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Note: Qualifiers are only supported for simple leaf properties at this time. (in the XMP SDK)

Returns true if the qualifier exists.

Parameters:

- **schemaNS**: The namespace URI for the struct. Has the same usage as in GetProperty.
- **propName**: The name of the property to which the qualifier is attached. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as in GetProperty.
- **qualNS**: The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
- **qualName**: The name of the qualifier. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the propName parameter.
- **qualValue**: A string variable that is assigned the value of the qualifier, if the qualifier has a value. Arrays and non-leaf levels of structs do not have values.
- **options**: An integer variable that is assigned option flags describing the qualifier.

**GetStructField**

GetStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** GetStructField provides access to fields within a nested structure.

**Notes:**

The names of fields should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix. This is unreliable since the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Returns true if the field exists.

Parameters:
schemaNS The namespace URI for the struct. Has the same usage as in GetProperty.
structName The name of the struct. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
fieldNS The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName The name of the field. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the structName parameter.
fieldValue An string variable that is assigned the value of the field, if the field has a value. Arrays and non-leaf levels of structs do not have values.
options An integer variable that is assigned option flags describing the field. May be null if the flags are not wanted.

184.6.59 GetVersionInfo as XMPVersionInfoMBS

184.6.60 GlobalOptions as Integer
MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Sets or retrieves the set of global option flags. Notes: (Read and Write computed property)

184.6.61 Iterator(schemaNS as string, propName as string, options as Integer) as XMPIteratorMBS

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "."
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing ".". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:
184.6. CLASS XMPMETAMBS

kXMP_JustChildren = & h100 Just visit the immediate children of the root, default is subtree.
kXMP_JustLeafNodes = & h200 Just visit the leaf nodes, default visits all nodes.
kXMP_JustLeafName = & h400 Return just the leaf part of the path, default is the full path.
kXMP_OmitQualifiers = & h1000 Omit all qualifiers.

184.6.62 MergeFromJPEG(extendedXMP as XMPMetaMBS)

**Notes:**
When an extended partition stores properties that do not fit into the JPEG file limitation of 64K bytes, this function integrates those properties back into the same XMP object with those from the standard XMP packet.

self: An XMP object which the caller has initialized from the standard XMP packet in a JPEG file. The extended XMP is added to this object.

extendedXMP: An XMP object which the caller has initialized from the extended XMP packet in a JPEG file.

184.6.63 PackageForJPEG(byref standardXMP as string, byref extendedXMP as string, byref extendedDigest as string)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** creates XMP serializations appropriate for a JPEG file.

**Notes:**
The standard XMP in a JPEG file is limited to 64K bytes. This function serializes the XMP metadata in an XMP object into a string of RDF (see \c SerializeToBuffer) the data does not fit into the 64K byte limit, it creates a second packet string with the extended data.

self: The XMP object containing the metadata.
standardXMP: A string object in which to return the full standard XMP packet.
extendedXMP: A string object in which to return the serialized extended XMP, empty if not needed.
extendedDigest: A string object in which to return an MD5 digest of the serialized extended XMP, empty if not needed.
184.6.64 ParseFromBuffer(buffer as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
ParseFromBuffer parses RDF from a series of input buffers.

**Notes:**
The buffers may be any length. The buffer boundaries need not respect XML tokens or even Unicode characters.

**Parameters:**

- `buffer` Input data buffer. Termination of an input loop is convenient by passing kXMP_ParseMoreBuffers (2) for all real input, then having a final call with a zero length and kXMP_NoOptions.
- `options` Options controlling the parsing.

The available options are:

- `kXMP_ParseMoreBuffers` = 2 This is not the last buffer of input, more calls follow.
- `kXMP_RequireXMPMeta` = 1 The x:xmpmeta XML element is required around rdf:RDF.
- `kXMP_StrictAliasing` = 4 Do not reconcile alias differences, throw an exception.

Note: The kXMP_StrictAliasing option is not yet implemented.

184.6.65 RegisterNamespace(namespaceURI as string, suggestedPrefix as string, byref registeredPrefix as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Register a namespace URI with a suggested prefix.

**Example:**

```vba
dim x as new XMPMetaMBS
dim registeredPrefix as string

call x.RegisterNamespace ("xwnv", "xwnv", registeredPrefix)

x.SetProperty "xwnv","MZSTID","test"

MsgBox x.SerializeToBuffer
```
184.6. CLASS XMPMETAMBS

Notes:

It is not an error if the URI is already registered, no matter what the prefix is. If the URI is not registered but the suggested prefix is in use, a unique prefix is created from the suggested one. The actual registered prefix is always returned. The function result tells if the registered prefix is the suggested one.

Parameters:

- namespaceURI The URI for the namespace. Must be a valid XML URI.
- suggestedPrefix The suggested prefix to be used if the URI is not yet registered. Must be a valid XML name.
- registeredPrefix Returns the prefix actually registered for this URI.

Returns true if the registered prefix matches the suggested prefix.

Note: No checking is presently done on either the URI or the prefix.

This is a global method which does not need a valid handle.

184.6.66 RemoveProperties(schemaNS as string=”, propName as string=”, options as Integer=0)

Notes:

RemoveProperties was created to support the File Info dialog’s Delete button, and has been been generalized somewhat from those specific needs. It operates in one of three main modes depending on the schemaNS and propName parameters:
- Non-empty schemaNS and propName - The named property is removed if it is an external property, or if the kXMPUI_DoAllProperties option is passed. It does not matter whether the named property is an actual property or an alias.
- Non-empty schemaNS and empty propName - The all external properties in the named schema are removed. Internal properties are also removed if the kXMPUI_DoAllProperties option is passed. In addition, aliases from the named schema will be removed if the kXMPUI_IncludeAliases option is passed.
- Empty schemaNS and empty propName - All external properties in all schema are removed. Internal properties are also removed if the kXMPUI_DoAllProperties option is passed. Aliases are implicitly handled because the associated actuals are.

It is an error to pass and empty schemaNS and non-empty propName.
### 184.6.67 SeparateArrayItems(schemaNS as string, arrayName as string, options as Integer, catedStr as string)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Separate a single edit string into an array of strings. **Notes:**

**Parameters:**

- **xmpObj** The XMP object containing the array to be updated.
- **schemaNS** The schema namespace URI for the array. Must not be null or the empty string.
- **arrayName** The name of the array. May be a general path expression, must not an empty string. Each item in the array must be a simple string value.
- **options** Option flags to control the separation.
- **catedStr** The string to be separated into the array items.

### 184.6.68 SerializeToBuffer(options as Integer, padding as Integer, newline as string, indent as string=’’’, baseIndent as Integer=0) as string

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SerializeToBuffer serializes an XMP object into a string as RDF. **Notes:**

Returns the serialized RDF.

**Parameters:**

- The available option flags are:
  - kXMP_OmitPacketWrapper
  - kXMP_ReadOnlyPacket
  - kXMP_IncludeThumbnailPad
  - kXMP_ExactPacketLength

The specified options must be logically consistent, an exception is thrown if not. You cannot specify both kXMP_OmitPacketWrapper along with kXMP_ReadOnlyPacket, kXMP_IncludeThumbnailPad, or kXMP_ExactPacketLength.
options  Option flags to control the serialization.
padding  The amount of padding to be added if a writeable XML packet is created. If zero is passed (the default) an appropriate amount of padding is computed.
newline The string to be used as a line terminator. If empty it defaults to linefeed, U+000A, the standard XML newline.
indent  The string to be used for each level of indentation in the serialized RDF. If empty it defaults to two ASCII spaces, U+0020.
baseIndent  The number of levels of indentation to be used for the outermost XML element in the serialized RDF. This is convenient when embedding the RDF in other text.

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kXMP_OmitPacketWrapper</td>
<td>&amp;h10</td>
<td>Do not include an XML packet wrapper.</td>
</tr>
<tr>
<td>kXMP_ReadOnlyPacket</td>
<td>&amp;h20</td>
<td>Create a read-only XML packet wrapper.</td>
</tr>
<tr>
<td>kXMP_UseCompactFormat</td>
<td>&amp;h40</td>
<td>Use a highly compact RDF syntax and layout.</td>
</tr>
<tr>
<td>kXMP_WriteAliasComments</td>
<td>&amp;h400</td>
<td>Include XML comments for aliases.</td>
</tr>
<tr>
<td>kXMP_IncludeThumbnailPad</td>
<td>&amp;h100</td>
<td>Include typical space for a JPEG thumbnail in the padding if no xmp:Thumbnail property is present.</td>
</tr>
<tr>
<td>kXMP_ExactPacketLength</td>
<td>&amp;h200</td>
<td>The padding parameter provides the overall packet length. The actual amount of padding is computed. An exception is thrown if the packet exceeds this length with no padding.</td>
</tr>
</tbody>
</table>

In addition, one of the following encoding options may be included:

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>kXMP_EncodeUTF8</td>
<td>0</td>
<td>Encode as UTF-8, the default.</td>
</tr>
<tr>
<td>kXMP_EncodeUTF16Big</td>
<td>2</td>
<td>Encode as big-endian UTF-16.</td>
</tr>
<tr>
<td>kXMP_EncodeUTF16Little</td>
<td>3</td>
<td>Encode as little-endian UTF-16.</td>
</tr>
<tr>
<td>kXMP_EncodeUTF32Big</td>
<td>4</td>
<td>Encode as big-endian UTF-32.</td>
</tr>
<tr>
<td>kXMP_EncodeUTF32Little</td>
<td>5</td>
<td>Encode as little-endian UTF-32.</td>
</tr>
</tbody>
</table>

See also:

• 184.6.69 SerializeToBuffer(options as Integer=0, padding as Integer=0) as string

184.6.69  SerializeToBuffer(options as Integer=0, padding as Integer=0) as string

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: SerializeToBuffer serializes an XMP object into a string as RDF.

Example:

```vbs
dim x as new XMPMetaMBS
dim registeredPrefix as string

call x.RegisterNamespace ("xwnv", "xwnv", registeredPrefix)
```
x.SetProperty "xwnv","MZSTID","test"

MsgBox x.SerializeToBuffer

Notes: Same as other SerializeToBuffer method, but with newline="", indent=0 and baseIndent=0. See also:

- 184.6.68 SerializeToBuffer(options as Integer, padding as Integer, newline as string, indent as string="", baseIndent as Integer=0) as string

184.6.70 SetArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetArrayItem provides access to items within an array.

**Notes:**
The index is passed as an integer, you need not worry about the path string syntax for array items, convert a loop index to a string, etc. The array passed to SetArrayItem must already exist. See also AppendArrayItem.

In normal usage the selected array item is modified. A new item is automatically appended if the index is the array size plus 1. A new item may be inserted before or after any item by using one of the following option flags:

- kXMP_InsertBeforeItem = & h4000 Insert a new array item before the selected one.
- kXMP_InsertAfterItem = & h8000 Insert a new array item after the selected one.

**Parameters:**

- **schemaNS** The namespace URI for the array. Has the same usage as in GetProperty.
- **arrayName** The name of the array. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
- **itemIndex** The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem always refers to the last existing array item.
- **itemValue** An UTF-8 string that is the value of the array item, if the array item has a value. Has the same usage as propValue in GetProperty.
- **options** Option flags describing the item. See the earlier description.
184.6.71  SetLocalizedText(schemaNS as string, altTextName as string, genericLang as string, specificLang as string, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetLocalizedText modifies the value of a selected item in an alt-text array.

**Notes:**
Creates an appropriate array item if necessary, and handles special cases for the x-default item.

If the selected item is from a match with the specific language, the value of that item is modified. If the existing value of that item matches the existing value of the x-default item, the x-default item is also modified. If the array only has 1 existing item (which is not x-default), an x-default item is added with the given value.

If the selected item is from a match with the generic language and there are no other generic matches, the value of that item is modified. If the existing value of that item matches the existing value of the x-default item, the x-default item is also modified. If the array only has 1 existing item (which is not x-default), an x-default item is added with the given value.

If the selected item is from a partial match with the generic language and there are other partial matches, a new item is created for the specific language. The x-default item is not modified.

If the selected item is from the last 2 rules then a new item is created for the specific language. If the array only had an x-default item, the x-default item is also modified. If the array was empty, items are created for the specific language and x-default.

**Parameters:**

- **schemaNS**   The namespace URI for the alt-text array. Has the same usage as in GetProperty.
- **altTextName** The name of the alt-text array. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
- **genericLang** The name of the generic language as an RFC 3066 primary subtag.
- **specificLang** The name of the specific language as an RFC 3066 tag. Must not be an empty string.
- **itemValue** An UTF-8 string that is the new value for the appropriate array item.
- **options** Option flags, none are defined at present.

184.6.72  SetProperty(schemaNS as string, propName as string, propValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetProperty is the simplest property setter, mainly for top level simple properties or after using the path
composition functions.

Notes:

Parameters:

schemaNS The namespace URI for the property. Has the same usage as in GetProperty.
propName The name of the property. Has the same usage as in GetProperty.
propValue An UTF-8 string that is the value of the property, if the property has a value.
Options and non-leaf levels of structs do not have values.
options Option flags describing the property.

184.6.73 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean)

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyBoolean sets the value of a Boolean property from a boolean.

Notes:

Parameters:

schemaNS The namespace URI for the property. Has the same usage as in GetProperty.
propName The name of the property. Has the same usage as in GetProperty.
propValue The bool value to be assigned to the property.
options An integer variable that is assigned option flags describing the property.

See also:

- 184.6.74 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean, options as Integer)

184.6.74 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyBoolean sets the value of a Boolean property from a boolean.

Notes:

Parameters:

See also:
schemaNS | The namespace URI for the property. Has the same usage as in GetProperty.
propName | The name of the property. Has the same usage as in GetProperty.
propValue | The bool value to be assigned to the property.
options  | An integer variable that is assigned option flags describing the property.

- 184.6.73 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean)

184.6.75 SetPropertyDate(schemaNS as string, propName as string, propValue as XMPDateTimeMBS, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyDate sets the value of a date/time property from an XMPDateTimeMBS object.

**Notes:**

Parameters:

- schemaNS: The namespace URI for the property. Has the same usage as in GetProperty.
- propName: The name of the property. Has the same usage as in GetProperty.
- propValue: The XMPDateTimeMBS object to be assigned to the property.
- options: Option flags describing the property.

184.6.76 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double)

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyFloat sets the value of a floating point property from a double.

**Notes:**

Parameters:

- schemaNS: The namespace URI for the property. Has the same usage as in GetProperty.
- propName: The name of the property. Has the same usage as in GetProperty.
- propValue: The double float value to be assigned to the property.
- options: Option flags describing the property.

See also:

- 184.6.77 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double, options as Integer)
184.6.77  SetPropertyFloat(schemaNS as string, propName as string, propValue as Double, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyFloat sets the value of a floating point property from a double.

**Notes:**

Parameters:

- schemaNS  The namespace URI for the property. Has the same usage as in GetProperty.
- propName  The name of the property. Has the same usage as in GetProperty.
- propValue  The double float value to be assigned to the property.
- options   Option flags describing the property.

See also:

- 184.6.76 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double)

184.6.78  SetPropertyInt64Double(schemaNS as string, propName as string, propValue as Double, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyInt64Double sets the value of a 64 bit integer property from a double.

**Notes:**

Parameters:

- schemaNS  The namespace URI for the property. Has the same usage as in GetProperty.
- propName  The name of the property. Has the same usage as in GetProperty.
- propValue  The double value to be assigned to the property.
- options   Option flags describing the property.

184.6.79  SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** SetPropertyInteger sets the value of an integer property from an integer.

**Notes:**

Parameters:
184.6. CLASS XMPMETAMBS

schemaNS The namespace URI for the property. Has the same usage as in GetProperty.
propName The name of the property. Has the same usage as in GetProperty.
propValue The long integer value to be assigned to the property.
options Option flags describing the property.

See also:
• 184.6.80 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer, options as Integer)

184.6.80 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
SetPropertyInteger sets the value of an integer property from an integer.

**Notes:**

Parameters:

schemaNS The namespace URI for the property. Has the same usage as in GetProperty.
propName The name of the property. Has the same usage as in GetProperty.
propValue The long integer value to be assigned to the property.
options Option flags describing the property.

See also:
• 184.6.79 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer)

184.6.81 SetPropertyInteger64(schemaNS as string, propName as string, propValue as Int64, options as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Sets the value of an integer property using an Int64.

**Notes:**

Sets a property with a binary value, creating it if necessary.

schemaNS: The namespace URI; see GetProperty().
propName: The name of the property. Can be a general path expression, must not be "" or the empty string; see GetProperty() for namespace prefix usage.
propValue: The new binary value.

options: Option flags describing the property; a logical OR of allowed bit-flag constants; see kPropValueIsStruct and following. Must match the type of a property that already exists.

184.6.82 SetQualifier(schemaNS as string, propName as string, qualNS as string, qualName as string, qualValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: SetQualifier provides access to a qualifier attached to a property.

Notes:
The namespace for the qualifier is passed as a URI, you need not worry about the path string syntax. In many regards qualifiers are like struct fields. See the introductory discussion of qualified properties for more information.

The names of qualifiers should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix, which is unreliable because the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Parameters:

schemaNS The namespace URI for the struct. Has the same usage as in GetProperty.
propName The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName The name of the qualifier. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the propName parameter.
qualValue An UTF-8 string that is the value of the qualifier, if the qualifier has a value. Has the same usage as propValue in GetProperty.
options Option flags describing the qualifier.

184.6.83 SetStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string, fieldValue as string, options as Integer=0)

Notes:
The namespace for the field is passed as a URI, you need not worry about the path string syntax.
The names of fields should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix, which is unreliable because the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Parameters:

- **schemaNS** The namespace URI for the struct. Has the same usage as in GetProperty.
- **structName** The name of the struct. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
- **fieldNS** The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
- **fieldName** The name of the field. Must be a single XML name, must not be null or the empty string. Has the same namespace prefix usage as the structName parameter.
- **fieldValue** An UTF-8 string that is the value of the field, if the field has a value. Has the same usage as propValue in GetProperty.
- **options** Option flags describing the field.

---

**184.6.84 Sort**

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** Sorts the data model tree of an XMP object. **Notes:**

Use this function to sort the data model of an XMP object into a canonical order. This can be convenient when comparing data models, (e.g. by text comparison of DumpObject output).

At the top level the namespaces are sorted by their prefixes. Within a namespace, the top level properties are sorted by name. Within a struct, the fields are sorted by their qualified name, i.e. their XML prefix:local form. Unordered arrays of simple items are sorted by value. Language Alternative arrays are sorted by the xml:lang qualifiers, with the "x-default" item placed first.

---

**184.6.85 Properties**

**184.6.86 Name as string**

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The object name.
184.6.87 Constants

184.6.88 kAllowCommas = & h10000000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.  
**Notes:** Used by CatenateArrayItems and SeparateArrayItems.

184.6.89 kArrayLastItem = -1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** The index constant for the last item.

184.6.90 kDeleteEmptyValues = 4

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for RemoveProperties() and AppendProperties().  
**Notes:** Delete properties if the new value is empty.

184.6.91 kDeleteExisting = & h20000000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants.  
**Notes:** Used by SetXyz functions to delete any pre-existing property.

184.6.92 kDoAllProperties = 1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for RemoveProperties() and AppendProperties().  
**Notes:** Do all properties, default is just external properties.

184.6.93 kEncodeUTF16Big = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().  
**Notes:** Use UTF16 big-endian encoding.
184.6.94 kEncodeUTF16Little = 3

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
**Notes:** Use UTF16 little-endian encoding

184.6.95 kEncodeUTF32Big = 4

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
**Notes:** Use UTF32 big-endian encoding

184.6.96 kEncodeUTF32Little = 5

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
**Notes:** Use UTF32 little-endian encoding

184.6.97 kEncodeUTF8 = 0

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
**Notes:** Use UTF8 encoding

184.6.98 kEncodingMask = & \text{h}7

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
**Notes:** Bit-flag mask for encoding-type bits

184.6.99 kExactPacketLength = & \text{h}200

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
**Notes:** The padding parameter is the overall packet length.

184.6.100 kImplReservedMask = & \text{h}70000000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants.
184.6.101  kIncludeAliases = & h800

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for RemoveProperties() and AppendProperties().
**Notes:** Include aliases, default is just actual properties.

184.6.102  kIncludeThumbnailPad = & h100

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
**Notes:** Include a padding allowance for a thumbnail image.

184.6.103  kInsertAfterItem = & h8000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option for array item location.
**Notes:** Insert a new item after the given index.

184.6.104  kInsertBeforeItem = & h4000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option for array item location.
**Notes:** Insert a new item before the given index.
184.6. CLASS XMPMETAMBS

184.6.105 kIterAliases = 1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
**Notes:** Iterate the global alias table.

184.6.106 kIterClassMask = &hFF

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
**Notes:** The low 8 bits are an enum of what data structure to iterate.

184.6.107 kIterIncludeAliases = &h800

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
**Notes:** Include aliases, default is just actual properties.

184.6.108 kIterJustChildren = &h100

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
**Notes:** Just do the immediate children of the root, default is subtree.

184.6.109 kIterJustLeafName = &h400

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
**Notes:** Return just the leaf part of the path, default is the full path.

184.6.110 kIterJustLeafNodes = &h200

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for XMPIteratorMBS construction.
**Notes:** Just do the leaf nodes, default is all nodes in the subtree.
184.6.111  \texttt{kIterNamespaces} = 2

MBS XMP Plugin, Plugin Version: 9.4. \textbf{Function}: One of the constants for the option bit flags for XMPIteratorMBS construction.
\textbf{Notes}: Iterate the global namespace table.

184.6.112  \texttt{kIterOmitQualifiers} = & h1000

MBS XMP Plugin, Plugin Version: 9.4. \textbf{Function}: One of the constants for the option bit flags for XMPIteratorMBS construction.
\textbf{Notes}: Omit all qualifiers.

184.6.113  \texttt{kIterProperties} = 0

MBS XMP Plugin, Plugin Version: 9.4. \textbf{Function}: One of the constants for the option bit flags for XMPIteratorMBS construction.
\textbf{Notes}: Iterate the property tree of a TXMPMeta object.

184.6.114  \texttt{kIterSkipSiblings} = 2

MBS XMP Plugin, Plugin Version: 9.4. \textbf{Function}: One of the constants for the option bit flags for Skip.
\textbf{Notes}: Skip the subtree below and remaining siblings of the current node.

184.6.115  \texttt{kIterSkipSubtree} = 1

MBS XMP Plugin, Plugin Version: 9.4. \textbf{Function}: One of the constants for the option bit flags for Skip.
\textbf{Notes}: Skip the subtree below the current node.

184.6.116  \texttt{kLittleEndianBit} = 1

MBS XMP Plugin, Plugin Version: 9.4. \textbf{Function}: One of the option bit flags for SerializeToBuffer().

184.6.117  \texttt{kNoOptions} = 0

MBS XMP Plugin, Plugin Version: 9.4. \textbf{Function}: The constant to specify to use no options.

The XML namespace for the XMP paged document schema.  
Deprecated XML namespace constant.

184.6.167  kOmitAllFormatting = & h800

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().  
**Notes:** Omit all formatting whitespace.
184.6. CLASS XMPMETA

184.6.168  kOmitPacketWrapper = & h10

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
**Notes:** Omit the XML packet wrapper.

184.6.169  kOmitXMPMetaElement = & h1000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
**Notes:** Omit the x:xmpmeta element surrounding the rdf:RDF element.

184.6.170  kParseMoreBuffers = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** This is the not last input buffer for this parse stream.

184.6.171  kPropArrayFormMask = & h1E00

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** Property type bit-flag mask for all array types

184.6.172  kPropArrayIsAlternate = & h800

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** Implies kPropArrayIsOrdered, items are alternates. It is serialized using an rdf:Alt container.

184.6.173  kPropArrayIsAltText = & h1000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** Implies kPropArrayIsAlternate, items are localized text. Each array element is a simple property with an xml:lang attribute.
184.6.174  kPropArrayIsOrdered = & h400

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** Implies kPropValueIsArray, item order matters. It is serialized using an rdf:Seq container.

184.6.175  kPropArrayIsUnordered = & h200

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** The item order does not matter.

184.6.176  kPropArrayLocationMask = & hC000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for the property setting functions.
**Notes:** Bit-flag mask for array-item location bits

184.6.177  kPropCompositeMask = & h1F00

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** Property type bit-flag mask for composite types (array and struct)

184.6.178  kPropHasAliases = & h20000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** This property is the base value (actual) for a set of aliases. This is only returned by GetProperty() and then only if the property name is simple, not an path expression.

184.6.179  kPropHasLang = & h40

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** Implies kPropHasQualifiers, property has xml:lang.
184.6.180  kPropHasQualifiers = & h10

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** The property has qualifiers, includes rdf:type and xml:lang.

184.6.181  kPropHasType = & h80

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** Implies kPropHasQualifiers, property has rdf:type.

184.6.182  kPropIsAlias = & h10000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** This property is an alias name for another property. This is only returned byGetProperty() and then only if the property name is simple, not an path expression.

184.6.183  kPropIsDerived = & h200000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** The value of this property is derived from the document content.

184.6.184  kPropIsInternal = & h40000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:** The value of this property is ”owned” by the application, and should not generally be editable in a UI.

184.6.185  kPropIsQualifier = & h20

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.
**Notes:**
This is a qualifier for some other property, includes rdf:type and xml:lang. Qualifiers can have arbitrary structure, and can themselves have qualifiers. If the qualifier itself has a structured value, this flag is only set for the top node of the qualifier’s subtree.

184.6.186 kPropIsStable = & h100000

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.  
**Notes:** The value of this property is not derived from the document content.

184.6.187 kPropValueIsArray = & h200

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.  
**Notes:** The value is an array (RDF alt/bag/seq). The "ArrayIs..." flags identify specific types of array; default is a general unordered array, serialized using an rdf:Bag container.

184.6.188 kPropValueIsStruct = & h100

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.  
**Notes:** The value is a structure with nested fields.

184.6.189 kPropValueIsURI = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for the property accessor functions.  
**Notes:** The XML string form of the property value is a URI, use rdf:resource attribute. DISCOURAGED

184.6.190 kPropValueOptionsMask = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants of the option bit flags for the property setting functions.  
**Notes:** Bit-flag mask for property-value option bits
184.6. CLASS XMPMETAMBS

184.6.191 kReadOnlyPacket = & h20

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
**Notes:** Default is a writeable packet.

184.6.192 kReplaceOldValues = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for RemoveProperties() and AppendProperties().
**Notes:** Replace existing values, default is to leave them.

184.6.193 kRequireXMPMeta = 1

MBS XMP Plugin, Plugin Version: 9.4. **Function:** Require a surrounding x:xmpmeta element.

184.6.194 kStrictAliasing = 4

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the constants for the option bit flags for ParseFromBuffer().
**Notes:** Do not reconcile alias differences, throw an exception.

184.6.195 kUseCompactFormat = & h40

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
**Notes:** Use a compact form of RDF.

184.6.196 kUseNullTermination = 0

MBS XMP Plugin, Plugin Version: 9.4. **Function:** The length constants for a string to determinate the length automatically.

184.6.197 kUTF16Bit = 2

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().
184.6.198  kUTF32Bit = 4

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().

184.6.199  kWriteAliasComments = & h400

MBS XMP Plugin, Plugin Version: 9.4. **Function:** One of the option bit flags for SerializeToBuffer().  
**Notes:** Show aliases as XML comments.

184.6.200  kXMPFiles_IgnoreLocalText = 2

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the flags for XMPFiles initialize.  
**Notes:** Ignore non-XMP text that uses an undefined "local" encoding.

184.6.201  kXMPFiles_ServerMode = 2

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the flags for XMPFiles initialize.  
**Notes:** Combination of flags necessary for server products using XMPFiles.

184.6.202  kXMPTemplate_AddNewProperties = 8

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the option constants for ApplyTemplate function.  
**Notes:** Perform an Add operation, add properties if they don’t already exist.

184.6.203  kXMPTemplate_ClearUnnamedProperties = & h10

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the option constants for ApplyTemplate function.  
**Notes:** Perform a Clear operation, keep named properties and delete everything else.

184.6.204  kXMPTemplate_InvokeInternalProperties = 1

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the option constants for ApplyTemplate function.
**184.6. CLASS XMPMETAMBS**

**Notes:** Do all properties, default is just external properties.

**184.6.205 kXMPTemplate.ReplaceExistingProperties = 2**

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the option constants for ApplyTemplate function.
**Notes:** Perform a Replace operation, add new properties and modify existing ones.

**184.6.206 kXMPTemplate.ReplaceWithDeleteEmpty = 4**

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the option constants for ApplyTemplate function.
**Notes:** Similar to Replace, also delete if the template has an empty value.

**184.6.207 kXMP_NS_BWF = ”http://ns.adobe.com/bwf/bext/1.0/”**

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the XML namespace constants for standard XMP schema.

**184.6.208 kXMP_NS_Script = ”http://ns.adobe.com/xmp/1.0/Script/”**

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the XML namespace constants for standard XMP schema.

**184.6.209 kXMP_WriteAliasComments = & h400**

MBS XMP Plugin, Plugin Version: 11.0. **Function:** One of the option flags for SerializeToBuffer.
**Notes:** Show aliases as XML comments.

**184.6.210 Version = ”5.5.0”**

MBS XMP Plugin, Plugin Version: 11.0. **Function:** The version string of the XMP library.
184.7  class XMPPacketInfoMBS

184.7.1  class XMPPacketInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for information about a xmp packet.

184.7.2  Properties

184.7.3  CharForm as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Character format using the values kChar8Bit, kChar16BitBig, etc.
**Notes:** (Read and Write property)

184.7.4  HasWrapper as Boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
True if there is a packet wrapper, the "<?xpacket...?>" XML processing instructions.
**Notes:** (Read and Write property)

184.7.5  Length as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Packet length in the file in bytes, -1 if unknown.
**Notes:** (Read and Write property)

184.7.6  Offset as Int64

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Packet offset in the file in bytes, -1 if unknown.
**Notes:** (Read and Write property)

184.7.7  PadSize as Integer

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Packet padding size in bytes, zero if unknown.
184.7. CLASS XMPPACKETINFOMBS

Notes: (Read and Write property)

184.7.8 Writeable as Boolean

MBS XMP Plugin, Plugin Version: 9.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
True if there is a packet wrapper and the trailer says writeable by dumb packet scanners.  
Notes: (Read and Write property)
184.8 class XMPScannerMBS

184.8.1 class XMPScannerMBS

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The class to scan any file stream for XMP data.

**Example:**

```vbs
' get file
source=GetOpenFolderItem("any")
if source=nil then Return

b=source.OpenAsBinaryFile(false)
if b=nil then Return

' read file to memory
l=b.Length
s=b.Read(l)

' scan for xmp blocks
MsgBox "Scanning "+str(lenb(s))+" of "+str(l)+" bytes."
xs=new XMPScannerMBS(l)
xs.Scan(s,0)

MsgBox "Found "+xs.Report+" blocks"

n=xs.Report-1

c=0
for i=0 to n

xn=xs.Snip(i)

if xn.State=3 then '// found
if xn.Length>50 then
try
b.Position=xn.Offset
```

```vbs
' try
```

```vbs
```
s=b.Read(xn.Length)

// debug output xmp data
'WriteInputXMP dest,s

// try to parse
x=new XMPMetaMBS(s)

// work with xmp meta data
catch r as XMPExceptionMBS
MsgBox "ExtractXMP failed on: " + r.message
end try
else
MsgBox "Found small xmp block? "+str(xn.Length)
end if
end if
end if
next

184.8.2 Methods

184.8.3 Constructor

See also:

- 184.8.4 Constructor(StreamLength as Integer)

184.8.4 Constructor(StreamLength as Integer)

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. Function: Constructor to create a XMPS scanner which reads the given number of bytes.

See also:

- 184.8.3 Constructor

184.8.5 Report as Integer

Notes: The snipps found are saved in an array which you can access using the snip() function. Returns the number of entries in this array.
184.8.6 **Scan(Buffer as string, Offset as Int64)**

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Scans the given part of the input, incorporating it in to the known snips.
**Notes:** The Offset is the offset of this block of input relative to the entire stream.

184.8.7 **Snip(index as UInt32) as XMPSnipMBS**

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns the snip with the given index.
**Notes:**
index is zero based.
Returns nil on any error.
You must call Report before this method.

184.8.8 **SnipCount as UInt32**

MBS XMP Plugin, Plugin Version: 11.3, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Number of snips found so far.

184.8.9 **StreamAllScanned as boolean**

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
Returns true if all of the stream has been seen.
184.9. **CLASS XMPSNIPMBS**

184.9  **class XMPSnipMBS**

184.9.1  **class XMPSnipMBS**

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The class for the XMP Snips found by the XMPScannerMBS class.

184.9.2  **Properties**

184.9.3  **Access as Integer**

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The read-only/read-write access from the end attribute.
**Notes:** (Read and Write property)

184.9.4  **BytesAttr as Int64**

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
The value of the bytes attribute, -1 if not present.
**Notes:** (Read only property)

184.9.5  **CharForm as Integer**

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:**
How the packet is divided into characters.
**Notes:**
The values allow easy testing for 16/32 bit and big/little endian.

```
eChar8Bit     = 0
eChar16BitBig = 2
eChar16BitLittle = 3
eChar32BitBig = 4
eChar32BitLittle = 5
```

**Notes:** (Read and Write property)
184.9.6 EncodingAttr as String

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The value of the encoding attribute, if any, with nulls removed. **Notes:** (Read and Write property)

184.9.7 Length as Int64

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The length in bytes of this snip. **Notes:** (Read only property)

184.9.8 Offset as Int64

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The byte offset of this snip within the input stream. **Notes:** (Read only property)

184.9.9 OutOfOrder as Integer

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** If true, this snip was seen before the one in front of it. **Notes:** (Read and Write property)

184.9.10 State as Integer

MBS XMP Plugin, Plugin Version: 6.5, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The state of this snip. **Notes:**

   constants:

    eNotSeenSnip          0  This snip has not been seen yet.
ePendingSnip           1  This snip is an input buffer being processed.
eRawInputSnip           2  This snip is raw input, it doesn’t contain any part of an XMP packet.
eValidPacketSnip        3  This snip is a complete, valid XMP packet.
ePartialPacketSnip      4  This snip contains the start of a possible XMP packet.
eBadPacketSnip          5  This snip contains a complete, but semantically incorrect XMP packet.
184.9. CLASS XMPSNIPMBS

(Read and Write property)
184.10  class XMPTextOutputMBS

184.10.1  class XMPTextOutputMBS

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** An event class for text output.

**Notes:** You may want to make a subclass which collects all the strings into one string or write them to a file.

184.10.2  Events

184.10.3  Output(text as string) as Integer

**Notes:**

You may get more than one event per line.

Return 0 for success or something else for failure.
184.11 class XMPVersionInfoMBS

184.11.1 class XMPVersionInfoMBS

**Example:**

```vba
dim v as XMPVersionInfoMBS
v=XMPMetaMBS.GetVersionInfo
MsgBox v.Message
```

**Notes:** Constructor sets values.

184.11.2 Properties

184.11.3 Build as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A rolling build number, monotonically increasing in a release.

**Notes:** (Read and Write property)

184.11.4 Flags as Integer

**Notes:** (Read and Write property)

184.11.5 IsDebug as boolean

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** True if this is a debug build.

**Notes:** (Read and Write property)

184.11.6 Major as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The primary release number, the "1" in version "1.2.3".
184.11.7 Message as String

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** A comprehensive version information string.

**Example:**

```vba
dim v as XMPVersionInfoMBS
v=XMPMetaMBS.GetVersionInfo
MsgBox v.Message
```

**Notes:** (Read and Write property)

184.11.8 Micro as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The tertiary release number, the "3" in version "1.2.3".

**Notes:** (Read and Write property)

184.11.9 Minor as Integer

MBS XMP Plugin, Plugin Version: 6.4, Console & Web: Yes, Mac: Yes, Win: Yes, Linux: Yes. **Function:** The secondary release number, the "2" in version "1.2.3".

**Notes:** (Read and Write property)

CHAPTER 185. LIST OF QUESTIONS IN THE FAQ

- 186.0.20 Can I use your plugin controls on a web application? 20817
- 186.0.21 Can you get an unique machine ID? 20817
- 186.0.22 ChartDirector: Alignment Specification 20818
- 186.0.23 ChartDirector: Color Specification 20818
- 186.0.24 ChartDirector: Font Specification 20822
- 186.0.25 ChartDirector: Mark Up Language 20825
- 186.0.26 ChartDirector: Parameter Substitution and Formatting 20829
- 186.0.27 ChartDirector: Shape Specification 20834
- 186.0.28 Copy styled text? 20835
- 186.0.29 Do you have code to validate a credit card number? 20835
- 186.0.30 Do you have plugins for X-Rite EyeOne, eXact or i1Pro? 20836
- 186.0.31 Does SQL Plugin handle stored procedures with multiple result sets? 20836
- 186.0.32 Does the plugin home home? 20837
- 186.0.33 folderitem.absolutepath is limited to 255 chars. How can I get longer ones? 20837
- 186.0.34 Future of editablemovie class? 20838
- 186.0.35 Has anyone played round with using CoreImage to do things like add dissolve transitions say when changing from one tab to another within a window? 20838
- 186.0.36 How about Plugin support for older OS X? 20839
- 186.0.37 How can I detect whether an Intel CPU is a 64bit CPU? 20840
- 186.0.38 How can I disable the close box of a window on Windows? 20841
- 186.0.39 How can I get all the environment variables from Windows? 20841
- 186.0.40 How can i get similar behavior to Roxio Toast or iTunes where clicking a 'burn' button allows the next inserted blank CD-R to bypass the Finder and be accepted by my application? 20842
- 186.0.41 How can I get text from a PDF? 20842
- 186.0.42 How can I get text from a Word Document? 20842
- 186.0.43 How can I get the item string for a given file creator? 20843
- 186.0.44 How can I launch an app using it’s creator code? 20844
- 186.0.45 How can I learn what shared libraries are required by a plugin on Linux? 20844
- 186.0.46 How can I validate an email address? 20845
- 186.0.47 How do I check if the QuickTime component for the JPEG exporting is available? 20846
• 186.0.48 How do I check if the QuickTime component for the JPEG importing is available? 20797
• 186.0.49 How do I check if the QuickTime component for the Sequence grabber is available? 20847
• 186.0.50 How do I decode correctly an email subject? 20848
• 186.0.51 How do I enable/disable a single tab in a tabpanel? 20849
• 186.0.52 How do I find the root volume for a file? 20850
• 186.0.53 How do I get the current languages list? 20850
• 186.0.54 How do I get the Mac OS Version? 20851
• 186.0.55 How do I get the printer name? 20852
• 186.0.56 How do I make a metal window if RB does not allow me this? 20852
• 186.0.57 How do I make a smooth color transition? 20853
• 186.0.58 How do I read the applications in the dock app? 20854
• 186.0.59 How do I truncate a file? 20855
• 186.0.60 How do update a Finder’s windows after changing some files? 20855
• 186.0.61 How to access a USB device directly? 20855
• 186.0.62 How to add icon to file on Mac? 20856
• 186.0.63 How to ask the Mac for the Name of the Machine? 20856
• 186.0.64 How to automatically enable retina in my apps? 20857
• 186.0.65 How to avoid leaks with Cocoa functions? 20857
• 186.0.66 How to avoid trouble connecting to oracle database with SQL Plugin? 20858
• 186.0.67 How to avoid __NSAutoreleaseNoPool console messages in threads? 20858
• 186.0.68 How to bring app to front? 20859
• 186.0.69 How to bring my application to front? 20859
• 186.0.70 How to catch Control-C on Mac or Linux in a console app? 20859
• 186.0.71 How to change name of application menu? 20860
• 186.0.72 How to change the name in the menubar of my app on Mac OS X? 20860
• 186.0.73 How to check if a folder/directory has subfolders? 20861
• 186.0.74 How to check if Macbook runs on battery or AC power? 20862
• 186.0.75 How to check if Microsoft Outlook is installed? 20862
• 186.0.76 How to check on Mac OS which country or language is currently selected? 20863
• 186.0.77 How to code sign my app with plugins? 20864
• 186.0.78 How to collapse a window? 20864
• 186.0.79 How to compare two pictures? 20865
• 186.0.80 How to compile PHP library? 20866
• 186.0.81 How to convert a BrowserType to a String with WebSession.Browser? 20868
• 186.0.82 How to convert a EngineType to a String with WebSession.Engine? 20868
• 186.0.83 How to convert a PlatformType to a String with WebSession.Platform? 20869
• 186.0.84 How to convert a text to iso-8859-1 using the TextEncoder? 20870
• 186.0.85 How to convert ChartTime back to Xojo date? 20870
• 186.0.86 How to convert line endings in text files? 20871
• 186.0.87 How to convert picture to string and back? 20871
• 186.0.88 How to copy an array? 20872
• 186.0.89 How to copy an dictionary? 20873
• 186.0.90 How to copy parts of a movie to another one? 20873
• 186.0.91 How to create a birthday like calendar event? 20874
• 186.0.92 How to create a GUID? 20875
• 186.0.93 How to create a Mac picture clip file? 20875
• 186.0.94 How to create a PDF file in REALbasic? 20876
• 186.0.95 How to create EmailAttachment for PDF Data in memory? 20876
• 186.0.96 How to create PDF for image files? 20877
• 186.0.97 How to CURL Options translate to Plugin Calls? 20878

Chapter 186

The FAQ

186.0.1 Can anyone help me convert seconds to time in this format hh:mm:ss?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Sure, here’s a routine I use (which has an advantage over the previously-posted Date-based solution in that you don’t have to rely on the creation of an object – all that happens is some division and string concatenation):

Example:

Function SecsToTimeString(timeInSecs as Integer, padHours as boolean, padMinutes as boolean) as string
// Given an amount time (in seconds), generates a string representing that amount
// of time. The padHours and padMinutes parameters determine whether to display
// hours and minutes if their values are zero.

// Examples:
// timeInSecs = 90, padHours = true; returns ”00:01:30”
// timeInSecs = 1, padHours = false, padMinutes = true; returns ”00:01”
// timeInSecs = 3601, padMinutes = false; returns ”01:00:01”

dim hours, minutes, seconds as Integer
dim hoursString, minutesString as string
hours = timeInSecs / 3600
minutes = (timeInSecs mod 3600) / 60
seconds = timeInSecs mod 60
if hours = 0 then
if padHours then
hoursString = ”00:“
else
hoursString = ”“
end if
else
end if
hoursString = Format(hours, "# # ":")
end if
if minutes = 0 then
if hours <> 0 or padMinutes then
minutesString = "00:"
else
minutesString = "" end if
else
minutesString = Format(minutes, "00:")
end if
return hoursString + minutesString + Format(seconds, "00")
End Function

Notes: (from the rb mailinglist)

186.0.2 How do I get the proper highlight color on Mac OS X for active/inactive selection?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: You can use functions from NSColor to get proper highlight color in RGB:

Example:

Function ProperHighlightColor(active as Boolean) As Color
  # if TargetCocoa
  Dim theColor As NSColorMBS
  If active Then
    theColor = NSColorMBS.alternateSelectedControlColor
  Else
    theColor = NSColorMBS.secondarySelectedControlColor
  End If

  Dim rgbColor As NSColorMBS = theColor.colorUsingColorSpaceName(NSColorSpaceMBS.NSCalibratedRGBColorSpace)
  If rgbColor <> Nil Then
    Dim red as Integer = rgbColor.redComponent * 255.0
    Dim green as Integer = rgbColor.greenComponent * 255.0
    Dim blue as Integer = rgbColor.blueComponent * 255.0
    Return RGB(red, green, blue)
  Else
    Return HighlightColor
  End If
  # else
return HighlightColor
#include "highlight.h"
#endif
End Function

Notes: As you see we convert color to Calibrated RGB for best results. See also:

- 186.0.3 How to catch delete key?

- 186.0.5 How to delete a folder?
- 186.0.6 How to detect if CPU if 64bit processor?
- 186.0.7 How to refresh a htmlviewer on Windows?

186.0.3 How to catch delete key?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: The following is the code in keydown event catches delete or backspace keys.

Example:

Function KeyDown(Key As String) As Boolean
    if asc(key) = 8 or asc(key) = 127 then
        MsgBox "Delete"
        Return true
    end if
End Function

- 186.0.6 How to detect if CPU if 64bit processor?
- 186.0.7 How to refresh a htmlviewer on Windows?

186.0.4 How to convert cmyk to rgb?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer:
The following is the code to convert cmyk values to an RGB color datatype. It’s just a basic estimate of the color values. If you are looking for completely color accurate solution, this is not it. It should work for most people. :) 

**Example:**

```vbnet
Function CMYKToRGB(c as Integer, m as Integer, y as Integer, k as Integer) As color
    // converts c,m,y,k values (0-100) to color data type RGB
    // place this in a method. Supply C,M,Y,K values-
    // it returns color datatype
    dim color
    RGB as color
    dim r, g, b as Integer

    r=255-round(2.55*(c+k))
    if r<0 then
        r=0
    end if
    g=255-round(2.55*(m+k))
    if g<0 then
        g=0
    end if
    b=255-round(2.55*(y+k))
    if b<0 then
        b=0
    end if

    color
    RGB=RGB(r,g,b)

    return color

End Function
```

**Notes:** (from the rb mailinglist)

- 186.0.6 How to detect if CPU if 64bit processor? 20810
- 186.0.7 How to refresh a htmlviewer on Windows? 20810
186.0.5  How to delete a folder?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** The following is the code deletes a folder recursively.

**Example:**

```
Sub deletefolder(f as folderitem)
  dim files(-1) as FolderItem

  if f=nil then Return

  // delete single file
  if f.Directory=false then
    f.Delete
    Return
  end if

  // get a list of all items in that folder
  dim i,c as Integer
  c=F.Count
  for i=1 to c
    files.Append f.TrueItem(i)
  next

  // delete each item
  for each fo as FolderItem in files
    if fo=nil then
      ' ignore
    elseif fo.Directory then
      deletefolder fo
    else ' file
      fo.Delete
    end if
  next

  f.Delete
End Sub
```

- 186.0.7 How to refresh a htmlviewer on Windows? 20810
186.0.6  How to detect if CPU if 64bit processor?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Via CPUID you can ask CPU:

Example:

```vbp
Dim c As New CPUIDMBS
If c.Flags(CPUIDMBS.kFeatureLM) Then
    MsgBox "64-bit CPU"
Else
    MsgBox "32-bit CPU"
End If
```

Notes: Should work on all intel compatible CPUs.

186.0.7  How to refresh a htmlviewer on Windows?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: You can ask the browser to reload the website with this code line:

Example:

```vbp
Call htmlViewer1.IERunJavaScriptMBS("javascript:document.location.reload()")
```

**186.0.8  Is there an example for vector graphics in REALbasic?**

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Try this example inside the paint event of a window:

**Example:**

```realbasic
dim v as Group2D
dim r as RectShape
dim s as StringShape

const pi=3.14

s=new StringShape
s.Text="Hello World!"
s.TextFont="Geneva"
s.TextSize=24
s.FillColor=rgb(0,0,255)
s.Italic=true
s.y=5
s.x=0

r=new RectShape

r.X=0
r.y=0
r.Height=100
r.Width=180
r.BorderColor=rgb(255,0,0)
r.FillColor=rgb(0,255,0)
r.BorderWidth=5
r.Border=50

v=new Group2d
v.Append r
v.Append s
v.Rotation=pi*-20.0/180.0
v.x=150
v.y=150

g.DrawObject v
```

**186.0.9  Picture functions do not preserve resolution values?**

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Yes, the picture functions return pictures with no/default resolution values.
Example:

```vba
dim l as Picture = LogoMBS(500)

l.HorizontalResolution = 300
l.VerticalResolution = 300

dim r as Picture = l.Rotate90MBS

MsgBox str(r.HorizontalResolution) + " x " + str(r.VerticalResolution)

r.HorizontalResolution = l.HorizontalResolution
r.VerticalResolution = l.VerticalResolution

MsgBox str(r.HorizontalResolution) + " x " + str(r.VerticalResolution)
```

Notes:
So please fix them yourself after calling a function.

Maybe in the future this changes, but currently you can’t really set this easily from plugin code.

186.0.10  A toolbox call needs a rect - how do I give it one?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** Fill a memoryblock like this:

**Example:**

```vba
Dim MB As Memoryblock
MB = NewMemoryBlock(8)
MB.Short(0) = window1.Top
MB.Short(2) = window1.Left
MB.Short(4) = window1.Height+window1.Top // bottom
MB.Short(6) = window1.Width+window1.Left // right
```

186.0.11  API client not supported?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** If you get this exception message on SQLConnectionMBS.Connect, we may have a problem.

**Notes:**
First case is that the given thing is not supported (e.g. MS SQL directly on Mac).
Second case is that the plugin compilation went wrong and the support for the database was not linked into the plugin. Like MySQL missing or MS SQL on Windows missing. In that case please contact us to fix the plugin.

186.0.12 Can I access Access Database with Java classes?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** You can use ucanaccess to access databases created with Microsoft

**Example:**

```vba
dim options(-1) as string

' load all the jar files we have in a folder called java:

dim appFolder as FolderItem = GetFolderItem("")

Dim count as Integer = appFolder.Parent.Child("java").Count

dim libjs() as string
For i as Integer = 1 to count
Dim f As FolderItem = appFolder.Parent.Child("java").item(i)
If f <> Nil and f.Exists Then
    libjs.append f.NativePath+";"
End If
Next

// now init virtual machine

dim library as string = Join(libjs, ":")
dim vm as new JavaVMMBS(library)

if vm.Handle = 0 then
    MsgBox "Failed to initialize virtual machine"
else
    // now make a new database connection with ucanaccess
dim d as new JavaDatabaseMBS(vm,"net.ucanaccess.jdbc.UcanaccessDriver")
Dim DbFile as FolderItem = appFolder.Parent.Child("Database11.accdb")
dim j as JavaConnectionMBS = d.getConnection("jdbc:ucanaccess://"+DbFile.NativePath)

    // select and show values
    dim r as JavaResultSetMBS = j.MySelectSQL("Select * From test")
    while r.NextRecord
        MsgBox r.getString("FirstName") +" " + r.getString("LastName")
    wend

end if

Exception e as JavaExceptionMBS
```
CHAPTER 186. THE FAQ

MsgBox e.message+" errorcode: "+str(e.ErrorNumber)

Notes:
see website:
http://ucanaccess.sourceforge.net/site.html

186.0.13 Can I create PDF from Real Studio Report using DynaPDF?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Sorry, no. We can’t provide a graphics subclass from plugin.
**Notes:**
The is a feature request to allow graphics subclasses:
Feedback case 11391: feedback://showreport?report_id=11391

186.0.14 Can I use AppleScripts in a web application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Yes, but they run on the server, not on the client.
**Example:**
```vbscript
dim a as new AppleScriptMBS

// query my application name
a.Compile "tell application ""System Events"" to return name of current application"

// run
a.Execute

// show result
label1.text = a.Result

// shows something like ”My Application.fcgi.debug”
```

**Notes:** This can be useful to control the server from remote, if and only if the your sever is running Mac OS X.
186.0.15 Can I use graphics class with DynaPDF?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Sorry, no. We can’t provide a graphics subclass from plugin.

**Notes:**
The is a feature request to allow graphics subclasses:
Feedback case 11391: feedback://showreport?report_id=11391

186.0.16 Can I use OGG with REALbasic?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** There is a QuickTime plugin for OGG which works with REALbasic.

**Notes:** That should be a solution for playback and recording on Mac and Windows.

186.0.17 Can I use sockets on a web application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Yes, but they run on the server, not on the client.

**Notes:**
You can use HTTPSocket, SMTPSocket, POP3Socket, SMTPSecureSocket, SecurePOP3Socket, EasyTCP- Socket, EasyUDPSocket, AutoDiscovery, our Bonjour classes or our CURL* classes. But all of them work on the server, not on the client.

This means if you search for a printer with Bonjour, you can find the printers in the local network on your server hosting site. Using SMTPSocket may be a good idea for sending emails from the server like notifications.

186.0.18 Can I use your ChartDirector plugin on a web application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Yes, our ChartDirector plugin works just fine on the Real Studio Web Edition.

**Example:**

```plaintext
// The data for the pie chart
dim data(-1) as Double=array(55.0, 18.0, 25.0, 22.0, 18.0, 30.0, 35.0)

// The labels for the pie chart, Words are choosen random to check font!
dim labels(-1) as string=array("Germany","Italy","France","Spain","UK","Poland","Russia")

// The colors to use for the sectors
```
20816

CHAPTER 186. THE FAQ

dim colors(-1) as Integer

if TargetLinux then
CDBaseChartMBS.SetFontSearchPath ”/usr/share/fonts/truetype/msttcorefonts”
end if
// Create a PieChart object of size 360 x 300 pixels
dim c as new CDPieChartMBS(700, 600)
c.setBackground(c.linearGradientColor(0, 0, 0, c.getHeight(), & h0000cc, & h000044))
c.setRoundedFrame(& hffffff, 16)
dim tt as CDTextBoxMBS = c.addTitle(”ChartDirector Demonstration”, ”timesbi.ttf”, 18)
tt.setMargin(0, 0, 16, 0)
tt.setFontColor(& hFFFFFF)
// Set the center of the pie at (180, 140) and the radius to 100 pixels
c.setPieSize 350,300,150
// Set the sector colors
c.setColors(c.kDataColor, colors)
// Draw the pie in 3D with a pie thickness of 20 pixels
c.set3D(20)
dim t as CDTextBoxMBS = c.setLabelStyle(”arialbd.ttf”, 10, & h000000)
t.setBackground(CDPieChartMBS.kSameAsMainColor, CDPieChartMBS.kTransparent, CDPieChartMBS.softLighting(CDPieChartMBS.kRight, 0))
t.setRoundedCorners(8)
// Use local gradient shading for the sectors, with 5 pixels wide
// semi-transparent white (bbffffff) borders
c.setSectorStyle(CDPieChartMBS.kLocalGradientShading, & hbbffffff, 0)
// Set the pie data and the pie labels
c.setData data,labels
call c.setLabelStyle ”arialbd.ttf”,18
dim pic as picture = c.makeChartPicture
dim wp as new WebPicture(pic, Picture.FormatJPEG) // JPEG makes it smaller and faster
ImageView1.Picture=wp


Notes:

Be aware that our plugin produces pictures for you, which you assign to ImageViews. Transferring those pictures takes time, so you can optimize that with using WebPicture class. There you can decide between different compressions to improve speed (use JPEG instead of PNG).

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

186.0.19 Can I use your DynaPDF plugin on a web application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Yes, our DynaPDF plugin works just fine on the Real Studio Web Edition.

Notes:

PDF files are created on the server. You may want to offer a preview to the user which uses reduced resolution images to reduce the time to download the PDF.

See our Create PDF example for the Real Studio Web Edition.
http://www.monkeybreadsoftware.de/realbasic/webapps.shtml

186.0.20 Can I use your plugin controls on a web application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** No.

186.0.21 Can you get an unique machine ID?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** There is nothing like an unique machine ID.

Notes:

1:
You can use the MAC IDs of the network interfaces.
This can be changed by the user with software tools.
And the list of network interfaces changes if user reorder the interfaces.

2:
You can use the system folder creation date/time.
This may stay equal after cloning machines or after migration to new PC.
3: You can use the Mac Serialnumber. Mac only and it can happen that a Mac does not have a serial number.

4: You can use the x86 CPU ID. This is x86 CPU only and does not avoid running on the same CPU in different PCs.

186.0.22 ChartDirector: Alignment Specification

Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** ChartDirector: Alignment Specification

**Notes:**

In many ChartDirector objects, you may specify the alignment of the object’s content relative to its boundary. For example, for a TextBox object, you may specify the text’s alignment relative to the box boundary by using TextBox.setAlignment.

The ChartDirector API defines several constants for the alignment options.

186.0.23 ChartDirector: Color Specification

Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** ChartDirector: Color Specification

**Notes:**

Many functions in the ChartDirector API accept colors as parameters. ChartDirector supports colors specified in web and HTML compatible ARGB format, in which ARGB refers to the Alpha transparency, Red, Green and Blue components of the color.

In addition to ARGB colors, ChartDirector supports "dynamic" colors. A dynamic color is a color that changes depending on the position of the pixels. The "dynamic" colors that ChartDirector supports include "pattern colors", "metal colors", "gradient colors", "zone colors" and "dash line colors".

ChartDirector supports specifying colors indirectly using "palette colors". When a "palette color" is used, the color is specified as an index to a palette. The actual color is looked up from the palette. ARGB Color ARGB color consists of 4 components - alpha transparency, red, green and blue. The four components are encoded as a 32-bit number, with each component occupying 8 bits. In hexadecimal notation, it is AAR-
BottomLeft  1  The leftmost point on the bottom line.
BottomCenter  2  The center point on the bottom line.
BottomRight  3  The rightmost point on the bottom line.
Left  4  The leftmost point on the middle horizontal line.
Center  5  The center point on the middle horizontal line.
Right  6  The rightmost point on the middle horizontal line.
TopLeft  7  The leftmost point on the top line.
TopCenter  8  The center point on the top line.
TopRight  9  The rightmost point on the top line.
Bottom  2  The center point on the bottom line. Same as BottomCenter.
Top  8  The center point on the top line. Same as TopCenter.
TopLeft2  10  An alternative top-left position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, TopLeft2 refers to the left of the top side, while TopLeft refers to the top of the left side. The reverse applies for a horizontal axis.
TopRight2  11  An alternative top-right position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, TopRight2 refers to the right of the top side, while TopRight refers to the top of the right side. The reverse applies for a horizontal axis.
BottomLeft2  12  An alternative bottom-left position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, BottomLeft2 refers to the left of the bottom side, while BottomLeft refers to the bottom of the left side. The reverse applies for a horizontal axis.
BottomRight2  13  An alternative bottom-right position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, BottomRight2 refers to the right of the bottom side, while BottomRight refers to the bottom of the right side. The reverse applies for a horizontal axis.

RGGBB, where AA, RR, GG and BB are the alpha transparency, red, green and blue components.

Each component ranges from 00 - FF (0 - 255), representing its intensity. For example, pure red color is 00FF0000, pure green color is 0000FF00, and pure blue color is 000000FF. White color is 00FFFFFF, and black color is 00000000.

Most programming language requires you to put special prefix in front of hexadecimal characters. For C++, the prefix is "0x". For example, the syntax for the hexadecimal number 00FFFFFF is 0x00FFFFFF, or simply 0xFFFFFF.

For the alpha transparency component, a zero value means the color is not transparent all at. This is equivalent to traditional RGB colors. A non-zero alpha transparency means the the color is partially transparent. The larger the alpha transparency, the more transparent the color will be. If a partially transparent color is used to draw something, the underlying background can still be seen.

For example, 80FF0000 is a partially transparent red color, while 00FF0000 is a non-transparent red color.
Note that ChartDirector’s ARGB color is web and HTML compatible. For example, red is FF0000, the same as in HTML. There are many resources on the web that provide tables in which you can click a color and it will show its HTML color code. These color codes can be used in ChartDirector.

If alpha transparency is FF (255), the color is totally transparent. That means the color is invisible. It does not matter what the RGB components are. So in ChartDirector, only one totally transparent color is used - FF000000. All other colors of the form FFnnnnnn are reserved to represent palette colors and dynamic colors, and should not be interpreted as the normal ARGB colors.

The totally transparent color FF000000 is often used in ChartDirector to disable drawing something. For example, if you want to disable drawing the border of a rectangle, you can set the border color to totally transparent.

For convenience, ChartDirector defines a constant called Transparent, which is equivalent to FF000000.

Pattern Color
A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

Pattern colors are created using BaseChart.patternColor, BaseChart.patternColor2, DrawArea.patternColor and DrawArea.patternColor2. The patternColor method creates pattern colors using an array of colors as a bitmap. The patternColor2 method creates pattern colors by loading the patterns from image files.

These methods return a 32-bit integer acting as a handle to the pattern color. The handle can be used in any ChartDirector API that expects a color as its input.

Metal Color
A metal color is a color of which the brightness varies smoothly across the chart surface as to make the surface looks shiny and metallic. ChartDirector supports using any color as the base color of the metal color. In particular, using yellow and grey as the base colors will result in metal colors that look gold and silver.

Metal colors are most often used as background colors of charts. They are created using CDBaseChartMBS.metalColor, CDBaseChartMBS.goldColor and CDBaseChartMBS.silverColor. The first method allows you to specify an arbitrary base color. The second and third methods use yellow and grey as the base colors, resulting in gold and silver metal colors.

These methods return a 32-bit integer acting as a handle to the gradient color. The handle can be used in any ChartDirector API that expects a color as its input.

Gradient Color
A gradient color is a color that changes progressively across a direction.

Gradient colors are created using BaseChart.gradientColor, BaseChart.gradientColor2, DrawArea.gradientColor and DrawArea.gradientColor2. The gradientColor method creates a 2-point gradient color that changes from color A to color B. The gradientColor2 method creates a multi-point gradient colors that changes from color A to B to C ....
These methods return a 32-bit integer acting as a handle to the gradient color. The handle can be used in any ChartDirector API that expects a color as its input.

One common use of multi-point gradient colors is to define colors that have metallic look and feel. Please refer to DrawArea.gradientColor2 for details.

Dash Line Colors
A dash line color is a color that switches on and off periodically. When used to draw a line, the line will appear as a dash line.

Dash line colors are created using BaseChart.dashLineColor and DrawArea.dashLineColor. They accept a line color and a dash pattern code as arguments, and return a 32-bit integer acting as a handle to the dash line color. The handle can be used in any ChartDirector API that expects a color as its input.

Zone Colors
A zone color is for XY charts only. It is a color that automatically changes upon reaching a data threshold value along the x-axis or y-axis. Zone colors are created using Layer.xZoneColor, Layer.yZoneColor, XYChart.xZoneColor or XYChart.yZoneColor.

Palette Colors
Palette colors are colors of the format FFFFnnnn, where the least significant 16 bits (nnnn) are the index to the palette. A palette is simply an array of colors. For a palette color, the actual color is obtained by looking up the palette using the index. For example, the color FFFF0001 is the second color in the palette (first color is index 0).

The colors in the palette can be ARGB colors or "dynamic" colors (pattern, gradient and dash line colors).

The first eight palette colors have special significance. The first three palette colors are the background color, default line color, and default text color of the chart. The 4th to 7th palette colors are reserved for future use. The 8th color is a special dynamic color that is equal to the data color of the "current data set".

The 9th color (index = 8) onwards are used for automatic data colors. For example, in a pie chart, if the sector colors are not specified, ChartDirector will automatically use the 9th color for the first sector, the 10th color for the second sector, and so on. Similarly, for a multi-line chart, if the line colors are not specified, ChartDirector will use the 9th color for the first line, the 10th color for the second line, and so on.

The ChartDirector API defines several constants to facilitate using palette colors.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When a chart is created, it has a default palette. You may modify the palette using BaseChart.setColor, BaseChart.setColors, or BaseChart.setColors2.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The advantages of using palette colors are that you can change the color schemes of the chart in one place. ChartDirector comes with several built-in palettes represented by the following predefined constants.
Palette FFFF0000 The starting point of the palette. The first palette color is (Palette + 0). The nth palette color is (Palette + n - 1).
BackgroundColor FFFF0000 The background color.
LineColor FFFF0001 The default line color.
TextColor FFFF0002 The default text color.
[ Reserved ] FFFF0003 - FFFF0006 These palette positions are reserved. Future versions of ChartDirector may use these palette positions for colors that have special significance.
SameAsMainColor FFFF0007 A dynamic color that is equal to the data color of the current data set. This color is useful for objects that are associated with data sets. For example, in a pie chart, if the sector label background color is SameAsMainColor, its color will be the same as the corresponding sector color.
DataColor FFFF0008 The starting point for the automatic data color allocation.

ConstantDescription

defaultPalette An array of colors representing the default palette. This palette is designed for drawing charts on white backgrounds (or lightly colored backgrounds).
whiteOnBlackPalette An array of colors useful for drawing charts on black backgrounds (or darkly colored backgrounds).
transparentPalette An array of colors useful drawing charts on white backgrounds (or lightly colored backgrounds). The data colors in this palette are all semi-transparent.

186.0.24 ChartDirector: Font Specification

Notes:

Font Name
In ChartDirector, the font name is simply the file name that contains the font. For example, under the Windows platform, the "Arial" font is "arial.ttf", while the "Arial Bold" font is "arialbd.ttf".

NOTE: Mac OS X Specific Information
In Mac OS X, in addition to ".ttf", ChartDirector also supports Mac OS X font file formats, such as Font Suitcase files and Datafork files (.dfont). These files often contain multiple fonts. For example, the "GillSans.dfont" file contains 6 fonts.

So in addition to the file name, an index is needed to determine the font. The index is specified by appending a " | " character to the font name, followed by the index number. For example, the third font in "GillSans.dfont" is denoted as "GillSans.dfont | 2". (Note: The first font starts at 0.) If no index number is provided, the first font is assumed.

ChartDirector also supports using Mac OS X Font Manager names. For example, one may use "Gill Sans Light Italic" instead of using "GillSans.dfont | 1" as the font name. However, the Mac OS X Font Manager
is active only if someone has logged into the Mac GUI console, so this method is only recommended for developing applications that run on the GUI console.

The sample programs that come with ChartDirector are designed to run on all operating systems, so they use generic font file names (eg. "arial.ttf") instead of Mac OS X specific names. To allow them to run on Mac OS X, ChartDirector on Mac OS X has a built-in table to map common font file names to Mac OS X font names:

"arial.ttf", "arialbd.ttf", "ariali.ttf" and "arialbi.ttf" are mapped to "Arial | 0" (Arial), "Arial | 1" (Arial Bold), "Arial | 2" (Arial Italic) and "Arial | 3" (Arial Bold Italic)

"times.ttf", "timesbd.ttf", "timesi.ttf" and "timesbi.ttf" are mapped to "Times New Roman | 0" (Times New Roman), "Times New Roman | 1" (Times New Roman Bold), "Times New Roman | 2" (Times New Roman Italic) and "Times New Roman | 3" (Times New Roman Bold Italic)

"cour.ttf", "courbd.ttf", "couri.ttf" and "courbi.ttf" are mapped to "Courier New | 0" (Courier New), "Courier New | 1" (Courier New Bold), "Courier New | 2" (Courier New Italic) and "Courier New | 3" (Courier New Bold Italic)

Font Location
ChartDirector on Windows does not come with any font files. It relies on the operating system’s font files in the "[windows] \Fonts" directory. To see what fonts are installed in your operating system and their file names, use the File Explorer to view that directory.

ChartDirector on Windows will also search for the font files in the "fonts" subdirectory (if it exists) under the directory where the ChartDirector DLL "chartdir.dll" is installed. This is useful for private fonts. Also, for some especially secure web servers, the web anonymous user may not have access to the "[windows] \Fonts" directory. In this case, you may copy the font files to the above subdirectory.

ChartDirector on Mac OS X relies on operating system font files in "/[Library/Fonts" and "/System/Library/Fonts".

ChartDirector on Linux, FreeBSD and Solaris assume the fonts files are in the "fonts" subdirectory under the directory where the ChartDirector shared object "libchartdir.so" is installed. ChartDirector on Linux, FreeBSD and Solaris come with a number of font files in the "fonts" subdirectory.

To keep the download size small, ChartDirector on Linux, FreeBSD and Solaris only come with some commonly used fonts. You may download additional fonts from the Internet. In particular, the Microsoft fonts at http://sourceforge.net/project/showfiles.php?group_id=34153&release_id=105355 is highly recommended. Please refer to http://www.microsoft.com/typography/faq/faq8.htm on how you could use the fonts legally in your system.
ChartDirector supports True Type fonts (.ttf), Type 1 fonts (.pfa and .pfb) and Windows bitmap fonts (.fon). On Mac OS X, ChartDirector also supports Font Suitcase and Datafork (.dfont) files. On Linux, FreeBSD and Solaris, ChartDirector also supports Portable Compiled Fonts (.pcf fonts).

If you want ChartDirector to search other directories for the font files, you may list the directories in an environment variable called "FONTPATH".

If you specify an absolute path name for the font file, ChartDirector will use the absolute path name and will not search other directories. Artificial Boldening and Italicizing

Whereas most popular font comes with different styles for "normal", "bold", "italic" and "bold italic", some fonts only come with one style (the normal style). For example, the Monotype Corsiva font that comes with MS Office only has the normal style (mtcorsva.ttf). For these cases, you may append the "Bold" and/or "Italic" words after the font file name (separated with a space) to ask ChartDirector to artificially bolden and/or italicize the font. For example, you may specify the font name as "mtcorsva.ttf Bold".

Font List

Instead of specifying a single font file as the font name, you may specify a list of font files as the font name, separated by semi-colons. This is useful when using international characters that are only available in some fonts.

For example, if you would like to use the Arial font ("arial.ttf") for western characters, and the MingLiu font "mingliu.ttc" for Chinese characters (since the Arial font does not have Chinese characters), you may specify the font name as "arial.ttf;mingliu.ttc". In this case, ChartDirector will try the Arial font first. If it cannot find a certain character there, it will try the MingLiu font.

Indirect Font Names

ChartDirector supports several special keywords for specifying the font name indirectly. When these keywords are used as font names, ChartDirector will look up the actual font names from a font table. The keywords are as follows:

<table>
<thead>
<tr>
<th>Keywords</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;normal&quot;</td>
<td>This default normal font, which is the first font in the font table. This is initially mapped to &quot;arial.ttf&quot; (Arial).</td>
</tr>
<tr>
<td>&quot;bold&quot;</td>
<td>The default bold font, which is the second font in the font table. This is initially mapped to &quot;arialbd.ttf&quot; (Arial Bold).</td>
</tr>
<tr>
<td>&quot;italic&quot;</td>
<td>The default italic font, which is the third font in the font table. This is initially mapped to &quot;ariali.ttf&quot; (Arial Italic).</td>
</tr>
<tr>
<td>&quot;boldItalic&quot;</td>
<td>The default bold-italic font, which is the fourth font in the font table. This is initially mapped to &quot;arialbi.ttf&quot; (Arial Bold Italic).</td>
</tr>
<tr>
<td>&quot;fontN&quot;</td>
<td>The (N + 1)th font in the font table (the first font is &quot;font0&quot;).</td>
</tr>
</tbody>
</table>

The font table can be modified using BaseChart.setFontTable or DrawArea.setFontTable.
The advantage of using indirect font names is that you can change the fonts in your charts in one place.

Font Index
Most font files contain one font. However, it is possible a font file contains multiple fonts (that is, a font collection). For example, in True Type fonts, font files with extension ".ttc" may represent a font collection.

If a font file contains multiple font, the font index can be used to specify which font to use. By default, the font index is 0, which means the first font in the font file will be used.

Font Size
The font size decides how big a font will appear in the image. The font size is expressed in a font unit called points. This is the same unit used in common word processors.

Instead of specifying font size, some ChartDirector API (eg. TextBox.setFontSize) allow you to specify font height and font width separately. You may use different point sizes for font height and font width to create special effects.

Font Color
This is the color to draw the font. (See Color Specification on how colors are represented in ChartDirector.)

Font Angle
This is the angle in degrees by which the font should be rotated anti-clockwise.

Vertical Layout
By default, text are laid out horizontally, with characters being drawn from left to right.

ChartDirector also supports vertical layout, with characters being drawn from top to bottom. For example, you may use BaseChart.addText to add text that are laid out vertically. Vertical layout is common for oriental languages such as Chinese, Japanese and Korean.

186.0.25 ChartDirector: Mark Up Language

Plugin Version: 8.2, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** ChartDirector: Mark Up Language

**Notes:**
ChartDirector Mark Up Language (CDML) is a language for including formatting information in text strings by marking up the text with tags.

CDML allows a single text string to be rendered using multiple fonts, with different colors, and even embed images in the text.

**Font Styles**
You can change the style of the text by using CDML tags. For example, the line:

```
<font=timesi.ttf,size=16,color=FF0000>Hello <font=arial.ttf,size=12,color=8000*>world!
```

will result in the following text rendered:

```
Hello world!
```

In general, all tags in CDML are enclosed by `<*` and `*>`. Attributes within the tags determine the styles of the text following the tags within the same block.

If you want to include `<*` in text without being interpreted as CDML tags, use `<<*` as the escape sequence.
The following table describes the supported font style attributes in CDML. See Font Specification for details on various font attributes.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>font</td>
<td>Starts a new style section, and sets the font name. You may use this attribute without a value (that is, use ”font” instead of ”font=arial.ttf”) to create a new style section without modifying the font name.</td>
</tr>
<tr>
<td>size</td>
<td>The font size.</td>
</tr>
<tr>
<td>width</td>
<td>The font width. This attribute is used to set the font width and height to different values. If the width and height are the same, use the size attribute.</td>
</tr>
<tr>
<td>height</td>
<td>The font height. This attribute is used to set the font width and height to different values. If the width and height are the same, use the size attribute.</td>
</tr>
<tr>
<td>color</td>
<td>The text color in hex format.</td>
</tr>
<tr>
<td>bgColor</td>
<td>The background color of the text in hex format.</td>
</tr>
<tr>
<td>underline</td>
<td>The line width of the line used to underline the following characters. Set to 0 to disable underline.</td>
</tr>
<tr>
<td>sub</td>
<td>Set the following text to be in subscript style. This attribute does not need to have a value. (You may use ”sub” as the attribute instead of ”sub=1”.)</td>
</tr>
<tr>
<td>super</td>
<td>Set the following text to be in superscript style. This attribute does not need to have a value. (You may use ”super” as the attribute instead of ”super=1”.)</td>
</tr>
</tbody>
</table>

Set the following text to be in superscript style. This attribute does not need to have a value. (You may use ”super” as the attribute instead of ”super=1”.)

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xoffset</td>
<td>Draw the following the text by shifting the text horizontally from the original position by the specified offset in pixels.</td>
</tr>
<tr>
<td>yoffset</td>
<td>Draw the following the text by shifting the text vertically from the original position by the specified offset in pixels.</td>
</tr>
<tr>
<td>advance</td>
<td>Move the cursor forward (to the right) by the number of pixels as specified by the value this attribute.</td>
</tr>
<tr>
<td>advanceTo</td>
<td>Move the cursor forward (to the right) to the position as specified by the value this attribute. The position is specified as the number of pixels to the right of the left border of the block. If the cursor has already passed through the specified position, the cursor is not moved.</td>
</tr>
</tbody>
</table>

Note that unlike HTML tags, no double or single quotes are used in the tags. It is because CDML tags are often embedded as string literals in source code. The double or single quotes, if used, will conflict with the string literal quotes in the source code. Therefore in CDML, no quotes are necessary and they must not be
used.

Also, unlike HTML tags, CDML uses the comma character as the delimiter between attributes. It is because certain attributes may contain embed spaces (such as the font file name). So space is not used as the delimiter and the comma character is used instead.

Note the font attribute above starts a new style section, while other attributes just modify the current style section. You may use <*/font*> to terminate a style section, which will restore the font styles to the state before the style section.

Blocks and Lines

In CDML, a text string may contain multiple blocks. A block may contain multiple lines of text by separating them with new line characters ("\n") or with <br/>. The latter is useful for programming languages that cannot represent new line characters easily.

For example, the line:

<font color=FF>BLOCK<br>ONE</font>
<font color=FF00>BLOCK<br>TWO</font>

will result in the following text rendered:

The above example contains a line of text. The line contains two blocks with the characters " and " in between. Each block in turn contains two lines. The blocks are defined using <block> as the start tag and <*/> as the end tag.

When a block ends, font styles will be restored to the state before entering the block.

Embedding Images

CDML supports embedding images in text using the following syntax:

<img=my_image_file.png>

where my_image_file.png is the path name of the image file.

For example, the line:

<size=20>A <img=sun.png>day</size>

will result in the following text rendered:

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath or DrawArea.setSearchPath on the directory that ChartDirector will search for the file.

The <img> tag may optionally contain width and height attributes to specify its pixel width and height. In this case, ChartDirector will stretch or compress the image if necessary to the required width and
CDML supports nesting blocks, that is, a block can contain other sub-blocks. Attributes are supported in the `<block>` tag to control the alignment and orientation of the sub-blocks. The `<img=my_image_file.png>` is treated as a block for layout purposes.

For example, the line:

```html
<block,valign=absmiddle><img=molecule.png><block>Hydrazino\nMolecule</block></block>
```

will result in the following text rendered:

The above starts `<block,valign=absmiddle>` which specifies its content should align with each others in the vertical direction using the absolute middle alignment. The block contains an image, followed by a space characters, and then another block which has two lines of text.

The following table describes the supported attributes inside `<block>` tag:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>The width of the block in pixels. By default, the width is automatically determined to be the width necessary for the contents of the block. If the width attribute is specified, it will be used as the width of the block. If the width is insufficient for the contents, the contents will be wrapped into multiple lines.</td>
</tr>
<tr>
<td>height</td>
<td>The height of the block in pixels. By default, the height is automatically determined to be the height necessary for the contents of the block. If the height attribute is specified, it will be used as the height of the block.</td>
</tr>
<tr>
<td>maxWidth</td>
<td>The maximum width of the block in pixels. If the content is wider than maximum width, it will be wrapped into multiple lines.</td>
</tr>
<tr>
<td>truncate</td>
<td>The maximum number of lines of the block. If the content requires more than the maximum number of lines, it will be truncated. In particular, if truncate is 1, the content will be truncated if it exceeds the maximum width (as specified by maxWidth or width) without wrapping. The last few characters at the truncation point will be replaced with &quot;...&quot;.</td>
</tr>
<tr>
<td>linespacing</td>
<td>The spacing between lines as a ratio to the default line spacing. For example, a line spacing of 2 means the line spacing is two times the default line spacing. The default line spacing is the line spacing as specified in the font used.</td>
</tr>
<tr>
<td>bgColor</td>
<td>The background color of the block in hex format.</td>
</tr>
<tr>
<td>valign</td>
<td>The vertical alignment of sub-blocks. This is for blocks that contain sub-blocks. Supported values are baseline, top, bottom, middle and absmiddle.</td>
</tr>
</tbody>
</table>

The value baseline means the baseline of sub-blocks should align with the baseline of the block. The baseline
is the underline position of text. This is normal method of aligning text, and is the default in CDML. For images or blocks that are rotated, the baseline is the same as the bottom.

The value top means the top line of sub-blocks should align with the top line of the block.

The value bottom means the bottom line of sub-blocks should align with the bottom line of the block.

The value middle means the middle line of sub-blocks should align with the the middle line of the block. The middle line is the middle position between the top line and the baseline.

The value absmiddle means the absolute middle line of sub-blocks should align with the absolute middle line of the block. The absolute middle line is the middle position between the top line and the bottom line.

halign The horizontal alignment of lines. This is for blocks that contain multiple lines. Supported values are left, center and right.

The value left means the left border of each line should align with the left border of the block. This is the default.

The value center means the horizontal center of each line should align with the horizontal center of the block.

The value right means the right border of each line should align with the right border of the block.

angle Rotate the content of the block by an angle. The angle is specified in degrees in counter-clockwise direction.

186.0.26 ChartDirector: Parameter Substitution and Formatting

Notes:

ChartDirector charts often contain a lot of text strings. For example, sector labels in pie charts, axis labels for x and y axes, data labels for the data points, HTML image maps, etc, are all text strings.

ChartDirector uses parameter substitution to allow you to configure precisely the information contained in the text and their format.

Format Strings
In parameter substitution, format strings are used to specify the entities to be include into labels and how to format numbers and dates.

For example, when drawing a pie chart with side label layout, the default sector label format string is:

" { label } ( { percent } % )"

When the sector label is actually drawn, ChartDirector will replace " { label } " with the sector name, and " { percent } " with the sector percentage. So the above label format will result in a sector label similar to "ABC (34.56%)".

You may change the sector label format by changing the format string. For example, you may change it to:

" { label } : US$ { value | 2 } K ( { percent } % )"

The sector label will then become something like "ABC: US$ 123.00 (34.56%)".

In general, in ChartDirector parameter substitution, parameters enclosed by curly brackets will be substituted with their actual values when creating the texts.

For parameters that are numbers or dates/times, ChartDirector supports a special syntax in parameter substitution to allow formatting for these values. Please refer to the Number Formatting and Date/Time Formatting sections below for details.

Parameter Expressions
ChartDirector supports numeric expressions in format strings. They are denoted by enclosing the expression with curly brackets and using "=" as the first character. For example:

"USD { value } (Euro { = { value } *0.9 } )"

In the above, " { value } " will be substituted with the actual value of the sector. The expression " { = { value } *0.9 } " will be substituted with the actual value of the sector multiplied by 0.9.

ChartDirector parameter expressions support operators "+", "/", ",", ",", "/", ",% " (modulo) and "^" (exponentiation). Operators ",", ",", ",", ",% " is computed first, followed by "+" and ",--". Operators of the same precedence are computed from left to right. Parenthesis "(" and ")" can be used to change the computation order.

Parameters for Pie Charts
The following table describes the parameters available for pie charts.

Parameters for All XY Chart Layers
The followings are parameters that are apply to all XY Chart layers in general. Some layer types may have
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sector</td>
<td>The sector number. The first sector is 0, while the nth sector is (n-1).</td>
</tr>
<tr>
<td>dataSet</td>
<td>Same as { sector }. See above.</td>
</tr>
<tr>
<td>label</td>
<td>The text label of the sector.</td>
</tr>
<tr>
<td>dataSetName</td>
<td>Same as { label }. See above.</td>
</tr>
<tr>
<td>value</td>
<td>The data value of the sector.</td>
</tr>
<tr>
<td>percent</td>
<td>The percentage value of the sector.</td>
</tr>
<tr>
<td>fieldN</td>
<td>The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using BaseChart.addExtraField or BaseChart.addExtraField2.</td>
</tr>
</tbody>
</table>

additional parameters (see below).

Note that certain parameters are inapplicable in some context. For example, when specifying the aggregate label of a stacked bar chart, the { dataSetName } parameter is inapplicable. It is because a stacked bar is composed of multiple data sets. It does not belong to any particular data set and hence does not have a data set name.

{ fieldN } means the extra field is indexed by the data point number. The Pth data point corresponds to the Pth element of the extra field.

Additional Parameters for Line Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Trend Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Box-Whisker Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for HLOC and CandleStick Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Vector Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Parameters for All Polar Layers
The followings are parameters that are apply to all Polar Chart layers in general. Some layer types may have additional parameters (see below).
Additional Parameters for PolarVector Layers

The followings are parameters that are in additional to the parameters for all Polar Chart layers.

Parameters for Axis

The following table describes the parameters available for pie charts.

Number Formatting

For parameters that are numbers, ChartDirector supports a number of formatting options in parameter substitution.

For example, if you want a numeric field \{ value \} to have a precision of two digits to the right of the decimal point, use ',' (comma) as the thousand separator, and use '.' (dot) as the decimal point, and you may use \{ value | 2,. \}. The number 123456.789 will then be displayed as 123,456.79.

For numbers, the formatting options are specified using the following syntax:

\{ [ param ] | [ a ] [ b ] [ c ] [ d ] \}

where:

If this field starts with "E" or "e", followed by a number, it means formatting the value using scientific notation with the specified number of decimal places. If the "E" or "e" is not followed by a number, 3 is assumed.

For example, \{ value | E4 \} will format the value 10.3 to 1.0300E+1, and \{ value | e4 \} will format the same value to 1.0300e+1.

If this field starts with "G" or "g", followed by a number, it means formatting the value using the scientific notation only if the value is large and requires more than the specified number of digits, or the value is less than 0.001. If scientific notation is used, the number following "G" or "g" also specifies the number of significant digits to use. If the "G" or "g" is not followed by a number, 4 is assumed.

For example, consider the format string \{ value | G4 \}. The value 10 will be formatted to 10. The value 100000 will be formatted to 1.000E+5. Similarly, for \{ value | g4 \}, the value 10 will be formatted to 10, while the value 100000 will be formatted to 1.000e+5.

If you skip this argument, ChartDirector will display the exact value using at most 6 decimal places.
You may skip \[ b \] \[ c \] \[ d \]. In this case, the default will be used.

Date/Time Formatting
For parameters that are dates/times, the formatting options can be specified using the following syntax:

\{ \ [ \ param \ ] \ | \ [ \ datetime\_format\_string \ ] \ \}

where \[ \ datetime\_format\_string \] must start with an English character (A-Z or a-z) that is not "G", "g", "E" or "e", and may contain any characters except \'}\'. (If it starts with "G", "g", "E" or "e", it will be considered as a number format string.)

Certain characters are substituted according to the following table. Characters that are not substituted will be copied to the output.

For example, a parameter substitution format of \{ value | mm-dd-yyyy \} will display a date as something similar to 09-15-2002. A format of \{ value | dd/mm/yy hh:mm:ss a \} will display a date as something similar to 15/09/02 03:04:05 pm.

If you want to include characters in the format string without substitution, you may enclose the characters in single or double quotes.

For example, the format \{ value | mmm '<*color=dd0000*>'yyyy \} will display a date as something like Jan <*color=dd0000*>2005 (the <*color=dd0000*> is a CDML tag to specify red text color). Note that the <*color=dd0000*> tag is copied directly without substitution, even it contains "dd" which normally will be substituted with the day of month.

Escaping URL/HTML/CDML characters
Parameter substitution is often used to create HTML image maps. In HTML, some characters has special meanings and cannot be used reliably. For example, the '>' is used to represent the end of an HTML tag.

Furthermore, if the field happens to be used as an URL, characters such as '?', '& ' and '+' also have special meanings.

By default, ChartDirector will escape template fields used in URL and query parameters when generating image maps. It will modify URL special characters to the URL escape format "% XX" (eg. "?" will become "% 3F"). After that, it will modify HTML special characters to the HTML escape format "&amp;# nn;" (eg. ">" will become "&amp;# 62;"). Similarly, it will escape other attributes in the image map using HTML escape format (but not URL escape format).

In addition to escaping HTML and URL special characters, ChartDirector will also remove CDML fields in creating image maps. It is because CDML is only interpreted in ChartDirector, should not be useful outside of ChartDirector (such as in browser tool tips).
In some cases, you may not want ChartDirector to escape the special characters. For example, if the parameters have already been escaped before passing to ChartDirector, you may want to disable ChartDirector from escaping them again.

ChartDirector supports the following special fields to control the escape methods - " { escape_url } ", " { noescape_url } ", " { escape_html } ", " { noescape_html } ", " { escape_cdml } ", and " { noescape_cdml } ". These fields enable/disable the escape methods used in the template fields that follow them.

### 186.0.27 ChartDirector: Shape Specification

**Plugin Version:** 8.2, **Console & Web:** No, **Mac:** Yes, **Win:** Yes, **Linux:** Yes. **Answer:** ChartDirector: Shape Specification  

**Notes:**

Several ChartDirector API accept shape specification as arguments. For example, `BarLayer.setBarShape` and `BarLayer.setBarShape2` can be used to specify shapes of bars in bar charts, while `DataSet.setDataSymbol`, `DataSet.setDataSymbol4`, `PolarLayer.setDataSymbol` and `PolarLayer.setDataSymbol4` can be used to specify shapes for data symbols.

Note that in addition to shapes, in many cases ChartDirector also accepts images or custom draw objects for data representation. For example, see `DataSet.setDataSymbol2`, `DataSet.setDataSymbol3`, `PolarLayer.setDataSymbol2` and `PolarLayer.setDataSymbol3`.

**Built-In Shapes**

Built-in shapes are specified as integers. The integers can be explicit constants, or can be generated by a ChartDirector method for parameterized shapes. For example, a circle is represented by an explicit constant `CircleShape (=7)`. On the other hand, the number representing a polygon depends on the number of sides the polygon has, so it is generated by using the `PolygonShape` method, passing in the number of sides as argument.

The following table illustrates the various ChartDirector shapes:

**Custom Shapes**

In ChartDirector, custom shapes are specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 1000 x 1000 units, in which the x-axis is from -500 to 500 going from left to right, and the y-axis is from 0 to 1000 going from bottom to top.
ChartDirector will automatically scale the polygon so that 1000 units will become to the pixel size as requested by the various ChartDirector API.

As an example, the shape of the standard diamond shape in ChartDirector is represented as an array with 8 numbers:

0, 0, 500, 500, 0, 1000, -500, 500

186.0.28 Copy styled text?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: How to quickly copy styled text from one textarea to another?

Example:

```java
# if TargetWin32 then
TextArea1.WinRTFDataMBS = TextArea2.WinRTFDataMBS
# else if TargetMacOS then
TextArea1.NSTextViewMBS.textStorage.setAttributedString TextArea2.NSTextViewMBS.textStorage
# else
TextArea1.StyledText = TextArea2.StyledText
# endif
```

Notes: The code above uses special plugin functions on Mac and Windows and falls back to framework for Linux.

186.0.29 Do you have code to validate a credit card number?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: You can check the checksum to tell if a credit card number is not valid.

Example:

```java
Dim strNumber As String
Dim nLength as Integer
Dim nValue as Integer
Dim nChecksum as Integer
Dim nIndex as Integer

strNumber = EditField1.Text
nLength = Len(strNumber)
nChecksum = 0

For nIndex = 0 To nLength - 2
    nValue = Mid(strNumber, nIndex + 1, 1)
    If nIndex Mod 2 = 0 Then
        nValue *= 2
    End If
    If nValue > 9 Then
        nValue = nValue - 9
    End If
    nChecksum = nChecksum + nValue
Next
```
nValue = Val(Mid(strNumber, nLength - (nIndex + 1), 1)) * (2 - (nIndex Mod 2))
If nValue < 10 Then
nChecksum = nChecksum + nValue
Else
nChecksum = nChecksum + (nValue - 9)
End If
Next

If Val(Mid(strNumber, Len(strNumber), 1)) = (10 - (nChecksum Mod 10)) Mod 10 Then
MsgBox("The credit card number looks valid")
Else
MsgBox("The credit card number is invalid")
End IF

Notes:
Here’s some code that will validate the checksum for a credit card. It works for Visa, MasterCard, American Express and Discover. Not sure about others, but I imagine they use the same basic algorithm. Of course, this doesn’t actually mean that the credit card is valid, it’s only useful for helping the user catch typos.

The above code doesn’t have any error checking and it expects that the credit card number will be entered without spaces, dashes or any other non-numeric characters. Addressing those issues will be an exercise left to the reader. :)  

(From Mike Stefanik)

186.0.30 Do you have plugins for X-Rite EyeOne, eXact or i1Pro?

Plugin Version: all, Console & Web: No. Answer: Our EyeOne plugin is available on request for licensees of the X-Rite SDKs.
Notes:
Please first go to X-Rite and get a SDK license. Than we can talk about the plugin.

186.0.31 Does SQL Plugin handle stored procedures with multiple result sets?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Yes, the plugin can work with multiple recordsets.
Notes:
You need to use SQLCommandMBS class. When you get back results, you use FetchNext to walk over all
records in the first result set. Then you simply start again with FetchNext to get the second record set. Even the RecordSet functions should work, just use them twice to get all records from both record sets.

186.0.32 Does the plugin home home?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Yes, we like to know who is using the plugin, so the plugin may contact our server.

**Example:**

none.

**Notes:**

Please note that this does not affect your users as the plugin will only do this in the IDE and the relevant plugin part is never included in your applications.

The plugin if used for some hours, does contact our server to provide statistical data about Xojo version and OS versions. This way we know what versions are used. We can return the version number of the current plugin which may be visible in future versions somehow. And we transmit partial licenses data so we can track use of illegal license keys.

If you do not like to have this, you can block Xojo IDE from contacting our website via your Firewall. Blocking the transfer will not disable the plugin or change the features. Or contact us for a plugin version which explicitly does not contain this feature.

186.0.33 folderitem.absolutepath is limited to 255 chars. How can I get longer ones?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Paths on a Mac are not unique, so use them only to display them to the user.

**Example:**

```vbnet
Function AbsolutePath(f as FolderItem) As String
    Dim s as string
    Dim nf as FolderItem
    nf = f
    s = ""
    while nf<>nil
        s = nf.name + ";:" + s
        nf = nf.parent
    wend
    Return s
```
186.0.34 Future of editablemovie class?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** In short, it will go away, so switch to plugin functions soon.

**Notes:**

The editableMovie class has been deprecated. Deprecated means that Real Software will remove it someday, but as of today (and probably a few more years) the class will be available and running. Just not forever. The reason is that Apple deprecated the old QuickTime APIs and they are not available for 64 bit.

For 64 bit, you can move to our QTKit plugin.

We expect the old QuickTime classes in Real Studio and our plugins will continue to work in 32 bit applications. Even if editableMovie class is removed next year from Real Studio, our plugin still provides movie class extensions to do similar functions.

186.0.35 Has anyone played round with using CoreImage to do things like add dissolve transitions say when changing from one tab to another within a window?

Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** This code implements animations for a tabpanel change:

**Example:**

```
// in a tabpanel.change event:

dim r as CGSTransitionRequestMBS
dim co as new CGSConnectionMBS
dim cw as CGSWindowMBS
dim ct as CGSTransitionMBS
static OldTab as Integer

cw=co.CGSWindow(window1)
If cw = Nil Then
    return // 10.3...
End If
r=new CGSTransitionRequestMBS
r.TransitionType=r.CGSFlip
r.HasBackGround=false
r.HasBackColor=false
r.Win=cw
// watch the value of the clicked tab versus the last tab
```
if tabpanel1.Value=0 or tabpanel1.Value < OldTab then
r.TransitionOption=r.CGSLeft
ct=co.NewTransition(r)
if ct<>Nil then
Refresh
cr.Invoke(1)
cr.Wait(1)
cr.Release
else
MsgBox "Error creating the transition."
end if
else
r.TransitionOption=r.CGSRight
ct=co.NewTransition(r)
if ct<>Nil then
Refresh
cr.Invoke(1)
cr.Wait(1)
cr.Release
else
MsgBox "Error creating the transition."
end if
end if
// Keep track of the last tab clicked
OldTab = tabpanel1.Value

Notes: See CGS* classes for more details.

186.0.36 How about Plugin support for older OS X?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: We support in general Mac OS X 10.5 and newer.

Notes:
All the 64-bit plugins on Mac require OS X 10.7.
Intel 32-bit plugins on Mac require OS X 10.5 or newer.

Currently the ChartDirector 6, GraphicsMagick and GameKit plugins requires Mac OS X 10.6.
Also for SQL Plugin the built in SQLite library requires 10.6.
**186.0.37 How can I detect whether an Intel CPU is a 64bit CPU?**

Plugin Version: all, Console & Web: No. **Answer:** Look on the CPU family returned by `sysctl`:

**Example:**

```vbs
Function is64bit() As Boolean
    # if TargetLittleEndian
    dim m as MemoryBlock = NewMemoryBlock(8)
    dim family as Integer
    dim s as string
    
    m=SystemControlNameToMIBMBS("hw.cpufamily")
    m=SystemControlMBS(m)
    
    if m<>nil then
        m.LittleEndian=True
    
    family=m.Long(0)
    
    const CPUFAMILY_INTEL_6_14 = & h73d67300 /* "Intel Core Solo" and "Intel Core Duo" (32-bit Pentium-M with SSE3) */
    const CPUFAMILY_INTEL_6_15 = & h426f69ef /* "Intel Core 2 Duo" */
    const CPUFAMILY_INTEL_6_23 = & h78ea4fbc /* Penryn */
    const CPUFAMILY_INTEL_6_26 = & h6b5a4cd2 /* Nehalem */
    
    Select case family
        case CPUFAMILY_INTEL_6_14
            Return false
        case CPUFAMILY_INTEL_6_15
            Return true
        case CPUFAMILY_INTEL_6_23
            Return true
        case CPUFAMILY_INTEL_6_26
            Return true
            // newer CPUs may be missing here
    end Select
    
    end if
    
    # endif
    
    Return false
    
    Exception
    Return false
End Function
```
Notes: This code is written for Mac OS X where you only have a limited number of possible CPUs.

186.0.38 How can I disable the close box of a window on Windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. Answer: The following code will remove the close item from the system menu of the window.

Example:

```vbnet
# if TargetWin32 then
Declare Function GetSystemMenu Lib "user32" (hwnd as Integer, bRevert as Integer) as Integer
Declare Function RemoveMenu Lib "user32" (hMenu as Integer, nPosition as Integer, wFlags as Integer) as Integer
Dim hSysMenu as Integer
hSysMenu = GetSystemMenu(me.WinHWND, 0)
RemoveMenu hSysMenu, & HF060, & H0
# endif
```

Notes: The window may not be updated directly.

186.0.39 How can I get all the environment variables from Windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. Answer: Try this code:

Example:

```vbnet
# if targetWin32
declare function GetEnvironmentStrings Lib "kernel32" () as ptr
dim m as memoryBlock
dim n as Integer

m=GetEnvironmentStrings()

n=0
do
msgBox m.cstring(n)
while m.byte(n)<0
n=n+1
wend
n=n+1
loop until m.byte(n)=0
# endif
```
Notes: The MBS Plugin has an EnvironmentMBS class for this.

186.0.40 How can I get similar behavior to Roxio Toast or iTunes where clicking a 'burn' button allows the next inserted blank CD-R to bypass the Finder and be accepted by my application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You need to get a media reservation.

**Example:**

```plaintext
dim d as DRDeviceMBS // get a device
d.AcquireMediaReservation
```

Notes:

Use the plugin function AcquireMediaReservation and later release it using ReleaseMediaReservation. See plugin examples on how to use it and check Apple's DiscRecording framework documentation for more details.

186.0.41 How can I get text from a PDF?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Crossplatform you can use DynaPDF Pro.

Notes:

On Mac OS X you can also use PDFKit for the same job. While DynaPDF Pro gives you each bit of text with rotation, font information and encoding details, PDFKit gives you only the text string for a PDF page.

186.0.42 How can I get text from a Word Document?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** to get the text string from a doc file, use the NSAttributedStringMBS class.

Notes:

The NSAttributedStringMBS class is Mac OS X only and we have currently no solution for Windows or Linux.

Use the NSAttributedStringMBS.initWithDocFormat(data as string) as boolean method.
186.0.43 How can I get the item string for a given file creator?

Plugin Version: all, Console & Web: No. **Answer:** Try this function:

**Example:**

```vbscript
Sub pullNativeDocs(aCREA As string)
Dim result as Integer
Dim m, k as memoryBlock
Dim f as folderItem
Dim newType as string
Dim anIcon As picture
Dim ofs as Integer

Declare Function GetFileTypesThatAppCanNativelyOpen Lib "Carbon" (appVRefNumHint as Short, appSignature as OSType, nativeTypes as Ptr) as Short Inline68K("701CABFC")
Declare Function GetDocumentKindString Lib "Carbon" (docVRefNum as Short, docType as OSType, docCreator as OSType, kindString as ptr) as Short Inline68K("7016ABFC")

listBox1.deleteAllRows

m = newMemoryBlock(1024)
result = GetFileTypesThatAppCanNativelyOpen(Volume(0).MacVRefNum, aCREA, m)
if result <> 0 then
    listBox1.addRow "<Not found.>"
    return
end if

do
if m.byte(ofs*4) = 0 then
    exit
else
    newType = m.OSTypeMBS(ofs*4)
    listBox1.addRow newType
    k = newMemoryBlock(64)
    result = GetDocumentKindString(Volume(0).MacVRefNum, newType, aCREA, k)
    if result = 0 then
        listBox1.cell(ofs,1) = k.pString(0)
        ofs = ofs + 1
    else
        listBox1.cell(ofs,1) = "(unknown)"
    end if
end if
loop

End Sub
```
186.0.44 How can I launch an app using it’s creator code?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Send an AppleEvent "odoc" with the creator code to the Finder ("MACS"):

Example:

```
Function LaunchByCreator(C As String) As Boolean
    Dim A As AppleEvent
    A = NewAppleEvent("aevt","odoc","MACS")
    A.ObjectSpecifierParam("—-") = GetUniqueIDObjectDescriptor("appf",nil,C)
    return A.Send
End Function
```

186.0.45 How can I learn what shared libraries are required by a plugin on Linux?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Please use the ldd command in the terminal.

Notes:

You build an app on any platform, but for Linux.
For the resulting .so files in the libs folder, you can run the ldd command with the library path as parameter. It shows you references lib files and you can make sure you have those installed.

This is a sample run of our graphicsmagick plugin:

cs@Ubuntu32:
textasciitilde /MeinProgramm/MeinProgramm Libs$ ldd libMBSGraphicsMagickPlugin17744.so
linux-gate.so.1 => (0xb76ee000)
libdl.so.2 => /lib/i386-linux-gnu/libdl.so.2 (0xb6f0e000)
libgtk-x11-2.0.so.0 => /usr/lib/i386-linux-gnu/libgtk-x11-2.0.so.0 (0xb6aa6000)
libpthread.so.0 => /lib/i386-linux-gnu/libpthread.so.0 (0xb6a8a000)
libstdc++.so.6 => /usr/lib/i386-linux-gnu/libstdc++.so.6 (0xb69a5000)
libm.so.6 => /lib/i386-linux-gnu/libm.so.6 (0xb6979000)
libgcc_s.so.1 => /lib/i386-linux-gnu/libgcc_s.so.1 (0xb695b000)
libc.so.6 => /lib/i386-linux-gnu/libc.so.6 (0xb67b1000)
/lib/id-linux.so.2 (0xb76ef000)
libgdk-x11-2.0.so.0 => /usr/lib/i386-linux-gnu/libgdk-x11-2.0.so.0 (0xb6701000)
libpangocairo-1.0.so.0 => /usr/lib/i386-linux-gnu/libpangocairo-1.0.so.0 (0xb66f4000)
libX11.so.6 => /usr/lib/i386-linux-gnu/libX11.so.6 (0xb65c0000)
As you see all library have been found and their load address is printed behind the name. If a library is missing, you usually see the address missing there or being zero.

186.0.46 How can I validate an email address?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: You can try this code: Example:
20846
CHAPTER 186. THE FAQ

Dim re As RegEx
re = New RegEx
Dim rm As RegExMatch

re.SearchPattern = "; [a-z0-9!#$%^&*+/=?ˆ\{ }]
\textasciitilde [ ] +\(?: [a-z0-9] (?: [a-z0-9-] * [a-z0-9] )?\(\)}+ [a-z0-9] (?: [a-z0-9-] * [a-z0-9] )?\)"
rm = re.Search(editField1.Text)

if rm = Nil Then
StaticText2.text = editField1.Text + " not valid email"
Else
StaticText2.Text = editField1.Text + " is valid"
End if

Notes:

Adapted from:
http://www.regular-expressions.info/email.html

186.0.47 How do I check if the QuickTime component for the JPEG exporting is available?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** If you want to know if the PictureToString functions will work, you may try this function:

**Example:**

Function IsQTJPEGExporterAvailable() As boolean
dim q as QTComponentInformationMBS

// search for QuickTime JPEG exporter codec
q=new QTComponentInformationMBS

while q.NextComponent
if q.Type="imco" and q.SubType="jpeg" then
Return true
end if
wend

Return false // not found
End Function
Notes:
It should work like this for other types like:
"tiff" -> TIFF
"PNTG" -> Mac Paint
"gif" -> GIF
"WRLE" -> Windows BMP
"tga" -> Targa
"png" -> PNG
etc.

186.0.48 How do I check if the QuickTime component for the JPEG importing is available?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. Answer: If you want to know if the StringToPicture functions will work, you may try this function:

Example:

Function IsQTJPEGImporterAvailable() As boolean
  dim q as QTComponentInformationMBS
  // search for QuickTime JPEG importer codec
  q=new QTComponentInformationMBS
  while q.NextComponent
    if q.Type="imdc" and q.SubType="jpeg" then
      Return true
      end if
  wend
  Return false // not found
End Function

Notes:
It should work like this for other types like:
"tiff" -> TIFF
"PNTG" -> Mac Paint
"gif" -> GIF
"WRLE" -> Windows BMP
"tga" -> Targa
"png" -> PNG
etc.
186.0.49 How do I check if the QuickTime component for the Sequence grabber is available?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** If you want to know if the QTGrabberClass will work, you can use this code:

**Example:**

```vba
Function IsQTGrabberAvailable() As boolean
    q as QTComponentInformationMBS
    q = new QTComponentInformationMBS
    while q.NextComponent
        if q.Type = "barg" then
            Return true
        end if
   wend
    Return false // not found
End Function
```

**Notes:** Don’t forget that you need to check for each other component you use like the compression functions.

186.0.50 How do I decode correctly an email subject?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** The following code can be used to decode an email subject including several encodings including Base 64.

**Example:**

```vba
dim src as string // input

dim theRegex as Regex
dim theRegexMatch as RegexMatch
dim result, infoCharset, encodedPart as string
dim theStart as Integer

if instr(src, "=?") > 0 then
    theRegex = new Regex
    theRegex.Options.Greedy = false
    theRegex.searchPattern = ".*=\?([\+\w]+)(Q|B)\?\+\[=\]
    theRegexMatch = theRegex.search(src)
    while theRegexMatch <> nil
        theStart = theRegexMatch.subExpressionStartB(0) + len(theRegexMatch.subExpressionString(0))
        result = result + theRegexMatch.subExpressionString(1)

    End Function
```
infoCharset = theRegexMatch.subExpressionString(2)
encodedPart = theRegexMatch.subExpressionString(4)
if theRegexMatch.subExpressionString(3) = "B" then
encodedPart = DecodeBase64(encodedPart)
elseif theRegexMatch.subExpressionString(3) = "Q" then
encodedPart = DecodeQuotedPrintable(encodedPart)
end if
if right(result, 1) = " " then
result = mid(result, 1, len(result)-1)
end if
encodedPart = encodedPart.DefineEncoding(GetInternetTextEncoding(infoCharset))
result = result + encodedPart
theRegex.SearchStartPosition = theStart
theRegexMatch = theRegex.search()
wend
result = result + mid(src, theStart+1)

else
result = src
end if
// theRegexMatch = theRegex.search

msgbox result

Notes: May not look nice depending on the controls used.

186.0.51  How do I enable/disable a single tab in a tabpanel?

Example:
TabpanelEnabledMBS(tabpanel1, 1, false)

Notes:
Use Carbon for MachO and CarbonLib for Mac Carbon and AppearanceLib for Mac OS Classic as library. For Cocoa, please use enabled property of NSTabViewItemMBS class.
186.0.52  How do I find the root volume for a file?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Try this function:

**Example:**

```vbnet
Function GetRootVolume(f as FolderItem) as FolderItem
    dim root, dum as FolderItem
    if f <> nil then
        root = f // f might be the volume
    do
        dum = root.parent
        if dum <> nil then
            root = dum
        end if
    loop until dum = nil
    return root
End Function
```

186.0.53  How do I get the current languages list?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code:

**Example:**

```vbnet
dim p as new CFPreferencesMBS
dim a as CFArrayMBS
dim s as CFStringMBS
dim o as CFObj ectMBS
dim sa(-1) as string

o=p.CopyAppValue("AppleLanguages", ".GlobalPreferences")

if o<>Nil then
    a=CFArrayMBS(o)

dim i,c as Integer

c=a.Count-1
for i=0 to c
    o=a.Item(i)
    if o isa CFStringMBS then
        s=CFStringMBS(o)
        sa.Append s.str
    end if
end for
```

next
end if

MsgBox Join(sa,EndOfLine)

Notes:
On Mac OS X you can get the list of current languages like this list:

de
en
ja
fr
es
it
pt
pt-PT
nl
sv
nb
da
fi
ru
pl
zh-Hans
zh-Hant
ko

Which has German (de) on the top for a German user.
This code has been tested on Mac OS X 10.5 only.

186.0.54 How do I get the Mac OS Version?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code:

**Example:**

```vbnet
dim i as Integer
if system.gestalt(“sysv”, i) then
//do this in an 'If' in case you don't get any value back at all and system.gestalt returns boolean
if i = &h750 then //If OS is 7.5
//do stuff
elseif i = &h761 then //If OS is 7.6.1
//do stuff
end if
```
Notes: The MBS Plugin has a function SystemInformationMBS.OSVersionString for this.

186.0.55 How do I get the printer name?

Plugin Version: all, Console & Web: No. Answer: For Mac OS Classic see the code below and for Mac OS X use the Carbon Print Manager Classes from the MBS Plugin.

Example:

```vba
Dim s As String
Dim i As Integer

s = app.ResourceFork.GetResource("STR ",-8192)
If s <> "" Then
    i = ascb(leftb(s, 1))
    s = mid(s, 2, i)
MsgBox s
End If
```

Notes:

A note from Craig Hoyt:

After looking at your example I had a little deja-vu experience. Several years ago I played around with this same code if FutureBasic. I discovered that it did not and still doesn’t provide the 'Printer Name', it does return the print driver name. If it returns 'LaserWriter 8' as the print driver you can look into this file and get the 'PAPA' resource # -8192 to get the actual Printer Name. Unfortunately this does not hold true for other printers. My Epson and HP Printers (the Epson has an Ethernet Card and the HP is USB) do not provide this info in their drivers. As far as I can tell it only returns the name by polling the printer itself.

186.0.56 How do I make a metal window if RB does not allow me this?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: The following declare turns any window on Mac OS X 10.2 or newer into a metal one.

Example:
declare sub ChangeWindowAttributes lib "Carbon" (win as windowptr, a as Integer, b as Integer)

ChangeWindowAttributes window1,256,0

Notes: May not look nice depending on the controls used.

186.0.57 How do I make a smooth color transition?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer:

I'd like to show in a report some bars, which start with color A and end with color B.

The color change should be very smooth.

My problem: If I would start from 255,0,0 and end by 0,0,0, I would have 255 different colors. If the bars are longer than 255 pixels, would this look nice?

Example:

// Window.Paint:
Sub Paint(g As Graphics)
    dim w,w1,x,p as Integer
    dim c1,c2,c as color
    dim p1,p2 as Double

    c1=rgb(255,0,0) // start color
    c2=rgb(0,255,0) // end color

    w=g.Width
    w1=w-1

    for x=0 to w1
        p1=x/w1
        p2=1.0-p1

        c=rgb(c1.red*p1+c2.red*p2, c1.green*p1+c2.green*p2, c1.blue*p1+c2.blue*p2)

        g.ForeColor=c
        g.DrawLine x, 0,x,g.Height
        next
    End Sub
Notes: Try the code above in a window paint event handler.

186.0.58  How do I read the applications in the dock app?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No.  Answer: Use CFPreferencesMBS class like in this example:

Example:

// Reads file names from persistent dock applications and puts them into the list

dim pref as new CFPreferencesMBS

dim persistentapps as CFStringMBS = NewCFStringMBS("persistent-apps")
dim ApplicationID as CFStringMBS = NewCFStringMBS("com.apple.dock")
dim tiledata as CFStringMBS = NewCFStringMBS("tile-data")
dim filelabel as CFStringMBS = NewCFStringMBS("file-label")

// get the array of persistent applications from dock preferences
dim o as CFObjectMBS = pref.CopyValue(persistentapps, ApplicationID, pref.kCFPreferencesCurrentUser, pref.kCFPreferencesAnyHost)

if o isa CFArrayMBS then
    dim a as CFArrayMBS = CFArrayMBS(o)

    // walk over all items in array
    dim c as Integer = a.Count-1
    for i as Integer = 0 to c

        // get dictionary describing item
        o = a.Item(i)

        if o isa CFDictionaryMBS then
            dim d as CFDictionaryMBS = CFDictionaryMBS(o)

            // and pick tile data dictionary
            o = d.Value(tiledata)
            if o isa CFDictionaryMBS then
                d = CFDictionaryMBS(o)

            // and pick there the file label
            o = d.Value(filelabel)
            if o isa CFStringMBS then
                // and display it
                dim name as string = CFStringMBS(o).str
                List.AddRow name
end if
end if
else
MsgBox "Failed to read dock preferences."
end if

Notes: You can use the CFPreferencesMBS.SetValue to change a value and CFPreferencesMBS+Synchronize to write the values to disc. You may need to restart the Dock.app if you modified things.

186.0.59 How do I truncate a file?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** In a binarystream you can set the length property to truncate.

186.0.60 How do update a Finder’s windows after changing some files?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code: **Example:**

```vbnet
dim f as folderitem ' some file
dim ae as appleevent
ea=newappleevent("fndr","fupd","MACS")
ea.folderitemparam("—-")=f
if not ae.send then
    //something went wrong
end if
```

Notes: The folderitem.finderupdate from the MBS Plugin does something like this.

186.0.61 How to access a USB device directly?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** First, it depends on the device.

Notes:
Some devices can be talked directly from user mode code, but some require a kernel driver.

For some devices you can use plugins to access them like:

- Audio and Video sources using the QTGrabberClassMBS
- Mass storage devices using the folderitem class.
- Serial devices using the System.SerialPort function.
- HID USB devices can be used with MacHIDMBS, WinHIDMBS or LinuxHIDInterface class.
- Any USB device may be used with MacUSBMBS or WinUSBMBS classes.

In general it is always the best to take the most high level access to have others do the work for the details.

### 186.0.62 How to add icon to file on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use FolderItem.AddCustomIcon or NSWorkspaceMBS.setIcon functions. **Notes:** Please close any open stream for the file you want to add an icon.

### 186.0.63 How to ask the Mac for the Name of the Machine?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Using Apple Events you can use this code: **Example:**

```vba
Function ComputerName() As string
    dim theEvent as AppleEvent
    dim err as boolean

    theEvent = newAppleEvent("mchn","getd","MACS")
    err = theEvent.send

    return theEvent.ReplyString
End Function
```

**Notes:**
Code above is for Mac OS 9!
Also the MBS Plugin has a function for this which may be faster and work also on Macs without Filesharing (which handles this event).

**186.0.64 How to automatically enable retina in my apps?**

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can run a build script on each build with this code:

**Example:**

```vba
Dim App As String = CurrentBuildLocation + "/' + CurrentBuildAppName + ".app"
Call DoShellCommand("/usr/bin/defaults write " + App + "/Contents/Info "’NSHighResolutionCapable’" YES")
```

**Notes:** This will set the NSHighResolutionCapable flag to YES.

**186.0.65 How to avoid leaks with Cocoa functions?**

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can try this code on Mac OS X:

**Example:**

```vba
// in a Timer Action event:
Sub Action()
    static LastPool as NSAutoreleasePoolMBS = nil
    static CurrentPool as NSAutoreleasePoolMBS = nil

    LastPool = CurrentPool
    CurrentPool = new NSAutoreleasePoolMBS
End Sub
```

**Notes:**

With REALbasic 2009r4 the code above should not be needed as REALbasic runtime does automatically handle the NSAutoreleasePools for you. For older REALbasic versions you need to use code with a timer with the action event above to avoid memory leaks.

Please do not use REALbasic 2009r4 and newer with plugins before version 9.5. You can get crashes there which typically show a line with a objc_msgSend call.
186.0.66  How to avoid trouble connecting to oracle database with SQL Plugin?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** For oracle the most important thing is to point the plugin to the libraries from oracle.

**Notes:**

In environment variables, the paths like ORACLE_HOME must be defined.
On Mac OS X you also need to define DYLD_LIBRARY_PATH to point to the dylib files from oracle.

For that you need to modify /etc/launchd.conf for Mac OS X 10.8 and newer.
In older versions those variables in .MacOSX/environment.plist file in user’s home.

Another way for the case you bundle things inside your app is to use the LSEnvironment key in info.plist.
In info.plist it looks like this:

```xml
<key>LSEnvironment</key>
<dict>
<key>test</key>
<string>Hello World</string>
</dict>
```

186.0.67  How to avoid __NSAutoreleaseNoPool console messages in threads?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You need to use your own NSAutoreleasePool on a thread like this:

**Example:**

```vbnet
sub MyThread.run
  dim pool as new NSAutoreleasePoolMBS
  // do work here
  pool=nil
end sub
```

**Notes:**

For more details read here:
186.0.68  How to bring app to front?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** On Mac you can use this code:

**Example:**

```plaintext
// First way:
app.FrontMostMBS = true

// second way:
dim p as new ProcessMBS
p.GetCurrentProcess
p.FrontProcess = true

// third way:
NSApplicationMBS.sharedApplication.activateIgnoringOtherApps(true)

// for Windows:
RemoteControlMBS.WinBringWindowToTop
```

**Notes:** This will bring a Mac app to the front layer.

186.0.69  How to bring my application to front?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** This makes SimpleText (Code ttxt) to the frontmost application:

**Example:**

```plaintext
Dim A As AppleEvent
A = NewAppleEvent(“misc”,”actv”,””)
If Not A.Send then
Beep
end if
```

**Notes:** (Code is Mac only)

186.0.70  How to catch Control-C on Mac or Linux in a console app?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use SignalHandlerMBS class for this.

**Example:**
// watch for Control-C on Mac
call SignalHandlerMBS.SetFlagHandler(2)

dim ende as boolean = false

do
if SignalHandlerMBS.IsFlagSet(2) then
Print "Flag 2 set. Existing..."
ende = true
end if

DoEvents 1
loop until ende

Notes: The signal is caught, a flag is set and you can ask later in your normal application flow for the result.

186.0.71 How to change name of application menu?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. Answer: Use this code to change the application menu name on Mac OS X:

Example:

dim mb as new MenubarMBS
dim m as MenuMBS = mb.item(1) // 1 is in my tests the app menu
if m<>Nil then
m.MenuTitle = "Hello World"
end if

Notes: This code is for Carbon only.

186.0.72 How to change the name in the menubar of my app on Mac OS X?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer:

You mean it screws up if the file name of the bundle itself is different than the name of the executable file in the MacOS folder within the bundle? If so, you should find something like this within your Info.plist file (or the 'plst' resource that the RB IDE builds for you):

<key>CFBundleExecutable</key>
<string>Executable file name here</string>
Just make sure that file name matches.

However, if your question involves how you can change the name of the app that appears in the menu and the dock, that’s different. You can make this name different from the file name by changing the CFBundleName key:

```
<key>CFBundleName</key>
<string>Name for menu here</string>
```

Note that if you use my free AppBundler program, this second part is taken care of for you – just fill in a custom name in the right field. You can find AppBundler (from Thomas Reed) at http://www.bitjuggler.com/products/appbundler/.

186.0.73  How to check if a folder/directory has subfolders?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use code like this to check all items in a folder:

**Example:**

```vba
Function HasSubFolder(folder as FolderItem) As Boolean
    dim c as Integer = folder.Count
    for i as Integer = 1 to c
        dim item as FolderItem = folder.TrueItem(i)
        if item<>Nil and item.Directory then
            Return true
        end if
    next
    End Function
```

**Notes:**

We use trueitem() here to avoid resolving alias/link files. Also we check for nil as we may not have permission to see all items. And if one is a directory, we return without checking the rest.
186.0.74  How to check if Macbook runs on battery or AC power?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Please use our IOPowerSourcesMBS class like this:
Example:

```
Function PowerSourceState() as Integer
    dim p as new IOPowerSourcesMBS
    
    // check all power sources
    dim u as Integer = p.Count-1
    for i as Integer = 0 to u
        dim d as CFDictionaryMBS = p.Item(i)
        if d<>nil then
            // check if they have a power source state key:
            dim o as CFObjectMBS = d.Value(NewCFStringMBS("Power Source State"))
            if o isa CFStringMBS then
                dim s as string = CFStringMBS(o).str
                'MsgBox s
                if s = "AC Power" then
                    Return 1
                elseif s = "Battery Power" then
                    Return 2
                end if
            end if
        end if
    next
    Return 0 // unknown
End Function
```

Notes: If you want to check the CFDictionaryMBS content, simply use a line like "dim x as dictionary = d.dictionary" and check the contents in the debugger.

186.0.75  How to check if Microsoft Outlook is installed?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: If you need Outlook for Scripting, you should simply check registry for the required Outlook.Application class:
Example:

```
Function OutlookInstalled() As Boolean
    # if TargetWin32 then
    try
```
dim r as new RegistryItem("HKEY_CLASSES_ROOT\Outlook.Application\CLSID", false)

Return true

catch r as RegistryAccessErrorException
// not installed
Return false
end try

# else
// Windows only, so false on other platforms
Return false
# endif

End Function

186.0.76 How to check on Mac OS which country or language is currently selected?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: The code below returns a country value.

Example:

dim result as Integer

IF TargetMacOS THEN

CONST smScriptLang = 28
CONST smSystemScript = -1

DECLARE FUNCTION GetScriptManagerVariable LIB "Carbon" ( selector as Integer) as Integer
DECLARE FUNCTION GetScriptVariable LIB "Carbon" ( script as Integer, selector as Integer) as Integer

result=GetScriptVariable(smSystemScript, smScriptLang)

END IF

Notes:

Returns values like:
CHAPTER 186. THE FAQ

For more values, check "Script.h" in the frameworks.

186.0.77 How to code sign my app with plugins?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: When you try to code sign the application with plugin dylibs on Mac OS X, you may see error message that there is actually a signature included.

Notes:

Please use the -f command line parameter with codesign utility to overwrite our MBS signature.
We sign our plugins for Mac and Windows to make sure they have not been modified.

In terminal, you do like this:

```
cd <Path to folder of app>

codesign -f -s "Developer ID Application: <Your Name>" "<Appname>.app/Contents/Frameworks/*.dylib"
codesign -f -s "Developer ID Application: <Your Name>" "<Appname>.app/Contents/Frameworks/*.framework"
codesign -f -s "Developer ID Application: <Your Name>" "<Appname>.app"
```

Please use the name of your certificate (See keychain), the name of your app and the path to the app folder. If you have helper apps you need to sign them first. You can use a build step to automatically sign your app on build.

186.0.78 How to collapse a window?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Use this function (Mac only):

Example:

```
Sub CollapseRBwindow(w as window, CollapseStatus as boolean)
dim state, err as Integer
dim wh as MemoryBlock

Declare Function CollapseWindow Lib "Carbon" (window as Integer,collapse as Integer) as Integer

IF CollapseStatus THEN
    state = 1
ELSE
    state = 0
END IF
```
err = CollapseWindow(w.MacWindowPtr, state)

End Sub

Notes:
Also the MBS Plugin has a window.collapsedmbs property you can set.
For Windows the MBS Plugin has a window.isiconicmbs property.

186.0.79 How to compare two pictures?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: You can try this code:
Example:

Function ComparePictures(p as picture,q as picture) as Integer
dim r,u as RGBSurface
dim x,y,n,m,h,w as Integer
dim w1,w2,h1,h2,d1,d2 as Integer
dim c1,c2 as color

h1=p.Height
h2=q.Height
w1=p.Width
w2=q.Width
d1=p.Depth
d2=q.Depth

if d1<>d2 then
Return 1
elseif w1<>w2 then
return 2
elseif h1<>h2 then
Return 3
else
r=p.RGBSurface
u=q.RGBSurface

if r=nil or u=nil then
Return -1
else
h=h1-1
w=w1-1
m=min(w,h)

endif
for n=0 to m
  c1=r.Pixel(n,n)
  c2=u.Pixel(n,n)
  if c1<>c2 then
    Return 4
  end if
  next

for y=0 to h
  for x=0 to w
    c1=r.Pixel(x,y)
    c2=u.Pixel(x,y)
    if c1<>c2 then
      Return 5
    end if
  next
next

// 0 for equal
// -1 for error (no RGBsurface)
// 1 for different depth
// 2 for different width
// 3 for different height
// 4 for different pixels (fast test)
// 5 for different pixels (slow test)
end if
end if

Exception
Return -1
End Function

Notes: Remember that this only works on bitmap pictures, so the picture.BitmapMBS function may be useful.

186.0.80 How to compile PHP library?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: You have to download the source code and compile a static version of the library.

Notes:

This instructions were written based on PHP 5.2.6 on Mac OS X:

• Best take a new Mac with current Xcode version installed.
• Download the source code archive. e.g. "php-5.2.6.tar.bz2"
• Expand that archive on your harddisc.
• Open terminal window
• change directory to the php directory. e.g. "cd /php-5.2.6"
• execute this two lines to define the supported CPU types and the minimum Mac OS X version:
  • export CFLAGS="-arch ppc -arch i386 -mmacosx-version-min=10.3"
  • export CXXFLAGS="-arch ppc -arch i386 -mmacosx-version-min=10.3"
• the command ".configure help" does show the configure options.
• use configure with a line like this:
  • ./configure --enable-embed --with-curl --enable-ftp --enable-zip --enable-sockets --enable-static --enable-soap
    --with-zlib --with-bz2 --enable-exif --enable-bcmath --enable-calendar
• start the compilation with "make all"
• other option is to use "make install" which first does the same as "make all" and than does some installation scripts.
• you may get an error about a duplicate symbole _yytext. Search the file "zend_imi_scanner.c", search a line with "char *yytext;" and change it to "extern char *yytext;".
• On the end you get a lot of error messages, but you have a working library (named libphp5.so) file in the invisible ".libs" folder inside your php source folder.

Possible problems and solutions:

• If the path to your files has spaces, you can get into trouble. e.g. "/RB Plugins/PHP" is bad as files will be searched sometimes in "/RB".
• If you have in /usr/local/lib libraries which conflict with the default libraries, you can get into trouble.
• If you installed some open source tools which compiled their own libraries, you can get into conflicts.
• if you have to reconfigure or after a problem, you may need to use "make clean" before you start "make all" again.

Feel free to install additional libraries and add more packages to the configure line.
186.0.81 How to convert a BrowserType to a String with WebSession.Browser?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use code like this:

**Example:**

```vbnet
Function GetBrowserName(s as WebSession.BrowserType) As string
    Select case s
        case WebSession.BrowserType.Android
            Return "Android"
        case WebSession.BrowserType.Blackberry
            Return "Blackberry"
        case WebSession.BrowserType.Chrome
            Return "Chrome"
        case WebSession.BrowserType.ChromeOS
            Return "ChromeOS"
        case WebSession.BrowserType.Firefox
            Return "Firefox"
        case WebSession.BrowserType.InternetExplorer
            Return "InternetExplorer"
        case WebSession.BrowserType.Opera
            Return "Opera"
        case WebSession.BrowserType.Safari
            Return "Safari"
        case WebSession.BrowserType.SafariMobile
            Return "SafariMobile"
        case WebSession.BrowserType.Unknown
            Return "Unknown"
        else
            Return "Unknown: " + str(integer(s))
    end Select
End Function
```

186.0.82 How to convert a EngineType to a String with WebSession.Engine?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use code like this:

**Example:**

```vbnet
Function GetRenderingEngineName(s as WebSession.EngineType) As string
    Select case s
        case WebSession.EngineType.Gecko
            Return "Gecko"
        case WebSession.EngineType.Presto
            Return "Presto"
        case WebSession.EngineType.Trident
```
Return "Trident"
case WebSession.EngineType.Unknown
Return "Unknown"
case WebSession.EngineType.WebKit
Return "WebKit"
else
Return "Unknown: " + str(integer(s))
end Select

End Function

186.0.83 How to convert a PlatformType to a String with WebSession.Platform?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Use code like this:

Example:

Function GetPlatformName(s as WebSession.PlatformType) As string
Select case s
    case WebSession.PlatformType.Blackberry
        Return "Blackberry"
    case WebSession.PlatformType.iPad
        Return "iPad"
    case WebSession.PlatformType.iPhone
        Return "iPhone"
    case WebSession.PlatformType.iPodTouch
        Return "iPodTouch"
    case WebSession.PlatformType.Linux
        Return "Linux"
    case WebSession.PlatformType.Macintosh
        Return "Macintosh"
    case WebSession.PlatformType.PS3
        Return "PS3"
    case WebSession.PlatformType.Unknown
        Return "Unknown"
    case WebSession.PlatformType.WebOS
        Return "WebOS"
    case WebSession.PlatformType.Wii
        Return "Wii"
    case WebSession.PlatformType.Windows
        Return "Windows"
else
    Return "Unknown: " + str(integer(s))
end Select
186.0.84 How to convert a text to iso-8859-1 using the TextEncoder?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**

This code can help you although it’s not perfect.
You need to set lc to the current color you use.

**Example:**

```vbnet
dim outstring as string
dim theMac, thePC as textencoding
dim Mac2PC as textconverter

theMac = getTextEncoding(0) // MacRoman
thePC = getTextEncoding(& h0201) // ISOLatin1

Mac2PC = getTextConverter(theMac, thePC)
// if you wanted to do the opposite just create a converter
// PC2Mac = getTextConverter(thePC, theMac)

outstring = Mac2PC.convert("Bjrn, this text should be converted")
Mac2PC.clear
```

**Notes:** You have to call Mac2PC.clear after every conversion to reset the encoding engine.

186.0.85 How to convert ChartTime back to Xojo date?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** We have this example code:

**Example:**

```vbnet
Function ChartTimeToDate(ChartTime as Double) As date
static diff as Double = 0.0

if diff = 0.0 then
    dim d2 as Double = CDBaseChartMBS.chartTime(2015, 1, 1)
    dim da as new date(2015, 1, 1)
    dim ts as Double = da.TotalSeconds
    diff = ts - d2
end if
```

dim d as new date
d.TotalSeconds = diff + ChartTime

Return d
End Function

Notes: As you see we calculate the difference in base date from Date and ChartTime and later use difference to convert.

186.0.86 How to convert line endings in text files?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: You can simply read file with TextInputStream and write with new line endings using TextOutputStream class.

Example:

dim inputfile as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim outputfile as FolderItem = SpecialFolder.Desktop.Child("output.txt")
dim it as TextInputStream = TextInputStream.Open(inputfile)
dim ot as TextOutputStream = TextOutputStream.Create(outputfile)

ot.Delimiter = EndOfLine.Windows // new line ending
while not it.EOF
    ot.WriteLine it.ReadLine
wend

Notes: TextInputStream will read any input line endings and with delimiter property in TextOutputStream you can easily define your new delimiter.

186.0.87 How to convert picture to string and back?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Use this plugin functions:

Notes:
JPEG:

JPEGStringToPictureMBS(buf as string) as picture
JPEGStringToPictureMBS(buf as string,allowdamaged as Boolean) as picture
PictureToJPEGStringMBS(pic as picture,quality as Integer) as string
186.0.88 How to copy an array?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use a function like this to copy an array:

**Example:**

```vbnet
Function CopyArray(a() as Double) as Double()
    dim r() as Double
    for each v as Double in a
        r.Append v
    next
    Return r
End Function
```
Notes:

If needed make several copies of this method with different data types, not just double.
For a deep copy of an array of objects, you need to change code to also make a copy of those objects.

186.0.89  How to copy an dictionary?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No.  Answer: You can use a function like this to copy a dictionary:

Example:

Function CopyDictionary(d as Dictionary) As Dictionary
    dim r as new Dictionary
    for each key as Variant in d.keys
        r.Value(key) = d.Value(key)
    next
    Return r
End Function

Notes:

If needed make several copies of this method with different data types, not just double.
For a deep copy of an dictionary of objects, you need to change code to also make a copy of those objects.

186.0.90  How to copy parts of a movie to another one?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No.  Answer: The code below copies ten seconds of the snowman movie to the dummy movie starting at the 5th second.

Example:

dim f as FolderItem
dim md as EditableMovie
dim ms as EditableMovie

f=SpecialFolder.Desktop.Child("Our First Snowman.mov")
ms=f.OpenEditableMovie

ms.SelectionStartMBS=5
ms.SelectionLengthMBS=10

f=SpecialFolder.Desktop.Child("dummy.mov")
md=f.CreateMovie

msgbox str(md.AddMovieSelectionMBS(ms))
Notes: If result is not 0, the method fails.

186.0.91 How to create a birthday like calendar event?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Try this code:

Example:

```vba
// start a connection to the calendar database
dim s as new CalCalendarStoreMBS

// needed for the error details
dim e as NSErrorMBS

dim r as CalRecurrenceRuleMBS = CalRecurrenceRuleMBS.initYearlyRecurrence(1, nil) // repeat every year without end

dim a as new CalAlarmMBS // add alarm
a.action = a.CalAlarmActionDisplay
a.relativeTrigger = -3600*24 // 24 Hours before

// create a new calendar
dim c as new CalEventMBS

dim d as new date(2011, 04, 20) // the date

dim calendars() as CalCalendarMBS = s.calendars

// set properties
c.Title = "Test Birthday"
c.startDate = d
c.recurrenceRule = r
c.calendar = calendars(0) // add to first calendar
c.addAlarm(a)
c.endDate = d
c.isAllDay = true

// save event
call s.saveEvent(c, s.CalSpanAllEvents, e)
if e<>nil then
    MsgBox e.localizedDescription
else
    MsgBox "New event was created."
end if
```
Notes: This adds an event to iCal for the given date with alarm to remember you and repeats it every year.

186.0.92 How to create a GUID?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use the UUIDMBS class for this.

186.0.93 How to create a Mac picture clip file?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** You can use code like this one.

**Example:**

```vbscript
dim f As FolderItem
dim p As Picture

f=SpecialFolder.Desktop.Child("Test.pictClipping")
if f=nil then Return

p=new Picture(300,200,32) 'Make a sample picture
p.Graphics.ForeColor=RGB(0,255,255)
p.Graphics.FillOval 0,0,99,99
p.Graphics.ForeColor=RGB(255,0,0)
p.Graphics.DrawOval 0,0,99,99

dim r As ResourceFork 'ResourceFork is needed for a clip file

// Please define a file type Any
r=f.CreateResourceFork("Any")

// get PICT data using plugin function
dim pictdata as string = p.PicHandleDataMBS
r.AddResource(pictdata,"PICT",256,"Picture")

dim m as new MemoryBlock(8)

m.LittleEndian = false
m.Int16Value(0) = 0
m.Int16Value(2) = 0
m.Int16Value(4) = p.Width
m.Int16Value(6) = p.Height
```
r.AddResource(m,"RECT",256,""")

'Values taken from a sample file and irrelevant to the problem
dim data as string = DecodeBase64("AQAAAAAAAAAAAAAAAAACAFRDRVIAAAABAAAAAAAAAAABUQ0lQAAAAAQAAAAAAAAAA")
r.AddResource(data,"drag",128,"") 'ditto
r.Close

Notes: In general Apple has deprecated this, but a few application still support clippings.

### 186.0.94 How to create a PDF file in REALbasic?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Check our DynaPDF plugin and the examples.

**Notes:**
An alternative can be to use the CoreGraphics and Cocoa functions on Mac OS X. For Windows, we can only suggest our DynaPDF plugin.

### 186.0.95 How to create EmailAttachment for PDF Data in memory?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use code like the one below:

**Example:**

```vba
Function EmailAttachmentFromPDFData(PDFData as string, filename as string) As EmailAttachment
dim a as new EmailAttachment

a.data = EncodeBase64(PDFData, 76)
a.ContentEncoding = "base64"
a.MIMEType = "application/pdf"
a.MacType = "PDF"
a.MacCreator = "prvw"
a.Name = filename

Return a
End Function
```

**Notes:**
Compared to sample code from Xojo documentation, we set the mime type correct for PDF. The MacType/MacCreator codes are deprecated, but you can still include them for older Mac email clients. "prvw" is the creator code for Apple’s preview app.
186.0.96 How to create PDF for image files?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use DynaPDF like this:

**Example:**

```vba
Function CreatePrintPDF(jpgFiles() as folderitem, pdfFile as FolderItem, PageWidth as Integer, PageHeight as Integer) As Boolean
    // have files?
    If pdfFile = Nil Then Return False
    If jpgFiles = Nil Then Return False
    If jpgFiles.Ubound <0 Then Return False

    // new DynaPDF
    Dim pdf As New MyDynapdfMBS

    // page width/height in MilliMeter
    Dim pdfWidth as Integer = PageWidth * 72 / 25.4
    Dim pdfHeight as Integer = PageHeight * 72 / 25.4

    // put your license here
    Call pdf.SetLicenseKey "Starter"

    // create pdf
    Call pdf.CreateNewPDF pdfFile

    // set a couple of options
    Call pdf.SetPageCoords(MyDynaPDFMBS.kpcTopDown)
    Call pdf.SetResolution(300)
    Call pdf.SetUseTransparency(False)
    Call pdf.SetSaveNewImageFormat(False)
    Call pdf.SetGStateFlags(MyDynaPDFMBS.kgfUseImageColorSpace, False)
    Call pdf.SetJPEGQuality(100)

    // set page size
    Call pdf.SetBBox(MyDynaPDFMBS.kpbMediaBox, 0, 0, pdfWidth, pdfHeight)
    Call pdf.SetPageWidth(pdfWidth)
    Call pdf.SetPageHeight(pdfHeight)

    // append pages with one image per page
    For i as Integer = 0 To jpgFiles.Ubound
        Call pdf.Append
        Call pdf.InsertImageEx(0, 0, pdfWidth, pdfHeight, jpgFiles(i), 1)
        Call pdf.EndPage
    Next

    Return True
End Function
```

CHAPTER 186. THE FAQ

Notes:
This is to join image files in paper size to a new PDF.
e.g. scans in A4 into an A4 PDF.

186.0.97 How to CURL Options translate to Plugin Calls?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Below a few tips on how to translate command line CURL calls to plugin calls.

Notes:

- The option -v means verbose. You can use OptionVerbose and listen for messages in the DebugMessage event.
- The option -X PUT means we want to do a HTTP PUT Request. So set OptionPut to true. Also you will want to set OptionUpload to true as you upload data.
- We have the URL which you put into OptionURL property.
- The -data-binary option tells CURL to pass the given data. With the @ before the data, it is interpreted as a file name, so the data is read from the given file. You’ll need to open this file and pass data with the Read event as needed. (See CURLS ftp file upload example project)
- The last option -H specifies an additional header for the upload. Pass this additional header with the SetOptionHTTPHeader method.

curl -X PUT http://127.0.0.1:5984/appserials/f2f4e540bf8bb60f61cfcd4328001c59 -d ' { "type":"Product","description":"Application Serial","acronym":"AppSerial","dateAdded":"2011-03-21 14:57:36" } ' 

- Option -X PUT like above.
- Pass the URL again in OptionURL
- This time data is passed in command line for CURL. You’d put this data in the quotes into a string and make it available in the Read event. (See CURLS ftp upload example project)
186.0.98  How to delete file with ftp and curl plugin?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can set post/pre quotes to have ftp commands executed before or after the download/upload.

**Example:**

```vba
dim d as CURLMBS // your curl object

// delete file
dim ws() As String
ws.Append "DELE Temp.txt"

d.SetOptionPostQuote(ws)
```

**Notes:**

Use SetOptionPostQuote, SetOptionPreQuote or SetOptionQuote. The ftp commands you pass here are native ftp commands and not the commands you use with ftp applications. To delete use DELE and the file path.

186.0.99  How to detect display resolution changed?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** On Mac OS X simply listen for display changed notifications.

**Notes:** Use the "Distribution Notification Center.rbp" example project as a base and use it to listen to notifications with the name "O3DeviceChanged".

186.0.100  How to detect retina?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Please use WindowBackingScaleFactorMBS to query the factor.

**Example:**

```vba
msgbox str(window1.BackingScaleFactorMBS)
```

186.0.101  How to disable force quit?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:**

Please visit this website and get the control panel for Mac OS 9 there: http://www3.sk.sympatico.ca/tinyjohn/DFQ.html
For Mac OS X use the MBS Plugin with the SetSystemUIModeMBS method.  
**Notes:** Please use presentationOptions in NSApplicationMBS for Cocoa applications.

### 186.0.102 How to disable the error dialogs from Internet Explorer on javascript errors?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No.  
**Answer:** You can use this code in the htmlviewer open event:  
**Example:**

```plaintext
if targetwin32 then
    htmlviewer1._ole.Content.value("Silent") = True
end if
```

**Notes:** This disables the error dialogs from Internet Explorer.

### 186.0.103 How to display a PDF file in REALbasic?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.  
**Answer:** On Mac OS X you can use CoreGraphics or PDFKit to display a PDF.  
**Notes:**  
An alternative can be to load the PDF into a htmlviewer so the PDF plugin can display it.  
On Windows you may need to use the Acrobat ActiveX control from Adobe or launch Acrobat Reader.

### 186.0.104 How to do a lottery in RB?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.  
**Answer:** Try this function:  
**Example:**

```plaintext
Sub Lotto(max as Integer,count as Integer,z() as Integer)
    // Lotto count numbers of max put into the array z beginning at index 0
    dim n(0) as Integer ' all the numbers
    dim m as Integer ' the highest field in the current array
    dim i,a,b,d as Integer ' working variables

    'fill the array with the numbers
    m=max-1
    redim n(m)
```
for i=0 to m
n(i)=i+1
next

' unsort them by exchanging random ones
m=max*10
for i=1 to m
a=rnd*max
b=rnd*max
d=n(a)
n(a)=n(b)
n(b)=d
next

' get the first count to the dest array
m=count-1
redim z(m)
for i=0 to m
z(i)=n(i)
next

'sort the result
z.sort
End Sub

Sub Open()
// Test it
dim za(0) as Integer ' the array of the numbers
lotto 49,6,za ' 6 of 49 in Germany

' and display them
staticText1.text=str(za(0))+chr(13)+str(za(1))+chr(13)+str(za(2))+chr(13)+str(za(3))+chr(13)+str(za(4))+chr(13)+str(za(5))+chr(13)+str(za(6))+chr(13)
End Sub

186.0.105 How to do an asycron DNS lookup?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. Answer: use CFHostMBS class (Mac OS X only).

Notes:
REALbasic internal functions and plugin DNS functions are synronized.
You can use DNSLookupThreadMBS class for doing them asyncron.

186.0.106  How to draw a dashed pattern line?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: You can try this code:

Example:

```vbnet
// call like this: DrawDashedPatternLine g,0,0,width,height,10

Sub DrawDashedPatternLine(g as graphics,x1 as Integer,y1 as Integer,x2 as Integer,y2 as Integer, partlen as Integer)
    dim x,y,ox,oy as Double
    dim dx,dy as Double
    dim w,h,d as Double
    dim b as Boolean

    w=x2-x1
    h=y2-y1

    d=sqrt(w*w+h*h)

    dx=w/d*partlen
    dy=h/d*partlen

    b=true
    x=x1
    while (x<x2) and (y<y2)
        ox=x
        oy=y

        x=x+dx
        y=y+dy

        if b then
            g.DrawLine ox,oy,x,y
        end if

        b=not b
    wend
End Sub
```

Notes: It would be possible to add this to the plugin, but I think it’s better if you do it in plain Realbasic code, so it even works on Windows.
How to draw a nice antialiased line?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer:

This code can help you although it’s not perfect.
You need to set lc to the current color you use.

Example:

Sub drawLine(xs as Integer, ys as Integer, xe as Integer, ye as Integer, face as RGBSurface, lineColor as color)
    dim intX, intY, count, n, xDiff, yDiff as Integer
    dim v, v1, floatX, floatY, xx, yy, xStep, yStep as Double
    dim c as color

    const st=1.0
    xDiff=xe-xs
    yDiff=ye-ys
    count=max(abs(xDiff), abs(yDiff))
    xStep=xDiff/count
    yStep=yDiff/count
    xx=xs
    yy=ys
    for n=1 to count
        intX=xx
        intY=yy
        floatX=xx-intX
        floatY=yy-intY
        v=(1-floatX)*(1-floatY)*st
        v1=1-v
        c=face.pixel(intX, intY)
        face.pixel(intX, intY)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
        v=floatX*(1-floatY)*st
        v1=1-v
        c=face.pixel(intX+1, intY)
        face.pixel(intX+1, intY)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
        v=(1-floatX)*floatY*st
        v1=1-v
        c=face.pixel(intX, intY+1)
        face.pixel(intX, intY+1)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
        v=floatX*floatY*st
        v1=1-v
        c=face.pixel(intX+1, intY+1)
        face.pixel(intX+1, intY+1)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
20884

CHAPTER 186. THE FAQ

xx=xx+xStep
yy=yy+yStep
next

End Sub

Notes: PS: st should be 1 and face should be a RGBSurface or a Graphics object.

186.0.108 How to draw with CGContextMBS using my own handle?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: You can try this code:

Example:

Soft Declare Function QDBeginCGContext Lib "Carbon" (port as Integer, ByRef contextHandle as Integer) as Integer
dim contextRef as Integer
call QDBeginCGContext(g.handle(graphics.HandleTypeCGrafPtr), contextRef)
dim c as new CGContextMBS(contextRef)
c.BeginPath
c.SetLineWidth(3)
c.SetRGBFillColor(1,0,0,0.5)
c.FillRect(CGMakeRectMBS(0,0,100,100))
c.DrawPath(c.kCGPathFillStroke)
c.Flush // and so on

Soft Declare Function QDEndCGContext Lib "Carbon" (port as Integer, ByRef contextHandle as Integer) as Integer
dim h as Integer = c.Handle
call QDEndCGContext(g.handle(graphics.HandleTypeCGrafPtr), h)
c.Handle=0

Notes: Basicly you can provide your own handle to CGContextMBS. But if you do not set it back to 0 the CGContextMBS destructor will release the handle which can result into a crash. (if the reference count is wrong)

186.0.109 How to dump java class interface?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: In terminal you can use "javap -s <classname>" to display the class with the method names and parameters.

Notes: For example show ResultSet class: javap -s java.sql.ResultSet
186.0.110  How to duplicate a picture with mask or alpha channel?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use code like this function:

**Example:**

```plaintext
Function Duplicate(extends p as Picture) As Picture

# if RBVersion >= 2011.04 then
if p.HasAlphaChannel then

    // create nw picture and copy content:
    dim q as new Picture(p.Width, p.Height)
    q.Graphics.DrawPicture p, 0,0

    Return q

end if

# endif

// create new picture
dim q as new Picture(p.Width, p.Height, 32)

// get mask
dim oldMask as Picture = p.mask(false)
if oldMask = nil then
    // no mask, so simple copy
    q.Graphics.DrawPicture p, 0,0
    Return q
end if

// remove mask
p.mask = nil

// copy picture and mask
q.Graphics.DrawPicture p, 0, 0
q.mask.Graphics.DrawPicture oldMask, 0,0

// restore mask
p.mask = oldmask

Return q

End Function
```

**Notes:**
CHAPTER 186. THE FAQ

Simply copy it to a module and call it like this: `q = p.duplicate`.
The code above works with old Real Studio versions because of the `#` if even if your RS version does not support alpha channel pictures. This way it’s future proof.

186.0.111 How to enable assistive devices?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use AppleScript code like below:

**Notes:**

tell application "System Events"
activate

set UI elements enabled to true

return UI elements enabled
end tell

You can run this with AppleScriptMBS class.

186.0.112 How to encrypt a file with Blowfish?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use code like this:

**Example:**

dim fi as FolderItem = SpecialFolder.Desktop.Child(”test.xojo_binary_project”)
dim fo as FolderItem = SpecialFolder.Desktop.Child(”test.encrypted”)

// read input
dim bi as BinaryStream = BinaryStream.Open(fi)
dim si as string = bi.Read(bi.Length)
bi.Close

// encrypt
dim so as string = BlowfishMBS.Encrypt(”MyKey”,si)

// write output
dim bo as BinaryStream = BinaryStream.Create(fo)
bo.Write so
bo.Close
Notes: Of course you can decrypt same way, just use Decrypt function and of course swap files.

186.0.113 How to extract text from HTML?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Use both Remove-HTMLTagsMBS and DecodingFromHTMLMBS like this:

Example:

dim html as string = "<p><b>Größ...</b></p>"
dim htmltext as string = RemoveHTMLTagsMBS(html)
dim text as string = DecodingFromHTMLMBS(htmltext)

MsgBox text // shows: Gre

Notes:
You can use it together with RemoveHTMLTagsMBS to remove html tags. What you get will be the text without tags.
DecodingFromHTMLMBS turns HTML escapes back to unicode characters. Like &auml; to .

186.0.114 How to find empty folders in a folder?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Try this code:

Example:

dim folder as folderitem // your folder

dim c as Integer = folder.count
for i as Integer = 1 to c
dim item as folderitem = folder.trueitem(i)
if item = nil then
    // ignore
elseif item.directory then
    // folder
if item.count = 0 then
    // found empty folder
end if
end if
next
186.0.115  How to find iTunes on a Mac OS X machine fast?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can try Launch Services.
**Example:**

```vbscript
dim f as FolderItem

f=LaunchServicesFindApplicationForInfoMBS("hook","com.apple.iTunes","iTunes.app")

MsgBox f.AbsolutePath
```

186.0.116  How to find network interface for a socket by it’s name?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use our plugin to build a lookup table.
**Example:**

```vbscript
Function FindNetworkInterface(name as string) As NetworkInterface
name = name.trim

if name.len = 0 then Return nil

// search by IP/MAC
dim u as Integer = System.NetworkInterfaceCount-1
for i as Integer = 0 to u
    dim n as NetworkInterface = System.GetNetworkInterface(i)
    if n.IPAddress = name or n.MACAddress = name then
        Return n
    end if
next

// use MBS Plugin to build a mapping
dim interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces
dim map as new Dictionary

for each n as NetworkInterfaceMBS in interfaces
    dim IPv4s() as string = n.IPv4s
    dim IPv6s() as string = n.IPv6s

    for each IPv4 as string in IPv4s
        map.Value(IPv4) = n.Name
    next

    for each IPv6 as string in IPv6s
        map.Value(IPv6) = n.Name
```

if n.MAC<>"" then
map.Value(n.MAC) = n.Name
end if
next

// now search interfaces by name, IPv4 or IPv6
for i as Integer = 0 to u
    dim n as NetworkInterface = System.GetNetworkInterface(i)
    if map.Lookup(n.IPAddress, "") = name then
        Return n
    end if

    if map.Lookup(n.MACAddress, "") = name then
        Return n
    end if
next

End Function

Notes: The code above uses a lookup table build using NetworkInterfaceMBS class to find the network interface by name.

186.0.117  How to find version of Microsoft Word?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: You can use code like this:

Example:

// find Word
dim f as FolderItem = LaunchServicesFindApplicationForInfoMBS("", "com.microsoft.Word","")

// open bundle
dim c as new NSBundleMBS(f)

// read info
dim d as Dictionary = c.infoDictionary

// show version
MsgBox d.Lookup("CFBundleVersion","")

Notes: Older versions of Word can be found with creator code "MSWD".

186.0.118  How to fix CURL error 60/53 on connecting to server?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You probably connect with SSL and you have no valid certificate.

**Example:**

```
    dim d as new CURLSMBS

    // Enable SSL verification
    d.OptionSSLVerifyHost = 0  // don’t verify server
    d.OptionSSLVerifyPeer = 0  // don’t proofs certificate is authentic

    // With SSL Verification:
    dim cacert as FolderItem = Getfolderitem("cacert.pem")
    d.OptionCAInfo = cacert.UnixpathMBS
    d.OptionSSLVerifyHost = 2  // verify server
    d.OptionSSLVerifyPeer = 1  // proofs certificate is authentic
```

**Notes:**

You can either use the code above to disable the SSL verification and have no security.
Or you use the cacert file and enable the verification. Than you only get a connection if the server has a valid certificate.

[http://curl.haxx.se/ca/](http://curl.haxx.se/ca/)

186.0.119  How to format double with n digits?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use the FormatMBS function for this.

**Example:**

```mbs
    dim d as Double = 123.4567890
    listbox1.AddRow FormatMBS("% f", d)
    listbox1.AddRow FormatMBS("% e", d)
    listbox1.AddRow FormatMBS("% g", d)

    listbox1.AddRow FormatMBS("% 5.5f", d)
    listbox1.AddRow FormatMBS("% 5.5e", d)
    listbox1.AddRow FormatMBS("% 5.5g", d)

    d = 0.000000123456
    listbox1.AddRow FormatMBS("% f", d)
    listbox1.AddRow FormatMBS("% e", d)
```
listbox1.AddRow FormatMBS("% g", d)
listbox1.AddRow FormatMBS("% 5.5f", d)
listbox1.AddRow FormatMBS("% 5.5e", d)
listbox1.AddRow FormatMBS("% 5.5g", d)

Notes:
see FormatMBS for details.
In general % f is normal style, % e is scientific and % g is whichever gives best result for given space.

186.0.120 How to get a time converted to user time zone in a web app?

Example:
Sub Open()
// current date on server
    dim d as new date
    dim s as string = d.LongTime

    // adjust to client GMT offset
    d.GMTOffset = d.GMTOffset + Session.GMTOffset

    dim t as string = d.LongTime
    MsgBox s+EndOfLine+t
End Sub

186.0.121 How to get an handle to the frontmost window on Windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. Answer: This function returns a handle for the frontmost window:
Example:
Function GetForegroundWindowHandle() as Integer
    # if targetwin32 then
    declare function GetForegroundWindow Lib "user32.dll" as Integer
    Return GetForegroundWindow()
    # endif
End Function
186.0.122  How to get CFAbsoluteTime from date?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No.  **Answer:** Use code like this:

**Example:**

```vba
dim d as new date
dim t as CFTimeZoneMBS = SystemCFTimeZoneMBS
dim g as new CFGregorianDateMBS
g.Day = d.Day
    g.Month = d.Month
    g.Year = d.Year
    g.Minute = d.Minute
    g.Hour = d.Hour
    g.Second = d.Second

    dim at as CFAbsoluteTimeMBS = g.AbsoluteTime(t)
dim x as Double = at.Value

MsgBox str(x)
```

**Notes:**

As you see we need a timezone and put the date values in a gregorian date record.
Now we can query absolute time for the given timezone.

186.0.123  How to get client IP address on web app?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use the WebSession.RemoteAddress property.

**Example:**

```vba
Sub Open()
    Title = Session.RemoteAddress
End Sub
```
186.0.124 How to get fonts to load in charts on Linux?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Please use the SetFontSearchPath method in the CDBaseChartMBS class to specify where your fonts are.

**Example:**

```pascal
if TargetLinux then
  CDBaseChartMBS.SetFontSearchPath "/usr/share/fonts/truetype"
else
  // on Mac and Windows we use system fonts.
end if
```

**Notes:**

On Mac OS X and Windows, the fonts are loaded from the system’s font folder.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts” as the path. No backslash on the end of a path, please.

---

186.0.125 How to get fonts to load in DynaPDF on Linux?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Please use the AddFontSearchPath method in the DynaPDFMBS class to specify where your fonts are.

**Example:**

```pascal
dim d as new DynaPDFMBS
if TargetLinux then
  call d.AddFontSearchPath "/usr/share/fonts/truetype", true
else
  // on Mac and Windows we use system fonts.
end if
```

**Notes:**

On Mac OS X and Windows, the fonts are loaded from the system’s font folder.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts” as the path. No backslash on the end of a path, please.
CHAPTER 186. THE FAQ

186.0.126 How to get GMT time and back?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use the date class and the GMTOffset property.

**Example:**

```vba
// now
dim d as new date

// now in GMT
dim e as new date
e.GMTOffset = 0

// show
MsgBox str(d.TotalSeconds,”0.0”)+” ”+str(e.TotalSeconds, ”0.0”)

dim GMTTimeStamp as Double = e.TotalSeconds

// restore
dim f as new date

// add GMT offset here
f.TotalSeconds = GMTTimeStamp + f.GMTOffset*3600

// because here it’s removed
f.GMTOffset = f.GMTOffset

MsgBox d.ShortTime+” (”+str(d.GMTOffset)+” ”)+str(d.TotalSeconds,”0.0”)+EndOfLine+_
e.ShortTime+” (”+str(e.GMTOffset)+” ”)+str(e.TotalSeconds,”0.0”)+EndOfLine+_
f.ShortTime+” (”+str(f.GMTOffset)+” ”)+str(f.TotalSeconds,”0.0”)
```

**Notes:** It’s sometimes a bit tricky with the date class as setting one property often changes the others.

186.0.127 How to get good crash reports?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Check this website from the webkit website:

**Notes:** http://webkit.org/quality/crashlogs.html

186.0.128 How to get list of all threads?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use the runtime module like in this function:
Example:

```vbnet
Function Threads() As Thread()
# pragma DisableBackgroundTasks
dim t() as Thread

Dim o as Runtime.ObjectIterator = Runtime.IterateObjects
While o.MoveNext
if o.Current isa Thread then
   t.Append thread(o.current)
end if
Wend
Return t
End Function
```

Notes:
This returns an array of all thread objects currently in memory.
The pragma is important here as it avoids thread switches which may cause a thread to be created or deleted.

186.0.129 How to get parameters from webpage URL in Real Studio Web Edition?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use the Webpage.ParametersReceived event.

**Example:**

```vbnet
Sub ParametersReceived(Variables As Dictionary)
for each key as Variant in Variables.keys
   MsgBox key + " -> " + Variables.Value(key)
next
End Sub
```

Notes: The text encodings of this strings is not defined in Real Studio 2010r5. Please use DefineEncoding.

186.0.130 How to get Real Studio apps running Linux?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You need to install some require packages.

Notes:
You need CUPS as well as GTK packages. On 64 bit systems also the ia32-libs package.

Please note that you need a x86 compatible Linux. So no PPC, Power, ARM or other CPUs.

186.0.131 How to get the color for disabled textcolor?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Ask the appearance manager:

**Example:**

```vba
Function GetThemeTextColor(inColor as Integer, inDepth as Integer, inColorDev as Boolean) As Color
    declare function GetThemeTextColor lib "Carbon" (inColor as Integer, inDepth as Integer, inColorDev as Boolean, outColor as Ptr) as Integer

dim i as Integer
dim col as MemoryBlock

col = newMemoryBlock(6)

i = GetThemeTextColor(inColor, inDepth, inColorDev, col)

return RGB(col.USHort(0) \ 256, col.USHort(2) \ 256, col.USHort(4) \ 256)
End Function
```

**Notes:**

The color for this is:

```vba
const kThemeTextColorDialogInactive = 2.

c = GetThemeTextColor(kThemeTextColorDialogInactive, Screen(0).Depth, true)
```

For Mac OS X you should use "CarbonLib" instead of "AppearanceLib" ...

186.0.132 How to get the current free stack space?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can something like the code below:

**Example:**
Sub ShowStackSize()
    dim threadid as Integer
    dim size as Integer

    declare function GetCurrentThread lib "Carbon" (byref threadid as Integer) as short
    declare function ThreadCurrentStackSpace lib "Carbon" (threadid as Integer, byref size as Integer) as short

    if GetCurrentThread(threadid)=0 then
        if 0=ThreadCurrentStackSpace(threadid,size) then
            MsgBox str(size)
        end if
    end if
End Sub

Notes: For Mac OS 9, use "ThreadLib" instead of "CarbonLib". You can use # if if you like for that.

186.0.133  How to get the current timezone?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. Answer:

You can use the TimeZoneMBS class or the CFTimeZoneMBS class.
Or code like below:
Example:

Function GMTOffsetInMinutes() as Integer
    // Returns the offset of the current time to GMT in minutes.
    // supports Mac OS and Windows, but not Linux yet (let me know if
    // you have code for that, please)
    //
    // Note that the offset is not always an even multiple of 60, but
    // there are also half hour offsets, even one 5:45h offset
    //
    // This version by Thomas Tempelmann (rb@tempel.org) on 25 Nov 2005
    // with a fix that should also make it work with future Intel Mac targets.
    //
    // Using code from various authors found on the RB NUG mailing list

    dim result, bias, dayLightbias as Integer
    dim info as memoryBlock
    dim offset as Integer

    # if targetMacOS then

Declare Sub ReadLocation lib "Carbon" (location As ptr)
info = NewMemoryBlock(12)
ReadLocation info
if false then
    // bad, because it does not work on Intel Macs:
    offset = info.short(9) * 256 + info.byte(11)
else
    offset = BitwiseAnd (info.long(8), & hFFFFFF)
end

offset = info.short(9) * 256 + info.byte(11)
offset = offset \ 60
return offset

# endif

# if targetWin32 then

Declare Function GetTimeZoneInformation Lib "Kernel32" ( tzInfoPointer as Ptr ) as Integer
    // returns one of
    // TIME_ZONE_ID_UNKNOWN 0
    // - Note: e.g. New Delhi (GMT+5:30) and Newfoundland (-3:30) return this value 0
    // TIME_ZONE_ID_STANDARD 1
    // TIME_ZONE_ID_DAYLIGHT 2

info = new MemoryBlock(172)
result = GetTimeZoneInformation(info)

bias = info.Long(0)
    // note: the original code I found in the NUG archives used Long(84) and switched to Long(0)
    // only for result=1 and result=2, but my tests found that Long(0) is also the right value for result=0

if result = 2 then
daylightBias = info.long(168)
end if
offset = - (bias + dayLightbias)
return offset

# endif

End Function

186.0.134  How to get the current window title?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** The code below returns the current window title for the frontmost window on Mac OS X if Accessibility services are
Example:

```vba
Function CurrentWindowTitle() As string
    dim SystemWideElement, FocusedApplicationElement, FocusedWindowElement as AXUIElementMBS
    dim FocusedApplication, FocusedWindow, Title as AXValueMBS
    dim s as String
    dim cs as CFStringMBS

    SystemWideElement = AccessibilityMBS.SystemWideAXUIElement
    if SystemWideElement <> nil then
        FocusedApplication = SystemWideElement.AttributeValue(AccessibilityMBS.kAXFocusedApplicationAttribute)
        if FocusedApplication.Type = AccessibilityMBS.kAXUIElementMBSTypeID then
            FocusedApplicationElement = new AXUIElementMBS
            FocusedApplicationElement.Handle = FocusedApplication.Handle
            FocusedApplicationElement.RetainObject

            FocusedWindow = FocusedApplicationElement.AttributeValue(AccessibilityMBS.kAXFocusedWindowAttribute)
            if FocusedWindow <> nil and AccessibilityMBS.kAXUIElementMBSTypeID = FocusedWindow.Type then
                FocusedWindowElement = new AXUIElementMBS
                FocusedWindowElement.Handle = FocusedWindow.Handle
                FocusedWindowElement.RetainObject

                Title = FocusedWindowElement.AttributeValue(AccessibilityMBS.kAXTitleAttribute)
                if Title <> nil and Title.Type = kCFStringMBSTypeID then
                    cs = new CFStringMBS
                    cs.Handle = Title.Handle
                    cs.RetainObject
                    Return cs.str
                end if
            end if
        end if
    end if
End Function
```

186.0.135 How to get the cursor blink interval time?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** On Mac OS you can use GetCaretTime from the toolbox.

**Example:**

```vba
declare function GetCaretTime lib "Carbon" () as Integer

MsgBox str(GetCaretTime())+" ticks"
```
**Notes:** 60 ticks make one second.

### 186.0.136 How to get the list of the current selected files in the Finder?

**Plugin Version:** all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:**

Use the AppleScript like this one:

```applescript
tell application "finder"
  return selection
end tell
```

Which translates into this AppleEvent:

```appletalk
Process("Finder").SendAE "core,getd,'—-':obj { form:prop, want:type(prop), seld:type(sele), from:'null' }```

and as Realbasic code it looks like this:

**Example:**

```realbasic
dim ae as appleevent
dim o1 as appleeventObjectSpecifier
dim f as folderItem
dim aList as appleeventdescList
dim i as Integer
dim dateiname as string

// setup the AppleEvent
o1=getpropertyObjectDescriptor( nil, "sele")
ae=newappleEvent("core", "getd", "MACS")
ae.objectSpecifierParam("—-")=o1

// send it
if ae.send then
  // got the list
  alist=ae.replyDescList

  // now show the list of filename into an editfield:
  for i=1 to alist.count
    f=alist.folderItemItem(i)
    dateiname=f.name
```
186.0.137  How to get the Mac OS system version?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** The following code queries the value and displays the version number:

**Example:**

```vba
dim first as Integer
dim second as Integer
dim third as Integer
dim l as Integer
if System.Gestalt("sysv",l) then
    Third=Bitwiseand(l,15)
    second=Bitwiseand(l \ 16,15)
    first=Bitwiseand(l \ 256,15)+10*Bitwiseand(l \ 256 \ 16,15)
end if
if First>=10 then
    msgbox "Mac OS X "+str(First)+"."+str(Second)+"."+str(third)
else
    msgbox "Mac OS "+str(First)+"."+str(Second)+"."+str(third)
end if
```

186.0.138  How to get the Mac OS Version using System.Gestalt?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code:

**Example:**

```vba
Dim s As String
Dim b As Boolean
Dim i, resp as Integer
// Systemversion
b = System.Gestalt("sysv", resp)
if b then
    s = Hex(resp)
```
\textbf{186.0.139} How to get the screen size excluding the task bar?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. \textbf{Answer:} Try this code:
\textbf{Notes:} Use the Screen class with the available* properties.

\textbf{186.0.140} How to get the size of the frontmost window on Windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. \textbf{Answer:} Try this code:
\textbf{Notes:}
Make yourself a class for the WindowRect with four properties:

- \texttt{Bottom} as Integer
- \texttt{Left} as Integer
- \texttt{Right} as Integer
- \texttt{Top} as Integer

Add the following method to your class:

\begin{verbatim}
Sub GetWindowRect(windowhandle as Integer)
   dim err as Integer
   dim mem as memoryBlock
   # if targetwin32 then
   Declare Function GetWindowRect Lib "user32.dll" (hwnd as Integer, ipRect As Ptr) as Integer
   mem = newmemoryBlock(16)
   err = GetWindowRect(windowhandle, mem)
   Left = mem.long(0)
   Top = mem.Long(4)
   Right = mem.Long(8)
   Bottom = mem.Long(12)
   # endif
\end{verbatim}
End Sub

Good to use for the MDI Master Window!

186.0.141 How to get the source code of a HTMLViewer?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Try this code:
Example:

// for Windows:

msgbox HTMLViewer1.IEHTMLTextMBS

// for Mac OS X:

msgbox HTMLViewer1.mainFrameMBS.dataSource.data

186.0.142 How to handle really huge images with GraphicsMagick or ImageMagick?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Sometimes it may be better to use an extra application to process images.
Notes:

A typical 32 bit app made with Xojo (Real Studio) can use around 1.8 GB on Windows and 3 GB on Mac OS X. Some images may be huge, so that processing them causes several copies of the image to be in memory. With a 500 MB image in memory, doing a scale or rotation may require a temp image. So with source, temp and dest images with each 500 MB plus your normal app memory usage, you may hit the limit of Windows with 1.8 GB.

In that case it may be worth running a tool like gm in the shell class. gm is the command line version of GraphicsMagick. There you can run the 64 bit version which is not limited in memory like your own application. Also you can monitor progress and keep your app responsive.

186.0.143 How to handle tab key for editable cells in listbox?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Use code like this function:
Example:
Function HandleTabInList(list as listbox, row as Integer, column as Integer, key as String) As Boolean
// Handle tab character in Listbox.CellKeyDown event

Select case asc(key)
case 9
if Keyboard.AsyncShiftKey then
    // back
    // look for column left
    for i as Integer = column-1 downto 0
        if list.ColumnType(i) >= list.TypeEditable then
            list.EditCell(row, i)
            Return true
        end if
    next
    // not found, so look in row before
    row = row - 1
    if row >= 0 then
        for i as Integer = list.ColumnCount-1 downto 0
            if list.ColumnType(i) >= list.TypeEditable then
                list.EditCell(row, i)
                Return true
            end if
        next
    end if
else
    // forward
    // look for column right
    for i as Integer = column+1 to list.ColumnCount-1
        if list.ColumnType(i) >= list.TypeEditable then
            list.EditCell(row, i)
            Return true
        end if
    next
    // not found, so look in row below
    row = row + 1
    if row < list.ListCount then
        for i as Integer = 0 to list.ColumnCount-1
            if list.ColumnType(i) >= list.TypeEditable then
                list.EditCell(row, i)
                Return true
            end if
        next
    end if
end if
Notes:
You call it from CellKeyDown event like this:

EventHandler Function CellKeyDown(row as Integer, column as Integer, key as String) As Boolean
if HandleTabInList(me, row, column, key) then Return true
End EventHandler

As you see in the code, we handle tab and shift + tab for moving back and forward. Also we wrap to previous/next row if needed. Feel free to extend this to wrap from last to first row or create a new row for editing.

186.0.144 How to hard link MapKit framework?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Our MapKit classes weak link the framework. If you need hard linking it for the App Store, you can add this method to a class: Example:

Sub ReferenceMapKit()
// just put this in window or app class

# if TargetMachO and Target64Bit then
Declare sub testing Lib "MapKit" Selector "test" (id as ptr)
testing(nil)
# endif

End Sub

Notes:
No need to call the method.
Just having it in a window or app, will cause the compiler to hard link the framework.

186.0.145 How to have a PDF downloaded to the user in a web application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: You can use a WebHTMLViewer control and load the PDF file with the PDF plugin from the browser. Example:
dim CurrentFile as WebFile // a property of the WebPage

// define the PDF file
CurrentFile = new WebFile
CurrentFile.Filename = "test.pdf"
CurrentFile.MIMEType = "application/pdf"
CurrentFile.Data = "some pdf data" // MyDynaPDF.GetBuffer
CurrentFile.ForceDownload = true

// start the download
showurl(CurrentFile.url)

Notes: See our Create PDF example for the Real Studio Web Edition.

186.0.146 How to hide all applications except mine?

Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: The code below will on Mac OS hide all applications except your one:

Example:

dim p as new ProcessMBS

p.GetFirstProcess
do
if not p.FrontProcess then
p.Visible=false
end if
loop until not p.GetNextProcess

186.0.147 How to hide script errors in HTMLViewer on Windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. Answer: Set Internet Explorer to silent mode with code like this:

Example:

htmlviewer1._ole.Content.value("Silent") = True

Notes: Simply put this code in the open event of your htmlviewer control (using me instead of htmlviewer1).
186.0.148 How to hide the grid/background/border in ChartDirector?  

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** If you want to hide something in a chart, simply assign the kTransparent constant as color.

186.0.149 How to hide the mouse cursor on Mac?  

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this declare: 

**Example:**

```vba
Declare Sub HideCursor Lib "Carbon" () Inline68K("A852")

HideCursor
```

**Notes:** The MBS Plugin has this function and supports it on Windows, too.

186.0.150 How to insert image to NSTextView or TextArea?  

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** With NSTextViewMBS you can use this code to insert file: 

**Example:**

```vbscript
// insert a file to textview

Public Sub InsertFile(textview as NSTextViewMBS, f as FolderItem)
    // read to file
    dim b as BinaryStream = BinaryStream.Open(f)
    dim s as string = b.Read(b.Length)

    // build wrapper
    dim fileWrapper as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(s)
    fileWrapper.preferredFilename = f.name

    // make attachment
    dim fileAttachment as new NSTextAttachmentMBS(fileWrapper)
    dim attributedString as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(fileAttachment)

    // add to a NSTextViewMBS
    textview.insertText attributedString

End Sub
```
Notes: For TextArea you can query the underlaying NSTextViewMBS object via TextArea.NSTextViewMBS method.

186.0.151 How to jump to an anchor in a htmlviewer?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. Answer: You can use javascript to change the current window’s location.

Example:

```javascript
// load website
htmlviewer1.LoadURL "http://www.monkeybreadsoftware.net/addressbook-abpersonmbs.shtml"

// later jump to anchor named "16":

if TargetWin32 then
  call HTMLViewer1.IERunJavaScriptMBS "window.location = " # 16""
elseif TargetMacOS then
  call HTMLViewer1.EvaluateJavaScriptMBS "window.location = " # 16""
else
  // not supported
end if
```

186.0.152 How to keep a movieplayer unclickable?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: To keep the user away from clicking on a playing Movie you can just drop a Canvas in front of the Movieplayer and take the clicks there.

Example:

```vbnet
Function Canvas1.MouseDown(X as Integer, Y as Integer) as boolean
  return true // take it and do nothing
End Function
```

186.0.153 How to keep my web app from using 100% CPU time?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: On Linux and Mac OS X you can use renice command in the terminal. On Windows use the task manager to reduce priority.

Notes:
If you launch your app with nohup on Linux or Mac OS X like this from the terminal or a script:

```
nohup /webapps/MyApp/MyApp &
```

you can simply have a second line saying this:

```
renice 20 $!
```

which tells the system to lower priority to lowest value for the latest background process.

### 186.0.154 How to kill a process by name?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can kill a process (or application) by name if you loop over all the processes and kill the one you need.

**Example:**

```vbs
   dim p as new ProcessMBS
   p.GetfirstProcess ' get first
   do
      if p.name = "TextEdit" then
         call p.KillProcess
         return
      end if
   loop until not p.GetNextProcess
```

**Notes:** You may want to check the result of killProcess function. Not every user is allowed to kill every application.

### 186.0.155 How to know how many CPUs are present?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this function:

**Example:**

```vbs
Function GetCPUCount() as Integer
    Declare Function MPProcessors Lib "Carbon" () as Integer

    Return MPProcessors()
End Function
```
Notes: Your app will then need that library to launch on Classic. To avoid this the MBS plugin checks if this library is available and return 1 if it’s not available.

186.0.156  How to know if a movie is finished?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. Answer: This code can help you although it’s not perfect:

Example:

Declare Function IsMovieDone Lib ”QuickTime” (theMovie as Integer) as Integer

if IsMovieDone(moviePlayer1.movie.handle) <>0 then
  //movie is finished
end if

Notes: But be careful! It crashes sometimes for an unknown reason!?

186.0.157  How to know if QuickTime is installed on any target and can play MPEG 4 movies?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. Answer: Try this code:

Example:

dim q as QTComponentInformationMBS

q=new QTComponentInformationMBS

// ”eat ” = Movie importers
while q.NextComponentOfType(”eat ”)
  if q.SubType=”MP4 ” then
    MsgBox ”found: ”+q.Name+ ” codec”
  end if
wend

Notes: If you find a MP4 movie importing codec you can be sure that a MP4 movie can be opened.
186.0.158  How to know if QuickTime is installed on any target?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** Try this function:

**Example:**

```vbscript
Dim theEffect as QTEffect
theEffect=GetQTCrossFadeEffect

if theEffect = nil then
    MsgBox "QuickTime is not installed."
else
    MsgBox "Quicktime is installed."
end if
```

**Notes:** The problem with this code is that it checks only if the QuickTime part of the cross fade effect is available. Use the QTComponentInformationMBS to check for the features you really need.

186.0.159  How to know the calling function?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** On Mac you can use a helper function like this this code:

**Example:**

```vbscript
Public Function CallingFunction() as string
    // Query name of calling function of a function
    # Pragma BreakOnExceptions false

    try

        // raise a dummy exception
        dim r as new NilObjectException
        raise r

        catch x as NilObjectException

            // get stack
            dim stack() as string = x.Stack

            // pick function name and return
            dim name as string = stack(2)
            Return name

    end try
```

186.0.160  How to launch an app using it’s creator code?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Answer:** Send an AppleEvent ”oapp” with the creator code to the Finder (”MACS”):

**Example:**

```vbnet
Dim a as AppleEvent
dim creator as string

creator = "MSIE" ' here the Internet Explorer

a = NewAppleEvent(“aevt”, ”odoc”, ”MACS”)
a.Timeout = -1

a.ObjectSpecifierParam(“—-”) = GetUniqueIDObjectDescriptor(”appf”, nil, creator)

if not a.send then
    msgBox ”An error has occured”
else
    end if
```

186.0.161  How to launch disc utility?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.  **Answer:** You can use this code:

**Example:**

```vbnet
dim f as FolderItem = LaunchServicesFindApplicationForInfoMBS(””, ”com.apple.DiskUtility”, ””)

if f<>Nil then
    f.Launch
    end if
```

**Notes:** This works even if people renamed the disc utility or moved it to another folder.
186.0.162  How to make a lot of changes to a REAL SQL Database faster?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You may try to embed your changes to the database between two transaction calls.

**Example:**

```vbscript
dim db as Database // some database

db.SQLExecute "BEGIN TRANSACTION"
// Do some Stuff
db.SQLExecute "END TRANSACTION"
```

**Notes:** This can increase speed by some factors.

186.0.163  How to make a NSImage object for my retina enabled app?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use code like this:

**Example:**

```vbscript
Function NewRetinaImage(pic as Picture, mask as Picture = nil) As NSImageMBS
    // first make a NSImageMBS from it
    dim n as new NSImageMBS(pic, mask)

    // now set to half the size, so we have 2x pixels for the image
    n.size = new NSSizeMBS(n.width/2, n.height/2)

    // and return
    Return n
End Function
```

**Notes:**

The thing to do is to have 2x the pixels, but assign a size to the image which gives it the right size in points. You can pass the NSImageMBS from here to NSMenuItemMBS. For Retina displays, the full resolution is used. For others it will be reduced.

186.0.164  How to make a window borderless on Windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Try this declares:

**Example:**
// Sets window to borderless popup type, and sets its initial dimensions.
// Call this method, then Win32SetBorderlessPos, and then RB’s Show
// method. Use RB Frame type 7 (Global Floating Window).

Const SWP_NOMOVE = & H2
Const SWP_FRAMECHANGED = & H20
Const HWND_TOPMOST = -1
Const GWL_STYLE = -16
Const WS_POPUPWINDOW = & H80880000

Dim styleFlags as Integer

# If TargetWin32 Then

Declare Function SetWindowLong Lib "user32" Alias "SetWindowLongA" (hwnd as Integer, nIndex as Integer, dwNewLong as Integer) as Integer
Declare Function SetWindowPos Lib "user32" (hwnd as Integer, hWndInstertAfter as Integer, x as Integer, y as Integer, cx as Integer, cy as Integer, flags as Integer) as Integer

styleFlags = SetWindowLong( w.WinHWND, GWL_STYLE, WS_POPUPWINDOW )
styleFlags = BitwiseOr( SWP_FRAMECHANGED, SWP_NOMOVE )
styleFlags = SetWindowPos( w.WinHWND, HWND_TOPMOST, 0, 0, wd, ht, styleFlags )

# EndIf

186.0.165 How to make an alias using AppleEvents?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Try this code:

Example:

Sub MakeAlias(folder as folderitem, target as folderitem, aliasname as string)
    dim ev as AppleEvent
    dim myResult as boolean
    dim properties as AppleEventRecord

    ev = NewAppleEvent("core","crel","MACS")
ev.MacTypeParam("kocl") = "alis"
ev.FolderItemParam("to ") = target
ev.FolderItemParam("insh") = folder

    properties=new AppleEventRecord
    properties.StringParam("pnam")=aliasname
    ev.RecordParam("prdt")=properties
myResult = ev.send
// true on success, false on error
End Sub

Notes:
Call it like this:
MakeAlias SpecialFolder.Desktop, SpecialFolder.Desktop.Child("Gif Copy.rb"), "test.rb alias"

Seems to not work on Mac OS X 10.6

186.0.166 How to make an application smaller?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer:
If you use an older copy of REALbasic, you should try to compile for 68k only instead of PPC. It’s a little bit slower, but code is much smaller.

On any Mac OS target you can save your images as JPEG and drop the into your application. REALbasic will include them as JPEGs into the Mac applications (convert to BMP for Windows). This will make the resources of your application smaller, but requires that the user has QuickTime 2.5 or newer installed.

186.0.167 How to make AppleScripts much faster?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: use ”ignoring application responses” like in this example:
Notes:
on run { fn,fpx,fpy }
ignoring application responses
tell app ”Finder” to set the position of folder fn to fpx,fpy
end ignoring
end run

186.0.168 How to make double clicks on a canvas?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer:
Update: Newer Xojo versions support DoubleClick event, so you don’t need this code.
Here's my tip from the tips list on how to add a double-click event to the Canvas control. The technique could easily be used for a window or any Rectcontrol:

Because of its built-in drawing methods, the Canvas control is often used to create custom interface controls. But while the Canvas control has event handlers for most mouse events, it doesn’t have an event handler for DoubleClick events. Fortunately, you can add a double-click event handler to a Canvas control easily. Basically, you’re going to create a new class based on Canvas and add a double-click event to that. You can then use the new class anytime you need a Canvas with a double-click event.

To create a new Canvas class with a DoubleClick event handler, do this:

1. Add a new class to your project.
2. Set the Super property of the new class to “Canvas”.
3. Change the name of this new class to “DoubleClickCanvas”.

A double-click occurs when two clicks occur within the users double-click time (set in the Mouse control panel on both Macintosh and Windows) and within five pixels of each other. So, you’ll need a few properties to store when and where the last click occurred.

4. Add a new property with the following declaration and mark it as private: lastClickTicks as Integer
5. Add a new property with the following declaration and mark it as private: lastClickX as Integer
6. Add a new property with the following declaration and mark it as private: lastClickY as Integer

Since the Canvas control doesn’t have a DoubleClick event, you will need to add one.

7. Add a new event to your class by choosing New Event from the Edit menu and enter ”DoubleClick” as the event name.

Double-clicks occur on MouseUp. In order for the mouseUp event to fire, you must return True in the MouseDown event.

8. In the MouseDown event, add the following code:
   Return True

In the MouseUp event, you will need to determine what the users double-click time is. This value is represented on both the Mac and Windows in ticks. A tick is 1/60th of a second. Since there isn’t a built-in function for this, you’ll need to make a toolbox call. The mouseUp event code below makes the appropriate toolbox call for both Macintosh and Windows. It then compares the time of the users last click to the time of the current click and compares the location of the users last click to the location of the current click.

9. Add the following code to the MouseUp event:
dim doubleClickTime, currentClickTicks as Integer

# if targetMacOS then
 Declare Function GetDb1Time Lib "Carbon" () as Integer
  doubleClickTime = GetDb1Time()
# endif

# if targetWin32 then
 Declare Function GetDoubleClickTime Lib "User32.DLL" () as Integer
  doubleClickTime = GetDoubleClickTime()/60 // convert to ticks from milliseconds
# endif

currentClickTicks = ticks
//if the two clicks happened close enough together in time
if (currentClickTicks - lastClickTicks) < doubleClickTime then
//if the two clicks occurred close enough together in space
if abs(X - lastClickX) <= 5 and abs(Y - LastClickY) <= 5 then
  DoubleClick //a double click has occurred so call the event
end if
end if
lastClickTicks = currentClickTicks
lastClickX = X
lastClickY = Y

10. Now to test out your new DoubleClickCanvas, drag the class from the Project window to a window in your project to create an instance of it.

11. Double-click on the canvas you just added to your window to open the Code Editor. Notice that the canvas has a DoubleClick event handler. In this event handler, add the following code:
BEEP

186.0.169  How to make my Mac not sleeping?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Just inform the Mac OS about some system activity with code like this:
Example:

Sub UpdateSystemActivity()

# if TargetCarbon
declare function myUpdateSystemActivity lib "Carbon" alias "UpdateSystemActivity" (activity as Integer) as short
const OverallAct = 0 // Delays idle sleep by small amount */
const UsrActivity = 1 // Delays idle sleep and dimming by timeout time */
const NetActivity = 2 // Delays idle sleep and power cycling by small amount */
const HDActivity = 3 // Delays hard drive spindown and idle sleep by small amount */
const IdleActivity = 4 // Delays idle sleep by timeout time */

dim e as Integer

e=myUpdateSystemActivity(UsrActivity)

// you may react on an error if e is not 0 after the call.

# endif
End Sub

Notes:
You may use another constant if you prefer some different behavior.
Call it maybe every second.

186.0.170  How to make my own registration code scheme?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. Answer: There are excellent articles about how to make a registration code scheme, but you can also simply use our RegistrationEngineMBS class.
Notes: If you need a license text, why not use the one from Real Studio as a starting point?

186.0.171  How to make small controls on Mac OS X?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: You can try this code on Mac OS X:
Example:

'/*
' Use the control’s default drawing variant. This does not apply to
' Scroll Bars, for which Normal is Large.
'*/
const kControlSizeNormal = 0

'/*
' Use the control’s small drawing variant. Currently supported by
' the Check Box, Combo Box, Radio Button, Scroll Bar, Slider and Tab
' controls.
const kControlSizeSmall = 1

const kControlSizeLarge = 2

const kControlSizeAuto = & hFFFF
const kControlSizeTag = "size"

declare function SetControlData lib "Carbon" (controlhandle as Integer, part as short, tagname as OS-Type, size as Integer, data as ptr) as short

dim m as MemoryBlock
m=NewMemoryBlock(2)
m.UShort(0)=kControlSizeSmall
Title=str(SetControlData(CheckBox1.Handle, 0, kControlSizeTag, 2, m))

186.0.172 How to mark my Mac app as background only?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can run a build script on each build with this code:

**Example:**

Dim App As String = CurrentBuildLocation + "/" + CurrentBuildAppName + ".app"
Call DoShellCommand("/usr/bin/defaults write " + App + "/Contents/Info ""NSUIElement"")" YES")

**Notes:** This will set the NSUIElement flag to YES.
**CHAPTER 186. THE FAQ**

**186.0.173 How to move a file or folder to trash?**

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use code like below:

**Example:**

```vbnet
Function MoveToTrash(f as FolderItem) As Boolean
# if TargetMacOS then
dim r as FolderItem
dim e as Integer = MacFileOperationMBS.MoveObjectToTrashSync(f, r, MacFileOperationMBS.kFSFileOperationDefaultOptions)
if e = 0 then
Return true // Ok
end if

# elseif TargetWin32 then
dim w as new WindowsFileCopyMBS

dim flags as Integer = w.FileOperationAllowUndo + w.FileOperationNoErrorUI + w.FileOperationSilent + w.FileOperationNoConfirmation
if w.FileOperationDelete(f, flags) then
Return true // OK
end if

flags = w.FileOperationNoErrorUI + w.FileOperationSilent + w.FileOperationNoConfirmation
if w.FileOperationDelete(f, flags) then
Return true // OK
end if
# else
// Target not supported
break
Return false
# endif
End Function
```

**Notes:**

If you want to move a file to trash, you could use f.movefileto f.trashfolder, but that will overwrite existing files in the trash. You can use our MacFileOperationMBS class to move a file on Mac to the trash. And it uses the same code as the Finder, so files are renamed when the same name is already in use in the trash:

On Windows we use WindowsFileCopyMBS class.
Requires Mac OS X 10.5.
186.0.174    How to move an application to the front using the creator code?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** This makes SimpleText (Code `ttxt`) to the frontmost application:

**Example:**

```vba
dim a as appleevent

a=newappleEvent("misc","actv","ttxt")

if a.send then
end if
```

**Notes:** (Code is Mac only)

186.0.175    How to move file with ftp and curl plugin?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can set post/pre quotes to have ftp commands executed before or after the download/upload.

**Example:**

```vba
dim d as CURLMBS // your curl object

// rename/move file
dim ws() As String
ws.Append "RNFR Temp.txt"
ws.append "RNTO MyFile.txt"

d.SetOptionPostQuote(ws)
```

**Notes:**

Use SetOptionPostQuote, SetOptionPreQuote or SetOptionQuote.
The ftp commands you pass here are native ftp commands and not the commands you use with ftp applications. So rename is two commands. First RNFR to tell where to rename from and second RNTO with the new file name. To delete use DELE and the file path.

186.0.176    How to normalize string on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use code like below:

**Example:**
Function Normalize(t as string) As string
const kCFStringNormalizationFormD = 0 // Canonical Decomposition
const kCFStringNormalizationFormKD = 1 // Compatibility Decomposition
const kCFStringNormalizationFormC = 2 // Canonical Decomposition followed by Canonical Composition
const kCFStringNormalizationFormKC = 3 // Compatibility Decomposition followed by Canonical Composition

dim s as CFStringMBS = NewCFStringMBS(t)
dim m as CFMutableStringMBS = s.Normalize(kCFStringNormalizationFormD)

Return m.str
End Function

Notes: This uses Apple’s CFString functions to normalize unicode variants.

186.0.177 How to obscure the mouse cursor on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Try this declare:
Example:
Declare Sub ObscureCursor Lib ”Carbon” ()

ObscureCursor

Notes: The MBS Plugin has this function, but it’s not supported for Windows.

186.0.178 How to open icon file on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Use the NSImageMBS class like this:
Example:
dim f as FolderItem = SpecialFolder.Desktop.Child(”test.ico”)
dim n as new NSImageMBS(f)

window1.Backdrop = n.CopyPictureWithMask
**186.0.179  How to open PDF in acrobat reader?**

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this code:

**Example:**

```vbscript
dim pdf as FolderItem = SpecialFolder.Desktop.Child("test.pdf")

// open PDF in Acrobat Reader on Mac:

// find app
dim bundleID as string = "com.adobe.Reader"
dim app as FolderItem = LaunchServicesFindApplicationForInfoMBS("", bundleID, "")

if app<>nil then

// launch app with parameters

dim docs() as FolderItem
docs.Append pdf

dim param as new LaunchServicesLaunchParameterMBS
param.Defaults = true
param.Application = app

dim x as FolderItem = LaunchServicesOpenXMBS(docs, param)

// on failure, simply launch it
if x = nil then
pdf.Launch(true)
end if

else
pdf.Launch(true)
end if
```

**Notes:** On Windows, simply use pdf.launch or WindowsShellExecuteMBS.

**186.0.180  How to open printer preferences on Mac?**

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use our OpenMacOSXPreferencesPaneMBS function like this:

**Example:**

```vbscript
dim e as Integer = OpenMacOSXPreferencesPaneMBS("PrintAndFax")
if 0 = e then
```
186.0.181  How to open special characters panel on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** We have functions for that in Cocoa and Carbon.

**Example:**

```ruby
dim a as new NSApplicationMBS
a.orderFrontCharacterPalette
```

**Notes:**

For Cocoa, you can use orderFrontCharacterPalette method in NSApplicationMBS class.

Or simply for Carbon and Cocoa the ShowCharacterPaletteMBS method.

186.0.182  How to optimize picture loading in Web Edition?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Use the WebPicture class.

**Notes:**

Take your picture and create a WebPicture object. Store this WebPicture in a property of the WebPage, Session or app (as global as possible). On the first time you use this picture on an user session, the browser will load it. Second time you use it, the browser will most likely pick it from the cache.

Having pictures in App or some module reuses the same picture for all sessions which reduces memory footprint.

This does not work well with pictures you change very often or use only for one webpage on one user.

If you like to see an example, check our Map example:

http://www.monkeybreadsoftware.de/realbasic/webapps.shtml
186.0.183  How to parse XML?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use code like this:

**Example:**

```vbs
dim s as string = "<test><test ///</test></test>"

try
dim x as new XmlDocument(s)
MsgBox "OK"
catch xe as XmlException
MsgBox "invalid XML"
end try
```

**Notes:** If you got an exception, you have a parse error.

186.0.184  How to play audio in a web app?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use the HTML5 audio tag and control it with javascript.

**Notes:**

See our web apps here:
http://www.monkeybreadsoftware.de/realbasic/webapps.shtml

This is just another example app I made today. It plays a christmas song. The audio file is provided by the application to the server, so no external web server is needed and this application can run stand alone. To compile and run you need Real Studio 2010r5.

In the open event we search the audio files and open them as binarystreams. We create the two webfile objects. Those webfiles are part of the app class, so we have them globally. There we set the data with the content of our streams. We also define file names and mime types. They are needed so browser know what we have here:

```vbs
audioFileM4V = new WebFile
audioFileM4V.Data = bM.Read(BM.Length)
audioFileM4V.Filename = "music.m4a"
audioFileM4V.MIMEType = "audio/m4a"

audioFileOGG = new WebFile
audioFileOGG.Data = bO.Read(BO.Length)
```
audioFileOGG.Filename = "music.ogg"
audioFileOGG.MIMEType = "audio/ogg"

Next in the open event of the webpage we have a PageSource control. The location is set to be before content. In the open event we define the html code for this. First we pick the URLs for the audio files. Then we build the html to use the audio tag. As you see, we give it an ID for later use and have it preload automatically. If you add an autoplay tag, you can have the audio play right away. Inside the audio tag we have two sources so we provide audio for both Firefox (OGG) and Safari (MPEG4). Finally we have a text to display if HTML5 audio tag is not supported.

You can set the source in the EditSource event:

dim urlo as string = app.audioFileOGG.URL
dim urlm as string = app.audioFileM4V.URL
me.Source = "<audio id=""mymusic"" preload=""auto"">  
<source src="""+urlo+"" type=""audio/ogg"
/>  
<source src="""+urlm+"" type=""audio/mpeg"
/>Your browser does not support the audio element.<\audio>"

Next in the Play button we execute code to play the audio. This is a short javascript code which searches in the html document for the element with the ID "mymusic" which is the ID of our audio tag above. Once we got the object, we call it's play method to start playback.

me.ExecuteJavaScript("document.getElementById('mymusic').play();")

same for pause:

me.ExecuteJavaScript("document.getElementById('mymusic').pause();")

and finally for changing volume:

me.ExecuteJavaScript("document.getElementById('mymusic').volume="+str(me.Value/100.0)+";")

186.0.185 How to pretty print xml?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Use the XML Transform method with the right XLS.

Notes:

Learn more here:
186.0.186 How to print to PDF?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: This code below shows how to redirect printing to a PDF file on Mac OS X.

Example:

```plaintext
// get Xojo printer setup
dim p as new PrinterSetup

// now put it into NSPrintInfo to manipulate
dim n as new NSPrintInfoMBS
n.SetupString = p.SetupString

// change destination to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
n.SetSaveDestination(f)

// move back
p.SetupString = n.SetupString

// and print as usual
dim g as Graphics = OpenPrinter(p)
g.DrawString "Hello World", 20, 20
```

Notes: And you can use normal graphics class for that.

186.0.187 How to query Spotlight’s Last Open Date for a file?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: You can use a MDItemMBS objec to query this value.

Example:

```plaintext
Function LastOpenedDate(Extends F As FolderItem, DefaultOtherDates As Boolean = True) As Date
# If TargetMacOS Then
Dim xMDItem as New MDItemMBS(F)
Dim xDate as Variant

If xMDItem <> Nil Then
xDate = xMDItem.GetAttribute(xMDItem.kMDItemLastUsedDate).DateValue
If xDate IsA Date Then Return xDate
Else
If xDate <> Nil Then Break
End If
# EndIf
```

```plaintext
End Function
```
If DefaultOtherDates Then
If F.ModificationDate <> Nil Then Return F.ModificationDate
If F.CreationDate <> Nil Then Return F.CreationDate
End If
End Function

Notes: Thanks for Josh Hoggan for this example code.

186.0.188 How to quit windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Try this code:

**Example:**

```plaintext
# if targetwin32 then
dim i1,i2,r as Integer
declare function ExitWindowsEx lib "user32" (uFlags as Integer, dwReserved as Integer) as Integer
i1 = 2
i2 = 0
r = ExitWindowsEx(i1,i2)
if r<>0 then
' Error()
end if

# endif
```

Notes:

uFlags parameters:

'4 = EWX_Force
'0 = EWX_Logoff
'2 = EWX_Reboot
'1 = EWX_shutdown, should shut down computer

Also check the ExitWindowsMBS method.

186.0.189 How to read a CSV file correctly?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** With all the rules for quotes and delimiters, you can simply use the SplitCommaSeparatedValuesMBS method in our plugins like
Example:

```vba
Dim f As FolderItem = SpecialFolder.Desktop.Child("test.csv")
Dim t As TextInputStream = f.OpenAsTextFile

While Not t.EOF
    Dim s As String = t.ReadLine(Encodings.ASCII)
    Dim items() As String = SplitCommaSeparatedValuesMBS(s, ";", "", ",")
    List.AddRow ""
    Dim u As Integer = UBound(items)
    For i As Integer = 0 To u
        List.Cell(List.LastIndex, i) = items(i)
    Next
    Wend
```

Notes: Please make sure you choose the right text encoding.

186.0.190 How to read the command line on windows?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Try this code:

Example:

```vbnet
# if targetwin32 then
Dim line As String
Dim mem As MemoryBlock

Declare Function GetCommandLineA Lib "kernel32" () As Ptr

mem=GetCommandLineA()
sql=mem.cstring(0)
# endif
```

Notes: Newer Realbasic versions have a system.commandline property.
186.0.191 How to render PDF pages with PDF Kit?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. Answer: Try this code:

```vba
// choose a file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")

// open it as PDF Document
dim sourceFile as New PDFDocumentMBS(f)
if sourceFile.handle <> 0 then // it is a PDF file

// get upper bound of pages
dim c as Integer = sourceFile.pageCount-1

// from first to last page
for n as Integer = 0 to c

// pick that page
    dim page as PDFPageMBS = sourceFile.pageAtIndex(n)

// render to image
    dim p as NSImageMBS = page.Render

// and convert to RB picture and display
Backdrop = p.CopyPictureWithMask
next

end if
```

Notes: PDFKit works only on Mac OS X.

186.0.192 How to restart a Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Ask the Finder via Apple Events:

```vba
dim ae as appleEvent
ae=newappleEvent("FNDR","rest","MACS")
if not ae.send then
    msgBox "The computer couldn’t be restarted."
end if
```
186.0.193 How to resume ftp upload with curl plugin?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** CURL supports that and you simply need to set the right options.

**Notes:**
First of course OptionUpload must be true. Second OptionFTPAppend must be true so the OptionResumeFrom is used. Store there (or in OptionResumeFromLarge) your start value. Don’t forget to implement the read event and return data there as requested.

186.0.194 How to rotate a PDF page with CoreGraphics?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** This code opens a PDF and draws the first page into a new PDF with 90 rotation.

**Example:**

```plaintext
// Rotate a PDF page

// our files
dim sourcefile as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim destfile as FolderItem = SpecialFolder.Desktop.Child("rotated.pdf")

// open PDF
dim pdf as CGPDFDocumentMBS = sourcefile.OpenAsCGPDFDocumentMBS

// query media size of first page
dim r as CGRectMBS = pdf.MediaBox(1)

// create new PDF
dim c as CGContextMBS = destfile.NewCGPDFDocumentMBS(r,"title","Author","Creator")

// create rotated rectangle
dim nr as new CGRectMBS(0,0,r.Height,r.Width)

// create new page
c.BeginPage nr
c.SaveGState

const pi = 3.14159265

// rotate by 90
c.RotateCTM pi*1.5
```
// fix origin
  c.TranslateCTM -r.width,0

// draw PDF
  c.DrawCGPDFDocument pdf,r,1

// cleanup
  c.RestoreGState
  c.EndPage

  c = nil

// show in PDF viewer
  destfile.Launch

Notes: This code is Mac only as it needs CoreGraphics.

186.0.195 How to rotate image with CoreImage?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Use the code like the one below:

Example:

// Rotate image with CoreImage

// load image
  dim f as FolderItem = SpecialFolder.Desktop.Child("test.png")
  dim image as new CIImageMBS(f)

  // rotate 45 degree
  dim n as new NSAffineTransformMBS
  n.rotateByDegrees(45)

  dim TransformFilter as new CIFilterAffineTransformMBS
  TransformFilter.inputImage = image
  TransformFilter.inputTransform = n

  // get result
  dim resultImage as CIImageMBS = TransformFilter.outputImage

  // for saving to file
  dim outputImage as NSImageMBS = resultImage.RenderNSImage(false)

  f = SpecialFolder.Desktop.Child("output.png")
  dim b as BinaryStream = BinaryStream.Create(f, true)
b.Write outputImage.PNGRepresentation

// as Real Studio picture object for display
dim pic as Picture = outputImage.CopyPictureWithMask

Backdrop = pic

186.0.196 How to run a 32 bit application on a 64 bit Linux?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Install 32 bit compatibility libraries.

**Notes:**
The package is called ia32-libs for ubuntu (and others).
Some applications need to be run on a 32 bit system as they need some hardware related libraries. Like libUSB or libHID for USB devices.

186.0.197 How to save a quicktime movie as a reference movie?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** Example code is below:

**Example:**

```plaintext
// save as reference movie
dim f as FolderItem
dim m as movie

f=SpecialFolder.Desktop.Child("test.mov")
m=f.OpenAsMovie

f=SpecialFolder.Desktop.Child("new movie.mov")

msgbox str(m.SaveMBS(f,false,false))
```

186.0.198 How to save HTMLViewer to PDF with landscape orientation?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use NSPrintInfoMBS to change the options for PrintToPDFFile function.

**Example:**

```plaintext
// make it landscape
dim n as NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
```
n.orientation = n.NSLandscapeOrientation

// save html to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
call HTMLViewer1.PrintToPDFFileMBS(f,10,30,10,30)

Notes:
You may want to reset options later.
This code is only for Mac OS X.

186.0.199  How to save RTFD?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** With NSTextViewMBS you can use this code to save to RTFD:

**Example:**

// save text as RTFD including image attachments
dim f as FolderItem = GetSaveFolderItem(FileTypes1.ApplicationRtfd, "test.rtfd")

if f = nil then Return

dim a as NSAttributedStringMBS = textView.textStorage
dim w as NSFileWrapperMBS = a.RTFDFileWrapperFromRange(0, a.length, DocumentAttributes)

dim e as NSErrorMBS
if w.writeToFile(f, e) then
else
MsgBox e.LocalizedDescription
end if

Notes: For TextArea you can query the underlaying NSTextViewMBS object via TextArea.NSTextViewMBS method.

186.0.200  How to scale a picture proportionally with mask?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** For a proportional scaling, we calculate the new picture size relative to the target maximum size.

**Example:**
Function ProportionalScaledWithMask(extends pic as Picture, Width as Integer, Height as Integer) As Picture

  // Calculate scale factor
  dim faktor as Double = min(Height / Pic.Height, Width / Pic.Width)

  // Calculate new size
  dim w as Integer = Pic.Width * faktor
  dim h as Integer = Pic.Height * faktor

  // create new picture
  dim NewPic as new Picture(w,h,32)

  // check if we have a mask and clear it
  dim m as picture = pic.mask(False)
  pic.mask = nil

  // draw picture in the new size
  NewPic.Graphics.DrawPicture Pic, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height

  if m <> nil then
    // restore mask and scale it
    pic.mask = m
    NewPic.mask.Graphics.DrawPicture m, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height
  end if

  // return result
  Return NewPic
End Function

Notes: This version handles mask. As you see we actually have to remove mask in order to copy the picture part correctly.

186.0.201 How to scale a picture proportionally?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: For a proportional scaling, we calculate the new picture size relative to the target maximum size.

Example:

Function ProportionalScaled(extends pic as Picture, Width as Integer, Height as Integer) As Picture

  // Calculate scale factor
  dim faktor as Double = min(Height / Pic.Height, Width / Pic.Width)
CHAPTER 186. THE FAQ

// Calculate new size
dim w as Integer = Pic.Width * faktor
dim h as Integer = Pic.Height * faktor

// create new picture
dim NewPic as new Picture(w,h,32)

// draw picture in the new size
NewPic.Graphics.DrawPicture Pic, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height

// return result
Return NewPic
End Function

Notes:
This does not handle mask, but you can scale the mask the same way and assign it to the new picture. (see other FAQ entry with mask)

186.0.202 How to scale/resize a picture?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. Answer: There are several ways to scale or resize a picture. The easiest way may be the ScaleMBS function in the Picture class.

Example:
dim Original, Scaled as Picture
Original=LogoMBS(500)
Scaled=Original.ScaleMBS(100,100,true)

Notes:
The plugin ways:
- The GWorld class which uses QuickTime. Includes nice Bicubic scaling with QuickTime 6.
- QTGraphicsImporterMBS and QTGraphicsExporterMBS can scale/resize.
- CoreImage scale filter may result in the fastest and best images on Mac OS X 10.4.
- NSImageMBS can scale, but is Mac OS X only.
- CGImageMBS can scale, but is Mac OS X only.
- CImageMBS can scale, but is Mac OS X only.
- QuickTime Graphics exporter and importer can be connected to scale. (this was used more often a few years ago)
- ImageMagick can scale very nice and crossplatform. But the ImageMagick libraries are big.
- The picture.ScaleMBS function is self written and results in equal output on Mac, Windows and Linux without any additional libraries installed.
- Picture.ScalingMBS does crossplatform scaling with several modes.

with pure REALbasic:
- make a new picture and draw the old one with new size inside.

186.0.203 How to search with regex and use unicode codepoints?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can specify unicode characters in search string with backslash x and digits.

**Example:**

```basic
dim r as RegExMbs
dim s as string
dim c as Integer

s="123 ABC 456"

r=new RegExMBS
if r.Compile("..") then
    c=r.Execute(s,0)
    MsgBox str(c)+" " +str(r.Offset(0))+" " +str(r.Offset(1))
    // shows: 1 4 10
    // 1 for ubound of the offset array
    // 4 for 4 bytes before the matched pattern
    // 10 for the 10 bytes before the end of the matched pattern
end if

r=new RegExMBS
if r.Compile("\.xF6.") then // finds using Unicode codepoint
    c=r.Execute(s,0)
    MsgBox str(c)+" " +str(r.Offset(0))+" " +str(r.Offset(1))
    // shows: 1 4 10
    // 1 for ubound of the offset array
    // 4 for 4 bytes before the matched pattern
    // 10 for the 10 bytes before the end of the matched pattern
end if
```

186.0.204 How to see if a file is invisible for Mac OS X?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this function:

**Example:**
Function Invisible(F As FolderItem) As Boolean
Dim TIS As TextInputStream
Dim S, All As String
Dim I as Integer
dim g as folderitem

If Left(F.Name,1)="." or not f.visible Then
Return True
End If

g=F.Parent.Child(".hidden")
If g.Exists Then
TIS=g.OpenAsTextFile
if tis<>Nil then
All=TIS.ReadAll
For I=1 to CountFields(All,Chr(11))
S=NthField(All, Chr(11), I)
If S=F.name Then
Return True
End If
Next
end if
End if
End if
End Function

186.0.205 How to set cache size for SQLite or REALSQLDatabase?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You use the pragma cache_size command on the database.

**Example:**

// set cache size to 20000 pages which is about 20 MB for default page size
Dim db as REALSQLDatabase
db.SQLExecute "PRAGMA cache_size = 20000"

**Notes:**

Default cache size is 2000 pages which is not much.
You get best performance if whole database fits in memory.
At least you should try to have a cache big enough so you can do queries in memory.
You only need to call this pragma command once after you opened the database.
186.0.206 How to set the modified dot in the window?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this declares:

Example:

```plaintext```
window1.ModifiedMBS=true
```

186.0.207 How to show a PDF file to the user in a Web Application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can use a WebHTMLViewer control and load the

Example:

```plaintext```
dim CurrentFile as WebFile // a property of the WebPage

// define the PDF file
CurrentFile = new WebFile
CurrentFile.Filename = "test.pdf"
CurrentFile.MIMEType = "application/pdf"
CurrentFile.Data = "some pdf data" // MyDynaPDF.GetBuffer

// load into html viewer
HTMLViewer1.URL = CurrentFile.URL
```

**Notes:**

See our Create PDF example for the Real Studio Web Edition.

http://www.monkeybreadsoftware.de/realbasic/webapps.shtml

186.0.208 How to show Keyboard Viewer programmatically?

Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Use Realbasic or AppleScript to launch the KeyboardViewerServer.app.

Example:

```plaintext```
dim a as new AppleScriptMBS
dim text as string
dim lines(-1) as string

lines.append "set theApplication to "/System/Library/Components/KeyboardViewer.component/Contents/Shared-Support/KeyboardViewerServer.app"
lines.append ""
```
CHAPTER 186. THE FAQ

```
lines.append "set POSIXPath to ((POSIX file thePath) as string)"
lines.append "tell application ""System Events"" to set isRunning to 0 < (count (application processes whose name is theApplication))"
lines.append "if isRunning then tell application POSIXPath to quit"
lines.append "delay 0.15"
lines.append "ignoring application responses"
lines.append "tell application POSIXPath to run"
lines.append "end ignoring"

text=join(lines,EndOfLine.macintosh)
```

a.Compile text
a.Execute

**Notes:**

AppleScript code:

```
set theApplication to "KeyboardViewerServer"
set thePath to "/System/Library/Components/KeyboardViewer.component/Contents/SharedSupport/KeyboardViewerServer.app"

set POSIXPath to ((POSIX file thePath) as string)
tell application "System Events" to set isRunning to 0 < (count (application processes whose name is theApplication))
if isRunning then tell application POSIXPath to quit
delay 0.15

ignoring application responses
tell application POSIXPath to run
end ignoring
```

186.0.209 How to show the mouse cursor on Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Try this declare:

**Example:**

```
Declare Sub ShowCursor Lib "Carbon" ()
```

ShowCursor
Notes: The MBS Plugin has this function and supports it on Windows, too.

186.0.210  How to shutdown a Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Ask the Finder via Apple Events:

Example:

```vba
Dim ae As AppleEvent
ae = NewAppleEvent("FNDR","shut","MACS")
If Not ae.Send Then
    MsgBox "The computer couldn't be shutdown."
End If
```

Notes:

Or toolbox call (Attention: This method will stop the computer immediately: No document asked to be saved, all applications quitting without knowing).

Declare Sub ShutDwnPower Lib "Carbon" ()
ShutDwnPower

186.0.211  How to sleep a Mac?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Ask the Finder via Apple Events:

Example:

```vba
Dim ae As AppleEvent
ae = NewAppleEvent("FNDR","slep","MACS")
If Not ae.Send Then
    MsgBox "The computer doesn't want to sleep."
End If
```
186.0.212 How to speed up rasterizer for displaying PDFs with DynaPDF?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Here a few speed tips:

- Use the DynaPDFRasterizerMBS function instead of our render functions.
- Reuse DynaPDFRasterizerMBS as long as the target picture size doesn’t change.
- Import only the PDF pages you want to display.
- Let DynaPDF do zooming, rotating or other effects instead of you change it.

186.0.213 How to use PDFLib in my RB application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** The PDFlib plugin was discontinued in favor of our DynaPDF plugin.

**Notes:** If you need help to move, please contact us.

186.0.214 How to use quotes in a string?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Just double them.

**Example:**

msgbox "This String contains ""quotes""."'

186.0.215 How to use Sybase in Web App?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Please use our MBS Real Studio SQL Plugin to connect to a Sybase Database in your web application.

**Notes:**

If you see db.Connect giving the error message "cs_ctx_alloc ->CS_MEM_ERROR", than some things are not setup right for Sybase.
The Apache process may not have all the SYBASE environment variables being set when the CGI was launched.

Adding these lines to /etc/httpd/conf/httpd.conf stopped the faux memory errors for us:

```
SetEnv LD_LIBRARY_PATH /opt/sybase/OCS-15_0/lib:/opt/sybase/OCS-15_0/lib3p64:/opt/sybase/OCS-15_0/lib3p:
SetEnv SYBROOT /opt/sybase
SetEnv SYBASE_OCS /opt/sybase
```
186.0.216 How to use the Application Support folder?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:**

I was saving a registration code for an app to the Preference folder. People on the list have suggested that it would be better in the ApplicationSupportFolder. How do I save the file called CWWPrefs into that folder using MBS?

I have checked for examples and the docs but can’t see how to apply it

```mbs
//f = SpecialFolder.Preferences.child("CWWPrefs")
f = ApplicationSupportFolderMBS(-32768)
```

**Example:**

```mbs
dim folder,file as FolderItem

folder = createApplicationSupportFolderMBS(-32763)

if folder=nil then
  // Some very old Mac OS Versions may not support it
  // or the plugin may fail for any reason
  folder=SpecialFolder.Preferences
end if

file=folder.Child("CWWPrefs")

MsgBox file.UnixpathMBS
```

**Notes:** You may not be able to write there with a normal user account!

186.0.217 How to use the IOPMCopyScheduledPowerEvents function in RealBasic?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You can use the following code which does this using the SoftDeclareMBS class.

**Example:**

```mbs
Sub Open()
  dim c as CFDateMBS
```
dim t as CFAbsoluteTimeMBS

// get current date
c=NewCFDateMBS

// in absolute time (seconds since x)
t=c.AbsoluteTime

// add 600 seconds (= 10 Minutes)
t.Value=t.Value+600

// Make a Date from it
c=t.Date

// Schedule the event
// 0 on success
// E00002C1 for missing root rights
Title=hex(schedulePowerEvent(c, "wake"))

// Just for information, display the scheduled stuff
CFShowMBS CopyScheduledPowerEvents
End Sub

Function CopyScheduledPowerEvents() As cfarrayMBS
dim s as SoftDeclareMBS
dim m as MemoryBlock

s=new SoftDeclareMBS

if s.LoadLibrary("IOKit.framework") then
if s.LoadFunction("IOPMCopyScheduledPowerEvents") then
if s.CallFunction(0,nil) then
Return NewCFArrayMBSHandle(s.Result,true)
else
MsgBox "Failed to Call IOPMCopyScheduledPowerEvents."
end if
else
MsgBox "Failed to load IOPMCopyScheduledPowerEvents."
end if
else
MsgBox "Failed to load IOKit."
end if

Return nil
End Function

Function SchedulePowerEvent(time_to_wake as CFDateMBS, Type as CFStringMBS) as Integer
dim s as SoftDeclareMBS
dim m as MemoryBlock

'/*
 */ Types of power event
'*/ These are potential arguments to IOPMSchedulePowerEvent().
'*/ These are all potential values of the kIOPMPowerEventTypeKey in the CFDictionarys
'*/ returned by IOPMCopyScheduledPowerEvents().
'*/
'/*!
'@define kIOPMAutoWake
'@abstract Value for scheduled wake from sleep.
'*/
'# define kIOPMAutoWake "wake"
'
'/*!
'@define kIOPMAutoPowerOn
'@abstract Value for scheduled power on from off state.
'*/
'# define kIOPMAutoPowerOn "poweron"
'
'/*!
'@define kIOPMAutoWakeOrPowerOn
'@abstract Value for scheduled wake from sleep, or power on. The system will either wake OR
'power on, whichever is necessary.
'*/
'
'# define kIOPMAutoWakeOrPowerOn "wakepoweron"
'
'/*!
'@define kIOPMAutoSleep
'@abstract Value for scheduled sleep.
'*/
'
'# define kIOPMAutoSleep "sleep"
'
'/*!
'@define kIOPMAutoShutdown
'@abstract Value for scheduled shutdown.
'*/
'
'# define kIOPMAutoShutdown "shutdown"

s=new SoftDeclareMBS

if s.LoadLibrary("IOKit.framework") then
if s.LoadFunction("IOPMSchedulePowerEvent") then

m=NewMemoryBlock(12)
m.Long(0)=time_to_wake.handle
m.Long(4)=0 // nil
m.Long(8)=type.Handle
if s.CallFunction(3,m) then
Return s.Result
end if
end if
End Function

Notes: Requires Mac OS X and to execute root rights.

186.0.218 How to validate a GUID?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: You can use this function below which uses a regular expression to verify that the string is a valid UUID/GUID:

Example:

Function IsGUID(guid as string) As Boolean
dim r as new RegEx
r.SearchPattern = "\{ \{ 0,1 \} \{ 0-9a-fA-F \} \{ 8 \} \{ 4 \} \{ 4 \} \{ 4 \} \{ 12 \} \} \{ 0,1 \} \} ^\{ 0,1 \} $"
Return r.Search(guid)<nil
End Function

Notes: Simply parsing the GUID with CFUUIDMBS does not give the same result as CFUUIDMBS will also take a string like "DDDD".

186.0.219 How to walk a folder hierarchie non recursively?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: Use code like this one:

Example:

Sub Walk(folder as FolderItem)
dim folders() as FolderItem
folders.Append folder
while UBound(folders)>=0
dim currentFolder as FolderItem = folders.pop

dim c as Integer = currentFolder.Count
for i as Integer = 1 to c
  dim item as FolderItem = currentFolder.TrueItem(i)
  if item = Nil then
    // no permission
  elseif item.Visible then // only visible
    if item.Directory then
      folders.Append item
    else
      // work with file here
    end if
  end if
end if

next
wend
End Sub

Notes:
As you see we go with a long loop which runs until we don’t have more folders to process.
We ignore items we can’t access due to permission limits.
And we only work visible items.
If you like, check folderitem.isBundleMBS on item to handle packages and applications better on Mac OS X.

186.0.220 I got this error: PropVal, QDPictMBS.Name (property value), Type mismatch error. Expected CGDataProviderMBS, but got Variant, Name:QDPictMBS

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: The plugins MacOSX and MacOSXCF belong together. If you use one part, please also install the other part.
Notes: We splitted the plugin because the Real Studio IDE on Windows crashed on compilation.
I registered the MBS Plugins in my application, but later the registration dialog is shown.

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** There are two main reasons.

**Notes:**

1. you may use the plugin before registering them. This is often the case if you register in a window open event and use the plugin in a control open event.

On the console on Mac OS X or Windows, you may see a message like this "MBS Plugins were used by the application before the RegisterMBSPlugin function was called. Please fix this in your code!".

2. you may have mixed different plugin versions which are not compatible.

In this case you can see a message "Internal plugin registration error." on the console on Mac OS X. Newer plugins may show a message dialog reporting this. Older version simply think they are not registered.

If the installer just merges old and new applications, users may have libraries of older and newer plugin versions in the libs folder. If your application loads the wrong version, the registration fails.

If you use remote debugging, make sure you clear the tempory files there, too. Otherwise you may have old DLLs on your hard disc which may disturb your application.

You can run into issues if you use your registration code on different places of your app. Please register only once in app.open (or app Constructor). If you have several codes, simply call them one after the other.

Also check that you only call RegisterMBSPlugin with valid serial number. If you later call RegisterMBSPlugin with Demo like in example code above, you remove the license.

Next check if you can clear the Xojo caches and that helps. This includes the Xojo Scratch folder and the Plugins & Project caches. Simply locate those folders and delete them. For Windows look in hidden AppData folder in your user folder. For Mac, please check .textasciitilde/Library/Caches and your temp folders.

Finally make sure you use the right serial number. Not an older one or a misspelled one.

I want to accept Drag & Drop from iTunes

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You need to accept AcceptMacDataDrop "itun" and Handle the DropObject.

**Example:**
Sub Open()
window1.AcceptMacDataDrop "itun"
End Sub

Sub DropObject(obj As DragItem)
dim s as string
dim f as folderItem
dim d as CFDictionaryMBS
dim o as CFObjectMBS
dim key as CFStringMBS
dim dl as CFDictionaryListMBS
dim i,c as Integer
dim u as CFURLMBS
dim file as FolderItem

if obj.MacDataAvailable("itun") then
    s = obj.MacData("itun")

    // Parse XML
    o=NewCFObjectMBSFromXML(NewCFBinaryDataMBSStr(s))

    // Make dictionary
    if o isa CFDictionaryMBS then
d=d=CFDictionaryMBS(o)

    // get Tracks Dictionary
    key=NewCFStringMBS("Tracks")
o=d.Value(key)

    if o isa CFDictionaryMBS then
d=d=CFDictionaryMBS(o)
dl=d.List

    // Walk over all entries in the Tracks dictionary
    c=dl.Count-1
    for i=0 to c
        o=dl.Value(i)

        if o isa CFDictionaryMBS then
d=d=CFDictionaryMBS(o)

        key=NewCFStringMBS("Location")
o=d.Value(key)
        if o isa CFStringMBS then
            u=NewCFURLMBS(CFStringMBS(CFStringMBS(o),nil))

            file=u.file
            if file<>nil then
MsgBox file.UnixpathMBS
end if
end if
next
end if
End Sub

Notes: The code above inside a window on Realbasic 5.5 with MBS Plugin 5.3 will do it nice and show the paths.

186.0.223  I’m drawing into a listbox but don’t see something.

Plugin Version: all, Console & Web: No. Answer: If you draw this in a listbox cellbackground, you need to draw on the correct position

Example:

Function CellBackgroundPaint(g As Graphics, row as Integer, column as Integer) As Boolean
dim f as FolderItem
f=SpecialFolder.Desktop
f.DrawWideIconMBS(g,listbox1.left,listbox1.top+row*20,16)
Return true
End Function

Notes: Try this in a listbox. The Graphics object there has a clipping and an offset which the plugin doesn’t know about.

186.0.224  I’m searching for a method or so to move a window from position x,y to somewhere else on the screen.

Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer:

The code I produced in RB isn’t smooth enough. Is there a call in MBS, if not, can it be done? The speed of it has to be like the show of a DrawerWindow.

Try the declare below for Carbon. With WindowLib it will work on Mac OS 8.5 and newer.

Notes: See Window.Transition functions.
186.0.225 If I use one of your plug-ins under windows, would this then impose the use of dll after compilation or my would my compiled soft still be a stand-alone single file software?

Notes:
REALbasic compiles all used plugins into the application binary.
Some plugin parts need external dlls but you will find that in the documentation. (e.g. pdflib for some classes)

186.0.226 Is the fn key on a powerbook keyboard down?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: I am unable to figure out how or if it is possible to detect if the fn key is down on a powerbook keyboard. Is it possible?
Example:
' Window.Open Event of a blank project:

dim i as Integer

for i=0 to 127
if keyboard.asynckeydown(i) then
    title=str(i) // found
    return
end if
next

title="" // not found

Notes: This test application shows the keycode (decimal) 63 for the fn key.

186.0.227 Is there a case sensitive Dictionary?

Plugin Version: all, Console & Web: No. Answer: The MBS Plugin has several classes which can work as a replacement.
Notes:
First you could use VariantToVariantHashMapMBS or VariantToVariantOrderedMapMBS.
If you know that all keys are Strings or Integers only, you can use the specialized classes which are a little bit faster due to avoiding variants:

IntegerToIntegerHashMapMBS class
IntegerToIntegerOrderedMapMBS class
Chapter 186. The FAQ

IntegerToStringHashMapMBS class
IntegerToStringOrderedMapMBS class
IntegerToVariantHashMapMBS class
IntegerToVariantOrderedMapMBS class
StringToStringHashMapMBS class
StringToStringOrderedMapMBS class
StringToVariantHashMapMBS class
StringToVariantOrderedMapMBS class

186.0.228 Is there a way to use the MBS plugin to get only the visible item and folder count on a volume?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: You can use the DirectorySizeMBS class for this as in the example below:

Example:

dim d as DirectorySizeMBS
d=new DirectorySizeMBS

// volume(1) as my boot volume is very full
if d.update(volume(1),true,0) then
    MsgBox str(d.VisibleItemCount)+" visible items, "+str(d.HiddenItemCount)+" invisible items."
end if

Notes:

Complete Question: Is there a way to use the MBS plugin to get only the visible item and folder count on a volume? The FileCount and FolderCount properties of VolumeInformationMBS seem to provide the total # of items including invisible items such as .DS_Store and more importantly .Trashes which is causing me a great amount of difficulty during a recursive scan of a volume. I've got a progress bar which uses the total of the filecount and foldercount properties as the maximum value, but my routine needs to filter out all invisible items, as it is creating a catalog of a volume for archiving purposes. Any thoughts how I could get accurate number.

186.0.229 Is there an easy way I can launch the Displays preferences panel?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Use the code below:

Example:
dim error as Integer

error=OpenMacOSXPreferencesPaneMBS("Displays")
if error<>0 then
MsgBox "Failed to launch QuickTime System Preferences panel."
end if

186.0.230  Is there an easy way I can launch the Quicktime preferences panel?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: Use the code below:
Example:
    
    dim error as Integer

    error=OpenMacOSXPreferencesPaneMBS("QuickTime")
    if error<>0 then
    MsgBox "Failed to launch QuickTime System Preferences panel."
    end if

186.0.231  List of Windows Error codes?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: We have a list of windows error codes on our website.
Notes: http://www.monkeybreadsoftware.de/xojo/winerror.shtml

186.0.232  Midi latency on Windows problem?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: The issue is system related, not a problem with RB or the plugin.
Notes:
Two things will adversely affect the timing:

1) latency of the software synthesizer output driver. The default Windows wavetable synthesizer has considerable latency. I don’t know how many milliseconds, but it is noticeable.

2) latency of the digital audio output driver. Different systems have different drivers for different audio hardware. My Dell laptop has a minimum 15ms latency in the audio driver.
These two things put together were causing a very sluggish MIDI response. I was able to verify these as the culprits by routing MIDI directly out of RB into a sample player, which only introduces the latency of (2) and does not include latency of (1).

I don’t know how widely known are these facts, if not then you may want to add this information to the documentation, since Windows programmers using the MIDI plugin may not know those problems, and might mistakenly blame your plugin, as I did :) Sorry about that!

(From Aaron Andrew Hunt)

186.0.233 My Xojo Web App does not launch. Why?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Here is a list of checks to do for linux apache installations with Xojo or Real Studio Web applications:

**Notes:**

Just a list of checks to do for linux apache installations:

- You have 64bit linux? Than you need 32 bit compatibility libraries.
- The folder of your app is writable? Set permissions to 777.
- The cgi script is executable? Set permissions to 755.
- The app file itself is executable? Set permissions to 755.
- You uploaded cgi file as text, so it has unix line endings? (this often gives error “Premature end of script headers” in apache log)
- You uploaded config.cfg file and made it writable? Set permissions to 666.
- Your apache allows execution of cgi scripts? You enabled cgi for apache and uncommented addhandler command for CGI on a new apache installation?
- You uploaded the app file and libraries as binary files? Upload as text breaks them.
- You did upload the libs folder?
- You don’t have code in app.open, session.open and other events which crashes app right at launch?
- You don’t have a print command in your app.open event? (see feedback case 23817)
- You allowed .htaccess file to overwrite permissions?
**186.0.234** Pictures are not shown in my application. Why?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:**

On Mac OS Classic, please check the memory partition size which may be too low. Else (most times on Windows) you are simple missing the part of QuickTime to load images.

**186.0.235** Realbasic doesn’t work with your plugins on Windows 98.

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Upgrade your Windows version or complain to Realsoftware.

**186.0.236** REALbasic or my RB application itself crashes on launch on Mac OS Classic. Why?

Plugin Version: all, Console & Web: No. **Answer:**

You may check if the application has enough memory to be loaded. RB should have on Mac OS Classic more than 20 MB of RAM. I prefered to use 50 MB and for an application a 10 MB partition is a good way to start.

**186.0.237** SQLDatabase not initialized error?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Before you can use SQLDatabaseMBS, it must be initialized.

**Example:**

```
    dim d as new SQLDatabaseMBS
```

**Notes:**

This happens normally when you use "new SQLDatabaseMBS". But if you just have a SQLConnectionMBS and get a recordset there, the initialization may not have happened, yet.

So please simply add a line "dim d as new SQLDatabaseMBS" to your app.open code after registration, so the plugin part can initialize and late provide recordsets.

**186.0.238** Textconverter returns only the first x characters. Why?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**
Some older REALbasic versions limit the Textconverter to around 1024 characters in input and output. This should be fixed with RB5.

Notes: REALbasic seems not to support Textconverters at all on Windows.

186.0.239 The type translation between CoreFoundation/Foundation and REALbasic data types.

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: The plugin does conversion between Cocoa/Carbon data types and native REALbasic data types. The following list help you knowing what the current plugins support:

Notes:

Cocoa NSObject to Variant:

nil ->nil
NSDictionary ->Dictionary
NSData ->MemoryBlock
NSString ->String
NSAttributedString ->NSAttributedStringMBS
NSDate ->Date
NSNumber ->double/integer/Int64/UInt64/UInt32/Boolean
NSURL ->String
NSNumber with NSRect ->NSRectMBS
NSNumber with NSPoint ->NSPointMBS
NSNumber with NSSize ->NSSizeMBS
NSNumber with NSRange ->NSRangeMBS
NSNumber with QTTime ->QTTimeMBS
NSNumber with QTTimeRange ->QTTimeRangeMBS
NSArray ->Array of Variant
QuartzFilter ->QuartzFilterMBS

* ->MBS

Variant to CocoaNSObject:

nil ->nil
Dictionary ->NSDictionary
Boolean ->NSNumber
Integer ->NSNumber
Color ->NSColor
Int64 ->NSNumber
Single ->NSNumber
Double ->NSNumber
Date ->NSDate
MemoryBlock -> NSData
String -> NSString
NSImageMBS -> NSImage
NSAttributedStringMBS -> NSAttributedString
NSColorMBS -> NSColor
NSRectMBS -> NSValue with NSRect
NSSizeMBS -> NSValue with NSSize
NSPointMBS -> NSValue with NSPoint
NSRangeMBS -> NSValue with NSRange
NSBurnMBS -> NSBurn
NSViewMBS -> NSView
NSFontMBS -> NSFont
NSParagraphStyleMBS -> NSParagraphStyle
NSAttributedStringMBS -> NSAttributedString
WebPolicyDelegateMBS -> WebPolicyDelegate
WebUIDelegateMBS -> WebUIDelegate
WebFrameLoadDelegateMBS -> WebFrameLoadDelegate
WebResourceLoadDelegateMBS -> WebResourceLoadDelegate
NSIndexSetMBS -> NSIndexSet
QTTimeMBS -> QTTime
QTTimeRangeMBS -> QTTimeRange
Array of Variant -> NSArray
Array of String -> NSArray
CFStringMBS -> NSString
CFNumberMBS -> NSNumber
CFDataMBS -> NSData
CFURLMBS -> NSURL
CFArrayMBS -> NSArray
CFDictionaryMBS -> NSDictionary
CFBinaryDataMBS -> NSDate

Carbon CFTypeRef to Variant:

CFDictionaryRef -> Dictionary
CFStringRef -> String
CFDataRef -> String
CFURL -> String
CFNumber -> Integer/Double/Int64
CFArray -> Array
CFDate -> date
nil -> nil
CGColorSpace -> CGColorSpaceMBS
CGColor -> CGColorMBS
CGImage -> CGImageMBS
CF* -> CF*MBS
Variant to Carbon CFTypeRef:

Dictionary -> CFDictionaryRef
Boolean -> CFBooleanRef
Color -> CFNumberRef
Integer -> CFNumberRef
Int64 -> CFNumberRef
Single -> CFNumberRef
Double -> CFNumberRef
String -> CFStringRef
Color -> CGColorRef
Date -> CFDateRef
nil -> nil
Memoryblock -> CFDataRef
Folderitem -> CFURLRef
Dictionary -> CFDictionaryRef
Array of Variant/String/Date/Double/Single/Int64/Integer -> CFArray
CGRectMBS -> CGRect as CFDataRef
CGSizeMBS -> CGSize as CFDataRef
CGPointMBS -> CGPoint as CFDataRef
CGColorMBS -> CGColor
CGColorSpaceMBS -> CGColorSpace
CGImageMBS -> CGImage
CGDataConsumerMBS -> CGDataConsumer
CGDataProviderMBS -> CGDataProvider
CF*MBS -> CF*

Strings without encodings should be put into dictionaries as memoryblocks.

186.0.240 Uploaded my web app with FTP, but it does not run on the server!

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** If you see errors like a simple "Segmentation Fault" on Linux or some other wired errors, you may want to check your FTP upload mode. It must be binary for web apps. ASCII mode corrupts the application.

186.0.241 What classes to use for hotkeys?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Please use Carbon-HotKeyMBS class on Mac and WindowsKeyFilterMBS on Windows.

**Notes:** CarbonHotKeyMBS will also work fine in Cocoa apps.
186.0.242  What do I need for Linux to get picture functions working?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.  **Answer:** In order to get our plugins working on Linux systems without GUI, the plugin loads graphics libraries dynamically.  **Notes:**

To get it working, the plugin tries to load gtk with this paths:

- libgtk-x11-2.0.so"
- libgtk-x11-2.0.so.0"
- /usr/lib/libgtk-x11-2.0.so"
- /usr/lib32/libgtk-x11-2.0.so"
- /usr/lib/libgtk-x11-2.0.so.0"
- /usr/lib32/libgtk-x11-2.0.so.0"

gdk is loaded with this paths:

- libgdk-x11-2.0.so"
- libgdk-x11-2.0.so.0"
- /usr/lib/libgdk-x11-2.0.so"
- /usr/lib32/libgdk-x11-2.0.so"
- /usr/lib/libgdk-x11-2.0.so.0"
- /usr/lib32/libgdk-x11-2.0.so.0"

For the paths without explicit path, the system will search in /lib, /usr/lib and all directories in the LD_LIBRARY_PATH environment variable.

186.0.243  What does the NAN code mean?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.  **Answer:**
186.0.244  What font is used as a 'small font' in typical Mac OS X apps?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No.  **Answer:**

REALbasic 4.5 has a constant "SmallSystem" to use for a font name.  
For older versions try this code:

**Example:**

```vbscript
Sub GetThemeFont(fontType as Integer, ByRef fontName as String, ByRef fontSize as Integer, ByRef fontStyle as Integer)
    dim err as Integer
    dim theFont, theFontSize, theFontStyle as MemoryBlock

    const smSystemScript = -1

    Declare Function GetThemeFont Lib "Carbon" (inFontID as Integer, inScript as Integer, outFontName as Ptr, outFontSize as Ptr, outStyle as Ptr) as Integer

    theFont = NewMemoryBlock(256)  '//Str255
    theFontSize = NewMemoryBlock(2)  '//SInt16
    theFontStyle = NewMemoryBlock(1)  '//Style

    err = GetThemeFont(fontType, smSystemScript, theFont, theFontSize, theFontStyle)

    if err = 0 then
        fontName = theFont.PString(0)
        fontSize = theFontSize.UShort(0)
        fontStyle = theFontStyle.Byte(0)
    else
        fontName = ""
        fontSize = 0
        fontStyle = 0
    end if
End Sub
```

186.0.245  What is last plugin version to run on Mac OS X 10.4?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No.  **Answer:** Last Version with 10.4 support is version 15.4.

**Notes:**

With version 15.4 you can build applications for OS X 10.4 and newer.  
For Version 16.0 we disabled 10.4 and moved minimum to 10.5.  We may be able to enable it again to build a version of 16.x, but may need to charge for this by hour.
186.0.246 What is last plugin version to run on PPC?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Last Version with PPC is 15.4.

**Notes:**
With version 15.4 you can build PPC applications for OS X 10.4 and newer.
For Version 16.0 we disabled PPC. We may be able to enable it again to build a PPC version of 16.x, but may need to charge for this by hour.

186.0.247 What is the difference between Timer and WebTimer?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Time is server side and WebTimer client side.

**Notes:** Timer is the normal timer class in Real Studio. It runs on the server. On the side the WebTimer runs on the client. It triggers a request to the server to perform the action. So a WebTimer is good to keep the connection running and the website updated regularly. A timer on the server is good to make regular jobs like starting a database backup every 24 hours.

186.0.248 What is the list of Excel functions?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Below a list of function names known by LibXL.

**Notes:**
LibXL parses the functions and writes tokens to the excel file. So even if Excel can do more functions, we can only accept the ones known by LibXL.

ABS, ABSREF, ACOS, ACOSH, ACTIVE.CELL, ADD.BAR, ADD.COMMAND, ADD.MENU, ADD.TOOLBAR, ADDRESS, AND, APP.TITLE, AREAS, ARGUMENT, ASC, ASIN, ASINH, ATAN, ATAN2, ATANH, AVEDEV, AVERAGE, AVERAGEA, BAHTTEXT, BETADIST, BETAINV, BINOMDIST, BREAK, CALL, CALLER, CANCEL.KEY, CEILING, CELL, CHAR, CHECK.COMMAND, CHIDIST, CHIINV, CHITEST, CHOOSE, CLEAN, CODE, COLUMN, COLUMNS, COMBIN, CONCATENATE, CONFIDENCE, CORREL, COS, COTH, COUNT, COUNTA, COUNTBLANK, COUNTIF, COVAR, CREATE.OBJECT, CRITBINOM, CUSTOM.REPEAT, CUSTOM.UNDO, DATE, DATEDIF, DATESTRINGS, DATEVALUE, DAVE, DAY, DAYS360, DB, DBCS, DCOUNT, DCOUNTA, DDB, DEGREES, DELETE.BAR, DELETE.COMMAND, DELETE.MENU, DELETE.TOOLBAR, DEREFS, DEVSQ, DGET, DIALOG.BOX, DIRECTORY, DMAX,DMIN, DOCUMENTS, DOLLAR, DPRODUCT, DSTDEV, DSTDEVP, DSUM, DVAR, DVARP, ECHO, ELSE, ELSEIF, ENABLE.COMMAND, ENABLE.TOOL, END.IF, ERROR, ERROR.TYPE, EVALUATE, EVEN, EXACT, EXECUTE, EXP, EXPONDIST, FACT, FALSE, FCLOSE, FDIST, FILES, FIND, FINDB, FINV, FISHER, FISHERINV, FIXED, FLOOR, FOPEN, FOR, FOR.CELL, FORECAST, FORMULA, CONVERT, FPOS, FREAD, FREADLN, FREQUENCY, FSIZE, FTET, FV, FWRITE, FWRITELN, GAMMADIST, GAMMAINV, GAMMALN, GEOMEAN, GET.BAR, GET.CELL, GET.CHART.ITEM, GET.DEFINITIONS, GET.DOCUMENT, GET.FORMULA, GET.LINK.INFO, GET.MOVIE, GET.NAME, GET.NOTE,
186.0.249  What is the replacement for PluginMBS?

186.0.250  What to do on Realbasic reporting a conflict?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes.  Answer:

I get an error like ”This item conflicts with another item of the same name” when using one of the plugin functions.

REALbasic just wants to tell you that you dropped something in the plugins folder what is not a plugin.  
Notes: Some users dropped the examples, the documentation or other files into the plugins folder. Don’t do it.
186.0.251  What to do with a NSImageCacheException?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** You need to add exception handlers for NSExceptionMBS in order to catch this exception.

**Notes:**

You may also add code to write the stack of the exception into a log file for later locating the error source.

A NSImage has several image representations in memory. So basically you pass in the base image and for whatever size an image is needed, the NSImage class will create a cache image representation of the requested size so on the next query it can use that cache for the same requested size.

186.0.252  What to do with MySQL Error 2014?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** You can get this error on MySQL if you have a recordset open while you create another one.

186.0.253  What ways do I have to ping?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** You have different ways

**Notes:**

1. Use the shell class and the ping utility.

2. Use the MBS Network Plugin and there the SuperSocket part:

   a) On Windows the ICMPPingMBS works to ping.
   b) On Mac OS X it uses OpenTransport and needs root rights. You need to use sudo to run this application. This does not work on Intel Macs, because the plugin is not endian safe.

3. The DarwinPingMBS.Ping method:

   Compiled for Mac OS X Macho target it works as a synchronized ping method.
   The Windows version had a bug and was fixed in plugin version 8.2pr4. So it works now.

4. The DarwinPingMBS.SimplePing method:

   Works on Mac OS X Macho target.
But this method can be called from a thread to make it working in background.

186.0.254 Where is CGGetActiveDisplayListMBS?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** This is now CGDisplayMBS.GetActiveDisplayList.

186.0.255 Where is CGGetDisplaysWithPointMBS?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** This is now CGDisplayMBS.GetDisplaysWithPoint.

186.0.256 Where is CGGetDisplaysWithRectMBS?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** This is now CGDisplayMBS.GetDisplaysWithRect.

186.0.257 Where is CGGetOnlineDisplayListMBS?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** This is now CGDisplayMBS.GetOnlineDisplayList.

186.0.258 Where is GetObjectClassNameMBS?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Please use this replacement method:

**Example:**

```vbnet
Function GetObjectClassNameMBS(o as Object) As string
    dim t as Introspection.TypeInfo = Introspection.GetType(o)
    Return t.FullName
End Function
```

**Notes:** GetObjectClassNameMBS was removed from the plugins.
Where is NetworkAvailableMBS?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. Answer: We removed NetworkAvailableMBS some versions ago. It was not working right and basically it’s not useful. If you want to check whether you have a network, than do a DNS resolve:

Example:

```vbnet
// two independent domain names
const domain1 = "www.google.com"
const domain2 = "www.macsw.de"

// resolve IPs
dim ip1 as string = DNSNameToAddressMBS(Domain1)
dim ip2 as string = DNSNameToAddressMBS(Domain2)

// if we got IPs and not the same IPs (error/login pages)
if len(ip1)=0 or len(ip2)=0 or ip1=ip2 then
    MsgBox "no connection"
else
    MsgBox "have connection"
end if
```

Notes: This way you can detect whether you got something from DNS. And you can make sure that a DNS redirection to a login page won’t catch you.

Where is StringHeight function in DynaPDF?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. Answer: Use the function GetFTextHeight or GetFTextHeightEx.

Notes: Be aware that GetFTextHeight works with format commands and you may want to escape your text if you don’t use them.

Where is XLSDocumentMBS class?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. Answer: This class has been removed in favor of XLBookMBS class.

Notes: This classes have been removed XLSCellMBS, XLSDocumentMBS, XLSFormatRecordMBS, XLSMergedCellsMBS, XLSRowMBS and XLSSheetMBS.
186.0.262 Where to get information about file formats?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**

Please visit this web page:
http://www.wotsit.org

186.0.263 Where to register creator code for my application?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:**

Register at Apple:

186.0.264 Which Mac OS X frameworks are 64bit only?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Some frameworks from Mac OS X do not support 32 bit applications, so we can’t provide plugins for Xojo until 64bit target is available.

**Notes:**

For Mac OS X 10.8:

- Accounts
- EventKit
- GLKit
- Social

and in 10.9:

- Accounts
- AVKit
- EventKit
- GameController
- GLKit
- MapKit
• MediaLibrary
• Social
• SpriteKit

In general Apple makes all new frameworks being 64 bit only.

186.0.265 Which plugins are 64bit only?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Some of our plugins work only in 64 bit modes as operation systems do not provide 32 bit code.

**Notes:** This effects currently: EventKit, Accounts, Social frameworks from Apple and our matching plugins.

186.0.266 Why application doesn’t launch because of a missing ddraw.dll!?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Some RB versions require that you install DirectX from Microsoft on your Windows.

186.0.267 Why application doesn’t launch because of a missing shlwapi.dll!?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** Some RB versions require that you install the Internet Explorer from Microsoft on your Windows.

**Notes:** This bug is for several older Windows 95 editions.

186.0.268 Why do I hear a beep on keydown?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** When the user presses a key, RB goes through all keydown event handlers till on returns true.

**Notes:** If no keydown event handler returns true for the key, a beep is performed.

186.0.269 Why does folderitem.item return nil?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:** Because RealBasic fails to make a folderitem for you. Reason may be an alias file which can’t be resolved or simply that you don’t have enough access rights to read the folder content.

**Notes:** A more rarely reason is that the directory changed and the file with the given index or name does no longer exist.
186.0.270  Why doesn't showurl work?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: Yes. **Answer:**

There are three main reasons:

1. showurl is not supported by REALbasic in 68k applications.
2. there is now application defined for the protocol (e.g. http) in the Internet Control panel.
3. You don’t have Internet Config installed.

You can use the InternetConfigMBS class to check for this stuff.

186.0.271  Why don’t the picture functions not work on Linux?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** Please make sure libcairo is installed.

**Notes:**

For accessing pictures on Linux, the MBS Plugin relays on the cairo library. Please install the package if you don’t have it already.
Our plugin looks for library called libcairo.so or libcairo.so.2.

186.0.272  Why have I no values in my chart?

Plugin Version: all, Console & Web: No, Mac: Yes, Win: Yes, Linux: No. **Answer:** You have no data points visible, there may be several reasons:

**Notes:**

For example one of the data values may be infinite or invalid. Or the scaling may be out of range, so you simply see nothing.

186.0.273  Will application size increase with using plugins?

Plugin Version: all, Console & Web: No, Mac: No, Win: Yes, Linux: No. **Answer:** All plugins used by your application will be included in the application.

**Notes:**

If you use no plugins, your application will not change size. And if you use one class from the plugins, your application size will increase by a few kilobytes. The documentation of the plugins include a list of all plugin parts and their sizes for the different platforms.
**186.0.274  XLS: Custom format string guidelines**

Plugin Version: all, Console & Web: No, Mac: Yes, Win: No, Linux: No. **Answer:** You have to download the source code and compile a static version of the library.

**Notes:**

Up to four sections of format codes can be specified. The format codes, separated by semicolons, define the formats for positive numbers, negative numbers, zero values, and text, in that order. If only two sections are specified, the first is used for positive numbers and zeros, and the second is used for negative numbers. If only one section is specified, it is used for all numbers. Four sections example:

```
# ,# # # .00); [ Red ] (# ,# # # .00);0.00;"sales "@
```

The following table describes the different symbols that are available for use in custom number formats.

Specify colors

To set the text color for a section of the format, type the name of one of the following eight colors in square brackets in the section. The color code must be the first item in the section.

Instead of using the name of the color, the color index can be used, like this [ Color3 ] for Red. Valid numeric indexes for color range from 1 to 56, which reference by index to the legacy color palette.

Specify conditions

To set number formats that will be applied only if a number meets a specified condition, enclose the condition in square brackets. The condition consists of a comparison operator and a value. Comparison operators include: = Equal to; > Greater than; < Less than; >= Greater than or equal to, <= Less than or equal to, and <> Not equal to. For example, the following format displays numbers that are less than or equal to 100 in a red font and numbers that are greater than 100 in a blue font.

```
[ Red ] [ <=100 ]; [ Blue ] [ >100 ]
```

If the cell value does not meet any of the criteria, then pound signs ("# ") are displayed across the width of the cell.

Dates and times

**Examples**
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>The x value of the data point. For an enumerated x-axis (see Axis.setLabels on what is an enumerated axis), the first data point is 0, and the nth data point is (n-1).</td>
</tr>
<tr>
<td>xLabel</td>
<td>The bottom x-axis label of the data point.</td>
</tr>
<tr>
<td>x2Label</td>
<td>The top x-axis label of the data point.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the data point.</td>
</tr>
<tr>
<td>accValue</td>
<td>The sum of values of all data points that are in the same x position and same data group as the current data point, and with data set number less than or equal to the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.</td>
</tr>
<tr>
<td>totalValue</td>
<td>The sum of values of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.</td>
</tr>
<tr>
<td>percent</td>
<td>The percentage of the data point based on the total value of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.</td>
</tr>
<tr>
<td>accPercent</td>
<td>The accumulated percentage of the data point based on the total value of all data points that are in the same x position and same data group as the current data point.</td>
</tr>
<tr>
<td>gpercent</td>
<td>The percentage of the data point based on the total value of all data points in a layer.</td>
</tr>
<tr>
<td>dataSet</td>
<td>The data set number to which the data point belongs. The first data set is 0. The nth data set is (n-1).</td>
</tr>
<tr>
<td>dataSetName</td>
<td>The name of the data set to which the data point belongs.</td>
</tr>
<tr>
<td>dataItem</td>
<td>The data point number within the data set. The first data point is 0. The nth data point is (n-1).</td>
</tr>
<tr>
<td>dataGroup</td>
<td>The data group number to which the data point belongs. The first data group is 0. The nth data group is (n-1).</td>
</tr>
<tr>
<td>dataGroupName</td>
<td>The name of the data group to which the data point belongs.</td>
</tr>
<tr>
<td>layerId</td>
<td>The layer number to which the data point belongs. The first layer is 0. The nth layer is (n-1).</td>
</tr>
<tr>
<td>fieldN</td>
<td>The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using Layer.addExtraField, Layer.addExtraField2, BaseChart.addExtraField or BaseChart.addExtraField2.</td>
</tr>
</tbody>
</table>
diFieldN     Same as fieldN. See above.
dsFieldN     Similar to fieldN, except that dsFieldN means the extra field is indexed by data set number. The Pth data set corresponds to the Pth element of the extra field.
dsdiFieldN   Similar to fieldN, except that dsdiFieldN means the extra fields are indexed by both the data set number and data point number. The Pth data item of the Qth data set corresponds to the Pth element of the \((N + Q)\)th extra field.

Parameter Description
zx The symbol scale in the x dimension. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.
zy The symbol scale in the y dimension. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.
z The symbol scale without distinguishing the dimension to use. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.

Parameter Description
slope The slope of the trend line.
intercept The y-intercept of the trend line.
corr The correlation coefficient in linear regression analysis.
stderr The standard error in linear regression analysis.

top The value of the top edge of the box-whisker symbol.
bottom The value of the bottom edge of the box-whisker symbol.
max The value of the maximum mark of the box-whisker symbol.
min The value of the minimum mark of the box-whisker symbol.
med The value of the median mark of the box-whisker symbol.

Parameter Description
high The high value.
low The low value.
open The open value.
close The close value.

dir The direction of the vector.
len The length of the vector.

Nan  Meaning
1   Invalid square root (negative number, usually)
2   Invalid addition (indeterminate such as infinity + (-infinity))
4   Invalid division (indeterminate such as 0/0)
8   Invalid multiplication (indeterminate such as 0*infinity)
9   Invalid modulo such as (a mod 0)
17  Try to convert invalid string to a number like val("x7")
33  Invalid argument in a trig function
34  Invalid argument in an inverse trig function
36  Invalid argument in a log function
37  Invalid argument in Pow function
38  Invalid argument in toolbox financial function
40  Invalid argument in hyperbolic function
42  Invalid argument in a gamma function

<tr>
<td>0</td>
<td>Digit placeholder. For example, if the value 8.9 is to be displayed as 8.90, use the format # .00</td>
</tr>
<tr>
<td>#</td>
<td>Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall not display extra zeros when the number typed has fewer digits on either side of the decimal than there are # symbols in the format. For example, if the custom format is # .# # , and 8.9 is in the cell, the number 8.9 is displayed.</td>
</tr>
<tr>
<td>?</td>
<td>Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall put a space for insignificant zeros on either side of the decimal point so that decimal points are aligned in the column. For example, the custom format 0.0? aligns the decimal points for the numbers 8.9 and 88.99 in a column.</td>
</tr>
<tr>
<td>.</td>
<td>(period) Decimal point.</td>
</tr>
<tr>
<td>%</td>
<td>Percentage. If the cell contains a number between 0 and 1, and the custom format 0% is used, the application shall multiply the number by 100 and adds the percentage symbol in the cell.</td>
</tr>
<tr>
<td>,</td>
<td>(comma) Thousands separator. The application shall separate thousands by commas if the format contains a comma that is enclosed by number signs (# ) or by zeros. A comma that follows a placeholder scales the number by one thousand. For example, if the format is # .0,, and the cell value is 12,200,000 then the number 12.2 is displayed.</td>
</tr>
<tr>
<td>E- E+ e- e+</td>
<td>Scientific format. The application shall display a number to the right of the &quot;E&quot; symbol that corresponds to the number of places that the decimal point was moved. For example, if the format is 0.00E+00, and the value 12,200,000 is in the cell, the number 1.22E+07 is displayed. If the number format is # 0.0E+0, then the number 12.2E+6 is displayed.</td>
</tr>
<tr>
<td>$ -+/():space</td>
<td>Displays the symbol. If it is desired to display a character that differs from one of these symbols, precede the character with a backslash (). Alternatively, enclose the character in quotation marks. For example, if the number format is (000), and the value 12 is in the cell, the number (012) is displayed.</td>
</tr>
<tr>
<td>\</td>
<td>Display the next character in the format. The application shall not display the backslash. For example, if the number format is 0!, and the value 3 is in the cell, the value 3! is displayed.</td>
</tr>
<tr>
<td>*</td>
<td>Repeat the next character in the format enough times to fill the column to its current width. There shall not be more than one asterisk in one section of the format. If more than one asterisk appears in one section of the format, all but the last asterisk shall be ignored. For example, if the number format is 0*x, and the value 3 is in the cell, the value 3xxxxxx is displayed. The number of x characters that are displayed in the cell varies based on the width of the column.</td>
</tr>
<tr>
<td>- (underline)</td>
<td>Skip the width of the next character. This is useful for lining up negative and positive values in different cells of the same column. For example, the number format .(0.0);(0.0) aligns the numbers 2.3 and -4.5 in the column even though the negative number is enclosed by parentheses.</td>
</tr>
<tr>
<td>&quot;text&quot;</td>
<td>Display whatever text is inside the quotation marks. For example, the format 0.00 &quot;dollars&quot; displays 1.23 dollars when the value 1.23 is in the cell.</td>
</tr>
<tr>
<td>@</td>
<td>Text placeholder. If text is typed in the cell, the text from the cell is placed in the format where the at symbol (@) appears. For example, if the number format is &quot;Bob &quot;@&quot; Smith&quot; (including quotation marks), and the value &quot;John&quot; is in the cell, the value Bob John Smith is displayed.</td>
